Revision 5.20 Oct.15.2025

# Table of Contents

**Chapter 1 Introduction** . . . 14
1.1 Overview . . . 14
1.2 Using this Manual . . . 14
1.3 Documentation Standard . . . 14
1.4 Introduction to FSP . . . 14
1.4.1 Purpose . . . 15
1.4.2 Quality . . . 15
1.4.3 Ease of Use . . . 15
1.4.4 Scalability . . . 15
1.4.5 Build Time Configurations . . . 15
1.4.6 e² studio IDE . . . 15
**Chapter 2 Reference Materials** . . . 16
2.1 Using Registers Directly . . . 16
2.1.1 Overview . . . 16
2.1.2 What's in an . . . 16
2.1.3 Where are iodefine files located? . . . 16
2.1.4 Using the register definitions . . . 17
2.1.5 Tips for writing hardware drivers . . . 18
2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide . . . 19
2.2.1 Overview . . . 19
2.2.2 Stack Migration Steps . . . 19
2.2.3 List of Code Change Highlights . . . 21
2.3 Cortex-M85 Caches . . . 22
2.3.1 Changes . . . 22
2.3.2 Overview . . . 22
2.3.3 CM85 Cache Features . . . 24
2.3.4 RA8 Cache Background Information . . . 25
2.3.5 Cache Maintenance . . . 26
2.3.6 Typical Cache Maintenance Scenarios . . . 26
2.3.7 Cache Functions and Macros . . . 29
2.3.8 Cache Details . . . 31
2.3.9 Other Information . . . 33
2.3.9.1 Cache ECC with FSP . . . 36
2.3.10 References . . . 37
2.4 Using Ocrypto . . . 39
2.4.1 Overview . . . 39
2.4.2 Limitations . . . 39
2.4.3 RA FSP Licensed Algorithms . . . 39
2.4.4 API Examples . . . 39
2.4.5 Additional Information . . . 40
2.4.6 Ocrypto - Side Channel Safety Statement . . . 40
2.4.7 Ocrypto - Function Overview . . . 43
2.5 Linker Script Generation Guide . . . 45
2.5.1 FSP Linker Scripts . . . 45
2.5.1.1 Why we changed . . . 45
2.5.1.2 New section model (high level) . . . 46
2.5.1.3 Interacting with the new flow . . . 47
2.5.1.4 Migration guide (step?by?step) . . . 49
2.5.1.5 Legacy (gcc, llvm) ? New **output** section translation . . . 49
2.5.1.6 Behavior differences worth noting . . . 50
2.5.1.7 Examples . . . 50

2.5.2 FAQ . . . 51
2.5.3 Summary . . . 51
2.5.4 Appendix: Linker Input Sections . . . 51
2.5.4.1 Memory Class Dictionaries . . . 52
2.5.4.2 RAM-Resident Sections . . . 52
2.5.4.3 ROM-Resident Sections . . . 53
2.5.4.4 Summary . . . 53
**Chapter 3 Starting Development** . . . 55
3.1 Starting Development Introduction . . . 55
3.2 e² studio User Guide . . . 56
3.2.1 What is e² studio? . . . 56
3.2.2 e² studio Prerequisites . . . 58
3.2.2.1 Obtaining an RA MCU Kit . . . 58
3.2.2.2 PC Requirements . . . 58
3.2.2.3 Installing e² studio, platform installer and the FSP package . . . 58
3.2.2.4 Choosing a Toolchain . . . 58
3.2.2.5 Licensing . . . 59
3.2.3 What is a Project? . . . 59
3.2.4 Creating a Project . . . 61
3.2.4.1 Creating a New Project . . . 61
3.2.4.2 Selecting a Board and Toolchain . . . 62
3.2.4.3 Selecting Flat or Arm TrustZone Project . . . 63
3.2.4.4 Selecting a Project Template . . . 64
3.2.5 Configuring a Project . . . 67
3.2.5.1 Summary Tab . . . 67
3.2.5.2 Configuring the BSP . . . 68
3.2.5.3 Configuring Clocks . . . 69
3.2.5.4 Configuring Pins . . . 70
3.2.5.5 Configuring Interrupts from the Stacks Tab . . . 72
3.2.5.6 Viewing Event Links . . . 75
3.2.6 Adding Threads and Drivers . . . 75
3.2.6.1 Adding and Configuring HAL Drivers . . . 76
3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers . . . 78
3.2.6.3 Configuring Threads . . . 82
3.2.7 Reviewing and Adding Components . . . 83
3.2.8 Writing the Application . . . 84
3.2.8.1 Coding Features . . . 84
3.2.8.2 HAL Modules in FSP: A Practical Description . . . 90
3.2.8.3 RTOS-Independent Applications . . . 91
3.2.8.4 RTOS Applications . . . 92
3.2.8.5 Additional Resources for Application Development . . . 94
3.2.9 Debugging the Project . . . 95
3.2.10 Modifying Toolchain Settings . . . 95
3.2.11 Creating RA project with Arm Compiler 6 in e² studio . . . 97
3.2.12 Importing an Existing Project into e² studio . . . 100
3.2.13 Using Semihosting in a Project . . . 104
3.3 Tutorial: Your First RA MCU Project - Blinky . . . 105
3.3.1 Tutorial Blinky . . . 105
3.3.2 What Does Blinky Do? . . . 105
3.3.3 Prerequisites . . . 105
3.3.4 Create a New Project for Blinky . . . 105
3.3.4.1 Details about the Blinky Configuration . . . 108
3.3.4.2 Configuring the Blinky Clocks . . . 109
3.3.4.3 Configuring the Blinky Pins . . . 109
3.3.4.4 Configuring the Parameters for Blinky Components . . . 109

3.3.4.5 Where is main()? . . . 109
3.3.4.6 Blinky Example Code . . . 109
3.3.5 Build the Blinky Project . . . 109
3.3.6 Debug the Blinky Project . . . 110
3.3.6.1 Debug prerequisites . . . 110
3.3.6.2 Debug steps . . . 111
3.3.6.3 Details about the Debug Process . . . 112
3.3.7 Run the Blinky Project . . . 113
3.4 Tutorial: Your First RA Multicore Application - Blinky . . . 113
3.4.1 Introduction . . . 113
3.4.2 Generate Multicore Project Pair . . . 113
3.4.3 Information On Multicore Related Changes To hal_entry.c . . . 116
3.4.4 Build Projects . . . 117
3.4.5 Information On Multicore Related Changes To Launch Configs . . . 117
3.4.6 Reset TrustZone Partition Boundaries . . . 118
3.4.7 Start Debugging . . . 119
3.4.8 Multicore Debugging Control . . . 121
3.4.9 Terminating a Multicore Debugging Session . . . 122
3.4.10 Starting Future Debug Sessions . . . 122
3.5 Tutorial: Using HAL Drivers - Programming the WDT . . . 122
3.5.1 Application WDT . . . 123
3.5.2 Creating a WDT Application Using the RA MCU FSP and e² studio . . . 123
3.5.2.1 Using FSP and e² studio . . . 123
3.5.2.2 The WDT Application . . . 123
3.5.2.3 WDT Application flow . . . 123
3.5.3 Creating the Project with e² studio . . . 124
3.5.4 Configuring the Project with e² studio . . . 127
3.5.4.1 BSP Tab . . . 128
3.5.4.2 Clocks Tab . . . 128
3.5.4.3 Interrupts Tab . . . 129
3.5.4.4 Event Links Tab . . . 129
3.5.4.5 Pins Tab . . . 129
3.5.4.6 Stacks Tab . . . 129
3.5.4.7 Components Tab . . . 132
3.5.5 WDT Generated Project Files . . . 133
3.5.5.1 WDT hal_data.h . . . 135
3.5.5.2 WDT hal_data.c . . . 136
3.5.5.3 WDT main.c . . . 137
3.5.5.4 WDT hal_entry.c . . . 137
3.5.6 Building and Testing the Project . . . 140
3.6 Primer: Arm TrustZone Project Development . . . 141
3.6.1 Target Device . . . 142
3.6.2 Renesas Implementation of Arm TrustZone Technology . . . 142
3.6.2.1 Calling from Non-Secure to Secure . . . 143
3.6.2.2 Calling from Secure to Non-Secure . . . 143
3.6.3 Workflow . . . 144
3.6.3.1 Secure Project . . . 144
3.6.3.2 Non-Secure Project . . . 144
3.6.3.3 Flat Project . . . 144
3.6.4 RA Project Generator (PG) . . . 145
3.6.4.1 Secure Project Set Up . . . 146
3.6.4.2 RTOS Support in TrustZone Project . . . 147
3.6.4.3 Peripheral Security Attribution . . . 148
3.6.4.4 Non-Secure . . . 149
3.6.4.5 Flat Project Type . . . 149

3.6.4.6 Secure Connection to Non-Secure Project . . . 149
3.6.4.7 Debug Configurations . . . 150
3.6.5 Secure Projects . . . 151
3.6.5.1 Secure Clock . . . 151
3.6.5.2 Setting Drivers as NSC . . . 151
3.6.5.3 Guard Functions . . . 152
3.6.6 Non-Secure projects . . . 153
3.6.6.1 Clock Set Up . . . 153
3.6.6.2 Selecting NSC Drivers . . . 153
3.6.6.3 Locked Resources . . . 154
3.6.6.4 Locked Channels . . . 154
3.6.7 IDAU registers . . . 154
3.6.7.1 SCI Boot Mode . . . 156
3.6.7.2 DLM States . . . 157
3.6.7.3 Devices with Alternate DLM States . . . 158
3.6.7.4 Devices without DLM . . . 160
3.6.8 Debug . . . 160
3.6.8.1 Non-Secure Debug . . . 160
3.6.9 Debugger support . . . 161
3.6.10 Third-Party IDEs . . . 162
3.6.11 Renesas Flash Programmer (RFP) . . . 162
3.6.12 Glossary . . . 163
3.6.12.1 Configurator Icon Glossary . . . 164
3.7 RASC User Guide for MDK and IAR . . . 164
3.7.1 What is RASC? . . . 164
3.7.2 Using RA Smart Configurator with Keil MDK . . . 164
3.7.2.1 Prerequisites . . . 164
3.7.2.2 Create new RA project . . . 165
3.7.2.3 Modify existing RA project . . . 166
3.7.2.4 Build and Debug RA project . . . 167
3.7.2.5 Notes and Restrictions . . . 168
3.7.3 Using RA Smart Configurator with IAR EWARM . . . 168
3.7.3.1 Prerequisites . . . 168
3.7.3.2 Create new RA project . . . 168
3.7.3.3 Notes and Restrictions . . . 170
**Chapter 4 FSP Architecture** . . . 171
4.1 FSP Architecture Overview . . . 171
4.1.1 C99 Use . . . 171
4.1.2 Doxygen . . . 171
4.1.3 Weak Symbols . . . 171
4.1.4 Memory Allocation . . . 171
4.1.5 FSP Terms . . . 171
4.2 FSP Modules . . . 173
4.2.1 Module Sources . . . 174
4.2.2 Module Distribution . . . 174
4.2.3 Module Versioning . . . 174
4.3 FSP Stacks . . . 174
4.4 FSP Interfaces . . . 175
4.4.1 FSP Interface Enumerations . . . 176
4.4.2 FSP Interface Callback Functions . . . 176
4.4.3 FSP Interface Data Structures . . . 178
4.4.3.1 FSP Interface Configuration Structure . . . 179
4.4.3.2 FSP Interface API Structure . . . 179
4.4.3.3 FSP Interface Instance Structure . . . 181

4.5 FSP Instances . . . 182
4.5.1 FSP Instance Control Structure . . . 182
4.5.2 FSP Interface Extensions . . . 183
4.5.2.1 FSP Extended Configuration Structure . . . 183
4.5.3 FSP Instance API . . . 183
4.6 FSP API Standards . . . 183
4.6.1 FSP Function Names . . . 183
4.6.2 Use of const in API parameters . . . 184
4.6.3 FSP Version Information . . . 184
4.7 FSP Build Time Configurations . . . 184
4.8 FSP File Structure . . . 185
4.9 FSP TrustZone Support . . . 185
4.9.1 FSP TrustZone Projects . . . 185
4.9.2 Non-Secure Callable Guard Functions . . . 185
4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules . . . 186
4.9.4 Migrating TrustZone Project to newer FSP Version . . . 186
4.9.5 Additional TrustZone Information . . . 186
4.10 FSP Architecture in Practice . . . 186
4.10.1 FSP Connecting Layers . . . 186
4.10.2 Using FSP Modules in an Application . . . 187
4.10.2.1 Create a Module Instance in the RA Configuration Editor . . . 187
4.10.2.2 Use the Instance API in the Application . . . 187
**Chapter 5 API Reference** . . . 189
5.1 BSP . . . 190
5.1.1 BSP I/O access . . . 192
5.1.2 BSP OSPI_B support . . . 207
5.1.3 BSP SDRAM support . . . 207
5.1.4 Common Error Codes . . . 208
5.1.5 MCU Board Support Package . . . 220
5.1.5.1 RA0E1 . . . 269
5.1.5.2 RA0E2 . . . 271
5.1.5.3 RA0L1 . . . 273
5.1.5.4 RA2A1 . . . 275
5.1.5.5 RA2A2 . . . 276
5.1.5.6 RA2E1 . . . 278
5.1.5.7 RA2E2 . . . 280
5.1.5.8 RA2E3 . . . 281
5.1.5.9 RA2L1 . . . 283
5.1.5.10 RA2L2 . . . 286
5.1.5.11 RA2T1 . . . 288
5.1.5.12 RA4C1 . . . 290
5.1.5.13 RA4E1 . . . 294
5.1.5.14 RA4E2 . . . 299
5.1.5.15 RA4L1 . . . 304
5.1.5.16 RA4M1 . . . 308
5.1.5.17 RA4M2 . . . 310
5.1.5.18 RA4M3 . . . 315
5.1.5.19 RA4T1 . . . 321
5.1.5.20 RA4W1 . . . 326
5.1.5.21 RA6E1 . . . 327
5.1.5.22 RA6E2 . . . 333
5.1.5.23 RA6M1 . . . 338
5.1.5.24 RA6M2 . . . 340
5.1.5.25 RA6M3 . . . 344
5.1.5.26 RA6M4 . . . 347

5.1.5.27 RA6M5 . . . 353
5.1.5.28 RA6T1 . . . 358
5.1.5.29 RA6T2 . . . 360
5.1.5.30 RA6T3 . . . 365
5.1.5.31 RA8D1 . . . 370
5.1.5.32 RA8D2 . . . 380
5.1.5.33 RA8E1 . . . 381
5.1.5.34 RA8E2 . . . 389
5.1.5.35 RA8M1 . . . 400
5.1.5.36 RA8M2 . . . 410
5.1.5.37 RA8P1 . . . 411
5.1.5.38 RA8T1 . . . 412
5.1.5.39 RA8T2 . . . 420
5.2 Modules . . . 421
5.2.1 Analog . . . 424
5.2.1.1 ADC (r_adc) . . . 425
5.2.1.2 ADC (r_adc_b) . . . 462
5.2.1.3 ADC (r_adc_d) . . . 498
5.2.1.4 Comparator, High-Speed (r_acmphs) . . . 521
5.2.1.5 Comparator, High-Speed (r_acmphs_b) . . . 528
5.2.1.6 Comparator, Low-Power (r_acmplp) . . . 534
5.2.1.7 DAC (r_dac) . . . 542
5.2.1.8 DAC8 (r_dac8) . . . 549
5.2.1.9 DAC_B (r_dac_b) . . . 555
5.2.1.10 Delta-Sigma Modulator Interface (r_dsmif) . . . 560
5.2.1.11 Operational Amplifier (r_opamp) . . . 593
5.2.1.12 SDADC Channel Configuration (r_sdadc) . . . 611
5.2.1.13 SDADC_B Channel Configuration (r_sdadc_b) . . . 633
5.2.2 AI . . . 650
5.2.2.1 Ethos-U (rm_ethosu) . . . 651
5.2.2.2 Reality AI Data Collector (rm_rai_data_collector) . . . 659
5.2.2.3 Reality AI Data Shipper (rm_rai_data_shipper) . . . 673
5.2.3 Audio . . . 678
5.2.3.1 ADPCM Decoder (rm_adpcm_decoder) . . . 679
5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm) . . . 683
5.2.3.3 Minimp3 Library . . . 695
5.2.3.4 Pulse Density Modulation Interface (r_pdm) . . . 698
5.2.4 Bootloader . . . 720
5.2.4.1 MCUboot Port (rm_mcuboot_port) . . . 720
5.2.5 CapTouch . . . 742
5.2.5.1 CTSU (r_ctsu) . . . 743
5.2.5.2 Touch (rm_touch) . . . 787
5.2.6 Connectivity . . . 809
5.2.6.1 Azure RTOS USBX Port (rm_usbx_port) . . . 815
5.2.6.2 CAN (r_can) . . . 931
5.2.6.3 CAN FD (r_canfd) . . . 969
5.2.6.4 CEC (r_cec) . . . 1005
5.2.6.5 I2C Communication Device (rm_comms_i2c) . . . 1016
5.2.6.6 I2C Master (r_iic_b_master) . . . 1024
5.2.6.7 I2C Master (r_iic_master) . . . 1038
5.2.6.8 I2C Master (r_iica_master) . . . 1052
5.2.6.9 I2C Master (r_sau_i2c) . . . 1064
5.2.6.10 I2C Master (r_sci_b_i2c) . . . 1080
5.2.6.11 I2C Master (r_sci_i2c) . . . 1093
5.2.6.12 I2C Slave (r_iic_b_slave) . . . 1106

5.2.6.13 I2C Slave (r_iic_slave) . . . . . 1118
5.2.6.14 I2C Slave (r_iica_slave) . . . . . 1129
5.2.6.15 I2S (r_ssi) . . . . . 1140
5.2.6.16 I3C (r_i3c) . . . . . 1155
5.2.6.17 LIN (r_sau_lin) . . . . . 1197
5.2.6.18 LIN (r_sci_b_lin) . . . . . 1221
5.2.6.19 LIN (r_sci_lin) . . . . . 1257
5.2.6.20 SMBUS Communication Device (rm_comms_smbus) . . . . . 1291
5.2.6.21 SMCI (r_sci_smci) . . . . . 1302
5.2.6.22 SPI (r_sau_spi) . . . . . 1316
5.2.6.23 SPI (r_sci_b_spi) . . . . . 1330
5.2.6.24 SPI (r_sci_spi) . . . . . 1342
5.2.6.25 SPI (r_spi) . . . . . 1354
5.2.6.26 SPI (r_spi_b) . . . . . 1372
5.2.6.27 SPI Communication Device (rm_comms_spi) . . . . . 1390
5.2.6.28 UART (r_sau_uart) . . . . . 1398
5.2.6.29 UART (r_sci_b_uart) . . . . . 1415
5.2.6.30 UART (r_sci_uart) . . . . . 1434
5.2.6.31 UART (r_uarta) . . . . . 1456
5.2.6.32 UART Communication Device (rm_comms_uart) . . . . . 1472
5.2.6.33 USB (r_usb_basic) . . . . . 1479
5.2.6.34 USB Composite (r_usb_composite) . . . . . 1541
5.2.6.35 USB HAUD (r_usb_haud) . . . . . 1571
5.2.6.36 USB HCDC (r_usb_hcdc) . . . . . 1592
5.2.6.37 USB HCDC_ECM (r_usb_hcdc_ecm) . . . . . 1604
5.2.6.38 USB HHID (r_usb_hhid) . . . . . 1625
5.2.6.39 USB HMSC (r_usb_hmsc) . . . . . 1635
5.2.6.40 USB Host Vendor class (r_usb_hvnd) . . . . . 1645
5.2.6.41 USB PAUD (r_usb_paud) . . . . . 1658
5.2.6.42 USB PCDC (r_usb_pcdc) . . . . . 1701
5.2.6.43 USB PHID (r_usb_phid) . . . . . 1710
5.2.6.44 USB PMSC (r_usb_pmsc) . . . . . 1722
5.2.6.45 USB PPRN (r_usb_pprn) . . . . . 1728
5.2.6.46 USB Peripheral Vendor class (r_usb_pvnd) . . . . . 1736
5.2.6.47 USB-TYPEC (r_usb_typec) . . . . . 1747
5.2.6.48 USB_PCDC Communication Device (rm_comms_usb_pcdc) . . . . . 1754
5.2.7 DSP . . . . . 1762
5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp) . . . . . 1763
5.2.7.2 IIR Filter Accelerator (r_iirfa) . . . . . 1764
5.2.8 Graphics . . . . . 1772
5.2.8.1 Azure RTOS GUIX Port (rm_guix_port) . . . . . 1774
5.2.8.2 Capture Engine Unit (r_ceu) . . . . . 1781

# Chapter 1 Introduction

## 1.1 Overview

This manual describes how to use the Renesas Flexible Software Package (FSP) for writing applications for the RA microcontroller series.

## 1.2 Using this Manual

This manual provides a wide variety of information, so it can be helpful to know where to start. Here is a short description of each main section and how they can be used.

Starting Development - Provides a step by step guide on how to use e² studio and FSP to develop a project for RA MCUs. This is a good place to start to get up to speed quickly and efficiently.

FSP Architecture - Provides useful background material on key FSP concepts such as Modules, Stacks, and API standards. Reference this section to extend or refresh your knowledge of FSP concepts.

**API Reference** - Provides detailed information on each module and interface including features, API functions, configuration settings, usage notes, function prototypes and code examples. Board Support Package (BSP) related API functions are also included.

*Note*

*Much of the information in the API Reference section is available from within the e² studio tool via the Developer Assistance feature. The information here can be referenced for additional details on API features.*

## 1.3 Documentation Standard

Each Modules section user guide outlines the following:

- Features: A bullet list of high level features provided by the module.
- Configuration: A description of module specific configurations available in the RA Configuration editor.
- Usage Notes: Module specific documentation and limitations.
- Examples: Example code provided to help the user get started.
- API Reference: Usage notes for each API in the module, including the function prototype and hyperlinks to the interface documentation for parameter definitions.

Each Interfaces section user guide outlines the following:

- Detailed Description: A short description and summary of the interface functionality.
- Data Structures: A list and definition of each data structure used by the interface including the structure of the pointers that define the API and are shared by all modules that implement the interface.
- Typedefs: A list and description of the typedefs used by the interface.
- Enumerations: A list and description of the enumerations used by the interface.

# 1.4 Introduction to FSP

## 1.4.1 Purpose

The Renesas Flexible Software Package (FSP) is an optimized software package designed to provide easy to use, scalable, high quality software for embedded system design. The primary goal is to provide lightweight, efficient drivers that meet common use cases in embedded systems.

## 1.4.2 Quality

FSP code quality is enforced by peer reviews, automated requirements-based testing, and automated static analysis.

## 1.4.3 Ease of Use

FSP provides uniform and intuitive APIs that are well documented. Each module is supported with detailed user documentation including example code.

## 1.4.4 Scalability

FSP modules can be used on any MCU in the RA family, provided the MCU has any peripherals required by the module.

## 1.4.5 Build Time Configurations

FSP modules also have build time configurations that can be used to optimize the size of the module for the feature set required by the application.

## 1.4.6 e² studio IDE

FSP provides a host of efficiency enhancing tools for developing projects targeting the Renesas RA series of MCU devices. The e² studio IDE provides a familiar development cockpit from which the key steps of project creation, module selection and configuration, code development, code generation, and debugging are all managed.

# Chapter 2 Reference Materials

This section contains miscellaneous reference materials.

| Document | Summary |
|---|---|
| Using Registers Directly | Overview of register definition files and their use. |
| FSP v4.0.0 FreeRTOS Stack Migration Guide | Migration guide for FreeRTOS Network stack users moving to FSP v4.0.0. |
| Cortex-M85 Caches | Overview of the Cortex-M85 caches present in RA8 devices and when to perform cache maintenance. |
| Using Ocrypto | Information for the use of Ocrypto |
| Linker Script Generation Guide | Linker section naming guide |

## 2.1 Using Registers Directly

### 2.1.1 Overview

In some cases users may wish to utilize chip functionality that is not supported yet by FSP. While we encourage contacting us when new feature requests arise it takes time before any updates are made. In the meantime, it is recommended to use the register definition files accessed via renesas.h to add custom functionality as needed. Official ARM CMSIS documentation refers to this format of related register definition files as device header files. Within Renesas, these files are often referred to as an **IO define** or more commonly **iodefine**.

### 2.1.2 What's in an "iodefine"?

Iodefine files contain definitions for all the I/O registers on a device. For RA FSP, one iodefine header is provided per device group (RA6M3, RA2A1 etc.) that contains all the register definitions provided in the hardware manual for that group. These headers are accessed via renesas.h, which selects the appropriate file based on the MCU configured in the project.

*Note*

*Prior to FSP 4.0.0 renesas.h contained a superset of all register definitions for RA MCUs. This became unsustainable as new device families were added and was confusing for users, so headers for each device were created and renesas.h was updated to serve as a selector.*

### 2.1.3 Where are iodefine files located?

In RA FSP, iodefine files are stored in ra/fsp/src/bsp/cmsis/Device/RENESAS/Include. This includes both renesas.h as well as the device group specific iodefine headers.

## 2.1.4 Using the register definitions

Each peripheral register set is provided as a struct. In general, the template to follow is:

```
R_ + peripheral abbreviation + channel number + -> + register name [ + _b. + bitfield
name]
```

### Basic register access

Registers are most commonly accessed whole. For example, say we want to read the counter on GPT channel 3:

```
uint32_t count = R_GPT3->GTCNT;
```

As shown in the template, the iodefines can also be used to access bitfields. For example, to start GPT channel 3:

```
R_GPT3->GTCR_b.CST = 1;
```

### Bitfield macros

It is worth noting that each bitfield access will cause a full read-modify-write which cannot be combined by the compiler because the register definitions are by necessity volatile. This can be very size and speed inefficient, particularly when the peripheral is on a very slow clock. It is recommended to write whole registers wherever possible. This is made easier by macros that are provided alongside the register definitions.

Every bitfield has two associated macros: _Msk (bitfield mask) and _Pos (bit position). These macros can be used to manipulate whole registers instead of using bitfield access when multiple bitfields are modified simultaneously. For example, setting both GPT3 output pins to 100% duty cycle:

```
uint32_t gtuddtyc = R_GPT3->GTUDDTYC
gtuddtyc         &= ~(R_GPT0_GTUDDTYC_OADTY_Msk |
R_GPT0_GTUDDTYC_OBDTY_MSK)             // Mask off bits to clear
gtuddtyc         |= (3 << R_GPT0_GTUDDTYC_OADTY_Pos) | (3 <<
R_GPT0_GTUDDTYC_OBDTY_Pos); // Shift values to bitfield positions
R_GPT3->GTUDDTYC = gtuddtyc;
```

*Note*

*The macros are all named with channel 0 due to internal process requirements; they can be used with all channels.*

### Arrays and clusters

Some registers are part of an array. These are typically listed in the manual using indexes like "n" or "m", but may occasionally be listed with individual numbers or letters. Accessing register arrays is just like accessing a regular array. For example, the GPT duty cycle registers are GTCCRA through GTCCRF. In the iodefine, they are accessed via the GTCCR array:

```
/* Set GTCCRB */
R_GPT3->GTCCR[1] = duty_cycle_b;
```

*Note*

*Not all indices may be available in every array. Be sure to check the hardware manual to verify which registers are provided on the device in use.*

Sometimes there are groups of registers that are repeated multiple times. These groups are called a **cluster**. Clusters are accessed similarly to arrays, except the actual registers are elements of the array values instead. For example, mailboxes in the CAN peripheral have several registers each:

```
/* Get data from mailbox 3 */
uint32_t mailbox = 3;
/* Get the frame data length code */
uint32_t data_length = R_CAN0->MB[mailbox].DL_b.DLC;
/* Get message data */
uint8_t data[8];
for (uint32_t i = 0U; i < data_length; i++)
{
    data[i] = p_reg->MB[mailbox].D[i]; // Copy receive data to buffer
}
```

## 2.1.5 Tips for writing hardware drivers

### Channel register access

FSP drivers often calculate a register offset in the Open function. This is typically done by multiplying the channel by the offset between channels 0 and 1. For example, here is the calculation for GPT:

```
  /* Save register base address. */
  uint32_t base_address = (uint32_t) R_GPT0 + (p_cfg->channel * ((uint32_t) R_GPT1 -
(uint32_t) R_GPT0));
  p_instance_ctrl->p_reg = (R_GPT0_Type *) base_address;
```

When drivers need to support multiple channels of a peripheral it can be helpful to save the offset in a persistent variable or structure so that it only needs to be calculated once.

# 2.2 FSP v4.0.0 FreeRTOS Stack Migration Guide

*Note*

***This guide only applies to users converting e² studio projects created with FSP v3.8.0 or earlier***
***Migration is only possible for network stacks using CoreMQTT and CoreHTTP modules. Stacks using deprecated MQTT Client and HTTP Client modules will not be able to be migrated over to FSP v4.0.0 and up.***
***See the following guide for migrating code from the deprecated Client libraries: https://aws.github.io/aws-iot-device-sdk-embedded-C/202103.00/docs/doxygen/output/html/mqtt_migration.html***

## 2.2.1 Overview

This migration guide is for moving to the new FreeRTOS Network stacks introduced in FSP v4.0.0. It will describe steps for moving over stacks as well as changes to make code compile correctly.

## 2.2.2 Stack Migration Steps

*Note*

***Perform all of the following steps before attempting to save the project. Failure to do so may cause unexpected errors in the configuration.xml.***

1. Open project to be migrated in e² studio using FSP v4.0.0 or greater. The existing CoreMQTT/HTTP stack should still exist. Many of the stack components will have No Longer Supported in the display and have permanent constraint error messages on them:

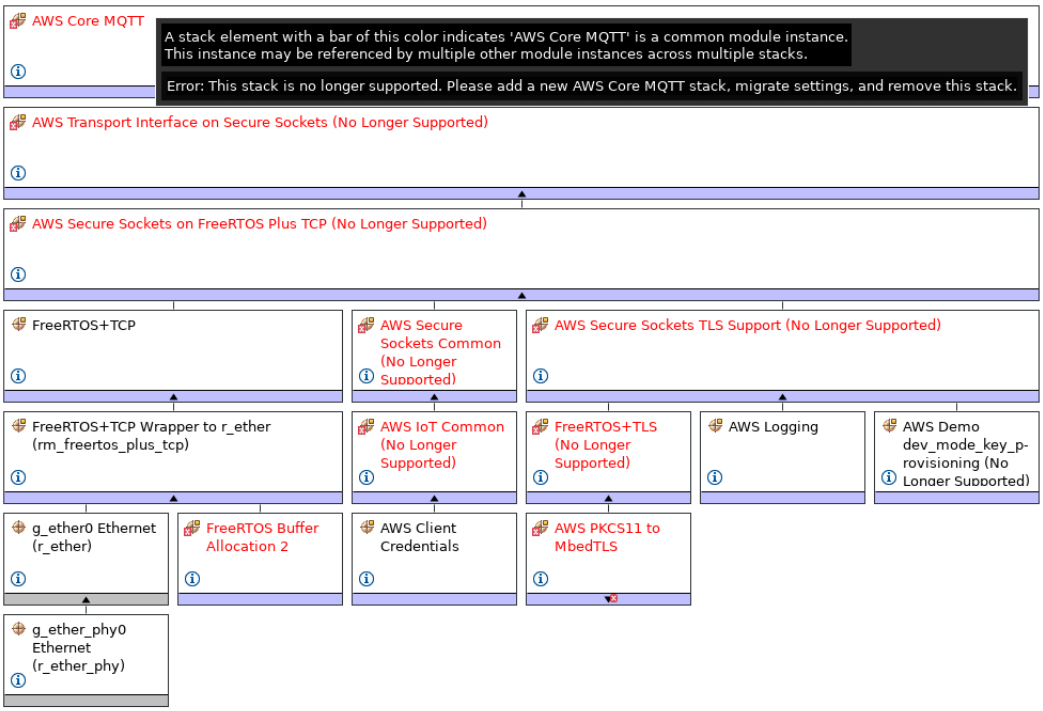

Figure 1: Old MQTT Stack

2. Add a new network stack (New Stack->Networking->AWS CoreHTTP or AWS CoreMQTT):

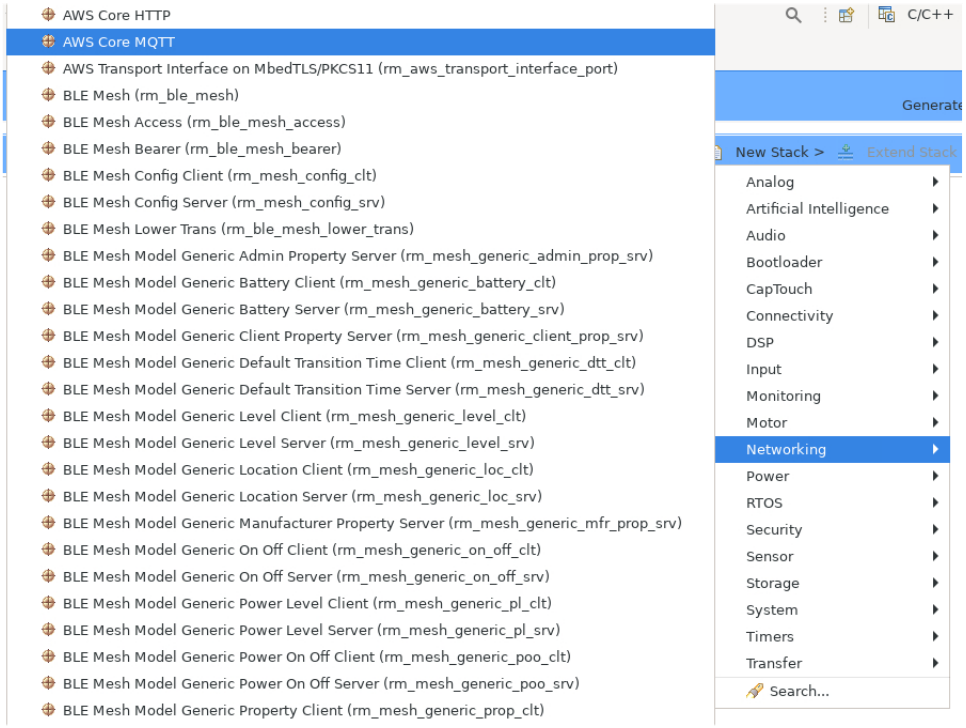

Figure 2: Add a New MQTT Stack

3. Choose a sockets wrapper for the new stack (Add Sockets Wrapper).

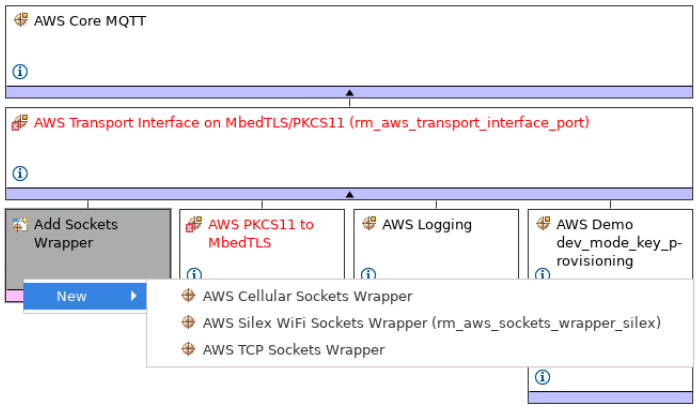

Figure 3: Add a Sockets Wrapper

4. The submodule for AWS PKCS11 to MbedTLS will likely be missing. Click Add FreeRTOS MbedTLS Port and use the existing instance:

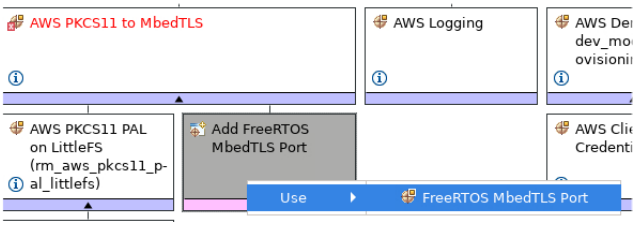

Figure 4: FreeRTOS MbedTLS Port

5. Got to the components tab and see if AWS MbedTLS FreeRTOS Port (AWS|Abstractions|FreeRTOS_Plus|utilities|mbedtls) is checked. If this component is not checked then check it so that appears like so:

Figure 5: FreeRTOS MbedTLS Port Component

6. Check that settings/properties are correct on the new stack. Common stack elements between the old and new stacks should already have previous settings.
7. Remove the old stack.
8. Save project and generate project content. See the next section for things to change in the code for successful compilation.

## 2.2.3 List of Code Change Highlights

This is a list of important changes from pre-4.0 code. For more detailed examples see CoreMQTT/HTTP examples and devassist.

- Any calls to SYSTEM_Init() should be removed. mbedtls_platform_setup() now does initialization that this IoT library function originally did.
- xLoggingTaskInitialize should no longer be called. Logging libraries which create a logging task no longer exist. Logging by default uses printf when enabled. The user can redefine vLoggingPrintf(const char * pcFormat, ...) and vLoggingPrint(const char * pcFormat) to change this behavior.
- The transport interface for CoreMQTT/HTTP will now need to be setup directly by creating a transport interface and setting the send and receive pointers to TLS_FreeRTOS_recv and TLS_FreeRTOS_send. See the examples and devassist for more info.
- The user will need to call TLS_FreeRTOS_Connect to connect to a server/endpoint before using CoreMQTT/HTTP APIs to communicate. TLS_FreeRTOS_Disconnect can be used to disconnect from a server/endpoint.

# 2.3 Cortex-M85 Caches

*Note*

***This overview should be considered supplementary information only. Consult with the listed references (non-exhaustive) for detailed information on the CM85 caches, Renesas caches, and cache coherency. Cache coherency can be a difficult problem to understand and solve correctly.***

## 2.3.1 Changes

| FSP Version | Changes |
|---|---|
| 5.6.0 | Add information about cache incoherency with memory attribute mismatch between TrustZone security states. Add information about CCR.xC TrustZone banked behavior. Add information about cache incoherency with predefined non-cacheable sections when crossing security states. Add new Arm KB reference. |
| 6.0.0 | Update information about predefined non-cacheable sections, which have changed with linker script updates. |

## 2.3.2 Overview

When using any type of caches in a system, coherency must be considered. A cache may contain data that is different from the backing memory (e.g. SRAM, Flash, etc.), or contain data that is different from another cache, which would make the cache incoherent. Coherency can be maintained through hardware and/or software support. For Cortex-M devices like the RA8, coherency can only be achieved through manual software management, and no automatic hardware coherency support exists.

In the default configuration for RA8 devices, FSP always enables the Code Flash Cache (FCACHE) and CM85 Instruction Cache (I-Cache) and handles the coherency of these caches where it is required. FSP does not handle FCACHE or I-Cache coherency outside of FSP. FSP optionally allows the CM85 Data Cache (D-Cache) to be enabled in the BSP configuration settings, where it is disabled by default. If the D-Cache is enabled, additional coherency concerns will arise. **FSP does not currently handle any D-Cache coherency. This is a work in-progress. Drivers that will require D-Cache coherency support do not presently support it.**

If D-Cache is enabled, the most common coherency concern is when data is shared between the CPU and another bus master. The D-Cache and backing memory for the shared location (usually SRAM) can become incoherent. To properly manage coherency in this situation, do one of the following:

- Place the shared data in a non-cacheable region defined by the MPU or hardware.

  Using a non-cacheable region means there will be no cache maintenance required and no coherency issues because the shared data will not be cached. A non-cacheable region can be defined in the MPU to contain the shared data. The non-cacheable region **MUST** be aligned to 32 bytes and be a length multiple of 32 bytes. This is required to meet MPU alignment and length requirements. FSP predefines several non-cacheable linker sections for this purpose, where data can be placed (see the BSP Usage Notes reference material). FSP configures and enables the MPU with these predefined regions at startup, if they have a non-zero size. Any address outside these regions will use the cacheability attributes defined by the default system address map. As an alternative, DTCM is always hardcoded as non-cacheable by the hardware and could contain the shared data. Using the MPU should be preferred, since DTCM can only be accessed through S-AHB by other bus masters and the access may contend with CPU access to DTCM.

- Place the shared data in a cache line aligned and padded cacheable region, and use the CMSIS cache maintenance functions.

  Using a cacheable region requires that the CMSIS cache maintenance functions be used to solve the coherency issues. The data **MUST** be aligned to 32 bytes and be a length multiple of 32 bytes. This is required to meet D-Cache line alignment and length requirements. **If data is not aligned and fit exactly to D-Cache lines, you will create rare and difficult bugs!** Use the CMSIS cache maintenance functions as required to manage the shared data coherency. When the D-Cache is enabled, FSP configures and enables the MPU at startup. Any address outside the predefined MPU regions will use the cacheability attributes defined by the default system address map. **Cacheable shared data cannot be pooled into a single aligned and padded region, like the non-cacheable region. Cacheable shared data must be aligned and padded to its own data cache lines.**

Less common coherency concerns include:

- FACI erasing and programming
  - FCACHE, I-Cache, and D-Cache can become incoherent if Code Flash or Data Flash changes
- Writing instructions into RAM using the CPU or a bus master
  - D-Cache and I-Cache can become incoherent if code in RAM changes
- Memory attributes mismatch between the Secure and Non-secure state when TrustZone is used
  - FCACHE and D-Cache can become incoherent if the cacheability attributes of an address are mismatched between the Secure and Non-secure state
  - Shared addresses must be configured with identical cacheability attributes, either by ensuring that the Secure and Non-secure state use the default system address

map for the shared address, or by configuring the same region in both the Secure and Non-secure MPU with the same attributes
    - I-Cache is usually not affected in this manner, because instruction fetch uses the banked MPU registers which correspond to the address security attribute
    - Consider that complex software designs may swap the current Secure or Non-secure MPU configuration at-will
- MPU configuration changes
    - FCACHE, I-Cache, and D-Cache can become incoherent if the cacheability attributes of an address changes
- SAU (Security Attribution Unit) configuration changes
    - FCACHE, I-Cache, and D-Cache can become incoherent if the security attributes of an address changes
- Changing power modes
    - May be required to clean and invalidate caches before changing to a low power mode

These less common situations require careful consideration for cache maintenance. FSP handles some of these less common situations for FCACHE and I-Cache where it must, but it is not possible to cover all user behavior that may occur.

Other special cache concerns that are not specifically coherency related include:

- Reading and writing from CSC, SDRAM, and Standby SRAM which use write buffers
    - If a write or read is intended to force a write buffer to flush, or to force a bus access to occur, the D-Cache may stop that from occurring by processing the read or write if the address is cacheable
    - Standby SRAM requires a different procedure than CSC or SDRAM to clear its write buffer
- OSPI provides both a prefetch buffer for reading and a write buffer for writing on each of its channels
    - These buffers are optionally enabled individually, and may also be flushed individually
    - Cache interactions with these buffers during normal operation and during their flush procedures must be considered

### 2.3.3 CM85 Cache Features

The CM85 optionally implements an I-Cache and/or D-Cache, with several configurable properties. Renesas RA8 devices have an implementation as follows:

- I-Cache and D-Cache are both implemented with 16 KiB size each
- ECC is optionally enabled for the I-Cache and D-Cache with OFS1.INITECCEN
    - The OFS1_SEL register selects whether the Secure or Non-secure OFS1.INITECCEN option bit is used
    - The OFS1.INITECCEN option bit also enables ECC for the ITCM and DTCM
- Automatic hardware cache invalidation is enabled at reset for I-Cache and D-Cache
    - This can be controlled with CACHEDBGCR.L1RSTDIS for debugging, but generally there is no use case
- TrustZone is integrated, which means
    - CCR.xC is banked between Secure and Non-secure modes
        - Cache allocation can be controlled per the security of the address being fetched, read, or written by configuring the associated bit
        - This bit is safe from causing cache incoherency since allocation policy (allocation hints) cannot cause incoherency, and are not counted towards memory attribute mismatch

        - See the Memory Attributes and TrustZone section
    - There is a Secure and Non-secure MPU with eight regions available for each
        - Which MPU is used depends on whether an instruction fetch (uses MPU that matches security of address) or data access (uses MPU that matches current security state) is occurring
        - See the Memory Attributes and TrustZone section
    - D-Cache maintenance from the Non-secure state is promoted to clean type maintenance since both Secure and Non-secure data may be cached, which prevents Secure data from being modified by the Non-secure state
        - Secure data may still be destroyed by the Non-secure state if it is not properly structured
        - See the Cache Maintenance and TrustZone section

## 2.3.4 RA8 Cache Background Information

### CM85 Caches

The I-Cache and D-Cache are implemented inside of the CM85 by Arm. The CM85 has a Harvard design, where instruction fetches and data reads/writes are performed on separate interfaces. The I-Cache can only perform lookup and allocation for instruction fetches. The D-Cache can only perform lookup and allocation for data reads and writes.

Whether lookup of an address occurs in a cache depends on:

1. Cache lookups are enabled in the MSCR register.
2. The Shareability (Non-shareable) (D-Cache Only), Inner Cacheability (Cacheable), and Memory Type (Normal) as defined by the System Address Map or the Arm MPU (S or NS).
3. Any hardware cacheability caveats, where some addresses can never lookup in a cache, like ITCM and DTCM.

Whether allocation of an address occurs in a cache depends on:

1. Cache allocations are enabled in the CCR register (S or NS).
2. Cache lookups are allowed for that address.
3. Inner Cacheability (Read and/or Write Allocate) as defined by the System Address Map or the Arm MPU (S or NS).

The MSCR register controls whether lookups may occur for a cache, while the CCR register (S or NS) controls whether allocation may occur for a cache.

The system address map and Arm MPU (S or NS) define the memory type, shareability attributes, and cacheability attributes for an address. All three memory properties combine to define whether an address may lookup and allocate within one of the caches. The CM85 defines specific behaviors for some architecturally implementation defined or undefined behaviors regarding combinations of these three properties.

Both caches accept Inner cacheability attributes from the system address map and the Arm MPU (S or NS). The support of cacheability attributes varies depending on the cache and its configuration.

The I-Cache and D-Cache have different associativity, supported cache policies, supported memory attributes, and supported shareability attributes. Because of these variations, the behavior of I-Cache and D-Cache will be different even when accessing the same address.

Even when the Arm MPU (S or NS) is disabled, the default system address map will provide the memory type, shareability attributes, and cacheability attributes for an address. If the Arm MPU (S or

NS) is enabled with no regions defined, it may be configured to use the default system address map as a background region.

Arm prescribes specific procedures for enabling and disabling the caches, and other cache maintenance operations that must be followed. There are I-Cache and D-Cache specific Arm architectural instructions that are used to perform these procedures. The Arm CMSIS library provides functions to perform these cache operations.

**Renesas FCACHE**

The FCACHE is implemented by Renesas and performs instruction prefetches, caches instruction fetches, and caches data reads from the CPU and other bus masters to **Code Flash** memory.

Cache maintenance for FCACHE is conducted through its peripheral registers.

In general, whether for the CM85 I-Cache or D-Cache, or Renesas FCACHE, cache maintenance is used to synchronize a given cache with the backing memory, and to synchronize caches with each other.

## 2.3.5 Cache Maintenance

The correct maintenance sequence must be followed to avoid caches reading stale data from each other or from backing memory.

Unlike the D-Cache, the I-Cache is a read-only interface which cannot be written with new instructions by the CPU. The only way for the CPU to see modified instructions while using I-Cache is through invalidation. Thus if instructions change, I-Cache maintenance is **always required** whether FCACHE maintenance is needed or not.

The D-Cache is a read and write interface. The CPU will write modified data into the D-Cache (if cacheable, and other properties are met), so any read back from the D-Cache will have the latest data. Thus if data changes, it *may* be necessary to perform D-Cache maintenance and possibly FCACHE maintenance depending on whether the data is shared between the CPU and another bus master or if the data is changed by FACI.

The word "shared" here does **not** mean "Shareability" as defined as an Arm memory attribute.

I-Cache and D-Cache cache lines are aligned to 32 bytes and are 32 bytes in length each. **For D-Cache specifically, where a cache line may become dirty when write-back is used, cacheable shared data written by a bus master cannot be allowed to mix on a write-back cache line with data that is unrelated. For simplicity, follow the most conservative rule of aligning and padding cacheable shared data to meet D-Cache line requirements.**

CM85 has an erratum with write-back when D-Cache is enabled. FSP v5.3.0 has added the recommended workaround of using MSCR.FORCEWT to force all D-Cache access to write-through, even if an access specifies write-back. **Developers should write software as if write-back is being used for full compatibility with data cache, which includes the above alignment and padding requirement.**

This guide describes common maintenance scenarios including write-back and write-through. **The write-through write policy does not obviate the need for using memory barriers on the CM85. The use of memory barriers is out-of-scope for this document.**

FSP handles some of these maintenance scenarios during startup and in the Flash HP driver.

## 2.3.6 Typical Cache Maintenance Scenarios

*Note*

***Whether full or address-based cache maintenance can or should be used depends on the capabilities of the target cache (FCACHE has no address-based maintenance capability) and the particular application scenario.***

### I-Cache, FCACHE Enabled (Default Configuration)

### Instructions Change

- Instructions Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Instructions Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Invalidate I-Cache
  - FACI Data Flash Program or Erase
    1. Invalidate I-Cache
  - In RAM or Other
    - Written by CPU
      1. Invalidate I-Cache
    - Written by Bus Master
      1. Invalidate I-Cache

### Data Change

- Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
  - FACI Data Flash Program or Erase
    - No Maintenance Required (D-Cache Disabled)
  - In RAM or Other
    - No Maintenance Required (D-Cache Disabled)

### Instructions and Data Change

- Instructions and Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Instructions and Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Invalidate I-Cache
  - FACI Data Flash Program or Erase
    1. Invalidate I-Cache
  - In RAM or Other
    - Written by CPU
      1. Invalidate I-Cache
    - Written by Bus Master
      1. Invalidate I-Cache

### D-Cache, I-Cache, FCACHE Enabled

### Data Change

- Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Clean And Invalidate D-Cache
  - FACI Data Flash Program or Erase
    1. Clean and Invalidate D-Cache
  - In RAM or Other
    - **Data Not Shared**
      - No Maintenance Required (Not Shared)
    - **Data Shared**
      - Written by CPU
        - Write Back

          **Area must be aligned and padded to D-Cache line requirements.**

          1. Clean D-Cache, After CPU Write
        - Write Through
          - No Maintenance Required (Write Through)
      - Written by Bus Master
        - Write Back

          **Area must be aligned and padded to D-Cache line requirements.**

          - Buffer to be Written is Dirty (e.g. Stack or Heap Allocated Buffer May Be Dirty Already)
            1. Invalidate D-Cache, Before and After Bus Master Write
          - Buffer to be Written is Clean
            1. Invalidate D-Cache, After Bus Master Write
        - Write Through
          1. Invalidate D-Cache, After Bus Master Write

**Instructions Change or Instructions and Data Change**

- Instructions Not Cacheable or Instructions and Data Not Cacheable
  - No Maintenance Required (Not Cacheable)
- Instructions Cacheable or Instructions and Data Cacheable
  - FACI Code Flash Program or Erase
    1. Invalidate FCACHE
    2. Clean And Invalidate D-Cache
    3. Invalidate I-Cache
  - FACI Data Flash Program or Erase
    1. Clean And Invalidate D-Cache
    2. Invalidate I-Cache
  - In RAM or Other
    - Written by CPU

- Write Back

  **Area must be aligned and padded to D-Cache line requirements if shared with a bus master.**

  1. Clean D-Cache, After CPU Write
  2. Invalidate I-Cache
- Write Through
  1. Invalidate I-Cache

- Written by Bus Master

  - Write Back

    **Area must be aligned and padded to D-Cache line requirements as we assume it is shared with CPU here.**

    - Buffer to be Written is Dirty (e.g. Stack or Heap Allocated Buffer May Be Dirty Already)
      1. Invalidate D-Cache, Before and After Bus Master Write
      2. Invalidate I-Cache
    - Buffer to be Written is Clean
      1. Invalidate D-Cache, After Bus Master Write
      2. Invalidate I-Cache
  - Write Through
    1. Invalidate D-Cache, After Bus Master Write
    2. Invalidate I-Cache

## 2.3.7 Cache Functions and Macros

### Renesas BSP Configuration Macros

| Macro | Purpose | Notes |
|---|---|---|
| BSP_CFG_DCACHE_ENABLED | Defaults to zero (disabled). If defined and non-zero, the FSP startup code in system.c will configure several predefined non-cacheable sections in the MPU if they are of non-zero size, enable the MPU, and enable the D-Cache. | This is normally configured in e2 Studio under the BSP->Cache settings->Data cache properties panel for the project. |
| BSP_CFG_OPTION_SETTING_OFS1_INITECCEN | Defaults to zero (disabled). Sets the value of OFS1.INITECCEN for BSP_CFG_OPTION_SETTING_OFS1, which controls whether ECC is enabled for caches and TCM. | This is normally configured in e2 Studio under the BSP->OFS1 register settings->Tightly Coupled Memory (TCM)/Cache ECC properties panel for the project. |

### CMSIS 6 I-Cache Functions

| Function | Purpose | Notes |
|---|---|---|

| | | |
|---|---|---|
| SCB_EnableICache | If I-Cache allocations are not already enabled, invalidate the entire I-Cache then enable I-Cache allocations with CCR.IC. | Will do nothing if I-Cache allocations are already enabled. FSP automatically enables the I-Cache at startup by directly setting CCR.IC instead of using this function. |
| SCB_DisableICache | Disable I-Cache allocations with CCR.IC, then invalidate the entire I-Cache. | |
| SCB_InvalidateICache | Invalidate the entire I-Cache. | This is safe to use at any time, because cache lines in the I-Cache can never be dirty. Used after modifying instructions anywhere in memory (e.g. Flash, RAM). FSP calls this function after initializing the predefined RAM code section during startup, and when exiting Code Flash program or erase mode in the Flash HP driver. |
| SCB_InvalidateICache_by_Addr | Loop to invalidate the instructions in the I-Cache, starting at a particular address and extending for the specified length in bytes. | This is safe to use at any time, because cache lines in the I-Cache can never be dirty. Can be used to more efficiently invalidate instructions at specific addresses. Will invalidate in increments of cache lines (32 bytes). |

These functions can be safely interrupted and do not need to be guarded by critical sections. However, depending on the structure of the application logic, guarding the functions may be necessary. This must be analyzed for an individual scenario. See the CMSIS 6 API reference material for further information.

**CMSIS 6 D-Cache Functions**

| Function | Purpose | Notes |
|---|---|---|
| SCB_EnableDCache | If D-Cache allocations are not already enabled, loop to invalidate the entire D-Cache then enable D-Cache allocations with CCR.DC. | Will do nothing if D-Cache allocations are already enabled. FSP automatically calls this function at startup if BSP_CFG_DCACHE_ENABLED is defined and non-zero. |
| SCB_DisableDCache | Disable D-Cache allocations with CCR.DC, then loop to clean and invalidate the entire D-Cache. | |

| | | |
|---|---|---|
| SCB_InvalidateDCache | Loop to invalidate the entire D-Cache. | This function should generally **not** be used, since no use case typically exists to invalidate the entire D-Cache. |
| SCB_CleanDCache | Loop to clean the entire D-Cache. | |
| SCB_CleanInvalidateDCache | Loop to clean and invalidate the entire D-Cache. | |
| SCB_InvalidateDCache_by_Addr | Loop to invalidate the data in the D-Cache, starting at a particular address and extending for the specified length in bytes. | Will invalidate in increments of cache lines (32 bytes). |
| SCB_CleanDCache_by_Addr | Loop to clean the data in the D-Cache, starting at a particular address and extending for the specified length in bytes. | Will clean in increments of cache lines (32 bytes). |
| SCB_CleanInvalidateDCache_by_Addr | Loop to clean and invalidate the data in the D-Cache, starting at a particular address and extending for the specified length in bytes. | Will clean and invalidate in increments of cache lines (32 bytes). |

These functions can be safely interrupted and do not need to be guarded by critical sections. However, depending on the structure of the application logic, guarding the functions may be necessary. This must be analyzed for an individual scenario. See the CMSIS 6 API reference material for further information.

## 2.3.8 Cache Details

### I-Cache Details

### FSP I-Cache and FCACHE Behavior

Because of the simplicity of the I-Cache and FCACHE relative to the D-Cache and the critical instruction execution performance enhancement that they provide, FSP always enables the I-Cache and the FCACHE. This is not configurable.

FSP automatically enables the I-Cache at startup for CM85 by directly setting CCR.IC. This method is used instead of the CMSIS 6 function, so that the I-Cache, branch prediction, and the low-overhead branch (LOB) extension may simultaneously be enabled. The automatic hardware cache invalidation of the CM85 ensures that cache lookups, allocations, and cache maintenance are no-op until the invalidation is finished, so immediately enabling the I-Cache is safe to do.

FSP invalidates the I-Cache using the CMSIS 6 functions:

- After initialzing the predefined RAM code section during startup
- After initializing the SAU for a Secure TZ application
- When exiting Code Flash program or erase mode in the Flash HP driver

The FCACHE is a Renesas cache, not an Arm cache, and it is controlled through its separate peripheral registers.

### User Required I-Cache Maintenance

If instructions have changed outside of the control of FSP, it is user responsibility to perform I-Cache maintenance. This means instructions stored in *any* cacheable location, including internal flash, internal RAM, external flash, external RAM, etc. It is recommended to use the CMSIS 6 functions to perform I-Cache maintenance.

Users must also consider the interactions that D-Cache has with instruction modifications. For example, if the modified instructions are written to a cacheable location while D-Cache is enabled (e.g. RAM), those data writes may be cached. The D-Cache will need to be cleaned to guarantee that all data writes have been written back to guarantee their visibility to the I-Cache. D-Cache maintenance will also be needed if instructions change in Code or Data Flash via FACI and are cacheable, since D-Cache will cache instructions as data.

There is no hardware mechanism between the I-Cache and D-Cache in which they automatically share coherency, so coherency must be manually maintained by software as required.

### D-Cache Details

### FSP D-Cache Behavior

The D-Cache is a cache with more complex interactions than the I-Cache. Thus, FSP leaves the D-Cache disabled by default on RA8 projects. It can be enabled in e2 Studio under the BSP->Cache settings->Data cache properties panel for the project.

Presently, FSP does not support any D-Cache functionality except:

- Configuring the Arm MPU (S and NS) with two predefined no-cache sections if they are non-zero size
    - One in SRAM
    - One in SDRAM
- Enabling the Arm MPU (S and NS) after configuration
- Enabling D-Cache allocations (S or NS) with the CMSIS function

**No FSP drivers are currently compatible with D-Cache enablement. This compatibility is a work in-progress.**

### User Required D-Cache Maintenance

Presently, D-Cache usage is fully in the realm of user responsibility. The user must perform all D-Cache maintenance as required, or must store data accordingly in the predefined non-cacheable regions or otherwise.

### Affected Bus Masters

Coherency must be considered for these bus masters:

- CEU
- DMAC
- DRW
- DTC
- EDMAC
- GLCDC
- MIPI

#### Other Interactions that are not Bus Masters

Coherency must be considered for interactions with:

- FACI
- CSC
- SDRAM
- Standby SRAM
- OSPI
- Code in RAM (I-Cache and D-Cache are not automatically coherent)

#### FSP Predefined No-Cache Sections

Warning

**The predefined non-cacheable sections are only understood as non-cacheable within their respective security state when TrustZone is used. This is due to the MPU configuration done by FSP and how Armv8-M chooses the MPU which matches the current security state for determining the memory attributes of a data access. Cache incoherency will occur if references to these sections are passed between security states. For example, passing a reference from the Non-secure application non-cacheable section to the Secure application will result in the Secure application treating the location as cacheable.**
**The predefined non-cacheable sections are only understood as non-cacheable within their respective core. In dual-core devices, each core has a separate MPU which may configure its own regions and attributes, so these sections cannot be used for coherent interprocessor communications in the case that D-Cache is enabled. Use the IPC peripheral instead.**

Several non-cacheable linker sections are predefined for GCC, LLVM, and IAR compilers, which may be zero-initialized or uninitialized. These same sections exist for AC6 prefixed with .bss, due to special naming restrictions with AC6 for non-loadable sections.

Anything placed within them will be non-cacheable. Instruction fetches and data reads or writes to these sections will never lookup or allocate in their respective caches.

The FSP startup code configures these sections as non-cacheable using the MPU during startup, if the D-Cache is enabled via the BSP configuration. Otherwise, they are not configured by FSP in the MPU if the D-Cache is disabled. The predefined sections are aligned to 32 bytes and are padded to a minimum of 32 bytes in length. This meets both MPU region alignment and length requirements, and cache line alignment and length requirements. The MPU and cache line alignment and length requirements protect against inadvertent mixing of cacheable and non-cacheable data.

### 2.3.9 Other Information

#### Cache Maintenance when MPU Configuration Changes

If the Secure and/or Non-secure MPU configuration is changed, and the cacheability of an address changes, cache maintenance is required to synchronize the caches with the new memory attributes. If this is not done, a newly non-cacheable address may be left in the cache, and behavior when accessing the address is considered **undefined**.

#### Cache Maintenance when SAU Configuration Changes

If the SAU configuration is changed, and the security attributes of an address changes, cache maintenance is required to synchronize the caches with the new security attributes. If this is not

done, cached data will be desynchronized with the new security attributes and may result in **undefined** behavior.

### Memory Attributes and TrustZone

Warning

**If data that is shared between the Secure and Non-secure application does not use the same memory attributes while being accessed because of a memory attribute mismatch, it will cause cache incoherency.** See the Arm knowledgebase article ka001216 and the Armv8-M Architecture Reference Manual for information on MPU selection behavior and memory attribute mismatch.

### Cache Maintenance and TrustZone

Warning

**If cacheable shared data is improperly structured by the Secure application and is not aligned and padded to match D-Cache line requirements, a clean and invalidate by set/way of the D-Cache by the Non-secure application, or an automatic D-Cache eviction by the Non-secure application, will cause data to be destroyed for the Secure application.** This consequence is additional to the bugs that the Secure application may trigger itself by improper data layout, D-Cache maintenance, and automatic D-Cache eviction.

### The System Address Map and the MPU

The Armv8-M Architecture Reference Manual specifies a default system address map that defines the memory regions of the architecture and their various properties.

These properties include the memory type, shareability attributes, and cacheability attributes for the regions. When the MPU is disabled, this default system address map provides the system with default attributes for instruction fetches, data reads, and data writes to and from addresses. When the MPU is enabled, it can be used to override the default system address map entirely, or both may be used together by setting the MPU_CTRL.PRIVDEFENA bit. This bit allows instruction fetches or data reads and writes that do not correspond to a configured MPU region to hit the default system address map as a background region instead, so long as the access is Privileged. FSP does not support Unprivileged execution, so it always assumes Privileged execution state. Allowing the default system address map as a background region is the method that FSP uses to provide the predefined no-cache sections, by configuring the MPU for the no-cache sections while allowing all other memory accesses to rely on the default system address map. Configuring an MPU region involves specifying a 32 byte aligned start address and an inclusive ending address, and also specifying the various memory attributes of the region. The MPU region beginning address register will mask downward to align to a 32 byte boundary. i.e (address & ~0x1F) The MPU region ending address register will OR upward with 0x1F for the inclusive ending boundary. i.e. (address | 0x1F) Thus, the minimum size of an MPU region is 32 bytes and the size may only increase in 32 byte increments.

See the Armv8-M Memory Model and Memory Protection User Guide in the references section for a high-level introduction, and the Armv8-M Architecture Reference Manual for details.

### Speculative Instruction Fetching and Data Reads

The CM85 may, with no deliberate software instruction, speculatively fetch instructions or read data from any memory location. Upon doing so, the instruction fetch or data read may enter the respective cache. The purpose of this speculative behavior is to predict the next instructions or data to be fetched, read, or written, which increases performance if the prediction is correct. **This may cause instructions or data to unexpectedly appear in cache, so speculation must be**

**considered when solving for cache coherency.**

### Cache Eviction

At any time, the I-Cache or D-Cache may evict cache lines. For I-Cache, this means invalidation of the evicted line. For D-Cache, this means cleaning and invalidation of the evicted line, where cleaning occurs if the cache line is dirty. **D-Cache eviction of dirty lines may cause data to be unexpectedly written out to backing memory when write-back is used, and this must be considered when solving for cache coherency. For D-Cache aligned and padded buffers derived from areas like the stack or heap, one or more of the associated cache lines may already be dirty and require cleaning and/or invalidation before being used by a bus master.**

### Example of D-Cache Eviction and Speculative Read Dangers

The CM85 will provide a SRAM buffer to the DMAC, the DMAC will write to the buffer, and the CM85 will read from the written buffer. I-Cache, D-Cache, and FCACHE are enabled. SRAM exists in the same "SRAM" region defined by the default system address map in the Armv8-M Architecture Reference Manual. SRAM is Normal memory, write-back, write-allocate, read-allocate, and non-shareable by the default system address map attributes.

The correct way to solve coherency in this situation using the two recommended solution options is:

1. The MPU is used to configure a non-cacheable region where the SRAM buffer is placed.
    - The MPU region is correctly aligned and padded to meet start and end address alignment requirements, and region attributes are correctly configured.
    - No additional effort is required.
    - FSP provides predefined non-cacheable sections that meet these requirements.
2. The SRAM buffer is left to its default attributes, making it cacheable.
    - Regardless of whether write-back or write-through is used, the buffer start must be aligned to a cache line and the buffer must be a length multiple of cache line size.
        - Unrelated data can never be mixed on cache lines if write-back is used. It is best to follow this strict guideline even when write-through is used.
    - The cache lines of the buffer may already be dirty, especially if the buffer is allocated in a stack or heap.
    - If write-back is used, cache maintenance is conducted in order.
        - Invalidate buffer.
        - CM85 provides buffer to DMAC and starts DMAC.
        - DMAC writes to buffer.
        - CM85 waits for DMAC to complete.
        - Invalidate buffer.
        - CM85 reads from buffer.
    - The first invalidation is to remove dirty lines, which may already exist from stack or heap allocation. The data does not need to be written back and can be discarded without a clean.
        - If this is not done, an eviction (effectively an automatic clean and invalidate by the hardware) will cause stale data to be written back to the buffer and destroy newly written DMAC data.
    - The second invalidation is to remove speculatively read cache lines, which may have been cached before the DMAC write completed.
        - If this is not done, the CM85 will read stale data from the buffer that has been prematurely cached.
    - Write-through may also use this sequence, although the first invalidate should be a no-op since no lines can be dirty and no stale data should be written back by an eviction.

- The CMSIS cache maintenance functions should be used to perform cache maintenance, since they include necessary memory barriers.

The second solution is shown in the D-Cache Enabled scenarios here where write-back is used and a bus master performs writing.

#### 2.3.9.1 Cache ECC with FSP

By default, FSP disables ECC for the caches and TCM with OFS1.INITECCEN. For best performance, it is recommended to keep ECC for cache and TCM disabled. If enabling is desired, please consult the reference material to understand the consequences of enabling ECC for cache and TCM, which are too numerous to describe here. Also see Devices with OFS1.INITECCEN. The automatic hardware cache invalidation performed by the CM85 is compatible with ECC.

**MPU Cacheability Attributes**

- Cacheable or Non-Cacheable
- Allocation Policies
  - Read Allocate
  - Write Allocate
- Write Policy
  - Write Back or Write Through
- Transient or Non-Transient

For D-Cache, Shareable or Non-Shareable also affects whether an address is Cacheable or Non-Cacheable. A Shareable address is forced to Non-Cacheable for D-Cache. I-Cache is not influenced by the Shareability properties and will always follow the MPU cacheability attributes. The Transient attribute is of limited utility and can mostly be ignored. Clean cache lines that are marked Transient are preferred for eviction before clean cache lines marked Non-Transient. Dirty cache lines whether marked Transient or Non-Transient are evicted with the same priority.

See the CM85 Technical Reference Manual reference material for further information.

**Cache Behavior with CCR and MSCR**

x = [I, D]

| CCR.xC (S or NS) | MSCR.xCACTIVE | Behavior |
|---|---|---|
| 1 | 1 | Allocate, Lookup |
| 0 | 1 | No Allocate, Lookup (Reset Behavior) |
| X | 0 | No Allocate, No Lookup |

This behavior is applicable to Cortex-M55 and Cortex-M85. If you have previous experience with a Cortex-M7 device, this cache behavior is different since MSCR.xCACTIVE bits were introduced for CM55 and CM85. No CM7 or CM55 core is offered by any current RA devices. The new addition of the MSCR.xCACTIVE bits allow for cache power control, and by allowing a third cache behavioral state of lookups without allocation, cleaning the D-Cache after disabling it becomes less error prone since dirty cache lines cannot be made stale before being cleaned, by writes occurring after D-Cache is disabled like on CM7. The MSCR.xCACTIVE bits have a reset value of 1, so the caches are powered by default and lookups are possible. Until the automatic hardware cache invalidation which begins after reset finishes, lookups and allocations do not occur even if CCR.xC is set, and cache maintenance

operations are no-op. The MSCR.xCACTIVE bits should generally never be cleared to 0.

### Cache Errata

Consult the latest Renesas Technical Updates (TU) and Arm Cortex-M85 Errata documents.

These are example errata to demonstrate the possibility of issues with cache usage at the time of this writing.

```
Cortex-M85 AT640 and Cortex-M85 with FPU AT641
Software Developer Errata Notice
Date of issue: April 16, 2024
Document version: 14.0
Document ID: SDEN-2236668
2682779
After deactivating the instruction cache, self-modified code might not be executed
correctly
Fault Type: Programmer Category C
Fault Status: Present in r0p0, r0p1, r0p2. Fixed in r1p0
3175626
AXI hang due to dependency between read data channel and write response channel
Fault Type: Programmer Category B
Fault Status: Present in r0p0, r0p1, r0p2, r1p0. Fixed in r1p1
3190818
Under limited circumstances, LDM to normal non-cacheable AXI location cannot complete
Fault Type: Programmer Category B
Fault Status: Present in r0p0, r0p1, r0p2, and r1p0. Fixed in r1p1
```

Currently available RA8D1, RA8M1, and RA8T1 devices use the r0p2 variant of the core, so they are affected by these errata.

Erratum 2682779 should not require a workaround, since I-Cache will never be powered off in most circumstances.

FSP added workarounds for 3175626 and 3190818 in v5.3.0.

# 2.4 Using Ocrypto

## 2.4.1 Overview

Ocrypto is a lightweight software crypto implementation by Oberon.

## 2.4.2 Limitations

The Ocrypto library is only to be used with RA2E1 devices.

## 2.4.3 RA FSP Licensed Algorithms

Below is a table that lists the Ocrypto algorithms licensed for use with RA FSP. Consider this table when referencing the below section - Additional Information

| Algorithm | API Header Files |
|---|---|
| SHA (224, 256, 384, 512) | ocrypto_sha224.h<br>ocrypto_sha256.h<br>ocrypto_sha384.h<br>ocrypto_sha512.h |
| HMAC (SHA256, SHA512) | ocrypto_hmac_sha256.h<br>ocrypto_hmac_sha512.h |
| AES-CMAC | ocrypto_aes_cmac.h |
| AES (CTR, CBC, ECB, GCM) | ocrypto_aes_cbc.h<br>ocrypto_aes_cbc_pkcs.h<br>ocrypto_aes_ctr.h<br>ocrypto_aes_ecb.h<br>ocrypto_aes_gcm.h<br>ocrypto_aes_key.h |
| ECDSA / Deterministic ECDSA (P256) | ocrypto_ecdsa_p256.h<br>ocrypto_ecdsa_p256_det_sign.h |
| ECDH (P256) | ocrypto_ecdh_p256.h |

## 2.4.4 API Examples

### Ocrypto Library Examples

For examples of how to use Ocrypto APIs, see Ocrypto test code under ra/oberon/ocrypto/tests/. These tests are not meant to be built or run in FSP and have been compiled out by the macro OCRYPTO_REFERENCE_TEST_CODE_DOES_NOT_BUILD by default.

## 2.4.5 Additional Information

| Document | Summary |
|---|---|
| Ocrypto - Side Channel Safety Statement | Side Channel Safety Statement for the Oberon Ocrypto stack |
| Ocrypto - Function Overview | Function Overview for the Oberon Ocrypto stack |

## 2.4.6 Ocrypto - Side Channel Safety Statement

### 1) Timing attacks, simple power/radiation analysis attacks

These attacks rely on data-dependent timing variations in the used algorithms. They can be applied passively, just by observing normal operation.

All *ocrypto* functions (see chapter 5) are PC-secure (execution paths do not depend on input data) and constant-time (execution time is independent of input data) except for the list of functions with special behavior listed below (see chapter 4).

A special case of timing variations are table reads with data-dependent indices. Accessing data-dependent memory addresses may influence the execution timing because of address-specific cache reload operations. Data-dependent table lookups may be dangerous even on systems without data cache because the table lookups in RAM or flash memory may dominate chip radiation if other calculations are done mainly in registers.

All *ocrypto* functions are free of data-dependent table reads except for the functions with special behavior listed below (see chapter 4).

### 2) Differential power/radiation analysis attacks

These attacks improve the precision of the analysis by averaging over several (typically hundreds of) runs and/or comparing several runs by feeding specific input data. They can only be applied if the system permits an arbitrary number of tries with either the same or arbitrarily chosen input data. Whether and what kind of countermeasures are needed for avoiding such attacks largely depends on the usage of the functions, not the functions themselves.

*ocrypto* does not contain any special provisions against differential attacks.

**3) Fault attacks**

In addition to differential analysis, fault attacks rely on actively influencing the attacked system to provoke faults in the execution. Countermeasures include physical protection of the device and/or attack detection mechanisms on all levels. Detection on an algorithm level is usually expensive and only justified if fault attacks are actually feasible for a given system.

*ocrypto* does not contain any special provisions against fault attacks.

**4) List of ocrypto functions with special behavior**

This list shows functions with special behavior:

- Ed25519/Ed25519ph/Ed448/Ed448ph verify

  Ed25519 et.al. verify is not constant-time "by design". The algorithm is chosen such that a highly efficient variable-time double multiplication algorithm can be used. This is justified by the fact that signature verification depends on public values only (signed data, public signature key). The variable-time multiplication does not harm even if the data or the public key are considered to be secret, because neither of them is directly involved in the multiplication, only values derived from them using secure hash functions.

- Ed25519/Ed25519/Ed448/Ed448ph public key and sign with "#define OCRYPTO_NO_CACHE"

  The point multiplication uses a table of base point multiples. Without caches, this poses no problems, but see the initial remark on table-based algorithms (chapter 1).

- RSA with "#define OCRYPTO_NO_CACHE"

  The RSA exponentiation uses a table of small exponents of the argument. Without caches, this may pose no problems, but see the initial remark on table-based algorithms (chapter 1).

- SRP

  The SRP calculations are not perfectly constant-time, because some hash values are taken on a compact representation of some critical values. In the worst case, this can reveal the number of leading zero bytes in these values, including the premaster secret. This cannot be avoided and is considered a design error in the SRP specification.

- ML-DSA and ML-KEM

  ML-DSA and ML-KEM are not constant-time because of rejection sampling in several places. However, the timing can only disclose information on values that are not used.

  ML-DSA is not table-free because the SampleInBall algorithm permutes array elements with pseudo-randomly derived indices. However, the seed of the resulting polynomial is part of the signature and thus public anyway.

**5) List of ocrypto functions**

This is the list of functions supported by *ocrypto*. Note that your specific distribution of *ocrypto* may

contain just a subset of these functions.

All algorithms except for Ed25519/Ed25519ph/Ed448/Ed448ph are implemented in a PC-secure way (i.e., always the same sequence of instructions is executed).

| Algorithm | Const-Time | Tables |
|---|---|---|
| SHA | yes | safe |
| SHA2 (224, 256, 384, 512) | yes | safe |
| SHA3 (224, 256, 384, 512) | yes | safe |
| SHAKE / cSHAKE (128, 256) | yes | safe |
| Ascon-Hash256 | yes | safe |
| HMAC (SHA1, SHA256, SHA512) | yes | safe |
| AES-CMAC | yes | safe |
| KMAC (128, 256) | yes | safe |
| ChaCha20 | yes | safe |
| XChaCha20 | yes | safe |
| AES (CTR, ECB, CBC) | yes | safe |
| AES (CCM, GCM, EAX) | yes | safe |
| ChaCha20-Poly1305 | yes | safe |
| XChaCha20-Poly1305 | yes | safe |
| Ascon-AEAD128 | yes | safe |
| HKDF (SHA1, SHA256, SHA512) | yes | safe |
| PBKDF2-HMAC (SHA1, SHA256) | yes | safe |
| PBKDF2-AES-CMAC-PRF128 | yes | safe |
| RSA (PKCS1, PSS) | yes | * |
| ECDSA (P-224, P-256, P-384, P-521) | yes | safe |
| ECDSA secp256k1 | yes | safe |
| EdDSA / EdDSAph (Ed25519, Ed448) | * | * |
| LMS/HSS verify (SHA256/SHAKE256) | yes | safe |
| XMSS/XMSS^MT verify (SHA256/SHAKE256) | yes | safe |
| ML-DSA (44, 56, 87) | * | * |
| RSA (PKCS1, OAEP) | yes | * |

| | | |
|---|---|---|
| ECDH (P-224, P-256, P-384, P-521) | yes | safe |
| ECDH secp256k1 | yes | safe |
| ECDH (X25519, X448) | yes | safe |
| EC-JPAKE (P-256) | yes | safe |
| SPAKE2+ (P-256, HMAC) | yes | safe |
| SRP-6 (SHA512) | * | safe |
| ML-KEM (512, 768, 1024) | * | safe |

* See comments in chapter 4.

*Note: If you build for the pure C Generic platform, make sure that your compiler issues constant-time multiply operations.*

### 2.4.7 Ocrypto - Function Overview

# Function Overview

**Algorithms**

This version of *ocrypto* supports the following algorithms:

| Message digests (hashes) | Specification |
|---|---|
| SHA2 (224, 256, 384, 512) | FIPS-PUB-180-4 |
| Message authentication codes (MAC) | Specification |
| HMAC (SHA256, SHA512) | RFC2104 |
| AES-CMAC | RFC4493, NIST SP 800-38B |
| Unauthenticated ciphers | Specification |
| AES (CTR, ECB, CBC) | FIPS-PUB-197, NIST SP 800-38* |
| Authenticated encryption with associated data (AEAD) | Specification |
| AES (GCM) | FIPS-PUB-197, NIST SP 800-38* |
| Asymmetric signature | Specification |
| ECDSA / Deterministic ECDSA (P-256) | FIPS-PUB-186-5 |
| Key agreement | Specification |

| | |
|---|---|
| ECDH (P-256) | NIST SP 800-56A |

### Key Sizes

- AES: 128, 192, and 256 bit keys are supported for all uses of AES.
- NIST P-256 curve (aka secp256r1) supports 256 bit keys.

### Function Types

*ocrypto* supports these two types of functions:

### Single-part

Function is executed in a single call, using only the stack.

### Incremental

Function is executed in multiple calls, to allow for streams of data to be processed in a piecemeal fashion. Additional memory is provided by caller in a context object. The functions are split into sets of functions whose names end in init, final and update.

### Function Type Matrix

This table shows which function types are supported for which algorithms:

| Algorithm | Single-part | Incremental |
|---|---|---|
| SHA | x | x |
| HMAC | x | x |
| AES-CMAC | x | |
| AES | x | x |
| ECDSA / Deterministic ECDSA (NIST curves) | x | |
| ECDH (NIST curves) | x | |

There are no stack-optimized functions in this distribution of *ocrypto*.

All functions are available as single-part function types.

### RAM Requirements

*ocrypto* does not use static memory (no global variables).

*ocrypto* does not use dynamic memory allocation - no heap is required.

The following table indicates how much memory is used on the stack:

| Function and type | Required size (bytes) |
|---|---|
| Single-part | < 1,000 |
| Incremental | < 300 |

For incremental functions, the caller must provide pre-allocated context object, of similar size as stack space for single-part functions. The application may allocate these context objects statically or in a heap.

# 2.5 Linker Script Generation Guide

## 2.5.1 FSP Linker Scripts

FSP prior to v6.0.0 provided linker scripts that were common to all MCUs. Only having a single linker script per toolchain had become increasingly complex as the RA MCU family continued to grow and diversify. Starting in FSP v6.0.0, linker scripts are specific to the toolchain, MCU, and type of project being built. This means that users will need to migrate any existing linker script modifications that might have been made when migrating to FSP v6.0.0 or later.

In this guide, we will examine the methodology behind the FSP6 linker script mechanism, highlighting key areas that have changed from earlier FSP releases and providing details of how to migrate user-modified linker scripts from earlier releases to the new mechanism.

> **Audience:** customers wishing deeper knowledge of the new linker scripting or migrating existing Renesas RA projects utilizing BSP_PLACE_IN_SECTION or custom linker scripts to the policy-generated linker scripts.

> **Note:** When using a Solution project it is recommended to use the Memories tab in the configuration editor to modify memory region sizes and location as necessary.

---

### 2.5.1.1 Why we changed

Hand-edited linker scripts had become **non-maintainable** as devices and project styles grew more complex:

- Multiple projects per MCU (bootloader, TrustZone, multicore), each with different **memory partitions**
- Device-specific **capabilities** (OFS/BPS layouts, ITCM/DTCM, SDRAM, OSPI, etc.)
- Divergent behavior across **toolchains** (GCC/LLVM/IAR/ArmCC6)
- Customer requests for **non-invasive placement** (no source edits) and **multi-RAM init**

**What the new system delivers**

- **One policy for four toolchains**: scripts are **generated** from a common policy so behavior is equivalent across GCC, LLVM/Clang, IAR, and AC6.

- **Per-device awareness**: OFS register locations and available memories (ITCM/DTCM/SDRAM/OSPI) are baked in at generation time.
- **Non-invasive placement**: place variables/functions/sections into arbitrary memories **without touching source** via the DDSC **Linker Section Mapping** dialog.
- **Multi-RAM initialization**: support for multiple RAM families (internal RAM, TCMs, SDRAM) with correct copy/zero at startup.
- **Solution-level partitioning**: allocate FLASH/RAM across projects in a **Solution Partitioning** dialog; scripts follow those partitions automatically.
- **Fine-grained OFS Registers**: separate, explicit sections for each register region instead of one all-or-nothing block.

---

**What changed (layout & file model)**

Each toolchain now uses the same two-file include pattern:

- **Region Information** memory_regions.* – *generated*. Declares device/solution memory bases & lengths (e.g., FLASH/RAM/ITCM/DTCM/SDRAM/OSPI, OFS/OTP, etc.). **Do not edit**; update via the Solution Partitioning dialog.
- **Linker Script** fsp_gen.* – *generated*. Defines output sections and default mappings for the current device and toolchain. **Do not edit**; change behavior with mapping rules.
- **Top-level** fsp.* – a tiny wrapper that INCLUDEs the two files above. This file is stable and meant to be referenced by the project.

  If you need custom script logic, prefer **mapping rules** first. If absolutely necessary, either: 1) keep a **patched copy** of the generated files (applied during your build before link), or 2) **fork** to new filenames and INCLUDE them from fsp.* (works, but you **disconnect** from tool-assisted mapping/partitioning).

---

### 2.5.1.2 New section model (high level)

Instead of monolithic .text/.data/.bss outputs, the new scripts split into **semantically named outputs** per memory and init behavior. These names are **consistent across toolchains** and expose **Base/Limit symbols** per region.

Common outputs (examples; presence depends on device/memory availability):

- **FLASH**
  - __flash_vectors$$ – Vector table / Reset handler
  - __flash_readonly_gap$$ – On devices with OFS registers at 0x400, this is space before that space, where we default map content to optimize memory utilization via the DDSC linker section mapping
  - __flash_readonly$$ – Code & const data (also GOT/EXIDX/ctor arrays: __flash_.got$$, __flash_arm.exidx$$, __flash_{preinit,init,fini}_array$$)
  - __flash_noinit$$ – Reserved/no-load content in flash
- **Internal RAM**
  - __ram_dtc_vector$$ - The vector table for the dtc peripheral (located at start of ram for alignment restrictions)
  - __ram_from_{ROM REGION}$$ – Initialized data copied from each available persistent source

    - __ram_zero$$ – Zero-initialized bss/tbss
    - __ram_noinit$$ – Non-initialized (e.g., heaps, main stack)
    - Thread/ELF TLS helpers: __ram_tdata$$, __ram_tbss$$, __ram_thread_stack$$
    - Optional **no-cache** variants (device-dependent): __ram_zero_nocache$$, __ram_noinit_nocache$$
- **Secondary ROM Memories** (such as data flash, qspi, ospi)
    - __{ROM Region}_readonly$$ - Initialized space in this region (constants, code)
    - __{ROM Region}_noinit$$ - Uninitialized space in this region that application code can write at runtime
- **Secondary RAM Memories** (such as tcm, ospi, sdram)
    - __{RAM Region}_from_{ROM Region}$$ - Initialized data copied from each available persistent source
    - __{RAM Region}_zero$$ – Zero-initialized data in this region
    - __{RAM Region}_noinit$$ – Non-initialized data in this region
- **OFS Registers** (fine-grained)
    - __option_setting_{OFS Register}_reg$$ - Fine grained output section for each OFS register

Each output exposes ...$$Base / ...$$Limit symbols for portable startup code and diagnostics across toolchains.

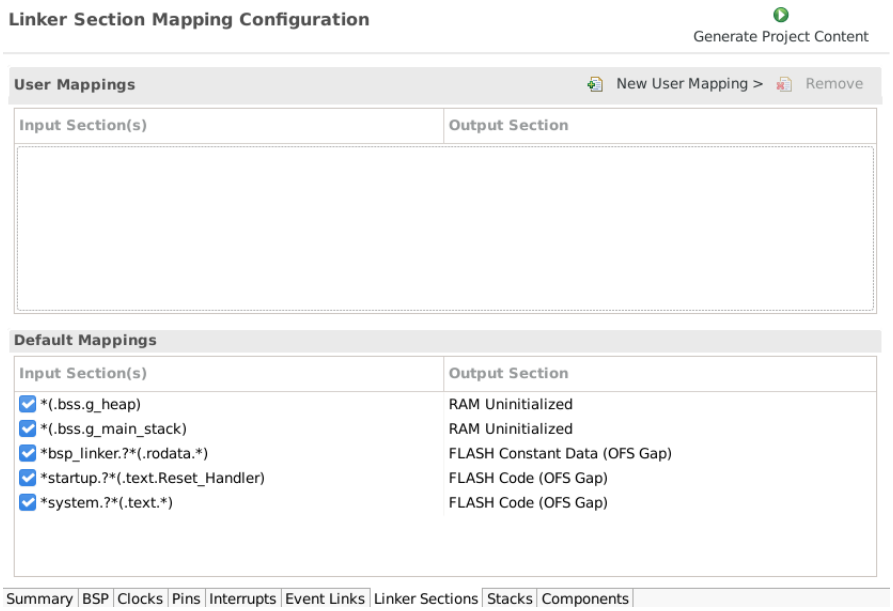
#### 2.5.1.3 Interacting with the new flow

**A) Place objects or code without source edits (recommended)**

Use **DDSC → Linker Section Mapping**

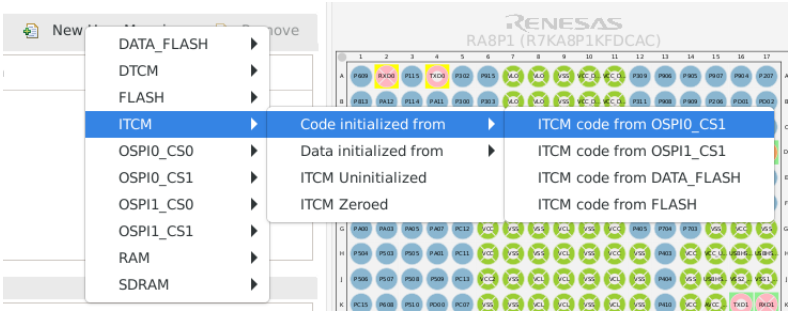
Here you can see typical default mappings for a device with the OFS flash gap.

- The heap and stack are mapped to uninitialized RAM (otherwise they would be placed in zeroed RAM memory)
    - Unchecking the default selection will remove the mapping and allow standard linker placement.
    - These allocations can be overridden to other regions. For example the stack could be placed in DTCM by unchecking the selection and creating a new input section mapping.
- Additionally, we are default placing content into the flash gap to maximize flash utilization.

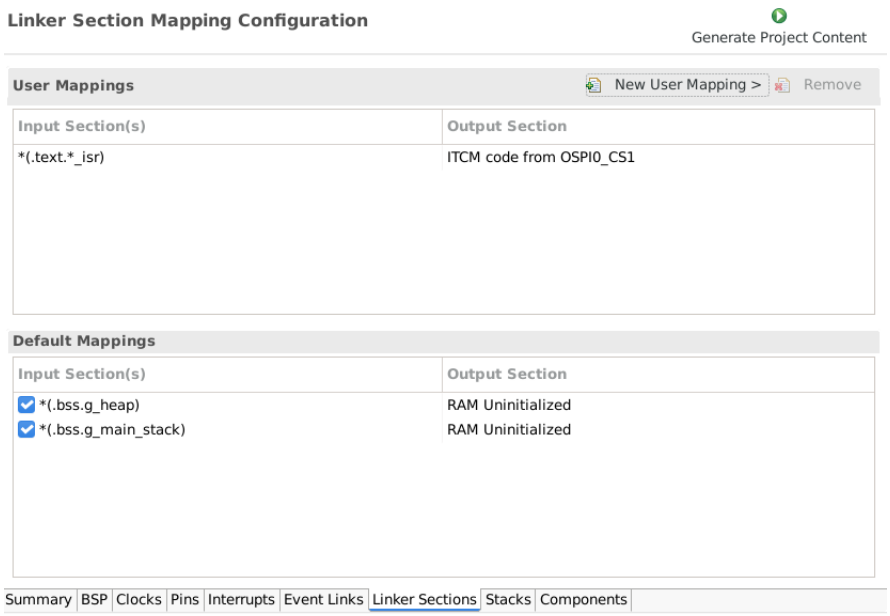


To create a new user mapping select the desired destination (and the intialization source if appropriate)

- Here we are selecting ITCM Code initialized from ITCM code from OSPI0_CS1
- In the dialog that is presented, we enter *(.text.*_isr)
- The syntax of these mappings follow gnu ld input section selection rules (including wildcard patterns) regardless of the toolchain



This means any function that ends in _isr will be persistently stored in OSPI0_CS1 space (in the output elf and srecord) and loaded to ITCM by the fsp startup code.



**B) Source-level placement (still supported)**

BSP_PLACE_IN_SECTION("<name>") continues to work. Some legacy section names changed for consistency; **prefer mapping rules** when migrating. If you keep the macro, use the **input names** as defined in the appendix.

**C) Solution-level partitioning**

Use **Solution Partitioning** to assign FLASH/RAM ranges across bootloader/app/TZ projects. memory_regions.* is regenerated to reflect those partitions; all scripts honor them automatically. Please refer to solution project documentation for details.

---

### 2.5.1.4 Migration guide (step-by-step)

1. **Update** to FSP 6.0 or later that includes the new behavior.
2. **Reference any customer edits** made to the legacy linker scripts and determine how to apply to the generated scripts.
3. **Review defaults** in **Linker Section Mapping**. Add rules for any special placements you previously had in hand-edited scripts.
4. If you used BSP_PLACE_IN_SECTION, either **remove** it and add a mapping rule, or **rename** the section to the new input names shown below.
5. **Build & verify** the project using the new scripts and compare the map files to prior.
6. Only if needed, implement a **patch step** (or a **fork + INCLUDE**) to carry forward any exotic script logic.

---

### 2.5.1.5 Legacy (gcc, llvm) → New **output** section translation

```
legacy_to_new_output_sections:
  .text: [__flash_vectors$$ (Reset handler & vectors), __flash_readonly$$
(code/rodata)]
```

```
  .data: __ram_from_flash$$
  .bss: __ram_zero$$
  .noinit: __ram_noinit$$
  .tdata: __ram_tdata$$
  .tbss: __ram_tbss$$
  .data_flash: [__data_flash_readonly$$, __data_flash_noinit$$]
  .qspi_flash/.OSPI_DEVICE_0/.OSPI_DEVICE_1: OSPI family outputs #(e.g.,
__ospi0_cs0_from_flash$$, __ospi0_cs1_readonly$$) – pick readonly/from/zero/noinit as
needed
  .got: __flash_.got$$
  .ARM.exidx/.ARM.extab: __flash_arm.exidx$$
  .option_setting_* (old single blob): fine?grained __option_setting_*_reg$$
```

**Note:** In the e2 Studio tooling, dialogs related to obj-copy do not properly parse the $$ suffix, so use globbing if required (such as --remove-section=__option_setting_*)

**Note:** exact availability of *_from_* and *_nocache outputs depends on the device and selected memories.

---

### 2.5.1.6 Behavior differences worth noting

- **Generated files overwrite**: fsp_gen.* and memory_regions.* are regenerated. Put customizations in **mapping rules** or in **patches/forks**.
- **Vectors moved**: Reset/ISR vectors live in __flash_vectors$$. General code/rodata live in __flash_readonly$$ (placed after **OFS flash gap** where required).
- **Copy/zero tables generalized**: initialization now spans multiple memories (RAM/TCM/SDRAM/OSPI) with per-output Base/Limit symbols.
- **Fine-grained protection**: OFS/BPS/OTP/SAS are each their own small section; tools can preserve or omit them independently.

---

### 2.5.1.7 Examples

#### A) Place a DMA buffer in non-cached RAM (no source edits)

- **Mapping path:** RAM Zero (No-Cache)
- **Input pattern:** my_dma.o(.bss.my_buffer)
- **Input section placed in:** .ram_nocache
- **Output section placed in:** __ram_zero_nocache$$

**B) Run a hot ISR from ITCM (copied from FLASH)**

- **Mapping path:** ITCM Code from FLASH
- **Input pattern:** isr_fast.o(.text.my_isr)
- **Input section placed in:** .itcm_code_from_flash
- **Output section placed in:** __itcm_from_flash$$

**C) Put firmware asset in OSPI1 CS1 ReadOnly**

- **Mapping path:** OSPI_CS1 Constant Data
- **Input pattern:** assets.o(.rodata*)
- **Input section placed in:** .ospi1_cs1
- **Output section placed in:** __ospi1_cs1_readonly$$

---

## 2.5.2 FAQ

**Q: Can I still edit the scripts directly?** A: You can, but we **don't recommend it**. Copy to new filenames and INCLUDE them, or maintain a **patch** step. Otherwise, tool-driven mapping/partitioning will be out of sync.

**Q: Will old BSP_PLACE_IN_SECTION() break?** A: It's still supported. A few legacy section names changed; prefer the mapping dialog or update the section names as in the quick translation above.

**Q: How do I share memory between bootloader and app?** A: Use **Solution Partitioning**. The generator will rebuild memory_regions.* and all projects will align automatically.

**Q: What about data that must *not* be re-initialized?** A: Use .noinit/.ram_noinit (or the mapping to **RAM Non-Initialized** → __ram_noinit$$).

**Q: What is the bsp_linker_info.h file located in the <configuration> folder?** A: To support the seamless support of the new linker process, we must pass information to the source code (such as the source and destination of memory initializers). Unfortunately, the current DDSC tooling has limitations that only allow us to generate a header file to this location. Future releases will likely change the location of this information.

---

## 2.5.3 Summary

The new generator brings **consistency, scalability, and zero-touch placement** across toolchains and devices. Start with **Solution Partitioning** and the **Linker Section Mapping** dialog; reserve script edits for exceptional cases via patches or forked includes.

---

## 2.5.4 Appendix: Linker Input Sections

This appendix documents the valid **input** linker_section values that appear in the linker script and may be referenced from user code or configuration macros.

Each section name is based on a **RAM or ROM class**, using a structured naming convention depending on the content type.

**RAM Target Capability Matrix**

| RAM Class | ROM Init | | Zeroed | | NoInit | |
|---|---|---|---|---|---|---|

| | Code | Data | | NoCache | | NoCache |
|---|---|---|---|---|---|---|
| RAM | □ | □ | □ | □ | □ | □ |
| TCM | □ | □ | □ | | □ | |

**ROM Target Capability Matrix**

| ROM Class | Code | ReadOnly | NoInit |
|---|---|---|---|
| ROM | □ | □ | □ |
| FLASH (Gap) | □ | □ | |

### 2.5.4.1 Memory Class Dictionaries

These are the valid memory class identifiers used in linker_section names.

```
ram_class ::= "ram" | "itcm" | "dtcm" | "stcm" | "ctcm" | "sdram" | "ospi0_cs0"
rom_class ::= "flash" | "data_flash" | "qspi_flash" | "ospi0_cs1" | "ospi1_cs1"
```

**The available memory classes depend on the capabilities of your specific device. Not all devices support all RAM or ROM types.**

### 2.5.4.2 RAM-Resident Sections

**Zero-Initialized RAM**

```
.<ram_class>
```

Used for memory cleared to zero at startup.

Examples:

- *(.ram)
- *(.sdram)
- *(.dtcm)

**Uninitialized RAM**

```
.<ram_class>_noinit
.<ram_class>_noinit_nocache
```

Used for reserved memory (e.g., heap/stack) that doesn't require initialization at startup. The _nocache variant is only available on devices with caching hardware.

Examples:

- *(.ram_noinit)
- *(.sdram_noinit_nocache)

**RAM Initialized from ROM**

```
.<ram_class>_code_from_<rom_class>
.<ram_class>_from_<rom_class>
```

Used for RAM-resident code or data loaded from ROM.

Examples:

- *(.ram_code_from_flash)
- *(.dtcm_from_data_flash)
- *(.tcm_code_from_qspi_flash)

### 2.5.4.3 ROM-Resident Sections

**Standard ROM Sections**

```
.<rom_class>
.<rom_class>_code
.<rom_class>_noinit
```

- .rom_class_code: Executable code
- .rom_class: Constants or read-only data
- .rom_class_noinit: Reserved (e.g., alignment)

Examples:

- *(.flash_code)
- *(.data_flash)
- *(.qspi_flash_noinit)

**Flash Gap Sections**

```
.flash_gap_code
.flash_gap_readonly
```

Used only on devices with restricted flash regions (e.g., 0x400–0x43F). These sections support only code and constant data.

### 2.5.4.4 Summary

- linker_section names follow consistent, structured patterns.
- RAM and ROM classes reflect physical memory categories and device-specific capabilities.

- Use _nocache suffixes only for memory that must not be cached (e.g., DMA regions).
- Flash gap sections are a special case for devices with non-contiguous flash address maps.

# Chapter 3 Starting Development

## 3.1 Starting Development Introduction

The wealth of resources available to learn about and use e² studio and FSP can be overwhelming on first inspection, so this section provides a Starting Development Guide with a list of the most important initial steps. Following these highly recommended first 11 steps will bring you up to speed on the development environment in record time. Even experienced developers can benefit from the use of this guide, to learn the terminology that might be unfamiliar or different from previous environments.

1. Read the section What is e² studio?, up to but not including e² studio Prerequisites. This will provide a description of the various windows and views to use e² studio to create a project, add modules and threads, configure module properties, add code, and debug a project. It also describes how to use key coding 'accelerators' like Developer Assist (to drag and drop parameter populated API function calls right into your code), a context aware Autocomplete (to easily find and select from suggested enumerations, functions, types, and many other coding elements), and many other similar productivity enhancers.
2. Read the FSP Architecture, FSP Modules and FSP Stacks sections. These provide the basic background on how FSP modules and stacks are used to construct your application. Understanding their definitions and the theory behind how they combine will make it easier to develop with FSP.
3. Read a few Modules sections to see how to use API function calls, structures, enumerations, types and callbacks. These module guides provide the information you will use to implement your project code.
4. After you have a Kit and you have downloaded and installed e² studio and FSP, you can build and debug a simple project to test your installation, tool flow, and the kit. (If you do not have a Kit or have not yet installed the development software, use the links included in the e² studio Prerequisites for more information.) The simple Tutorial: Your First RA MCU Project - Blinky will Blink an LED on and off. Follow the instructions for importing and running this project in section Create a New Project for Blinky. It will use some of the key steps for managing projects within e² studio and is a good way to learn the basics. If you are using a multicore RA MCU then you will want to read Tutorial: Your First RA Multicore Application - Blinky for information on creating a multicore blinky application.
5. Once you have successfully run Blinky you have a good starting point for using FSP for more complex projects. The Using HAL Drivers Tutorial, available at Tutorial: Using HAL Drivers - Programming the WDT, shows how to create a project from scratch, using FSP API functions. Do this next.
6. Several Hands-on Quick FSP Labs are available that cover key development topics with short 15-minute Do it Yourself (DiY) activities targeting the EK-RA6M3. Topics covered include code development accelerators like Developer Assistance, Autocomplete, Help, Visual Expressions and using Example Projects. The complete list of available Quick FSP Labs can be found here: https://en-support.renesas.com/knowledgeBase/category/31087/subcategory/31090. Doing a couple of these labs provides further details on using FSP, and is also good practice. Running these labs is highly recommended.
7. The balance of the FSP Architecture sections (that is, those not called out in step 2 above) contain additional reference material that may be helpful in the future. Scan them so you know what they contain, in case you need them.

8. The balance of the e² studio User Guide, starting with the What is a Project? section up to, but not including, Writing the Application section, provides a detailed description of each of the key steps, windows, and entries used to create, manage, configure, build and debug a project. Much of this may be familiar after running through the tutorials and Quick Labs. However, it is important to have a good grasp of what each of the configuration tabs are used for as that is where the bulk of the project preparation work takes place prior to writing code. Skim over this section as it may help with any questions in the future.
9. Read the Writing the Application section to get a short introduction to the steps used when creating application code with FSP. It covers both RTOS-independent and RTOS-dependent applications. It also includes a short description for several of the code accelerators you should be familiar with by now. Using additional Quick FSP Labs is a good way to become familiar with the application development process and links to them are included in the appropriate places in this section. You can find the complete list of available Quick FSP Labs here: https://en-support.renesas.com/knowledgeBase/19308277.
10. Scan the Debugging the Project section to see the steps required to download and start a debug session.
11. Explore the additional material available on the following web pages and bookmark the resources that look most valuable to you:
    a. RA Landing Page: https://www.renesas.com/ra
    b. FSP Landing Page: https://www.renesas.com/fsp
    c. Example Projects on GitHub: https://github.com/renesas/ra-fsp-examples
    d. Quick FSP Labs Listing: https://en-support.renesas.com/knowledgeBase/19308277
    e. RA and FSP Knowledge Base (with articles of interest on RA and FSP): https://en-support.renesas.com/knowledgeBase/category/31087
    f. RA and FSP Renesas Rulz site (Community posted and answered questions): https://community.renesas.com/mcu-mpu/ra/
    g. FSP Releases: https://github.com/renesas/fsp/releases
    h. FSP Documentation: https://renesas.github.io/fsp
    i. Online Technical Support: https://www.renesas.com/us/en/support/contact.html

# 3.2 e² studio User Guide

## 3.2.1 What is e² studio?

Renesas e² studio is a development tool encompassing code development, build, and debug. e² studio is based on the open-source Eclipse IDE and the associated C/C++ Development Tooling (CDT).

When developing for RA MCUs, e² studio hosts the Renesas Flexible Software Package (FSP). FSP provides a wide range of time saving tools to simplify the selection, configuration, and management of modules and threads, to easily implement complex applications. The time saving tools available in e² studio and FSP include the following:

- A Graphical User Interface (GUI) (see Adding Threads and Drivers) with numerous wizards for configuring and auto-generating code
- A context sensitive Autocomplete (see Tutorial: Using HAL Drivers - Programming the WDT) feature that provides intelligent options for completing a programming element
- A Developer Assistance tool for selection of and drag and drop placement of API functions directly in application code
- A Welcome Window with links to example projects, application notes and a variety of other self-help support resources
- An Information Icon from each module is provided in the graphic configuration viewer that links to specific design resources, including code 'cheat sheets' that provide useful starting points for common application implementations.

Figure 6: e² studio Splash Screen

e² studio organizes project work based on Perspectives, Views, Windows, Panes, and Pages (sometimes called Tabs). A window is a section of the e² studio GUI that presents information on a key topic. Windows often use tabs to select sub-topics. For example, an editor window might have a tab available for each open file, so it is easy to switch back and forth between them. A window Pane is a section of a window. Within a window, multiple Panes can be opened and viewed simultaneously, as opposed to a tabbed window, where only individual content is displayed. A memory-display Window, for example, might have multiple Panes that allow the data to be displayed in different formats, simultaneously. A Perspective is a collection of Views and Windows typical for a specific stage of development. The default perspectives are a C/C++ Perspective, an FSP Configuration Perspective and a Debug Perspective. These provide specific Views, Windows, Tabs, and Panes tailored for the common tasks needed during the specific development stage.

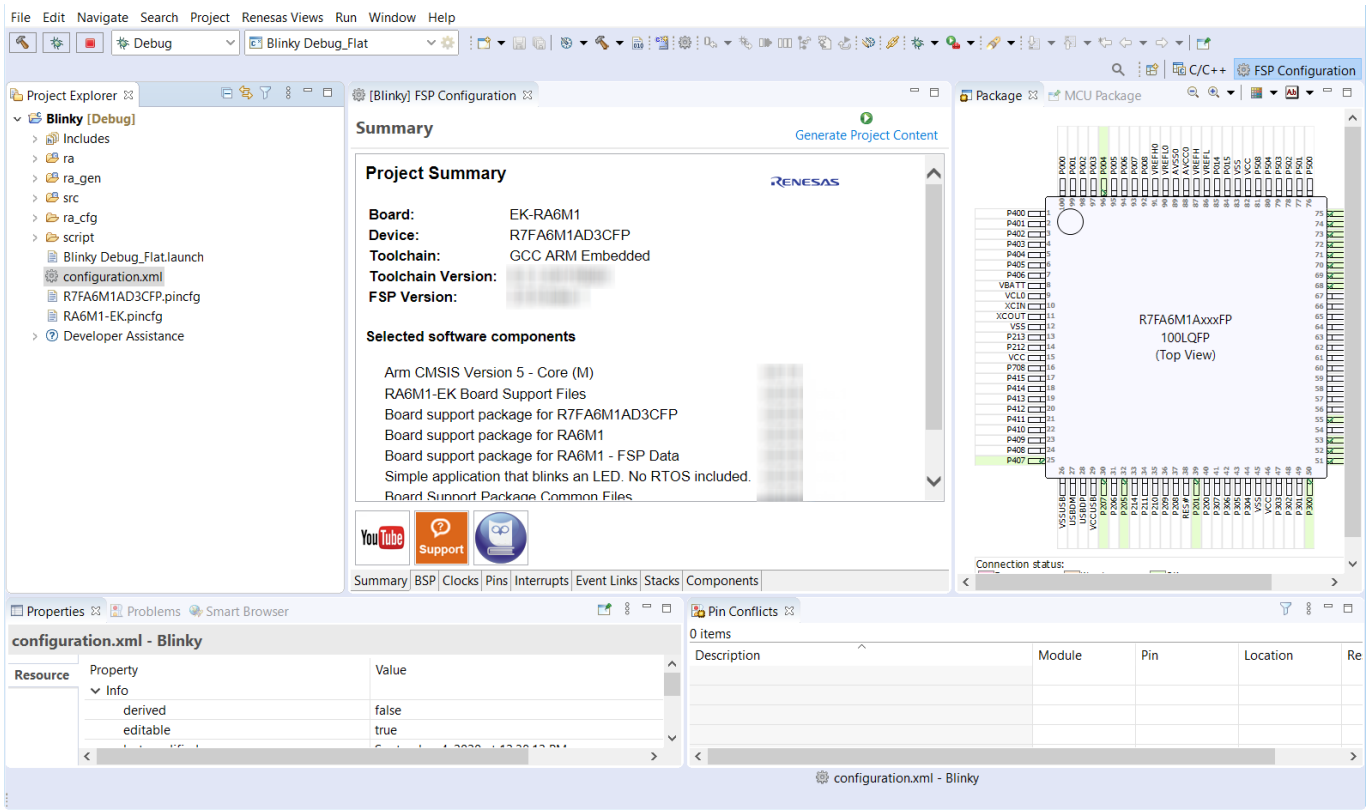


Figure 7: Default Perspective

In addition to managing project development, selecting modules, configuring them and simplifying code development, e² studio also hosts the engine for automatically generating code based on module selections and configurations. The engine continually checks for dependencies and automatically adds any needed lower level modules to the module stack. It also identifies any lower level modules that require configuration (for example, an interrupt that needs to have a priority assigned). It also provides a guide for selecting between multiple choices or options to make it easy to complete a fully functional module stack.

The Generate Project Content function takes the selected and configured modules and automatically generates the complete and correct configuration code. The code is added to the folders visible in the **Project Explorer** window in e² studio. The configuration.xml file in the project folder holds all the generated configuration settings. This file can be opened in the GUI-based RA Configuration editor to make further edits and changes. Once a project has been generated, you can go back and reconfigure any of the modules and settings if required using this editor.

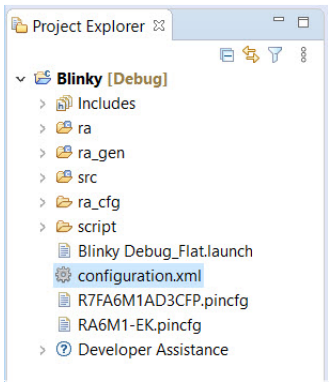

Figure 8: Project Explorer Window showing generated folders and configuration.xml file

## 3.2.2 e² studio Prerequisites

### 3.2.2.1 Obtaining an RA MCU Kit

To develop applications with FSP, start with one of the Renesas RA MCU Evaluation Kits. The Renesas RA MCU Evaluation Kits are designed to seamlessly integrate with e² studio.

Ordering information, Quick Start Guides, User Manuals, and other related documents for all RA MCU Evaluation Kits are available at https://www.renesas.com/ra.

### 3.2.2.2 PC Requirements

The following are the minimum PC requirements to use e² studio:

- Windows 10 with Intel i5 or i7, or AMD A10-7850K or FX
- Memory: 8-GB DDR3 or DDR4 DRAM (16-GB DDR4/2400-MHz RAM is preferred)
- Minimum 250-GB hard disk

### 3.2.2.3 Installing e² studio, platform installer and the FSP package

Detailed installation instructions for e² studio and FSP are available on the Renesas website https://www.renesas.com/fsp. Review the release notes for e² studio to ensure that the e² studio version supports the selected FSP version. The starting version of the installer includes all features of the RA MCUs.

#### 3.2.2.4 Choosing a Toolchain

e² studio can work with several toolchains and toolchain versions such as the GNU Arm compiler, Arm AC6, and LLVM Embedded Toolchain for Arm. Versions of the GNU Arm and LLVM compilers verified for use with FSP are included in the e² studio installer.

#### 3.2.2.5 Licensing

FSP licensing includes full source code, limited to Renesas hardware only.

### 3.2.3 What is a Project?

In e² studio, all FSP applications are organized in RA MCU projects. Setting up an RA MCU project involves:

1. Creating a Project
2. Configuring a Project

These steps are described in detail in the next two sections. When you have existing projects already, after you launch e² studio and select a workspace, all projects previously saved in the selected workspace are loaded and displayed in the **Project Explorer** window. Each project has an associated configuration file named configuration.xml, which is located in the project's root directory.

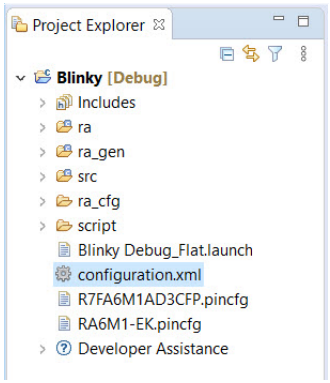

Figure 9: e² studio Project Configuration file

Double-click on the configuration.xml file to open the RA MCU Project Editor. To edit the project configuration, make sure that the **FSP Configuration** perspective is selected in the upper right hand corner of the e² studio window. Once selected, you can use the editor to view or modify the configuration settings associated with this project.

Figure 10: e² studio FSP Configuration Perspective

*Note*

*Whenever the RA project configuration (that is, the configuration.xml file) is saved, a verbose RA Project Report file (ra_cfg.txt) with all the project settings is generated. The format allows differences to be easily viewed using a text comparison tool. The generated file is located in the project root directory.*

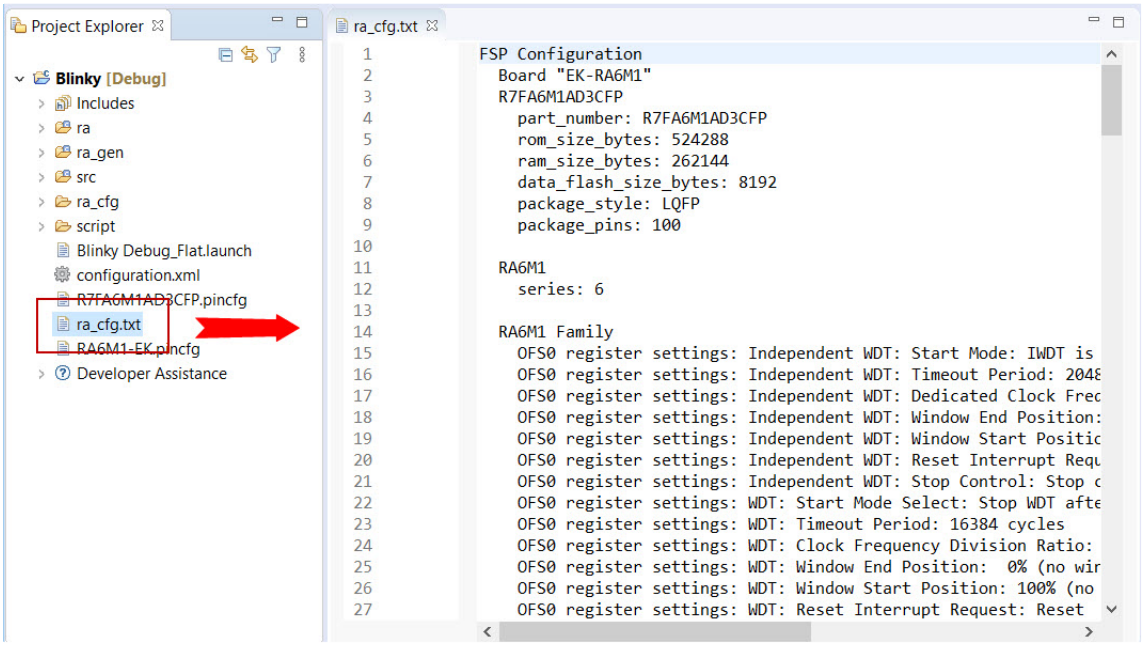

Figure 11: RA Project Report

The RA Project Editor has a number of tabs. The configuration steps and options for individual tabs are discussed in the following sections.

*Note*

*The tabs available in the RA Project Editor depend on the e² studio version and the layout may vary slightly, however the functionality should be easy to follow..*

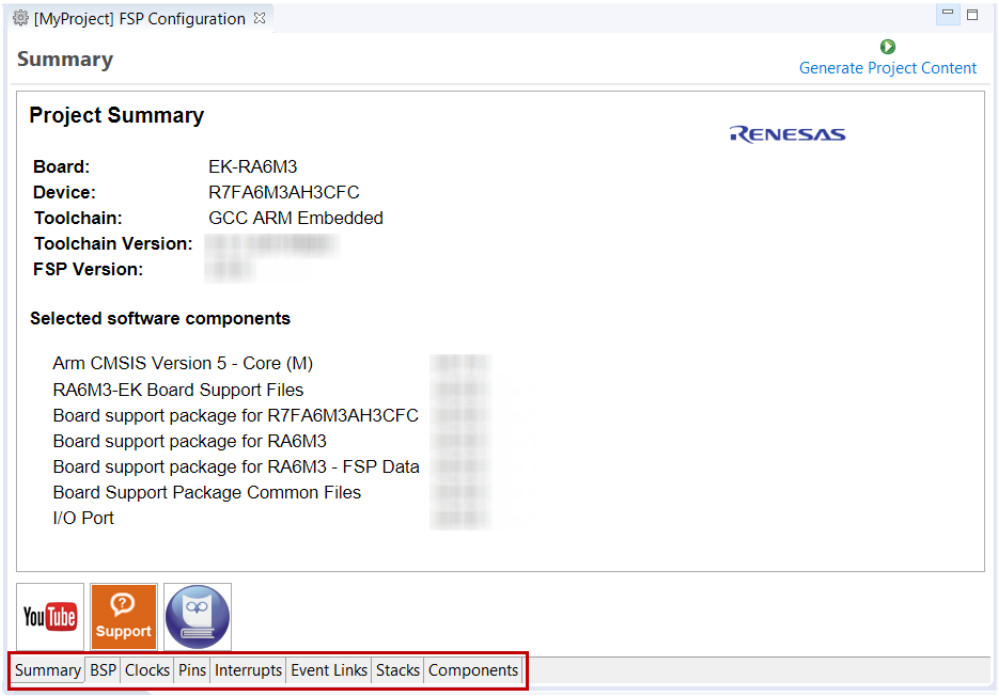

Figure 12: RA Project Editor tabs

- Click on the YouTube icon to visit the Renesas FSP playlist on YouTube
- Click on the Support icon to visit RA support pages at Renesas.com
- Click on the user manual (owl) icon to open the RA software package User's Manual

## 3.2.4 Creating a Project

During project creation, you specify the type of project, give it a project name and location, and configure the project settings for version, target board, whether an RTOS is included, the toolchain version, and the beginning template. This section includes easy-to-follow step-by-step instructions for all of the project creation tasks. Once you have created the project, you can move to configuring the project hardware (clocks, pins, interrupts) and the parameters of all the modules that are part of your application.

### 3.2.4.1 Creating a New Project

For RA MCU applications, generate a new project using the following steps:

1. Click on **File > New > RA C/C++ Project > Renesas RA**.

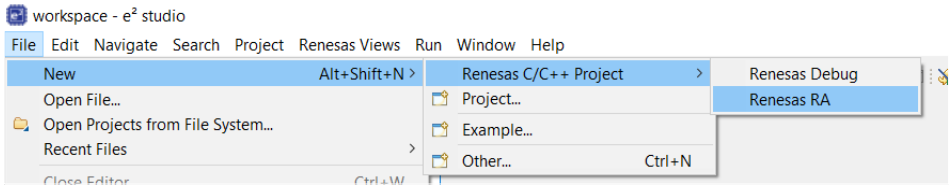

Figure 13: New RA MCU Project

Then click on the type of template for the type of project you are creating.

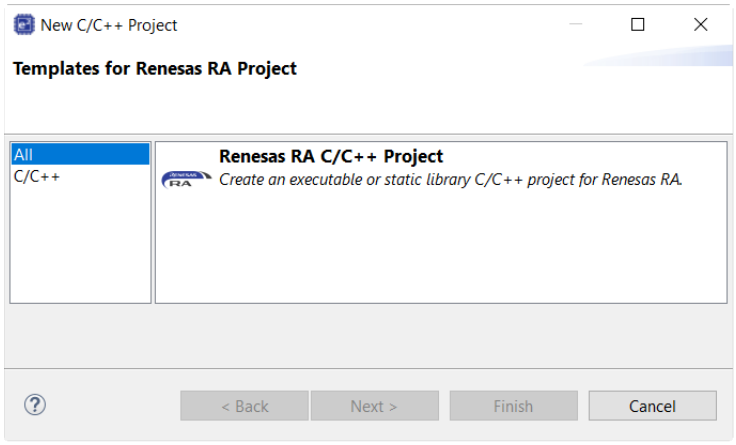

Figure 14: New Project Templates

2. Select a project name and location.

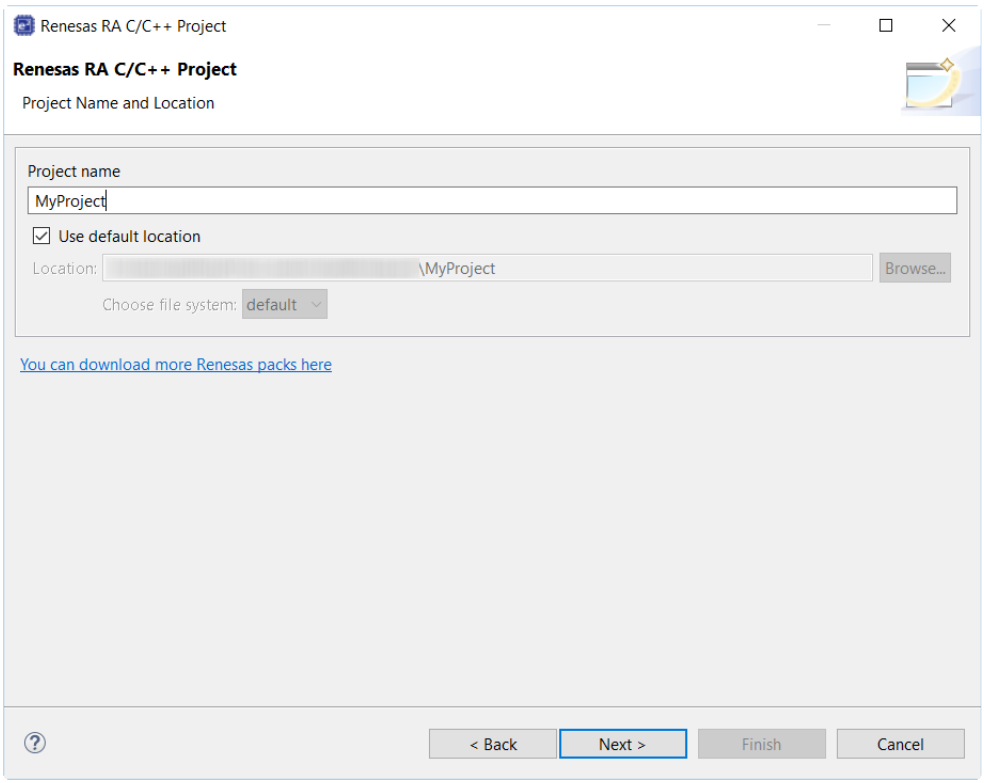

Figure 15: RA MCU Project Generator (Screen 1)

3. Click **Next**.

#### 3.2.4.2 Selecting a Board and Toolchain

In the **Project Configuration** window select the hardware and software environment:

1. Select the **FSP version**.
2. Select the **Board** for your application. You can select an existing RA MCU Evaluation Kit or select **Custom User Board** for any of the RA MCU devices with your own BSP definition.
3. Select the **Device**. The **Device** is automatically populated based on the **Board** selection. Only change the **Device** when using the **Custom User Board (Any Device)** board selection.
4. To add threads, select **RTOS**, or **No RTOS** if an RTOS is not being used.
5. The **Toolchain** selection defaults to **GCC Arm Embedded**.
6. Select the **Toolchain version**. This should default to the installed toolchain version.
7. Select the **Debugger**. The J-Link Arm Debugger is preselected.

8. Click **Next**.

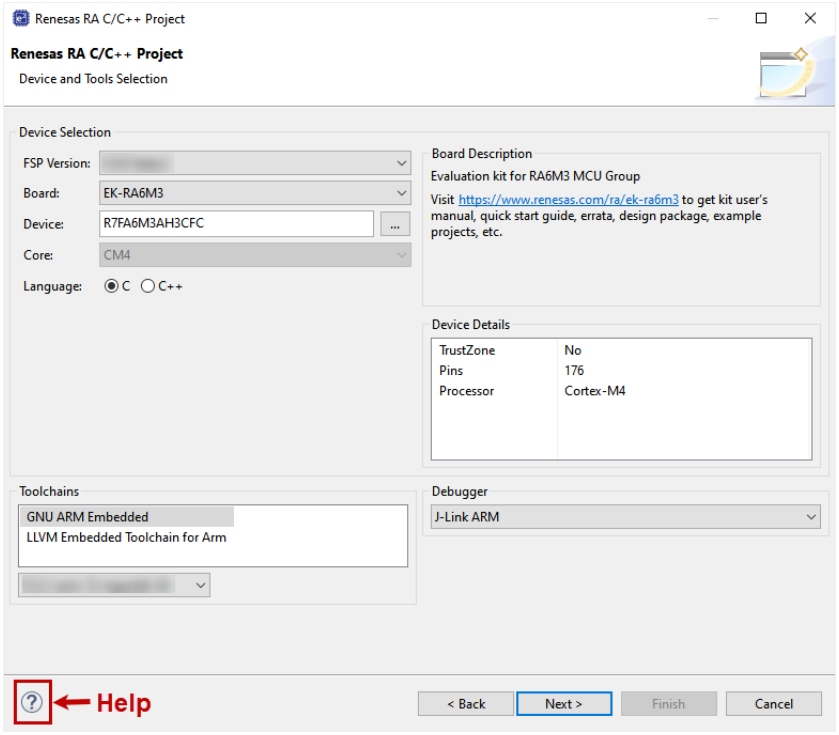

Figure 16: RA MCU Project Generator (Screen 2)

*Note*

*Click on the **Help** icon (?) for user guides, RA contents, and other documents.*

### 3.2.4.3 Selecting Flat or Arm TrustZone Project

If you selected a device or tool based on an Arm® Cortex®-M33, you next select whether to use Arm® TrustZone® technology in your project. For normal, non-TrustZone projects, select "Flat".

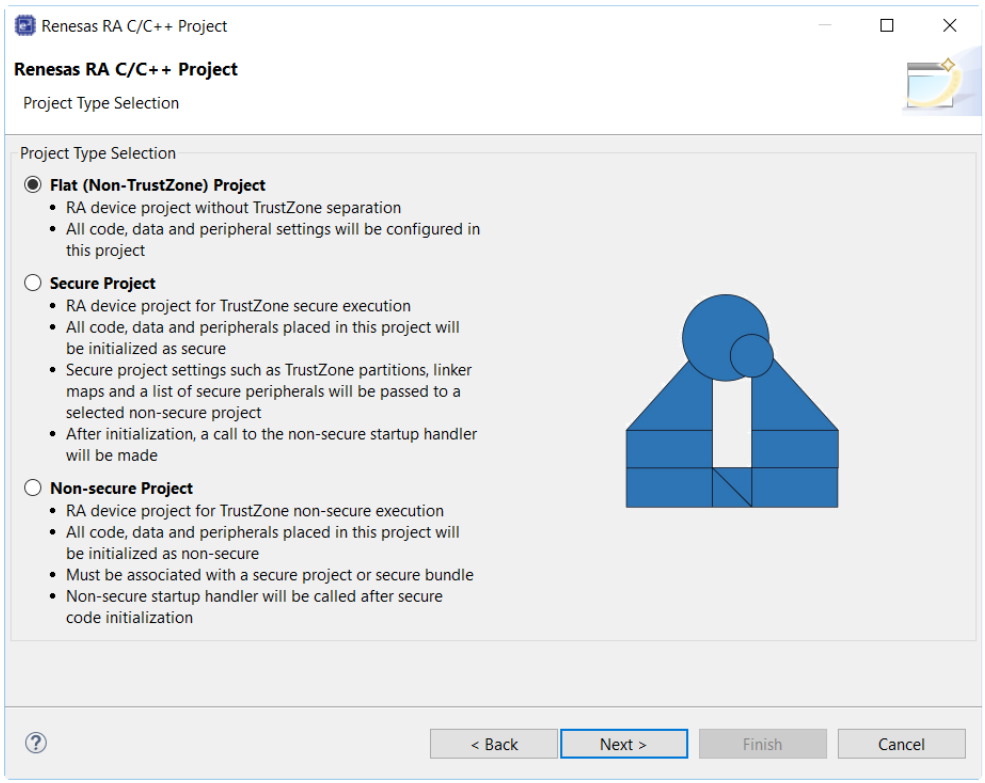

Figure 17: Flat, Secure, or Non-Secure Project

For more information on Arm TrustZone technology, see Primer: Arm TrustZone Project Development.

### 3.2.4.4 Selecting a Project Template

In the next window, select the buiild artifact and RTOS.

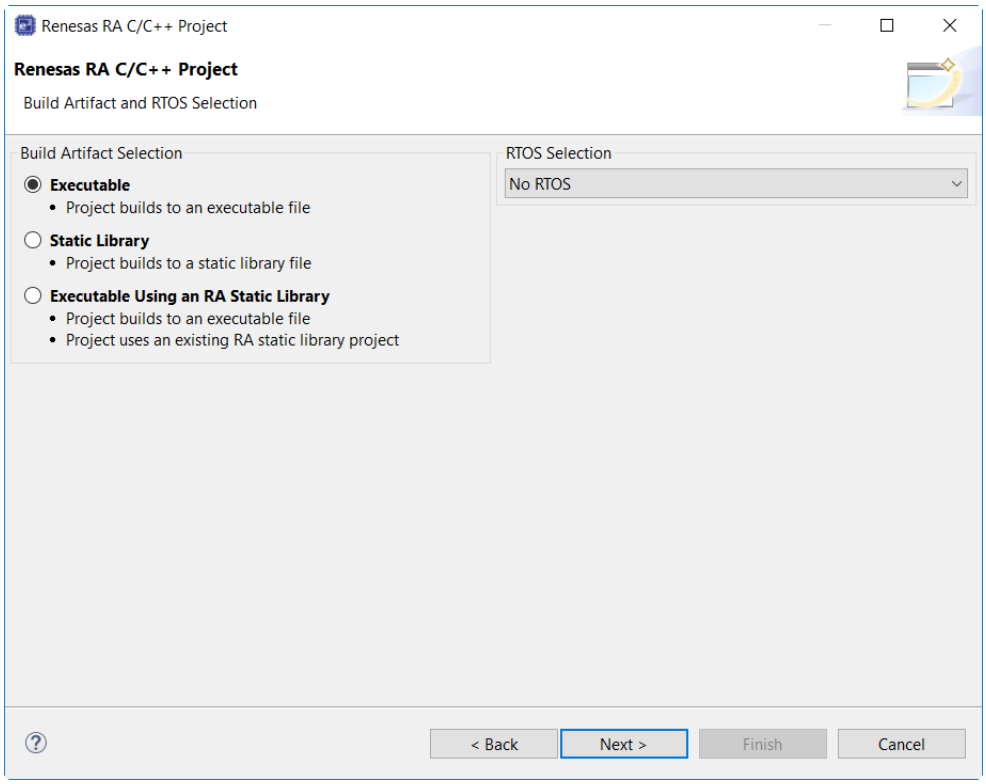

Figure 18: RA MCU Project Generator (Screen 3)

In the next window, select a project template from the list of available templates. By default, this screen shows the templates that are included in your current RA MCU pack. Once you have selected the appropriate template, click **Finish**.

*Note*

*If you want to develop your own application, select the basic template for your board,* ***Bare Metal - Minimal****.*

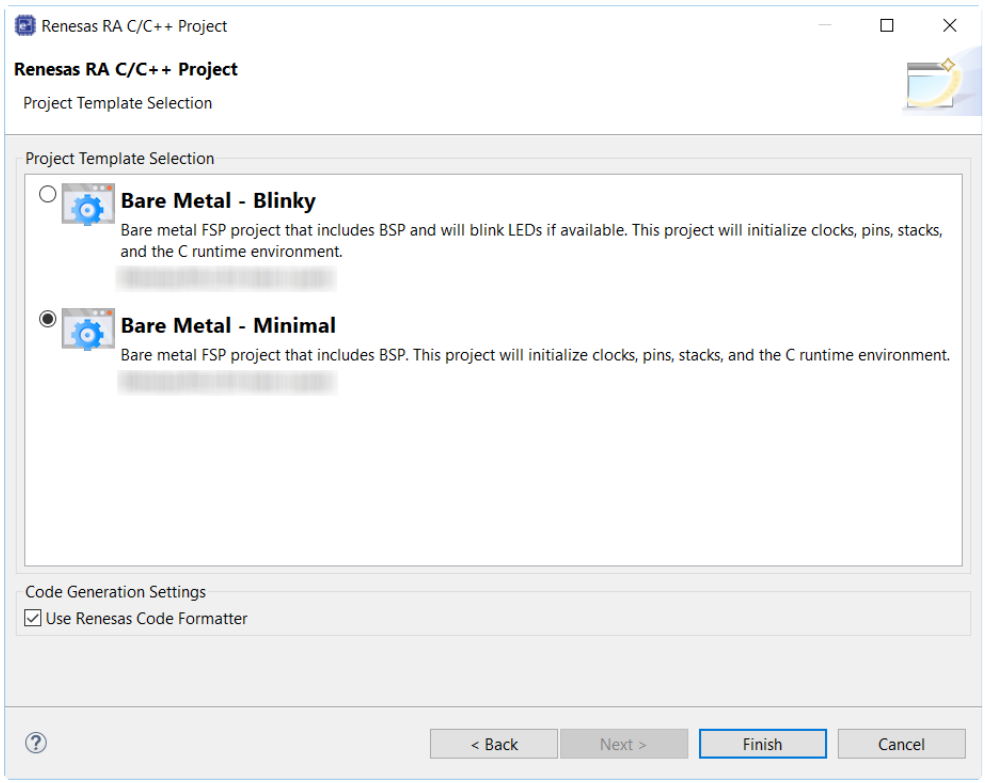

Figure 19: RA MCU Project Generator (Screen 4)

When the project is created, e² studio displays a summary of the current project configuration in the RA MCU Project Editor.

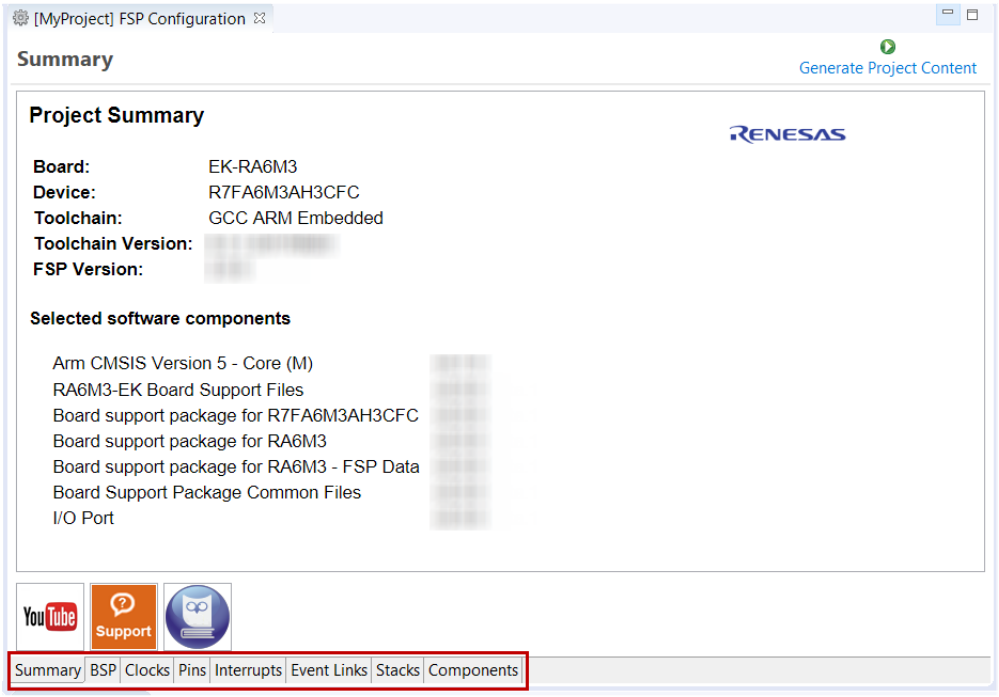

Figure 20: RA MCU Project Editor and available editor tabs

On the bottom of the RA MCU Project Editor view, you can find the tabs for configuring multiple aspects of your project:

- With the **Summary** tab, you can see all they key characteristics of the project: board, device, toolchain, and more.
- With the **BSP** tab, you can change board specific parameters from the initial project selection.
- With the **Clocks** tab, you can configure the MCU clock settings for your project.
- With the **Pins** tab, you can configure the electrical characteristics and functions of each port pin.
- With the **Interrupts** tab, you can add new user events/interrupts.
- With the **Event Links** tab, you can configure events used by the Event Link Controller.
- With the **Stacks** tab, you can add and configure FSP modules. For each module selected in this tab, the **Properties** window provides access to the configuration parameters, interrupt priorities, and pin selections.
- The **Components** tab provides an overview of the selected modules. Although you can also add drivers for specific FSP releases and application sample code here, this tab is normally only used for reference.

The functions and use of each of these tabs is explained in detail in the next section.

## 3.2.5 Configuring a Project

Each of the configurable elements in an FSP project can be edited using the appropriate tab in the RA Configuration editor window. Importantly, the initial configuration of the MCU after reset and before any user code is executed is set by the configuration settings in the **BSP**, **Clocks** and **Pins** tabs. When you select a project template during project creation, e² studio configures default values that are appropriate for the associated board. You can change those default values as needed. The following sections detail the process of configuring each of the project elements for each of the associated tabs.

### 3.2.5.1 Summary Tab

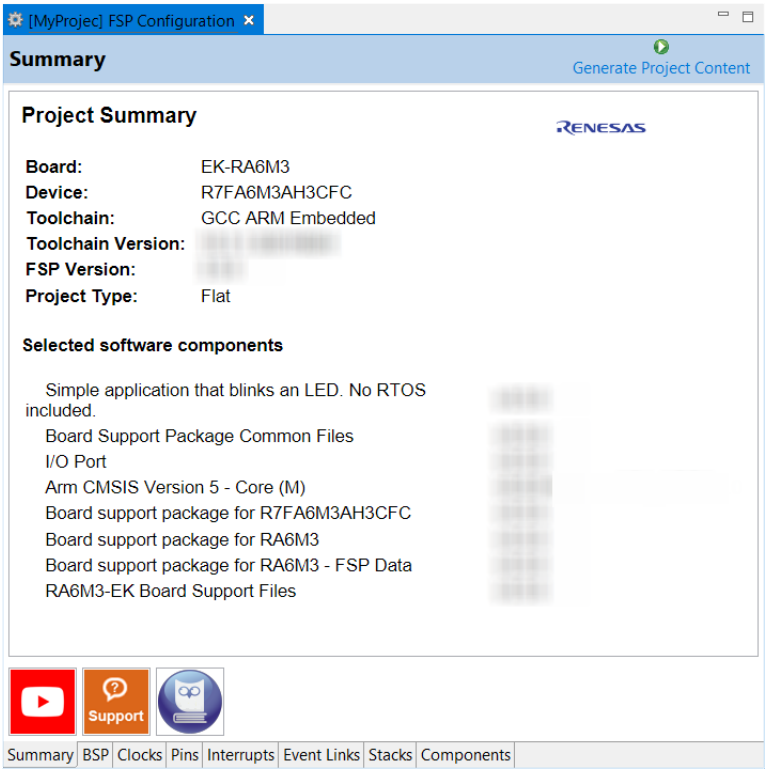

Figure 21: Configuration Summary tab

The **Summary** tab, seen in the above figure, identifies all the key elements and components of a project. It shows the target board, the device, toolchain and FSP version. Additionally, it provides a list of all the selected software components and modules used by the project. This is a more convenient summary view when compared to the **Components** tab.

The summary tab also includes handy icons with links to the Renesas YouTube channel, the Renesas support page and to the RA FSP User Manual that was downloaded during the installation process.

### 3.2.5.2 Configuring the BSP

The **BSP** tab shows the currently selected board (if any) and device. The Properties view is located in the lower left of the Project Configurations view as shown below.

*Note*

*If the Properties view is not visible, click **Window** > **Show View** > **Properties** in the top menu bar.*

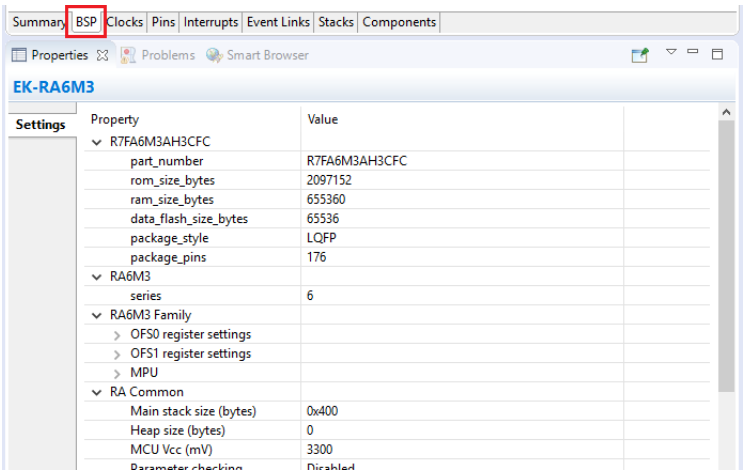

Figure 22: Configuration BSP tab

The **Properties** view shows the configurable options available for the BSP. These can be changed as required. The BSP is the FSP layer above the MCU hardware. e² studio checks the entry fields to flag invalid entries. For example, only valid numeric values can be entered for the stack size.

When you click the **Generate Project Content** button, the BSP configuration contents are written to ra_cfg/fsp_cfg/bsp/bsp_cfg.h

This file is created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

### 3.2.5.3 Configuring Clocks

The **Clocks** tab presents a graphical view of the MCU's clock tree, allowing the various clock dividers and sources to be modified. If a clock setting is invalid, the offending clock value is highlighted in red. It is still possible to generate code with this setting, but correct operation cannot be guaranteed. In the figure below, the USB clock UCLK has been changed so the resulting clock frequency is 60 MHz instead of the required 48 MHz. This parameter is colored red.

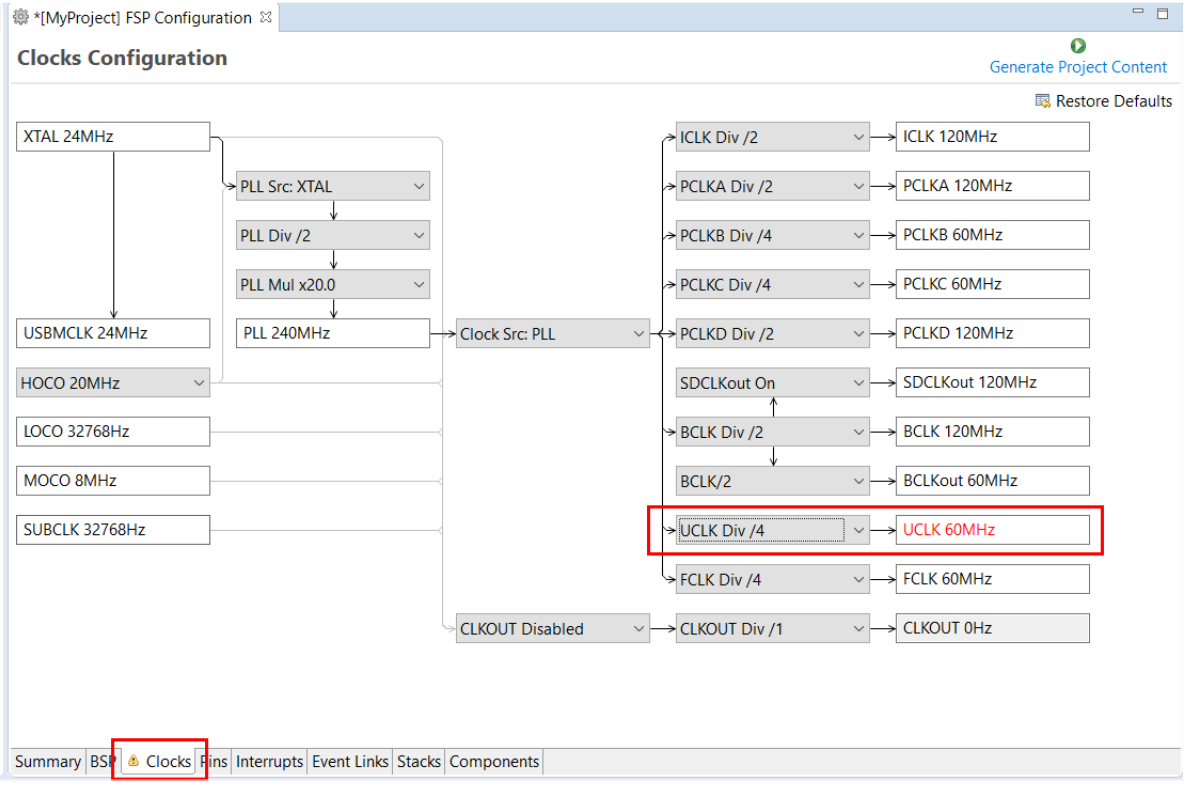

Figure 23: Configuration Clocks tab

When you click the **Generate Project Content** button, the clock configuration contents are written to: ra_gen/bsp_clock_cfg.h

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

### 3.2.5.4 Configuring Pins

The **Pins** tab provides flexible configuration of the MCU's pins. As many pins are able to provide multiple functions, they can be configured on a peripheral basis. For example, selecting a serial channel via the SCI peripheral offers multiple options for the location of the receive and transmit pins for that module and channel. Once a pin is configured, it is shown as green in the **Package** view.

*Note*

*If the **Package** view window is not open in e² studio, select **Window** > **Show View** > **Pin Configurator** > **Package** from the top menu bar to open it.*

The **Pins** tab simplifies the configuration of large packages with highly multiplexed pins by highlighting errors and presenting the options for each pin or for each peripheral. If you selected a project template for a specific board such as the EK-RA6M3, some peripherals connected on the board are preselected.

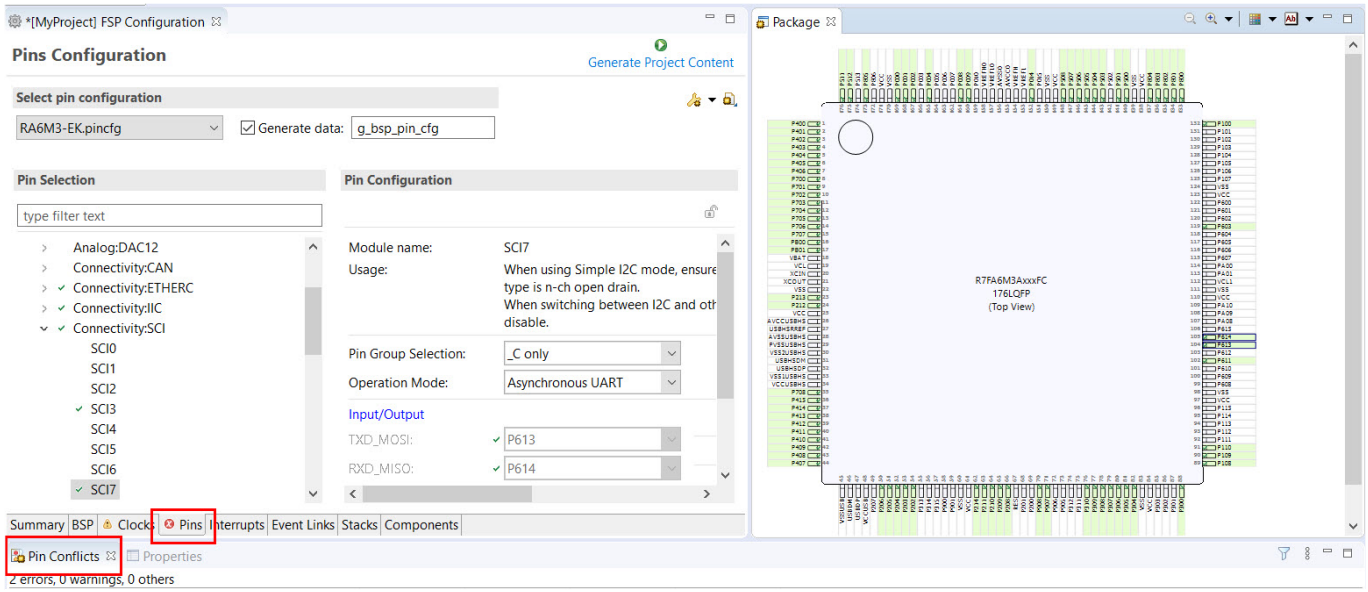

Figure 24: Pins Configuration

The pin configurator includes a built-in conflict checker, so if the same pin is allocated to another peripheral or I/O function the pin will be shown as red in the package view and also with white cross in a red square in the **Pin Selection** pane and **Pin Configuration** pane in the main **Pins** tab. The **Pin Conflicts** view provides a list of conflicts, so conflicts can be quickly identified and fixed.

In the example shown below, port P611 is already used by the CAC, and the attempt to connect this port to the Serial Communications Interface (SCI) results in a dangling connection error. To fix this error, select another port from the pin drop-down list or disable the CAC in the **Pin Selection** pane on the left side of the tab.

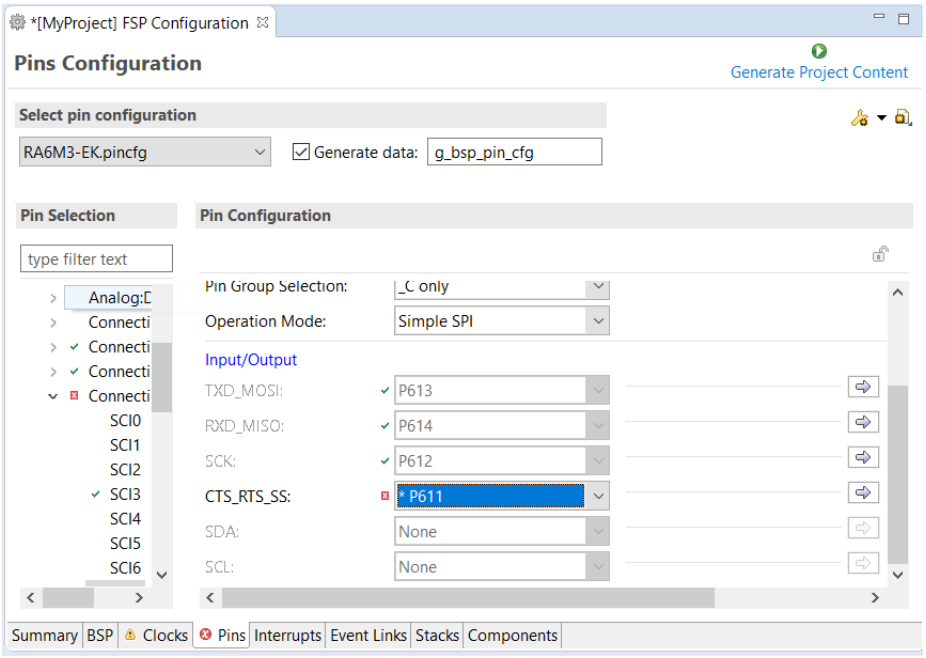

Figure 25: e² studio Pin configurator

The pin configurator also shows a package view and the selected electrical or functional characteristics of each pin.

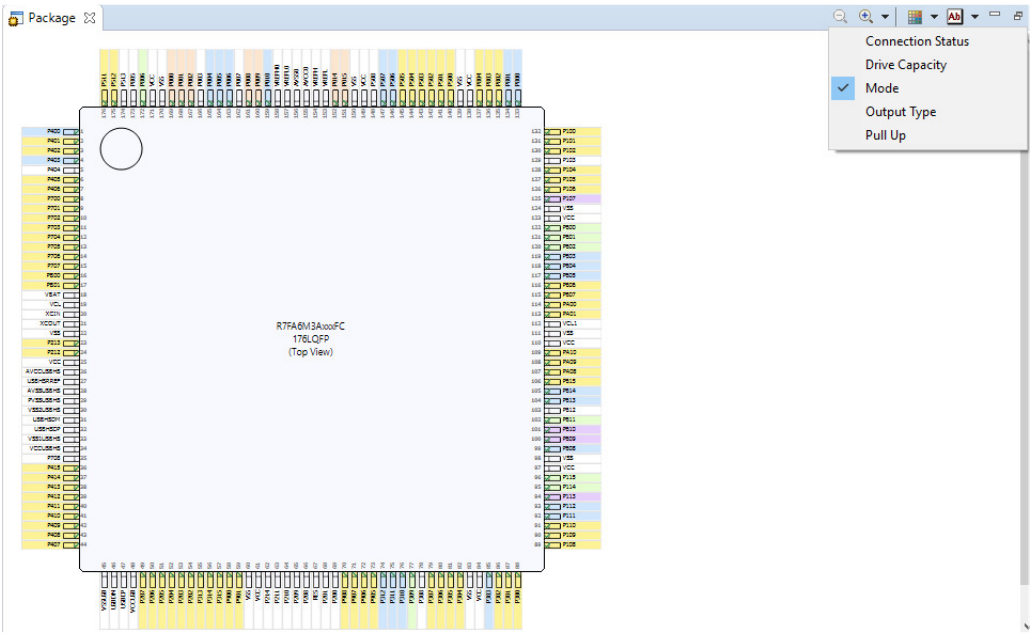

Figure 26: e² studio Pin configurator package view

When you click the **Generate Project Content** button, the pin configuration contents are written to: ra_gen\bsp_pin_cfg.h

This file will be created if it does not already exist.

Warning

Do not edit this file as it is overwritten whenever the **Generate Project Content** button is clicked.

To make it easy to share pinning information for your project, e² studio exports your pin configuration settings to a csv format and copies the csv file to ra_gen/<MCU package>.csv.

### 3.2.5.5 Configuring Interrupts from the Stacks Tab

You can use the **Properties** view in the **Stacks** tab to enable interrupts by setting the interrupt priority. Select the driver in the **Stacks** pane to view and edit its properties.

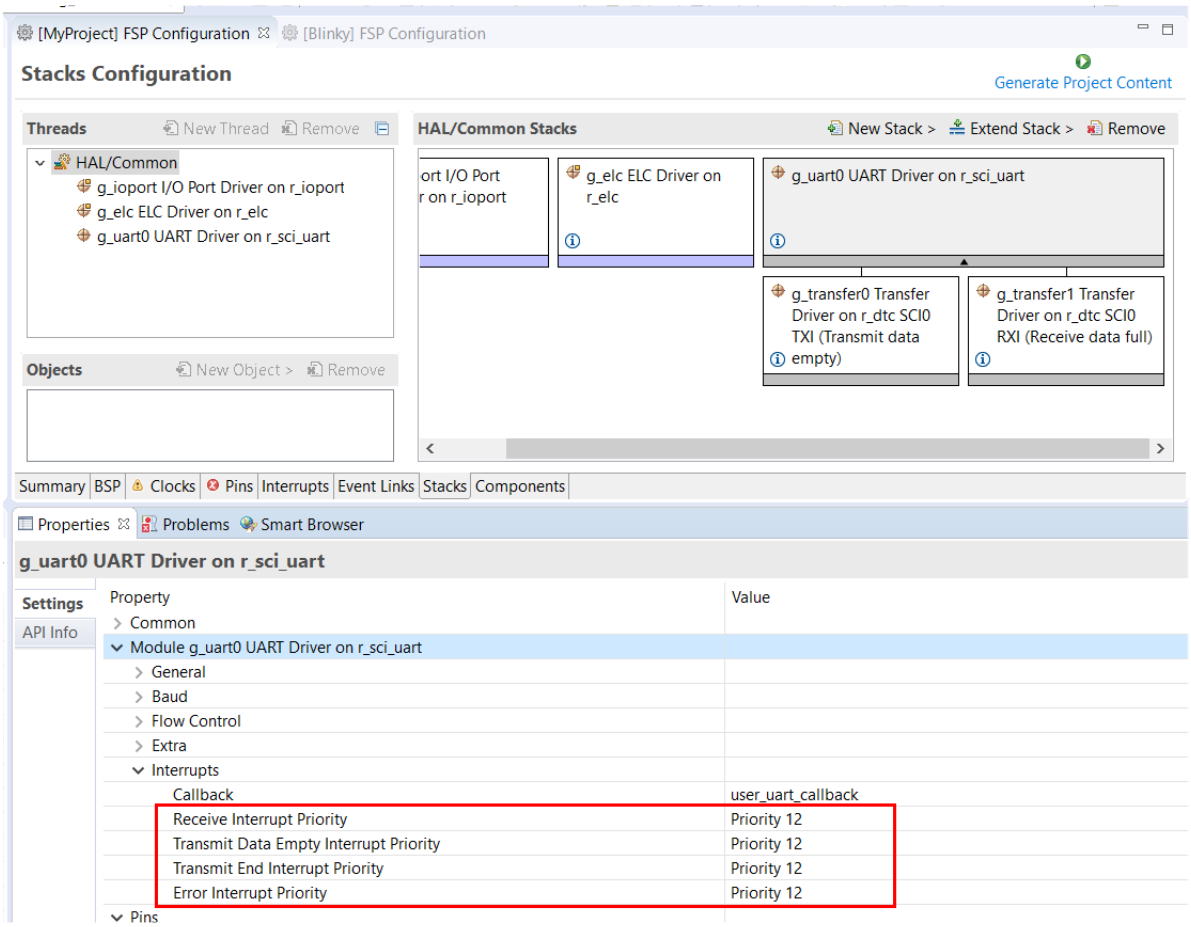

Figure 27: Configuring Interrupts in the Stacks tab

### Creating Interrupts from the Interrupts Tab

On the **Interrupts** tab, the user can bypass a peripheral interrupt set by FSP by setting a user-defined ISR. This can be done by adding a new event via the **New User Event** button.

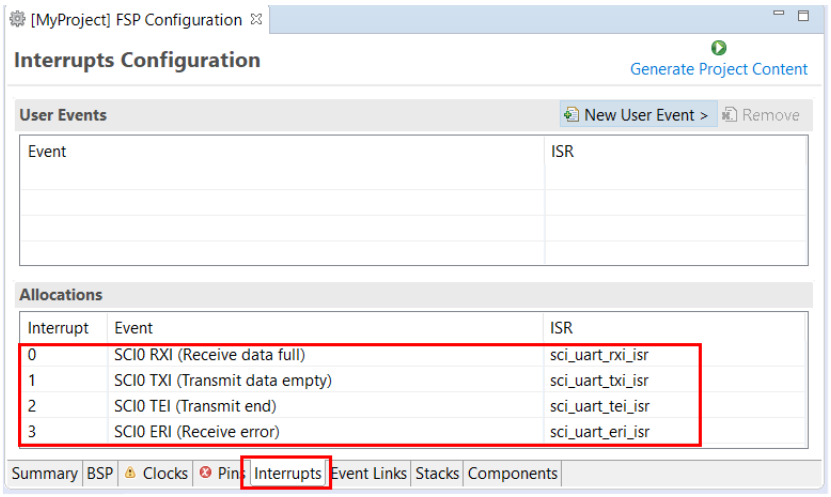

Figure 28: Configuring interrupt in Interrupt Tab

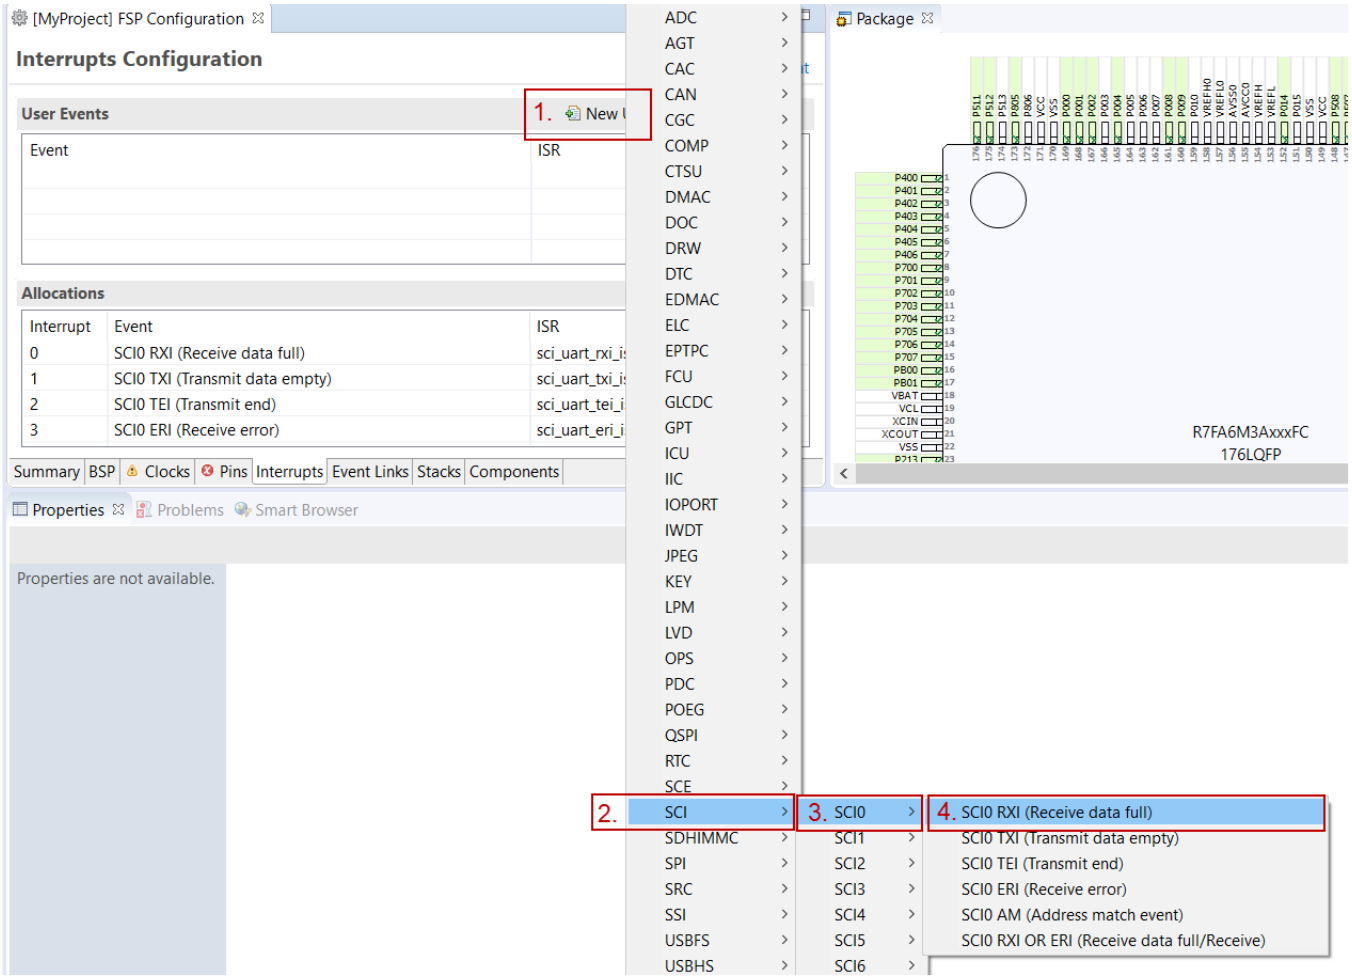

Figure 29: Adding user-defined event

Enter the name of ISR for the new user event.

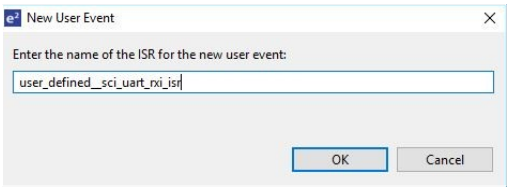

Figure 30: User-defined event ISR

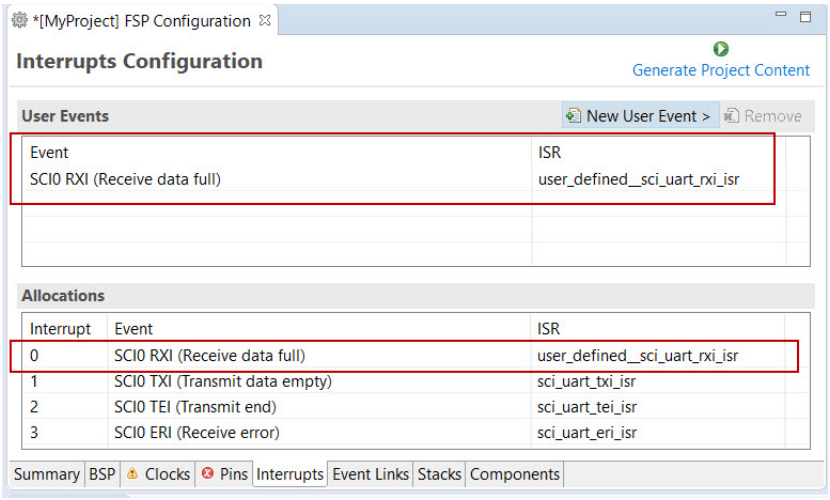

Figure 31: Using a user-defined event

### 3.2.5.6 Viewing Event Links

The Event Links tab can be used to view the Event Link Controller events. The events are sorted by peripheral to make it easy to find and verify them.

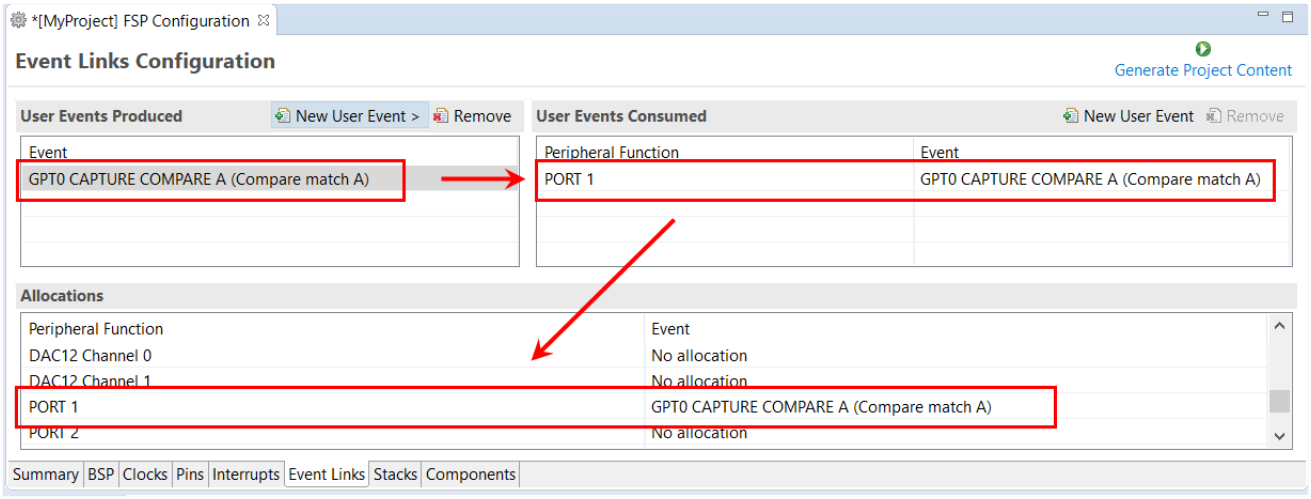

Figure 32: Viewing Event Links

Like the Interrupts tab, user-defined event sources and destinations (producers and consumers) can be defined by clicking the relevant **New User Event** button. Once a consumer is linked to a producer the link will appear in the **Allocations** section at the bottom.

*Note*

*When selecting an ELC event to receive for a module (or when manually defining an event link), only the events that are made available by the modules configured in the project will be shown.*

## 3.2.6 Adding Threads and Drivers

Every RTOS-based RA Project includes at least one RTOS Thread and a stack of FSP modules running

in that thread. The **Stacks** tab is a graphical user interface which helps you to add the right modules to a thread and configure the properties of both the threads and the modules associated with each thread. Once you have configured the thread, e² studio automatically generates the code reflecting your configuration choices.

For any driver, or, more generally, any module that you add to a thread, e² studio automatically resolves all dependencies with other modules and creates the appropriate stack. This stack is displayed in the Stacks pane, which e² studio populates with the selected modules and module options for the selected thread.

The default view of the **Stacks** tab includes a Common Thread called **HAL/Common**. This thread includes the driver for I/O control (IOPORT). The default stack is shown in the **HAL/Common Stacks** pane. The default modules added to the HAL/Common driver are special in that FSP only requires a single instance of each, which e² studio then includes in every user-defined thread by default.

In applications that do not use an RTOS or run outside of the RTOS, the HAL/Common thread becomes the default location where you can add additional drivers to your application.

For a detailed description on how to add and configure modules and stacks, see the following sections:

- Adding and Configuring HAL Drivers
- Adding Drivers to a Thread and Configuring the Drivers

Once you have added a module either to HAL/Common or to a new thread, you can access the driver's configuration options in the **Properties** view. If you added thread objects, you can access the objects configuration options in the **Properties** view in the same way.

You can find details about how to configure threads here: Configuring Threads

*Note*

*Driver and module selections and configuration options are defined in the FSP pack and can therefore change when the FSP version changes.*

### 3.2.6.1 Adding and Configuring HAL Drivers

For applications that run outside or without the RTOS, you can add additional HAL drivers to your application using the HAL/Common thread. To add drivers, follow these steps:

1. Click on the HAL/Common icon in the **Stacks** pane. The Modules pane changes to **HAL/Common Stacks**.

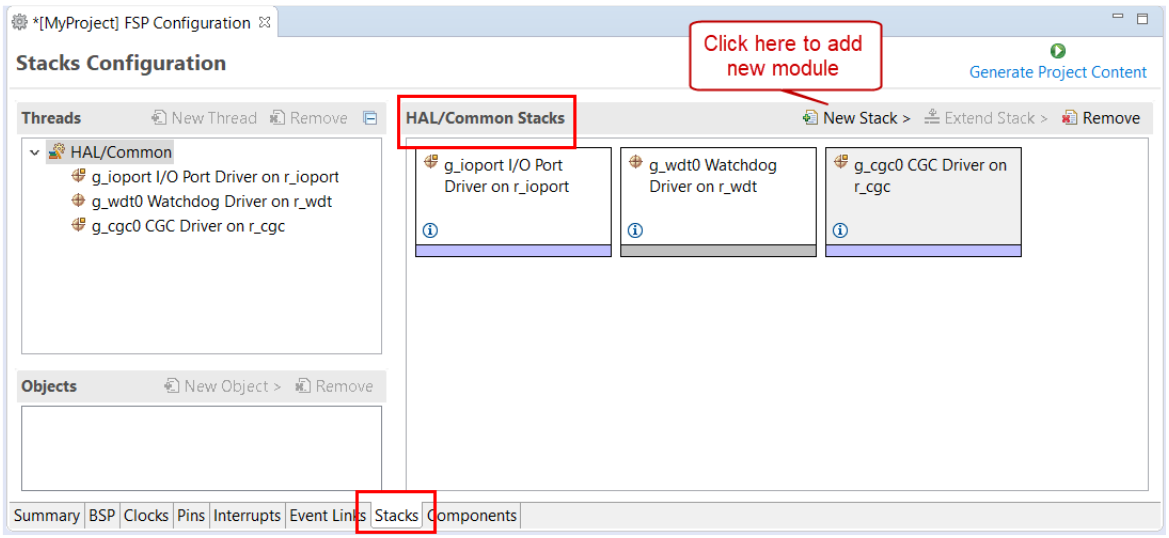

Figure 33: e² studio Project configurator - Adding drivers

2. Click **New Stack** to see a drop-down list of HAL level drivers available in FSP.

3. Select a driver from the menu **New Stack > Driver**.

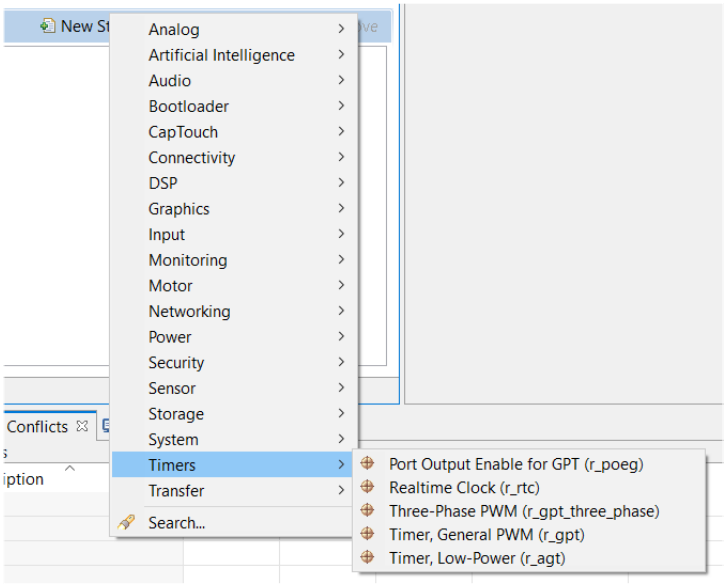

Figure 34: Select a driver

4. Select the driver module in the **HAL/Common Modules** pane and configure the driver properties in the **Properties** view.

e² studio adds the following files when you click the **Generate Project Content** button:

- The selected driver module and its files to the ra/fsp directory
- The main() function and configuration structures and header files for your application as shown in the table below.

| File | Contents | Overwritten by Generate Project Content? |
|---|---|---|
| ra_gen/main.c | Contains main() calling generated and user code. When called, the BSP already has Initialized the MCU. | Yes |
| ra_gen/hal_data.c | Configuration structures for HAL Driver only modules. | Yes |
| ra_gen/hal_data.h | Header file for HAL driver only modules. | Yes |
| src/hal_entry.c | User entry point for HAL Driver only code. Add your code here. | No |

The configuration header files for all included modules are created or overwritten in this folder: ra_cfg/fsp_cfg

#### 3.2.6.2 Adding Drivers to a Thread and Configuring the Drivers

For an application that uses the RTOS, you can add one or more threads, and for each thread at least one module that runs in the thread. You can select modules from the Driver dropdown menu. To add modules to a thread, follow these steps:

1. In the **Threads** pane, click **New Thread** to add a Thread.

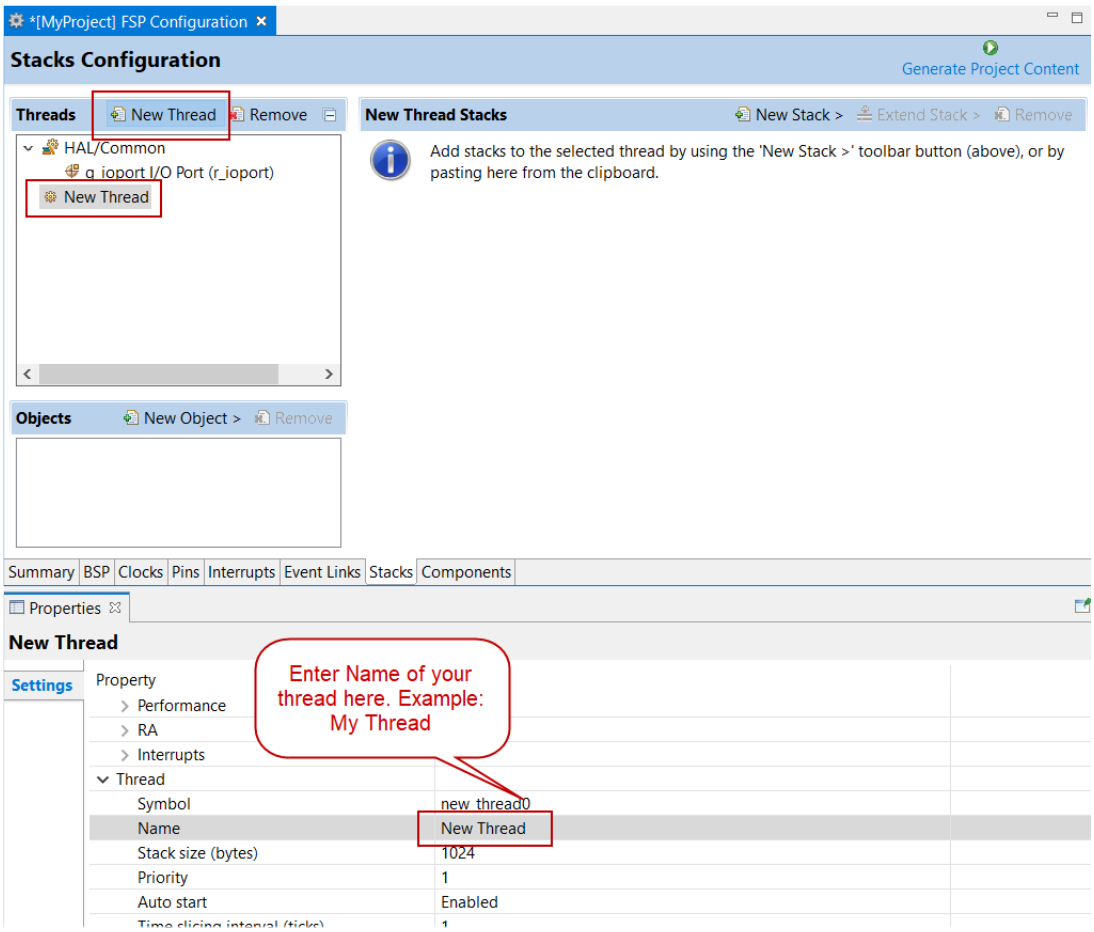

Figure 35: Adding a new RTOS Thread on the Stacks tab

2. In the **Properties** view, click on the **Name** and **Symbol** entries and enter a distinctive name and symbol for the new thread.

   *Note*

   *e² studio updates the name of the thread stacks pane to **My Thread Stacks**.*

3. In the **My Thread Stacks** pane, click on **New Stack** to see a list of modules and drivers. HAL-level drivers can be added here.

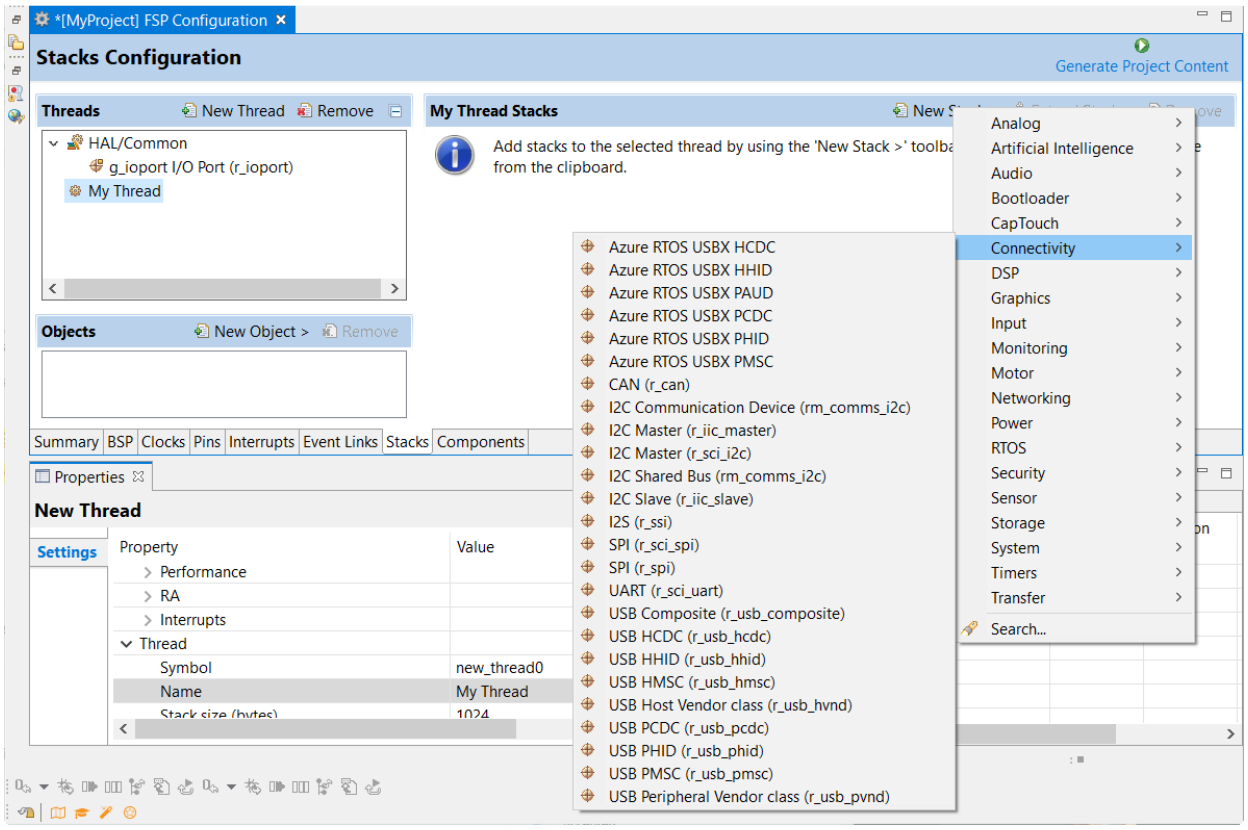

Figure 36: Adding Modules and Drivers to a thread

4. Select a module or driver from the list.

5. Click on the added driver and configure the driver as required by the application by updating the configuration parameters in the **Properties** view. To see the selected module or driver and be able to edit its properties, make sure the Thread containing the driver is highlighted in the **Threads** pane.

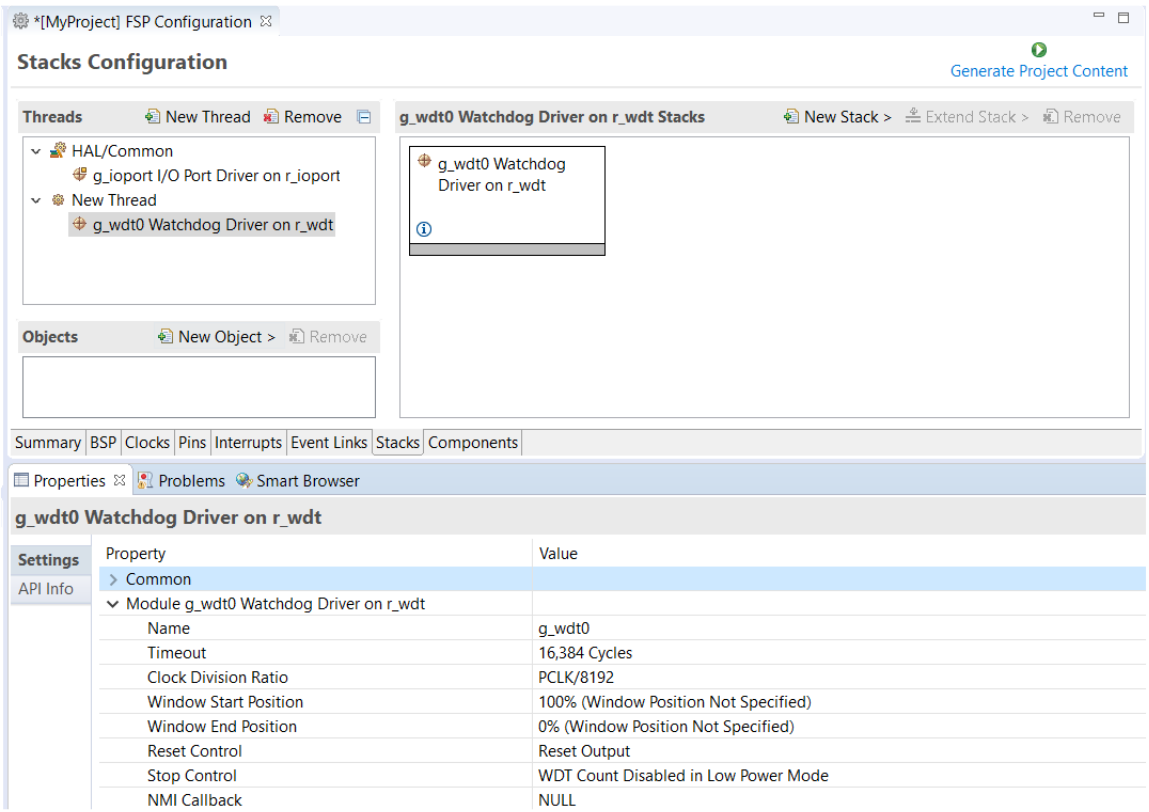

Figure 37: Configuring Module or Driver properties

6. If needed, add another thread by clicking **New Thread** in the **Threads** pane.

When you press the **Generate Project Content** button for the example above, e² studio creates the files as shown in the following table:

| File | Contents | Overwritten by Generate Project Content? |
|---|---|---|
| ra_gen/main.c | Contains main() calling generated and user code. When called the BSP will have initialized the MCU. | Yes |
| ra_gen/my_thread.c | Generated thread "my_thread" and configuration structures for modules added to this thread. | Yes |
| ra_gen/my_thread.h | Header file for thread "my_thread" | Yes |
| ra_gen/hal_data.c | Configuration structures for HAL Driver only modules. | Yes |
| ra_gen/hal_data.h | Header file for HAL Driver only modules. | Yes |
| src/hal_entry.c | User entry point for HAL Driver only code. Add your code here. | No |

| | | |
|---|---|---|
| src/my_thread_entry.c | User entry point for thread "my_thread". Add your code here. | No |

The configuration header files for all included modules and drivers are created or overwritten in the following folders: ra_cfg/fsp_cfg/<header files>

### 3.2.6.3 Configuring Threads

If the application uses an RTOS, the **Stacks** tab can be used to simplify the creation of RTOS threads, semaphores, mutexes, and event flags.

The components of each thread can be configured from the **Properties** view as shown below.

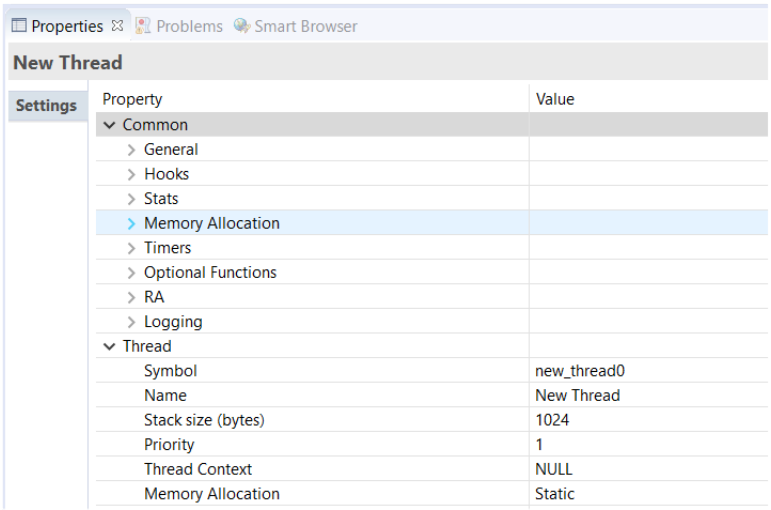

Figure 38: New Thread Properties

The **Properties** view contains settings common for all Threads (**Common**) and settings for this particular thread (**Thread**).

For this thread instance, the thread's name and properties (such as priority level or stack size) can be easily configured. e² studio checks that the entries in the property field are valid. For example, it will verify that the field **Priority**, which requires an integer value, only contains numeric values between 0 and 9.

To add RTOS resources to a Thread, select a thread and click on **New Object** in the Thread Objects pane. The pane takes on the name of the selected thread, in this case **My Thread Objects**.

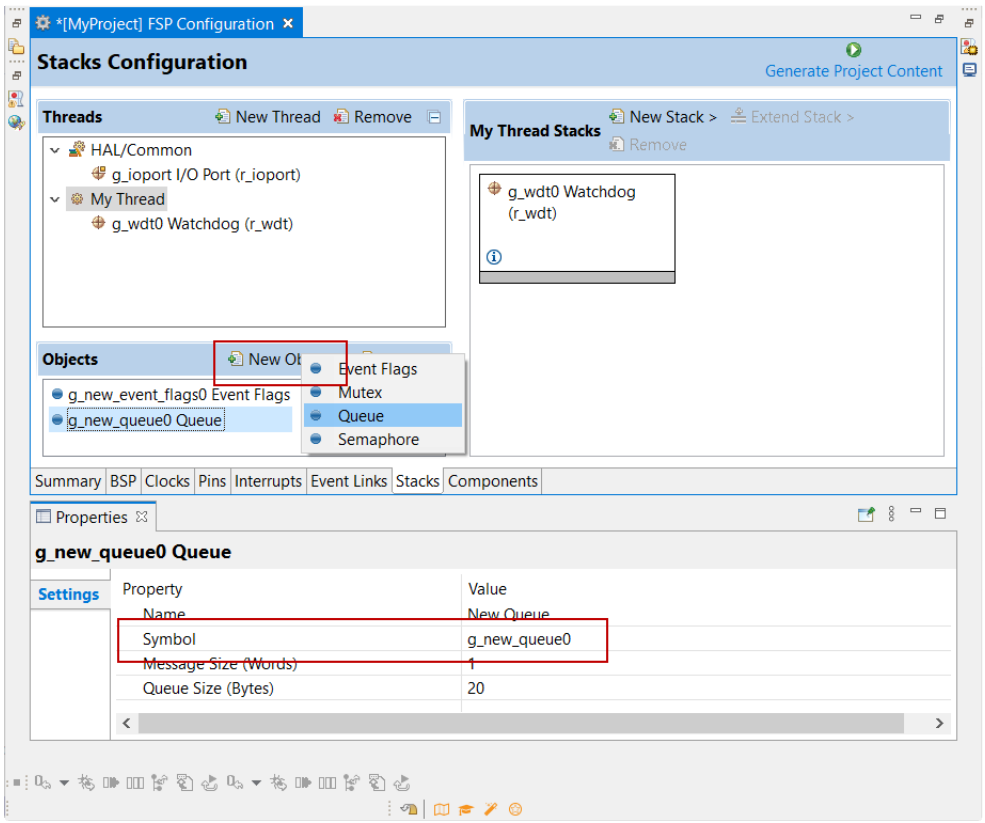

Figure 39: Configuring Thread Object Properties

Make sure to give each thread object a unique name and symbol by updating the **Name** and **Symbol** entries in the **Properties** view.

## 3.2.7 Reviewing and Adding Components

The **Components** tab enables the individual modules required by the application to be included or excluded. Modules common to all RA MCU projects are preselected (for example: **BSP > BSP > Board-specific BSP** and **HAL Drivers > all > r_cgc**). All modules that are necessary for the modules selected in the **Stacks** tab are included automatically. You can include or exclude additional modules by ticking the box next to the required component.

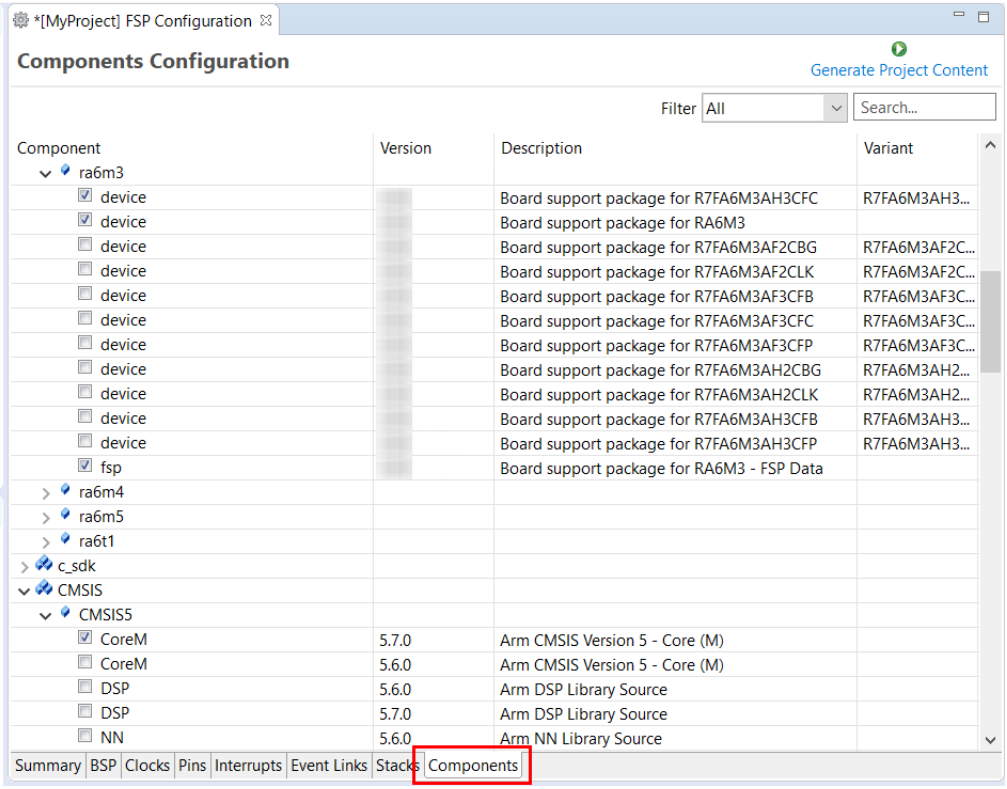

Figure 40: Components Tab

Clicking the **Generate Project Content** button copies the .c and .h files for each selected component into the following folders:

- ra/fsp/inc/api
- ra/fsp/inc/instances
- ra/fsp/src/bsp
- ra/fsp/src/<Driver_Name>

e² studio also creates configuration files in the ra_cfg/fsp_cfg folder with configuration options set in the **Stacks** tab.

## 3.2.8 Writing the Application

Once you have added Modules and drivers and set their configuration parameters in the **Stacks** tab, you can add the application code that calls the Modules and drivers.

*Note*

*To check your configuration, build the project once without errors before adding any of your own application code.*

### 3.2.8.1 Coding Features

e² studio provides several efficiency improving features that help write code. Review these features prior to digging into the code development step-by-step sections that follow.

## Autocomplete

Autocomplete is a context aware coding accelerator that suggests possible completions for partially

typed-in code elements. If you can 'guess' the first part of a macro, for example, the Autocomplete function can suggest options for completing the rest of the macro.

In the following example, a macro related to a BSP_IO setting needs to be found. After typing BSP_IO_ in a source code file, pressing Ctrl + Space opens the Autocomplete list. This list shows a selection of context aware options for completing the macro. Scroll through the window to find the desired macro (in this case BSP_IO_LEVEL_HIGH) and click on it to add it to your code.

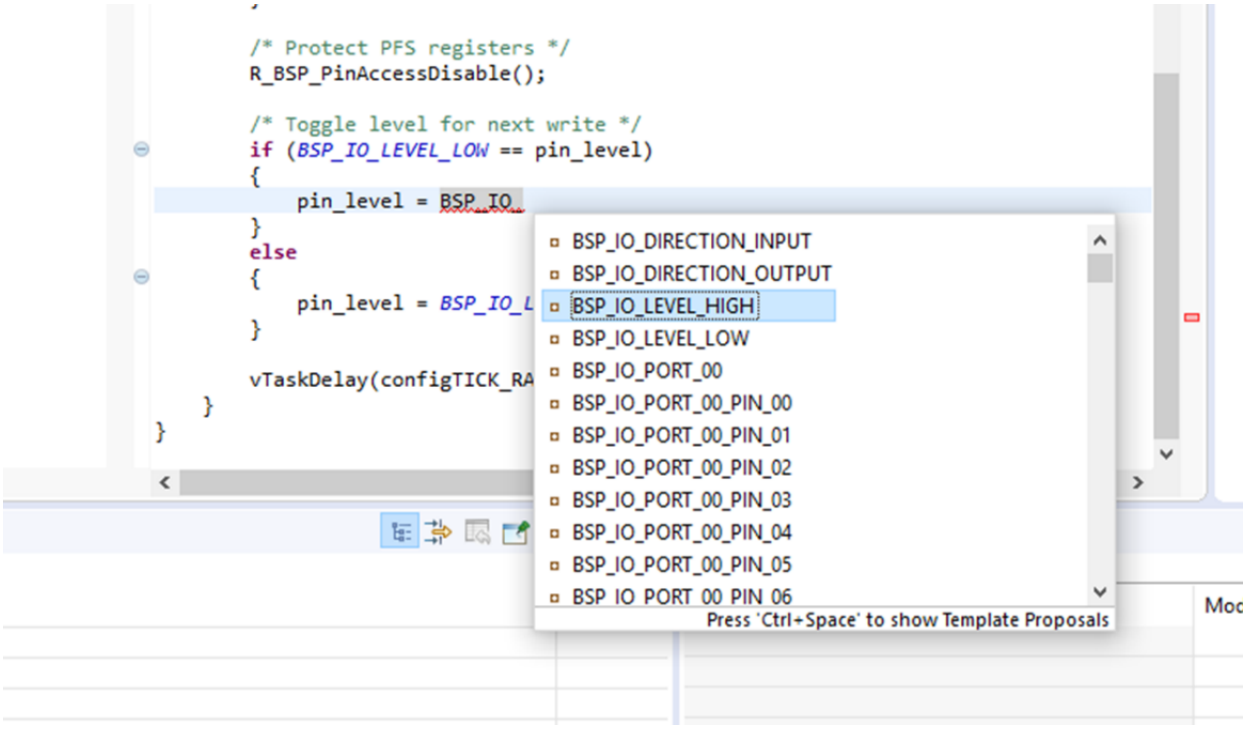

Figure 41: Autocomplete example

Other code elements can use autocomplete too. Some of the more common uses for Autocomplete include Enumerations, Types, and API functions - but try it in any situation you think the tool may have enough context to determine what you might be looking for.

For a hands-on experience using Autocomplete use the Quick FSP Labs for Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

### Welcome Window

The e² studio Welcome window displays useful information and common links to assist in development. Check out these resources to see what is available. They are updated with each release, so check back to see what has been added after a new release.

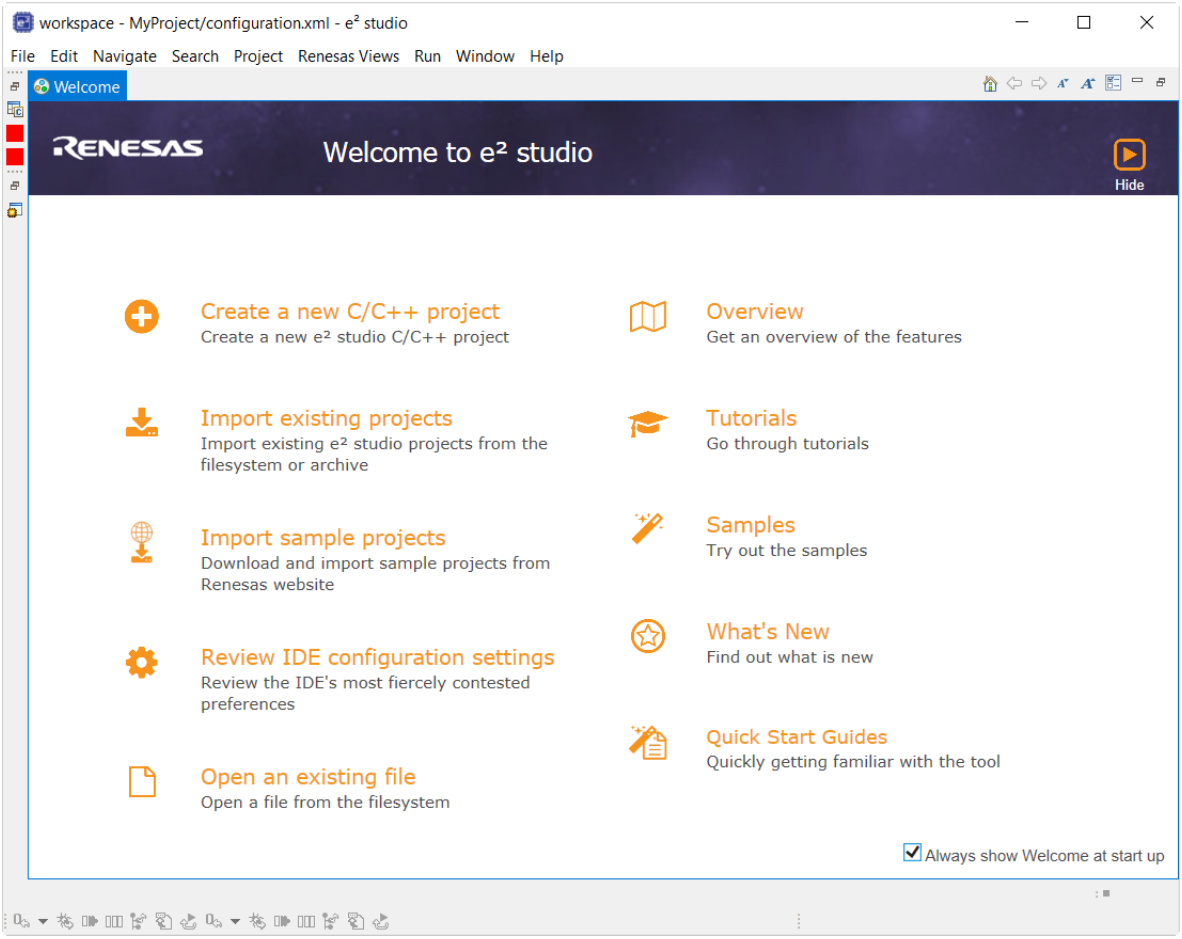

Figure 42: Welcome window

## Cheat Sheets

Cheat sheets are macro driven illustrations of some common tasks. They show, step-by-step, what commands and menus are used. These will be populated with more examples on each release. Cheat Sheets are available from the **Help** menu.

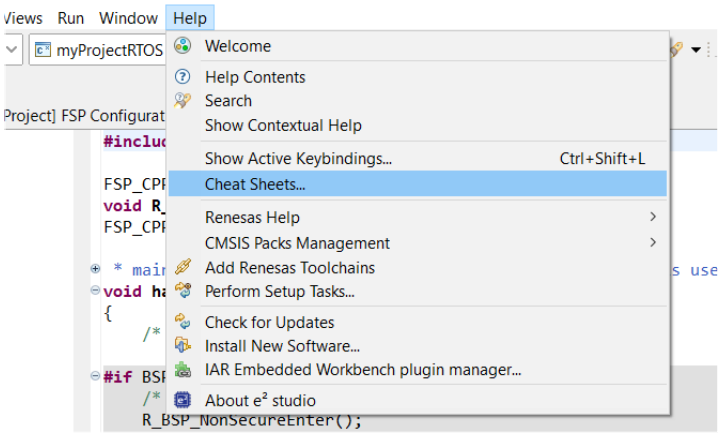

Figure 43: Cheat Sheets

## Developer Assistance

FSP Developer Assistance provides developers with module and Application Programming Interface (API) reference documentation in e² studio. After configuring the threads and software stacks for an FSP project with the RA Configuration editor, Developer Assistance quickly helps you get started writing C/C++ application code for the project using the configured stack modules.

1. Expand the project explorer to view Developer Assistance

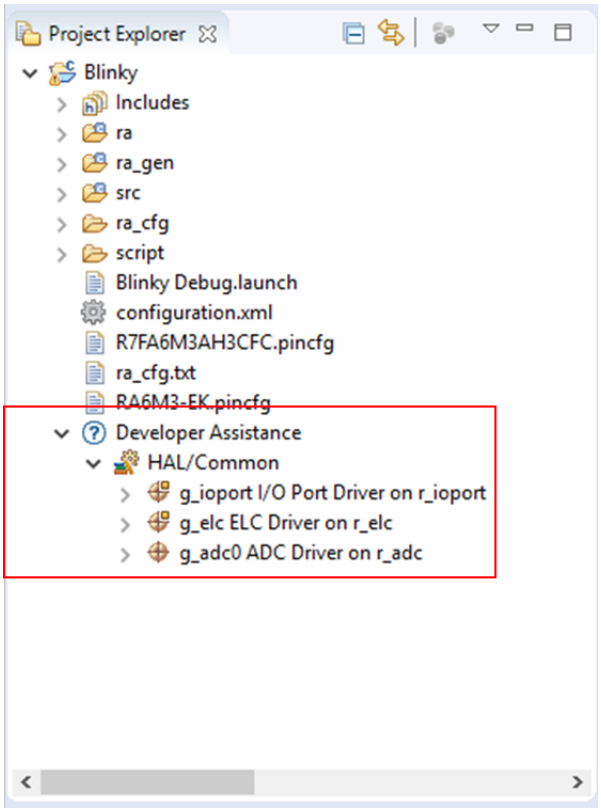

Figure 44: Developer Assistance

2. Expand a stack module to show its APIs

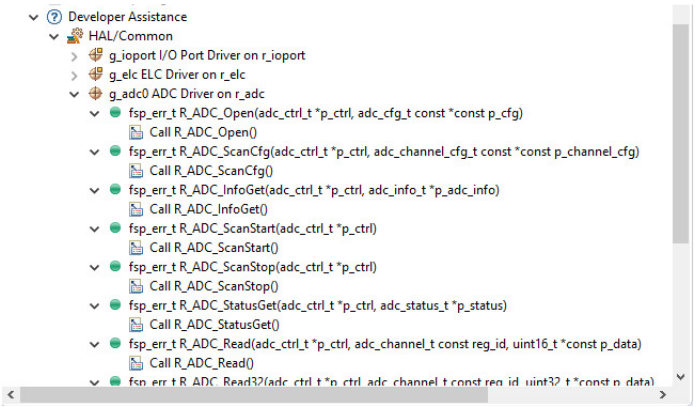

Figure 45: Developer Assistance APIs

3. Dragging and dropping an API from Develop Assistance to a source file helps to write source code quickly.

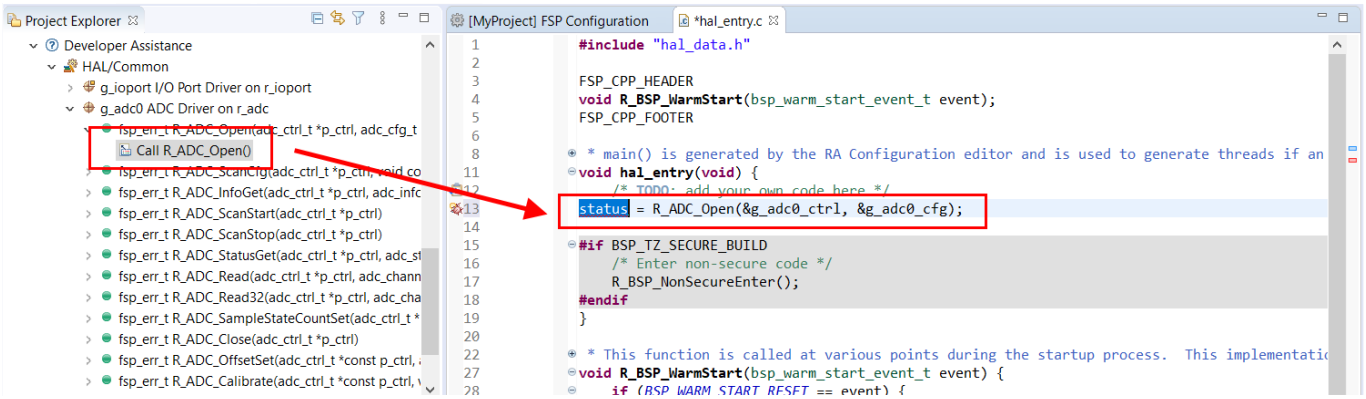

Figure 46: Dragging and Dropping an API in Developer Assistance

For a hands-on experience using Developer Assistance use the Quick FSP Labs for An Introduction to Developer Assistance, Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

### Information Icon

Information icons are available on each module in the thread stack. Clicking on these icons opens a module folder on GitHub that contains additional information on the module. An example information Icon is shown below:

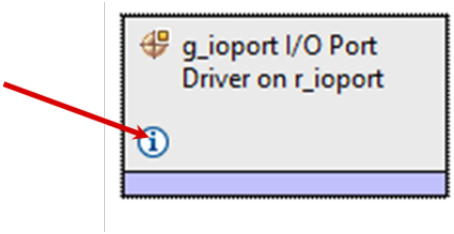

Figure 47: Information icon

### IDE Help

A good source of additional information for many FSP topics is the Help system. To get to the Help system, click on **Help** and then select **Help Contents** as seen below.

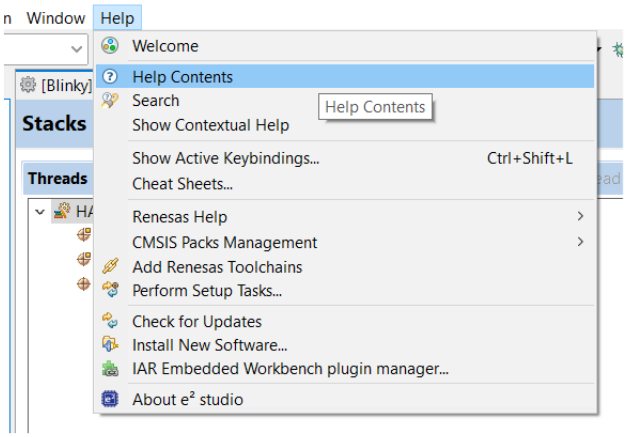

Figure 48: Opening the Help System

Once the Help system is open, select the **RA Contents** entry in the left side Guide-bar. Expand it to see the main RA Topics.

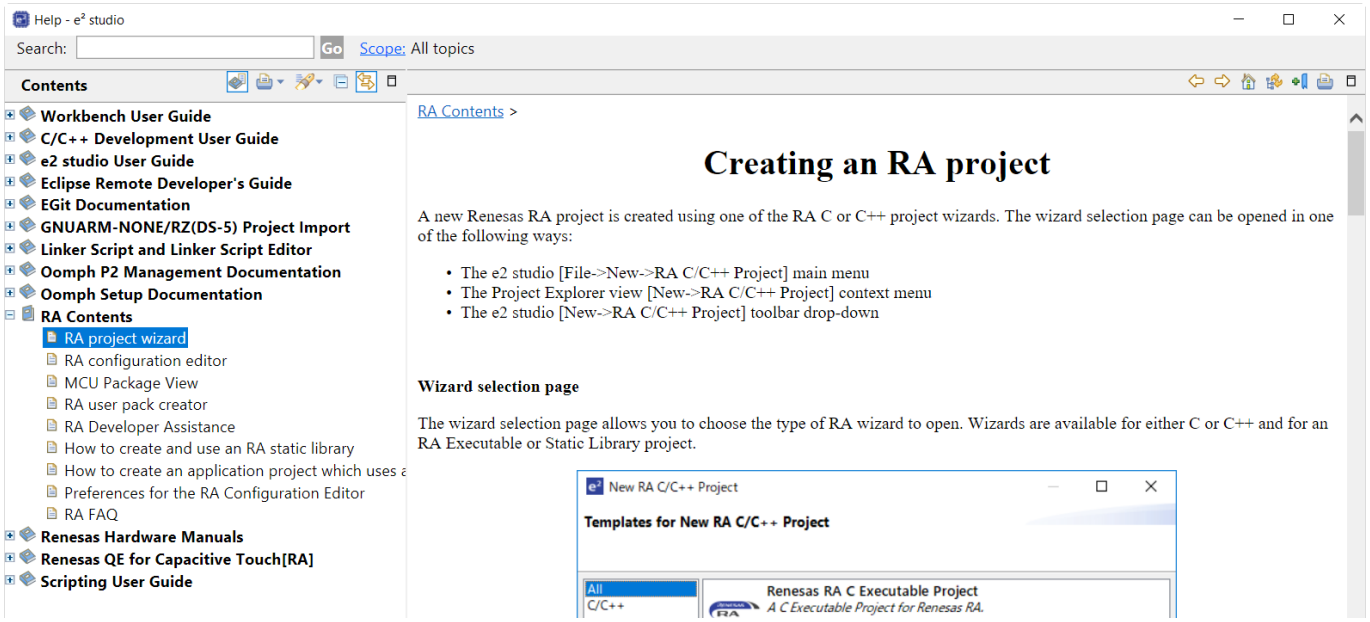

Figure 49: RA Content Help

You can also search for help topics by using the Search bar. Below is an example searching for Visual Expressions, a helpful feature in the e² studio debugger.

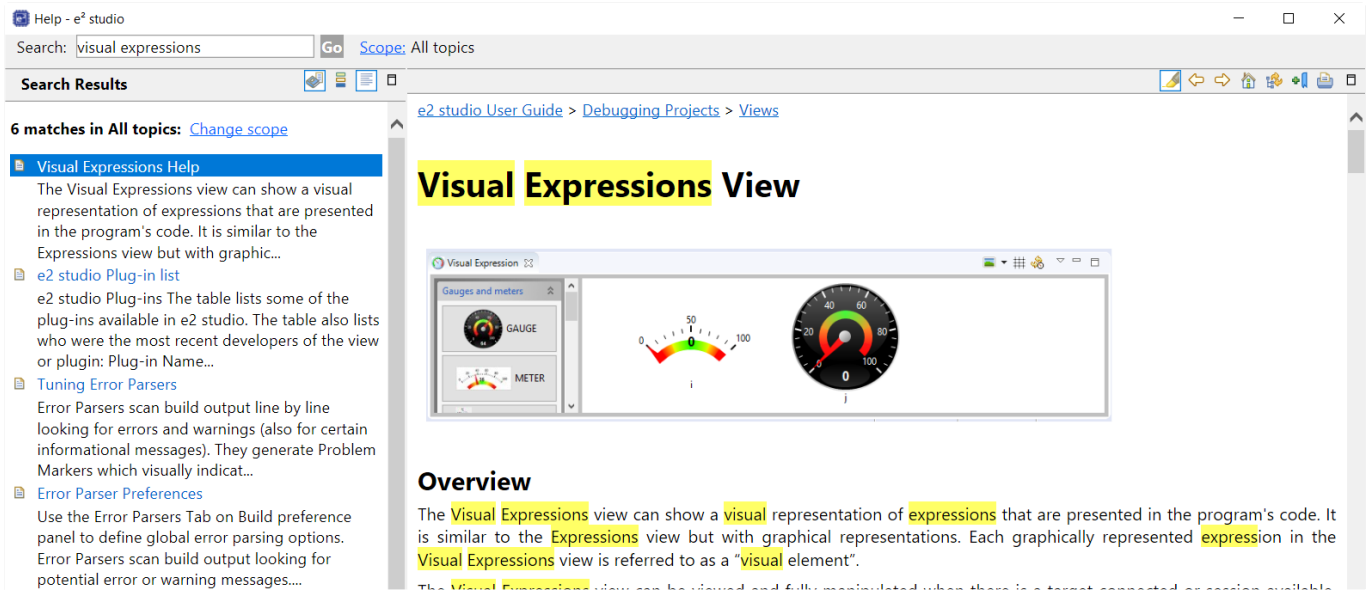

Figure 50: e² studio Help from the Search Bar

For a hands-on experience using the Help system use the Quick FSP Labs for An Introduction to Developer Assistance, Creating Blinky from Scratch and Creating an RTC Blinky from Scratch. These 15-minute Do it Yourself labs take you through the step-by-step process of using Autocomplete, Developer Assistance, and the Help system.

### 3.2.8.2 HAL Modules in FSP: A Practical Description

The FSP Architecture section describes FSP stacks, modules and interfaces in significant detail, providing an understanding of the theory behind them. The following sections provides a quick and practical introduction on how to use API functions when writing code and where in the API reference sections you can find useful API related information.

#### Introduction to HAL Modules

In FSP, HAL module drivers provide convenient API functions that access RA processor peripheral features. Module properties are defined in the RA GUI configurator, eliminating the tedious and error prone process of setting peripheral control registers. When configuration is complete, the generator automatically creates the code needed to implement the associated API functions. API functions are the main way a developer interacts with the target processor and peripherals.

#### HAL Driver API Function Call Formats

HAL driver API functions all have a similar format. They all start with "R_" to indicate they are HAL related functions. Next comes the module name followed by the function and any parameters. This format is illustrated below:

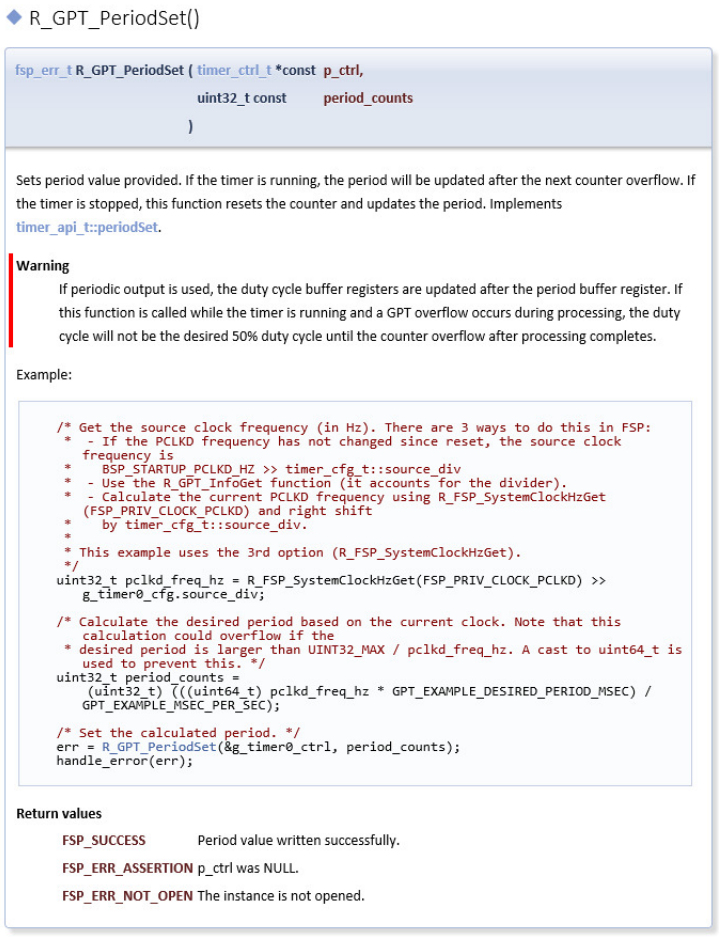
```
R_<module>_<function>(<parameters>);
```

Here are some examples:

```
status = R_GPT_Open(&g_timer0_ctrl, &g_timer0_cfg);
status = R_GPT_Start(&g_timer0_ctrl);
status = R_GPT_PeriodSet(&g_timer0_ctrl, period);
status = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
status = R_ADC_InfoGet(&g_adc0_ctrl, &adc_info);
```

### HAL Driver API Call Reference Information

Each HAL module has a useful API Reference section that includes key details on each function. The function prototype is presented first, showing the return type (usually fsp_status_t for HAL functions) and the function parameters. A short description and any warnings or notes follow the function definition. In some cases, a code snippet is included to illustrate use of the function. Finally, all possible return values are provided to assist in debugging and error management.



◆ R_GPT_PeriodSet()

```
fsp_err_t R_GPT_PeriodSet ( timer_ctrl_t *const  p_ctrl,
                            uint32_t const       period_counts
                          )
```

Sets period value provided. If the timer is running, the period will be updated after the next counter overflow. If the timer is stopped, this function resets the counter and updates the period. Implements timer_api_t::periodSet.

**Warning**

If periodic output is used, the duty cycle buffer registers are updated after the period buffer register. If this function is called while the timer is running and a GPT overflow occurs during processing, the duty cycle will not be the desired 50% duty cycle until the counter overflow after processing completes.

Example:

```
/* Get the source clock frequency (in Hz). There are 3 ways to do this in FSP:
 *  - If the PCLKD frequency has not changed since reset, the source clock
   frequency is
 *    BSP_STARTUP_PCLKD_HZ >> timer_cfg_t::source_div
 *  - Use the R_GPT_InfoGet function (it accounts for the divider).
 *  - Calculate the current PCLKD frequency using R_FSP_SystemClockHzGet
   (FSP_PRIV_CLOCK_PCLKD) and right shift
 *    by timer_cfg_t::source_div.
 *
 * This example uses the 3rd option (R_FSP_SystemClockHzGet).
 */
uint32_t pclkd_freq_hz = R_FSP_SystemClockHzGet(FSP_PRIV_CLOCK_PCLKD) >>
   g_timer0_cfg.source_div;

/* Calculate the desired period based on the current clock. Note that this
   calculation could overflow if the
 * desired period is larger than UINT32_MAX / pclkd_freq_hz. A cast to uint64_t is
   used to prevent this. */
uint32_t period_counts =
    (uint32_t) (((uint64_t) pclkd_freq_hz * GPT_EXAMPLE_DESIRED_PERIOD_MSEC) /
   GPT_EXAMPLE_MSEC_PER_SEC);

/* Set the calculated period. */
err = R_GPT_PeriodSet(&g_timer0_ctrl, period_counts);
handle_error(err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Period value written successfully. |
| FSP_ERR_ASSERTION | p_ctrl was NULL. |
| FSP_ERR_NOT_OPEN | The instance is not opened. |

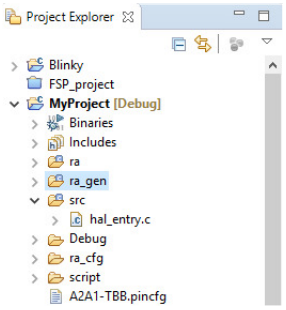
Figure 51: Module Api Reference Section Example

### 3.2.8.3 RTOS-Independent Applications

To write application code:

1. Add all drivers and modules in the **Stacks** tab and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
2. Configure the drivers in the **Properties** view.
3. In the Project Configuration view, click the **Generate Project Content** button.

4. In the **Project Explorer** view, double-click on the src/hal_entry.c file to edit the source file.



*Note*

*All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/hal_data.c.*

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

5. Add your application code here:

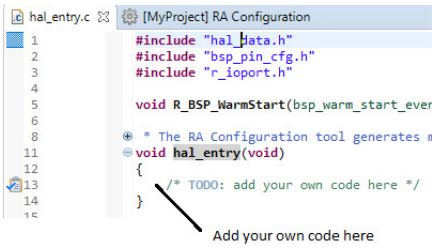


Figure 52: Adding user code to hal_entry.c

6. Build the project without errors by clicking on **Project > Build Project**.

The following tutorial shows how execute the steps above and add application code: Tutorial: Using HAL Drivers - Programming the WDT.

The WDT example is a HAL level application which does not use an RTOS. The user guides for each module also include basic application code that you can add to hal_entry.c.

### 3.2.8.4 RTOS Applications

To write RTOS-aware application code using RTOS, follow these steps:

1. Add a thread using the **Stacks** tab.
2. Provide a unique name for the thread in the **Properties** view for this thread.

3. Configure all drivers and resources for this thread and resolve all dependencies flagged by e² studio such as missing interrupts or drivers.
4. Configure the thread objects.
5. Provide unique names for each thread object in the **Properties** view for each object.
6. Add more threads if needed and repeat steps 1 to 5.
7. In the **RA Project Editor**, click the **Generate Project Content** button.

8. In the **Project Explorer** view, double-click on the src/my_thread_1_entry.c file to edit the source file.

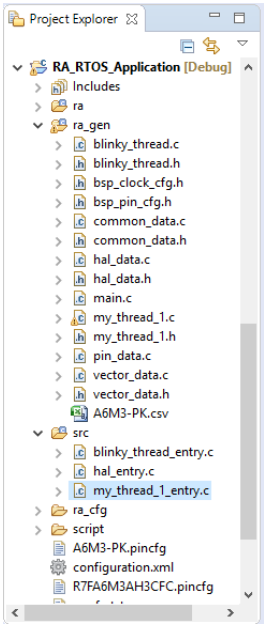

Figure 53: Generated files for an RTOS application

*Note*

*All configuration structures necessary for the driver to be called in the application are initialized in ra_gen/my_thread_1.c and my_thread_2.c*

Warning

Do not modify the files in the directory ra_gen. These files are overwritten every time you push the **Generate Project Content** button.

9. Add your application code here:

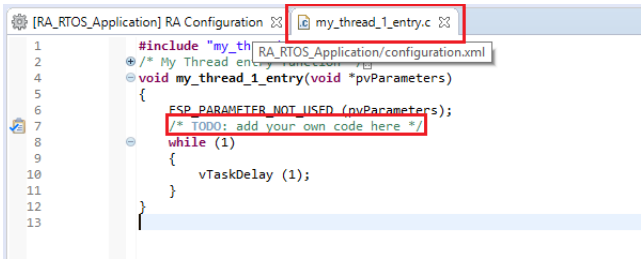

Figure 54: Adding user code to my_thread_1.entry

10. Repeat steps 1 to 9 for the next thread.

11. Build your project without errors by clicking on **Project > Build Project**.

### 3.2.8.5 Additional Resources for Application Development

#### Example Projects

A wide variety of Example Projects for FSP and RA MCUs is available on the GitHub site here: https://github.com/renesas/ra-fsp-examples. Example projects are organized by target kit so it is easy to find all the examples for your kit of choice.

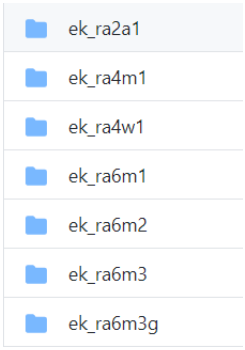

Figure 55: FSP Example Projects Organized by Kit

Projects are available as both downloadable zip files and as project source files. Typically, there is a project for each module. New example projects are being added periodically, so check back if a particular module isn't yet available.

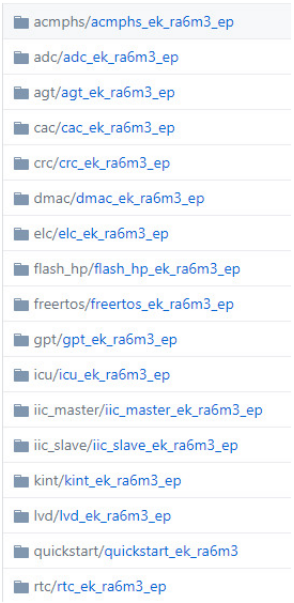

Figure 56: A Selection of Example Projects Available on GitHub

#### Quick Labs

A variety of Hands-on Do It Yourself labs are available on the Renesas RA and FSP Knowledge Base. Quick FSP Labs target the EK-RA6M3 kit and typically require only 15 minutes to complete. Each lab covers a couple related development tools and techniques like Autocomplete, Developer Assistance,

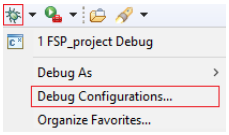
console I/O over RTT, and Visual Expressions, that can speed up the development process. A list of all available Quick Labs can be found here: https://en-support.renesas.com/knowledgeBase/19450948

## 3.2.9 Debugging the Project

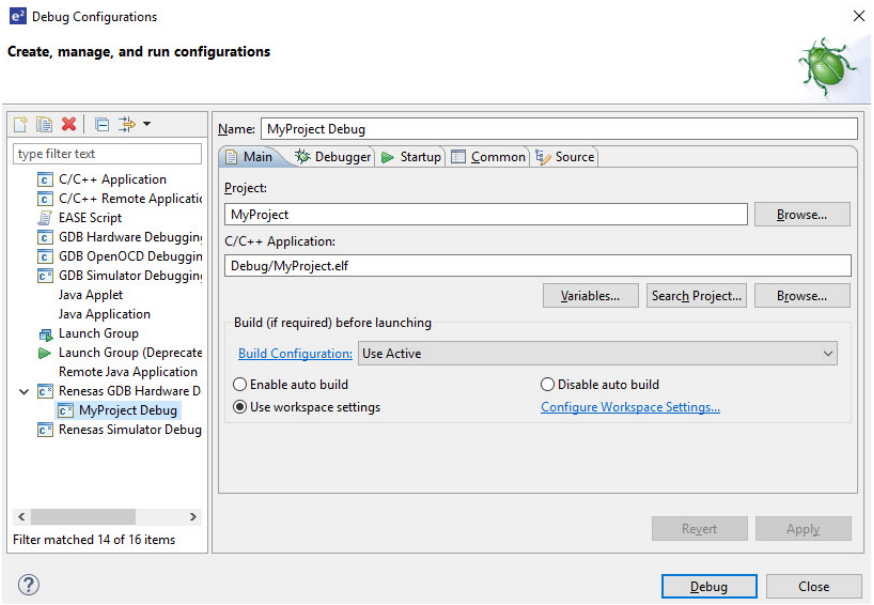
Once your project builds without errors, you can use the Debugger to download your application to the board and execute it.

To debug an application follow these steps:

1. On the drop-down list next to the debug icon, select **Debug Configurations**.



2. In the **Debug Configurations** view, click on your project listed as **MyProject Debug**.



3. Connect the board to your PC via either a standalone Segger J-Link debugger, a Segger J-Link On-Board (included on all RA EKs), or an E2 or E2 Lite and click **Debug**.

*Note*

*For details on using J-Link and connecting the board to the PC, see the Quick Start Guide included in the RA MCU Kit.*

## 3.2.10 Modifying Toolchain Settings

There are instances where it may be necessary to make changes to the toolchain being used (for example, to change optimization level of the compiler or add a library to the linker). Such modifications can be made from within e² studio through the menu **Project > Properties > C/C++ Build > Settings** when the project is selected. The following screenshots show the settings dialogs for the GNU Arm and LLVM toolchains. The dialog looks slightly different depending upon the toolchain being used.

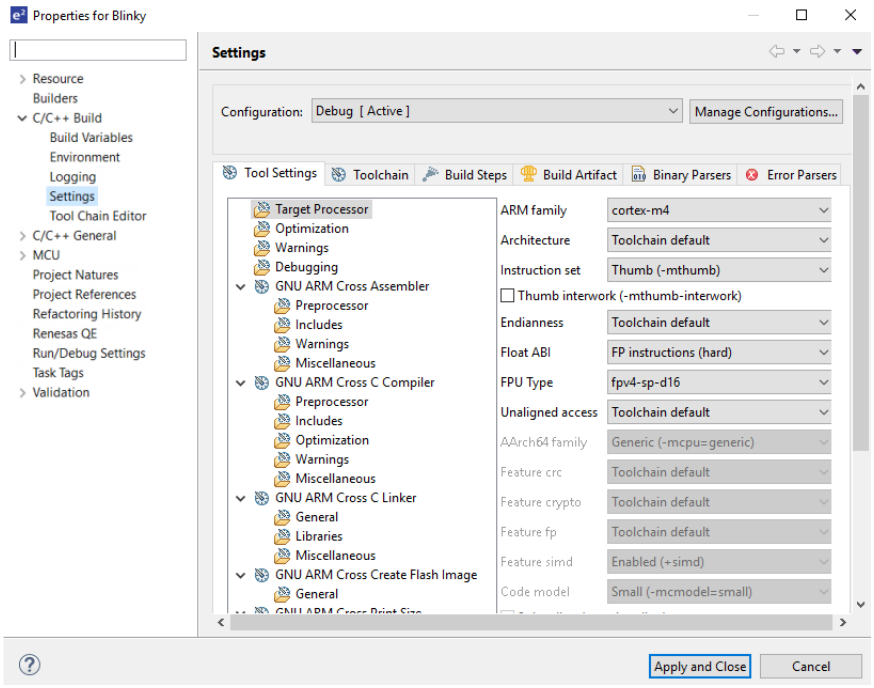


Figure 57: e² studio Project toolchain settings for GNU Arm

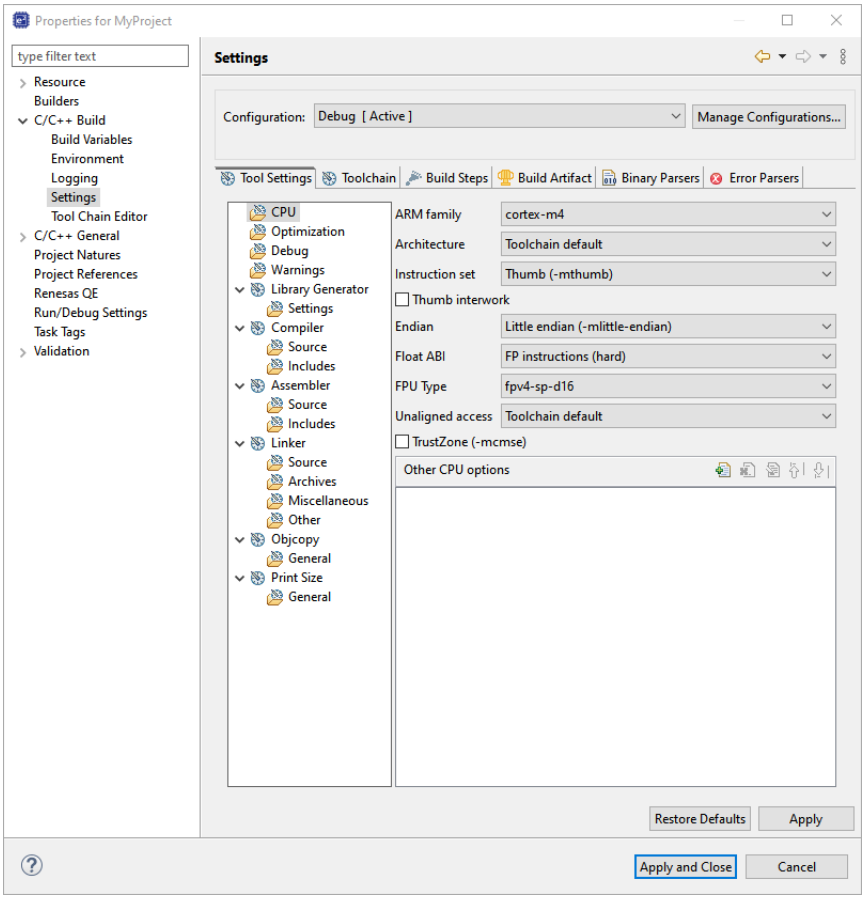

Figure 58: e² studio Project toolchain settings for LLVM

The scope for the settings is project scope which means that the settings are valid only for the project being modified.

The settings for the linker which control the location of the various memory sections are contained in a script file specific for the device being used. This script file is included in the project when it is created and is found in the script folder (for example, /script/a6m3.ld).

## 3.2.11 Creating RA project with Arm Compiler 6 in e² studio

e² studio does not include the Arm Compiler 6 (AC6) toolchain by default. Follow the steps below to integrate AC6 into e² studio and create an AC6 RA project.

*Note*

*It is assumed that the user is already familiar with RA project creation in e² studio. e² studio does not include Arm Compiler 6 (AC6) toolchain by default.*

Steps 1 through 8 describe the process for integrating Arm Compiler 6 into e² studio.

1. Download, install, and configure license for the AC6 toolchain (https://developer.arm.com/tools-and-software/embedded/arm-compiler/downloads/version-6).
2. Launch e² studio.
3. Go to **Window > Preferences > Toolchains**.

4. Click **Add**.

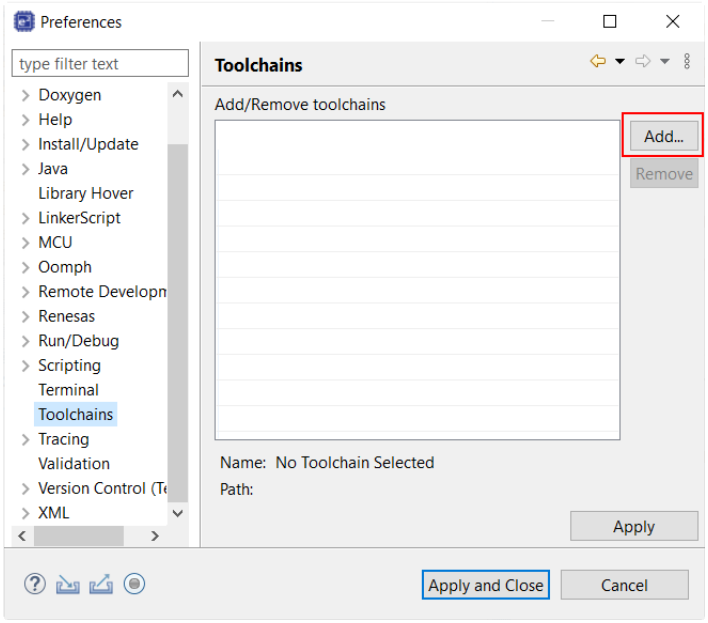

Figure 59: Add Toolchain

5. Browse to the path where AC6 toolchain is installed and select the \bin folder. Click **Next**.

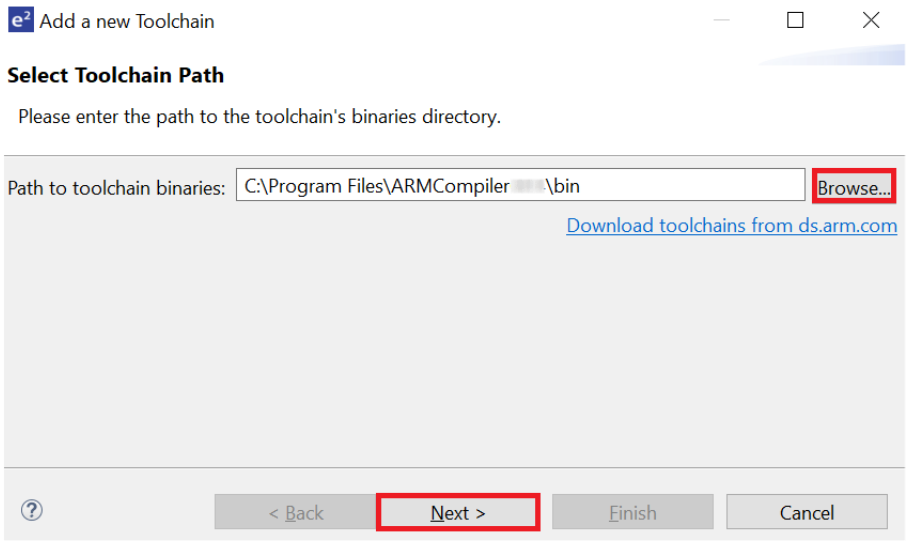

Figure 60: Browse to AC6 Compiler

6. Toolchain information in displayed. Click **Finish**.

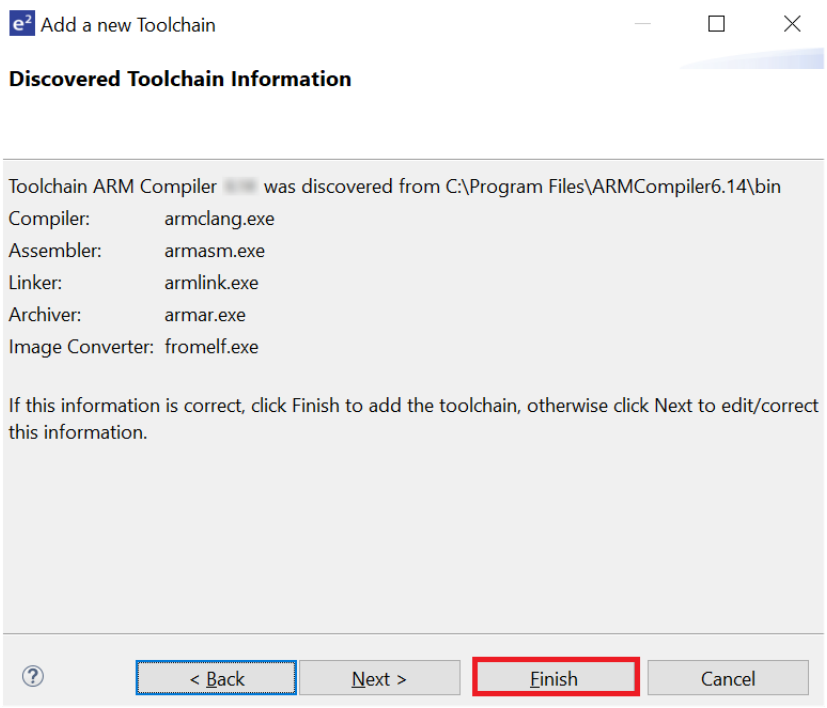

Figure 61: Toolchain Information

7. Click **Apply and Close**.

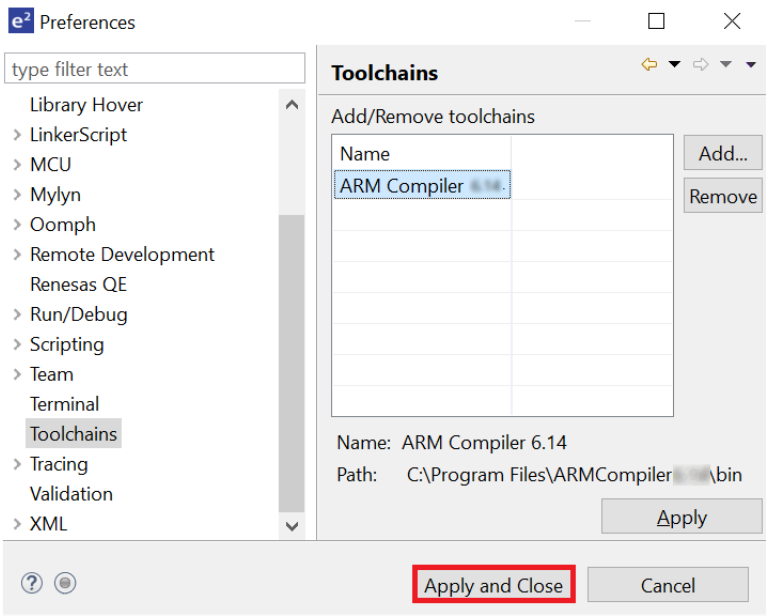

Figure 62: Apply and Close

8. Click **Restart Eclipse** when prompted.

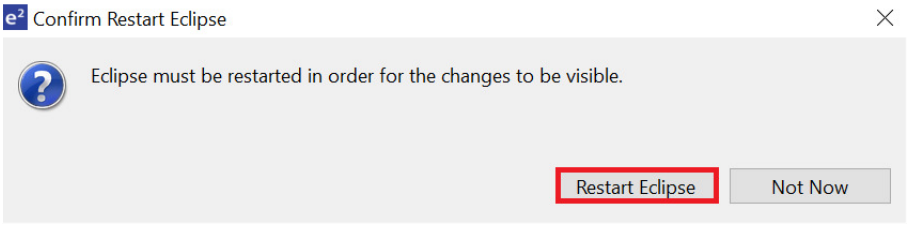

Figure 63: Restart Eclipse

9. When creating a new RA C/C++ project, select **ARM Compiler 6** included in the Toolchains section.

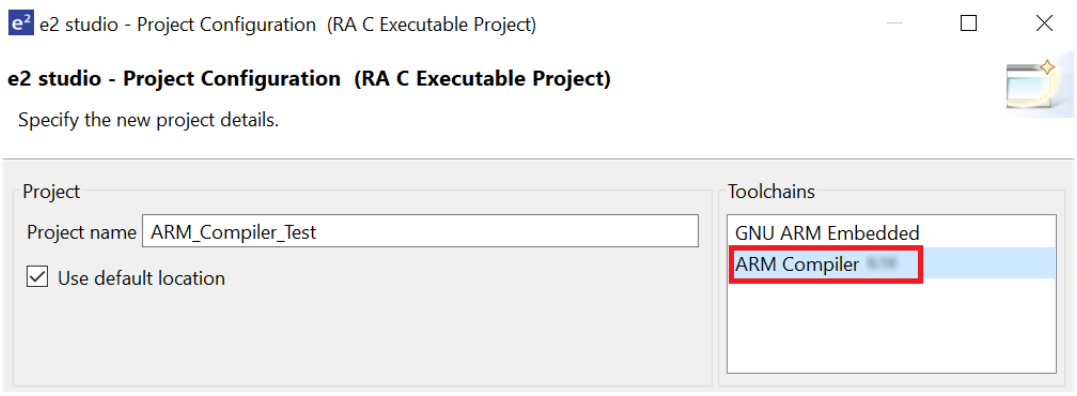

Figure 64: Select Arm Compiler

## 3.2.12 Importing an Existing Project into e² studio

1. Start by opening e² studio.
2. Open an existing Workspace to import the project and skip to step d. If the workspace doesn't exist, proceed with the following steps:

    a. At the end of e² studio startup, you will see the Workspace Launcher Dialog box as shown in the following figure.

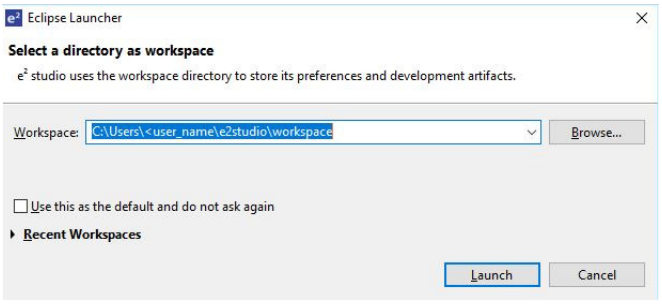

Figure 65: Workspace Launcher dialog

b. Enter a new workspace name in the Workspace Launcher Dialog as shown in the following figure. e² studio creates a new workspace with this name.

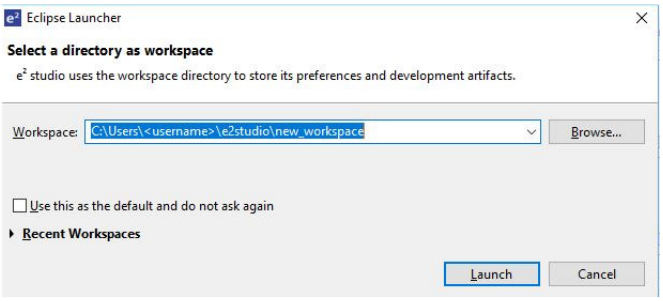

Figure 66: Workspace Launcher dialog - Select Workspace

c. Click **Launch**.

d. When the workspace is opened, you may see the Welcome Window. Click on the **Hide** arrow button to proceed past the Welcome Screen as seen in the following figure.

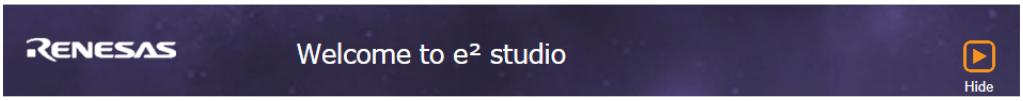

Figure 67: Workbench arrow button

3. You are now in the workspace that you want to import the project into. Click the **File** menu in the menu bar, as shown in the following figure.

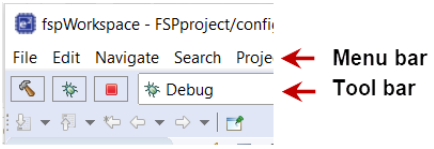

Figure 68: Menu and tool bar

4. Click **Import** on the **File** menu or in the menu bar, as shown in the following figure.

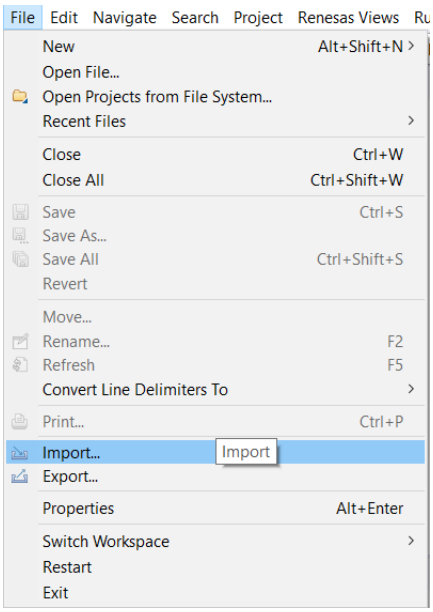

Figure 69: File drop-down menu

5. In the **Import** dialog box, as shown in the following figure, choose the **General** option, then **Existing Projects into Workspace**, to import the project into the current workspace.

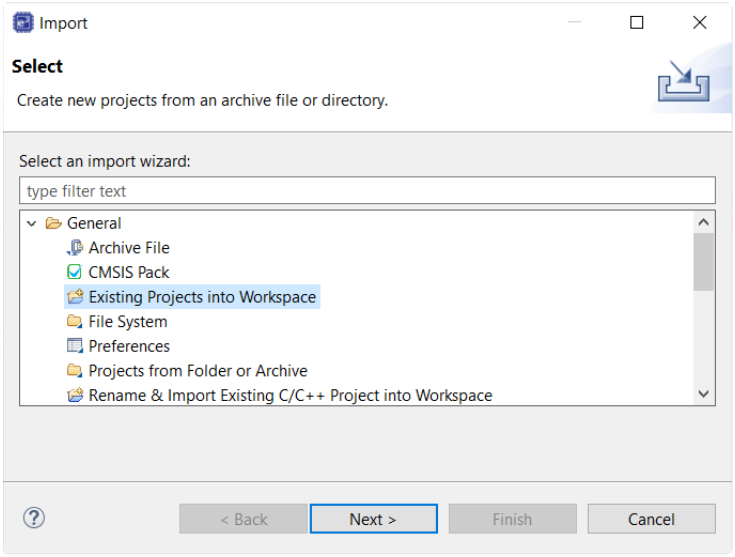

Figure 70: Project Import dialog with "Existing Projects into Workspace" option selected

6. Click **Next**.
7. To import the project, use either **Select archive file** or **Select root directory**.

    a. Click **Select archive file** as shown in the following figure.

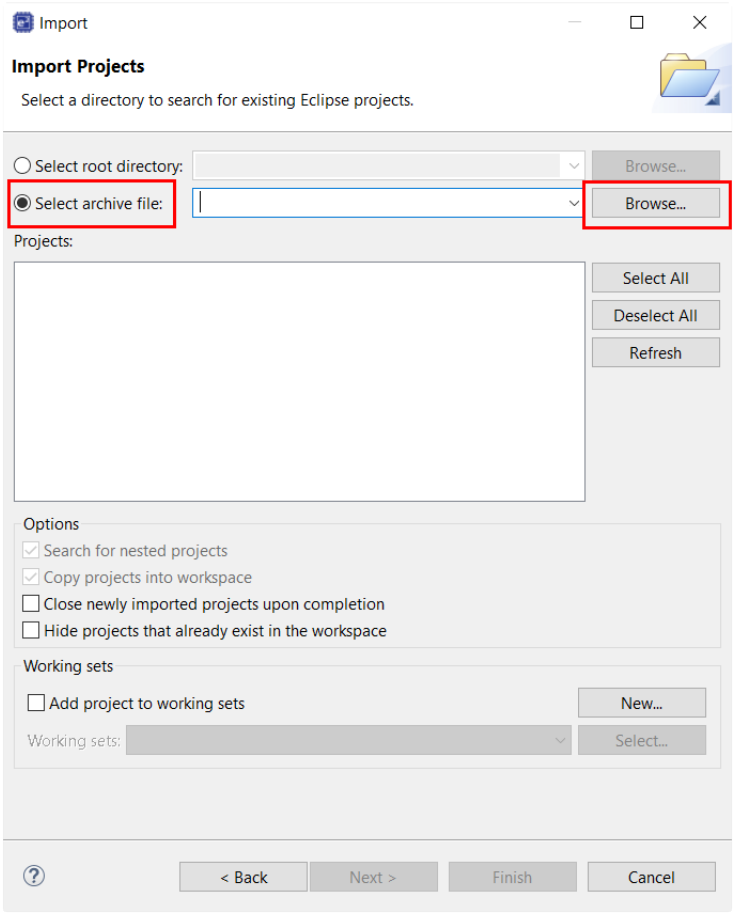

Figure 71: Import Existing Project dialog 1 - Select archive file

b. Click **Select root directory** as shown in the following figure.

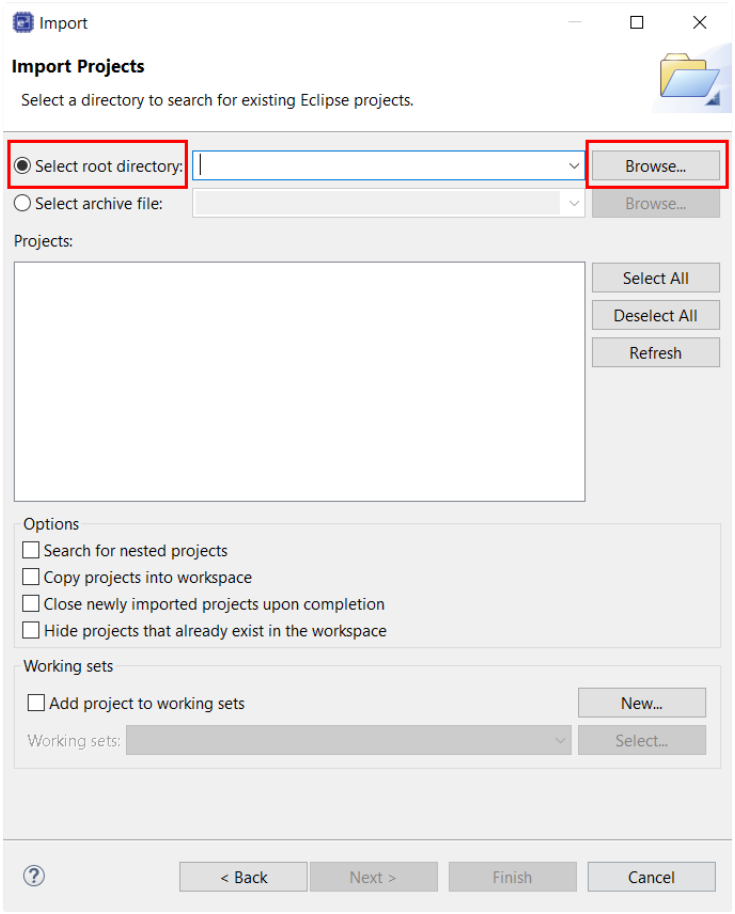

Figure 72: Import Existing Project dialog 1 - Select root directory

8. Click **Browse**.
9. For **Select archive file**, browse to the folder where the zip file for the project you want to import is located. For **Select root directory**, browse to the project folder that you want to import.
10. Select the file for import. In our example, it is CAN_HAL_MG_AP.zip or CAN_HAL_MG_AP.
11. Click **Open**.

12. Select the project to import from the list of **Projects**, as shown in the following figure.

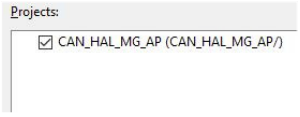

Figure 73: Import Existing Project dialog 2

13. Click **Finish** to import the project.

## 3.2.13 Using Semihosting in a Project

*Note*

***printf requires use of the heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes))***

When using certain standard C I/O functions such as printf and scanf semihosting must be initialized

for them to work correctly with the **Renesas Debug Virtual Console**. In order to setup semihosting a call to initialise_monitor_handles should be added somewhere in your application before any semihosting related calls are made. Here is an example declaration and call:

```
extern void initialise_monitor_handles(void); /* Add this declaration before calling.
*/

initialise_monitor_handles(); /* Add this call to your application. */
```

# 3.3 Tutorial: Your First RA MCU Project - Blinky

## 3.3.1 Tutorial Blinky

The goal of this tutorial is to quickly get acquainted with the Flexible Platform by moving through the steps of creating a simple application using e² studio and running that application on an RA MCU board.

## 3.3.2 What Does Blinky Do?

The application used in this tutorial is Blinky, traditionally the first program run in a new embedded development environment.

Blinky is the "Hello World" of microcontrollers. If the LED blinks you know that:

- The toolchain is setup correctly and builds a working executable image for your chip.
- The debugger has installed with working drivers and is properly connected to the board.
- The board is powered up and its jumper and switch settings are probably correct.
- The microcontroller is alive, the clocks are running, and the memory is initialized.

The Blinky example application used in this tutorial is designed to run the same way on all boards offered by Renesas that hold the RA microcontroller. The code in Blinky is completely board independent. It does the work by calling into the BSP (board support package) for the particular board it is running on. This works because:

- Every board has at least one LED connected to a GPIO pin.
- That one LED is always labelled LED1 on the silk screen.
- Every BSP supports an API that returns a list of LEDs on a board, and their port and pin assignments.

## 3.3.3 Prerequisites

To follow this tutorial, you need:

- Windows based PC
- e² studio
- Flexible Software Package
- An RA MCU board kit

## 3.3.4 Create a New Project for Blinky

The creation and configuration of an RA MCU project is the first step in the creation of an application.

The base RA MCU pack includes a pre-written Blinky example application that is simple and works on all Renesas RA MCU boards.

Follow these steps to create an RA MCU project:

1. In e² studio, click **File > New > C/C++ Project > Renesas RA** and select **Renesas RA C/C++ Project**.
2. Assign a name to this new project. Blinky is a good name to use for this tutorial.

3. Click **Next**. The **Project Configuration** window shows your selection.

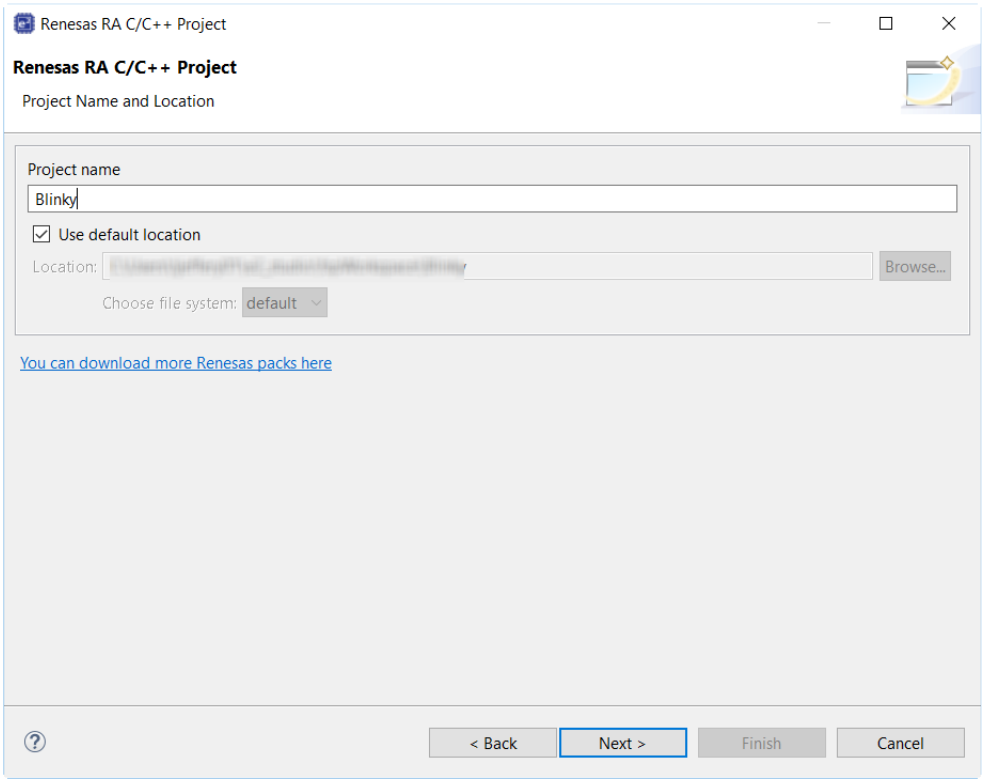

Figure 74: e² studio Project Configuration window (part 1)

4. Select the board support package by selecting the name of your board from the **Device Selection** drop-down list and click **Next**.

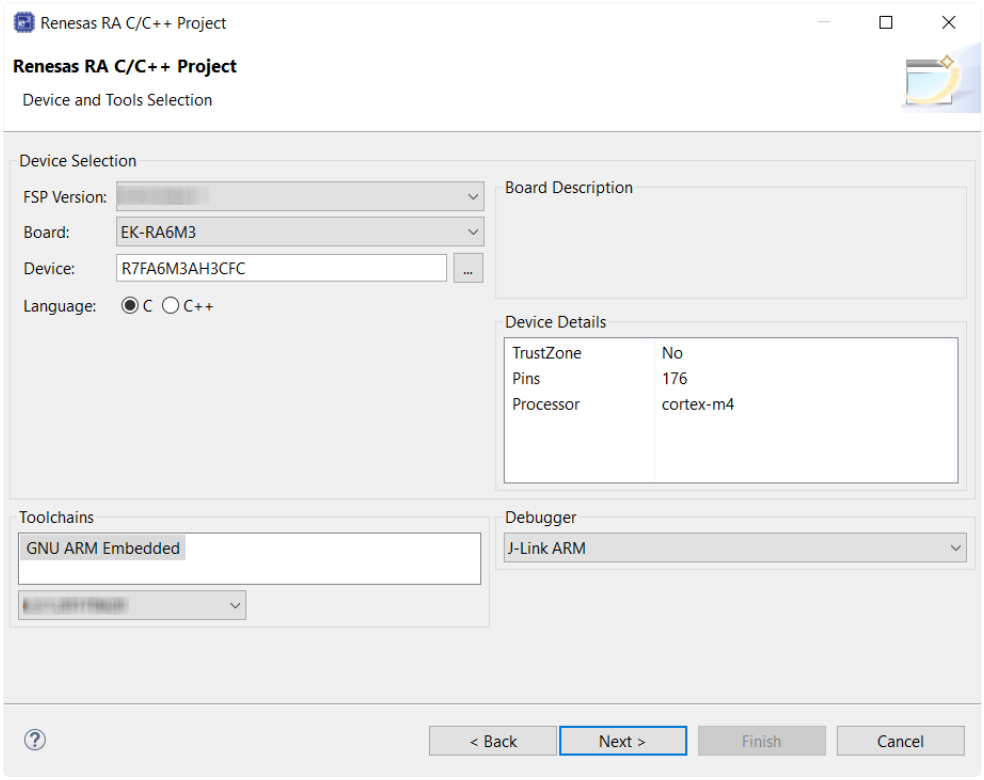

Figure 75: e² studio Project Configuration window (part 2)

5. Select the build artifact and RTOS.

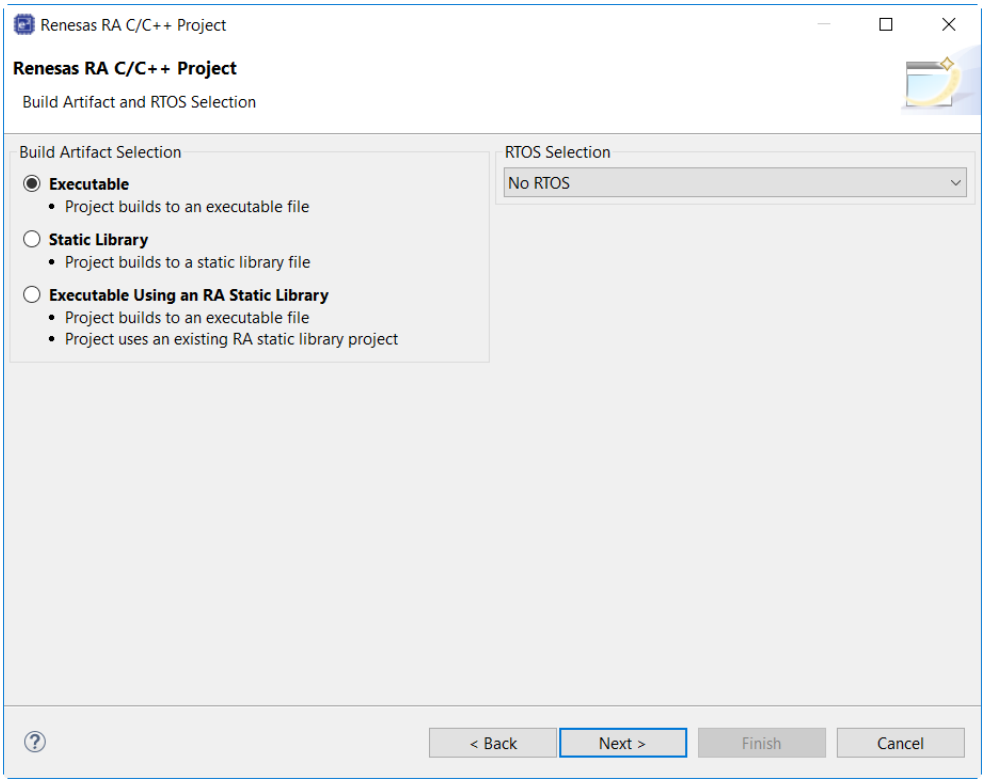

Figure 76: e² studio Project Configuration window (part 3)

6. Select the Blinky template for your board and click **Finish**.

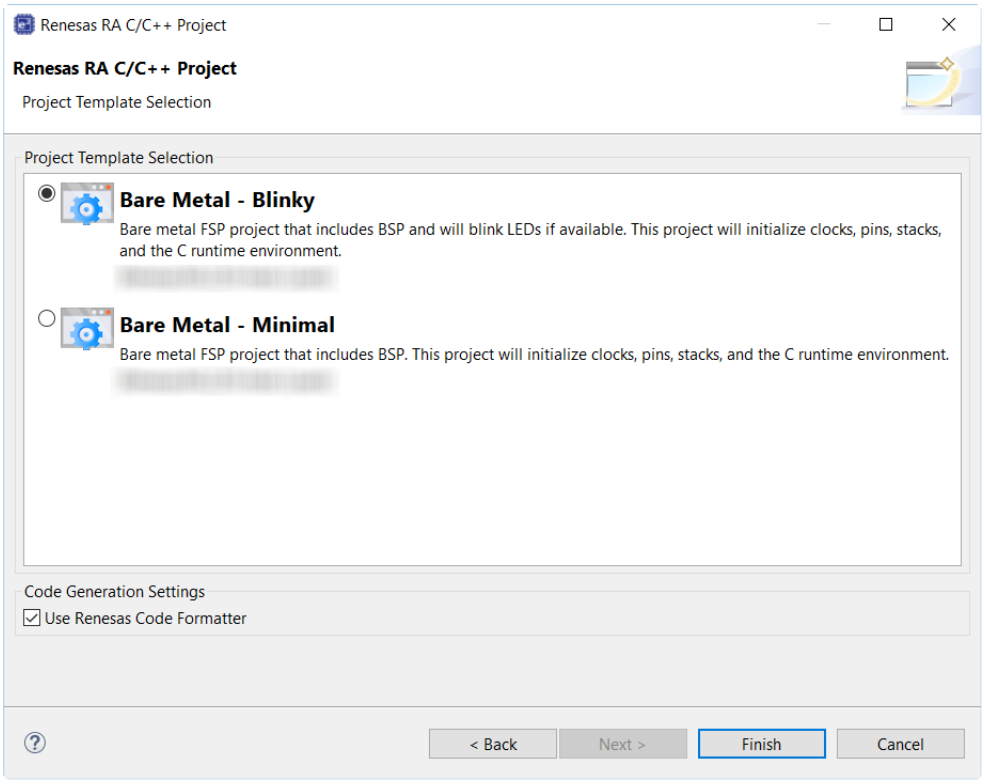

Figure 77: e² studio Project Configuration window (part 4)

Once the project has been created, the name of the project will show up in the **Project Explorer** window of e² studio. Now click the **Generate Project Content** button in the top right corner of the **Project Configuration** window to generate your board specific files.

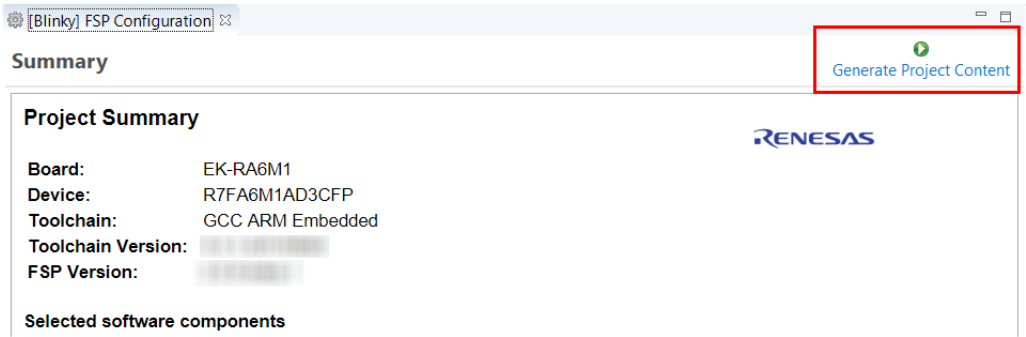

Figure 78: e² studio Project Configuration tab

Your new project is now created, configured, and ready to build.

### 3.3.4.1 Details about the Blinky Configuration

The **Generate Project Content** button creates configuration header files, copies source files from templates, and generally configures the project based on the state of the **Project Configuration** screen.

For example, if you check a box next to a module in the **Components** tab and click the **Generate Project Content** button, all the files necessary for the inclusion of that module into the project will be copied or created. If that same check box is then unchecked those files will be deleted.

#### 3.3.4.2 Configuring the Blinky Clocks

By selecting the Blinky template, the clocks are configured by e² studio for the Blinky application. The clock configuration tab (see Configuring Clocks) shows the Blinky clock configuration. The Blinky clock configuration is stored in the BSP clock configuration file (see BSP Clock Configuration).

#### 3.3.4.3 Configuring the Blinky Pins

By selecting the Blinky template, the GPIO pins used to toggle the LED1 are configured by e² studio for the Blinky application. The pin configuration tab shows the pin configuration for the Blinky application (see Configuring Pins). The Blinky pin configuration is stored in the BSP configuration file (see BSP Pin Configuration).

#### 3.3.4.4 Configuring the Parameters for Blinky Components

The Blinky project automatically selects the following HAL components in the Components tab:

- r_ioport

To see the configuration parameters for any of the components, check the **Properties** tab in the HAL window for the respective driver (see Adding and Configuring HAL Drivers).

#### 3.3.4.5 Where is main()?

The main function is located in < project >/ra_gen/main.c. It is one of the files that are generated during the project creation stage and only contains a call to hal_entry(). For more information on generated files, see Adding and Configuring HAL Drivers.

#### 3.3.4.6 Blinky Example Code

The blinky application is stored in the hal_entry.c file. This file is generated by e² studio when you select the Blinky Project template and is located in the project's src/ folder.

The application performs the following steps:

1. Get the LED information for the selected board by bsp_leds_t structure.
2. Define the output level HIGH for the GPIO pins controlling the LEDs for the selected board.
3. Get the selected system clock speed and scale down the clock, so the LED toggling can be observed.
4. Toggle the LED by writing to the GPIO pin with R_BSP_PinWrite((bsp_io_port_pin_t) pin, pin_level);

### 3.3.5 Build the Blinky Project

Highlight the new project in the **Project Explorer** window by clicking on it and build it.

There are three ways to build a project:

1. Click on **Project** in the menu bar and select **Build Project**.
2. Click on the hammer icon.
3. Right-click on the project and select **Build Project**.

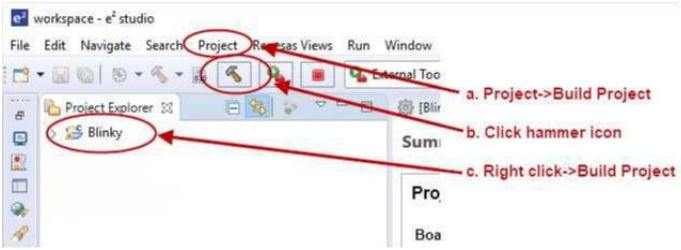

Figure 79: e² studio Project Explorer window

Once the build is complete a message is displayed in the build **Console** window that displays the final image file name and section sizes in that image.

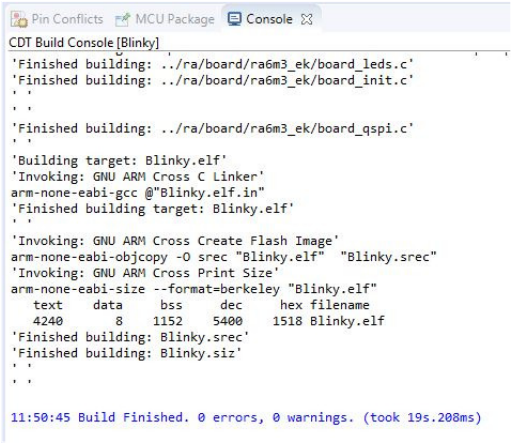

Figure 80: e² studio Project Build console

## 3.3.6 Debug the Blinky Project

### 3.3.6.1 Debug prerequisites

To debug the project on a board, you need

- The board to be connected to e² studio
- The debugger to be configured to talk to the board
- The application to be programmed to the microcontroller

Applications run from the internal flash of your microcontroller. To run or debug the application, the application must first be programmed to the microcontroller's flash. There are two ways to do this:

- JTAG debugger
- Built-in boot-loader via UART or USB

Some boards have an on-board JTAG debugger and others require an external JTAG debugger connected to a header on the board.

Refer to your board's user manual to learn how to connect the JTAG debugger to e² studio.

### 3.3.6.2 Debug steps

To debug the Blinky application, follow these steps:

1. Configure the debugger for your project by clicking **Run > Debugger Configurations ...**

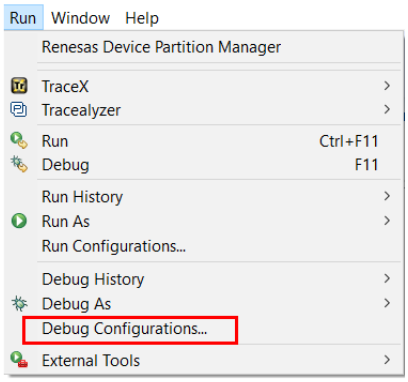

Figure 81: e² studio Debug icon

or by selecting the drop-down menu next to the bug icon and selecting **Debugger Configurations ...**

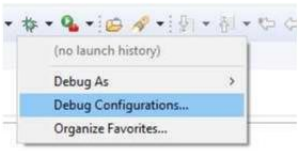

Figure 82: e² studio Debugger Configurations selection option

2. Select your debugger configuration in the window. If it is not visible then it must be created by clicking the **New** icon in the top left corner of the window. Once selected, the **Debug Configuration** window displays the Debug configuration for your Blinky project.

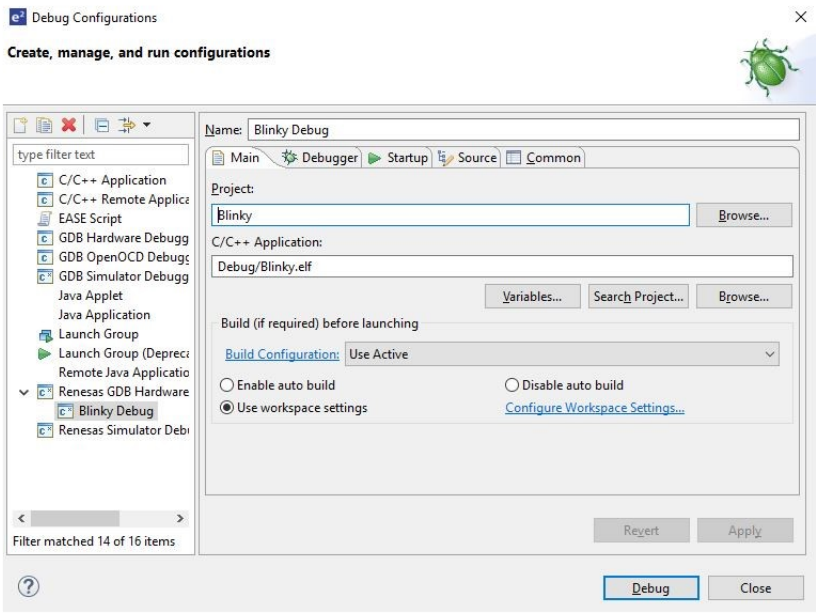

Figure 83: e² studio Debugger Configurations window with Blinky project

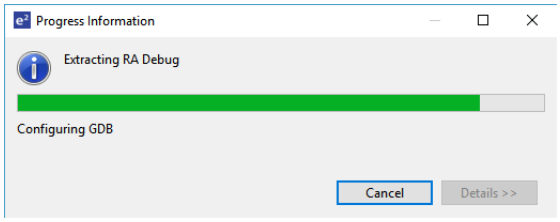
3. Click **Debug** to begin debugging the application.

4. Extracting RA Debug.



### 3.3.6.3 Details about the Debug Process

In debug mode, e² studio executes the following tasks:

1. Downloading the application image to the microcontroller and programming the image to the internal flash memory.
2. Setting a breakpoint at main().
3. Setting the stack pointer register to the stack.
4. Loading the program counter register with the address of the reset vector.
5. Displaying the startup code where the program counter points to.

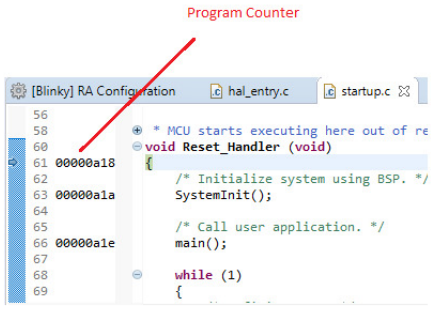


Figure 84: e² studio Debugger memory window

### 3.3.7 Run the Blinky Project

While in Debug mode, click **Run > Resume** or click on the **Play** icon twice.

Figure 85: e² studio Debugger Play icon

The LEDs on the board marked LED1, LED2, and LED3 should now be blinking.

## 3.4 Tutorial: Your First RA Multicore Application - Blinky

### 3.4.1 Introduction

This section provides information on how to create and debug multicore projects using e² studio and FSP. It is recommended that users read the section Tutorial: Your First RA MCU Project - Blinky before this one. The multicore application created will consist of a single project for each core of an RA8P1. Multicore support was added to FSP in v6.0.0 and the features available will be expanding in future releases. This section will be updated as needed.

**Note:** This section assumes the user already has a working knowledge of normal (non-multicore) usage of RA FSP and e² studio.

### 3.4.2 Generate Multicore Project Pair

e² studio now offers a mechanism to generate a multicore project pair using a single run through the project wizard. This is accessed via the "Renesas RA FSP Solution" option (rather than using the traditional C/C++ Project option):

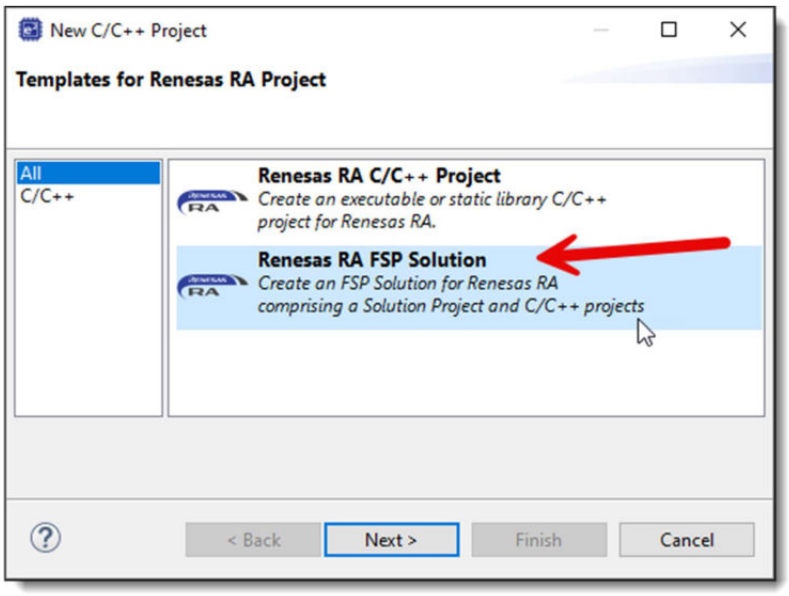

Figure 86: Project Generator - RA FSP Solution

When this option is selected, a similar set of dialog pages to the standard wizard will then be displayed, but currently reduced in number and with fewer options available.

Enter a name that will be used for the Solution project and the prefix for individual core projects. For example, if you choose a project name of "my_application" for an RA MCU with 2 cores, then there will be 3 resulting projects: "my_application" (Solution), "my_application_CPU0", and "my_application_CPU1".

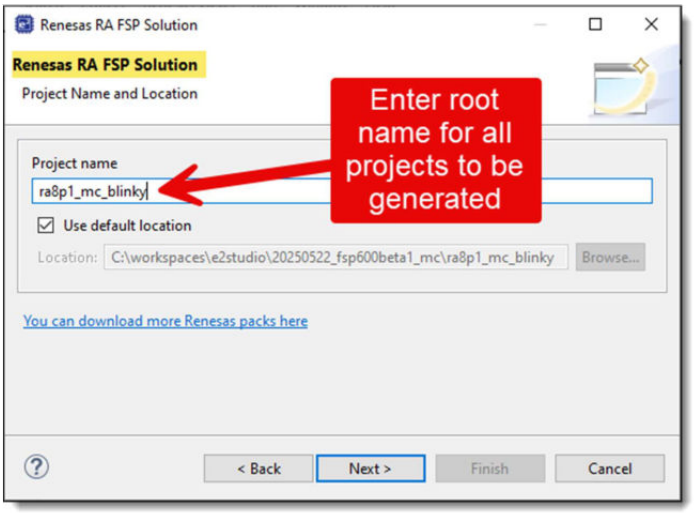

Figure 87: Project Generator - Enter Root Name

Choose the board you are using and confirm the toolchain you wish to use.

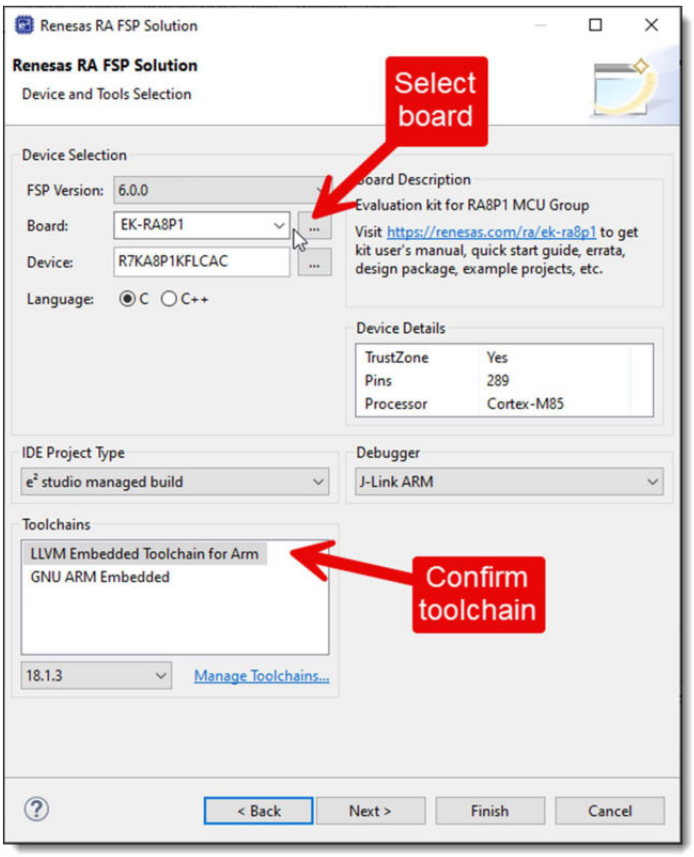

Figure 88: Project Generator - Configure Setup

Choose the "Bare Metal - Blinky" project template. This template will be used for creating the projects for all cores.

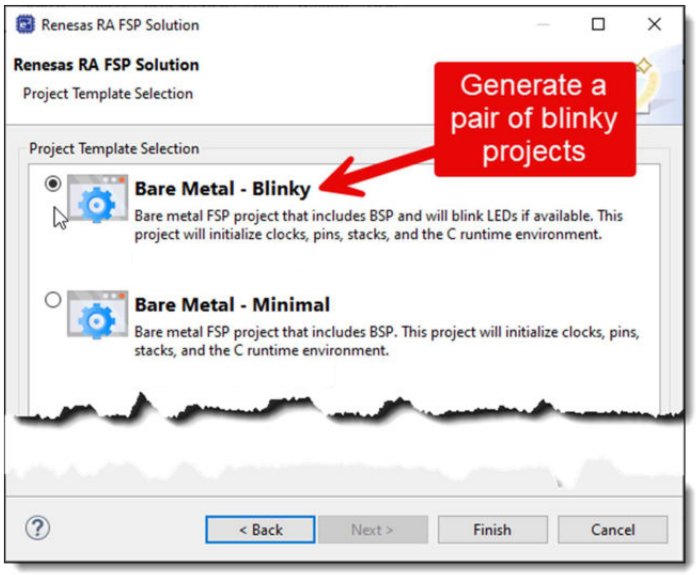

Figure 89: Project Generator - Choose Template

After clicking on the Finish button in the wizard, a set of projects will be generated with appropriate

linkage between them. Two of the projects are "normal" projects independent to each core which, when combined, will generate the overall multicore application that will be downloaded to the target MCU. The third project is the "container" Solution project which contains and controls configuration of the overall MCU and the CPU projects.

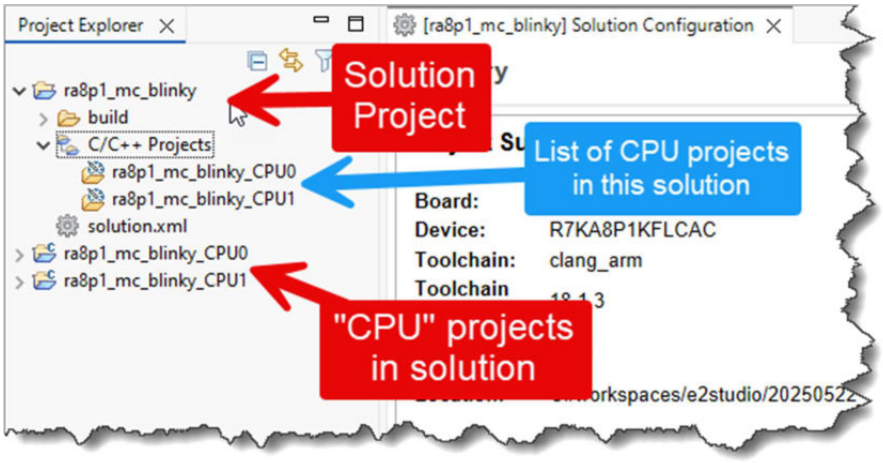

Figure 90: FSP Solution - Project Overview

*Note*

*After project creation, in order to carry out the population of some of the configuration data stored in the central solution project an initial build of both of the created CPU projects will be automatically performed.*

### 3.4.3 Information On Multicore Related Changes To hal_entry.c

Starting in FSP 6.0.0, the hal_entry.c file generated as part of the Blinky project template has been updated to support multicore projects. First, a call to the FSP inline function R_BSP_SecondaryCoreStart() (that starts execution of CPU1 by releasing it from reset) has been added to hal_entry() in the case that this file is being built for the primary core in a set of multicore projects.

Figure 91: Multicore Blinky - Starting secondary core

Second, the LED flashing code in hal_entry() has been changed so that it only blinks one of the LEDs for a multicore project (rather than all LEDs on the board).

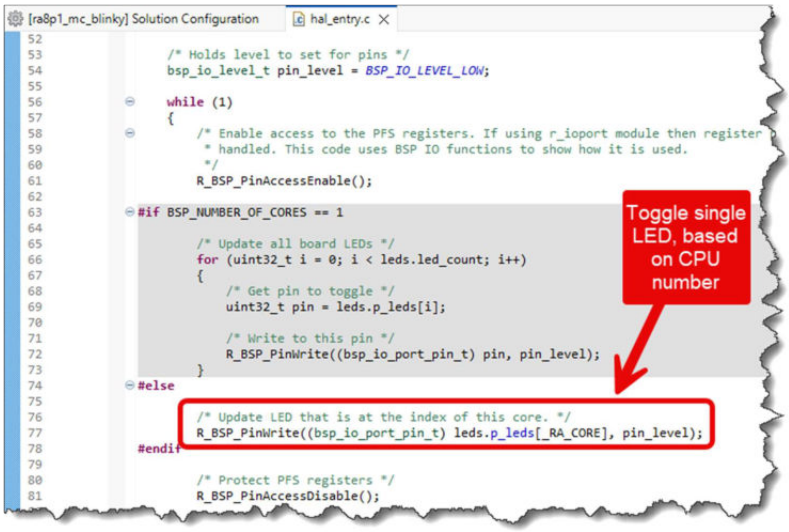

Figure 92: Multicore Blinky - Updated Code

This means that for a multicore application the primary core (CPU0) will blink the first LED on the board and the secondary core (CPU1) will blink the second LED. This allows the user to easily tell which core or cores are currently active.

## 3.4.4 Build Projects

When a FSP Solution application is used, builds should always be triggered from the Solution project. The reason is that the Solution project stores information that is applicable to all downstream projects. Building from the Solution ensures that all the latest settings are propagated to each downstream project.

*Note*

*To trigger a Solution build right-click on the Solution project and choose Build Project. In e² studio 2025-04.1 building Solutions by clicking the hammer icon is not available.*

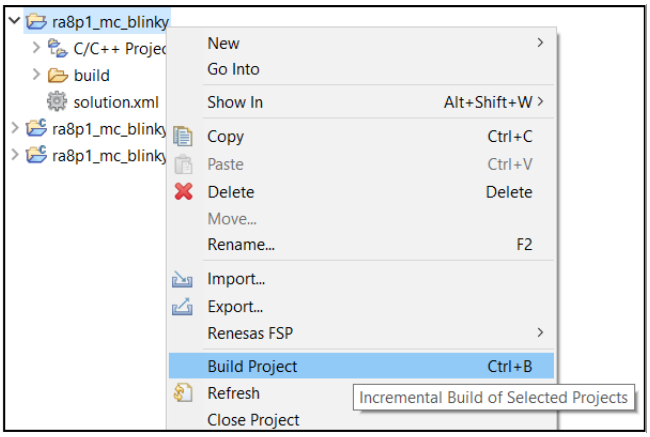

Figure 93: Solution Build

## 3.4.5 Information On Multicore Related Changes To Launch Configs

Although it is possible to start a debug session for CPU0 then manually start a second debug session for CPU1, it is easier to have e² studio do the two operations in one.

To enable this, the multicore solutions project wizard will create a "Launch Group" inside the CPU1 project containing the two individual launch configurations, one for each of the CPUs. This launch group is what will then be used to start a multicore debug session rather than the launch configurations themselves being used directly.

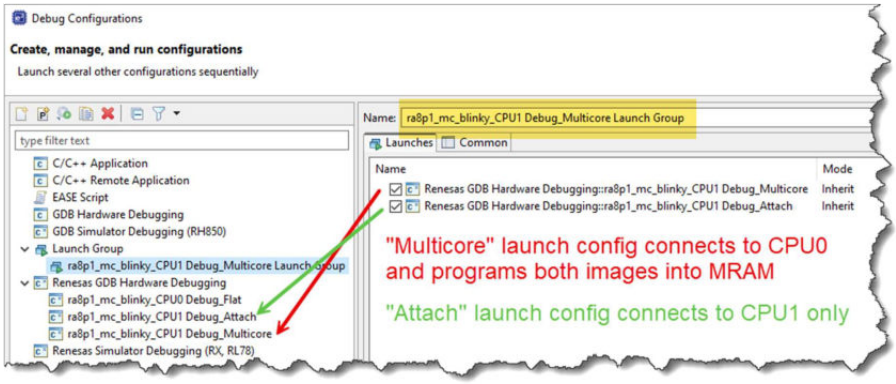

Figure 94: Multicore Debug - Launch Group

Note that the launch configuration generated inside the CPU0 project is generally not used when debugging the multicore application, as it simply connects to CPU0 and only programs the CPU0 image.

## 3.4.6 Reset TrustZone Partition Boundaries

**Important note: Currently the debug of multicore applications does not support the configuration of the TrustZone partition boundaries inside the MCU.** Therefore before carrying out debug of a multicore application for the first time, it is necessary to use either RFP or RDPM to do an initialize operation of your MCU to ensure that the whole Code ROM (Flash/MRAM) area is marked as Secure. RDPM can be accessed from within e² studio by going to Run >> Renesas Debug Tools >> Renesas Device Partition Manager **while a non-Solution project is selected**. If this is not done, the download of your images and debug startup may not work correctly. This will be improved in a future release of FSP and e² studio.

The image below shows the RDPM settings to initialize an EK-RA8P1. Note that "Initialize device" is selected and the Connection Type was changed to "SWD". It is recommended to power cycle the board after using RDPM and before debugging.

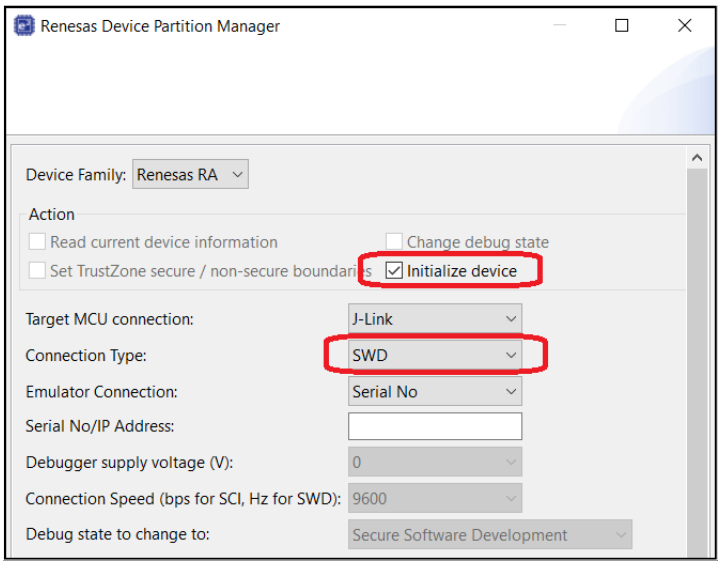

Figure 95: Multicore Debug - RDPM

### 3.4.7 Start Debugging

The first time you start debugging your multicore application, you will need to open the Debug Configurations dialog:

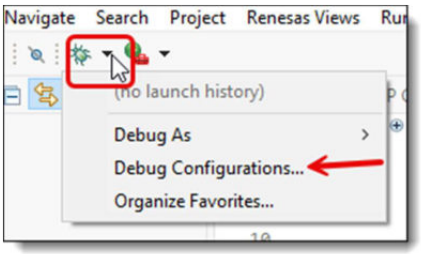

Figure 96: Multicore Debug - Debug Configuration

You will see the launch group that has been created. Select the Multicore Launch Group, then click the Debug button to start the debug session.

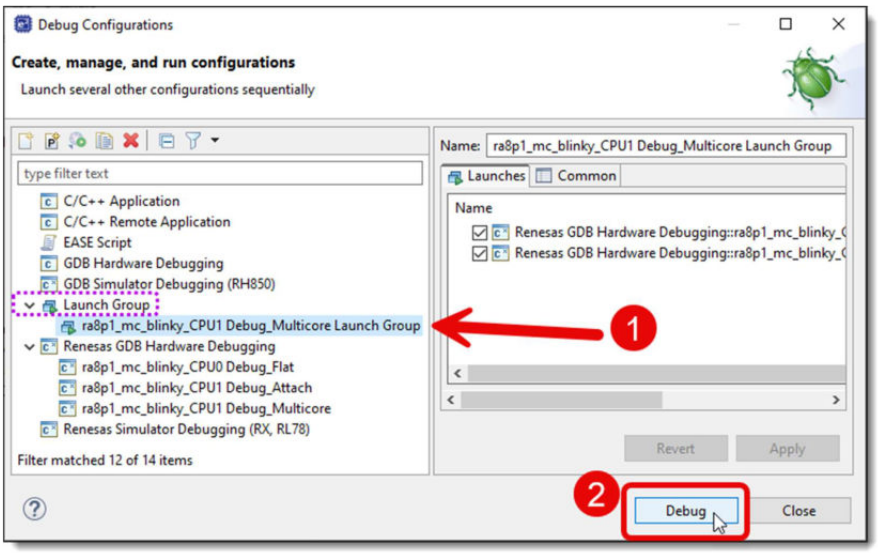

Figure 97: Multicore Debug - Start Launch Group

You should see the CPU0 project debug session start up and connect, followed by the CPU1 project. CPU1 will be shown in the Debug tree but will still be held in reset.

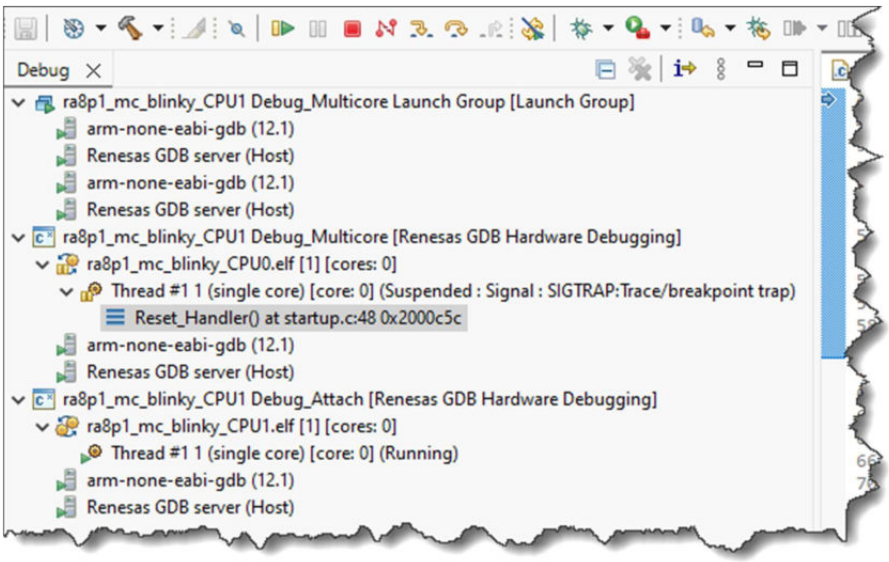

Figure 98: Multicore Debug - Reset

With the Reset_Handler() of the CPU0 elf file highlighted, if you now resume, CPU0 will start running. Once you pass main(), one of the LEDs on your board will begin to blink.

Once the call to R_BSP_SecondaryCoreStart() has been made from the CPU0 code, the CPU1 debug connection will also become fully active. At this point you can control CPU1 as you would CPU0.

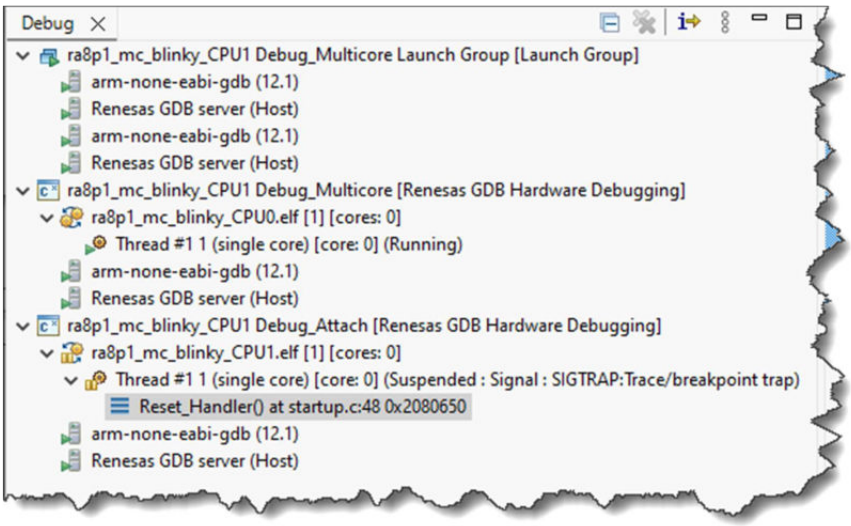

Figure 99: Multicore Debug - CPU1 Running

In the above screenshot, the Reset_Handler() of the CPU1 project is highlighted. Clicking Resume will start running code on CPU1. Once execution of main() on CPU1 has started, the 2nd LED on your board will also begin to blink.

## 3.4.8 Multicore Debugging Control

Once connected to both cores, the currently active debug connection (as highlighted in the Debug view) is the one that will be controlled by the usual debug controls (step, resume, suspend, etc).

However it is possible to have these buttons control both debug connections in parallel, by selecting both connections at once in the Debug View (using the control key to multi-select):

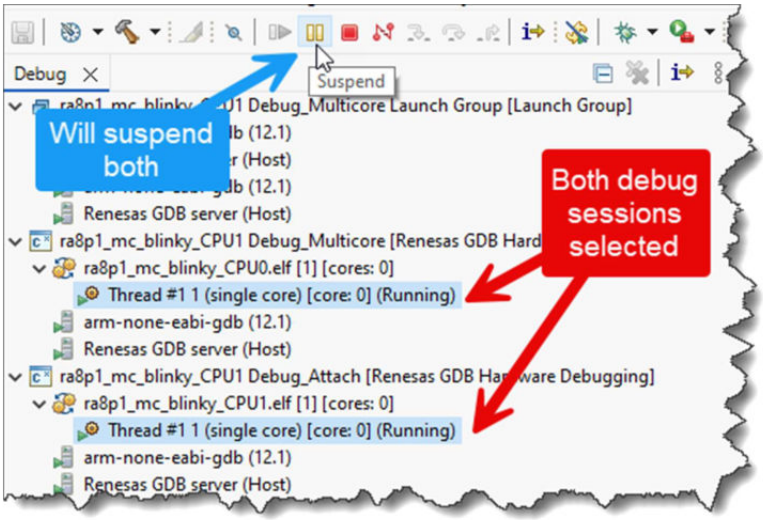

Figure 100: Multicore Debug - Suspend Both Cores

Note that the synchronization of operations here is being done at the software level within the GUI (cycling through each debug connection in turn, carrying out the requested operation). Although not

fully lockstepped at the MCU hardware level, the functionality this provides is still useful in many circumstances.

With regard to other views such as Registers, Memory, and Breakpoints, these will show the MCU state as seen by the currently selected core. However it is possible to pin each of these to a particular core, and also to clone the views so that you can have one pin to each core.

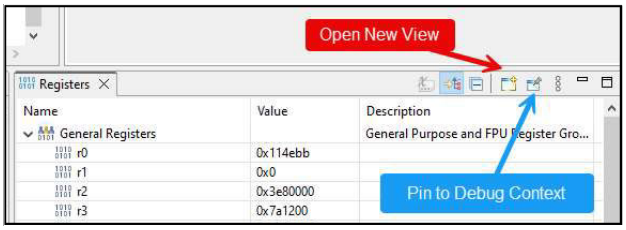

Figure 101: Multicore Debug - Pin View

## 3.4.9 Terminating a Multicore Debugging Session

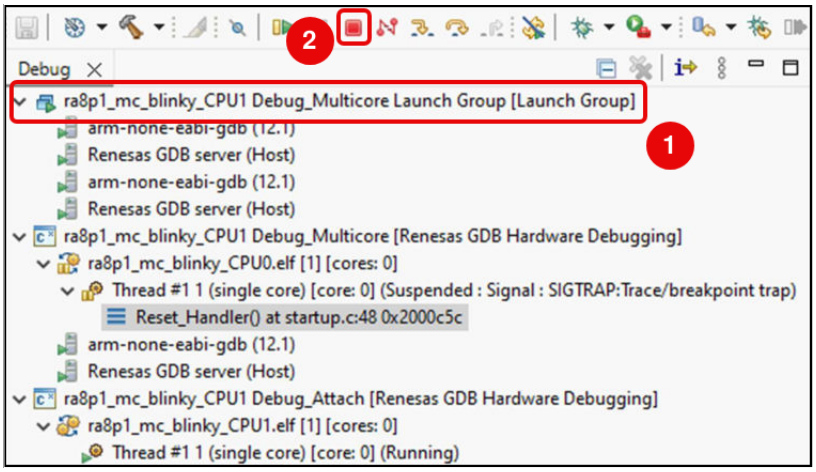

Figure 102: Multicore Debug - Terminate

## 3.4.10 Starting Future Debug Sessions

Once you have carried out your first multicore debug session, you can start further debug sessions simply using the appropriate Launch Group option which will then appear on the drop down menu:

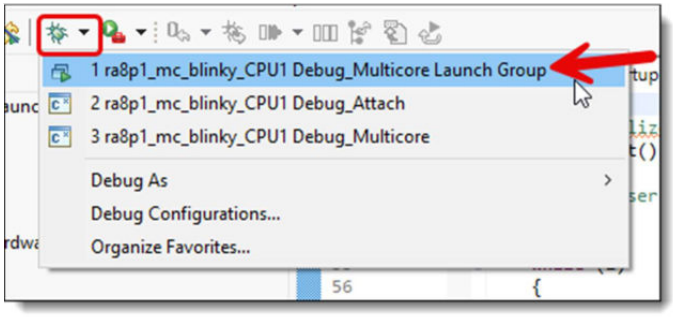

Figure 103: Multicore Debug - Starting Again

# 3.5 Tutorial: Using HAL Drivers - Programming the WDT

## 3.5.1 Application WDT

This tutorial illustrates the creation of a simple application that uses the Watchdog Timer module to monitor program operation. The tutorial shows each step in the development process and in particular identifies the auto-generated files and project structure created when using FSP and its GUI based configurator. The level of detail provided here is more than is normally needed during development but can be helpful in explaining how FSP works behind the scenes to simply your work.

This application makes use of the following FSP modules:

- MCU Board Support Package
- Watchdog (r_wdt)
- I/O Port (r_ioport)

## 3.5.2 Creating a WDT Application Using the RA MCU FSP and e² studio

### 3.5.2.1 Using FSP and e² studio

The Flexible Software Package (FSP) from Renesas provides a complete driver library for developing RA MCU applications. FSP provides Hardware Abstraction Layer (HAL) drivers, Board Support Package (BSP) drivers for the developer to use to create applications. FSP is integrated into Renesas e² studio based on eclipse providing build (editor, compiler and linker) and debug phases with an extended GNU Debug (GDB) interface.

### 3.5.2.2 The WDT Application

The flowchart for the WDT application is shown below.

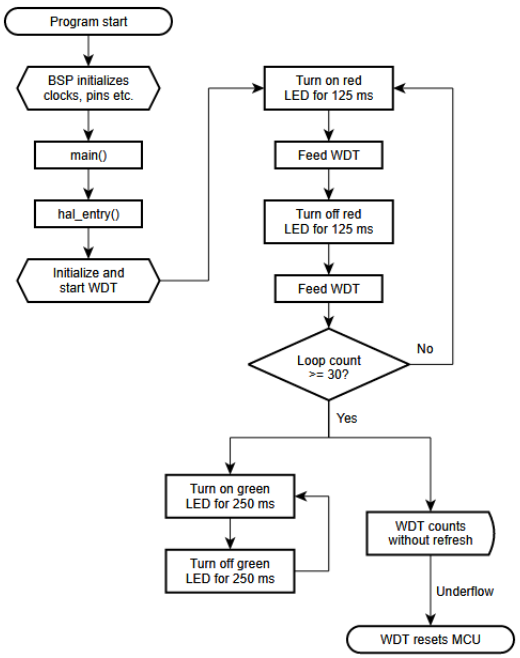

Figure 104: WDT Application flow diagram

#### 3.5.2.3 WDT Application flow

The main sections of the WDT application are:

1. The BSP initializes the clocks, pins and other elements of the MCU readying the application to run.
2. main() calls hal_entry(). The function hal_entry() is created by FSP with a placeholder for user code. The code for the WDT is added to this function.
3. Initialize the WDT, but do not start it.
4. Start the WDT by refreshing it.
5. In the first loop the red LED flashes 30 times and refreshes the watchdog each time the LED state is changed.
6. In the second loop, the green LED flashes, but the program DOES NOT refresh the watchdog. After the watchdog timeout period the device will reset which can be observed by the red LED flashing again as the sequence repeats.

### 3.5.3 Creating the Project with e² studio

Start e² studio and choose a workspace folder in the Workspace Launcher. Configure a new RA MCU project as follows.

1. Select **File > New > RA C/C++ Project**. Then select the template for the project.

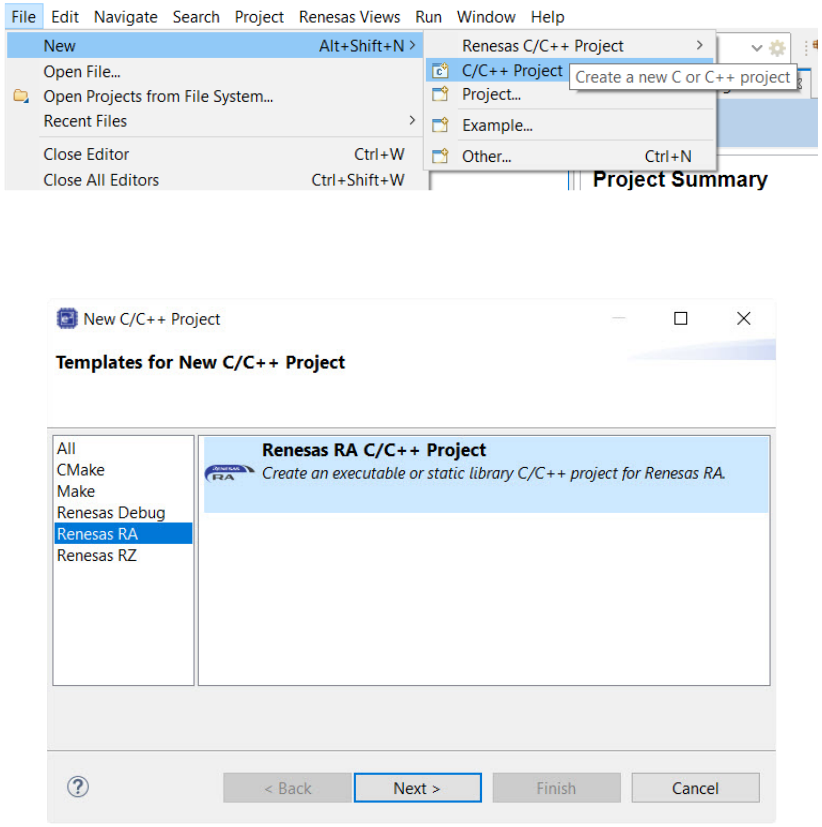

Figure 105: Creating a new project

2. In the e² studio Project **Configuration (RA Project)** window enter a project name, for example, WDT_Application. In addition, select the toolchain. If you want to choose new

locations for the project unselect **Use default location**. Click **Next**.

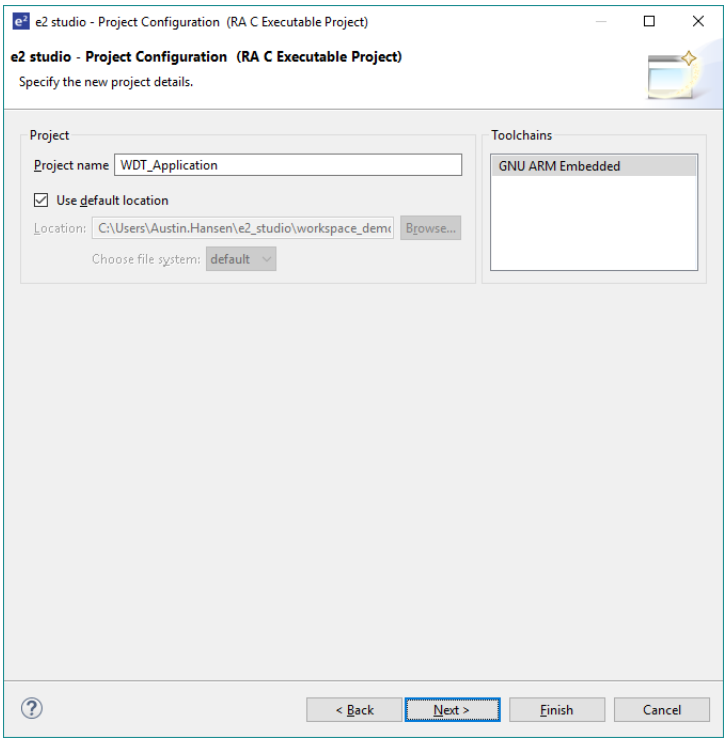

Figure 106: Project configuration (part 1)

3. This application runs on the EK-RA6M3 board. So, for the **Board** select **EK-RA6M3**.

   This will automatically populate the **Device** drop-down with the correct device used on this board. Select the **Toolchain** version. Select **J-Link ARM** as the **Debugger**. Click **Next** to configure the project.

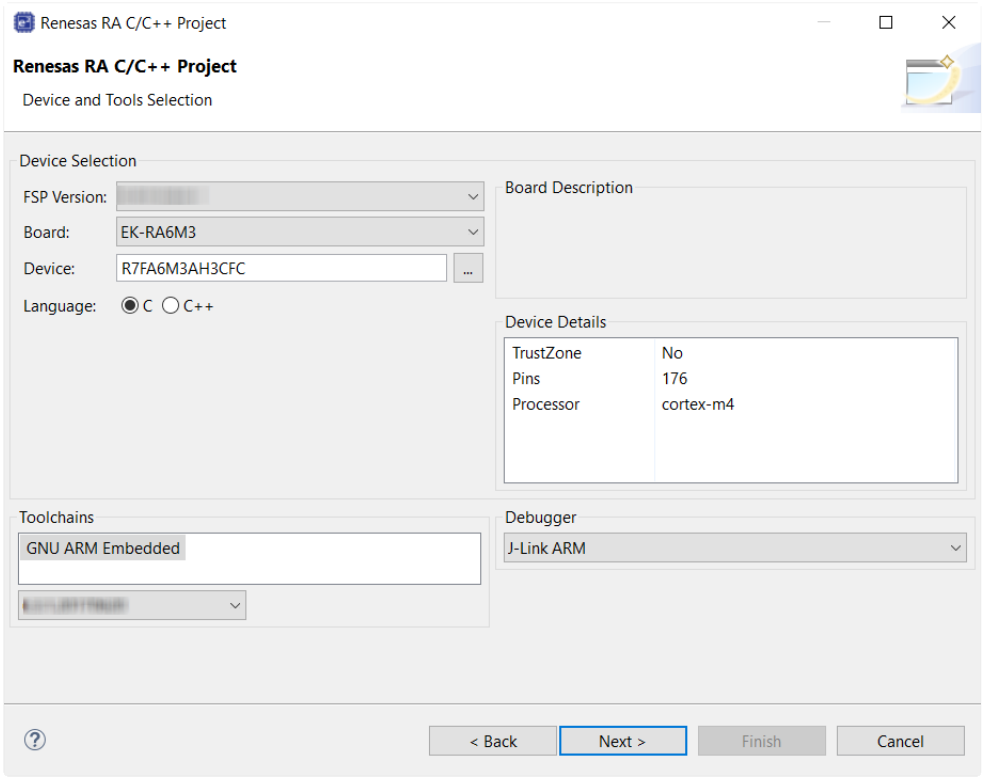

Figure 107: Project configuration (part 2)

The project template is now selected. As no RTOS is required select **Bare Metal - Blinky**.

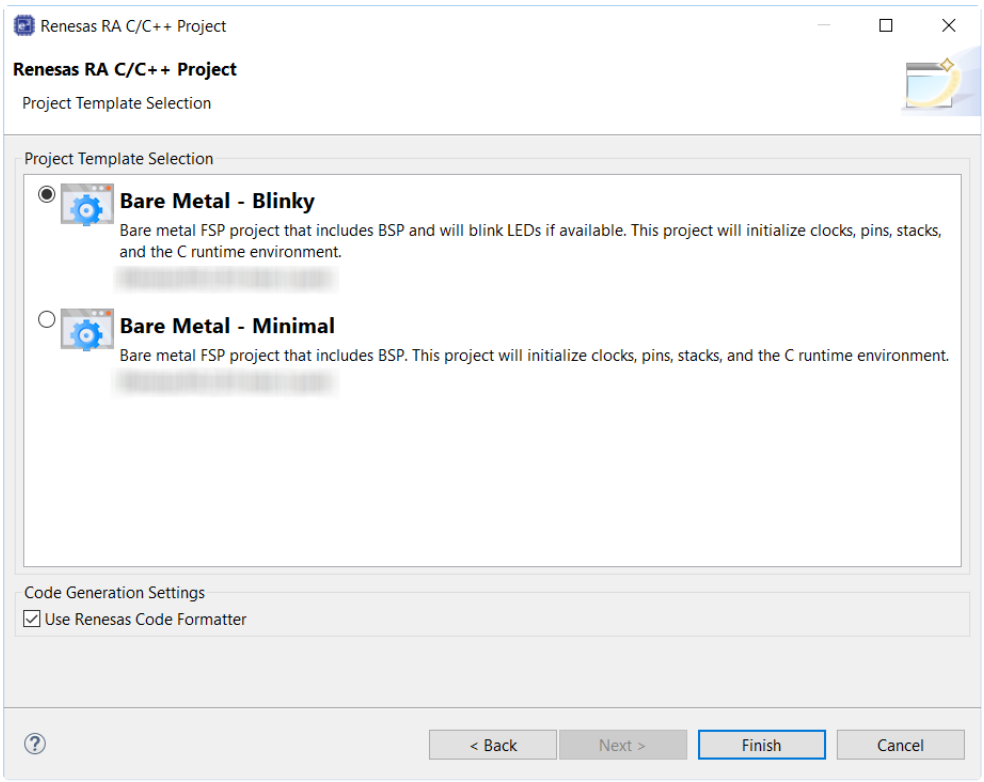

Figure 108: Project configuration (part 3)

4. Click **Finish**.

   e² studio creates the project and opens the **Project Explorer** and **Project Configuration Settings** views with the **Summary** page showing a summary of the project configuration.

## 3.5.4 Configuring the Project with e² studio

e² studio simplifies and accelerates the project configuration process by providing a GUI interface for selecting the options to configure the project.

e² studio offers a selection of perspectives presenting different windows to the user depending on the operation in progress. The default perspectives are **C/C++**, **FSP Configuration** and **Debug**. The perspective can be changed by selecting a new one from the buttons at the top right.

Figure 109: Selecting a perspective

The **C/C++** perspective provides a layout selected for code editing. The **FSP Configuration** perspective provides elements for configuring a RA MCU project, and the **Debug** perspective provides a view suited for debugging.

1. In order to configure the project settings ensure the **FSP Configuration** perspective is selected.
2. Ensure the **Project Configuration [WDT Application]** is open. It is already open if the Summary information is visible. To open the Project Configuration now or at any time make sure the **RA Configuration** perspective is selected and double-click on the configuration.xml file in the Project Explorer pane on the right side of e² studio.

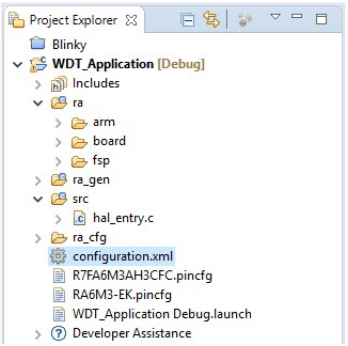

Figure 110: RA MCU Project Configuration Settings

At the base of the Project Configuration view there are several tabs for configuring the project. A project may require changes to some or all of these tabs. The tabs are shown below.

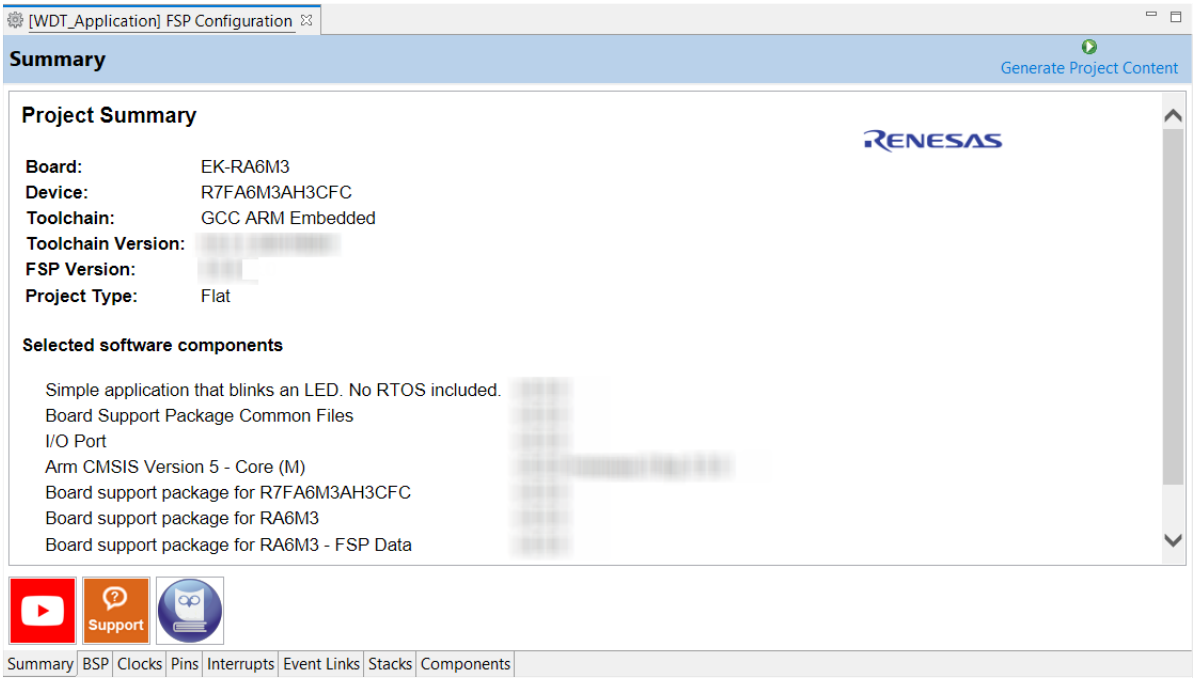

Figure 111: Project Configuration Tabs

### 3.5.4.1 BSP Tab

The **BSP** tab allows the Board Support Package (BSP) options to be modified from their defaults. For this particular WDT project no changes are required. However, if you want to use the WDT in auto-start mode, you can configure the settings of the OFS0 (Option Function Select Register 0) register in the **BSP** tab. See the RA Hardware User's Manual for details on the WDT autostart mode.

### 3.5.4.2 Clocks Tab

The **Clocks** tab presents a graphical view of the clock tree of the device. The drop-down boxes in the GUI enables configuration of the various clocks. The WDT uses PCLCKB. The default output frequency for this clock is 60 MHz. Ensure this clock is outputting this value.

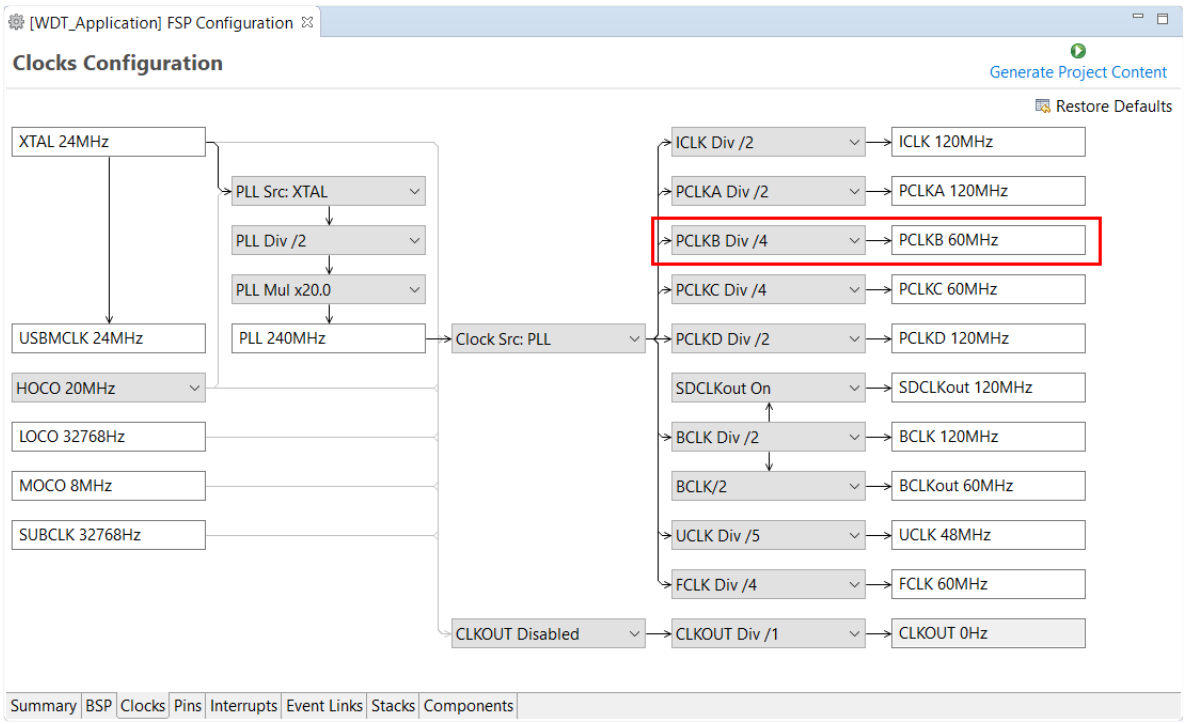

Figure 112: Clock configuration

### 3.5.4.3 Interrupts Tab

The **Interrupts** tab is used to add new user events or interrupts. No new interrupts or events are needed by the application, so no edits in this tab are required.

### 3.5.4.4 Event Links Tab

The **Event Links** tab is used to configure events used by the Event Link Controller (ELC). This project doesn't use the ELC, so no edits in this tab are required.

### 3.5.4.5 Pins Tab

The **Pins** tab provides a graphical tool for configuring the functionality of the pins of the device. For the WDT project no pin configuration is required. Although the project uses two LEDs connected to pins on the device, these pins are pre-configured as output GPIO pins by the BSP.

### 3.5.4.6 Stacks Tab

You can add any driver to the project using the **Stacks** tab. The HAL driver IO port pins are added automatically by e² studio when the project is configured. The WDT application uses no RTOS Resources, so you only need to add the HAL WDT driver.

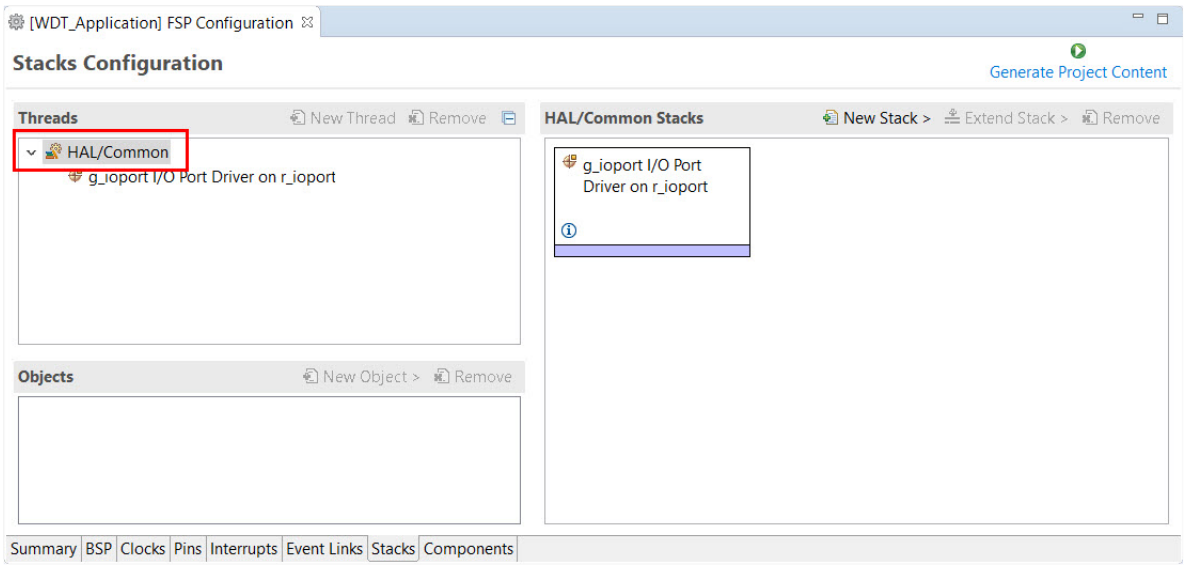

Figure 113: Stacks tab

1. Click on the **HAL/Common Panel** in the Threads Window as indicated in the figure above.

   The Stacks Panel becomes a **HAL/Common Stacks** panel and is populated with the modules preselected by e² studio.

2. Click on **New Stack** to find a pop-up window with the available HAL level drivers.
3. Select **WATCHDOG Driver on r_wdt**.

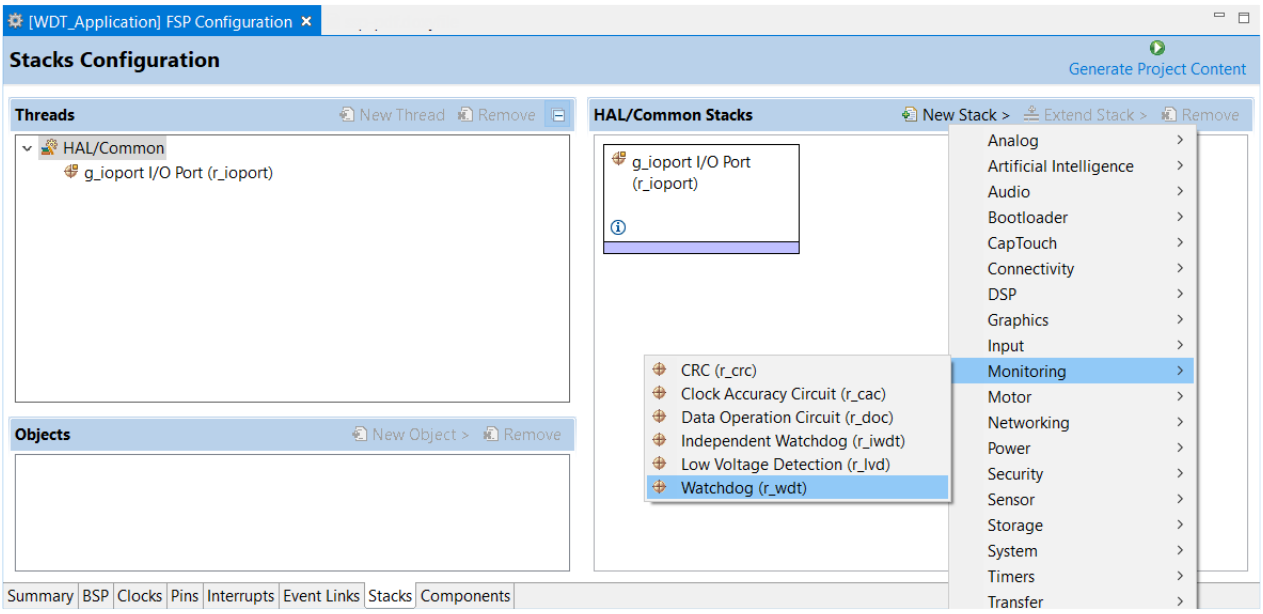

Figure 114: Module Selection

The selected HAL WDT driver is added to the **HAL/Common Stacks** Panel and the **Property** Window shows all configuration options for the selected module. The **Property** tab for the WDT should be visible at the bottom left of the screen. If it is not visible, check that the **FSP Configuration** perspective is selected.

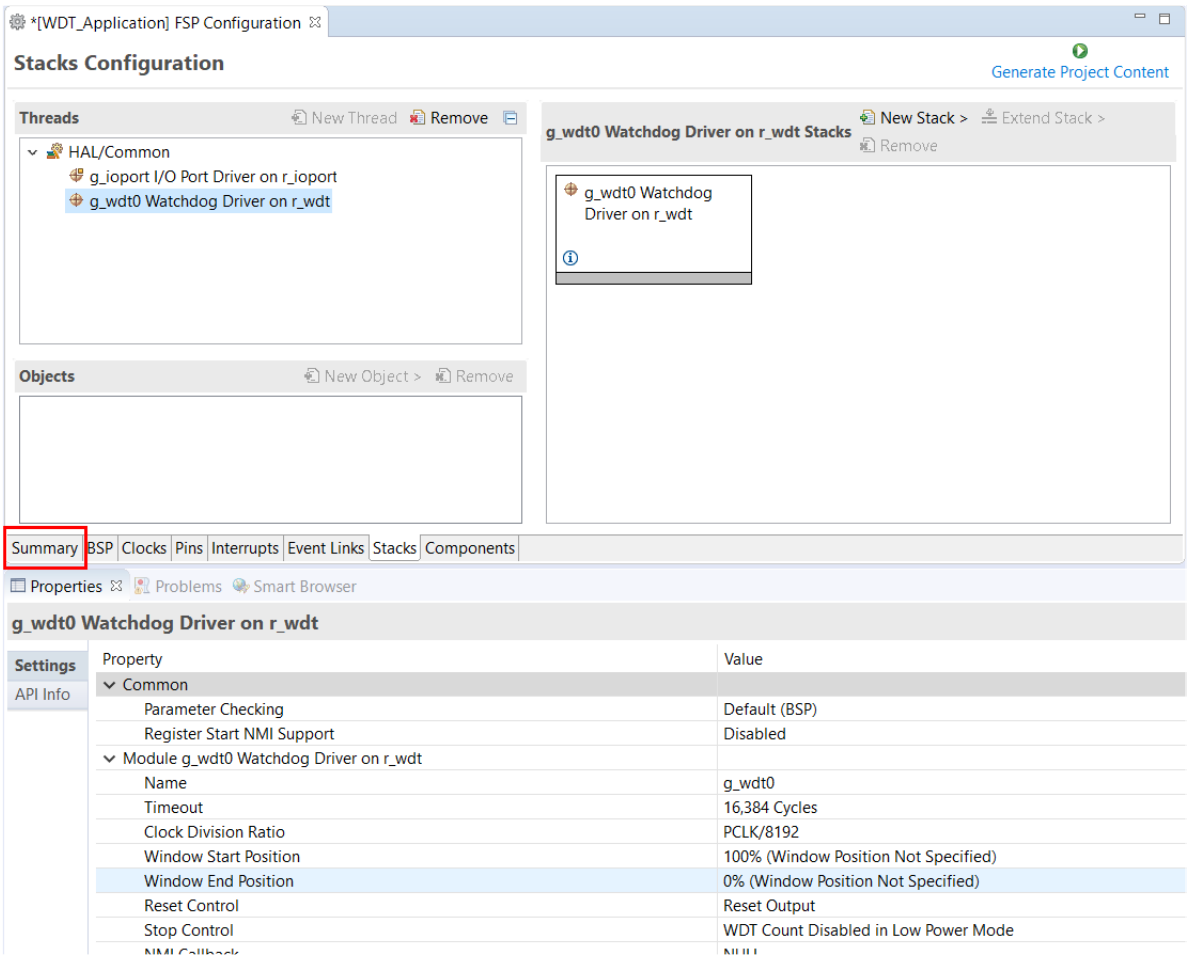

Figure 115: Module Properties

All parameters can be left with their default values.

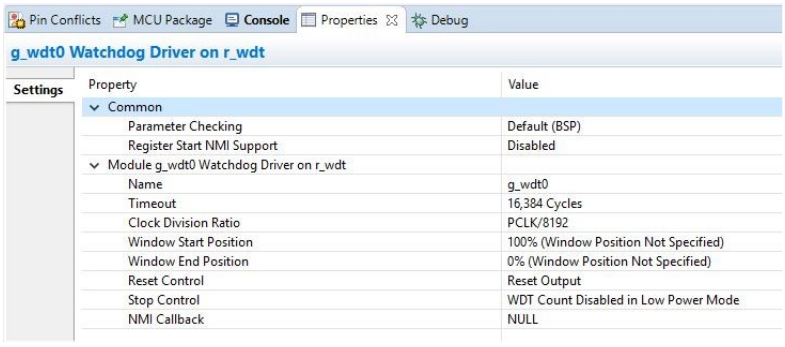

Figure 116: g_wdt WATCHDOG Driver on WDT properties

With PCLKB running at 60 MHz the WDT will reset the device 2.23 seconds after the last refresh.

WDT clock = 60 MHz / 8192 = 7.32 kHz

Cycle time = 1 / 7.324 kHz = 136.53 us

Timeout = 136.53 us x 16384 = 2.23 seconds

Save the **Project Configuration** file and click the **Generate Project Content** button in the top right corner of the **Project Configuration** pane.

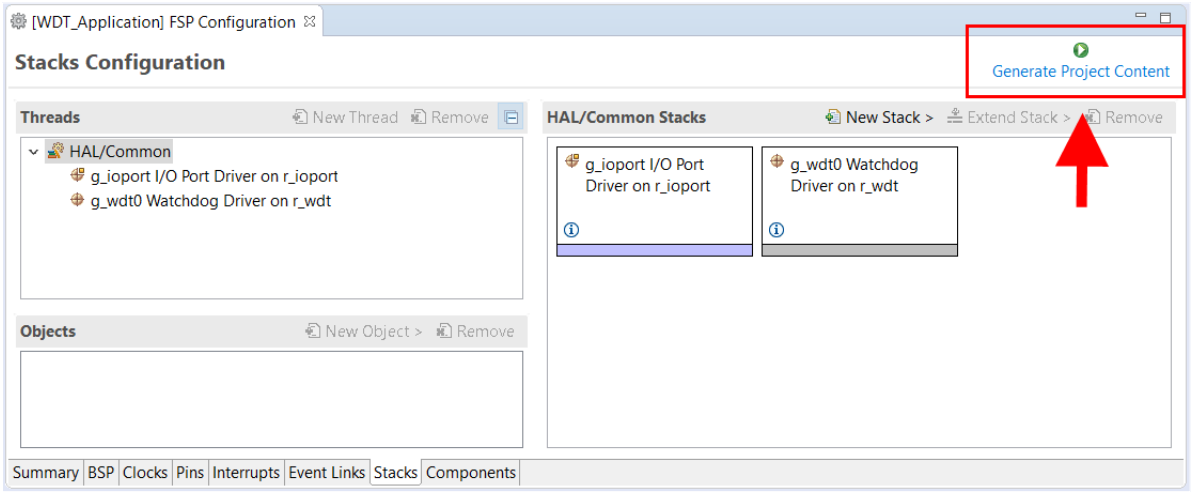

Figure 117: Generate Project Content button

e² studio generates the project files.

### 3.5.4.7 Components Tab

The components tab is included for reference to see which modules are included in the project. Modules are selected automatically in the Components view after they are added in the Stacks Tab.

For the WDT project ensure that the following modules are selected:

1. HAL_Drivers -> r_ioport
2. HAL_Drivers -> r_wdt

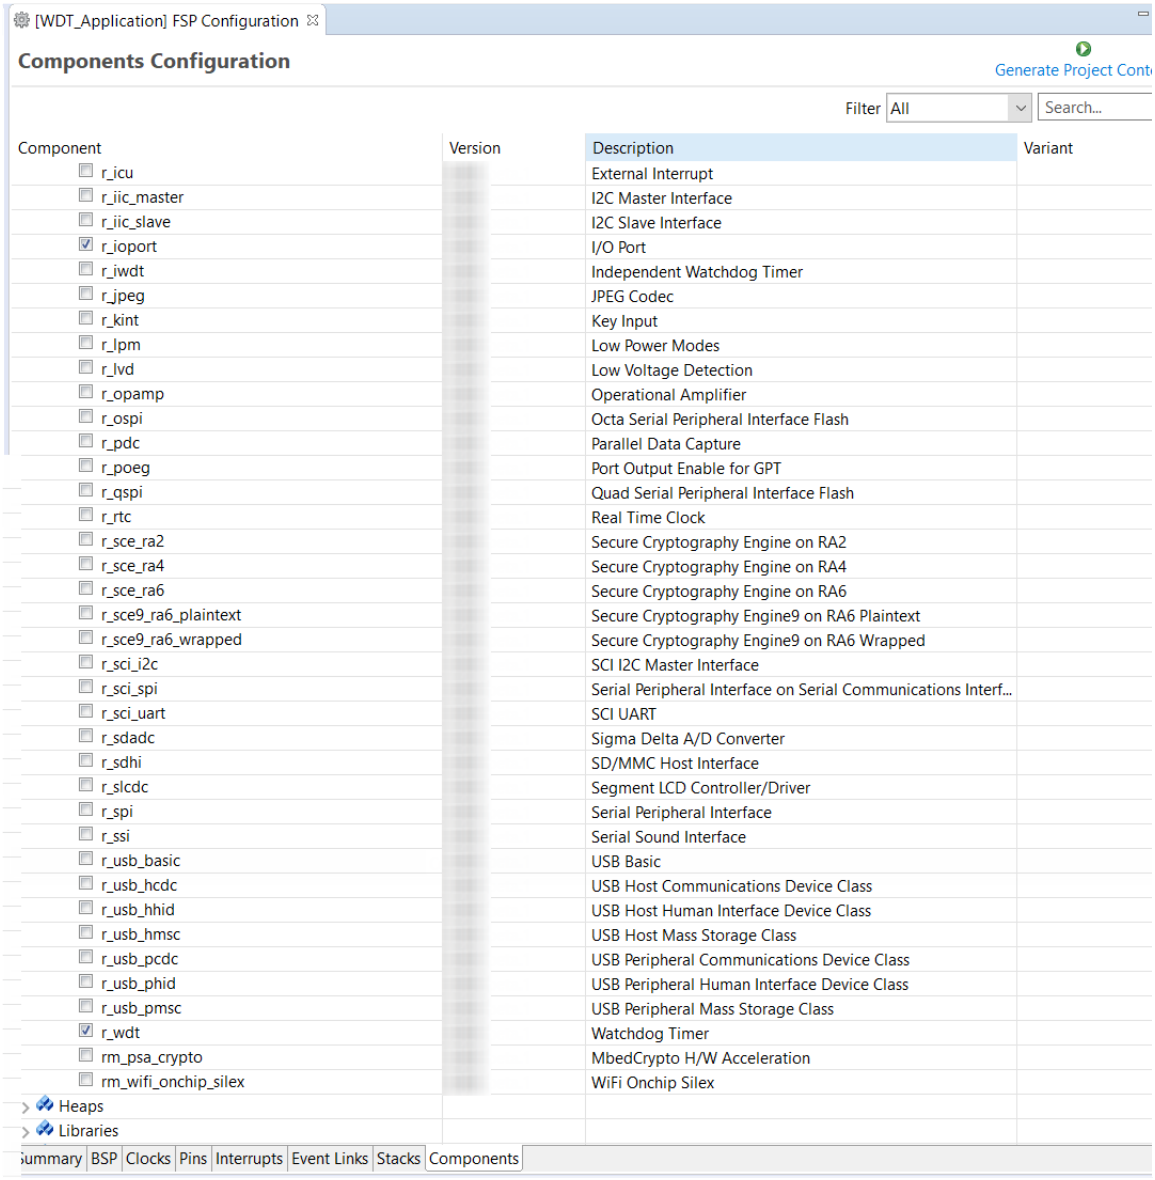

Figure 118: Component Selection

*Note*

*The list of modules displayed in the Components tab depends on the installed FSP version.*

## 3.5.5 WDT Generated Project Files

Clicking the Generate Project Content button performs the following tasks.

- r_wdt folder and WDT driver contents created at:

  ra/fsp/src

- r_wdt_api.h created in:

  ra/fsp/inc/api

- r_wdt.h created in:

  ra/fsp/inc/instances

The above files are the standard files for the WDT HAL module. They contain no specific project contents. They are the driver files for the WDT. Further information on the contents of these files can be found in the documentation for the WDT HAL module.

Configuration information for the WDT HAL module in the WDT project is found in:

ra_cfg/fsp_cfg/r_wdt_cfg.h

The above file's contents are based upon the **Common** settings in the **g_wdt WATCHDOG Driver on WDT Properties** pane.

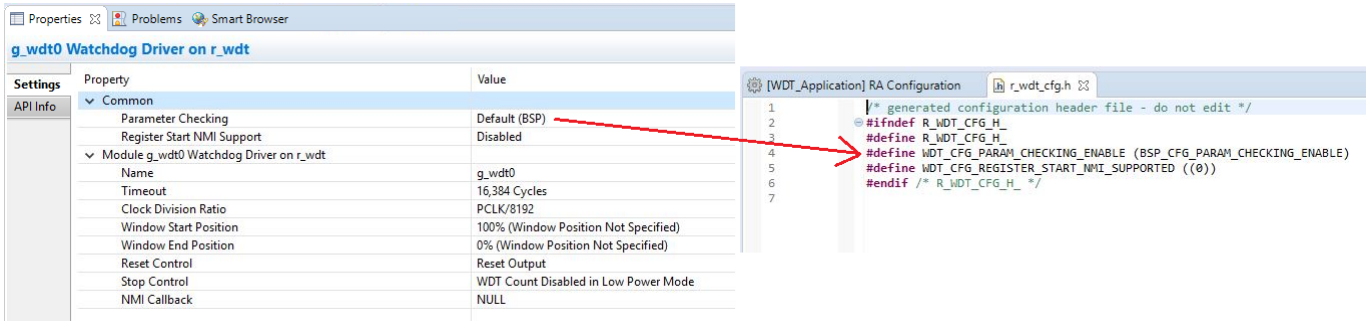

Figure 119: r_wdt_cfg.h contents

Warning

Do not edit any of these files as they are recreated every time the Generate Project Content button is clicked and so any changes will be overwritten.

The r_ioport folder is not created at ra/fsp/src as this module is required by the BSP and so already exists. It is included in the WDT project in order to include the correct header file in ra_gen/hal_data.c–see later in this document for further details. For the same reason the other IOPORT header files– ra/fsp/inc/api/r_ioport_api.handra/fsp/inc/instances/r_ioport.h–are not created as they already exist.

In addition to generating the HAL driver files for the WDT and IOPORT files e² studio also generates files containing configuration data for the WDT and a file where user code can safely be added. These files are shown below.

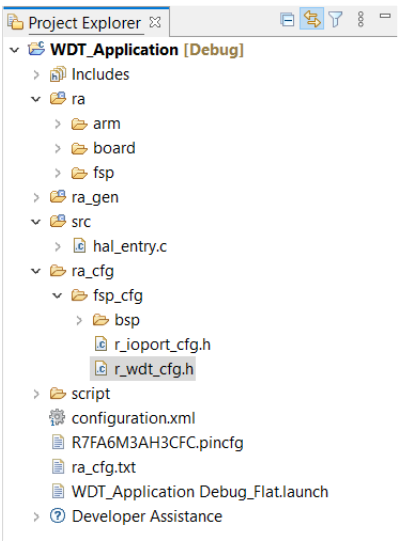

Figure 120: WDT project files

### 3.5.5.1 WDT hal_data.h

The contents of hal_data.h are shown below.

```
/* generated HAL header file - do not edit */
#ifndef HAL_DATA_H_
 #define HAL_DATA_H_
 #include <stdint.h>
 #include "bsp_api.h"
 #include "common_data.h"
 #include "r_wdt.h"
 #include "r_wdt_api.h"
 #ifdef __cplusplus
extern "C"
{
 #endif
extern const wdt_instance_t g_wdt0;
 #ifndef NULL
void NULL(wdt_callback_args_t * p_args);
 #endif
extern wdt_instance_ctrl_t g_wdt0_ctrl;
extern const wdt_cfg_t g_wdt0_cfg;
void hal_entry(void);
```

```
void g_hal_init(void);
 #ifdef __cplusplus
} /* extern "C" */
 #endif
#endif  /* HAL_DATA_H_ */
```

hal_data.h contains the header files required by the generated project. In addition this file includes external references to the **g_wdt0** instance structure which contains pointers to the configuration, control, api structures used for WDT HAL driver.

Warning

This file is regenerated each time Generate Project Content is clicked and must not be edited.

### 3.5.5.2 WDT hal_data.c

The contents of hal_data.c are shown below.

```
/* generated HAL source file - do not edit */
#include "hal_data.h"
wdt_instance_ctrl_t g_wdt0_ctrl;
const wdt_cfg_t g_wdt0_cfg =
{
    .timeout       = WDT_TIMEOUT_16384,
    .clock_division = WDT_CLOCK_DIVISION_8192,
    .window_start   = WDT_WINDOW_START_100,
    .window_end    = WDT_WINDOW_END_0,
    .reset_control = WDT_RESET_CONTROL_RESET,
    .stop_control   = WDT_STOP_CONTROL_ENABLE,
    .p_callback    = NULL,
};
/* Instance structure to use this module. */
const wdt_instance_t g_wdt0 =
{.p_ctrl = &g_wdt0_ctrl, .p_cfg = &g_wdt0_cfg, .p_api = &g_wdt_on_wdt};
void g_hal_init (void)
{
    g_common_init();
}
```

hal_data.c contains g_wdt0_ctrl which is the control structure for this instance of the WDT HAL driver. This structure should not be initialized as this is done by the driver when it is opened.

The contents of g_wdt0_cfg are populated in this file using the **Watchdog Driver on g_wdt0** pane in the Project Configuration **Stacks** tab. If the contents of this structure do not reflect the settings made in the IDE, ensure the **Project Configuration** settings are saved before clicking the **Generate Project Content** button.

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

#### 3.5.5.3 WDT main.c

Contains main() called by the BSP start-up code. main() calls hal_entry() which contains user developed code (see next file). Here are the contents of main.c.

```
/* generated main source file - do not edit*/
#include "hal_data.h"
int main (void)
{
    hal_entry();
 return 0;
}
```

Warning

This file is regenerated each time Generate Project Content is clicked and so should not be edited.

#### 3.5.5.4 WDT hal_entry.c

This file contains the function hal_entry() called from main(). User developed code should be placed in this file and function.

For the WDT project edit the contents of this file to contain the code below. This code implements the flowchart in overview section of this document.

```
#include "hal_data.h"
#include "bsp_pin_cfg.h"
#include "r_ioport.h"
#define RED_LED_NO_OF_FLASHES 30
#define RED_LED_PIN BSP_IO_PORT_01_PIN_00
```

```
#define GREEN_LED_PIN BSP_IO_PORT_04_PIN_00
#define RED_LED_DELAY_MS 125
#define GREEN_LED_DELAY_MS 250
volatile uint32_t delay_counter;
volatile uint16_t loop_counter;
void R_BSP_WarmStart(bsp_warm_start_event_t event);
/*******************************************************************************
*******************************/
void hal_entry (void)
{
 /* Allow the WDT to run when the debugger is connected */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
 /* Open the WDT */
 R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Start the WDT by refreshing it */
 R_WDT_Refresh(&g_wdt0_ctrl);
 /* Flash the red LED and feed the WDT for a few seconds */
 for (loop_counter = 0; loop_counter < RED_LED_NO_OF_FLASHES; loop_counter++)
    {
 /* Turn red LED on */
 R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_LOW);
 /* Delay */
 R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Refresh WDT */
 R_WDT_Refresh(&g_wdt0_ctrl);
 R_IOPORT_PinWrite(&g_ioport_ctrl, RED_LED_PIN, BSP_IO_LEVEL_HIGH);
 /* Delay */
 R_BSP_SoftwareDelay(RED_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Refresh WDT */
 R_WDT_Refresh(&g_wdt0_ctrl);
    }
 /* Flash green LED but STOP feeding the WDT. WDT should reset the
  * device */
 while (1)
```

```
    {
 /* Turn green LED on */
 R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_LOW);
 /* Delay */
 R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Turn green off */
 R_IOPORT_PinWrite(&g_ioport_ctrl, GREEN_LED_PIN, BSP_IO_LEVEL_HIGH);
 /* Delay */
 R_BSP_SoftwareDelay(GREEN_LED_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
    }
}
/*******************************************************************************
*******************************/
void R_BSP_WarmStart (bsp_warm_start_event_t event)
{
 if (BSP_WARM_START_RESET == event)
    {
#if BSP_FEATURE_FLASH_LP_VERSION != 0
 /* Enable reading from data flash. */
       R_FACI_LP->DFLCTL = 1U;
 /* Would normally have to wait for tDSTOP(6us) for data flash recovery. Placing the
enable here, before clock and
  * C runtime initialization, should negate the need for a delay since the
initialization will typically take more than 6us. */
#endif
    }
 if (BSP_WARM_START_POST_C == event)
    {
 /* C runtime environment and system clocks are setup. */
 /* Configure pins. */
 R_IOPORT_Open(&IOPORT_CFG_CTRL, &IOPORT_CFG_NAME);
    }
}
```

The WDT HAL driver API functions are defined in r_wdt.h. The WDT HAL driver is opened through the open API call using the instance structure defined in r_wdt_api.h:

```
/* Open the WDT */
R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

The first passed parameter is the pointer to the control structure g_wdt0_ctrl instantiated in hal_data.c. The second parameter is the pointer to the configuration data g_wdto_cfg instantiated in the same hal_data.c file.

The WDT is started and refreshed through the API call:

```
/* Start the WDT by refreshing it */
R_WDT_Refresh(&g_wdt0_ctrl);
```

Again the first (and only in this case) parameter passed to this API is the pointer to the control structure of this instance of the driver.

### 3.5.6 Building and Testing the Project

Build the project in e² studio by clicking **Build > Build Project** or by clicking the build icon. The project should build without errors.

To debug the project

1. Connect the USB cable between the target board debug port and host PC.
2. In the **Project Explorer** pane on the left side of e² studio, right-click on the WDT project **WDT_Application** and select **Debug As > Debug Configurations**.

3. Under **Renesas GDB Hardware Debugging** select **WDT_Application Debug** as shown below.

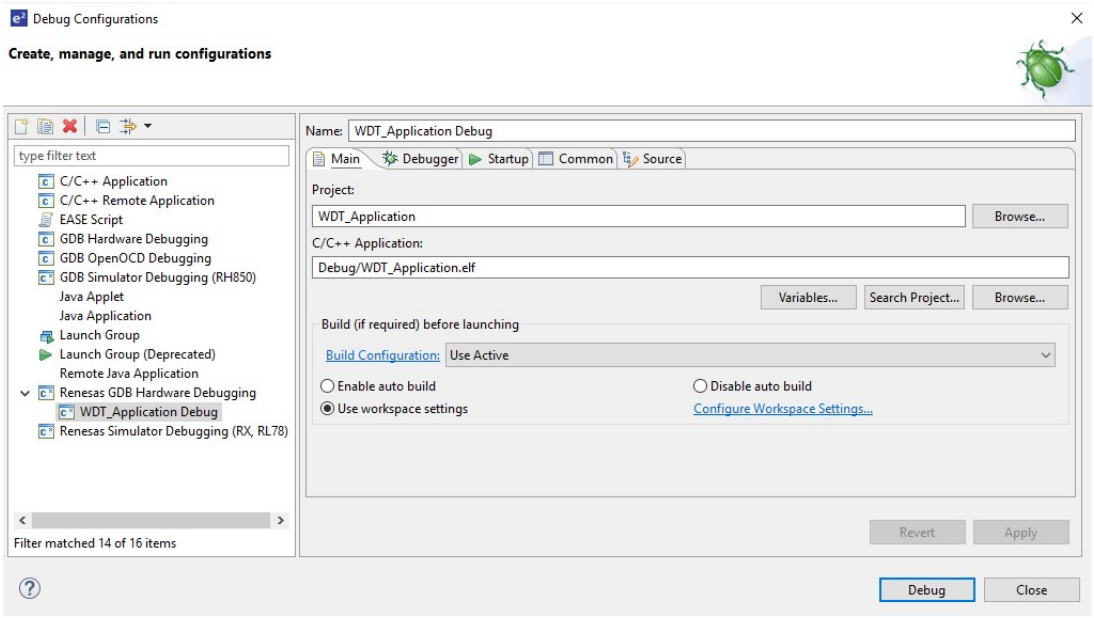

Figure 121: Debug configuration

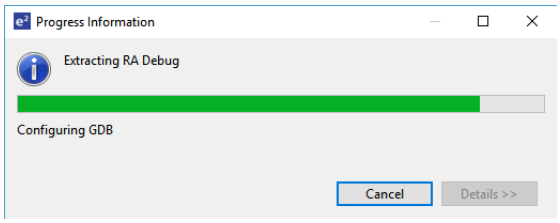
4. Click the **Debug** button. Click Yes to the debug perspective if asked.



5. The code should run the Reset_Handler() function.
6. Resume execution via **Run > Resume**. Execution will stop in main() at the call to hal_entry().
7. Resume execution again.

The red LED should start flashing. After 30 flashes the green LED will start flashing and the red LED will stop flashing.

While the green LED is flashing the WDT will underflow and reset the device resulting in the red LED to flash again as the sequence repeats.

1. Stop the debugger in e² studio via **Run > Terminate**.
2. Click the reset button on the target board. The LEDs begin flashing.

# 3.6 Primer: Arm TrustZone Project Development

This section will introduce the user to the tools supporting Arm® TrustZone® technology configuration for the RA Family of microcontrollers. It is intended to be read by development engineers implementing RA Arm TrustZone projects for the first time. It will introduce basic concepts

followed by workflow and tooling functions designed to simplify and accelerate their first Arm TrustZone development. A background knowledge of e² studio and RA device hardware is expected.

### 3.6.1 Target Device

RA Cortex®-M33 and Cortex®-M85 devices with Arm TrustZone security extension. As shown in the following table, most RA devices that include TrustZone support also support Device Lifecycle Management (DLM).

| MCU Groups with TrustZone and DLM | MCU Groups with TrustZone and no DLM | MCU Groups with TrustZone and Alternate DLM |
|---|---|---|
| RA4E1, RA4M2, RA4M3, RA6E1, RA6M4, RA6M5, RA6T2, RA8E1, RA8E2, RA8P1, RA8T2 | RA4E2, RA4T1, RA6E2, RA6T3 | RA8M1, RA8D1, RA8T1 |

### 3.6.2 Renesas Implementation of Arm TrustZone Technology

The following section is supplied for reference only. For full details of TrustZone implementation, refer to Arm documentation (https://developer.arm.com/ip-products/security-ip/trustzone) and the MCU user manual.

Arm TrustZone technology divides the MCU and therefore the application into Secure and Non-Secure partitions. Secure applications can access both Secure and Non-Secure memory and resources. Non-Secure code can access Non-Secure memory and resources as well as Secure resources through a set of so-called veneers located in the Non-Secure Callable (NSC) region. This ensures a single access point for Secure code when called from the Non-Secure partition. The MCU starts up in the Secure partition by default. The security state of the CPU can be either Secure or Non-Secure.

The MCU code flash, data flash, and SRAM are divided into Secure (S) and Non-Secure (NS) regions. Code flash and SRAM include a further region known as Non-Secure Callable (NSC). The method to set these memory security attributes depends on whether the device supports DLM:

- For devices that support DLM, memory security attributes are set into the non-volatile memory through SCI or USB boot mode commands when the device lifecycle is Secure Software Debug (SSD) state. The memory security attributes are loaded into the Implementation Defined Attribution Unit (IDAU) peripheral and the memory controller before application execution and cannot be updated by application code.
- For devices that do not support DLM, memory security attributes are written to IDAU registers at startup by application code using secure accesses.

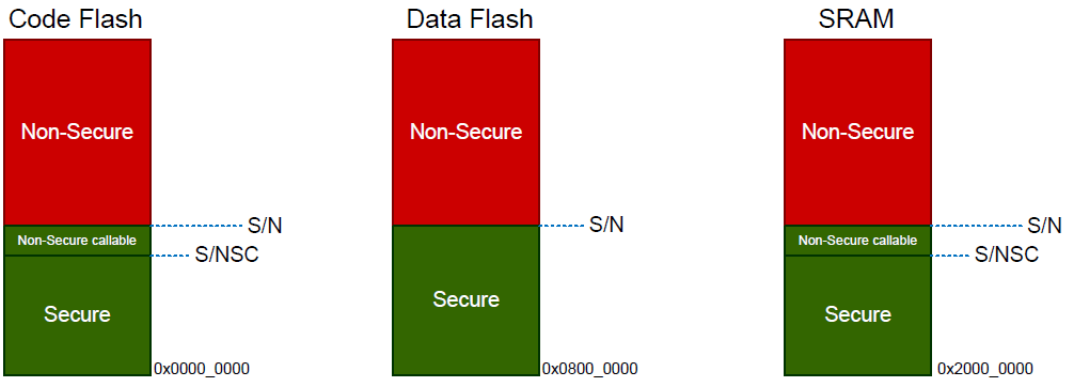


Figure 122: Secure and Non-Secure Regions

Note: All external memory accesses are considered to be Non-Secure.

Code Flash and SRAM can be divided into Secure, Non-Secure, and Non-Secure Callable. All secure memory accesses from the Non-Secure region MUST go through the Non-Secure Callable gateway and target a specific Secure Gateway (SG) assembler instruction. This forces access to Secure APIs at a fixed location and prevents calls to sub-functions and so on. Failing to target an SG instruction will generate a TrustZone exception.

TrustZone enabled compilers will manage generation of the NSC veneer automatically using CMSE extensions.

### 3.6.2.1 Calling from Non-Secure to Secure

A new instruction SG (Secure Gateway) has been added to the Armv8-M architecture. This MUST be the destination instruction for any branch within the Non-Secure Callable region. If an attempt is made to branch to any other instruction from the Non-Secure partition, a TrustZone exception will be thrown.

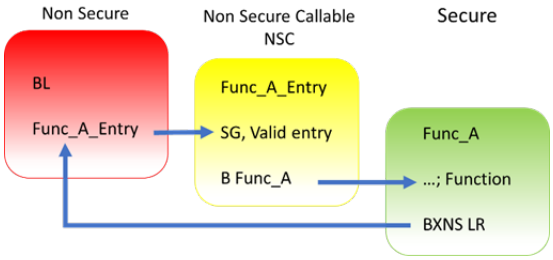

Figure 123: Calling from Non-Secure to Secure Functions

### 3.6.2.2 Calling from Secure to Non-Secure

Secure code uses B(L)XNS instructions to make direct calls to Non-Secure functions. While this is certainly possible, it can create a security vulnerability in the application. It is also challenging for the Secure application to determine the address of the non-secure function during build phase. From the RA Tools and FSP point view, calling directly from Secure to Non-Secure via FSP API is not supported.

Preference is for the Secure code to initialise as necessary from reset, then pass control to the Non-Secure partition. It will manage any data transfers and so forth via FSP call-backs as security checks. For example, secure data can be copied to Non-Secure RAM.

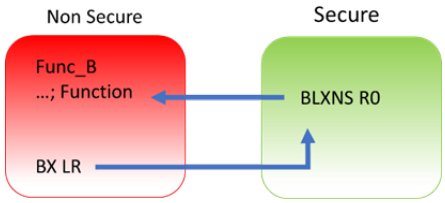

Figure 124: Calling from Secure to Non-Secure Functions

## 3.6.3 Workflow

Arm TrustZone MCU development normally consists of two projects within a workspace, Secure and Non-Secure. General project workflows are described in the following sections. The Renesas project generator also supports development with "Flat project" model with no Arm TrustZone awareness.

### 3.6.3.1 Secure Project

1. Start a new Secure project in e² studio.
2. Select and configure pins and drivers/stacks that need to be initialized and used in Secure mode. This should be kept to a minimum to reduce the security attack surface.
3. Expose top of stacks as Non-Secure Callable (NSC) ***if*** they need to be accessed from Non-Secure partition. Again, this should be kept to a minimum.
4. Generate project content and write Secure code such as key handling and opening drives as needed.
5. Modify/remove any unnecessary "Guard" functions as needed to control access via NSC.
6. Build project.
7. A Non-Secure project will be needed before debugging. If necessary, prepare a "dummy" Non-Secure project or replace R_BSP_NonSecureEnter(); with while(1); in hal_entry.c.

### 3.6.3.2 Non-Secure Project

1. Start a new Non-Secure project.
2. If you have access to the Secure project, choose this option. However, if you only have access to a device with pre-programmed Secure code (commonly referred to as provisioned device) choose "Secure Bundle".
3. Select and configure pins and drivers/stacks that need to be initialized and used in Non-Secure mode.
4. Note that you can add NSC drivers and stacks as needed.
5. Generate project content and write Non-Secure code as needed
6. Access NSC drivers and Stacks via Guard functions.
7. Build and debug project.

### 3.6.3.3 Flat Project

A flat project does not technically use Arm TrustZone as the developer has made a decision to place the entire application in Secure partition from restart.

Notes:

- Any code placed in external memory (such as OSPI or QSPI) will be Non-Secure.

- The Ethernet EDMAC is designed to be a Non-Secure bus master so associated Ethernet RAM buffers will be placed in Non-Secure RAM. The tooling will automatically manage this.

The workflow is as follows:

1. Start a new Flat project.
2. Select and configure pins and drivers/stacks as needed.
3. Generate project content and write code as needed.
4. Build and debug project.

### 3.6.4 RA Project Generator (PG)

The RA project generators have been created to help users through setting up new TrustZone enabled projects. User will be prompted for project settings such as Project Type (Secure, Non-Secure, or Flat), compiler, RTOS and debugger. Care is needed when setting up a TrustZone project to ensure that the connection between Secure and Non-Secure partitions are managed correctly.

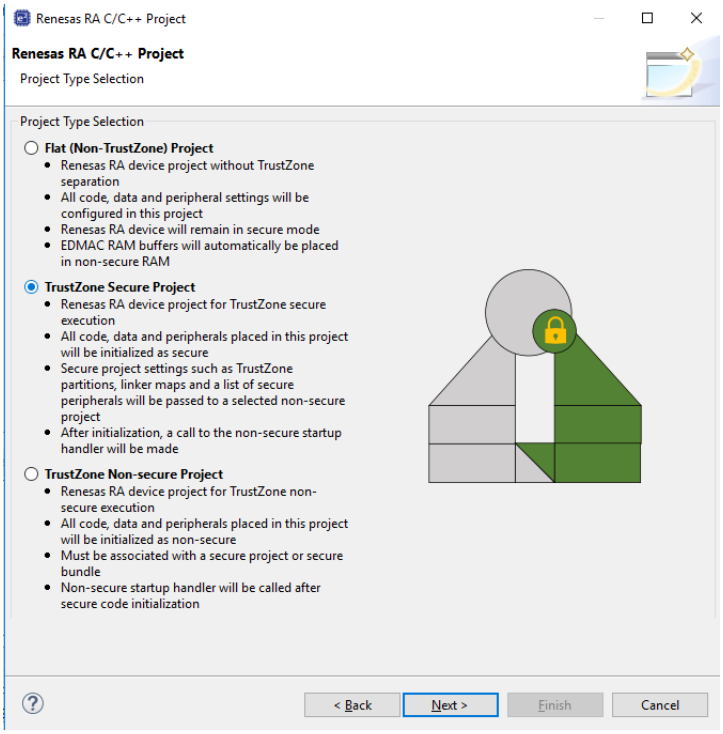

Figure 125: Secure Project (following Arm notation as green)

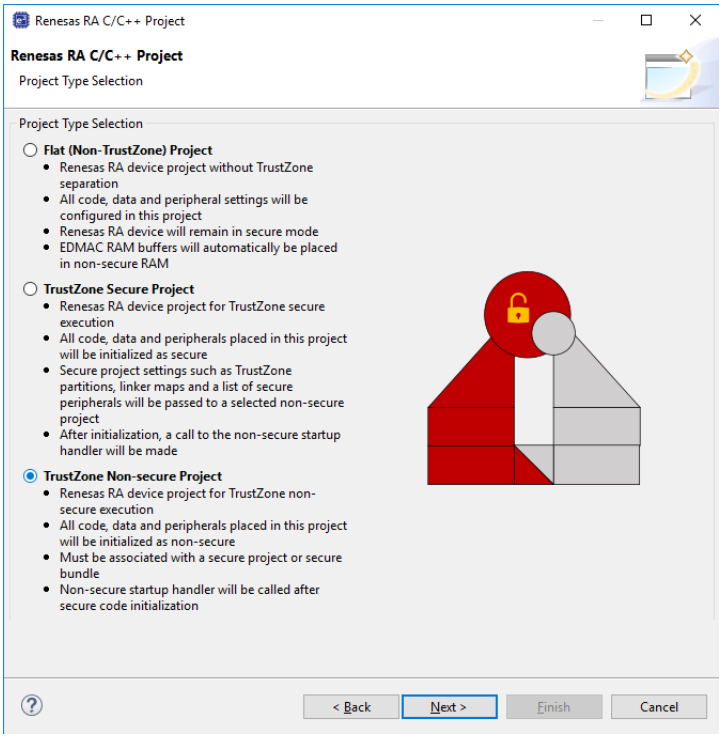

Figure 126: Non-Secure Project (following Arm notation as red)

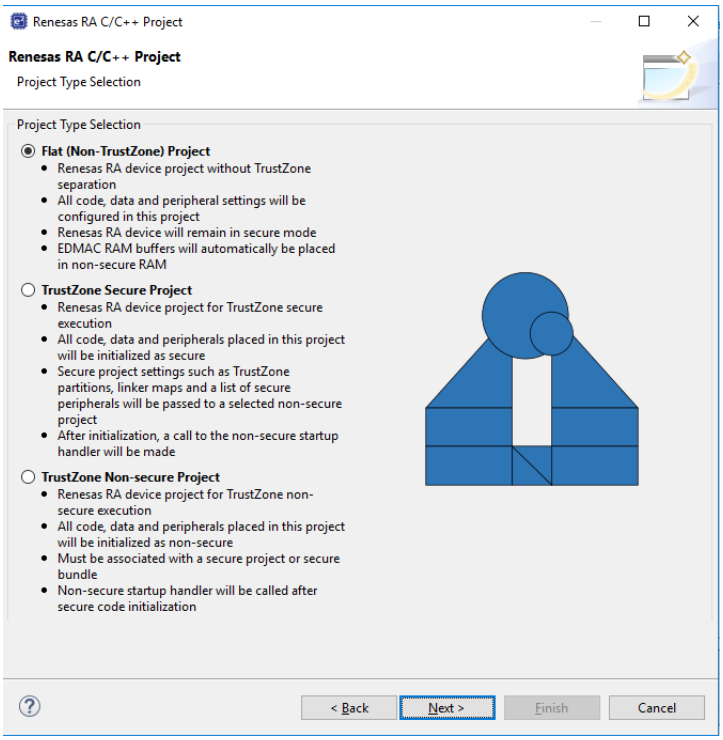

Figure 127: Flat Project

### 3.6.4.1 Secure Project Set Up

All code, data, and peripherals in this project will be configured as Secure using the device Peripheral

Security Attribution (PSA) registers. Although it is very application specific, we recommend keeping the Secure project code as small as possible to reduce the attack surface. For example, secure key handling may be the only application code in the secure project.

Necessary values to set up the TrustZone memory partition (IDAU registers) will be automatically calculated after the project is built to ensure they match the code and data size, keeping the attack surface as small as possible.

Typically, ANSI C start up code (clearing of RAM, variable initialisation, etc) , clock, and secure peripheral initialisation will occur in this project.

At the end of the Secure code, a call will be made to R_BSP_NonSecureEnter(); to pass control to the Non-Secure partition.

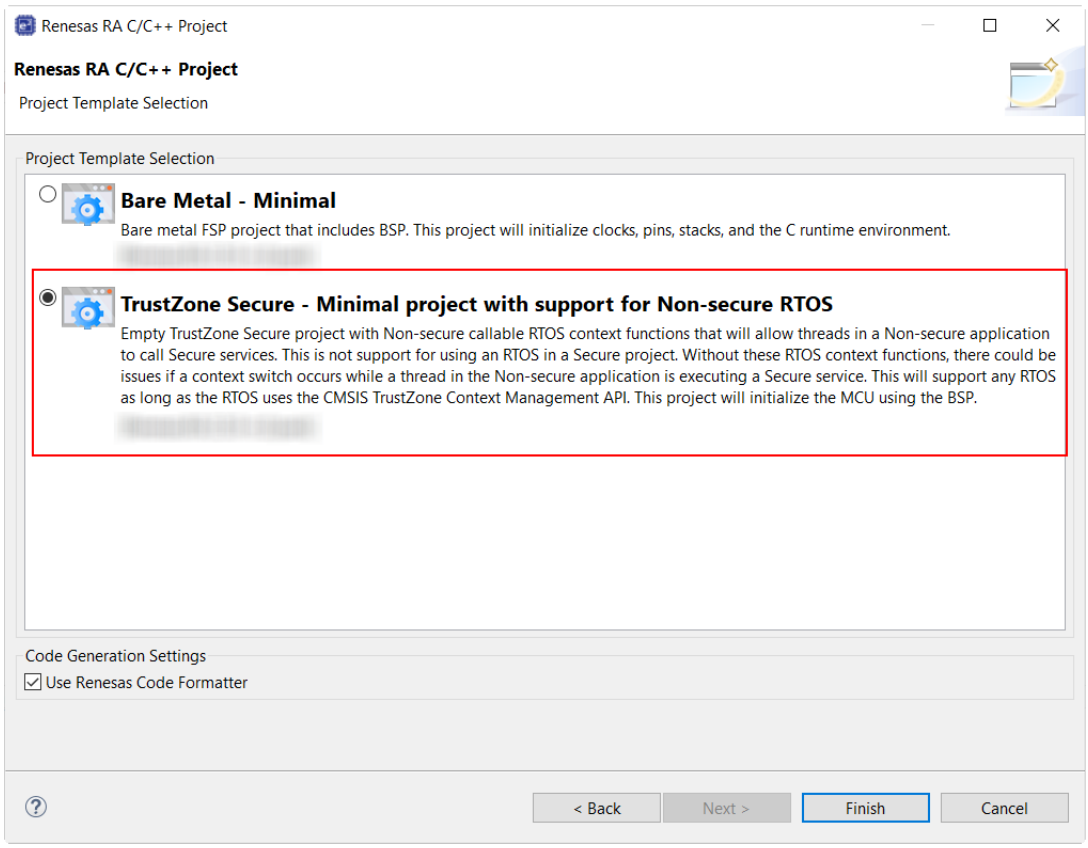
Non-Secure Callable (NSC) "Guard" functions are added to the project and expose selected modules to Non-Secure projects. User can add application-specific access checks as needed in these functions.

Output of this project type will be an elf file that must be either pre-programmed (provisioned) into a device or referenced by a Non-Secure project (via Secure bundle *.SBD) to build a final image.

This project type will NOT typically be debugged in isolation and will normally require a Non-Secure project such as a call to a R_BSP_NonSecureEnter() to be made. This can be replaced with while(1); if needed.

#### 3.6.4.2 RTOS Support in TrustZone Project

Although the RTOS kernel and user tasks will reside in the Non-Secure partition, the Secure partition needs to allocate stack space and so on. It is essential when starting a new RTOS project that the TrustZone Secure RTOS-Minimal template is selected. This will add the Arm TrustZone Context RA Port as below.



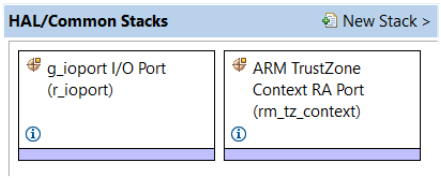


Figure 128: Secure RTOS-Minimal Template

### 3.6.4.3 Peripheral Security Attribution

Each peripheral can be configured to be Secure or Non-Secure. Peripherals are divided into two types.

Type-1 peripherals have one security attribute. Access to all registers is controlled by one security attribute. The Type-1 peripheral security attribute is set in the PSARx (x = B to E) register by the secure application.

Type-2 peripherals have the security attribute for each register or for each bit. Access to each register or bit field is controlled according to these security attributes. The Type-2 peripheral security attribute is set in the Security Attribution register in each module by the Secure application. For more information about the Security Attribution register, see sections in the Appropriate MCU's User's Manual for each peripheral.

Table 1. Secure and Non-Secure Peripherals

| Type | Peripheral |
|---|---|
| Type 1 | SCI, SPI, USBFS, CAN, IIC, SCE9, DOC, SDHI, SSIE, CTSU, CRC, CAC, TSN, ADC12, DAC12, POEG, AGT, GPT, RTC, IWDT, WDT |
| Type 2 | System control (Resets, LVD, Clock Generation Circuit, Low Power Modes, Battery Backup Function), FLASH CACHE, SRAM controller, CPU CACHE, DMAC, DTC, ICU, MPU, BUS, Security setting, ELC, I/O ports |
| Always Non-Secure | CS Area Controller, QSPI, OSPI, ETHERC, EDMAC |

FSP will initialise the arbitration registers during Secure project BSP start up. User code may also be written to set or clear further arbitration. However care must be taken not to undermine FSP.

#### 3.6.4.4 Non-Secure

All code, data, and peripherals in this project will be configured as Non-Secure. This project type must be associated with a Secure project to enable access to secure code, peripherals, linker scripts and others.

#### 3.6.4.5 Flat Project Type

All code, data, and peripherals are configured in a Secure single partition except for the EDMAC RAM buffers that will remain in the Non-Secure partition. Effectively, TrustZone is disabled.

#### 3.6.4.6 Secure Connection to Non-Secure Project

When starting a new Non-Secure Project, the user will be prompted for either a Secure Project or Secure Bundle. In each case, details of the linker settings, Non-Secure Callable functions, and Secure peripherals will be read to enable the Non-Secure project setup.

Should the Secure project or bundle be rebuilt, the Non-Secure editor will detect this and prompt user to regenerate the Non-Secure project configuration.

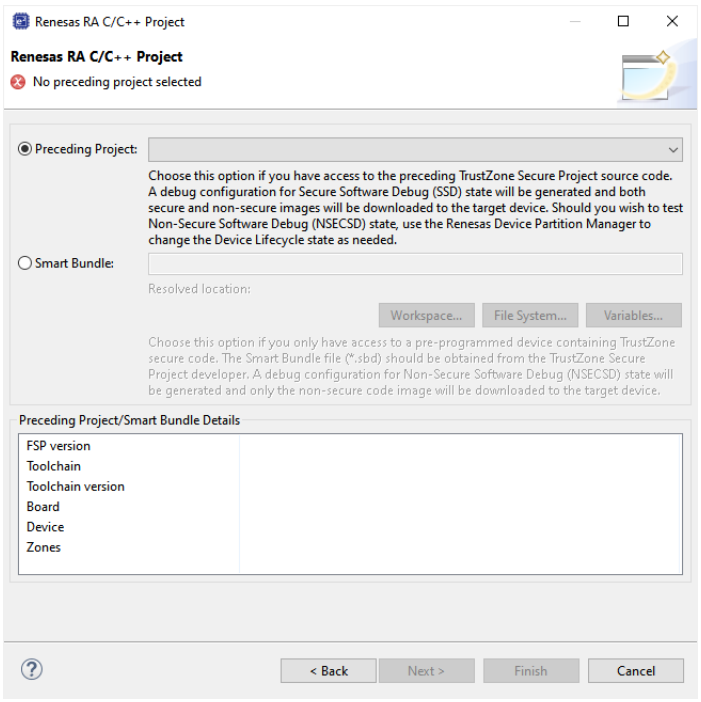

Figure 129: Secure Project or Bundle Selection

### Secure Project (Combined)

A Secure project must reside in the same Workspace as the Non-Secure project and will typically be used when a design engineer has access to both the Secure and Non-Secure project sources. This is sometimes known as "Combined model".

A Secure .elf file will be referenced and included in the debug configuration for download to the target device. The development engineer will have visibility of Secure and Non-Secure project source code and configuration.

### Secure Bundle (Split)

A Secure Bundle will ONLY include linker memory ranges, symbol references, and details of locked Secure peripheral configuration settings but no access to Secure source code (API header files will be included as necessary).

The Secure bundle file (*.SBD) must be supplied to the Non-Secure developer by the Secure project developer.

The development engineer will typically not have access to the Secure project or .elf file which MUST be pre-programmed or provisioned into the target MCU.

For devices that support DLM, the DLM state of the target device should then be switched to NSECSD (see section 6.2) before the device is provided to the non-secure developer.

This is often referred to as "Split model" where a basic security set up is developed by a Secure team and then passed to the Non-Secure team in the same facility or at a third party. The Non-Secure team has no access to the Secure source code and cannot directly access Secure peripherals, data, or APIs.

#### 3.6.4.7 Debug Configurations

After each project type has been selected, a suitable debug configuration will be generated.

**Non-Secure with Secure Project (Combined)**

Both Secure and Non-Secure .elf files will be downloaded.

A debug configuration called <project name>_SSD will be generated.

**Non-Secure with Secure Bundle (Split)**

Only a Non-Secure elf will be downloaded. This configuration must be used with a pre-provisioned device (Secure project pre-programmed into MCU Flash).

A debug configuration called <project name>_NSECSD will be generated.

**Flat Debug**

A single .elf file will be downloaded.

A debug configuration called <project name>_FLAT will be generated.

### 3.6.5 Secure Projects

As mentioned, Secure code will be called immediately after device reset and run ANSI C start up, clock, interrupt vector table, and secure peripheral initialization before starting user code. All selected peripheral configuration settings will be automatically initialised as Secure.

#### 3.6.5.1 Secure Clock

Device clock settings are the possible exception in that they will be initialised in the Secure project (to enable faster start up from reset) but can be set as Secure or Non-Secure as user application may need to change settings during execution (for low-power mode and so on). The Secure and Non-Secure FSP BSPs can both change the clock settings.

However, clock settings can be locked as Secure should the developer choose to do so.

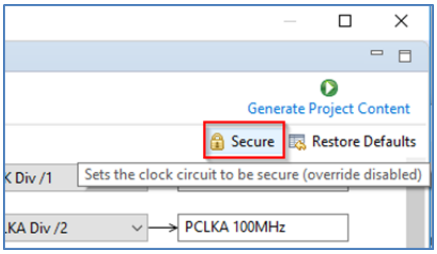

Figure 130: Secure Clock Setting

#### 3.6.5.2 Setting Drivers as NSC

Some driver and middleware stacks in the Secure project may need to be accessed by the Non-Secure partition. To enable generation of NSC veneers, set "Non-Secure Callable" from the right-click context menu for the selected modules in the Configurator.

Note: It is only possible to "expose" top of stacks as NSC.

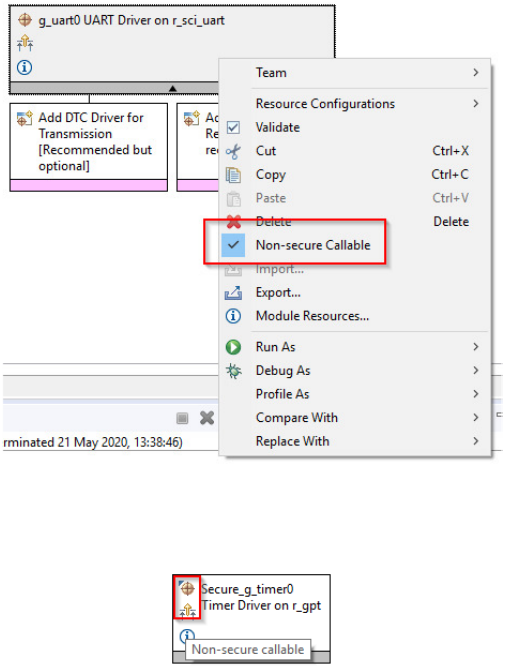

Figure 131: Generate NSC Veneers

The top of the stack will be marked with a new icon and tool tip to signify NSC access.

### 3.6.5.3 Guard Functions

Access to NSC drivers from a Non-Secure project is possible through the Guard APIs. FSP will automatically generate Guard functions for all the top of stack/driver APIs added to the project as Non-Secure Callable.

User can choose to add further levels of access control or delete guard function if they wish to only expose a limited range of APIs to a Non-Secure developer.

```
BSP_CMSE_NONSECURE_ENTRY fsp_err_t g_uart0_open_guard(
       uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg) {
    /* User can add security checks here */
    FSP_PARAMETER_NOT_USED(p_api_ctrl);
    FSP_PARAMETER_NOT_USED(p_cfg);
    return R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
}
```

For example, an SCI channel may be opened and configured for a desired baud rate by the Secure developer, but only enable the Write API to the Non-Secure developer. In which case, all but g_uart0_write_guard() could be deleted. CTRL structures are not required as they will be added on the Secure side.

For example, the call from the Non-Secure partition would be as follows:

```
err = g_uart0_open_guard(0,0);
```

## 3.6.6 Non-Secure projects

Configuration of the project can continue as for other RA devices, but certain resources will be locked if they have been previously set up as Secure.

The Non-Secure project will be called from the Secure project via R_BSP_NonSecureEnter();

### 3.6.6.1 Clock Set Up

You may recall that clocks can be set as Secure or Non-Secure. If they are set as Secure, settings will only be available to view, and user will not be able to change them. The Override button will be greyed. This is useful to preserve CGC sync with secure project by not overriding unless necessary. If it is NOT set as Secure, user can choose to override the initial Secure settings

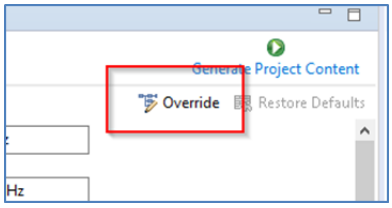

Figure 132: Clock Setting as Non-Secure

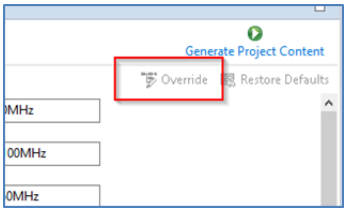

Figure 133: Clock Setting as Secure

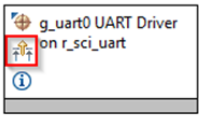
### 3.6.6.2 Selecting NSC Drivers

Drivers declared as NSC in a Secure project can be selected and added to Non-Secure project and will be decorated as before.



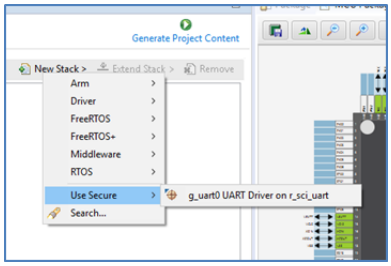


Figure 134: Selecting NSC Drivers

### 3.6.6.3 Locked Resources

When a NSC Secure driver is added to a Non-Secure project, the configuration settings are locked and are available for information only. A padlock is added for indication.

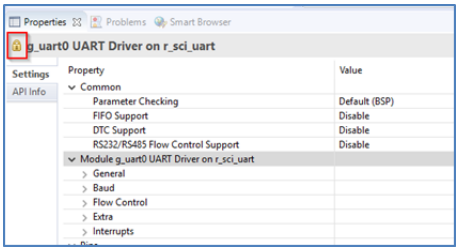

Figure 135: Locked Resources

### 3.6.6.4 Locked Channels

In a peripheral with multiple channels, for example, DMA, if a Non-Secure developer tries to select a channel that has already been defined as Secure, the following error message type will be displayed.

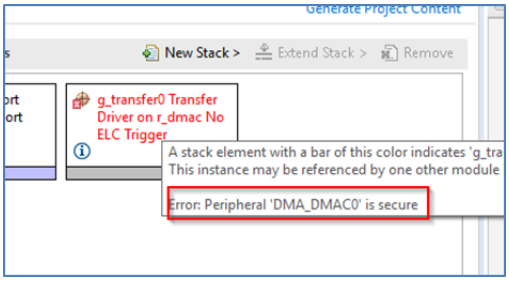

Figure 136: Error Message when Selecting a Secure Channel

## 3.6.7 IDAU registers

Renesas RA TrustZone-enabled devices include a set of registers known as Implementation Defined Attribution Unit (IDAU) that are used to set up partitions between Secure, Non-Secure Callable, and Non-Secure regions.

For devices that use DLM, the IDAU registers can only be programmed during MCU ***boot mode*** and NOT through the debug interfaces. Because of this, special debugger firmware has been developed to manage bringing the device up in SCI boot mode to set up the IDAU registers (automatically

drives MD pin) and then switch back to debug mode as needed.

**Note:** Please be aware of the extra signal connection (MD pin) needed on the debug interface connector. The Renesas Evaluation Kit (EK) for your selected device is a good reference.

| Pin No. | SWD | JTAG | Serial Programming using SCI |
|---|---|---|---|
| 1 | VCC | VCC | VCC |
| 2 | P108/SWDIO | P108/TMS | NC |
| 4 | P300/SWCLK<br>Wired OR with MD | P300/TCK<br>Wired OR with MD | P201/MD |
| 6 | P109/SWO/TXD9 | P109/TDO/TXD9 | P109/TXD9 |
| 8 | P110/RXD9 | P110/TDI/RXD9 | P110/RXD9 |
| 9 | GNDdetect | GNDdetect | GNDdetect |
| 10 | nRESET | nRESET | nRESET |
| 12 | P214/TRACECLK | P214/TRACECLK | NC |
| 14 | P211/TRACEDATA[0] | P211/TRACEDATA[0] | NC |
| 16 | P210/TRACEDATA[1] | P210/TRACEDATA[1] | NC |
| 18 | P209/TRACEDATA[2] | P209/TRACEDATA[2] | NC |
| 20 | P208/TRACEDATA[3] | P208/TRACEDATA[3] | NC |
| 3, 5, 15,17, 19 | GND | GND | GND |
| 7 | NC | NC | NC |
| 11, 13 | NC | NC | NC |

The e² studio build phase automatically extracts the IDAU partition register settings from the Secure .elf file and programs them into the device during debug connection, which can be observed in the console.

This is an important phase of TrustZone development as the Secure partitions should be set as small as possible to ensure that the security attack surface is as small as possible.

However, should the developer wish to make these partitions larger to accommodate, for example during field firmware updates, const or data arrays should be placed in the Secure project as needed.

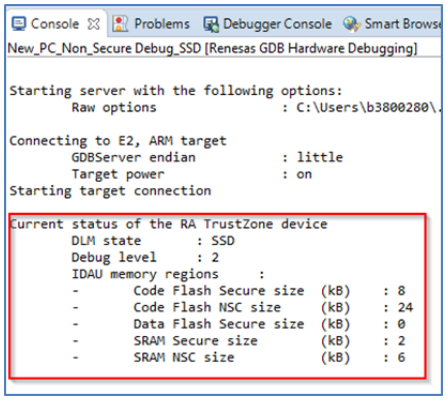

Figure 137: RA TrustZone Device Current Status

It is also possible to manually set up the partition registers through the Renesas Device Partition Manager.

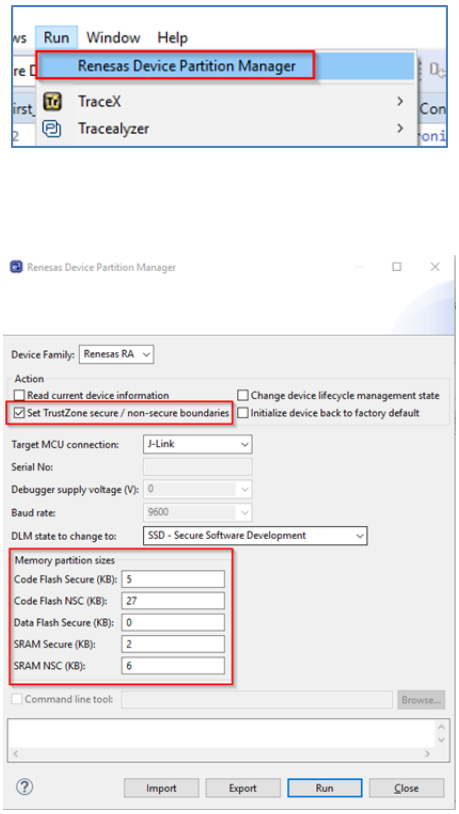

Figure 138: Renesas Device Partition Manager

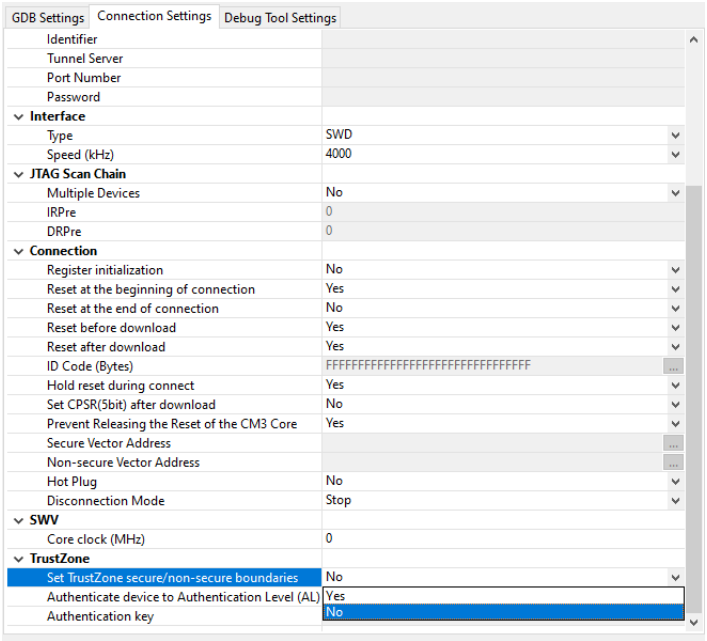
In e² studio, when manually setting partitions, make sure to disable setting partitions in the debug configuration to prevent the settings from being overridden when a debug session is launched.



### 3.6.7.1 SCI Boot Mode

Example of MD mode pin connection to debugger connector (from EK schematic).

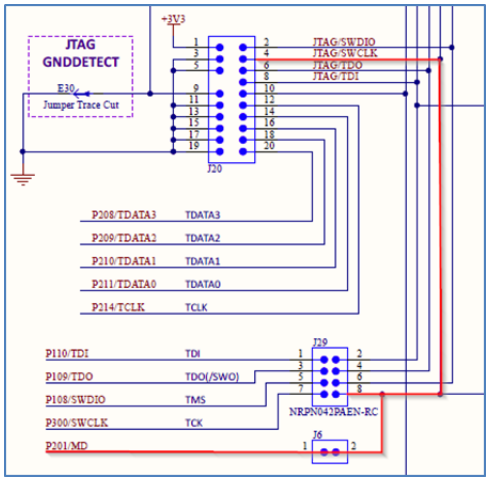


Figure 139: Example of MD Mode Pin Connection to Debugger Connector (from EK schematic

### 3.6.7.2 DLM States

Device lifecycle defines the current phase of the device and controls the capabilities of the debug interface, the serial programming interface and Renesas test mode. The following illustration shows the lifecycle definitions and capability in each lifecycle.

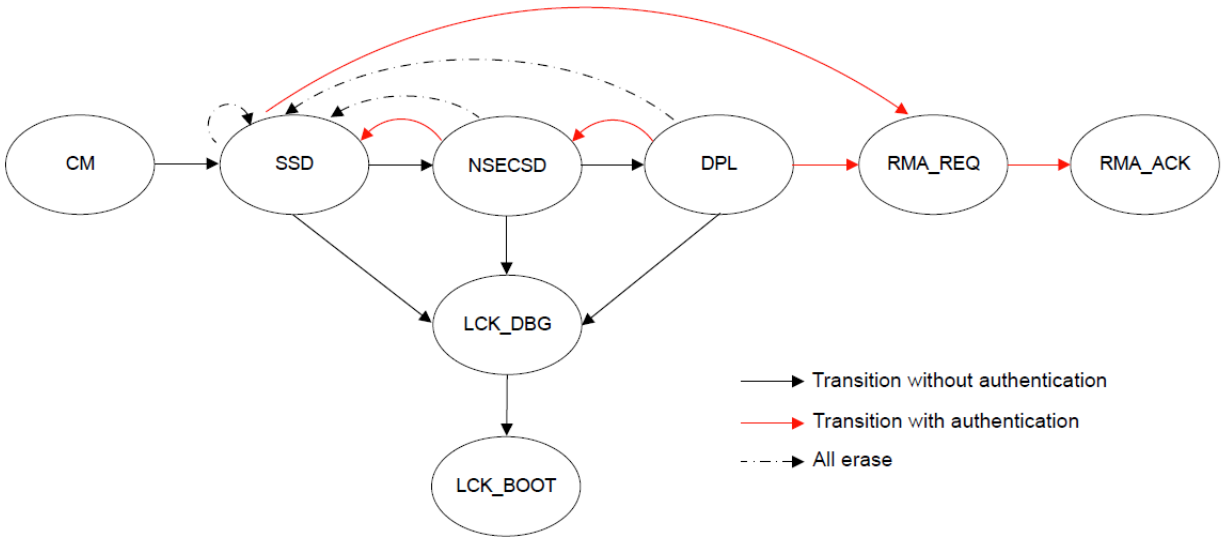

Figure 140: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_DBG, LCK_BOOT, RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

| Lifecycle | Definition | Debug level | Serial programming | Test mode |
|---|---|---|---|---|
| CM | "Chip Manufacturing"<br>The state when the customer received the device. | DBG2 | Available, cannot access code/data flash | Not available |
| SSD | "Secure Software Development"<br>The secure part of application is being developed. | DBG2 | Available<br>can program/erase/read all code/data flash area | Not available |
| NSECSD | "Non-SECure Software Development"<br>The non-secure part of application is being developed. | DBG1 | Available<br>can program/erase/read all code/data flash area | Not available |
| DPL | "DePLoyed"<br>The device is in-field. | DBG0 | Available<br>cannot access code/data flash area | Not available |
| LCK_DBG | "LoCKed DeBuG"<br>The debug interface is permanently disabled. | DBG0 | Available<br>cannot access code/data flash area | Not available |
| LCK_BOOT | "LoCKed BOOT interface"<br>The debug interface and the serial programming interface are permanently disabled. | DBG0 | Not available | Not available |
| RMA_REQ | "Return Material Authorization REQuest"<br>Request for RMA. The customer must send the device to Renesas in this state. | DBG0 | Available<br>cannot access code/data flash area | Not available |
| RMA_ACK | "Return Material Authorization ACKnowledged"<br>Failure analysis in Renesas | DBG2 | Available<br>cannot access code/data flash area | Available |

Figure 141: Lifecycle Stages and Debug Levels

There are three debug access levels. The debug access level changes according to the lifecycle state.

- DBG2: The debugger connection is allowed, and no restriction to access memories and peripherals
- DBG1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- DBG0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

### 3.6.7.3 Devices with Alternate DLM States

Some devices have an alternate implementation of Device Lifecycle Management (See Target Device ). While the concept is the same, the DLM states are a little different. The following illustration shows the lifecycle definitions and capability in each lifecycle.

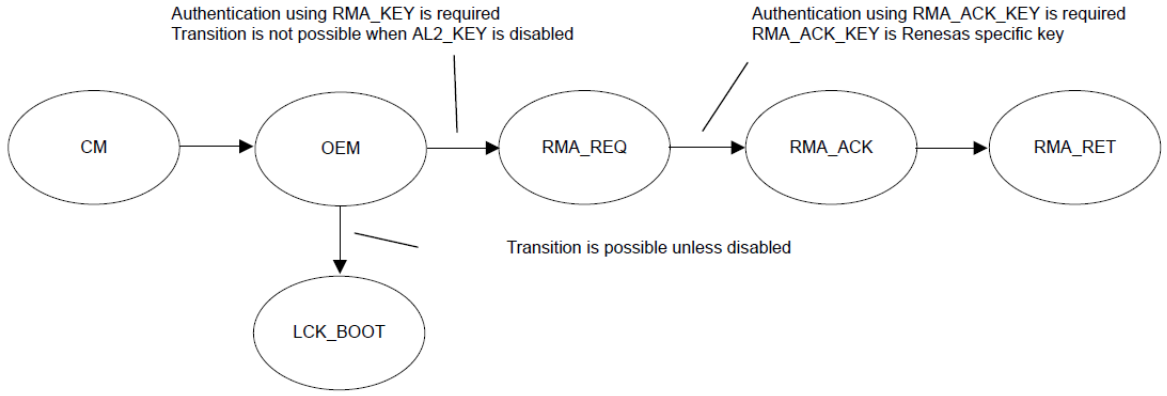

Figure 142: Lifecycle Stages

Note: All authentication key exchange and transitioning to LCK_BOOT, and RMA_REQ is only managed by Renesas Flash Programmer (RFP) or other production programming tools, and NOT within e² studio.

| Lifecycle | Definition | Protection level | Debug function | Serial programming | Renesas test mode |
|---|---|---|---|---|---|
| CM | "Chip Manufacturing"<br>The device is out of Renesas factory.<br>The customer receives the device in this state. | PL2 | Available in the secure and non-secure debug | Available<br>Cannot access code/data flash area | Not available |
| OEM | "Original Equipment Manufacturer"<br>The device is owned by the customer. | PL2 or PL1 or PL0 | Depend on the authentication level | | Not available |
| LCK_BOOT | "LoCKed BOOT interface"<br>The debug interface and the serial programming interface are permanently disabled. | PL0 | Not available | Not available | Not available |
| RMA_REQ | "Return Material Authorization REQuest"<br>Request for RMA. The customer must send the device to Renesas in this state. | PL0 | Not available | Available<br>Cannot access code/data flash area | Not available |
| RMA_ACK | "Return Material Authorization ACKnowledged"<br>Failure analysis in Renesas | PL2 | Available in the secure and non-secure debug | Available<br>Cannot access code/data flash area | Available |
| RMA_RET | "Return Material Authorization RETurn"<br>The device is back to the customer. The device does not boot. | PL0 | Not available | Not available | Not available |

Figure 143: Lifecycle Stages and Debug Levels

There are three authentication levels. The available authentication levels change according to the lifecycle state and determine the memory and resources that are accessible by the debugger.

- AL2: The debugger connection is allowed, and no restriction to access memories and peripherals
- AL1: The debugger connection is allowed, and restricted to access only Non-Secure memory regions and peripherals
- AL0: The debugger connection is not allowed

State transitions can be performed using the Renesas Flash Programmer (RFP, see section below) or using the Renesas Device Partition Manager (limited number of states possible). It is possible to secure transitions between states using authentication keys. For more information on DLM states and transitions (device specific), please refer to device user manual.

In addition to having different DLM States, these devices also handle memory partitioning differently. Code Flash and Data Flash partitions are divided into secure and non-secure regions using SCI or USB boot mode commands. All other memory regions are set in IDAU and SAU registers in the secure application during the BSP startup procedure. All memory regions and peripherals that are configured as non-secure must be accessed using an aliased non-secure address. This non-secure address is calculated by setting bit 28 in the address.

#### 3.6.7.4 Devices without DLM

For devices that do not have DLM, the IDAU registers are programmed by secure application code at startup. Devices without DLM do not support IDAU register programming using boot mode commands.

## 3.6.8 Debug

By default, devices supporting DLM will be in SSD mode and so allow access to Secure and Non-Secure partitions. In this mode both Secure and Non-Secure .elf files will be downloaded.

The current debugger status is displayed in the lower left corner and includes the DLM state (SSD or NSECSD) and current partition (Secure, Non-Secure, or Non-Secure Callable) when the debugger is stopped, for example.

Figure 144: Current Debugger Status

#### 3.6.8.1 Non-Secure Debug

Once the device is transitioned to NSECSD mode, only Non-Secure Flash, RAM and Peripherals can be accessed. In this mode, a Secure .elf must be pre-programmed (provisioned) into the device, and only a Non-Secure .elf file will be downloaded.

When in NSECSD mode access to Secure elements will be blocked and data displayed as ????????.

In NSECSD mode, it is not possible to set breakpoints on Secure code or data.

It is not possible to step into Secure code; the debugger will perform a step-over of any Secure function calls. Should the user press the Suspend button during execution, the debugger will stop at the next Non-Secure code access.

Assuming Secure memory region finishes at 32K (0x8000) in NSECSD debug mode (colour coding

added for indication only), memory will be displayed as shown in the following figure.

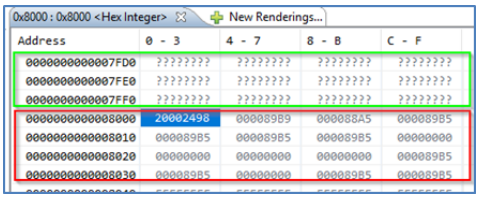

Figure 145: Memory Display in NSECSD Debug Mode

Disassembly will be displayed as shown in the following figure.

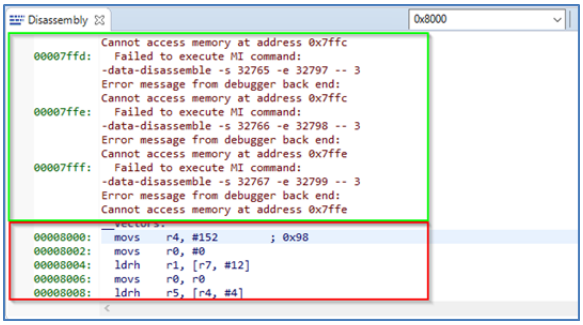

Figure 146: Disassembly Display in NSECSD Debug Mode

## 3.6.9 Debugger support

Renesas E2, E2 Lite, and SEGGER J-Link are supported in e² studio for TrustZone projects.

**Debugger Support for TrustZone Projects**

| Feature | E2 Lite | E2 | J-Link | J-Link OB | ULINK | IAR I-jet |

## 3.6.10 Third-Party IDEs

Third-party IDEs such as IAR Systems EWARM and Keil MDK (uVision) are supported by the RA Smart Configurator (RASC).

In general, RASC offers the same configurator functionality as e² studio documented above. Project generators are available to initialise workspaces in the target IDEs as well as setting up debug configurations and so forth. However, there are some limitations that need to be noted especially with regards to IDAU TrustZone partition register programming. See the specific RASC documentation for usage details.

## 3.6.11 Renesas Flash Programmer (RFP)

Updated versions of Renesas Flash Programmer (RFP) are available to support setting of partitions, DLM state and Authentication keys.

RFP can be downloaded free of charge on the Renesas web site.

A new mode has been added to Program Flash Options as shown in the following graphics.

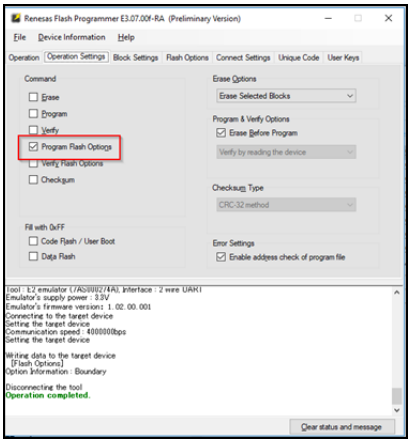

Figure 147: RFP Program Flash Options

Options to set partition boundaries are shown in the following figure.

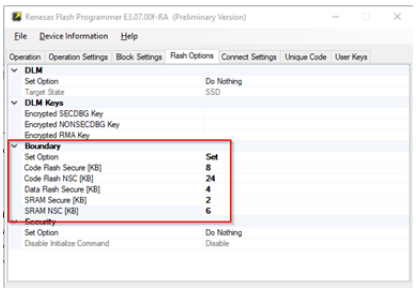

Figure 148: RFP Partition Boundaries

Options to set DLM state, Authentication keys, and Security settings are shown in the following figure.

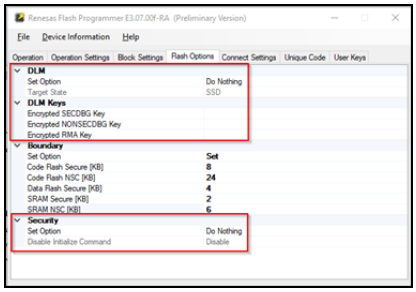

Figure 149: RFP DLM State, Authentication Keys, and Security Settings

Great care is needed here as some DLM states can **permanently** turn off debug and boot mode on the devices. Equally programming a security access authentication key can lead to permanently locked devices if the key is lost.

## 3.6.12 Glossary

**IDAU**

Implementation Defined Attribute Unit. Used to program TrustZone partitions.

**NSECSD**

Non-Secure Software Development mode

**SSD**

Secure Software Development mode

**NSC**

Non-Secure Callable. Special Secure memory region used for Veneer to allow access to Secure APIs from Non-Secure code.

**Provisioned**

Device with Secure code pre-programmed and DLM state set to **NSECSD**

**Flat project**

All code, data and peripherals are configured as secure with the exception of the EDMAC RAM buffer which are placed in Non-Secure RAM due to the configuration of the internal bus masters.

**Veneer**

Code that resides in Non-Secure Callable region

**Combined model**

Development engineer has access to both Secure and Non-Secure project and source code

**Split model**

Development Engineer has access to only the Non-Secure partition. No visibility of Secure source code. Secure code will be provisioned into device.

#### 3.6.12.1 Configurator Icon Glossary

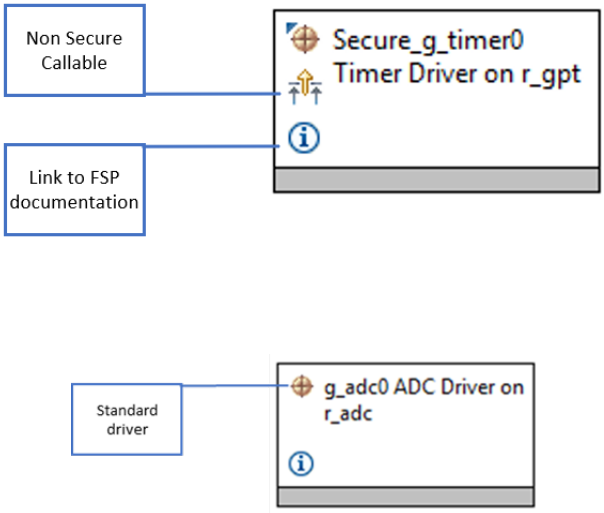

Figure 150: Configurator Icons

# 3.7 RASC User Guide for MDK and IAR

## 3.7.1 What is RASC?

The Renesas RA Smart Configurator (RASC) is a desktop application designed to configure device hardware such as clock set up and pin assignment as well as initialization of FSP software components for a Renesas RA microcontroller project when using a 3rd-party IDE and toolchain.

The RA Smart Configurator can currently be used with

1. Keil MDK and the Arm compiler toolchain.
2. IAR EWARM with IAR toolchain for Arm

Projects can be configured and the project content generated in the same way as in e² studio. Please refer to Configuring a Project section for more details.

## 3.7.2 Using RA Smart Configurator with Keil MDK

#### 3.7.2.1 Prerequisites

- Keil MDK and Arm compiler are installed and licensed. Please refer to the RASC Release notes for the version to be installed.
- Import the RA device pack. Download the RA device pack archive file (ex: MDK_Device_Packs_2.x.x.zip) from the FSP GitHub release page. Extract the archive file to locate the RA device pack. To import the RA device pack, launch the PackInstaller.exe from <keil_mdk_install_dir>\UV4. Select the menu item **File > Import...** and browse to the

extracted .pack file.
- Verify that the latest updates for RA devices are included in Keil MDK. To verify, select the menu "Packs" in Pack Installer and verify that the menu item **Check for Updates on Launch** is selected. If not, select **Check for Updates on Launch** and relaunch Pack Installer.
- For flashing and debugging, the latest Segger J-Link DLL is installed into Keil MDK.
- Install RASC and FSP using the Platform Installer from the GitHub release page.

#### 3.7.2.2 Create new RA project

The following steps are required to create an RA project using Keil MDK, RASC and FSP:

1. Start the RA Smart Configurator.

2. Enter a project folder and project name.

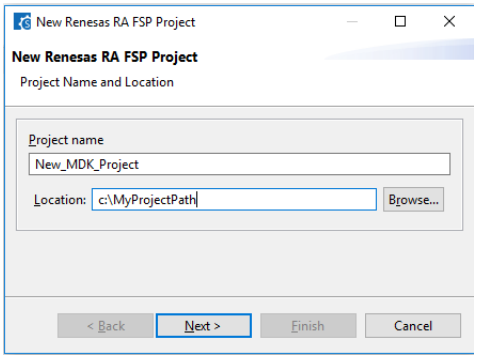

Figure 151: RASC project settings

3. Select the target device and IDE.

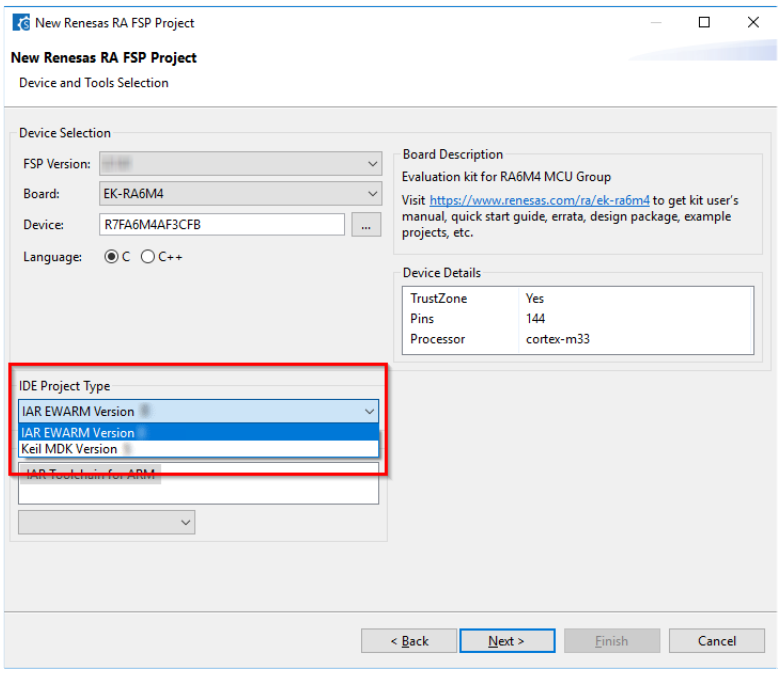

Figure 152: Target device and IDE selection

4. The rest of the project generator and FSP configuration is the same as e² studio. Please refer to the previous sections for details.
5. On completion of FSP configuration, press "Generate Project Content"

6. A new Keil MDK project file will be generated in the project path. Double click this file to open MDK and continue development as usual.

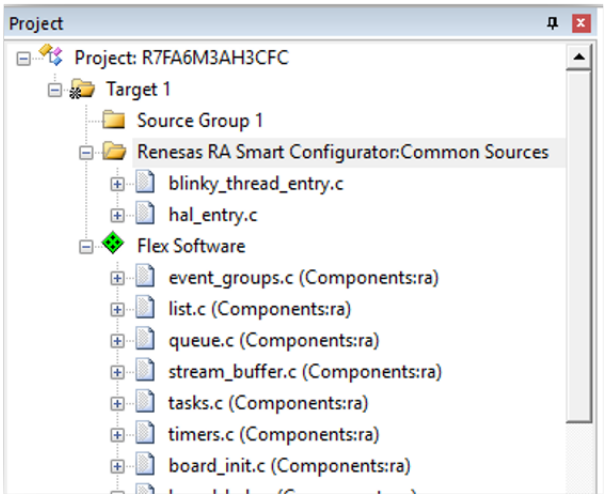

Figure 153: uVision project workspace with imported project data

### 3.7.2.3 Modify existing RA project

Once an initial project has been generated and configured, it is also possible to make changes using RASC as follows.

*Note*

*This setup only needs to be done once per project.*

Set up the following links to RASC:

1. In Keil MDK uVision, select **Tools > Customize Tools Menu...**.
2. Select the **new** icon and fill in the fields as follows for each tool:
    a. RA Smart Configurator:
        - Menu item name: Enter: RA Smart Configurator
        - Command: Select "..." and navigate to rasc.exe
        - Initial Folder: Enter: $P
        - Arguments: Enter: configuration.xml

    b. Device Partition Manager:
        - Menu item name: Enter: Device Partition Manager
        - Command: Select "..." and navigate to rasc.exe
        - Initial Folder: Enter: $P
        - Arguments: Enter: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "$L%L"

To reconfigure an existing project select **Tools > RA Smart Configurator**

To reconfigure the TrustZone partitions select **Tools > Device Partition Manager**

### 3.7.2.4 Build and Debug RA project

The project can be built by selecting the menu item **Project > Build Target** or tool bar item **Rebuild** or the keyboard shortcut F7.

Assembler, Compiler, Linker and Debugger settings can be changed in **Options for Target** dialog, which can be launched using the menu item **Project > Options for Target**, the tool bar item **Options for Target** or the keyboard shortcut Alt+F7.

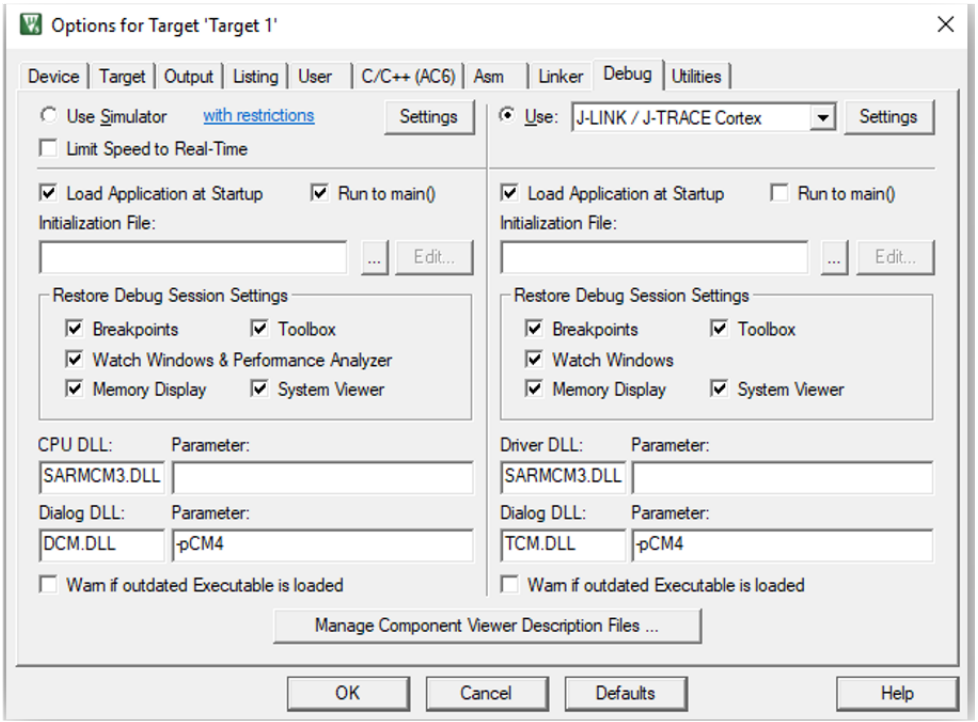

Figure 154: Options for Target

RASC will set up the uVision project to debug the selected device using J-Link or J-Link OB debugger by default.

A Debug session can be started or stopped by selecting the menu item **Debug > Start/Stop Debug Session** or keyboard shortcut CTRL+F5. When debugging for the first time, J-Link firmware update may be needed if requested by the tool.

Refer to the documentation from Keil to get more information on the debug features in uVision. Note that not all features supported by uVision debugger are implemented in the J-Link interface. Consult SEGGER J-Link documentation for more information.

#### 3.7.2.5 Notes and Restrictions

1. **When debugging a TrustZone based project, the Secure project image MUST be downloaded before the Non Secure project.**

2. For TrustZone enabled devices, the user will need to manually set up the memory partitions using the "Renesas Device Partition Manager" from inside RASC before downloading.

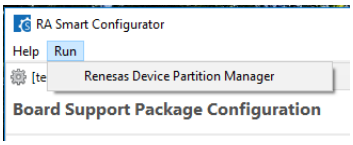

Figure 155: Renesas Device partition Manager

3. RA FSP contains a full set of drivers and middleware and may not be compatible with other CMSIS packs from Keil, Arm or third parties.
4. Flash programming is currently only supported through the debugger connection.

### 3.7.3 Using RA Smart Configurator with IAR EWARM

IAR Systems Embedded Workbench for Arm (EWARM) includes support for Renesas RA devices. These can be set up as bare metal designs within EWARM. However, most RA developers will want to integrate RA FSP drivers and middleware into their designs. RASC will facilitate this.

RASC generates a "Project Connection" file that can be loaded directly into EWARM to update project files.

#### 3.7.3.1 Prerequisites

- IAR EWARM installed and licensed. Pleae refer to the Release notes for the version to be installed.
- RASC and FSP Installed

#### 3.7.3.2 Create new RA project

The following steps are required to create an RA project using IAR EWARM, RASC and FSP:

1. Start the RA Smart Configurator.

2. Enter a project folder and project name.

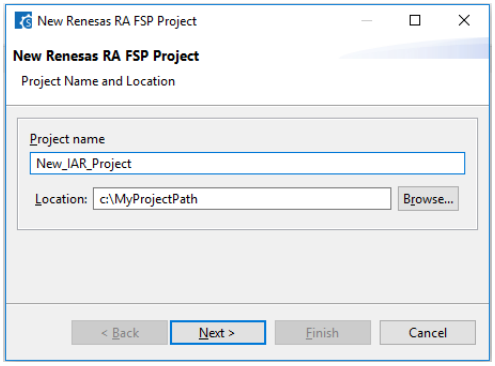

Figure 156: RASC project settings

3. Select the target device and IDE.

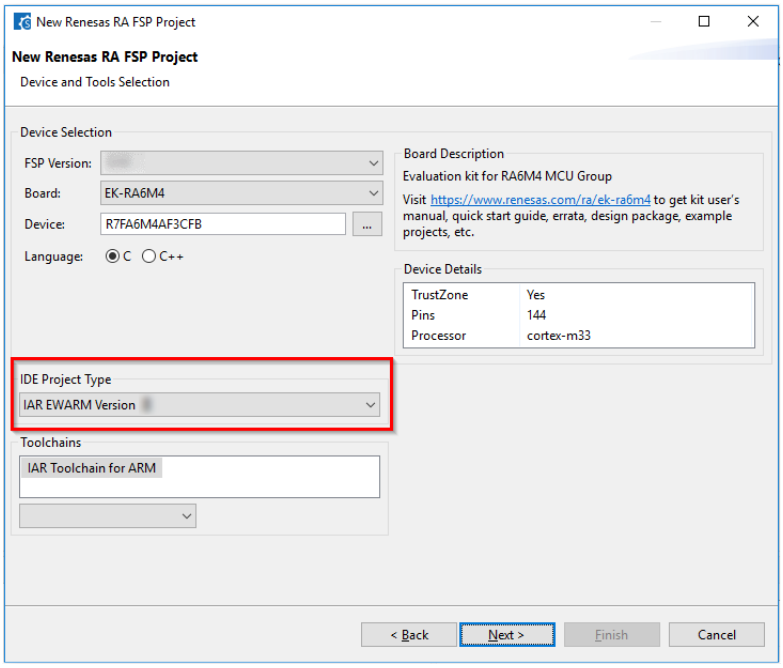

Figure 157: Target device and IDE selection

4. The rest of the project generator and FSP configuration operates the same as e² studio. Refer to the previous sections for details.
5. On completion of FSP configuration, press **Generate Project Content**.
6. A new IAR EWARM project file will be generated in the project path. Double click this file to open IAR EWARM and continue development as usual.
7. To Use RASC with EWARM, RASC needs to configured as a tool in EWARM by selecting the menu item **Tools > Configure Tools...**. Select **New** to create a new tool in the dialog shown and add the following information:
    - Menu Text: **RA Smart Configurator**
        a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
        b. Argument: configuration.xml

c. Initial Directory: $PROJ_DIR$
d. Tool Available: Always

- Menu Text: **Device Partition Manager**
  a. Command: Select **Browse...** and navigate to rasc.exe in the installed RASC
  b. Argument: -application com.renesas.cdt.ddsc.dpm.ui.dpmapplication configuration.xml "$TARGET_PATH$"
  c. Initial Directory: $PROJ_DIR$
  d. Tool Available: Always

8. RASC can now be re-launched from EWARM using the menu item **Tools > RA Smart Configurator**.
9. A Project connection needs to be set up in EWARM to build the project. Select **Project > Add Project Connection** in EWARM and select **IAR Project Connection**. Navigate to the project folder and select buildinfo.ipcf and click **Open**. The project can now build in EWARM.

#### 3.7.3.3 Notes and Restrictions

When starting a TrustZone enabled debug session Partition sizes are checked automatically.

- If partition sizes are set correctly, the debug session will launch as normal.
- If partition sizes need to be changed, IAR EWARM will prompt to run the Renesas Device Partition Manager. Select **Yes**. The Device Partition Manager will start with the required partition sizes prefilled.
- Select **Set TrustZone secure / non-secure boundaries** as the only action.
- Enter debugger details, if required.
- Select **Run** to program the partitions.
- Return to the IDE and relaunch the debug session

# Chapter 4 FSP Architecture

## 4.1 FSP Architecture Overview

This guide describes the Renesas Flexible Software Package (FSP) architecture and how to use the FSP Application Programming Interface (API).

### 4.1.1 C99 Use

FSP uses the ISO/IEC 9899:1999 (C99) C programming language standard. Specific features introduced in C99 that are used include standard integer types (stdint.h), booleans (stdbool.h), designated initializers, and the ability to intermingle declarations and code.

### 4.1.2 Doxygen

Doxygen is the default documentation tool used by FSP. You can find Doxygen comments throughout the FSP source.

### 4.1.3 Weak Symbols

Weak symbols are used occasionally in FSP. They are used to ensure that a project builds even when the user has not defined an optional function.

### 4.1.4 Memory Allocation

Dynamic memory allocation through use of the malloc() and free() functions are not used in FSP modules; all memory required by FSP modules is allocated in the application and passed to the module in a pointer. Exceptions are considered only for ports of 3rd party code that require dynamic memory.

### 4.1.5 FSP Terms

| Term | Description | Reference |
|---|---|---|
| BSP | Short for Board Support Package. In FSP, the BSP provides just enough foundation to allow other FSP modules to work together without issue. | MCU Board Support Package |

| | | |
|---|---|---|
| Module | Modules can be peripheral drivers, purely software, or anything in between. Each module consists of a folder with source code, documentation, and anything else that the customer needs to use the code effectively. Modules are independent units, but they may depend on other modules. Applications can be built by combining multiple modules to provide the user with the features they need. | FSP Modules |
| Driver | A driver is a specific kind of module that directly modifies registers on the MCU. | - |
| Interface | An interface contains API definitions that can be shared by modules with similar features. Interfaces are definitions only and do not add to code size. | FSP Interfaces |
| Stacks | The FSP architecture is designed such that modules work together to form a stack. A stack consists of a top level module and all its dependencies. | FSP Stacks |
| Module Instance | Single and independent instantiation of a module. An application may require two GPT timers. Each of these timers is a module instance of the r_gpt module. | - |
| Application | Code that is owned and maintained by the user. Application code may be based on sample application code provided by Renesas, but it is the responsibility of the user to maintain as necessary. | - |

| | | |
|---|---|---|
| Callback Function | This term refers to a function that is called when an event occurs. As an example, suppose the user would like to be notified every second based on the RTC. As part of the RTC configuration, a callback function can be supplied that will be jumped to during each RTC interrupt. When a single callback services multiple events, the arguments contain the triggering event. Callback functions for interrupts should be kept short and handled carefully because when they are called the MCU is still inside of an interrupt, delaying any pending interrupts. | - |

# 4.2 FSP Modules

Modules are the core building block of FSP. Modules can do many different things, but all modules share the basic concept of providing functionality upwards and requiring functionality from below.

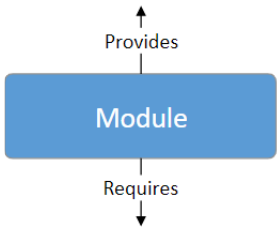

Figure 158: Modules

The amount of functionality provided by a module is determined based on functional use cases. Common functionality required by multiple modules is often placed into a self-contained submodule so it can be reused. Code size, speed and complexity are also considered when defining a module.

The simplest FSP application consists of one module with the Board Support Package (BSP) and the user application on top.

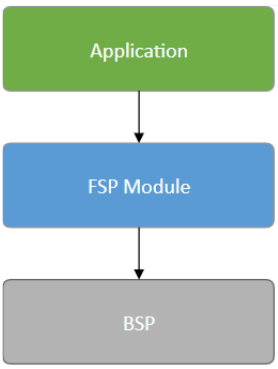

Figure 159: Module with application

The Board Support Package (BSP) is the foundation for FSP modules, providing functionality to determine the MCU used as well as configuring clocks, interrupts and pins. For the sake of clarity, the BSP will be omitted from further diagrams.

### 4.2.1 Module Sources

Some modules distributed alongside FSP originate from outside sources. A full list of sources for FSP modules, including versions and hyperlinks, can be found in the Third Party Software section of the release notes for each release.

### 4.2.2 Module Distribution

All modules distributed with FSP are packaged as CMSIS components in CMSIS packs. Each module consists of source files and a tooling support file used to integrate the module with e² studio or RASC. The tooling support file defines the configurations used to generate code in the ra_gen and ra_cfg folders.

### 4.2.3 Module Versioning

Module versions can be seen on the Components tab of the FSP Configuration editor. The FSP Configuration editor automatically selects compatible components.

All third party modules have a semantic version are versioned with their original semantic version plus added metadata fsp.<fsp_semantic_version>. The metadata is added to reflect the tooling support file added for the FSP configuration tool.

Third party modules versioned with +renesas.<counter> in the metadata have been forked and updated for FSP. If +renesas.<counter> is not in the metadata, the third party code is unchanged from its original source.

If changes are made to third party module source code to support FSP, the changes are pushed to a public Renesas GitHub fork of the original source. Links to Renesas forks are provided in the Third Party Software section of the release notes for each release.

Modules that originate from outside sources that do not have a semantic version are versioned with the FSP version.

All modules that are part of FSP or integrated with FSP are tested as a package. Mixing versions is not encouraged and may lead to support issues.

# 4.3 FSP Stacks

When modules are layered atop one another, an FSP stack is formed. The stacking process is performed by matching what one module provides with what another module requires. For example, the SPI module (SPI (r_spi)) requires a module that provides the transfer interface (Transfer Interface ) to send or receive data without a CPU interrupt. The transfer interface requirement can be fulfilled by the DTC driver module (Transfer (r_dtc)).

Through this methodology the same code can be shared by several modules simultaneously. The example below illustrates how the same DTC module can be used with SPI (SPI (r_spi)), UART (UART (r_sci_uart)) and SDHI (SD/MMC (r_sdhi)).

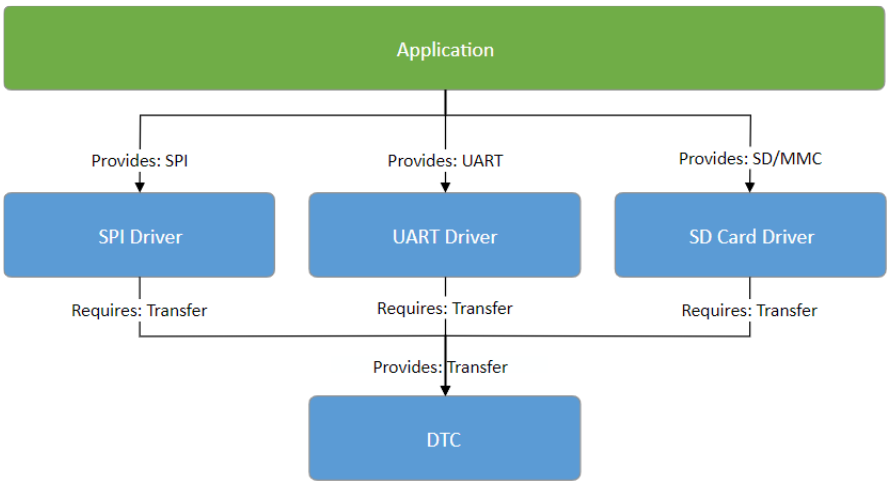

Figure 160: Stacks -- Shared DTC Module

The ability to stack modules ensures the flexibility of the architecture as a whole. If multiple modules include the same functionality issues arise when application features must work across different user designs. To ensure that modules are reusable, any dependent modules must be capable of being swapped out for other modules that provide the same features. The FSP architecture provides this flexibility to swap modules in and out through the use of FSP interfaces.

# 4.4 FSP Interfaces

At the architecture level, interfaces are the way that modules provide common features. This commonality allows modules that adhere to the same interface to be used interchangeably. Interfaces can be thought of as a contract between two modules - the modules agree to work together using the information that was established in the contract.

On RA hardware there is occasionally an overlap of features between different peripherals. For example, I2C communications can be achieved through use of the IIC peripheral or the SCI peripheral. However, there is a difference in the level of features provided by both peripherals; in I2C mode the SCI peripheral will only support a subset of the capabilities of the fully-featured IIC.

Interfaces aim to provide support for the common features that most users would expect. This means that some of the advanced features of a peripheral (such as IIC) might not be available in the interface. In most cases these features are still available through interface extensions.

In FSP design, interfaces are defined in header files. All interface header files are located in the folder

ra/fsp/inc/api and end with *_api.h. Interface extensions are defined in header files in the folder ra/fsp/inc/instances. The following sections detail what makes up an interface.

### 4.4.1 FSP Interface Enumerations

Whenever possible, interfaces use typed enumerations for function parameters and structure members.

```
typedef enum e_i2c_master_addr_mode
{
    I2C_MASTER_ADDR_MODE_7BIT = 1,    ///< Use 7-bit addressing mode
    I2C_MASTER_ADDR_MODE_10BIT = 2,    ///< Use 10-bit addressing mode
} i2c_master_addr_mode_t;
```

Enumerations remove uncertainty when deciding what values are available for a parameter. FSP enumeration options follow a strict naming convention where the name of the type is prefixed on the available options. Combining the naming convention with the autocomplete feature available in e² studio (Ctrl + Space) provides the benefits of rapid coding while maintaining high readability.

### 4.4.2 FSP Interface Callback Functions

Callback functions allow modules to asynchronously alert the user application when an event has occurred, such as when a byte has been received over a UART channel or an IRQ pin is toggled. FSP driver modules define and handle the interrupt service routines for RA MCU peripherals to ensure any required hardware procedures are implemented. The interrupt service routines in FSP modules then call the user-defined callbacks to allow the application to respond.

Callback functions must be defined in the user application. They always return void and take a structure for their one parameter. The structure is defined in the interface for the module and is named <interface>_callback_args_t. The contents of the structure may vary depending on the interface, but two members are common: event and p_context.

The event member is an enumeration defined in the interface used by the application to determine why the callback was called. Using the UART example, the callback could be triggered for many different reasons, including when a byte is received, all bytes have been transmitted, or a framing error has occurred. The event member allows the application to determine which of these three events has occurred and handle it appropriately.

The p_context member is used for providing user-specified data to the callback function. In many cases a callback function is shared between multiple channels or module instances; when the callback occurs, the code handling the callback needs context information so that it can determine which module instance the callback is for. For example, if the callback wanted to make an FSP API call in the callback, then at a minimum the callback will need a reference to the relevant control structure. To make this easy, the user can provide a pointer to the control structure as the p_context. When the callback occurs, the control structure is passed in the p_context element of the callback structure.

Callback functions are called from within an interrupt service routine. For this reason callback functions should be kept as short as possible so they do not affect the real time performance of the user's system. An example skeleton function for the flash interface callback is shown below.

```
void flash_callback (flash_callback_args_t * p_args)
{
 /* See what event caused this callback. */
 switch (p_args->event)
    {
 case FLASH_EVENT_ERASE_COMPLETE:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_WRITE_COMPLETE:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_BLANK:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_NOT_BLANK:
      {
 /* Handle event. */
 break;
       }
 case FLASH_EVENT_ERR_DF_ACCESS:
      {
 /* Handle error. */
 break;
       }
 case FLASH_EVENT_ERR_CF_ACCESS:
      {
 /* Handle error. */
 break;
```

```
      }
 case FLASH_EVENT_ERR_CMD_LOCKED:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_FAILURE:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_ONE_BIT:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_TWO_BIT:
     {
 /* Handle error. */
 break;
      }
 case FLASH_EVENT_ERR_ECC:
     {
 /* Handle error. */
 break;
      }
   }
}
```

When a module is not directly used in the user application (that is, it is not the top layer of the stack), its callback function will be handled by the module above. For example, if a module requires a UART interface module the upper layer module will control and use the UART's callback function. In this case the user would not need to create a callback function for the UART module in their application code.

### 4.4.3 FSP Interface Data Structures

At a minimum, all FSP interfaces include three data structures: a configuration structure, an API structure, and an instance structure.

#### 4.4.3.1 FSP Interface Configuration Structure

The configuration structure is used for the initial configuration of a module during the <MODULE>_Open() call. The structure consists of members such as channel number, bitrate, and operating mode.

The configuration structure is used purely as an input into the module. It may be stored and referenced by the module, so the configuration structure and anything it references must persist as long as the module is open.

The configuration structure is allocated for each module instance in files generated by the RA Configuration editor.

When FSP stacks are used, it is also important to understand that configuration structures only have members that apply to the current interface. If multiple layers in the same stack define the same configuration parameters then it becomes difficult to know where to modify the option. For example, the baud rate for a UART is only defined in the UART module instance. Any modules that use the UART interface rely on the baud rate being provided in the UART module instance and do not offer it in their own configuration structures.

#### 4.4.3.2 FSP Interface API Structure

All interfaces include an API structure which contains function pointers for all the supported interface functions. An example structure for the DAC is shown below.

```
typedef struct st_dac_api
{
    /** Initial configuration.
    *
    * @param[in] p_ctrl Pointer to control block. Must be declared by user. Elements
set here.
    * @param[in] p_cfg Pointer to configuration structure. All elements of this
structure must be set by user.
    */
    fsp_err_t (* open)(dac_ctrl_t * const p_ctrl, dac_cfg_t const * const p_cfg);
    /** Close the D/A Converter.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    */
    fsp_err_t (* close)(dac_ctrl_t * const p_ctrl);
    /** Write sample value to the D/A Converter.
```

```
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    * @param[in] value Sample value to be written to the D/A Converter.
    */
    fsp_err_t (* write)(dac_ctrl_t * const p_ctrl, uint16_t value);
    /** Start the D/A Converter if it has not been started yet.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    */
    fsp_err_t (* start)(dac_ctrl_t * const p_ctrl);
    /** Stop the D/A Converter if the converter is running.
    *
    * @param[in] p_ctrl Control block set in @ref dac_api_t::open call for this
timer.
    */
    fsp_err_t (* stop)(dac_ctrl_t * const p_ctrl);
} dac_api_t;
```

The API structure is what allows for modules to easily be swapped in and out for other modules that are instances of the same interface. Let's look at an example application using the DAC interface above.

RA MCUs have an internal DAC peripheral. If the DAC API structure in the DAC interface is not used the application can make calls directly into the module. In the example below the application is making calls to the R_DAC_Write() function which is provided in the r_dac module.

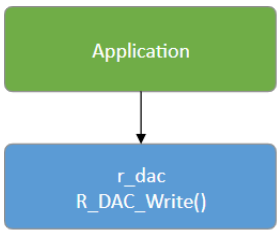

Figure 161: DAC Write example

Now let's assume that the user needs more DAC channels than are available on the MCU and decides to add an external DAC module named dac_external using I2C for communications. The application must now distinguish between the two modules, adding complexity and further

dependencies to the application.

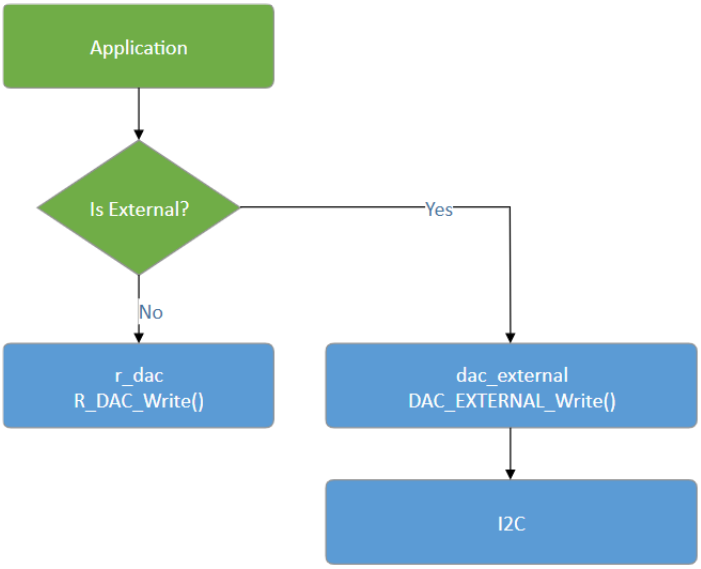

Figure 162: DAC Write with two write modules

The use of interfaces and the API structure allows for the use of an abstracted DAC. This means that no extra logic is needed if the user's dac_external module implements the FSP DAC interface, so the application no longer depends upon hard-coded module function names. Instead the application now depends on the DAC interface API which can be implemented by any number of modules.

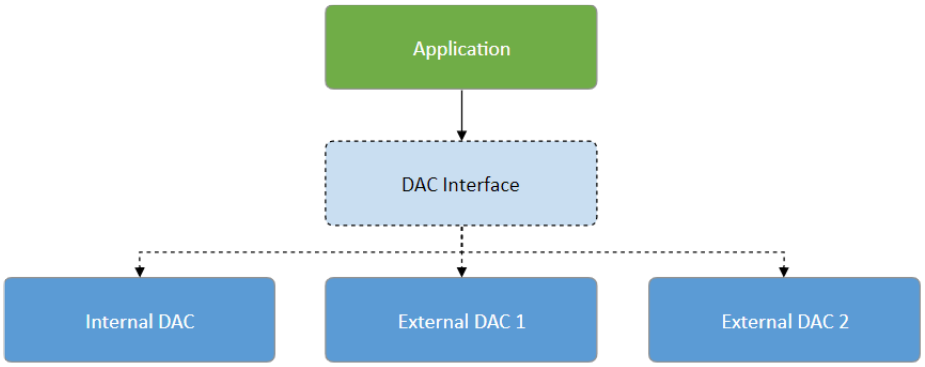

Figure 163: DAC Interface

#### 4.4.3.3 FSP Interface Instance Structure

Every FSP interface also has an instance structure. The instance structure encapsulates everything required to use the module:

- A pointer to the instance API structure (FSP Instance API)
- A pointer to the configuration structure
- A pointer to the control structure

The instance structure is not required at the application layer. It is used to connect modules to their dependencies (other than the BSP).

Instance structures have a standardized name of <interface>_instance_t. An example from the Transfer Interface is shown below.

```
typedef struct st_transfer_instance
{
  transfer_ctrl_t     * p_ctrl; ///< Pointer to the control structure for this
instance
    transfer_cfg_t const * p_cfg;      ///< Pointer to the configuration structure
for this instance
    transfer_api_t const * p_api;      ///< Pointer to the API structure for this
instance
} transfer_instance_t;
```

Note that when an instance structure variable is declared, the API is the only thing that is instance specific, not *module instance* specific. This is because all module instances of the same module share the same underlying module source code. If SPI is being used on SCI channels 0 and 2 then both module instances use the same API while the configuration and control structures are typically different.

# 4.5 FSP Instances

While interfaces dictate the features that are provided, instances actually implement those features. Each instance is tied to a specific interface. Instances use the enumerations, data structures, and API prototypes from the interface. This allows an application that uses an interface to swap out the instance when needed.

On RA MCUs some peripherals are used to implement multiple interfaces. In the example below the IIC and SPI peripherals map to only one interface each while the SCI peripheral implements three interfaces.

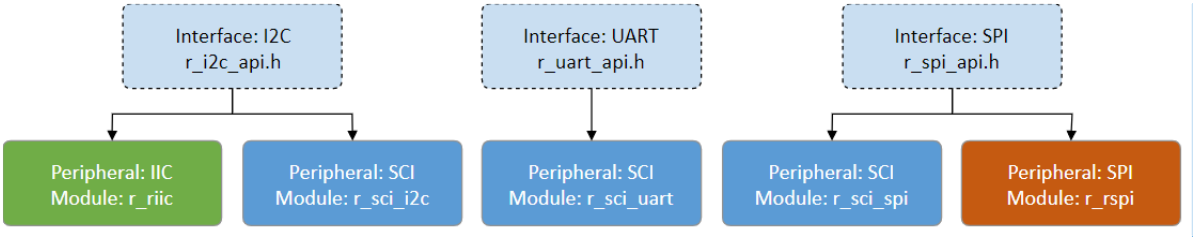

Figure 164: Instances

In FSP design, instances consist of the interface extension and API defined in the instance header file located in the folder ra/fsp/inc/instances and the module source ra/fsp/src/<module>.

## 4.5.1 FSP Instance Control Structure

The control structure is used as a unique identifier for the module instance and contains memory

required by the module. Elements in the control structure are owned by the module and *must not be modified* by the application. The user allocates storage for a control structure, often as a global variable, then sends a pointer to it into the <MODULE>_Open() call for a module. At this point, the module initializes the structure as needed. The user must then send in a pointer to the control structure for all subsequent module calls.

### 4.5.2 FSP Interface Extensions

In some cases, instances require more information than is provided in the interface. This situation can occur in the following cases:

- An instance offers extra features that are not common to most instances of the interface. An example of this is the start source selection of the GPT (Timer, General PWM (r_gpt)). The GPT can be configured to start based on hardware events such as a falling edge on a trigger pin. This feature is not common to all timers, so it is included in the GPT instance.
- An interface must be very generic out of necessity. As an interface becomes more generic, the number of possible instances increases. An example of an interface that must be generic is a block media interface that abstracts functions required by a file system. Possible instances include SD card, SPI Flash, SDRAM, USB, and many more.

The p_extend member provides this extension function.

Use of interface extensions is not always necessary. Some instances do not offer an extension since all functionality is provided in the interface. In these cases the p_extend member can be set to NULL. The documentation for each instance indicates whether an interface extension is available and whether it is mandatory or optional.

#### 4.5.2.1 FSP Extended Configuration Structure

When extended configuration is required it can be supplied through the p_extend parameter of the interface configuration structure.

The extended configuration structure is part of the instance, but it is also still considered to be part of the configuration structure. All usage notes about the configuration structure described in FSP Interface Configuration Structure apply to the extended configuration structure as well.

The extended configuration structure and all typed structures and enumerations required to define it make up the interface extension.

### 4.5.3 FSP Instance API

Each instance includes a constant global variable tying the interface API functions to the functions provided by the module. The name of this structure is standardized as g_<interface>_on_<instance>. Examples include g_spi_on_spi, g_transfer_on_dtc, and g_adc_on_adc. This structure is available to be used through an extern in the instance header file (r_spi.h, r_dtc.h, and r_adc.h respectively).

## 4.6 FSP API Standards

### 4.6.1 FSP Function Names

FSP functions start with the uppercase module name (<MODULE>). All modules have <MODULE>_Open() and <MODULE>_Close() functions. The <MODULE>_Open() function must be called before any of the other functions.

Other functions that will commonly be found are <MODULE>_Read(), <MODULE>_Write(), <MODULE>_InfoGet(), and <MODULE>_StatusGet(). The <MODULE>_StatusGet() function provides a status that could change asynchronously, while <MODULE>_InfoGet() provides information that cannot change after open or can only be updated by API calls. Example function names include:

- R_SPI_Read(), R_SPI_Write(), R_SPI_WriteRead()
- R_SDHI_StatusGet()
- R_RTC_CalendarAlarmSet(), R_RTC_CalendarAlarmGet()
- R_FLASH_HP_AccessWindowSet(), R_FLASH_HP_AccessWindowClear()

### 4.6.2 Use of const in API parameters

The const qualifier is used with API parameters whenever possible. An example case is shown below.

```
fsp_err_t R_FLASH_HP_Open(flash_ctrl_t * const p_api_ctrl, flash_cfg_t const * const
p_cfg);
```

In this example, flash_cfg_t is a structure of configuration parameters for the r_flash_hp module. The parameter p_cfg is a pointer to this structure. The first const qualifier on p_cfg ensures the flash_cfg_t structure cannot be modified by R_FLASH_HP_Open(). This allows the structure to be allocated as a const variable and stored in ROM instead of RAM.

The const qualifier after the pointer star for both p_ctrl and p_cfg ensures the FSP function does not modify the input pointer addresses. While not fool-proof by any means this does provide some extra checking inside the FSP code to ensure that arguments that should not be altered are treated as such.

### 4.6.3 FSP Version Information

The BSP provides a function R_FSP_VersionGet() which fills in a structure of type fsp_pack_version_t. This can be used to determine the FSP version at runtime.

There are also FSP_VERSION_* macros in fsp_version.h that can be used to determine the FSP version at build time.

## 4.7 FSP Build Time Configurations

All modules have a build-time configuration header file. Most configuration options are supplied at run time, though options that are rarely used or apply to all instances of a module may be moved to build time. The advantage of using a build-time configuration option is to potentially reduce code size reduction by removing an unused feature.

All modules have a build time option to enable or disable parameter checking for the module. FSP modules check function arguments for validity when possible, though this feature is disabled by default to reduce code size. Enabling it can help catch parameter errors during development and debugging. By default, each module's parameter checking configuration inherits the BSP parameter checking setting (set on the BSP tab of the RA Configuration editor). Leaving each module's parameter checking configuration set to Default (BSP) allows parameter checking to be enabled or disabled globally in all FSP code through the parameter checking setting on the BSP tab.

If an error condition can reasonably be avoided it is only checked in a section of code that can be

disabled by disabling parameter checking. Most FSP APIs can only return FSP_SUCCESS if parameter checking is disabled. An example of an error that cannot be reasonably avoided is the "bus busy" error that occurs when another master is using an I2C bus. This type of error can be returned even if parameter checking is disabled.

# 4.8 FSP File Structure

The high-level file structure of an FSP project is shown below.

```
ra_gen
ra
+---fsp
    +---inc
    |   +---api
    |   \---instances
    \---src
       +---bsp
       \---r_module
ra_cfg
+---fsp_cfg
    +---bsp
    +---driver
```

Directly underneath the base ra folder the folders are split into the source and include folders. Include folders are kept separate from the source for easy browsing and easy setup of include paths.

The ra_gen folder contains code generated by the RA Configuration editor. This includes global variables for the control structure and configuration structure for each module.

The ra_cfg folder is where configuration header files are stored for each module. See FSP Build Time Configurations for information on what is provided in these header files.

# 4.9 FSP TrustZone Support

TrustZone support for FSP is primarily handled in the RA Configuration Tool.

## 4.9.1 FSP TrustZone Projects

During development of a TrustZone project, users create an RA TrustZone Secure Project first, followed by an RA TrustZone Non-secure Project that is linked to the RA TrustZone Secure Project. Allocation of secure memory is handled automatically within the tooling. The non-secure project starts at the required alignment boundary beyond the memory taken by the secure project.

## 4.9.2 Non-Secure Callable Guard Functions

The tooling generates guard functions for any module marked as Non-secure Callable. These guard functions are owned by the application once generated, so they can be modified as necessary by the secure application developer.

The default non-secure callable guard functions limit the configuration and control structure to the structures generated in the secure project. They also check any input pointers to ensure the caller does not overwrite secure memory.

### 4.9.3 Callbacks in Non-Secure from Non-Secure Callable Modules

If the non-secure project needs a callback function from a non-secure callable module, the callback can be registered after the module is opened using the callback_set() guard function.

### 4.9.4 Migrating TrustZone Project to newer FSP Version

The TrustZone projects can be migrated to newer FSP version as mentioned in the following resource.

- Migrating Projects to New FSP Version (Application Note)

Additional steps are required if newer FSP version introduces new guard function. In such case, simply migrating the project would result in the build failure for non secure project. Following extra steps are required:

- If xxx_guard.c file in src folder of secure project was not modified earlier
    1. Delete the xxx_guard.c file in secure project before generating the Project Files.
    2. Generate Project contents and build the secure project.
    3. Follow the steps in Application Note to migrate the Non-Secure project.
- If xxx_guard.c file in src folder of secure project was modified earlier
    1. Take the backup of existing xxx_guard.c file and delete it from src folder of secure project before generating the Project Files.
    2. Generate Project contents. It creates a new guard.c file. Compare the contents of the older file and newly generated guard.c file.
    3. Copy the modified code from the older file (i.e Security checks added by user) and add it to newly generated file.
    4. Follow the steps in Application Note to migrate the Non-Secure project.

### 4.9.5 Additional TrustZone Information

The following resources provide technical background, application notes and example projects that demonstrate key TrustZone concepts and implementation procedures.

- The Benefits of Using Arm® TrustZone® in Your Design (Brochure)
- RA Arm® TrustZone® Tooling Primer (Application Note)
- Renesas RA Family Security Design with Arm® TrustZone® - IP Protection (Application Note)
- Renesas RA Family Securing Data at Rest Using the Arm® TrustZone® (Application Note)

## 4.10 FSP Architecture in Practice

### 4.10.1 FSP Connecting Layers

FSP modules are meant to be both reusable and stackable. It is important to remember that modules

are not dependent upon other modules, but upon other interfaces. The user is then free to fulfill the interface using the instance that best fits their needs.

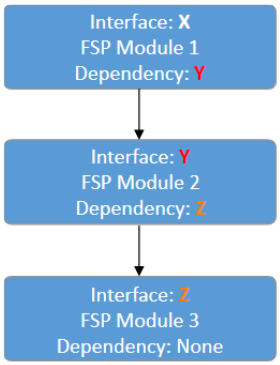

Figure 165: Connecting layers

In the image above interface Y is a dependency of interface X and has its own dependency on interface Z. Interface X only has a dependency on interface Y. Interface X has no knowledge of interface Z. This is a requirement for ensuring that layers can easily be swapped out.

## 4.10.2 Using FSP Modules in an Application

The typical use of an FSP module involves generating required module data then using the API in the application.

### 4.10.2.1 Create a Module Instance in the RA Configuration Editor

The RA Configuration editor (available both in the Renesas e² studio IDE as well as through the standalone RA Smart Configurator) provides a graphical user interface for setting the parameters of the interface and instance configuration structures. It also automatically includes those structures (once they are configured in the GUI) in application-specific header files that can be included in application code.

The RA Configuration editor allocates storage for the control structures, all required configuration structures, and the instance structure in generated files in the ra_gen folder. Use the **Properties** window to set the values for the members of the configuration structures as needed. Refer to the Configuration section of the module usage notes for documentation about the configuration options.

If the interface has a callback function option then the application must declare and define the function. The return value is always of type void and the parameter to the function is a typed structure of name <interface>_callback_args_t. Once the function has been defined, assign its name to the p_callback member of the configuration structure. Callback function names can be assigned through the **Properties** window for the selected module.

### 4.10.2.2 Use the Instance API in the Application

Call the module's <MODULE>_Open() function. Pass pointers to the generated control structure and configuration structure. The names of these structures are based on the 'Name' field provided in the configuration editor. The control structure is <Name>_ctrl and the configuration structure is <Name>_cfg. An example <MODULE>_Open() call for an r_rtc module instance named g_clock is:

```
R_RTC_Open(&g_clock_ctrl, &g_clock_cfg);
```

*Note*

*Each layer in the FSP Stack is responsible for calling the API functions of its dependencies. This means that users are only responsible for calling the API functions at the layer at which they are interfacing. Using the example above of a SPI module with a DTC dependency, the application uses only SPI APIs. The application starts by calling R_SPI_Open(). Internally, the SPI module opens the DTC. It locates R_DTC_Open() by accessing the dependent transfer interface function pointers from the pointers DTC instances (spi_cfg_t::p_transfer_tx and spi_cfg_t::p_transfer_rx) to open the DTC.*

Refer to the module usage notes for example code to help get started with any particular module.

# Chapter 5 API Reference

This section includes the FSP API Reference for the Module and Interface level functions.

| | |
|---|---|
| ▼BSP | Common code shared by FSP drivers |
| BSP I/O access | This module provides basic read/write access to port pins |
| BSP OSPI_B support | Code that initializes the OSPI_B device memory |
| BSP SDRAM support | Code that initializes the SDRAMC and SDR SDRAM device memory |
| Common Error Codes | |
| ►MCU Board Support Package | The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor |

| Unique FSP version ID. |

## 5.1.1 BSP I/O access

BSP

### Functions

| | |
|---|---|
| __STATIC_INLINE uint32_t | R_BSP_PinRead (bsp_io_port_pin_t pin) |
| __STATIC_INLINE void | R_BSP_PinWrite (bsp_io_port_pin_t pin, bsp_io_level_t level) |
| __STATIC_INLINE void | R_BSP_PinCfg (bsp_io_port_pin_t pin, uint32_t cfg) |
| __STATIC_INLINE void | R_BSP_PinAccessEnable (void) |
| __STATIC_INLINE void | R_BSP_PinAccessDisable (void) |

## Detailed Description

This module provides basic read/write access to port pins.

### Enumerations

| | |
|---|---|
| enum | bsp_io_level_t |
| enum | bsp_io_direction_t |
| enum | bsp_io_port_t |
| enum | bsp_io_port_pin_t |

## Enumeration Type Documentation

### ◆ bsp_io_level_t

| enum bsp_io_level_t | |
|---|---|
| Levels that can be set and read for individual pins | |
| Enumerator | |
| BSP_IO_LEVEL_LOW | Low. |
| BSP_IO_LEVEL_HIGH | High. |

### ◆ bsp_io_direction_t

| enum bsp_io_direction_t | |
|---|---|
| Direction of individual pins | |
| Enumerator | |
| BSP_IO_DIRECTION_INPUT | Input. |
| BSP_IO_DIRECTION_OUTPUT | Output. |

### ◆ bsp_io_port_t

| enum bsp_io_port_t | |
|---|---|
| Superset list of all possible IO ports. | |
| Enumerator | |
| BSP_IO_PORT_00 | IO port 0. |
| BSP_IO_PORT_01 | IO port 1. |
| BSP_IO_PORT_02 | IO port 2. |
| BSP_IO_PORT_03 | IO port 3. |
| BSP_IO_PORT_04 | IO port 4. |
| BSP_IO_PORT_05 | IO port 5. |
| BSP_IO_PORT_06 | IO port 6. |
| BSP_IO_PORT_07 | IO port 7. |
| BSP_IO_PORT_08 | IO port 8. |
| BSP_IO_PORT_09 | IO port 9. |
| BSP_IO_PORT_10 | IO port 10. |
| BSP_IO_PORT_11 | IO port 11. |
| BSP_IO_PORT_12 | IO port 12. |
| BSP_IO_PORT_13 | IO port 13. |
| BSP_IO_PORT_14 | IO port 14. |

### ◆ bsp_io_port_pin_t

| enum bsp_io_port_pin_t | |
|---|---|
| Superset list of all possible IO port pins. | |
| Enumerator | |
| BSP_IO_PORT_00_PIN_00 | IO port 0 pin 0. |
| BSP_IO_PORT_00_PIN_01 | IO port 0 pin 1. |

| | |
|---|---|
| BSP_IO_PORT_00_PIN_02 | IO port 0 pin 2. |
| BSP_IO_PORT_00_PIN_03 | IO port 0 pin 3. |
| BSP_IO_PORT_00_PIN_04 | IO port 0 pin 4. |
| BSP_IO_PORT_00_PIN_05 | IO port 0 pin 5. |
| BSP_IO_PORT_00_PIN_06 | IO port 0 pin 6. |
| BSP_IO_PORT_00_PIN_07 | IO port 0 pin 7. |
| BSP_IO_PORT_00_PIN_08 | IO port 0 pin 8. |
| BSP_IO_PORT_00_PIN_09 | IO port 0 pin 9. |
| BSP_IO_PORT_00_PIN_10 | IO port 0 pin 10. |
| BSP_IO_PORT_00_PIN_11 | IO port 0 pin 11. |
| BSP_IO_PORT_00_PIN_12 | IO port 0 pin 12. |
| BSP_IO_PORT_00_PIN_13 | IO port 0 pin 13. |
| BSP_IO_PORT_00_PIN_14 | IO port 0 pin 14. |
| BSP_IO_PORT_00_PIN_15 | IO port 0 pin 15. |
| BSP_IO_PORT_01_PIN_00 | IO port 1 pin 0. |
| BSP_IO_PORT_01_PIN_01 | IO port 1 pin 1. |
| BSP_IO_PORT_01_PIN_02 | IO port 1 pin 2. |
| BSP_IO_PORT_01_PIN_03 | IO port 1 pin 3. |
| BSP_IO_PORT_01_PIN_04 | IO port 1 pin 4. |
| BSP_IO_PORT_01_PIN_05 | IO port 1 pin 5. |
| BSP_IO_PORT_01_PIN_06 | IO port 1 pin 6. |
| BSP_IO_PORT_01_PIN_07 | IO port 1 pin 7. |
| BSP_IO_PORT_01_PIN_08 | IO port 1 pin 8. |
| BSP_IO_PORT_01_PIN_09 | IO port 1 pin 9. |

| | |
|---|---|
| BSP_IO_PORT_01_PIN_10 | IO port 1 pin 10. |
| BSP_IO_PORT_01_PIN_11 | IO port 1 pin 11. |
| BSP_IO_PORT_01_PIN_12 | IO port 1 pin 12. |
| BSP_IO_PORT_01_PIN_13 | IO port 1 pin 13. |
| BSP_IO_PORT_01_PIN_14 | IO port 1 pin 14. |
| BSP_IO_PORT_01_PIN_15 | IO port 1 pin 15. |
| BSP_IO_PORT_02_PIN_00 | IO port 2 pin 0. |
| BSP_IO_PORT_02_PIN_01 | IO port 2 pin 1. |
| BSP_IO_PORT_02_PIN_02 | IO port 2 pin 2. |
| BSP_IO_PORT_02_PIN_03 | IO port 2 pin 3. |
| BSP_IO_PORT_02_PIN_04 | IO port 2 pin 4. |
| BSP_IO_PORT_02_PIN_05 | IO port 2 pin 5. |
| BSP_IO_PORT_02_PIN_06 | IO port 2 pin 6. |
| BSP_IO_PORT_02_PIN_07 | IO port 2 pin 7. |
| BSP_IO_PORT_02_PIN_08 | IO port 2 pin 8. |
| BSP_IO_PORT_02_PIN_09 | IO port 2 pin 9. |
| BSP_IO_PORT_02_PIN_10 | IO port 2 pin 10. |
| BSP_IO_PORT_02_PIN_11 | IO port 2 pin 11. |
| BSP_IO_PORT_02_PIN_12 | IO port 2 pin 12. |
| BSP_IO_PORT_02_PIN_13 | IO port 2 pin 13. |
| BSP_IO_PORT_02_PIN_14 | IO port 2 pin 14. |
| BSP_IO_PORT_02_PIN_15 | IO port 2 pin 15. |
| BSP_IO_PORT_03_PIN_00 | IO port 3 pin 0. |
| BSP_IO_PORT_03_PIN_01 | IO port 3 pin 1. |

| | |
|---|---|
| BSP_IO_PORT_03_PIN_02 | IO port 3 pin 2. |
| BSP_IO_PORT_03_PIN_03 | IO port 3 pin 3. |
| BSP_IO_PORT_03_PIN_04 | IO port 3 pin 4. |
| BSP_IO_PORT_03_PIN_05 | IO port 3 pin 5. |
| BSP_IO_PORT_03_PIN_06 | IO port 3 pin 6. |
| BSP_IO_PORT_03_PIN_07 | IO port 3 pin 7. |
| BSP_IO_PORT_03_PIN_08 | IO port 3 pin 8. |
| BSP_IO_PORT_03_PIN_09 | IO port 3 pin 9. |
| BSP_IO_PORT_03_PIN_10 | IO port 3 pin 10. |
| BSP_IO_PORT_03_PIN_11 | IO port 3 pin 11. |
| BSP_IO_PORT_03_PIN_12 | IO port 3 pin 12. |
| BSP_IO_PORT_03_PIN_13 | IO port 3 pin 13. |
| BSP_IO_PORT_03_PIN_14 | IO port 3 pin 14. |
| BSP_IO_PORT_03_PIN_15 | IO port 3 pin 15. |
| BSP_IO_PORT_04_PIN_00 | IO port 4 pin 0. |
| BSP_IO_PORT_04_PIN_01 | IO port 4 pin 1. |
| BSP_IO_PORT_04_PIN_02 | IO port 4 pin 2. |
| BSP_IO_PORT_04_PIN_03 | IO port 4 pin 3. |
| BSP_IO_PORT_04_PIN_04 | IO port 4 pin 4. |
| BSP_IO_PORT_04_PIN_05 | IO port 4 pin 5. |
| BSP_IO_PORT_04_PIN_06 | IO port 4 pin 6. |
| BSP_IO_PORT_04_PIN_07 | IO port 4 pin 7. |
| BSP_IO_PORT_04_PIN_08 | IO port 4 pin 8. |
| BSP_IO_PORT_04_PIN_09 | IO port 4 pin 9. |

| | |
|---|---|
| BSP_IO_PORT_04_PIN_10 | IO port 4 pin 10. |
| BSP_IO_PORT_04_PIN_11 | IO port 4 pin 11. |
| BSP_IO_PORT_04_PIN_12 | IO port 4 pin 12. |
| BSP_IO_PORT_04_PIN_13 | IO port 4 pin 13. |
| BSP_IO_PORT_04_PIN_14 | IO port 4 pin 14. |
| BSP_IO_PORT_04_PIN_15 | IO port 4 pin 15. |
| BSP_IO_PORT_05_PIN_00 | IO port 5 pin 0. |
| BSP_IO_PORT_05_PIN_01 | IO port 5 pin 1. |
| BSP_IO_PORT_05_PIN_02 | IO port 5 pin 2. |
| BSP_IO_PORT_05_PIN_03 | IO port 5 pin 3. |
| BSP_IO_PORT_05_PIN_04 | IO port 5 pin 4. |
| BSP_IO_PORT_05_PIN_05 | IO port 5 pin 5. |
| BSP_IO_PORT_05_PIN_06 | IO port 5 pin 6. |
| BSP_IO_PORT_05_PIN_07 | IO port 5 pin 7. |
| BSP_IO_PORT_05_PIN_08 | IO port 5 pin 8. |
| BSP_IO_PORT_05_PIN_09 | IO port 5 pin 9. |
| BSP_IO_PORT_05_PIN_10 | IO port 5 pin 10. |
| BSP_IO_PORT_05_PIN_11 | IO port 5 pin 11. |
| BSP_IO_PORT_05_PIN_12 | IO port 5 pin 12. |
| BSP_IO_PORT_05_PIN_13 | IO port 5 pin 13. |
| BSP_IO_PORT_05_PIN_14 | IO port 5 pin 14. |
| BSP_IO_PORT_05_PIN_15 | IO port 5 pin 15. |
| BSP_IO_PORT_06_PIN_00 | IO port 6 pin 0. |
| BSP_IO_PORT_06_PIN_01 | IO port 6 pin 1. |

| | |
|---|---|
| BSP_IO_PORT_06_PIN_02 | IO port 6 pin 2. |
| BSP_IO_PORT_06_PIN_03 | IO port 6 pin 3. |
| BSP_IO_PORT_06_PIN_04 | IO port 6 pin 4. |
| BSP_IO_PORT_06_PIN_05 | IO port 6 pin 5. |
| BSP_IO_PORT_06_PIN_06 | IO port 6 pin 6. |
| BSP_IO_PORT_06_PIN_07 | IO port 6 pin 7. |
| BSP_IO_PORT_06_PIN_08 | IO port 6 pin 8. |
| BSP_IO_PORT_06_PIN_09 | IO port 6 pin 9. |
| BSP_IO_PORT_06_PIN_10 | IO port 6 pin 10. |
| BSP_IO_PORT_06_PIN_11 | IO port 6 pin 11. |
| BSP_IO_PORT_06_PIN_12 | IO port 6 pin 12. |
| BSP_IO_PORT_06_PIN_13 | IO port 6 pin 13. |
| BSP_IO_PORT_06_PIN_14 | IO port 6 pin 14. |
| BSP_IO_PORT_06_PIN_15 | IO port 6 pin 15. |
| BSP_IO_PORT_07_PIN_00 | IO port 7 pin 0. |
| BSP_IO_PORT_07_PIN_01 | IO port 7 pin 1. |
| BSP_IO_PORT_07_PIN_02 | IO port 7 pin 2. |
| BSP_IO_PORT_07_PIN_03 | IO port 7 pin 3. |
| BSP_IO_PORT_07_PIN_04 | IO port 7 pin 4. |

| BSP_IO_PORT_14_PIN_02 | IO port 14 pin 2. |
| BSP_IO_PORT_14_PIN_03 | IO port 14 pin 3. |
| BSP_IO_PORT_14_PIN_04 | IO port 14 pin 4. |
| BSP_IO_PORT_14_PIN_05 | IO port 14 pin 5. |
| BSP_IO_PORT_14_PIN_06 | IO port 14 pin 6. |
| BSP_IO_PORT_14_PIN_07 | IO port 14 pin 7. |
| BSP_IO_PORT_14_PIN_08 | IO port 14 pin 8. |
| BSP_IO_PORT_14_PIN_09 | IO port 14 pin 9. |
| BSP_IO_PORT_14_PIN_10 | IO port 14 pin 10. |
| BSP_IO_PORT_14_PIN_11 | IO port 14 pin 11. |
| BSP_IO_PORT_14_PIN_12 | IO port 14 pin 12. |
| BSP_IO_PORT_14_PIN_13 | IO port 14 pin 13. |
| BSP_IO_PORT_14_PIN_14 | IO port 14 pin 14. |
| BSP_IO_PORT_14_PIN_15 | IO port 14 pin 15. |
| BSP_IO_PORT_FF_PIN_FF | Invalid IO port. |

## Function Documentation

### ◆ R_BSP_PinRead()

__STATIC_INLINE uint32_t R_BSP_PinRead ( bsp_io_port_pin_t *pin*)

Read the current input level of the pin.

**Parameters**

| | | |
|---|---|---|
| [in] | pin | The pin |

**Return values**

| | |
|---|---|
| Current | input level |

### ◆ R_BSP_PinWrite()

__STATIC_INLINE void R_BSP_PinWrite ( bsp_io_port_pin_t *pin*, bsp_io_level_t *level* )

Set a pin to output and set the output level to the level provided. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.

**Parameters**

| | | |
|---|---|---|
| [in] | pin | The pin |
| [in] | level | The level |

### ◆ R_BSP_PinCfg()

__STATIC_INLINE void R_BSP_PinCfg ( bsp_io_port_pin_t *pin*, uint32_t *cfg* )

Configure a pin. If PFS protection is enabled, disable PFS protection using R_BSP_PinAccessEnable() before calling this function.

**Parameters**

| | | |
|---|---|---|
| [in] | pin | The pin |
| [in] | cfg | Configuration for the pin (PmnPFS register setting) |

### ◆ R_BSP_PinAccessEnable()

__STATIC_INLINE void R_BSP_PinAccessEnable ( void )

Enable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code.

### ◆ R_BSP_PinAccessDisable()

| __STATIC_INLINE void R_BSP_PinAccessDisable ( void ) |
| --- |
| Disable access to the PFS registers. Uses a reference counter to protect against interrupts that could occur via multiple threads or an ISR re-entering this code. |

## 5.1.2 BSP OSPI_B support

BSP

Code that initializes the OSPI_B device memory.

## 5.1.3 BSP SDRAM support

BSP

### Functions

| | |
| --- | --- |
| void | R_BSP_SdramInit (bool init_memory)<br>Initializes SDRAM. More... |
| void | R_BSP_SdramSelfRefreshEnable (void)<br>Changes SDRAM from Auto-refresh to Self-refresh. More... |
| void | R_BSP_SdramSelfRefreshDisable (void)<br>Changes SDRAM from Self-refresh to Auto-refresh. More... |

### Detailed Description

Code that initializes the SDRAMC and SDR SDRAM device memory.

### Function Documentation

### ◆ R_BSP_SdramInit()

| void R_BSP_SdramInit ( bool *init_memory*) |
|---|
| Initializes SDRAM.<br><br>**Parameters**<br>init_memory — If true, this function will execute the initialization of the external modules. Otherwise, it will only initialize the SDRAMC and leave the memory in self-refresh mode.<br><br>This function initializes SDRAMC and SDR SDRAM device.<br><br>***Note***<br>*This function must only be called once after reset.* |

### ◆ R_BSP_SdramSelfRefreshEnable()

| void R_BSP_SdramSelfRefreshEnable ( void ) |
|---|
| Changes SDRAM from Auto-refresh to Self-refresh.<br><br>This function allows Software Standby and Deep Software Standby modes to be entered without data loss.<br><br>***Note***<br>*SDRAM cannot be accessed after calling this function. Use R_BSP_SdramSelfRefreshDisable to resume normal SDRAM operation.* |

### ◆ R_BSP_SdramSelfRefreshDisable()

| void R_BSP_SdramSelfRefreshDisable ( void ) |
|---|
| Changes SDRAM from Self-refresh to Auto-refresh.<br><br>This function changes back to Auto-refresh and allows normal SDRAM operation to resume. |

## 5.1.4 Common Error Codes

BSP

### Detailed Description

All FSP modules share these common error codes.

### Macros

| | |
|---|---|
| #define | FSP_PARAMETER_NOT_USED(p) |
| #define | FSP_CPP_HEADER |
| #define | FSP_HEADER |
| #define | FSP_SECURE_ARGUMENT |

**Enumerations**

| | |
|---|---|
| enum | fsp_err_t |

## Macro Definition Documentation

### ◆ FSP_PARAMETER_NOT_USED

```
#define FSP_PARAMETER_NOT_USED ( p)
```

This macro is used to suppress compiler messages about a parameter not being used in a function. The nice thing about using this implementation is that it does not take any extra RAM or ROM.

### ◆ FSP_CPP_HEADER

```
#define FSP_CPP_HEADER
```

Determine if a C++ compiler is being used. If so, ensure that standard C is used to process the API information.

### ◆ FSP_HEADER

```
#define FSP_HEADER
```

FSP Header and Footer definitions

### ◆ FSP_SECURE_ARGUMENT

```
#define FSP_SECURE_ARGUMENT
```

Macro to be used when argument to function is ignored since function call is NSC and the parameter is statically defined on the Secure side.

## Enumeration Type Documentation

### ◆ fsp_err_t

| enum fsp_err_t | |
|---|---|
| Common error codes | |
| Enumerator | |
| FSP_ERR_ASSERTION | A critical assertion has failed. |
| FSP_ERR_INVALID_POINTER | Pointer points to invalid memory location. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |
| FSP_ERR_INVALID_CHANNEL | Selected channel does not exist. |
| FSP_ERR_INVALID_MODE | Unsupported or incorrect mode. |
| FSP_ERR_UNSUPPORTED | Selected mode not supported by this API. |
| FSP_ERR_NOT_OPEN | Requested channel is not configured or API not open. |
| FSP_ERR_IN_USE | Channel/peripheral is running/busy. |
| FSP_ERR_OUT_OF_MEMORY | Allocate more memory in the driver's cfg.h. |
| FSP_ERR_HW_LOCKED | Hardware is locked. |
| FSP_ERR_IRQ_BSP_DISABLED | IRQ not enabled in BSP. |
| FSP_ERR_OVERFLOW | Hardware overflow. |
| FSP_ERR_UNDERFLOW | Hardware underflow. |
| FSP_ERR_ALREADY_OPEN | Requested channel is already open in a different configuration. |
| FSP_ERR_APPROXIMATION | Could not set value to exact result. |
| FSP_ERR_CLAMPED | Value had to be limited for some reason. |
| FSP_ERR_INVALID_RATE | Selected rate could not be met. |
| FSP_ERR_ABORTED | An operation was aborted. |
| FSP_ERR_NOT_ENABLED | Requested operation is not enabled. |
| FSP_ERR_TIMEOUT | Timeout error. |

| | |
|---|---|
| FSP_ERR_INVALID_BLOCKS | Invalid number of blocks supplied. |
| FSP_ERR_INVALID_ADDRESS | Invalid address supplied. |
| FSP_ERR_INVALID_SIZE | Invalid size/length supplied for operation. |
| FSP_ERR_WRITE_FAILED | Write operation failed. |
| FSP_ERR_ERASE_FAILED | Erase operation failed. |
| FSP_ERR_INVALID_CALL | Invalid function call is made. |
| FSP_ERR_INVALID_HW_CONDITION | Detected hardware is in invalid condition. |
| FSP_ERR_INVALID_FACTORY_FLASH | Factory flash is not available on this MCU. |
| FSP_ERR_INVALID_STATE | API or command not valid in the current state. |
| FSP_ERR_NOT_ERASED | Erase verification failed. |
| FSP_ERR_SECTOR_RELEASE_FAILED | Sector release failed. |
| FSP_ERR_NOT_INITIALIZED | Required initialization not complete. |
| FSP_ERR_NOT_FOUND | The requested item could not be found. |
| FSP_ERR_NO_CALLBACK_MEMORY | Non-secure callback memory not provided for non-secure callback. |
| FSP_ERR_BUFFER_EMPTY | No data available in buffer. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |
| FSP_ERR_INTERNAL | Internal error. |
| FSP_ERR_WAIT_ABORTED | Wait aborted. |
| FSP_ERR_FRAMING | Framing error occurs. |
| FSP_ERR_BREAK_DETECT | Break signal detects. |
| FSP_ERR_PARITY | Parity error occurs. |
| FSP_ERR_RXBUF_OVERFLOW | Receive queue overflow. |
| FSP_ERR_QUEUE_UNAVAILABLE | Can't open s/w queue. |
| FSP_ERR_INSUFFICIENT_SPACE | Not enough space in transmission circular |

| | |
|---|---|
| | buffer. |
| FSP_ERR_INSUFFICIENT_DATA | Not enough data in receive circular buffer. |
| FSP_ERR_TRANSFER_ABORTED | The data transfer was aborted. |
| FSP_ERR_MODE_FAULT | Mode fault error. |
| FSP_ERR_READ_OVERFLOW | Read overflow. |
| FSP_ERR_SPI_PARITY | Parity error. |
| FSP_ERR_OVERRUN | Overrun error. |
| FSP_ERR_CLOCK_INACTIVE | Inactive clock specified as system clock. |
| FSP_ERR_CLOCK_ACTIVE | Active clock source cannot be modified without stopping first. |
| FSP_ERR_NOT_STABILIZED | Clock has not stabilized after its been turned on/off. |
| FSP_ERR_PLL_SRC_INACTIVE | PLL initialization attempted when PLL source is turned off. |
| FSP_ERR_OSC_STOP_DET_ENABLED | Illegal attempt to stop LOCO when Oscillation stop is enabled. |
| FSP_ERR_OSC_STOP_DETECTED | The Oscillation stop detection status flag is set. |
| FSP_ERR_OSC_STOP_CLOCK_ACTIVE | Attempt to clear Oscillation Stop Detect Status with PLL/MAIN_OSC active. |
| FSP_ERR_CLKOUT_EXCEEDED | Output on target output clock pin exceeds maximum supported limit. |
| FSP_ERR_USB_MODULE_ENABLED | USB clock configure request with USB Module enabled. |
| FSP_ERR_HARDWARE_TIMEOUT | A register read or write timed out. |
| FSP_ERR_LOW_VOLTAGE_MODE | Invalid clock setting attempted in low voltage mode. |
| FSP_ERR_PE_FAILURE | Unable to enter Programming mode. |
| FSP_ERR_CMD_LOCKED | Peripheral in command locked state. |
| FSP_ERR_FCLK | |

| | |
|---|---|
| | FCLK must be >= 4 MHz. |
| FSP_ERR_INVALID_LINKED_ADDRESS | Function or data are linked at an invalid region of memory. |
| FSP_ERR_BLANK_CHECK_FAILED | Blank check operation failed. |
| FSP_ERR_HUK_ZEROIZATION | W-HUK zeroization is in progress. |
| FSP_ERR_INVALID_CAC_REF_CLOCK | Measured clock rate < reference clock rate. |
| FSP_ERR_INVALID_RESULT | The result of one or more calculations was +/- infinity. |
| FSP_ERR_CLOCK_GENERATION | Clock cannot be specified as system clock. |
| FSP_ERR_INVALID_TIMING_SETTING | Invalid timing parameter. |
| FSP_ERR_INVALID_LAYER_SETTING | Invalid layer parameter. |
| FSP_ERR_INVALID_ALIGNMENT | Invalid memory alignment found. |
| FSP_ERR_INVALID_GAMMA_SETTING | Invalid gamma correction parameter. |
| FSP_ERR_INVALID_LAYER_FORMAT | Invalid color format in layer. |
| FSP_ERR_INVALID_UPDATE_TIMING | Invalid timing for register update. |
| FSP_ERR_INVALID_CLUT_ACCESS | Invalid access to CLUT entry. |
| FSP_ERR_INVALID_FADE_SETTING | Invalid fade-in/fade-out setting. |
| FSP_ERR_INVALID_BRIGHTNESS_SETTING | Invalid gamma correction parameter. |
| FSP_ERR_JPEG_ERR | JPEG error. |
| FSP_ERR_JPEG_SOI_NOT_DETECTED | SOI not detected until EOI detected. |
| FSP_ERR_JPEG_SOF1_TO_SOFF_DETECTED | SOF1 to SOFF detected. |
| FSP_ERR_JPEG_UNSUPPORTED_PIXEL_FORMAT | Unprovided pixel format detected. |
| FSP_ERR_JPEG_SOF_ACCURACY_ERROR | SOF accuracy error: other than 8 detected. |
| FSP_ERR_JPEG_DQT_ACCURACY_ERROR | DQT accuracy error: other than 0 detected. |
| FSP_ERR_JPEG_COMPONENT_ERROR1 | Component error 1: the number of SOF0 header components detected is other than 1, 3, or 4. |

| | |
|---|---|
| FSP_ERR_JPEG_COMPONENT_ERROR2 | Component error 2: the number of components differs between SOF0 header and SOS. |
| FSP_ERR_JPEG_SOF0_DQT_DHT_NOT_DETECTED | SOF0, DQT, and DHT not detected when SOS detected. |
| FSP_ERR_JPEG_SOS_NOT_DETECTED | SOS not detected: SOS not detected until EOI detected. |
| FSP_ERR_JPEG_EOI_NOT_DETECTED | EOI not detected (default) |
| FSP_ERR_JPEG_RESTART_INTERVAL_DATA_NUMBER_ERROR | Restart interval data number error detected. |
| FSP_ERR_JPEG_IMAGE_SIZE_ERROR | Image size error detected. |
| FSP_ERR_JPEG_LAST_MCU_DATA_NUMBER_ERROR | Last MCU data number error detected. |
| FSP_ERR_JPEG_BLOCK_DATA_NUMBER_ERROR | Block data number error detected. |
| FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH | User provided buffer size not enough. |
| FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE | JPEG Image size is not aligned with MCU. |
| FSP_ERR_CALIBRATE_FAILED | Calibration failed. |
| FSP_ERR_IIRFA_ECC_1BIT | 1-bit ECC error detected |
| FSP_ERR_IIRFA_ECC_2BIT | 2-bit ECC error detected |
| FSP_ERR_IP_HARDWARE_NOT_PRESENT | Requested IP does not exist on this device. |
| FSP_ERR_IP_UNIT_NOT_PRESENT | Requested unit does not exist on this device. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Requested channel does not exist on this device. |
| FSP_ERR_NO_MORE_BUFFER | No more buffer found in the memory block pool. |
| FSP_ERR_ILLEGAL_BUFFER_ADDRESS | Buffer address is out of block memory pool. |
| FSP_ERR_INVALID_WORKBUFFER_SIZE | Work buffer size is invalid. |
| FSP_ERR_INVALID_MSG_BUFFER_SIZE | Message buffer size is invalid. |
| FSP_ERR_TOO_MANY_BUFFERS | Number of buffer is too many. |
| FSP_ERR_NO_SUBSCRIBER_FOUND | No message subscriber found. |

| | |
|---|---|
| FSP_ERR_MESSAGE_QUEUE_EMPTY | No message found in the message queue. |
| FSP_ERR_MESSAGE_QUEUE_FULL | No room for new message in the message queue. |
| FSP_ERR_ILLEGAL_SUBSCRIBER_LISTS | Message subscriber lists is illegal. |
| FSP_ERR_BUFFER_RELEASED | Buffer has been released. |
| FSP_ERR_D2D_ERROR_INIT | D/AVE 2D has an error in the initialization. |
| FSP_ERR_D2D_ERROR_DEINIT | D/AVE 2D has an error in the initialization. |
| FSP_ERR_D2D_ERROR_RENDERING | D/AVE 2D has an error in the rendering. |
| FSP_ERR_D2D_ERROR_SIZE | D/AVE 2D has an error in the rendering. |
| FSP_ERR_ETHER_ERROR_NO_DATA | No Data in Receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | ETHERC/EDMAC has an error in the Auto-negotiation. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, and transmission/reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_ETHER_ERROR_FILTERING | Detect multicast frame when multicast frame filtering enable. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | ETHERC/EDMAC has an error in the phy communication. |
| FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE | Receive buffer is active. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | PHY has an error in the Auto-negotiation. |
| FSP_ERR_QUEUE_FULL | Queue is full, cannot queue another data. |
| FSP_ERR_QUEUE_EMPTY | Queue is empty, no data to dequeue. |
| FSP_ERR_CTSU_SCANNING | Scanning. |
| FSP_ERR_CTSU_NOT_GET_DATA | Not processed previous scan data. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

| | |
|---|---|
| FSP_ERR_CTSU_DIAG_NOT_YET | Diagnosis of data collected no yet. |
| FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE | Diagnosis of LDO over voltage failed. |
| FSP_ERR_CTSU_DIAG_CCO_HIGH | Diagnosis of CCO into 19.2uA failed. |
| FSP_ERR_CTSU_DIAG_CCO_LOW | Diagnosis of CCO into 2.4uA failed. |
| FSP_ERR_CTSU_DIAG_SSCG | Diagnosis of SSCG frequency failed. |
| FSP_ERR_CTSU_DIAG_DAC | Diagnosis of non-touch count value failed. |
| FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE | Diagnosis of LDO output voltage failed. |
| FSP_ERR_CTSU_DIAG_OVER_VOLTAGE | Diagnosis of over voltage detection circuit failed. |
| FSP_ERR_CTSU_DIAG_OVER_CURRENT | Diagnosis of over current detection circuit failed. |
| FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE | Diagnosis of LDO internal resistance value failed. |
| FSP_ERR_CTSU_DIAG_CURRENT_SOURCE | Diagnosis of Current source value failed. |
| FSP_ERR_CTSU_DIAG_SENSCLK_GAIN | Diagnosis of SENSCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_SUCLK_GAIN | Diagnosis of SUCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY | Diagnosis of SUCLK clock recovery function failed. |
| FSP_ERR_CTSU_DIAG_CFC_GAIN | Diagnosis of CFC oscillator gain failed. |
| FSP_ERR_CARD_INIT_FAILED | SD card or eMMC device failed to initialize. |
| FSP_ERR_CARD_NOT_INSERTED | SD card not installed. |
| FSP_ERR_DEVICE_BUSY | Device is holding DAT0 low or another operation is ongoing. |
| FSP_ERR_CARD_NOT_INITIALIZED | SD card was removed. |
| FSP_ERR_CARD_WRITE_PROTECTED | Media is write protected. |
| FSP_ERR_TRANSFER_BUSY | Transfer in progress. |
| FSP_ERR_RESPONSE | Card did not respond or responded with an error. |

| | |
|---|---|
| FSP_ERR_MEDIA_FORMAT_FAILED | Media format failed. |
| FSP_ERR_MEDIA_OPEN_FAILED | Media open failed. |
| FSP_ERR_CAN_DATA_UNAVAILABLE | No data available. |
| FSP_ERR_CAN_MODE_SWITCH_FAILED | Switching operation modes failed. |
| FSP_ERR_CAN_INIT_FAILED | Hardware initialization failed. |
| FSP_ERR_CAN_TRANSMIT_NOT_READY | Transmit in progress. |
| FSP_ERR_CAN_RECEIVE_MAILBOX | Mailbox is setup as a receive mailbox. |
| FSP_ERR_CAN_TRANSMIT_MAILBOX | Mailbox is setup as a transmit mailbox. |
| FSP_ERR_CAN_MESSAGE_LOST | Receive message has been overwritten or overrun. |
| FSP_ERR_CAN_TRANSMIT_FIFO_FULL | Transmit FIFO is full. |
| FSP_ERR_WIFI_CONFIG_FAILED | WiFi module Configuration failed. |
| FSP_ERR_WIFI_INIT_FAILED | WiFi module initialization failed. |
| FSP_ERR_WIFI_TRANSMIT_FAILED | Transmission failed. |
| FSP_ERR_WIFI_INVALID_MODE | API called when provisioned in client mode. |
| FSP_ERR_WIFI_FAILED | WiFi Failed. |
| FSP_ERR_WIFI_SCAN_COMPLETE | Wifi scan has completed. |
| FSP_ERR_WIFI_AP_NOT_CONNECTED | WiFi module is not connected to access point. |
| FSP_ERR_WIFI_UNKNOWN_AT_CMD | DA16XXX Unknown AT command Error. |
| FSP_ERR_WIFI_INSUF_PARAM | DA16XXX Insufficient parameter. |
| FSP_ERR_WIFI_TOO_MANY_PARAMS | DA16XXX Too many parameters. |
| FSP_ERR_WIFI_INV_PARAM_VAL | DA16XXX Wrong parameter value. |
| FSP_ERR_WIFI_NO_RESULT | DA16XXX No result. |
| FSP_ERR_WIFI_RSP_BUF_OVFLW | DA16XXX Response buffer overflow. |
| FSP_ERR_WIFI_FUNC_NOT_CONFIG | DA16XXX Function is not configured. |

| | |
|---|---|
| FSP_ERR_WIFI_NVRAM_WR_FAIL | DA16XXX NVRAM write failure. |
| FSP_ERR_WIFI_RET_MEM_WR_FAIL | DA16XXX Retention memory write failure. |
| FSP_ERR_WIFI_UNKNOWN_ERR | DA16XXX unknown error. |
| FSP_ERR_CELLULAR_CONFIG_FAILED | Cellular module Configuration failed. |
| FSP_ERR_CELLULAR_INIT_FAILED | Cellular module initialization failed. |
| FSP_ERR_CELLULAR_TRANSMIT_FAILED | Transmission failed. |
| FSP_ERR_CELLULAR_FW_UPTODATE | Firmware is uptodate. |
| FSP_ERR_CELLULAR_FW_UPGRADE_FAILED | Firmware upgrade failed. |
| FSP_ERR_CELLULAR_FAILED | Cellular Failed. |
| FSP_ERR_CELLULAR_INVALID_STATE | API Called in invalid state. |
| FSP_ERR_CELLULAR_REGISTRATION_FAILED | Cellular Network registration failed. |
| FSP_ERR_BLE_FAILED | BLE operation failed. |
| FSP_ERR_BLE_INIT_FAILED | BLE device initialization failed. |
| FSP_ERR_BLE_CONFIG_FAILED | BLE device configuration failed. |
| FSP_ERR_BLE_PRF_ALREADY_ENABLED | BLE device Profile already enabled. |
| FSP_ERR_BLE_PRF_NOT_ENABLED | BLE device not enabled. |
| FSP_ERR_BLE_ABS_INVALID_OPERATION | Invalid operation is executed. |
| FSP_ERR_BLE_ABS_NOT_FOUND | Valid data or free space is not found. |
| FSP_ERR_CRYPTO_CONTINUE | Continue executing function. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | Hardware resource busy. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal I/O buffer is not empty. |
| FSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX | Invalid index. |
| FSP_ERR_CRYPTO_SCE_RETRY | Retry. |
| FSP_ERR_CRYPTO_SCE_VERIFY_FAIL | Verify is failed. |

| | |
|---|---|
| FSP_ERR_CRYPTO_SCE_ALREADY_OPEN | HW SCE module is already opened. |
| FSP_ERR_CRYPTO_NOT_OPEN | Hardware module is not initialized. |
| FSP_ERR_CRYPTO_UNKNOWN | Some unknown error occurred. |
| FSP_ERR_CRYPTO_NULL_POINTER | Null pointer input as a parameter. |
| FSP_ERR_CRYPTO_NOT_IMPLEMENTED | Algorithm/size not implemented. |
| FSP_ERR_CRYPTO_RNG_INVALID_PARAM | An invalid parameter is specified. |
| FSP_ERR_CRYPTO_RNG_FATAL_ERROR | A fatal error occurred. |
| FSP_ERR_CRYPTO_INVALID_SIZE | Size specified is invalid. |
| FSP_ERR_CRYPTO_INVALID_STATE | Function used in an valid state. |
| FSP_ERR_CRYPTO_ALREADY_OPEN | control block is already opened |
| FSP_ERR_CRYPTO_INSTALL_KEY_FAILED | Specified input key is invalid. |
| FSP_ERR_CRYPTO_AUTHENTICATION_FAILED | Authentication failed. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Failure to Init Cipher. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input date is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function call occurred. |
| FSP_ERR_CRYPTO_SCE_LBIST_CHECK_BUSY | LBIST Check BUSY. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | Hardware resource is busy. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Hardware fatal error or unexpected return. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key type is illegal. |
| FSP_ERR_CRYPTO_RSIP_AUTHENTICATION | Authentication failed. |
| FSP_ERR_CRYPTO_RSIP_LBIST_CHECK_BUSY | LBIST Check BUSY. |
| FSP_ERR_CRYPTO_COMMON_NOT_OPENED | Crypto Framework Common is not opened. |

| | |
|---|---|
| FSP_ERR_CRYPTO_HAL_ERROR | Cryoto HAL module returned an error. |
| FSP_ERR_CRYPTO_KEY_BUF_NOT_ENOUGH | Key buffer size is not enough to generate a key. |
| FSP_ERR_CRYPTO_BUF_OVERFLOW | Attempt to write data larger than what the buffer can hold. |
| FSP_ERR_CRYPTO_INVALID_OPERATION_MODE | Invalid operation mode. |
| FSP_ERR_MESSAGE_TOO_LONG | Message for RSA encryption is too long. |
| FSP_ERR_RSA_DECRYPTION_ERROR | RSA Decryption error. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid.<br>*Note*<br>*SF_CRYPTO APIs may return an error code starting from 0x10000 which is of Crypto module. Refer to sf_cryoto_err.h for Crypto error codes.* |
| FSP_ERR_SENSOR_IN_STABILIZATION | Sensor is stabilizing. |
| FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED | Measurement is not finished. |
| FSP_ERR_COMMS_BUS_NOT_OPEN | Bus is not open. |

### 5.1.5 MCU Board Support Package

### Detailed Description

The BSP is responsible for getting the MCU from reset to the user's application. Before reaching the user's application, the BSP sets up the stacks, heap, clocks, interrupts, C runtime environment, and stack monitor.

- BSP Features
- BSP Clock Configuration
- System Interrupts
- Group Interrupts
- External and Peripheral Interrupts
- Error Logging
- BSP Weak Symbols
- Warm Start Callbacks
- Sub Clock Stabilization Wait Callback
- SDRAM Initialization
- C Runtime Initialization
- Register Protection
- Option-Setting Memory
- ID Codes
- TrustZone Security Attribution Registers
- Software Delay
- Trignometric Function
- Digital Signal Processing with 32-bit Multiply-Accumulator
- Octal-SPI Clock Update
- Devices with OFS1.INITECCEN
- Limited D-Cache Support
- Non-Cacheable Buffer Placement Example
- Inter-Processor Communication (IPC) Support
- Configuration

# Overview

### BSP Features

### BSP Clock Configuration

All system clocks are set up during BSP initialization based on the settings in bsp_clock_cfg.h. These settings are derived from clock configuration information provided from the RA Configuration editor **Clocks** tab.

- Clock configuration is performed prior to initializing the C runtime environment to speed up the startup process, as it is possible to start up on a relatively slow (that is, 32 kHz) clock.
- The BSP implements the required delays to allow the selected clock to stabilize.
- The BSP will configure the CMSIS SystemCoreClock variable after clock initialization with the current system clock frequency.

### System Interrupts

As RA MCUs are based on the Arm Cortex-M architecture, the NVIC Nested Vectored Interrupt Controller (NVIC) handles exceptions and interrupt configuration, prioritization and interrupt masking. In the Arm architecture, the NVIC handles exceptions. Some exceptions are known as System Exceptions. System exceptions are statically located at the "top" of the vector table and occupy vector numbers 1 to 15. Vector zero is reserved for the MSP Main Stack Pointer (MSP). The remaining 15 system exceptions are shown below:

- Reset
- NMI
- Cortex-M4 Hard Fault Handler
- Cortex-M4 MPU Fault Handler
- Cortex-M4 Bus Fault Handler
- Cortex-M4 Usage Fault Handler
- Reserved
- Reserved
- Reserved
- Reserved
- Cortex-M4 SVCall Handler
- Cortex-M4 Debug Monitor Handler
- Reserved
- Cortex-M4 PendSV Handler
- Cortex-M4 SysTick Handler

NMI and Hard Fault exceptions are enabled out of reset and have fixed priorities. Other exceptions have configurable priorities and some can be disabled.

### Group Interrupts

Group interrupt is the term used to describe the 12 sources that can trigger the Non-Maskable Interrupt (NMI). When an NMI occurs the NMI Handler examines the NMISR (status register) to determine the source of the interrupt. NMI interrupts take precedence over all interrupts, are usable only as CPU interrupts, and cannot activate the RA peripherals Data Transfer Controller (DTC) or Direct Memory Access Controller (DMAC).

Possible group interrupt sources include:

- IWDT Underflow/Refresh Error
- WDT Underflow/Refresh Error
- Voltage-Monitoring 1 Interrupt
- Voltage-Monitoring 2 Interrupt
- VBATT monitor Interrupt
- Oscillation Stop is detected
- NMI pin
- RAM Parity Error
- RAM ECC Error
- MPU Bus Slave Error
- MPU Bus Master Error
- MPU Stack Error
- TrustZone Filter Error A user may enable notification for one or more group interrupts by registering a callback using the BSP API function R_BSP_GroupIrqWrite(). When an NMI interrupt occurs, the NMI handler checks to see if there is a callback registered for the cause of the interrupt and if so calls the registered callback function.

### External and Peripheral Interrupts

User configurable interrupts begin with slot 16. These may be external, or peripheral generated interrupts.

Although the number of available slots for the NVIC interrupt vector table may seem small, the BSP defines up to 512 events that are capable of generating an interrupt. By using Event Mapping, the BSP maps user-enabled events to NVIC interrupts. For an RA6M3 MCU, only 96 of these events may be active at any one time, but the user has flexibility by choosing which events generate the active event.

By allowing the user to select only the events they are interested in as interrupt sources, we are able to provide an interrupt service routine that is fast and event specific.

For example, on other microcontrollers a standard NVIC interrupt vector table might contain a single vector entry for the SCI0 (Serial Communications Interface) peripheral. The interrupt service routine for this would have to check a status register for the 'real' source of the interrupt. In the RA implementation there is a vector entry for each of the SCI0 events that we are interested in.

### BSP Weak Symbols

You might wonder how the BSP is able to place ISR addresses in the NVIC table without the user having explicitly defined one. All that is required by the BSP is that the interrupt event be given a priority.

This is accomplished through the use of the 'weak' attribute. The weak attribute causes the declaration to be emitted as a weak symbol rather than a global. A weak symbol is one that can be overridden by an accompanying strong reference with the same name. When the BSP declares a function as weak, user code can define the same function and it will be used in place of the BSP function. By defining all possible interrupt sources as weak, the vector table can be built at compile time and any user declarations (strong references) will be used at runtime.

Weak symbols are supported for ELF targets and also for a.out targets when using the GNU assembler and linker.

Note that in CMSIS system.c, there is also a weak definition (and a function body) for the Warm Start callback function R_BSP_WarmStart(). Because this function is defined in the same file as the weak declaration, it will be called as the 'default' implementation. The function may be overridden by the user by copying the body into their user application and modifying it as necessary. The linker identifies this as the 'strong' reference and uses it.

### Warm Start Callbacks

As the BSP is in the process of bringing up the board out of reset, there are three points where the user can request a callback. These are defined as the 'Pre Clock Init', 'Post Clock Init' and 'Post C' warm start callbacks.

As described above, this function is already weakly defined as R_BSP_WarmStart(), so it is a simple matter of redefining the function or copying the existing body from CMSIS system.c into the application code to get a callback. R_BSP_WarmStart() takes an event parameter of type bsp_warm_start_event_t which describes the type of warm start callback being made.

This function is not enabled/disabled and is always called for both events as part of the BSP startup. Therefore it needs a function body, which will not be called if the user is overriding it. The function body is located in system.c. To use this function just copy this function into your own code and

modify it to meet your needs.

### Sub Clock Stabilization Wait Callback

When Sub-Clock oscillator is populated in the application, the BSP startup code waits for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. Enabling the watchdog (IWDT or WDT) timer with Auto start mode in an application using Sub-clock may cause system to generate Reset or NMI interrupt before reaching the application code if watchdog refresh register is not updated in the configured refresh Window. To overcome this problem a weakly defined callback R_BSP_SubClockStabilizeWait() can be overridden. Redefine the callback function in the application code and add code to update the watchdog refresh register. R_BSP_SubClockStabilizeWait() takes a parameter delay of type uint32_t which describes the time in milliseconds required to stabilize the sub-clock.

### Sub Clock Stabilization Wait After Reset callback

After Power-On-Reset, the BSP startup code may have to wait for some time(sub-clock stabilization time) to allow Sub-clock to stabilize. This can cause problem to RTC in case device is to be reset frequently. If Sub-Clock registers are not initialized during a reset, BSP actually does not have to wait for Sub-clock to stabilize. To overcome this problem, a weakly defined callback R_BSP_SubClockStabilizeWaitAfterReset() is provided. Reimplement the callback function in the application code to determine whether BSP has to wait for stabilization time based on the current reset type. R_BSP_SubClockStabilizeWaitAfterReset() takes a parameter delay of type uint32_t which describes the time in milliseconds required to stabilize the sub-clock.

### SDRAM Initialization

The BSP provides support for usage of external SDRAM modules on MCUs with SDRAM support. SDRAM is enabled and configured in the BSP tab of the RA configuration editor. The default location for initialization is in the 'Post C' warm start callback. If required, the call to R_BSP_SdramInit() can be moved anywhere after clock and pin initialization, but it must only be called once after reset. The BSP will not initialize any memory sections in the SDRAM. The user is responsible for initializing any code or data stored in SDRAM.

Before entering Software Standby or Deep Software Standby, the user must call R_BSP_SdramSelfRefreshEnable() to change from Auto-Refresh to Self-Refresh in order to preserve data during the low power state. No SDRAM access is allowed after this function is called. The user must not place FSP code or data or their wakeup interrupt handling functions into SDRAM to ensure there are no issues around transitions into and out of Software Standby since SDRAM access will be disabled then and trigger a fault if access is requested.

When resuming from Software Standby, the user must call R_BSP_SdramSelfRefreshDisable() to change from Self-Refresh to Auto-Refresh and restore SDRAM access.

When resuming operation after Deep Software Standby or another situation where there is already data present in the SDRAM modules that must be preserved, the user must call R_BSP_SdramInit(false) before pin initialization and then call R_BSP_SdramSelfRefreshDisable() after pins have been configured in order to resume operations with the SDRAM.

### OSPI_B Initialization

The BSP provides support for usage of external or SiP OSPI memories on MCUs with OSPI_B support. OSPI_B intialization is enabled in the BSP tab of the RA configuration editor, but an OSPI_B stack component must also be added. It requires the "Early BSP Initialization" option to be enabled. The default location for initialization is during the BSP_WARM_START_POST_CLOCK event of

R_BSP_WarmStart callback. When enabled, the function specified in the macro BSP_CFG_OSPI_B_STARTUP_FN will be executed by the BSP and any internal memory regions sourced from OSPI_B memory will be initialized. The BSP will not initialize any memory sections in the OSPI memory; the user is responsible for initializing any code or data stored in the OSPI memory.

OSPI must be initialized before other external memories (for example, HyperRAM) if they source initialization data from OSPI. If required, the call to R_BSP_OspiBInit() can be moved anywhere after the clock initialization, but must be called once after reset. Moving initilization to be after the BSP_WARM_START_POST_C event will prevent external memories from automatically being initialized if sourced from OSPI.

On low voltage devices, for example, RA8P1 SiP, the BSP must be configured to the appropriate I/O port driver voltage or instabilities can occur.

### C Runtime Initialization

This BSP configuration allows the user to skip the FSP C runtime initialization code by setting the "C Runtime Initialization" to "Disabled" on the BSP tab of the RA Configuration editor. Disabling this option is useful in cases where a non-standard linker script is being used or other modifications to the runtime initialization are desired. If this macro is disabled, the user must use the 'Post Clock Init' event from the warm start (described above) to run their own runtime initialization code.

### Heap Allocation

The relatively low amount of on-chip SRAM available and lack of memory protection in an MCU means that heap use must be very carefully controlled to avoid memory leaks, overruns and attempted overallocation. Further, many RTOSes provide their own dynamic memory allocation system. For these reasons the default heap size is set at 0 bytes, effectively disabling dynamic memory. If it is required for an application setting a positive value to the "Heap size (bytes)" option in the RA Common configurations on the **BSP** tab will allocate a heap.

*Note*

*When using printf/sprintf (and other variants) to output floating point numbers a heap is required. A minimum size of 0x1000 (4096) bytes is recommended when starting development in this case.*

### Error Logging

When error logging is enabled, the error logging function can be redefined on the command line by defining FSP_ERROR_LOG(err) to the desired function call. The default function implementation is FSP_ERROR_LOG(err)=fsp_error_log(err, **FILE**, **LINE**). This implementation uses the predefined macros **FILE** and **LINE** to help identify the location where the error occurred. Removing the line from the function call can reduce code size when error logging is enabled. Some compilers may support other predefined macros like **FUNCTION**, which could be helpful for customizing the error logger.

### Register Protection

The BSP register protection functions utilize reference counters to ensure that an application which has specified a certain register and subsequently calls another function doesn't have its register protection settings inadvertently modified.

Each time R_BSP_RegisterProtectDisable() is called, the respective reference counter is incremented.

Each time R_BSP_RegisterProtectEnable() is called, the respective reference counter is decremented.

Both functions will only modify the protection state if their reference counter is zero.

```
/* Enable writing to protected CGC registers */
R_BSP_RegisterProtectDisable(BSP_REG_PROTECT_CGC);
/* Insert code to modify protected CGC registers. */
/* Disable writing to protected CGC registers */
R_BSP_RegisterProtectEnable(BSP_REG_PROTECT_CGC);
```

### Option-Setting Memory

Option-setting memory includes OFS registers (e.g. OFS1), the debugger ID code (OSIS), block protections settings (BPS/PBPS), and other device-dependent non-volatile options. Option-setting memory is MCU specific, and not all MCUs implement all option-setting registers. Option-setting configurations available on the selected device are configurable in the BSP properties. These configurations are placed in sections to be loaded at the required flash address by the linker.

OFS registers can be individually enabled or disabled. When an OFS register is disabled, its flash address will not be erased or programmed. The existing settings on the device will not be changed. For safety purpose, OFS registers that could limit or disable debug or ROM write access (like OSIS, BANKSEL, BPS, PBPS etc.) are disabled by default. Please note:

- Secure OFS registers can only be set by Secure/Flat projects. Secure OFS register settings are ignored in Non-Secure projects.
- For multiple-core use case, OFS registers will only be set by CPU0 projects.
- For MCUBoot use case, OFS registers will only be set by bootloader projects.

### ID Codes

The ID code is a 16-byte value that can be used to protect the MCU from being connected to a debugger or from connecting in Serial Boot Mode. There are different settings that can be set for the ID code; please refer to the hardware manual for your device for available options.

On MCUs that support TrustZone, option-setting registers are placed in a different locations for Non-Secure projects than for Secure or Flat projects. This is handled automatically by the BSP and linker scripts.

All *_SEL registers default to allowing both Secure and Non-Secure access unless otherwise noted here. If block protection is configured in a Secure project, the BSP sets the corresponding configuration to Secure access only by updating the corresponding *_SEL register. Similarly, the LVD related settings in the OFSn_SEL registers are automatically set to Secure if the corresponding LVD monitor is used in the Secure project.

### TrustZone Security Attribution Registers

On MCUs that support TrustZone, Security Attribution Registers for modules used in the Secure project are configured to allow Secure access only as part of the startup code of the Secure project. This logic is skipped for Flat projects.

### Software Delay

Implements a blocking software delay. A delay can be specified in microseconds, milliseconds or seconds. The delay is implemented based on the system clock rate.

```
 /* Delay at least 1 second. Depending on the number of wait states required for the
region of memory
  * that the software_delay_loop has been linked in this could take longer. The
default is 4 cycles per loop.
  * This can be modified by redefining DELAY_LOOP_CYCLES. BSP_DELAY_UNITS_SECONDS,
BSP_DELAY_UNITS_MILLISECONDS,
  * and BSP_DELAY_UNITS_MICROSECONDS can all be used with R_BSP_SoftwareDelay. */
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
```

### Trignometric Function

Implements Trignometric math inline functions utilizing TFU hardware. These functions can calculate sine, cosine, arctangent and hypotenuse. The trigonometric library functions sinf(), cosf(), atan2f(), and hypotf() can be mapped to respective TFU functions by enabling TFU Mathlib property in FSP Configuration tool. Extended functions sincosf() and atan2hypotf() are also available when the TFU Mathlib property is enabled in the RA Configuration editor.

TFU functions are not reentrant. Disable the TFU Mathlib property in RA Configuration editor if reentrant access to trigonometric library functions is required.

*Note*

*Refer to the MCU hardware user's manual or datasheet to determine if it has TFU support.*

### Digital Signal Processing With 32-bit Multiply-Accumulator

Implements DSP (digital signal processing) functions via MACL (32-bit Multiply-Accumulator) hardware. These functions will support CMSIS DSP APIs to perform the calculation, the activation of MACL can be controlled by stack MACL (rm_cmsis_dsp) in the RA Configuration editor.

When stack MACL (rm_cmsis_dsp) is added, the CMSIS DSP APIs will generate normal functions which overrides weak functions of Arm and use hardware for calculating. When stack MACL (rm_cmsis_dsp) is not added, CMSIS DSP APIs will perform the calculation by using software.

For examples, how to use the CMSIS DSP APIs refer to the link: https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM.

CMSIS APIs supported by MACL list:

| No | CMSIS DSP API | MACL BSP API | Description |
|---|---|---|---|
| 1 | arm_mult_q31 | R_BSP_MaclMulQ31 | Q31 vector multiplication |
| 2 | arm_scale_q31 | R_BSP_MaclScaleQ31 | Multiplies a Q31 vector by a scalar |
| 3 | arm_mat_mult_q31 | R_BSP_MaclMatMultQ31 | Q31 matrix multiplication |
| 4 | arm_mat_vec_mult_q31 | R_BSP_MaclMatVecMul | Q31 matrix and vector |

| | | | |
|---|---|---|---|
| | | Q31 | multiplication |
| 5 | arm_mat_scale_q31 | R_BSP_MaclMatScaleQ31 | Q31 matrix scaling |
| 6 | arm_biquad_cascade_df1_q31 | R_BSP_MaclBiquadCsdDf1Q31 | Processing function for the Q31 Biquad cascade filter |
| 7 | arm_conv_partial_q31 | R_BSP_MaclConvPartialQ31 | Partial convolution of Q31 sequences |
| 8 | arm_conv_q31 | R_BSP_MaclConvQ31 | Convolution of Q31 sequences |
| 9 | arm_correlate_q31 | R_BSP_MaclCorrelateQ31 | Correlation of Q31 sequences |
| 10 | arm_fir_decimate_q31 | R_BSP_MaclFirDecimateQ31 | Processing function for the Q31 FIR decimator |
| 11 | arm_fir_interpolate_q31 | R_BSP_MaclFirInterpolateQ31 | Processing function for the Q31 FIR interpolator |
| 12 | arm_fir_q31 | R_BSP_MaclFirQ31 | Processing function for Q31 FIR filter |
| 13 | arm_fir_sparse_q31 | R_BSP_MaclFirSparseQ31 | Processing function for the Q31 sparse FIR filter |
| 14 | arm_lms_norm_q31 | R_BSP_MaclLmsNormQ31 | Processing function for Q31 normalized LMS filter |
| 15 | arm_lms_q31 | R_BSP_MaclLmsQ31 | Processing function for Q31 LMS filter |

*Note*

*Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.*

### Critical Section Macros

Implements a critical section. Some MCUs (MCUs with the BASEPRI register) support allowing high priority interrupts to execute during critical sections. On these MCUs, interrupts with priority less than or equal to BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION are not serviced in critical sections. Interrupts with higher priority than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION still execute in critical sections.

```
   FSP_CRITICAL_SECTION_DEFINE;
/* Store the current interrupt posture. */
FSP_CRITICAL_SECTION_ENTER;
/* Interrupts cannot run in this section unless their priority is less than
BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. */
```

```
/* Restore saved interrupt posture. */
FSP_CRITICAL_SECTION_EXIT;
```

### OctaClock Update

Supports changing the Octal-SPI Clock (OCTACLK) during runtime if supported by the MCU. The OCTACLK source and clock divisor can be updated. It is user's responsibility to ensure the selected clock source is running before attempting to update OCTACLK.

### Devices with OFS1.INITECCEN

By default, FSP disables ECC for the caches and TCM with OFS1.INITECCEN. For best performance, it is recommended to keep ECC for cache and TCM disabled.

*Note*

*When ECC is enabled for TCM, a full and unconditional zero-initialization of all TCM memory will occur at startup of the first project after reset. This may be either a bootloader if present, or a Flat or Secure application. Because of this, any noinit section contained within TCM will be functionally a zero-initialized section, if ECC is enabled. This is an unavoidable requirement of ECC initialization. Also see Cache ECC with FSP.*

### Devices with LVOCR

By default, FSP disables I/O port low voltage mode for devices with the LVOCR register. Presently, RA8 devices are the only RA devices with the LVOCR register, which configures I/O ports based on VCC and VCC2 voltage levels. For cases where VCC and/or VCC2 will be less than 2.7 V for these devices, the I/O port low voltage mode should be enabled for VCC and/or VCC2.

*Note*

*If the I/O port low voltage mode is not enabled for VCC and/or VCC2 when less than 2.7 V, device electrical characteristics cannot be guaranteed. Do not enable I/O port low voltage mode for VCC or VCC2 when they are greater than or equal to 2.7 V.*

### Sealing the Main Stack (TrustZone Secure Projects)

In TrustZone secure projects, the BSP seals the main stack by placing the value 0xFEF5EDA5 above the stack top. For more information, refer to section 3.5 "Sealing a Stack" in "Secure software guidelines for ARMv8-M": https://developer.arm.com/documentation/100720/0300.

## Limited D-Cache Support

For MCUs with Cortex-M85 cores with D-Cache, limited support is available for enabling the D-Cache and automatically configuring predefined non-cacheable regions via the MPU during BSP initialization. For these MCUs, D-Cache is disabled by default because certain existing drivers do not support data coherency with D-Cache enabled. Enabling the D-Cache requires that data coherency be considered in any circumstance where a core interacts with other bus members.

### Non-Cacheable Buffer Placement Example

Warning

**The predefined non-cacheable sections are only understood as non-cacheable**

**within their respective security state when TrustZone is used. This is due to the MPU configuration done by FSP and how Armv8-M chooses the MPU which matches the current security state for determining the memory attributes of a data access. Cache incoherency will occur if references to these sections are passed between security states. For example, passing a reference from the Non-secure application non-cacheable section to the Secure application will result in the Secure application treating the location as cacheable.**
**The predefined non-cacheable sections are only understood as non-cacheable within their respective core. In dual-core devices, each core has a separate MPU which may configure its own regions and attributes, so these sections cannot be used for coherent interprocessor communications in the case that D-Cache is enabled. Use the IPC peripheral instead.**

The predefined non-cacheable regions configured by the MPU when D-Cache is enabled can be used to contain data that should not be cached, ensuring data coherency for that data. To use the predefined non-cacheable regions, place the data into the corresponding non-cacheable section defined by the linker script for the chosen toolchain. The predefined non-cacheable regions are not initialized by the BSP.

Below are two examples of placing buffers in non-cacheable regions:

```
uint8_t uncached_uninitialized_buffer_sram[1024] BSP_PLACE_IN_SECTION(".ram_noinit_no
cache");

uint8_t uncached_zero_initialized_buffer_sram[1024] BSP_PLACE_IN_SECTION(".ram_nocach
e");
```

*Note*

*Prior to FSP 6.0.0, the .ram_nocache and .sdram_nocache sections were treated as uninitialized sections. In v6.0.0 and up they default to zero initialization during startup. Use the new section names containing _noinit_ for placement into an uninitialized non-cacheable section.*

Section names differ by data region and compiler. Names predefined by the BSP are shown below.

| Region | Initialization | Name (GCC, IAR, LLVM) | Name (AC6) |
|---|---|---|---|
| SRAM | Uninitialized | .ram_noinit_nocache | .bss.ram_noinit_nocache |
| SRAM | Zero | .ram_nocache | .bss.ram_nocache |
| SDRAM | Uninitialized | .sdram_noinit_nocache | .bss.sdram_noinit_nocache |
| SDRAM | Zero | .sdram_nocache | .bss.sdram_nocache |
| OSPI0 CS0 | Uninitialized | .ospi0_cs0_noinit_nocache | .bss.ospi0_cs0_noinit_nocache |
| OSPI0 CS0 | Zero | .ospi0_cs0_nocache | .bss.ospi0_cs0_nocache |
| OSPI1 CS0 | Uninitialized | .ospi1_cs0_noinit_nocache | .bss.ospi1_cs0_noinit_nocache |
| OSPI1 CS0 | Zero | .ospi1_cs0_nocache | .bss.ospi1_cs0_nocache |

# Inter-Processor Communication (IPC) Support

*Note*

*For using IPC message FIFOs and maskable interrupts see the HAL IPC driver: Overview*

For dual-core MCUs with an IPC peripheral, the BSP provides APIs to use IPC NMIs and semaphores.

### NMI Support

In order to configure receiving IPC NMIs from the opposing core the user should call R_BSP_IpcNmiEnable to enable the interrupt and setup a callback for interrupt processing. On the other hand R_BSP_IpcNmiRequestSet should be called to trigger an interrupt on the opposing core.

### Semaphore Support

R_BSP_IpcSemaphoreTake and R_BSP_IpcSemaphoreGive should be used to manage any IPC semaphore. The semaphore_handle should be linked to a valid hardware semaphore number.

A IPC semaphore stack is provided which can be used to create semaphore handles.

### Configurations for System > IPC Semaphore

This module can be added to the Stacks tab via New Stack > System > IPC Semaphore.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_ipc_semaphore0 | Module name. |
| Semaphore Number | MCU Specific Options | | Select the IPC semaphore number. This semaphore number will determine which hardware semaphore register is used. |

# Configuration

The BSP is heavily data driven with most features and functionality being configured based on the content from configuration files. Configuration files represent the settings specified by the user and are generated when the project is built and/or when the Generate Project Content button is clicked in the RA Configuration editor.

### Build Time Configurations for fsp_common

The following build time configurations are defined in fsp_cfg/bsp/bsp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Main stack size (bytes) | Value must be an integer multiple of 8 and between 8 and 0xFFFFFFFF | 0x400 | Set the size of the main program stack.<br><br>NOTE: This entry is for |

| | | | |
|---|---|---|---|
| | | | the main stack. When using an RTOS, thread stacks can be configured in the properties for each thread. |
| Heap size (bytes) | Value must be 0 or an integer multiple of 8 between 8 and 0xFFFFFFFF. | 0 | The main heap is disabled by default. Set the heap size to a positive integer divisible by 8 to enable it.<br><br>A minimum of 4K (0x1000) is recommended if standard library functions are to be used. |
| Bootloader Secondary XIP | • Disabled<br>• Enabled | Disabled | This bootloader application project wants to be linked to Secondary XIP area |
| MCU Vcc (mV) | Value must between 0 and 5500 (5.5V) | 3300 | Some peripherals require different settings based on the supplied voltage. Entering Vcc here (in mV) allows the relevant driver modules to configure the associated peripherals accordingly. |
| Parameter checking | • Enabled<br>• Disabled | Disabled | When enabled, parameter checking for the BSP is turned on. In addition, any modules whose parameter checking configuration is set to 'Default (BSP)' will perform parameter checking as well. |
| Assert Failures | • Return FSP_ERR_ASSERTION<br>• Call fsp_error_log then Return FSP_ERR_ASSERTION<br>• Use assert() to Halt Execution<br>• Disable checks | Return FSP_ERR_ASSERTION | Define the behavior of the FSP_ASSERT() macro. |

| | | | |
|---|---|---|---|
| | that would return FSP_ERR_ASSERTION | | |
| Clock Registers not Reset Values during Startup | • Disabled<br>• Enabled | Disabled | If enabled, registers are assumed to be set to their reset value during startup. Enable this if another application such as a bootloader or Secure project has already configured the clocks before the startup code runs. |
| Main Oscillator Populated | • Populated<br>• Not Populated | Populated | Select whether or not there is a main oscillator (XTAL) on the board. This setting can be overridden in board_cfg.h. |
| PFS Protect | • Disabled<br>• Enabled | Enabled | Keep the PFS registers locked when they are not being modified. If disabled they will be unlocked during startup. |
| C Runtime Initialization | • Enabled<br>• Disabled | Enabled | Select if the C runtime initialization in the BSP is to be used. If disabled, use the BSP_WARM_START_POST_CLOCK event to run user defined equivalent. |
| Early BSP Initialization | • Enabled<br>• Disabled | Disabled | Enable this option to use BSP functions before C runtime initialization (BSP_WARM_START_RESET or BSP_WARM_START_POST_CLOCK). |
| Main Oscillator Clock Source | • External Oscillator<br>• Crystal or Resonator | Crystal or Resonator | Select the main oscillator clock source. This setting can be overridden in board_cfg.h |
| Subclock Populated | • Populated<br>• Not Populated | Populated | Select whether or not there is a subclock crystal on the board. This setting can be overridden in board_cfg.h. |

| | | | |
|---|---|---|---|
| Subclock Drive (Drive capacitance availability varies by MCU) | • Standard/Normal mode<br>• Low/Low power mode 1<br>• Low power mode 2<br>• Low power mode 3 | Standard/Normal mode | Select the subclock oscillator drive capacitance. This setting can be overridden in board_cfg.h |
| Subclock Stabilization Time (ms) | Value must between 0 and 10000 | 1000 | Select the subclock oscillator stabilization time. This is only used in the startup code if the subclock is selected as the system clock on the Clocks tab or if the HOCO FLL function is enabled. This setting can be overridden in board_cfg.h |

| enum | bsp_reg_protect_t |
| enum | fsp_ip_t |
| enum | fsp_signal_t |

### Variables

| | |
|---|---|
| uint32_t SystemCoreClock | BSP_SECTION_EARLY_INIT |

## Data Structure Documentation

### ◆ bsp_ipc_semaphore_handle_t

| struct bsp_ipc_semaphore_handle_t | | |
|---|---|---|
| Semaphore handle for IPC semaphores. | | |
| Data Fields | | |
| uint8_t | semaphore_num | Semaphore number, controls which IPCSEMn register is used. |

### ◆ mmf_status_t

| struct mmf_status_t |
|---|
| Status instance of Memory Mirror Function. |

## Macro Definition Documentation

### ◆ BSP_IRQ_DISABLED

| #define BSP_IRQ_DISABLED |
|---|
| Used to signify that an ELC event is not able to be used as an interrupt. |

### ◆ FSP_LOG_PRINT

| #define FSP_LOG_PRINT ( X) |
|---|
| Macro that can be defined in order to enable logging in FSP modules. |

### ◆ FSP_RETURN

| #define FSP_RETURN ( err) |
| --- |
| Macro to log and return error without an assertion. |

### ◆ FSP_ERROR_LOG

| #define FSP_ERROR_LOG ( err) |
| --- |
| This function is called before returning an error code. To stop on a runtime error, define fsp_error_log in user code and do required debugging (breakpoints, stack dump, etc) in this function. |

### ◆ FSP_ASSERT

| #define FSP_ASSERT ( a) |
| --- |
| Default assertion calls FSP_ERROR_RETURN if condition "a" is false. Used to identify incorrect use of API's in FSP functions. |

### ◆ FSP_ERROR_RETURN

| #define FSP_ERROR_RETURN ( a, err ) |
| --- |
| All FSP error codes are returned using this macro. Calls FSP_ERROR_LOG function if condition "a" is false. Used to identify runtime errors in FSP functions. |

### ◆ FSP_CRITICAL_SECTION_ENTER

| #define FSP_CRITICAL_SECTION_ENTER |
| --- |
| This macro temporarily saves the current interrupt state and disables interrupts. |

### ◆ FSP_CRITICAL_SECTION_EXIT

| #define FSP_CRITICAL_SECTION_EXIT |
| --- |
| This macro restores the previously saved interrupt state, reenabling interrupts. |

### ◆ FSP_INVALID_VECTOR

| #define FSP_INVALID_VECTOR |
| --- |
| Used to signify that the requested IRQ vector is not defined in this system. |

### ◆ BSP_CFG_HANDLE_UNRECOVERABLE_ERROR

| #define BSP_CFG_HANDLE_UNRECOVERABLE_ERROR ( x) |
| --- |
| In the event of an unrecoverable error the BSP will by default call the __BKPT() intrinsic function which will alert the user of the error. The user can override this default behavior by defining their own BSP_CFG_HANDLE_UNRECOVERABLE_ERROR macro. |

### ◆ BSP_STACK_ALIGNMENT

| #define BSP_STACK_ALIGNMENT |
| --- |
| Stacks (and heap) must be sized and aligned to an integer multiple of this number. |

### ◆ MEMORY_MIRROR_REG_KEY

| #define MEMORY_MIRROR_REG_KEY |
| --- |
| Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. |

### ◆ R_BSP_MODULE_START

| #define R_BSP_MODULE_START ( ip, channel ) |
| --- |
| Cancels the module stop state.<br><br>**Parameters**<br><br>ip — fsp_ip_t enum value for the module to be stopped<br><br>channel — The channel. Use channel 0 for modules without channels. |

### ◆ R_BSP_MODULE_STOP

| #define R_BSP_MODULE_STOP ( ip, channel ) |
| --- |
| Enables the module stop state.<br><br>**Parameters**<br><br>ip — fsp_ip_t enum value for the module to be stopped<br><br>channel — The channel. Use channel 0 for modules without channels. |

## Typedef Documentation

### ◆ bsp_ipc_nmi_cb_t

| typedef void(* bsp_ipc_nmi_cb_t) (void) |
|---|
| IPC NMI callback type. |

## Enumeration Type Documentation

### ◆ bsp_warm_start_event_t

| enum bsp_warm_start_event_t | |
|---|---|
| Different warm start entry locations in the BSP. | |
| Enumerator | |
| BSP_WARM_START_RESET | Called almost immediately after reset. No C runtime environment, clocks, or IRQs. |
| BSP_WARM_START_POST_CLOCK | Called after clock initialization. No C runtime environment or IRQs. |
| BSP_WARM_START_POST_C | Called after clocks and C runtime environment have been set up. |

### ◆ fsp_priv_clock_t

| enum fsp_priv_clock_t | |
|---|---|
| Enumerator | |
| FSP_PRIV_CLOCK_UNUSED | Sentinel value for unused clock. |

### ◆ fsp_priv_source_clock_t

| enum fsp_priv_source_clock_t | |
|---|---|
| Enumerator | |
| FSP_PRIV_CLOCK_HOCO | The high speed on chip oscillator. |
| FSP_PRIV_CLOCK_MOCO | The middle speed on chip oscillator. |
| FSP_PRIV_CLOCK_LOCO | The low speed on chip oscillator. |
| FSP_PRIV_CLOCK_MAIN_OSC | The main oscillator. |
| FSP_PRIV_CLOCK_SUBCLOCK | The subclock oscillator. |
| FSP_PRIV_CLOCK_PLL | The PLL output. |
| FSP_PRIV_CLOCK_PLL1P | The PLL1P output. |
| FSP_PRIV_CLOCK_PLL2 | The PLL2 output. |
| FSP_PRIV_CLOCK_PLL2P | The PLL2P output. |
| FSP_PRIV_CLOCK_PLL1Q | The PLL1Q output. |
| FSP_PRIV_CLOCK_PLL1R | The PLL1R output. |
| FSP_PRIV_CLOCK_PLL2Q | The PLL2Q output. |
| FSP_PRIV_CLOCK_PLL2R | The PLL2R output. |

### ◆ bsp_delay_units_t

| enum bsp_delay_units_t | |
|---|---|
| Available delay units for R_BSP_SoftwareDelay(). These are ultimately used to calculate a total # of microseconds | |
| Enumerator | |
| BSP_DELAY_UNITS_SECONDS | Requested delay amount is in seconds. |
| BSP_DELAY_UNITS_MILLISECONDS | Requested delay amount is in milliseconds. |
| BSP_DELAY_UNITS_MICROSECONDS | Requested delay amount is in microseconds. |

### ◆ bsp_grp_irq_t

| enum bsp_grp_irq_t | |
|---|---|
| Which interrupts can have callbacks registered. | |
| Enumerator | |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_VBATT | VBATT monitor interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_RAM_PARITY | RAM Parity Error. |
| BSP_GRP_IRQ_RAM_ECC | RAM ECC Error. |
| BSP_GRP_IRQ_MPU_BUS_SLAVE | MPU Bus Slave Error. |
| BSP_GRP_IRQ_MPU_BUS_MASTER | MPU Bus Master Error. |
| BSP_GRP_IRQ_MPU_STACK | MPU Stack Error. |
| BSP_GRP_IRQ_TRUSTZONE | MPU Stack Error. |
| BSP_GRP_IRQ_CACHE_PARITY | MPU Stack Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |

| | |
|---|---|
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_SOSC_STOP_DETECT | Sub Oscillation stop is detected. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCAL_MEMORY | Local Memory Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_FPU | FPU Exception. |
| BSP_GRP_IRQ_MRC | MRAM Code read error. |
| BSP_GRP_IRQ_MRE | MRAM Extra read error. |
| BSP_GRP_IRQ_IPC | IPC Interrupt. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |

| | |
|---|---|
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |

| | |
|---|---|
| BSP_GRP_IRQ_SOSC_STOP_DETECT | Sub Oscillation stop is detected. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCAL_MEMORY | Local Memory Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_FPU | FPU Exception. |
| BSP_GRP_IRQ_MRC | MRAM Code read error. |
| BSP_GRP_IRQ_MRE | MRAM Extra read error. |
| BSP_GRP_IRQ_IPC | IPC Interrupt. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_SOSC_STOP_DETECT | Sub Oscillation stop is detected. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCAL_MEMORY | Local Memory Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_FPU | FPU Exception. |
| BSP_GRP_IRQ_MRC | MRAM Code read error. |

| | |
|---|---|
| BSP_GRP_IRQ_MRE | MRAM Extra read error. |
| BSP_GRP_IRQ_IPC | IPC Interrupt. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_IWDT_ERROR | IWDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_WDT_ERROR | WDT underflow/refresh error has occurred. |
| BSP_GRP_IRQ_LVD1 | Voltage monitoring 1 interrupt. |
| BSP_GRP_IRQ_LVD2 | Voltage monitoring 2 interrupt. |
| BSP_GRP_IRQ_SOSC_STOP_DETECT | Sub Oscillation stop is detected. |
| BSP_GRP_IRQ_OSC_STOP_DETECT | Oscillation stop is detected. |
| BSP_GRP_IRQ_NMI_PIN | NMI Pin interrupt. |
| BSP_GRP_IRQ_MPU_BUS_TZF | MPU Bus or TrustZone Filter Error. |
| BSP_GRP_IRQ_COMMON_MEMORY | SRAM ECC or SRAM Parity Error. |
| BSP_GRP_IRQ_LOCAL_MEMORY | Local Memory Error. |
| BSP_GRP_IRQ_LOCKUP | LockUp Error. |
| BSP_GRP_IRQ_FPU | FPU Exception. |
| BSP_GRP_IRQ_MRC | MRAM Code read error. |

| | |
|---|---|
| BSP_GRP_IRQ_MRE | MRAM Extra read error. |
| BSP_GRP_IRQ_IPC | IPC Interrupt. |

### ◆ mmf_state_t

| enum mmf_state_t |
|---|
| Enum for state of Memory Mirror Function. |

### ◆ bsp_reg_protect_t

| enum bsp_reg_protect_t | |
|---|---|
| The different types of registers that can be protected. | |
| Enumerator | |
| BSP_REG_PROTECT_CGC | Enables writing to the registers related to the clock generation circuit. |
| BSP_REG_PROTECT_OM_LPC_BATT | Enables writing to the registers related to operating modes, low power consumption, and battery backup function. |
| BSP_REG_PROTECT_LVD | Enables writing to the registers related to the LVD: LVCMPCR, LVDLVLR, LVD1CR0, LVD1CR1, LVD1SR, LVD2CR0, LVD2CR1, LVD2SR. |
| BSP_REG_PROTECT_SAR | Enables writing to the registers related to the security function. |
| BSP_REG_PROTECT_RESET | Enables writing to the registers related to reset control. |

### ◆ fsp_ip_t

| enum fsp_ip_t | |
|---|---|
| Available modules. | |
| Enumerator | |
| FSP_IP_CFLASH | Code Flash. |
| FSP_IP_DFLASH | Data Flash. |
| FSP_IP_RAM | RAM. |

| FSP_SIGNAL_USB_USB_INT_RESUME | USB USB INT RESUME. |
| FSP_SIGNAL_WDT_UNDERFLOW | WDT UNDERFLOW. |
| FSP_SIGNAL_ULPT_COMPARE_A | ULPT COMPARE A. |
| FSP_SIGNAL_ULPT_COMPARE_B | ULPT COMPARE B. |
| FSP_SIGNAL_ULPT_INT | ULPT INT. |

## Function Documentation

### ◆ R_FSP_VersionGet()

fsp_err_t R_FSP_VersionGet ( fsp_pack_version_t *const *p_version*)

Get the FSP version based on compile time macros.

**Parameters**

| | | |
|---|---|---|
| [out] | p_version | Memory address to return version information to. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Version information stored. |
| FSP_ERR_ASSERTION | The parameter p_version is NULL. |

### ◆ R_BSP_SourceClockHzGet()

uint32_t R_BSP_SourceClockHzGet ( fsp_priv_source_clock_t *clock*)

Gets the frequency of a source clock.

**Parameters**

| | | |
|---|---|---|
| [in] | clock | Pointer to Octaclk setting structure which provides information regarding Octaclk source and divider settings to be applied. |

**Returns**

Frequency of requested clock in Hertz.

### ◆ R_FSP_CurrentIrqGet()

__STATIC_INLINE IRQn_Type R_FSP_CurrentIrqGet ( void )

Return active interrupt vector number value

**Returns**

Active interrupt vector number value

### ◆ R_FSP_SystemClockHzGet()

__STATIC_INLINE uint32_t R_FSP_SystemClockHzGet ( fsp_priv_clock_t *clock*)

Gets the frequency of a system clock.

**Returns**
Frequency of requested clock in Hertz.

### ◆ R_FSP_ClockDividerGet()

__STATIC_INLINE uint32_t R_FSP_ClockDividerGet ( uint32_t *ckdivcr*)

Converts a clock's CKDIVCR register value to a clock divider (Eg: SPICKDIVCR).

**Returns**
Clock Divider

### ◆ R_BSP_UniqueIdGet()

__STATIC_INLINE bsp_unique_id_t const* R_BSP_UniqueIdGet ( void )

Get unique ID for this device.

**Returns**
A pointer to the unique identifier structure

### ◆ R_BSP_PartNumberGet()

__STATIC_INLINE fsp_err_t R_BSP_PartNumberGet ( bsp_part_number_t *const *p_part_number*)

Get part number for this device.

**Parameters**

| | | |
|---|---|---|
| [out] | p_part_number | Memory address to return MCU's part number to. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Part number information stored. |
| FSP_ERR_ASSERTION | The parameter p_part_number is NULL. |
| FSP_ERR_NOT_FOUND | An error occurred when retrieving data from part number register. |

### ◆ R_BSP_FlashCacheDisable()

| __STATIC_INLINE void R_BSP_FlashCacheDisable ( void ) |
|---|
| Disables the flash cache. |

### ◆ R_BSP_FlashCacheEnable()

| __STATIC_INLINE void R_BSP_FlashCacheEnable ( void ) |
|---|
| Enables the flash cache. |

### ◆ R_BSP_SecondaryCoreStart()

| __STATIC_INLINE void R_BSP_SecondaryCoreStart ( void ) |
|---|
| Sets the secondary core VTOR and activates the secondary core. |

### ◆ R_BSP_SoftwareDelay()

| void R_BSP_SoftwareDelay ( uint32_t *delay*, bsp_delay_units_t *units* ) |
|---|
| Delay for at least the specified duration in units and return.<br><br>**Parameters** |

| | | |
|---|---|---|
| [in] | delay | The number of 'units' to delay. |
| [in] | units | The 'base' (bsp_delay_units_t) for the units specified. Valid values are: BSP_DELAY_UNITS_SECONDS, BSP_DELAY_UNITS_MILLISECONDS, BSP_DELAY_UNITS_MICROSECONDS.<br>For example:<br>At 1 MHz one cycle takes 1 microsecond (.000001 seconds).<br>At 12 MHz one cycle takes 1/12 microsecond or 83 nanoseconds.<br>Therefore one run through bsp_prv_software_delay_loop() takes: ~ (83 * BSP_DELAY_LOOP_CYCLES) or 332 ns. A delay of 2 us therefore requires 2000ns/332ns or 6 loops. |

The 'theoretical' maximum delay that may be obtained is determined by a full 32 bit loop count and the system clock rate. @120MHz: ((0xFFFFFFFF loops * 4 cycles /loop) / 120000000) = 143 seconds. @32MHz: ((0xFFFFFFFF loops * 4 cycles /loop) / 32000000) = 536 seconds

Note that requests for very large delays will be affected by rounding in the calculations and the actual delay achieved may be slightly longer. @32 MHz, for example, a request for 532 seconds will be closer to 536 seconds.

Note also that if the calculations result in a loop_cnt of zero, the bsp_prv_software_delay_loop() function is not called at all. In this case the requested delay is too small (nanoseconds) to be carried out by the loop itself, and the overhead associated with executing the code to just get to this point has certainly satisfied the requested delay.

***Note***

*This function calls bsp_cpu_clock_get() which ultimately calls R_CGC_SystemClockFreqGet() and therefore requires that the BSP has already initialized the CGC (which it does as part of the Sysinit). Care should be taken to ensure this remains the case if in the future this function were to be called as part of the BSP initialization.*
*This function will delay for **at least** the specified duration. Due to overhead in calculating the correct number of loops to delay, very small delay values (generally 1-5 microseconds) may be significantly longer than specified. Approximate overhead for this function is as follows:*

- *CM4: 20-50 cycles*
- *CM33: 10-60 cycles*
- *CM23: 75-200 cycles*

*If more accurate microsecond timing must be performed in software it is recommended to use bsp_prv_software_delay_loop() directly. In this case, use BSP_DELAY_LOOP_CYCLES or BSP_DELAY_LOOPS_CALCULATE() to convert a calculated delay cycle count to a number of software delay loops.*
*Delays may be longer than expected when compiler optimization is turned off.*

**Warning**

The delay will be longer than specified on CM23 devices when the core clock is greater than 32 MHz. Setting BSP_DELAY_LOOP_CYCLES to 6 will improve accuracy at 48 MHz but will result in shorter than expected delays at lower speeds.

### ◆ R_BSP_GroupIrqWrite()

fsp_err_t R_BSP_GroupIrqWrite ( bsp_grp_irq_t *irq*, void(*)(bsp_grp_irq_t irq) *p_callback* )

Register a callback function for supported interrupts. If NULL is passed for the callback argument then any previously registered callbacks are unregistered.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | Interrupt for which to register a callback. |
| [in] | p_callback | Pointer to function to call when interrupt occurs. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback registered |
| FSP_ERR_ASSERTION | Callback pointer is NULL |

### ◆ NMI_Handler()

| void NMI_Handler ( void ) |
|---|
| Non-maskable interrupt handler. This exception is defined by the BSP, unlike other system exceptions, because there are many sources that map to the NMI exception. |

### ◆ R_BSP_IpcSemaphoreTake()

| fsp_err_t R_BSP_IpcSemaphoreTake ( bsp_ipc_semaphore_handle_t const *const *p_semaphore_handle*) |
|---|
| Attempt to take IPC semaphore<br><br>**Parameters**<br>[in] \| p_semaphore_handle \| Semaphore handle corresponding to IPCSEMn to use.<br><br>**Return values**<br>FSP_SUCCESS \| Semaphore successfully taken<br>FSP_ERR_IN_USE \| Semaphore already taken<br>FSP_ERR_IP_CHANNEL_NOT_PRESENT \| Specified semaphore doesn't exist on device |

### ◆ R_BSP_IpcSemaphoreGive()

| fsp_err_t R_BSP_IpcSemaphoreGive ( bsp_ipc_semaphore_handle_t const *const *p_semaphore_handle*) |
|---|
| Give/clear the IPC semaphore<br><br>**Parameters**<br>[in] \| p_semaphore_handle \| Semaphore handle corresponding to IPCSEMn to use.<br><br>**Return values**<br>FSP_SUCCESS \| Semaphore successfully given<br>FSP_ERR_IP_CHANNEL_NOT_PRESENT \| Specified semaphore doesn't exist on device |

### ◆ R_BSP_IpcNmiEnable()

fsp_err_t R_BSP_IpcNmiEnable ( bsp_ipc_nmi_cb_t *p_callback*)

Enable NMI for current core

**Parameters**

| | | |
|---|---|---|
| [in] | p_callback | Pointer to callback to use for NMI. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | NMI request set |

### ◆ R_BSP_IpcNmiRequestSet()

fsp_err_t R_BSP_IpcNmiRequestSet ( void )

Set NMI request for the opposing core

**Return values**

| | |
|---|---|
| FSP_SUCCESS | NMI request set |

### ◆ R_BSP_IrqClearPending()

void R_BSP_IrqClearPending ( IRQn_Type *irq*)

Clear the interrupt status flag (IR) for a given interrupt and clear the NVIC pending interrupt.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | Interrupt for which to clear the IR bit. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_IrqCfg()

void R_BSP_IrqCfg ( IRQn_Type const *irq*, uint32_t *priority*, void * *p_context* )

Sets the interrupt priority and context.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | The IRQ to configure. |
| [in] | priority | NVIC priority of the interrupt |
| [in] | p_context | The interrupt context is a pointer to data required in the ISR. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_IrqEnableNoClear()

void R_BSP_IrqEnableNoClear ( IRQn_Type const *irq*)

Enable the IRQ in the NVIC (Without clearing the pending bit).

**Parameters**

| | | |
|---|---|---|
| [in] | irq | The IRQ to enable. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_IrqEnable()

void R_BSP_IrqEnable ( IRQn_Type const *irq*)

Clears pending interrupts in both ICU and NVIC, then enables the interrupt.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | Interrupt for which to clear the IR bit and enable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_IrqDisable()

void R_BSP_IrqDisable ( IRQn_Type const *irq*)

Disables interrupts in the NVIC.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | The IRQ to disable in the NVIC. Note that the enums listed for IRQn_Type are only those for the Cortex Processor Exceptions Numbers. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_IrqCfgEnable()

void R_BSP_IrqCfgEnable ( IRQn_Type const *irq*, uint32_t *priority*, void * *p_context* )

Sets the interrupt priority and context, clears pending interrupts, then enables the interrupt.

**Parameters**

| | | |
|---|---|---|
| [in] | irq | Interrupt number. |
| [in] | priority | NVIC priority of the interrupt |
| [in] | p_context | The interrupt context is a pointer to data required in the ISR. |

**Warning**

Do not call this function for system exceptions where the IRQn_Type value is < 0.

### ◆ R_BSP_MemoryMirrorStatusGet()

__STATIC_INLINE fsp_err_t R_BSP_MemoryMirrorStatusGet ( mmf_status_t * *p_mmf_status*)

Get the current status of Memory Mirror.

**Parameters**

| | | |
|---|---|---|
| [out] | p_mmf_status | Pointer to instance which used for storing the state of MMF after invoked this function. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MMF status retrieved successfully. |
| FSP_ERR_UNSUPPORTED | MCU does not support MMF. |
| FSP_ERR_ASSERTION | NULL pointer passed as argument. |

This function retrieves the current state of the MMF and the mirrored address into a user provided structure.

### ◆ R_BSP_MemoryMirrorAddrSet()

__STATIC_INLINE fsp_err_t R_BSP_MemoryMirrorAddrSet ( const uint32_t *addr*)

Set address for MMF region.

**Parameters**

| | | |
|---|---|---|
| [in] | addr | Address of memory region to be mirrored into MMF region. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address is set successfully. |
| FSP_ERR_UNSUPPORTED | MCU does not support MMF. |
| FSP_ERR_INVALID_ADDRESS | Requested address is out of supported range. |

This function sets the memory address to be mirrored by MMF.

### ◆ R_BSP_RegisterProtectEnable()

void R_BSP_RegisterProtectEnable ( bsp_reg_protect_t *regs_to_protect*)

Enable register protection. Registers that are protected cannot be written to. Register protection is enabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

**Parameters**

| | | |
|---|---|---|
| [in] | regs_to_protect | Registers which have write protection enabled. |

### ◆ R_BSP_RegisterProtectDisable()

void R_BSP_RegisterProtectDisable ( bsp_reg_protect_t *regs_to_unprotect*)

Disable register protection. Registers that are protected cannot be written to. Register protection is disabled by using the Protect Register (PRCR) and the MPC's Write-Protect Register (PWPR).

**Parameters**

| | | |
|---|---|---|
| [in] | regs_to_unprotect | Registers which have write protection disabled. |

### ◆ Reset_Handler()

| void Reset_Handler ( void ) |
|---|
| MCU starts executing here out of reset. Main stack pointer is set up already. |

### ◆ Default_Handler()

| void Default_Handler ( void ) |
|---|
| Default exception handler. |

### ◆ SystemInit()

| void SystemInit ( void ) |
|---|
| Initialize the MCU and the runtime environment. |

### ◆ R_BSP_WarmStart()

| void R_BSP_WarmStart ( bsp_warm_start_event_t *event*) |
|---|
| This function is called at various points during the startup process. This function is declared as a weak symbol higher up in this file because it is meant to be overridden by a user implemented version. One of the main uses for this function is to call functional safety code during the startup process. To use this function just copy this function into your own code and modify it to meet your needs.<br><br>**Parameters**<br>[in] event — Where the code currently is in the start up process |

## Variable Documentation

### ◆ BSP_SECTION_EARLY_INIT

| uint32_t SystemCoreClock BSP_SECTION_EARLY_INIT |
|---|
| System Clock Frequency (Core Clock) |

#### 5.1.5.1 RA0E1

BSP » MCU Board Support Package

## Detailed Description

### Build Time Configurations for ra0e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Disabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Main Oscillation Stabilization Time | • 2^8/MOSC<br>• 2^9/MOSC<br>• 2^10/MOSC<br>• 2^11/MOSC<br>• 2^13/MOSC<br>• 2^15/MOSC<br>• 2^17/MOSC<br>• 2^18/MOSC | 2^18/MOSC | |
| Use Low Voltage Mode | Not Supported | Not Supported | Use the low voltage mode. This limits the ICLK operating frequency to 4 MHz and requires all clock dividers to be at least 4 when oscillation stop detection is used. |

### Macros

### ◆ bsp_power_mode_t

| enum bsp_power_mode_t | |
|---|---|
| Voltage regulator mode | |
| Enumerator | |
| BSP_POWER_MODE_DCDC_2V4_TO_2V7 | DCDC mode; 2.4V to 2.7V supply. |
| BSP_POWER_MODE_DCDC_2V7_TO_3V6 | DCDC mode; 2.7V to 3.6V supply. |
| BSP_POWER_MODE_DCDC_3V6_TO_4V5 | DCDC mode; 3.6V to 4.5V supply. |
| BSP_POWER_MODE_DCDC_4V5_TO_5V5 | DCDC mode; 4.5V to 5.5V supply. |
| BSP_POWER_MODE_LDO | LDO mode. |

## Function Documentation

### ◆ R_BSP_PowerModeSet()

bsp_power_mode_t R_BSP_PowerModeSet ( bsp_power_mode_t *mode*)

Select either the LDO or DCDC regulator and/or update the MCU supply voltage range. Returns the previously selected mode.

***Note***

*DCDC mode has the following limitations:*

- *Supply voltage must be 2.4V or greater*
- *Low- and Subosc-speed modes are not available*
- *Software Standby is not available Ensure these limitations are respected before entering DCDC mode. If supply voltage may drop below 2.4V during operation, configure a LVD channel to interrupt or reset the MCU near this threshold to switch back to the LDO.*

*Switching to DCDC mode temporarily disables all interrupts and blocks for 22 microseconds; switching to LDO from DCDC temporarily disables all peripherals and interrupts and blocks for 60 microseconds.*

*If the supply voltage falls outside the range originally specified when starting the DCDC regulator, call this function again with the updated supply voltage.*

**Returns**

The previously selected power mode.

## 5.1.5.12 RA4C1

BSP » MCU Board Support Package

### Detailed Description

#### Build Time Configurations for ra4c1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
| --- | --- | --- | --- |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines |

| | | | |
|---|---|---|---|
| | | | whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMPRCR is write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM ECC | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAM ECC registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |

| | | | |
|---|---|---|---|
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| Cache Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Cache registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with |

| | | | |
|---|---|---|---|
| | | | TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure Application Fallback | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | Disabled | Disabled | FLL is not supported. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Startup C-Cache Line Size | • 32 Bytes<br>• 64 Bytes | 32 Bytes | Set the C-Cache line size configured during startup. |
| Main Oscillator Wait Time | • 2 cycles<br>• 1024 cycles<br>• 2048 cycles<br>• 4096 cycles<br>• 8192 cycles<br>• 16384 cycles<br>• 32768 cycles<br>• 65536 cycles<br>• 131072 cycles<br>• 262144 cycles | 262144 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

## 5.1.5.28 RA6T1

BSP » MCU Board Support Package

## Detailed Description

### Build Time Configurations for ra6t1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| MOSC Drive Capability Auto Switching | • Enabled<br>• Disabled | Disabled | When enabled, the drive capability auto switching function lowers the MOSC drive capability automatically after the MOSC starts and suppresses the EMI associated with the MOSC. |
| Main Oscillator Wait Time | • 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

| | | | |
|---|---|---|---|
| | • 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | | |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |

#### Detailed Description

#### Build Time Configurations for ra6t2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less |

| | | | |
|---|---|---|---|
| | | | bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMPRCR is write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM ECC | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAM ECC registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Standby RAM | • Regions 7-0 are all Secure.<br>• Region 7 is Non-secure. Regions 6-0 are Secure.<br>• Regions 7-6 are Non-secure. Regions 5-0 are Secure.<br>• Regions 7-5 are Non-secure. Regions 4-0 are Secure.<br>• Regions 7-4 are Non-secure. Regions 3-0 are Secure.<br>• Regions 7-3 are Non-secure. Regions 2-0 are Secure.<br>• Regions 7-2 are Non-secure. | config.bsp.fsp.tz.stbramsar.both | Defines whether Standby RAM registers are accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |

| | | | |
|---|---|---|---|
| | Regions 1-0 are Secure.<br>• Regions 7-1 are Non-secure. Region 0 is Secure.<br>• Regions 7-0 are all Non-secure. | | |
| Security > BUS Accessibility | | | |
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| Cache Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Cache registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |

| | | | |
|---|---|---|---|
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure Application Fallback | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Startup C-Cache Line Size | • 32 Bytes<br>• 64 Bytes | 32 Bytes | Set the C-Cache line size configured during startup. |
| TFU Mathlib | • Disabled<br>• Enabled | Enabled | If enabled, trigonometric library functions sinf, cosf, atan2f, and hypotf are replaced with hardware accelerated TFU functions. Disable this if reentrant access to these functions is required. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

## 5.1.5.31 RA8D1

BSP » MCU Board Support Package

### Detailed Description

#### Build Time Configurations for ra8d1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| SDRAM | | | |

| | | | |
|---|---|---|---|
| SDRAM > Timings | | | |
| tRAS (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | 6 cycles | Row Active Interval |
| tRCD (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles | 3 cycles | Row Column Latency |
| tRP (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles | 3 cycles | Row Precharge Interval |
| tWR (cycles) | • 1 cycles<br>• 2 cycles | 2 cycles | Write Recovery Interval |
| tCL (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles | 3 cycles | Column Latency |
| tRFC (cycles) | tRFC must be between 2 and 4096 cycles | 937 | Auto-Refresh Request Interval Setting |
| tREFW (cycles) | Refer to the RA Configuration tool for available options. | 8 cycles | Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting. |
| SDRAM > Initialization | | | |
| Auto-Refresh Interval (ARFI) | Refer to the RA Configuration tool for available options. | 10 cycles | Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence. |
| Auto-Refresh Count (ARFC) | Refer to the RA Configuration tool for available options. | 8 times | Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence. |
| Precharge Cycle Count (PRC) | • 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles<br>• 9 cycles | 3 cycles | Specifies the number of precharged cycles in the SDRAM initialization sequence. |

| | | | |
|---|---|---|---|
| | • 10 cycles | | |
| SDRAM Support | • Enabled<br>• Disabled | Disabled | If enabled, SDRAM will be initialized and configured by the BSP with the provided settings. |
| Address Multiplex Shift | • 8-bit shift<br>• 9-bit shift<br>• 10-bit shift<br>• 11-bit shift | 9-bit shift | Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing. |
| Endian Mode | • Little Endian<br>• Big Endian | Little Endian | Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian. |
| Continuous Access Mode | • Enabled<br>• Disabled | Enabled | If enabled, SDRAM continuous access mode will be enabled. |
| Bus Width | • 8-bit<br>• 16-bit<br>• 32-bit | 16-bit | Specifies the data bus width for SDRAM. |
| OSPI_B | | | |
| Startup Support | • Enabled<br>• Disabled | Disabled | If enabled, the OSPI_B driver will be initialized and configured by the BSP. A 'Storage > OSPI (r_ospi_b)' or 'Storage > SiP Flash (r_ospi_b)' stack must be configured. |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State | Secure State | Value for SCB->AIRCR register bit |

| | | | |
|---|---|---|---|
| | • Secure State | | BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM0 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM1 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application. |

| | | | |
|---|---|---|---|
| | | | This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register C | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the |

| | | | |
|---|---|---|---|
| | | | SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Battery Backup Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.<br><br>This setting is only valid when building projects with TrustZone. |
| Graphics Power Domain Security Attribution | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Defines whether the PDCTRGD register is write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has |

| | | | |
|---|---|---|---|
| | Application Fallback | | not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| Clock Settling Delay | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8D1 HWM (R01UH0995EJ0100) section 8.11.1 for details. |
| Sleep Mode Entry and Exit Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays before and after |

| | | | |
|---|---|---|---|
| | | | entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 100MHz. See RA8D1 HWM (R01UH0995EJ0100) Section 10.8.10 for details. |
| RTOS Sleep on Idle | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details. |
| MSTP Change Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8D1 HWM (R01UH0995EJ0100) Section 10.4 for details. |
| Settling Delay (us) | Unit must be a non-negative integer | 150 | Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays. |
| Cache settings | | | |
| Data cache | • Enabled<br>• Disabled | Disabled | Enable limited D-Cache support. See BSP usage notes for limitations. |
| I/O Ports | | | |
| I/O Ports > Voltage Mode | | | |
| VCC | • Low (VCC < 2.7 V)<br>• High (VCC >= 2.7 V) | High (VCC >= 2.7 V) | When VCC is lower than 2.7 V, set VCC I/O Ports Voltage Mode to Low. |

| | | | |
|---|---|---|---|
| VCC2 | • Low (VCC2 < 2.7 V)<br>• High (VCC2 >= 2.7 V) | High (VCC2 >= 2.7 V) | When VCC2 is lower than 2.7 V, set VCC2 I/O Ports Voltage Mode to Low. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles<br>• 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

### 5.1.5.33 RA8E1

BSP » MCU Board Support Package

## Detailed Description

### Build Time Configurations for ra8e1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| OSPI_B | | | |
| Startup Support | • Enabled<br>• Disabled | Disabled | If enabled, the OSPI_B driver will be initialized and configured by the BSP. A 'Storage > OSPI (r_ospi_b)' or 'Storage > SiP Flash (r_ospi_b)' stack must be configured. |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then |

| | | | |
|---|---|---|---|
| | | | setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM1 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure |

| | | | |
|---|---|---|---|
| | | | application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Battery Backup Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.<br><br>This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non- |

| | | | |
|---|---|---|---|
| | Non-Secure Application Fallback | | secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| Clock Settling Delay | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8E1 HWM (R01UH1129EJ0100) section 8.11.1 for details. |
| Sleep Mode Entry and Exit Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert |

| | | | |
|---|---|---|---|
| | | | delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8E1 HWM (R01UH1129EJ0100) Section 10.8.10 for details. |
| RTOS Sleep on Idle | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8E1 HWM (R01UH1129EJ0100) Section 10.8.10 for details. |
| MSTP Change Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8E1 HWM (R01UH1129EJ0100) Section 10.4 for details. |
| Settling Delay (us) | Unit must be a non-negative integer | 150 | Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays. |
| Cache settings | | | |
| Data cache | • Enabled<br>• Disabled | Disabled | Enable limited D-Cache support. See BSP usage notes for limitations. |
| I/O Ports | | | |
| I/O Ports > Voltage Mode | | | |
| VCC | • Low (VCC < 2.7 V)<br>• High (VCC >= 2.7 V) | High (VCC >= 2.7 V) | When VCC is lower than 2.7 V, set VCC I/O Ports Voltage Mode to Low. |

| | | | |
|---|---|---|---|
| VCC2 | • Low (VCC2 < 2.7 V)<br>• High (VCC2 >= 2.7 V) | High (VCC2 >= 2.7 V) | When VCC2 is lower than 2.7 V, set VCC2 I/O Ports Voltage Mode to Low. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles<br>• 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

| BSP_CLOCKS_OCTACLK_DIV_4 | Divide OCTA source clock by 4. |
| BSP_CLOCKS_OCTACLK_DIV_6 | Divide OCTA source clock by 6. |
| BSP_CLOCKS_OCTACLK_DIV_8 | Divide OCTA source clock by 8. |
| BSP_CLOCKS_OCTACLK_DIV_3 | Divide OCTA source clock by 3. |
| BSP_CLOCKS_OCTACLK_DIV_5 | Divide OCTA source clock by 5. |
| BSP_CLOCKS_OCTACLK_DIV_1 | Divide OCTA source clock by 1. |
| BSP_CLOCKS_OCTACLK_DIV_2 | Divide OCTA source clock by 2. |
| BSP_CLOCKS_OCTACLK_DIV_4 | Divide OCTA source clock by 4. |
| BSP_CLOCKS_OCTACLK_DIV_6 | Divide OCTA source clock by 6. |
| BSP_CLOCKS_OCTACLK_DIV_8 | Divide OCTA source clock by 8. |
| BSP_CLOCKS_OCTACLK_DIV_3 | Divide OCTA source clock by 3. |
| BSP_CLOCKS_OCTACLK_DIV_5 | Divide OCTA source clock by 5. |
| BSP_CLOCKS_OCTACLK_DIV_1 | Divide OCTA source clock by 1. |
| BSP_CLOCKS_OCTACLK_DIV_2 | Divide OCTA source clock by 2. |
| BSP_CLOCKS_OCTACLK_DIV_4 | Divide OCTA source clock by 4. |
| BSP_CLOCKS_OCTACLK_DIV_6 | Divide OCTA source clock by 6. |
| BSP_CLOCKS_OCTACLK_DIV_8 | Divide OCTA source clock by 8. |
| BSP_CLOCKS_OCTACLK_DIV_3 | Divide OCTA source clock by 3. |
| BSP_CLOCKS_OCTACLK_DIV_5 | Divide OCTA source clock by 5. |

### 5.1.5.34 RA8E2

BSP » MCU Board Support Package

#### Detailed Description

#### Build Time Configurations for ra8e2_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| SDRAM | | | |
| SDRAM > Timings | | | |
| tRAS (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | 6 cycles | Row Active Interval |
| tRCD (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles | 3 cycles | Row Column Latency |
| tRP (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles | 3 cycles | Row Precharge Interval |
| tWR (cycles) | • 1 cycles<br>• 2 cycles | 2 cycles | Write Recovery Interval |
| tCL (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles | 3 cycles | Column Latency |
| tRFC (cycles) | tRFC must be between 2 and 4096 cycles | 937 | Auto-Refresh Request Interval Setting |
| tREFW (cycles) | Refer to the RA Configuration tool for available options. | 8 cycles | Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting. |
| SDRAM > Initialization | | | |
| Auto-Refresh Interval (ARFI) | Refer to the RA Configuration tool for available options. | 10 cycles | Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence. |

| | | | |
|---|---|---|---|
| Auto-Refresh Count (ARFC) | Refer to the RA Configuration tool for available options. | 8 times | Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence. |
| Precharge Cycle Count (PRC) | • 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles<br>• 9 cycles<br>• 10 cycles | 3 cycles | Specifies the number of precharged cycles in the SDRAM initialization sequence. |
| SDRAM Support | • Enabled<br>• Disabled | Disabled | If enabled, SDRAM will be initialized and configured by the BSP with the provided settings. |
| Address Multiplex Shift | • 8-bit shift<br>• 9-bit shift<br>• 10-bit shift<br>• 11-bit shift | 9-bit shift | Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing. |
| Endian Mode | • Little Endian<br>• Big Endian | Little Endian | Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian. |
| Continuous Access Mode | • Enabled<br>• Disabled | Enabled | If enabled, SDRAM continuous access mode will be enabled. |
| Bus Width | • 8-bit<br>• 16-bit<br>• 32-bit | 16-bit | Specifies the data bus width for SDRAM. |
| OSPI_B | | | |
| Startup Support | • Enabled<br>• Disabled | Disabled | If enabled, the OSPI_B driver will be initialized and configured by the BSP. A 'Storage > OSPI (r_ospi_b)' or 'Storage > SiP Flash (r_ospi_b)' stack must be configured. |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt | Non-Maskable Interrupt | Configure the result of a TrustZone Filter |

| | | | |
|---|---|---|---|
| | • Reset | | exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM0 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure |

| | | | |
|---|---|---|---|
| | | | application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM1 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register C | • Both Secure and Non-Secure | Both Secure and Non-Secure State | Defines whether the SDRAM/CSC Control |

| | | | |
|---|---|---|---|
| | State<br>• Secure State | | registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Battery Backup Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.<br><br>This setting is only valid when building projects with TrustZone. |
| Graphics Power Domain Security Attribution | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Defines whether the PDCTRGD register is write accessible for the Non-secure application. |

| | | | |
|---|---|---|---|
| | | | This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure Application Fallback | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| Clock Settling Delay | • Enabled | Enabled | Setting this option to |

| | | | |
|---|---|---|---|
| | • Disabled | | Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8E2 HWM (R01UH1130EJ0100) section 8.11.1 for details. |
| Sleep Mode Entry and Exit Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 100MHz. See RA8E2 HWM (R01UH1130EJ0100) Section 10.8.10 for details. |
| RTOS Sleep on Idle | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8E2 HWM (R01UH1130EJ0100) Section 10.8.10 for details. |
| MSTP Change Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8E2 HWM (R01UH1130EJ0100) Section 10.4 for details. |
| Settling Delay (us) | Unit must be a non-negative integer | 150 | Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays. |
| Cache settings | | | |

| | | | |
|---|---|---|---|
| Data cache | • Enabled<br>• Disabled | Disabled | Enable limited D-Cache support. See BSP usage notes for limitations. |
| I/O Ports | | | |
| I/O Ports > Voltage Mode | | | |
| VCC | • Low (VCC < 2.7 V)<br>• High (VCC >= 2.7 V) | High (VCC >= 2.7 V) | When VCC is lower than 2.7 V, set VCC I/O Ports Voltage Mode to Low. |
| VCC2 | • Low (VCC2 < 2.7 V)<br>• High (VCC2 >= 2.7 V) | High (VCC2 >= 2.7 V) | When VCC2 is lower than 2.7 V, set VCC2 I/O Ports Voltage Mode to Low. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles<br>• 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

### 5.1.5.35 RA8M1

BSP » MCU Board Support Package

#### Detailed Description

#### Build Time Configurations for ra8m1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| SDRAM | | | |
| SDRAM > Timings | | | |
| tRAS (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | 6 cycles | Row Active Interval |
| tRCD (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles | 3 cycles | Row Column Latency |
| tRP (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles | 3 cycles | Row Precharge Interval |
| tWR (cycles) | • 1 cycles<br>• 2 cycles | 2 cycles | Write Recovery Interval |
| tCL (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles | 3 cycles | Column Latency |
| tRFC (cycles) | tRFC must be between 2 and 4096 cycles | 937 | Auto-Refresh Request Interval Setting |
| tREFW (cycles) | Refer to the RA Configuration tool for available options. | 8 cycles | Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting. |
| SDRAM > Initialization | | | |
| Auto-Refresh Interval (ARFI) | Refer to the RA Configuration tool for available options. | 10 cycles | Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence. |
| Auto-Refresh Count (ARFC) | Refer to the RA Configuration tool for available options. | 8 times | Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence. |
| Precharge Cycle Count (PRC) | • 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | 3 cycles | Specifies the number of precharged cycles in the SDRAM initialization sequence. |

| | | | |
|---|---|---|---|
| | • 8 cycles<br>• 9 cycles<br>• 10 cycles | | |
| SDRAM Support | • Enabled<br>• Disabled | Disabled | If enabled, SDRAM will be initialized and configured by the BSP with the provided settings. |
| Address Multiplex Shift | • 8-bit shift<br>• 9-bit shift<br>• 10-bit shift<br>• 11-bit shift | 9-bit shift | Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing. |
| Endian Mode | • Little Endian<br>• Big Endian | Little Endian | Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian. |
| Continuous Access Mode | • Enabled<br>• Disabled | Enabled | If enabled, SDRAM continuous access mode will be enabled. |
| Bus Width | • 8-bit<br>• 16-bit<br>• 32-bit | 16-bit | Specifies the data bus width for SDRAM. |
| OSPI_B | | | |
| Startup Support | • Enabled<br>• Disabled | Disabled | If enabled, the OSPI_B driver will be initialized and configured by the BSP. A 'Storage > OSPI (r_ospi_b)' or 'Storage > SiP Flash (r_ospi_b)' stack must be configured. |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |

| | | | |
|---|---|---|---|
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM0 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM1 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the |

| | | | |
|---|---|---|---|
| | | | Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |
| Bus Security Attribution Register A | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register C | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure | Secure State | Value for SCB->AIRCR register bit |

| | | | |
|---|---|---|---|
| | State<br>• Secure State | | SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Battery Backup Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only except for VBTBKRn registers which are both read and write protected.<br><br>This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure Application Fallback | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the |

| | | | |
|---|---|---|---|
| | | | MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| Clock Settling Delay | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8M1 HWM (R01UH0994EJ0100) section 8.11.1 for details. |
| Sleep Mode Entry and Exit Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) |

| | | | |
|---|---|---|---|
| | | | Section 10.7.10 for details. |
| RTOS Sleep on Idle | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details. |
| MSTP Change Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.4 for details. |
| Settling Delay (us) | Unit must be a non-negative integer | 150 | Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays. |
| Cache settings | | | |
| Data cache | • Enabled<br>• Disabled | Disabled | Enable limited D-Cache support. See BSP usage notes for limitations. |
| I/O Ports | | | |
| I/O Ports > Voltage Mode | | | |
| VCC | • Low (VCC < 2.7 V)<br>• High (VCC >= 2.7 V) | High (VCC >= 2.7 V) | When VCC is lower than 2.7 V, set VCC I/O Ports Voltage Mode to Low. |
| VCC2 | • Low (VCC2 < 2.7 V)<br>• High (VCC2 >= 2.7 V) | High (VCC2 >= 2.7 V) | When VCC2 is lower than 2.7 V, set VCC2 I/O Ports Voltage Mode to Low. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease |

| | | | |
|---|---|---|---|
| | | | cycles taken in ISRs in return. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles<br>• 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

### Detailed Description

#### Build Time Configurations for ra8t1_fsp

The following build time configurations are defined in fsp_cfg/bsp/bsp_mcu_family_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| SDRAM | | | |
| SDRAM > Timings | | | |
| tRAS (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles | 6 cycles | Row Active Interval |

| | | | |
|---|---|---|---|
| | • 6 cycles<br>• 7 cycles | | |
| tRCD (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles | 3 cycles | Row Column Latency |
| tRP (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles | 3 cycles | Row Precharge Interval |
| tWR (cycles) | • 1 cycles<br>• 2 cycles | 2 cycles | Write Recovery Interval |
| tCL (cycles) | • 1 cycles<br>• 2 cycles<br>• 3 cycles | 3 cycles | Column Latency |
| tRFC (cycles) | tRFC must be between 2 and 4096 cycles | 937 | Auto-Refresh Request Interval Setting |
| tREFW (cycles) | Refer to the RA Configuration tool for available options. | 8 cycles | Auto-Refresh Cycle/Self-Refresh Clearing Cycle Count Setting. |
| SDRAM > Initialization | | | |
| Auto-Refresh Interval (ARFI) | Refer to the RA Configuration tool for available options. | 10 cycles | Specifies the interval at which the auto-refresh commands are issued in the SDRAM initialization sequence. |
| Auto-Refresh Count (ARFC) | Refer to the RA Configuration tool for available options. | 8 times | Specifies the number of times auto-refresh is to be performed in the SDRAM initialization sequence. |
| Precharge Cycle Count (PRC) | • 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles<br>• 8 cycles<br>• 9 cycles<br>• 10 cycles | 3 cycles | Specifies the number of precharged cycles in the SDRAM initialization sequence. |
| SDRAM Support | • Enabled<br>• Disabled | Disabled | If enabled, SDRAM will be initialized and configured by the BSP with the provided settings. |

| | | | |
|---|---|---|---|
| Address Multiplex Shift | • 8-bit shift<br>• 9-bit shift<br>• 10-bit shift<br>• 11-bit shift | 9-bit shift | Selects the size of the shift towards the lower half of the row address in row address/column address multiplexing. |
| Endian Mode | • Little Endian<br>• Big Endian | Little Endian | Specifies the endianness of the SDRAM address space. See HWM for full list of constraints when using Big Endian. |
| Continuous Access Mode | • Enabled<br>• Disabled | Enabled | If enabled, SDRAM continuous access mode will be enabled. |
| Bus Width | • 8-bit<br>• 16-bit<br>• 32-bit | 16-bit | Specifies the data bus width for SDRAM. |
| Security | | | |
| Security > Exceptions | | | |
| Exception Response | • Non-Maskable Interrupt<br>• Reset | Non-Maskable Interrupt | Configure the result of a TrustZone Filter exception. This exception is generated when a the TrustZone Filter detects access to a protected region.<br><br>This setting is only valid when building projects with TrustZone. |
| BusFault, HardFault, and NMI Target | • Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit BFHFNMINS. Defines whether BusFault and NMI exceptions are Non-secure, and whether exceptions target the Non-secure HardFault exception.<br><br>This setting is only valid when building projects with TrustZone. |
| Prioritize Secure Exceptions | • Enabled<br>• Disabled | Disabled | Value for SCB->AIRCR register bit PRIS. When enabled, all Non-secure interrupt priorities are automatically demoted |

| | | | |
|---|---|---|---|
| | | | by right shifting their priority by one then setting the most significant bit. As there is effectively one less bit care must be taken to ensure the prioritization of non-secure interrupts is correct.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > SRAM Accessibility | | | |
| SRAM0 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR0, SRAMECCRGN0, SRAMESCLR.CLR00, and SRAMESCLR.CLR01 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| SRAM1 Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether SRAMCR1, and SRAMESCLR.CLR1 are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Standby SRAM Protection | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether STBRAMCR, and SRAMESCLR.CLRS are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Security > BUS Accessibility | | | |
| Bus Security Attribution | • Both Secure | Both Secure and Non- | Defines whether the |

| | | | |
|---|---|---|---|
| Register A | and Non-Secure State<br>• Secure State | Secure State | Slave Bus Control Registers (BUSSCNT<slave>) are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register B | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the Bus and DMAC/DTC Error Clear Registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| Bus Security Attribution Register C | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the SDRAM/CSC Control registers are write accessible for the Non-secure application.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Request Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Secure State | Value for SCB->AIRCR register bit SYSRESETREQS. Defines whether the SYSRESETREQ bit is functional for Non-secure use.<br><br>This setting is only valid when building projects with TrustZone. |
| System Reset Status Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the reset status registers (RSTSRn) can be cleared from the Non-secure application.<br><br>This setting is only valid when building projects with |

| | | | |
|---|---|---|---|
| | | | TrustZone. |
| Battery Backup Accessibility | • Both Secure and Non-Secure State<br>• Secure State | Both Secure and Non-Secure State | Defines whether the battery backup registers are accessible for the Non-secure application. If Secure State is selected, all battery backup registers are read only.<br><br>This setting is only valid when building projects with TrustZone. |
| Uninitialized Non-Secure Application Fallback | • Enable Uninitialized Non-Secure Application Fallback<br>• Disable Uninitialized Non-Secure Application Fallback | Enable Uninitialized Non-Secure Application Fallback | If enabled, the secure application checks if the non-secure application has been programmed in non-secure flash before branching. If the non-secure application has not been programmed, then the secure application branches to an infinite loop in non-secure RAM. This prevents an issue where the debugger may not connect if the MCU is configured in the NSECSD lifecycle state. |
| Clocks | | | |
| HOCO FLL Function | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled improves HOCO accuracy significantly by using the subclock, but incurs certain restrictions.<br><br>The FLL function requires the subclock oscillator to be running and stabilized. When enabled and running the PLL or system clock from HOCO, the BSP will wait for both the Subclock Stabilization Time as well as the FLL |

| | | | |
|---|---|---|---|
| | | | Stabilization Time when setting up clocks at startup.<br><br>When FLL is enabled Software Standby and Deep Software Standby modes are not available. |
| Clock Settling Delay | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays for clocking scaling and transitions to ensure voltage supply stability. See the RA8T1 HWM (R01UH0996EJ0100) section 8.11.1 for details. |
| Sleep Mode Entry and Exit Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays before and after entering sleep modes to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK over 120MHz. See RA8T1 HWM (R01UH0996EJ0100) Section 10.7.10 for details. |
| RTOS Sleep on Idle | • Enabled<br>• Disabled | Disabled | Setting this option to Enabled will allow RTOS ports to enter CPU Sleep mode while idle. This should not be used when CPUCLK is configured over 120MHz. See RA8M1 HWM (R01UH0994EJ0100) Section 10.7.10 for details. |
| MSTP Change Delays | • Enabled<br>• Disabled | Enabled | Setting this option to Enabled will insert delays after setting a MSTP bit to ensure voltage supply stability. This is not required if you do not intend to run CPUCLK |

| | | | |
|---|---|---|---|
| | | | over 120MHz. See RA8T1 HWM (R01UH0996EJ0100) Section 10.4 for details. |
| Settling Delay (us) | Unit must be a non-negative integer | 150 | Specifies the length of the delay to be used for the Clock settling, Sleep mode, and MSTP change delays. |
| Cache settings | | | |
| Data cache | • Enabled<br>• Disabled | Disabled | Enable limited D-Cache support. See BSP usage notes for limitations. |
| I/O Ports | | | |
| I/O Ports > Voltage Mode | | | |
| VCC | • Low (VCC < 2.7 V)<br>• High (VCC >= 2.7 V) | High (VCC >= 2.7 V) | When VCC is lower than 2.7 V, set VCC I/O Ports Voltage Mode to Low. |
| VCC2 | • Low (VCC2 < 2.7 V)<br>• High (VCC2 >= 2.7 V) | High (VCC2 >= 2.7 V) | When VCC2 is lower than 2.7 V, set VCC2 I/O Ports Voltage Mode to Low. |
| Enable inline BSP IRQ functions | • Enabled<br>• Disabled | Enabled | Using static inline functions will slightly increase code size, but will slightly decrease cycles taken in ISRs in return. |
| Main Oscillator Wait Time | • 3 cycles<br>• 35 cycles<br>• 67 cycles<br>• 131 cycles<br>• 259 cycles<br>• 547 cycles<br>• 1059 cycles<br>• 2147 cycles<br>• 4291 cycles<br>• 8163 cycles | 8163 cycles | Number of cycles to wait for the main oscillator clock to stabilize. |

# 5.2 Modules

### Detailed Description

Modules are the smallest unit of software available in FSP. Each module implements one interface.

For more information on FSP Modules and Interfaces review FSP Modules, FSP Stacks and FSP Interfaces in the FSP Architecture section of this manual.

*Note*

*Not all modules are available for all MCUs. For more information, see the User's Manual for the specific MCU.*

### Organization of Module Sections

Each module within FSP has a detailed Users' Guide listed below. Each guide typically includes the following content:

- Functions: A list of all the API functions associated with the module
- Detailed Description: A short description of the module and the peripherals used
- Overview: An operational summary and a list of high level features provided by the module
- Configuration: A description of module specific settings available in the configuration tool

including clock and pin configurations
- Usage Notes: Module specific documentation and limitations
- Examples: Illustrative code snippets that help the user better understand API use and operation
- Data Structure and Enumeration: Definitions for data structures, enumerations and similar elements used by the module API
- Function Documentation: Details on each API function, including the function prototype, a function summary, a simple use example, list of return values and links to documentation for any needed parameter definitions

### Detailed Description

Driver for the ADC12, ADC14, and ADC16 peripherals on RA MCUs. This module implements the ADC Interface.

# Overview

### Features

The ADC module supports the following features:

- 12, 14, or 16 bit maximum resolution depending on the MCU
- Configure scans to include:
  - Multiple analog channels
  - Temperature sensor channel
  - Voltage sensor channel
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
  - External scan triggers from the ADTRGn port pins
- Configurable scan mode:

    - Single scan mode, where each trigger starts a single scan
    - Continuous scan mode, where all channels are scanned continuously
    - Group scan mode, where channels are grouped into group A and group B. The groups can be assigned different start triggers, and group A can be given priority over group B. When group A has priority over group B, a group A trigger suspends an ongoing group B scan.
- Supports adding and averaging converted samples
- Optional callback when scan completes
- Sample and hold support
- Double-trigger support
- Hardware comparator with interrupt and event output

# Configuration

### Build Time Configurations for r_adc

The following build time configurations are defined in fsp_cfg/r_adc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > ADC (r_adc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_adc0 | Module name |
| Unit | Unit must be a non-negative integer | 0 | Specifies the ADC Unit to be used. |
| Resolution | MCU Specific Options | | Specifies the conversion resolution for this unit. |
| Alignment | MCU Specific Options | | Specifies the conversion result alignment. |
| Clear after read | • Off<br>• On | On | Specifies if the result register will be automatically cleared after the conversion result is read. |
| Mode | • Single Scan | Single Scan | Specifies the mode that |

| | | | |
|---|---|---|---|
| | • Continuous Scan<br>• Group Scan | | this ADC unit is used in. |
| Double-trigger | • Disabled<br>• Enabled<br>• Enabled (extended mode) | Disabled | When enabled, the scan-end interrupt for Group A is only thrown on every second scan. Extended double-trigger mode (single-scan only) triggers on both ELC events, allowing (for example) a scan on two different timer compare match values.<br><br>In group mode Group B is unaffected. |
| Input | | | |
| Input > Sample and Hold | | | |
| Sample and Hold Channels (Available only on selected MCUs) | • Channel 0<br>• Channel 1<br>• Channel 2 | | Specifies if this channel is included in the Sample and Hold Mask. |
| Sample Hold States (Applies only to channels 0, 1, 2) | Must be a valid non-negative integer with configurable value 4 to 255 | 24 | Specifies the updated sample-and-hold count for the channel dedicated sample-and-hold circuit |
| Input > Window Compare | | | |
| Input > Window Compare > Window A | | | |
| Enable | • Disabled<br>• Enabled | Disabled | Enable or disable comparison with Window A. |
| Channels to compare (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | | Select channels to be compared to Window A. |
| Channel comparison mode (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | | Checking a box sets the comparison mode for that channel to Greater Than or Inside Window depending on whether Window Mode is disabled or enabled (respectively). If left unchecked the comparison mode will |

| | | | |
|---|---|---|---|
| | | | likewise be Less Than or Outside Window (respectively). |
| Lower Reference | Must be a positive 16-bit integer. | 0 | Set the lower comparison value. |
| Upper Reference | Must be a positive 16-bit integer. | 0 | Set the upper comparison value. |
| Input > Window Compare > Window B | | | |
| Enable | • Disabled<br>• Enabled | Disabled | Enable or disable comparison with Window B. |
| Channel to compare (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | Channel 0 | Select a channel to be compared to Window B. |
| Comparison mode | • Less Than or Outside Window<br>• Greater Than or Inside Window | Less Than or Outside Window | Select the comparison mode for Window B. For each option, the first condition applies when Window Mode is disabled and the second option applies when Window Mode is enabled. |
| Lower Reference | Must be a positive 16-bit integer. | 0 | Set the lower comparison value. |
| Upper Reference | Must be a positive 16-bit integer. | 0 | Set the upper comparison value. |
| Window Mode | • Disabled<br>• Enabled | Disabled | When disabled, ADC values will be compared only with the lower reference on each comparator. When enabled, both the lower and upper reference values will be used to create a comparison window. |
| Event Output | • OR<br>• XOR<br>• AND | OR | Select how comparison results should be composited for event output. |
| Channel Scan Mask (channel availability varies by MCU) | Refer to the RA Configuration tool for available options. | | In Normal mode of operation, this bitmask field specifies the channels that are enabled in that ADC unit. In group mode, |

| | | | |
|---|---|---|---|
| | | | this field specifies which channels belong to group A. |
| Group B Scan Mask (channel availability varies by MCU) | Refer to the RA Configuration tool for available options. | | In group mode, this field specifies which channels belong to group B. |
| Add/Average Count | MCU Specific Options | | Specifies if addition or averaging needs to be done for any of the channels in this unit. |
| Reference Voltage control | MCU Specific Options | | Specify VREFH/VREFADC output voltage control. |
| Addition/Averaging Mask (channel availability varies by MCU and unit) | Refer to the RA Configuration tool for available options. | | Select channels to include in the Addition/Averaging Mask |
| Interrupts | | | |
| Normal/Group A Trigger | MCU Specific Options | | Specifies the trigger type to be used for this unit. Triggers that specify ADC Unit must be selected for correct ADC unit to operate correctly. |
| Group B Trigger | MCU Specific Options | | Specifies the trigger for Group B scanning in group scanning mode. This event is also used to trigger Group A in extended double-trigger mode. Triggers that specify ADC Unit must be selected for correct ADC unit to operate correctly. |
| Group Priority (Valid only in Group Scan Mode) | • Group A cannot interrupt Group B<br>• Group A can interrupt Group B; Group B scan restarts at next trigger<br>• Group A can interrupt Group B; Group B scan restarts immediately | Group A cannot interrupt Group B | Determines whether an ongoing group B scan can be interrupted by a group A trigger, whether it should abort on a group A trigger, or if it should pause to allow group A scan and restart immediately after group A scan is complete. |

| | | | |
|---|---|---|---|
| | • Group A can interrupt Group B; Group B scan restarts immediately and scans continuously | | |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes. |
| Scan End Interrupt Priority | MCU Specific Options | | Select scan end interrupt priority. |
| Scan End Group B Interrupt Priority | MCU Specific Options | | Select group B scan end interrupt priority. |
| Window Compare A Interrupt Priority | MCU Specific Options | | Select Window Compare A interrupt priority. |
| Window Compare B Interrupt Priority | MCU Specific Options | | Select Window Compare B interrupt priority. |
| Extra | | | |
| ADC Ring Buffer | MCU Specific Options | | ADC Ring Buffer to be used only with DMAC transfers, keep this property disabled for normal ADC operations. When enabled, ADC converted data is stored in ADBUF registers in place of ADDR registers. The read API will not read from this location for normal ADC operations. |

### Clock Configuration

The ADC clock is PCLKC if the MCU has PCLKC, or PCLKD otherwise.

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA0E1 | ICLK/PCLKB |

| | |
|---|---|
| RA0E2 | ICLK/PCLKB |
| RA0L1 | ICLK/PCLKB |
| RA2A1 | PCLKD |
| RA2A2 | PCLKD |
| RA2E1 | PCLKD |
| RA2E2 | PCLKD |
| RA2E3 | PCLKD |
| RA2L1 | PCLKD |
| RA2L2 | PCLKD |
| RA2T1 | PCLKD |
| RA4C1 | PCLKC |
| RA4E1 | PCLKC |
| RA4E2 | PCLKC |
| RA4L1 | PCLKC |
| RA4M1 | PCLKC |
| RA4M2 | PCLKC |
| RA4M3 | PCLKC |
| RA4T1 | PCLKC |
| RA4W1 | PCLKC |
| RA6E1 | PCLKC |
| RA6E2 | PCLKC |
| RA6M1 | PCLKC |
| RA6M2 | PCLKC |
| RA6M3 | PCLKC |
| RA6M4 | PCLKC |
| RA6M5 | PCLKC |
| RA6T1 | PCLKC |
| RA6T3 | PCLKC |
| RA8D1 | PCLKC |
| RA8E1 | PCLKC |
| RA8E2 | PCLKC |
| RA8M1 | PCLKC |
| RA8T1 | PCLKC |

The ADC clock must be at least 1 MHz when the ADC is used. Many MCUs also have PCLK ratio restrictions when the ADC is used. For details on PCLK ratio restrictions, reference the footnotes in the second table of the Clock Generation Circuit chapter of the MCU User's Manual (for example, Table "Specifications of the clock generation circuit for the internal clocks" in the CGC section of the relevant hardware manual).

### Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger for unit 0 and 1 respectively. When external triggers are used, ADC scans begin on the falling edge of the ADTRG pin.

## Usage Notes

### Sample Hold

Enabling the sample and hold functionality reduces the maximum scan frequency because the sample and hold time is added to each scan. Refer to the hardware manual for details on the sample and hold time.

### ADC Operational Modes

The driver supports three operation modes: single-scan, continuous-scan, and group-scan modes. In each mode, analog channels are converted in ascending order of channel number, followed by scans of the temperature sensor and voltage sensor if they are included in the mask of channels to scan.

### Single-scan Mode

In single scan mode, one or more specified channels are scanned once per trigger.

### Continuous-scan Mode

In continuous scan mode, a single trigger is required to start the scan. Scans continue until R_ADC_ScanStop() is called.

*Note*

*1) To help ensure a responsive system, developers should consider system clock speed, ADCLK speed, and callback processing time. In particular, using a scan-end callback with a high scan rate relative to core clocks (for example, in continuous scan mode) may result in constant or high-frequency interrupts and is not recommended.*
*2) On some MCUs, scanning the temperature sensor or internal reference voltage in continuous or group scan modes is prohibited. Check the "ADC12 specifications" section of the device's User Manual to see if this restriction applies.*

### Group-scan Mode

Group-scan mode allows the application to allocate channels to one of two groups (A and B). Conversion begins when the specified ELC start trigger for that group is received.

With the priority configuration parameter, you can optionally give group A priority over group B. If group A has priority over group B, a group B scan is interrupted when a group A scan trigger occurs. The following options exist for group B when group A has priority:

- To restart the interrupted group B scan after the group A scan completes.
- To wait for another group B trigger and forget the interrupted scan.
- To continuously scan group B and suspend scanning group B only when a group A trigger is received.

  *Note*

  *If this option is selected, group B scanning begins immediately after R_ADC_ScanCfg(). Group A scan triggers must be enabled by R_ADC_ScanStart() and can be disabled by R_ADC_ScanStop(). Group B scans can only be disabled by reconfiguring the group A priority to a different mode.*

### Double-triggering

When double-triggering is enabled a single channel is selected to be scanned twice before an interrupt is thrown. The first scan result when using double-triggering is always saved to the selected channel's data register. The second result is saved to the data duplexing register (ADC_CHANNEL_DUPLEX).

Double-triggering uses Group A; only one channel can be selected when enabled. No other scanning is possible on Group A while double-trigger mode is selected. In addition, any special ADC channels (such as temperature sensors or voltage references) are not valid double-trigger channels.

When extended double-triggering is enabled, both ADC input (ELC) events are routed to Group A. The interrupt is still thrown after every two scans regardless of the triggering event(s). While the first and second scan are saved to the selected ADC data register and the ADC duplexing register as before, scans associated with event A and B are additionally copied into duplexing register A and B, respectively (ADC_CHANNEL_DUPLEX_A and ADC_CHANNEL_DUPLEX_B).

### When Interrupts Are Not Enabled

If interrupts are not enabled, the R_ADC_StatusGet API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result. This applies to both normal scans and calibration scans for MCUs that support calibration.

### Window Compare Function

The ADC contains comparators that allow scan data to be compared to user-provided reference values. When a value meets the configured condition an interrupt and/or an ELC event can be produced.

Each unit has two configurable comparison units, Window A and Window B. Window A allows for configuring multiple simultaneous channels to compare while Window B only allows one channel at a time.

The window compare function can be configured both through the RA Configuration tool and at runtime by providing a pointer to an adc_window_cfg_t struct to adc_channel_cfg_t::p_window_cfg when calling R_ADC_ScanCfg. The available comparison modes are shown below:

| Window setting | Channel mode 0 | Channel mode 1 |
|---|---|---|
| Disabled | Scan < Low Ref | Scan > Low Ref |
| Enabled | (Scan < Low Ref) OR (Scan > High Ref) | Low Ref < Scan < High Ref |

*Note*

*The window setting applies to all channels configured on a unit.*

### Event Output Function

To use the event output of compare function, Set the mode of operation to Single Scan Mode. The compare function can be configured by enabling both Window A and Window B. Select the channel of Window A. Select Window B channel to NOT SELECTED. Set the upper and lower reference values for both Window A and Window B.

*Note*

*When using ADC12 in Snooze Mode, both Compare Window A and Compare Window B must be enabled.*

### Sample-State Count Setting

The application program can modify the setting of the sample-state count for analog channels by calling the R_ADC_SampleStateCountSet() API function. The application program only needs to modify the sample-state count settings from their default values to increase the sampling time. This can be either because the impedance of the input signal is too high to secure sufficient sampling time under the default setting or if the ADCLK is too slow. To modify the sample-state count for a given channel, set the channel number and the number of states when calling the R_ADC_SampleStateCountSet() API function. Valid sample state counts are 7-255.

*Note*

*Although the hardware supports a minimum number of sample states of 5, some MCUs require 7 states, so the minimum is set to 7. At the lowest supported ADC conversion clock rate (1 MHz), these extra states will lead to, at worst case, a 2 microsecond increase in conversion time. At 60 MHz the extra states will add 33.4 ns to the conversion time.*

If the sample state count needs to be changed for multiple channels, the application program must call the R_ADC_SampleStateCountSet() API function repeatedly, with appropriately modified arguments for each channel.

If the ADCLK frequency changes, the sample states may need to be updated.

### Sample States for Temperature Sensor and Internal Voltage Reference

Sample states for the temperature sensor and the internal reference voltage are calculated during R_ADC_ScanCfg() based on the ADCLK frequency at the time. The sample states for the temperature sensor and internal voltage reference cannot be updated with R_ADC_SampleStateCountSet(). If the ADCLK frequency changes, call R_ADC_ScanCfg() before using the temperature sensor or internal reference voltage again to ensure the sampling time for the temperature sensor and internal voltage reference is optimal.

### Selecting Reference Voltage

The ADC high-potential and low-potential reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e² studio for further details.

*Note*

*When using VREFADC, a stabilization time of 1500us is required after call for R_ADC_Open(). Consult section "Selecting Reference Voltage" in the ADC section of the relevant hardware manual for details.*
*When the internal reference voltage is selected as the high-potential reference voltage, the Low-power A/D Conversion mode will automatically be selected. Consult Section "Selecting Reference Voltage" in the ADC section of the relevant hardware manual for details.*

### Using the Temperature Sensor with the ADC

The ADC HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, T = (Vs - V1)/slope + T1, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = (V2 - V1)/(T2 - T1)

*Note*

*The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.*

### Reading CTSU TSCAP with ADC

Some MCUs support reading CTSU TSCAP with ADC. CTSU TSCAP is connected to ADC0 channel 16. Use existing enums for channel 16 to set sample states for the sensor connected to CTSU TSCAP, enable scanning of CTSU TSCAP, and read results for CTSU TSCAP.

### Usage Notes for ADC16

#### Calibration

Calibration is required to use the ADC16 peripheral. When using this driver on an MCU that has ADC16, call R_ADC_Calibrate() after open, and prior to any other function.

### Range of ADC16 Results

The range of the ADC16 is from 0 (lowest) to 0x7FFF (highest) when used in single-ended mode. This driver only supports single ended mode.

### Limitations

Developers should be aware of the following limitations when using the ADC:

- If the ratio between the core clock and the ADC source clock is higher than 32:1, call R_ADC_ScanStop before calling R_ADC_Close if ADC is still running.
- When using the Window Compare function:
  - Only Single Scan mode may be configured when match or mismatch ELC events are used.
  - When one compare window is configured to check the temperature sensor or voltage reference the other window cannot be used.
  - Both windows cannot reference the same channel.
  - When using ADC in Snooze Mode, both Window A and Window B must be enabled.

# Examples

### Basic Example

This is a basic example of minimal use of the ADC in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_ScanCfg. */
const adc_channel_cfg_t g_adc0_channel_cfg =
{
    .scan_mask          = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
    .scan_mask_group_b = 0,
    .priority_group_a   = (adc_group_a_t) 0,
    .add_mask          = 0,
    .sample_hold_mask   = 0,
    .sample_hold_states = 0,
};
void adc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable channels. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
```

```
    }
 /* Read converted data. */
    uint16_t channel1_conversion_result;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
    assert(FSP_SUCCESS == err);
}
```

### Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC and the temperature sensor.

```
#define ADC_EXAMPLE_CALIBRATION_DATA_RA6M1 (0x7D5)
#define ADC_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_EXAMPLE_TEMPERATURE_RESOLUTION (12U)
#define ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE (127)
void adc_temperature_example (void)
{
 /* The following example calculates the temperature using the data provided in the
section
  * See "Preparation for Using the Temperature Sensor" in the TSN secton of the
relevant hardware manual. */
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable temperature sensor. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_ScanStart(). In other
modes, enable external
  * triggers by calling R_ADC_ScanStart(). */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
```

```
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t temperature_conversion_result;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_TEMPERATURE,
&temperature_conversion_result);
    assert(FSP_SUCCESS == err);

 /* Formula for calculating temperature copied from section "Preparation for Using
the Temperature Sensor"
  * of the relevant hardware manual:
  *
  * In this MCU, the TSCDR register stores the temperature value (CAL127) of the
temperature sensor measured
  * under the condition Ta = Tj = 127 C and AVCC0 = 3.3 V. By using this value as the
sample measurement result
```

```
  * at the first point, preparation before using the temperature sensor can be
omitted.
  *
  * If V1 is calculated from CAL127,
  * V1 = 3.3 * CAL127 / 4096 [V]
  *
  * Using this, the measured temperature can be calculated according to the following
formula.
  *
  * T = (Vs - V1) / Slope + 127 [C]
  * T: Measured temperature (C)
  * Vs: Voltage output by the temperature sensor when the temperature is measured (V)
  * V1: Voltage output by the temperature sensor when Ta = Tj = 127 C and AVCC0 = 3.3
V (V)
  * Slope: Temperature slope given in Table 52.38 / 1000 (V/C)
  */
    int32_t v1_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
                  reference_calibration_data;
    int32_t vs_uv = (ADC_EXAMPLE_VCC_MICROVOLT >> ADC_EXAMPLE_TEMPERATURE_RESOLUTION)
*
                  temperature_conversion_result;
    int32_t temperature_c = (vs_uv - v1_uv) / slope_uv_per_c +
ADC_EXAMPLE_REFERENCE_CALIBRATION_TEMPERATURE;
 /* Expect room temperature, break if temperature is outside the range of 20 C to 25
C. */
 if ((temperature_c < 20) || (temperature_c > 25))
    {
       __BKPT(0);
    }
}
```

### Double-Trigger Example

This example demonstrates reading data from a double-trigger scan. A flag is used to wait for a

callback event. Two scans must occur before the callback is called. These results are read via R_ADC_Read using the selected channel enum value as well as ADC_CHANNEL_DUPLEX.

```
volatile bool scan_complete_flag = false;
void adc_callback (adc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    scan_complete_flag = true;
}
void adc_double_trigger_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the module. */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable double-trigger channel. */
    err = R_ADC_ScanCfg(&g_adc0_ctrl, &g_adc0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable scan triggering from ELC events. */
    (void) R_ADC_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. Two scans must be triggered before a callback
occurs. */
    scan_complete_flag = false;
 while (!scan_complete_flag)
    {
 /* Wait for callback to set flag. */
    }
 /* Read converted data from both scans. */
    uint16_t channel1_conversion_result_0;
    uint16_t channel1_conversion_result_1;
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result_0);
    assert(FSP_SUCCESS == err);
    err = R_ADC_Read(&g_adc0_ctrl, ADC_CHANNEL_DUPLEX,
&channel1_conversion_result_1);
```

```
    assert(FSP_SUCCESS == err);
}
```

### ADC-DMAC Repeat-Block Transfer Example

This example demonstrates writing multiple data from DAC peripheral to ADC channels and storing the data in memory through DMAC using Repeat-Block Transfer mode. It creates single block to multiple ring buffer type of transfer topology. Ping-Pong mechanism is used to read the data from memory in between the transfers. This example is valid only for MCUs that have ADBUF.

```
 #define ADC_DMAC_EXAMPLE_DATA_LOW (0U)
 #define ADC_DMAC_EXAMPLE_DATA_HIGH (0x000FU)
 #define ADC_DMAC_EXAMPLE_DELAY_1000_MS (1000U)
 #define ADC_DMAC_EXAMPLE_NUM_PING_PONG_BUFFERS (2)
static uint16_t g_adc_dmac_example_buffer[ADC_DMAC_EXAMPLE_NUM_PING_PONG_BUFFERS][
    ADC_DMAC_EXAMPLE_ADC_CHANNELS_PER_BLOCK][ADC_DMAC_EXAMPLE_SAMPLES_PER_CHANNEL];
// Destination buffer for DMAC transfers
static volatile uint16_t g_adc_dmac_example_ping_pong_index = 0U;
static volatile void * gp_read_data;
/* DMAC callback */
void adc_dmac_callback (dmac_callback_args_t * p_args)
{
    (void) p_args;
 /* Store the pointer to the last buffer that was written
  * An array of data for the first enabled channel is at
&g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
  * an array of data for the next channel is at
&g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][1][0], etc.
  */
    gp_read_data =
&g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0];
 /* Select the other ping-pong buffer which is free for writing */
    g_adc_dmac_example_ping_pong_index = !g_adc_dmac_example_ping_pong_index;
 /* Reset the destination pointer and DMAC peripheral */
 R_DMAC_Reset(&g_transfer0_ctrl,
               NULL,
```

```
                (void *)
&g_adc_dmac_example_buffer[g_adc_dmac_example_ping_pong_index][0][0],
                ADC_DMAC_EXAMPLE_SAMPLES_PER_CHANNEL);
 FSP_PARAMETER_NOT_USED(gp_read_data);
}
void adc_dmac_repeat_block_transfer_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open ADC Module and configure the channels */
 /* Enable the ADBUF property from configurations */

      count++;
   }
}
```

### Window Compare Example

This example shows how to configure the window compare function at runtime as well as how to handle events and obtain comparison results through a callback.

```
adc_window_cfg_t g_adc0_window_cfg =
{
 /* Enable Window A and Window B; enable Window mode */
```

```
    .compare_cfg       =
       (adc_compare_cfg_t) (ADC_COMPARE_CFG_A_ENABLE | ADC_COMPARE_CFG_B_ENABLE |
ADC_COMPARE_CFG_WINDOW_ENABLE),
 /* Compare scan values from Channels 0 and 1 */
    .compare_mask       = ADC_MASK_CHANNEL_0 | ADC_MASK_CHANNEL_1,
 /* Set Channel 1 condition to be inside the window instead of outside */
    .compare_mode_mask = ADC_MASK_CHANNEL_1,
 /* Set reference voltage levels for Window A */
    .compare_ref_low = ADC_SCAN_MAX / 3,
    .compare_ref_high = ADC_SCAN_MAX * 2 / 3,
 /* Configure Window B to compare Channel 2 (inside window) */
    .compare_b_channel = ADC_WINDOW_B_CHANNEL_2,
    .compare_b_mode    = ADC_WINDOW_B_MODE_GREATER_THAN_OR_INSIDE,
 /* Set reference voltage levels for Window B */
    .compare_b_ref_low = ADC_SCAN_MAX / 4,
    .compare_b_ref_high = ADC_SCAN_MAX * 3 / 4,
};
void adc0_callback (adc_callback_args_t * p_args)
{
 if (ADC_EVENT_WINDOW_COMPARE_A == p_args->event)
    {
 /* Get channel that met the comparison criteria */
       adc_channel_t channel = p_args->channel;
 /* Process event here */
 FSP_PARAMETER_NOT_USED(channel);
    }
 else if (ADC_EVENT_WINDOW_COMPARE_B == p_args->event)
    {
 /* Process Window B events here */
    }
 else
    {
 /* ... */
    }
```

```
}
void adc_window_compare_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the ADC module */
    err = R_ADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
    assert(FSP_SUCCESS == err);
 /* Set the window compare configuration in the channel config */
    g_adc0_channel_runtime_cfg.p_window_cfg = &g_adc0_window_cfg;
 /* The window compare function is configured as part of the scan configuration */

## Data Structure Documentation

### ◆ adc_sample_state_t

| struct adc_sample_state_t | | |
|---|---|---|
| ADC sample state configuration | | |
| Data Fields | | |
| adc_sample_state_reg_t | reg_id | Sample state register ID. |
| uint8_t | num_states | Number of sampling states for conversion. Ch16-20/21 use the same value. |

### ◆ adc_window_cfg_t

| struct adc_window_cfg_t | | |
|---|---|---|
| ADC Window Compare configuration | | |
| Data Fields | | |
| uint32_t | compare_mask | Channel mask to compare with Window A. |
| uint32_t | compare_mode_mask | Per-channel condition mask for Window A. |
| adc_compare_cfg_t | compare_cfg | Window Compare configuration. |
| uint16_t | compare_ref_low | Window A lower reference value. |
| uint16_t | compare_ref_high | Window A upper reference value. |
| uint16_t | compare_b_ref_low | Window B lower reference |

| | | |
|---|---|---|
| | | value. |
| uint16_t | compare_b_ref_high | Window A upper reference value. |
| adc_window_b_channel_t | compare_b_channel | Window B channel. |
| adc_window_b_mode_t | compare_b_mode | Window B condition setting. |

### ◆ adc_extended_cfg_t

| struct adc_extended_cfg_t | | |
|---|---|---|
| Extended configuration structure for ADC. | | |
| Data Fields | | |
| adc_add_t | add_average_count | Add or average samples. |
| adc_clear_t | clearing | Clear after read. |
| adc_start_source_t | trigger | Trigger source for ADC. |
| adc_start_source_t | trigger_group_b | Trigger source for ADC group B; valid only for group mode. |
| adc_double_trigger_t | double_trigger_mode | Double-trigger mode setting. |
| adc_vref_control_t | adc_vref_control | VREFADC output voltage control. |
| uint8_t | enable_adbuf | Enable ADC Ring Buffer, Valid only to use along with DMAC transfer. |
| IRQn_Type | window_a_irq | IRQ number for Window Compare A interrupts. |
| IRQn_Type | window_b_irq | IRQ number for Window Compare B interrupts. |
| uint8_t | window_a_ipl | Priority for Window Compare A interrupts. |
| uint8_t | window_b_ipl | Priority for Window Compare B interrupts. |

### ◆ adc_channel_cfg_t

| struct adc_channel_cfg_t | | |
|---|---|---|
| ADC channel(s) configuration | | |
| Data Fields | | |
| uint32_t | scan_mask | Channels/bits: bit 0 is ch0; bit 15 is ch15. |
| uint32_t | scan_mask_group_b | Valid for group modes. |
| uint32_t | add_mask | Valid if add enabled in Open(). |
| adc_window_cfg_t * | p_window_cfg | Pointer to Window Compare configuration. |

| | | |
|---|---|---|
| adc_group_a_t | priority_group_a | Valid for group modes. |
| uint8_t | sample_hold_mask | Channels/bits 0-2. |
| uint8_t | sample_hold_states | Number of states to be used for sample and hold. Affects channels 0-2. |

### ◆ adc_instance_ctrl_t

| struct adc_instance_ctrl_t |
|---|
| ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open(). |

## Enumeration Type Documentation

### ◆ adc_mask_t

| enum adc_mask_t | |
|---|---|
| For ADC Scan configuration adc_channel_cfg_t::scan_mask, adc_channel_cfg_t::scan_mask_group_b, adc_channel_cfg_t::add_mask and adc_channel_cfg_t::sample_hold_mask. Use bitwise OR to combine these masks for desired channels and sensors. | |
| Enumerator | |
| ADC_MASK_OFF | No channels selected. |
| ADC_MASK_CHANNEL_0 | Channel 0 mask. |
| ADC_MASK_CHANNEL_1 | Channel 1 mask. |
| ADC_MASK_CHANNEL_2 | Channel 2 mask. |
| ADC_MASK_CHANNEL_3 | Channel 3 mask. |
| ADC_MASK_CHANNEL_4 | Channel 4 mask. |
| ADC_MASK_CHANNEL_5 | Channel 5 mask. |
| ADC_MASK_CHANNEL_6 | Channel 6 mask. |
| ADC_MASK_CHANNEL_7 | Channel 7 mask. |
| ADC_MASK_CHANNEL_8 | Channel 8 mask. |
| ADC_MASK_CHANNEL_9 | Channel 9 mask. |
| ADC_MASK_CHANNEL_10 | Channel 10 mask. |
| ADC_MASK_CHANNEL_11 | Channel 11 mask. |

| | |
|---|---|
| ADC_MASK_CHANNEL_12 | Channel 12 mask. |
| ADC_MASK_CHANNEL_13 | Channel 13 mask. |
| ADC_MASK_CHANNEL_14 | Channel 14 mask. |
| ADC_MASK_CHANNEL_15 | Channel 15 mask. |
| ADC_MASK_CHANNEL_16 | Channel 16 mask. |
| ADC_MASK_CHANNEL_17 | Channel 17 mask. |
| ADC_MASK_CHANNEL_18 | Channel 18 mask. |
| ADC_MASK_CHANNEL_19 | Channel 19 mask. |
| ADC_MASK_CHANNEL_20 | Channel 20 mask. |
| ADC_MASK_CHANNEL_21 | Channel 21 mask. |
| ADC_MASK_CHANNEL_22 | Channel 22 mask. |
| ADC_MASK_CHANNEL_23 | Channel 23 mask. |
| ADC_MASK_CHANNEL_24 | Channel 24 mask. |
| ADC_MASK_CHANNEL_25 | Channel 25 mask. |
| ADC_MASK_CHANNEL_26 | Channel 26 mask. |
| ADC_MASK_CHANNEL_27 | Channel 27 mask. |
| ADC_MASK_CHANNEL_28 | Channel 28 mask. |
| ADC_MASK_TEMPERATURE | Temperature sensor channel mask. |
| ADC_MASK_VOLT | Voltage reference channel mask. |
| ADC_MASK_SENSORS | All sensor channel mask. |

### ◆ adc_add_t

| enum adc_add_t | |
|---|---|
| ADC data sample addition and averaging options | |
| Enumerator | |
| ADC_ADD_OFF | Addition turned off for channels/sensors. |
| ADC_ADD_TWO | Add two samples. |
| ADC_ADD_THREE | Add three samples. |
| ADC_ADD_FOUR | Add four samples. |
| ADC_ADD_SIXTEEN | Add sixteen samples. |
| ADC_ADD_AVERAGE_TWO | Average two samples. |
| ADC_ADD_AVERAGE_FOUR | Average four samples. |
| ADC_ADD_AVERAGE_EIGHT | Average eight samples. |
| ADC_ADD_AVERAGE_SIXTEEN | Add sixteen samples. |

### ◆ adc_clear_t

| enum adc_clear_t | |
|---|---|
| ADC clear after read definitions | |
| Enumerator | |
| ADC_CLEAR_AFTER_READ_OFF | Clear after read off. |
| ADC_CLEAR_AFTER_READ_ON | Clear after read on. |

### ◆ adc_vref_control_t

| enum adc_vref_control_t | |
|---|---|
| Enumerator | |
| ADC_VREF_CONTROL_VREFH | VREFAMPCNT reset value. VREFADC Output voltage is Hi-Z. |
| ADC_VREF_CONTROL_1_5V_OUTPUT | BGR turn ON. VREFADC Output voltage is 1.5 V. |
| ADC_VREF_CONTROL_2_0V_OUTPUT | BGR turn ON. VREFADC Output voltage is 2.0 V. |
| ADC_VREF_CONTROL_2_5V_OUTPUT | BGR turn ON. VREFADC Output voltage is 2.5 V. |
| ADC_VREF_CONTROL_AVCC0_AVSS0 | High potential is AVCC0, low potential is AVSS0. |
| ADC_VREF_CONTROL_VREFH0_AVSS0 | High potential is VREFH0, low potential is AVSS0. |
| ADC_VREF_CONTROL_IVREF_AVSS0 | High potential is internal reference voltage, low potential is AVSS0. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement. |
| ADC_VREF_CONTROL_AVCC0_VREFL0 | High potential is AVCC0, low potential is VREFL0. |
| ADC_VREF_CONTROL_VREFH0_VREFL0 | High potential is VREFH0, low potential is VREFL0. |
| ADC_VREF_CONTROL_IVREF_VREFL0 | High potential is internal reference voltage, low potential is VREFL0. When the high potential is set to the internal reference voltage, wait 5 us after R_ADC_Open() to start an ADC measurement. |

### ◆ adc_sample_state_reg_t

| enum adc_sample_state_reg_t | |
|---|---|
| ADC sample state registers | |
| Enumerator | |
| ADC_SAMPLE_STATE_CHANNEL_0 | Sample state register channel 0. |
| ADC_SAMPLE_STATE_CHANNEL_1 | Sample state register channel 1. |
| ADC_SAMPLE_STATE_CHANNEL_2 | Sample state register channel 2. |
| ADC_SAMPLE_STATE_CHANNEL_3 | Sample state register channel 3. |
| ADC_SAMPLE_STATE_CHANNEL_4 | Sample state register channel 4. |
| ADC_SAMPLE_STATE_CHANNEL_5 | Sample state register channel 5. |
| ADC_SAMPLE_STATE_CHANNEL_6 | Sample state register channel 6. |
| ADC_SAMPLE_STATE_CHANNEL_7 | Sample state register channel 7. |
| ADC_SAMPLE_STATE_CHANNEL_8 | Sample state register channel 8. |
| ADC_SAMPLE_STATE_CHANNEL_9 | Sample state register channel 9. |
| ADC_SAMPLE_STATE_CHANNEL_10 | Sample state register channel 10. |
| ADC_SAMPLE_STATE_CHANNEL_11 | Sample state register channel 11. |
| ADC_SAMPLE_STATE_CHANNEL_12 | Sample state register channel 12. |
| ADC_SAMPLE_STATE_CHANNEL_13 | Sample state register channel 13. |
| ADC_SAMPLE_STATE_CHANNEL_14 | Sample state register channel 14. |
| ADC_SAMPLE_STATE_CHANNEL_15 | Sample state register channel 15. |
| ADC_SAMPLE_STATE_CHANNEL_16_TO_31 | Sample state register channel 16 to 31. |

### ◆ adc_compare_cfg_t

| enum adc_compare_cfg_t |
|---|
| ADC comparison settings |

### ◆ adc_window_b_channel_t

| enum adc_window_b_channel_t |
| --- |
| ADC Window B channel |

### ◆ adc_window_b_mode_t

| enum adc_window_b_mode_t |
| --- |
| ADC Window B comparison mode |

### ◆ adc_group_a_t

| enum adc_group_a_t | |
| --- | --- |
| ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode. | |
| Enumerator | |
| ADC_GROUP_A_PRIORITY_OFF | Group A ignored and does not interrupt ongoing group B scan. |
| ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER | Group A interrupts Group B(single scan) which restarts at next Group B trigger. |
| ADC_GROUP_A_GROUP_B_RESTART_SCAN | Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete. |
| ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN | Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger. |

### ◆ adc_double_trigger_t

| enum adc_double_trigger_t | |
|---|---|
| ADC double-trigger mode definitions | |
| Enumerator | |
| ADC_DOUBLE_TRIGGER_DISABLED | Double-triggering disabled. |
| ADC_DOUBLE_TRIGGER_ENABLED | Double-triggering enabled. |
| ADC_DOUBLE_TRIGGER_ENABLED_EXTENDED | Double-triggering enabled on both ADC ELC events. |

### ◆ adc_start_source_t

| enum adc_start_source_t | |
|---|---|
| ADC Trigger synchronous start source Note: not all sources are available for all MCUs or channels. See User Manual for more information. | |
| Enumerator | |
| ADC_START_SOURCE_DISABLED | ELC/GPT Start source disabled (For use with software start) |
| ADC_START_SOURCE_ASYNC_EXTERNAL | External Trigger Input. |
| ADC_START_SOURCE_ELC_AD0 | ELC_AD0 (Converter 0 and Converter 1) |
| ADC_START_SOURCE_ELC_AD1 | ELC_AD1 (Converter 0 and Converter 1) |
| ADC_START_SOURCE_ELC_AD01 | ELC_AD0 and ELC_AD1 (Converter 0) also ELC_AD0 and ELC_AD1 (Converter 1) |
| ADC_START_SOURCE_GPT_A0_A4 | GTADTRA0 (Converter 0) and GTADTRA4 (Converter 1) |
| ADC_START_SOURCE_GPT_B0_B4 | GTADTRB0 (Converter 0) and GTADTRB4 (Converter 1) |

### Function Documentation

#### ◆ R_ADC_Open()

fsp_err_t R_ADC_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt is enabled, the function registers a callback function pointer for notifying the user whenever a scan has completed.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |
| FSP_ERR_IRQ_BSP_DISABLED | A callback is provided, but the interrupt is not enabled. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested unit does not exist on this MCU. |
| FSP_ERR_INVALID_HW_CONDITION | The ADC clock must be at least 1 MHz |

### ◆ R_ADC_ScanCfg()

fsp_err_t R_ADC_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_channel_cfg* )

Configures the ADC scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_channel_cfg_t to p_channel_cfg.

***Note***

*This starts group B scans if adc_channel_cfg_t::priority_group_a is set to ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_CallbackSet()

fsp_err_t R_ADC_CallbackSet ( adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void *const *p_context*, adc_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_ADC_ScanStart()

fsp_err_t R_ADC_ScanStart ( adc_ctrl_t * *p_ctrl*)

Starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_Open call. If the unit was configured for ELC or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, then this function starts the software triggered scan.

**Precondition**

Call R_ADC_ScanCfg after R_ADC_Open before starting a scan.
On MCUs that support calibration, call R_ADC_Calibrate and wait for calibration to complete before starting a scan.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_IN_USE | Another scan is still in progress (software trigger). |

### ◆ R_ADC_ScanGroupStart()

fsp_err_t R_ADC_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id* )

adc_api_t::scanStart is not supported on the ADCH. Use scanStart instead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_ADC_ScanStop()

fsp_err_t R_ADC_ScanStop ( adc_ctrl_t * *p_ctrl*)

Stops the software scan or disables the unit from being triggered by the hardware trigger (ELC or external) based on what type of trigger the unit was configured for in the R_ADC_Open function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan stopped (software trigger) or hardware triggers disabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

### ◆ R_ADC_StatusGet()

fsp_err_t R_ADC_StatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_Read()

fsp_err_t R_ADC_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data* )

Reads conversion results from a single channel or sensor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

### ◆ R_ADC_Read32()

fsp_err_t R_ADC_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data* )

Reads conversion results from a single channel or sensor register into a 32-bit result.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

### ◆ R_ADC_SampleStateCountSet()

fsp_err_t R_ADC_SampleStateCountSet ( adc_ctrl_t * *p_ctrl*, adc_sample_state_t * *p_sample* )

Sets the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of reset.

***Note***

*The sample states for the temperature and voltage sensor are set in R_ADC_ScanCfg.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Sample state count updated. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_InfoGet()

fsp_err_t R_ADC_InfoGet ( adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info* )

Returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned.

Also provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

***Note***

*In group mode, information is returned for group A only. Calculating information for group B is not currently supported.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_Close()

fsp_err_t R_ADC_Close ( adc_ctrl_t * *p_ctrl*)

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_Calibrate()

fsp_err_t R_ADC_Calibrate ( adc_ctrl_t *const *p_ctrl*, void const * *p_extend* )

Initiates calibration of the ADC on MCUs that require calibration. This function must be called before starting a scan on MCUs that require calibration.

Calibration is complete when the callback is called with ADC_EVENT_CALIBRATION_COMPLETE or when R_ADC_StatusGet returns ADC_STATUS_IDLE. See figure "Software flow and operation example of calibration operation." in the ADC section of the relevant hardware manual.

ADC calibration time: 12 PCLKB + 774,930 ADCLK. See table "Required calibration time (shown as the number of ADCLK and PCLKB cycles)" in the ADC section of the relevant hardware manual. The lowest supported ADCLK is 1MHz.

Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. This wait could take up to 780 milliseconds for a 1 MHz PCLKD (ADCLK).

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to the instance control structure |
| [in] | p_extend | Unused argument. Pass NULL. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Calibration successfully initiated. |
| FSP_ERR_INVALID_HW_CONDITION | A scan is in progress or hardware triggers are enabled. |
| FSP_ERR_UNSUPPORTED | Calibration not supported on this MCU. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_OffsetSet()

fsp_err_t R_ADC_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset* )

adc_api_t::offsetSet is not supported on the ADC.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### Detailed Description

Driver for the ADC_B peripheral on RA MCUs. This module implements the ADC Interface.

# Overview

### Features

The ADC_B module supports the following features:

- 16 bit resolution
- Selectable data format (16, 14, 12, and 10-bit)
- Configurable high-speed and high-accuracy conversion methods
- Configure scans to include:
    - Multiple analog channels
    - Temperature sensor channel
    - Reference Voltage sensor channel
    - Self-Diagnostic channel
- Configurable scan start trigger:
    - Software scan triggers
    - Hardware scan triggers (timer expiration, for example)
    - External scan triggers from the ADTRGn port pins
- Configurable scan modes:
    - Single scan mode, where each trigger starts a single scan
    - Continuous scan mode, where all channels are scanned continuously
    - Synchronous scan mode, where A/D converters operate synchronously
- Variable sampling time
- Self-calibration
- Channel-dedicated sample-and-hold circuits
- Supports adding and averaging converted samples
- Limiter clip function
- User offset adjustment function
- User gain adjustment function
- Built-in FIFO
- Channel-dedicated programmable gain amplifier (PGA):
    - Support single-ended or pseudo-differential input
    - 2.5x to 13.33x gain (1.5x to 5.56x for pseudo-differential inputs)
- Optional callback when scan completes, FIFO data is ready, an error occurrs, or other conditions are triggered.

# Configuration

### Virtual Channels and Scan Groups

A virtual channel is a group of registers that stores the A/D conversion configuration for a single analog pin. Each virtual channel has a number of options including the channel for conversion, settings for conversion, data processing method and so on.

To perform A/D conversion of an analog pin, the channel associated with the pin must first be assigned to a virtual channel. That virtual channel is then assigned to a scan group, which brings together one or more virtual channels to be converted in sequence with a specified conversion unit.

*Note*

*Analog channels may be assigned to more than one virtual channel. However, a virtual channel can be assigned to only one scan group. When performing A/D conversion on one analog channel in different scan groups or when converting a channel several times within the same scan group, assign several virtual channels to one analog channel.*
*To avoid data being overwritten, when converting a channel multiple times within the same scan group use R_ADC_B_FifoRead() instead of R_ADC_B_Read().*

### Configuring a Scan

To perform A/D conversion of a scan group the following should be configured:

- Assign the analog channel for conversion to a virtual channel.
- Assign the virtual channel to a scan group.
- Assign the scan group to an A/D Converter.

*Note*

*Up to 8 virtual channels can be assigned to a scan group. If more than 8 channels are assigned to a group, only the lowest 8 will be targeted for A/D conversion.*

### Build Time Configurations for r_adc_b

The following build time configurations are defined in fsp_cfg/r_adc_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | bsp | If selected, code for parameter checking is included in the build. |

*Note*

*The instance configurations available in this driver are too numerous to list here. Please refer to the RA Configuration editor in e² studio for further details.*

### Clock Configuration

The ADC_B conversion clock source may be configured to use PCLKC, PCLKA, or GPT with a selectable division ratio. The ADC_B clock may operate between 25 MHz at a minimum and 60 MHz at a maximum.

### Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_B.

ADTRG0 and ADTRG1 can be used to start scans with an external trigger. When external triggers are used, ADC_B scans begin on the falling edge of the ADTRG pin.

## Usage Notes

### Limitations

Developers should be aware of the following limitations when using R_ADC_B:

- Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.

### Self-Calibration

Calibration is required to use this peripheral; call R_ADC_B_Calibrate() after R_ADC_B_ScanCfg() and prior to any other function. Self-Calibration should be performed any time ADC operating characteristics are modified, including after reset, releasing module-stop, when returning from software standby or deep software standby mode, each time the ADC ScanCfg function is called, and

any time ADC related clocks are updated.

*Note*

*Self-calibration is a non-blocking operation. The application should wait for an ADC_EVENT_CALIBRATION_COMPLETE callback before using other ADC_B functionality. The self-calibration process will disable hardware triggers that were previously enabled.*

### ADC_B Operation Modes

The driver supports two primary operational modes, single-scan and continuous-scan. In single scan mode, one or more groups are scanned once per trigger. In continuous scan mode, one or more groups are started with a single trigger. Scans continue until R_ADC_B_ScanStop() is called. In each mode, analog groups and virtual channels are converted in ascending order.

### Single Scan Mode

- Assign any selected analog input or analog channel to any scan group, and convert the selected analog input only once per scan group for each start condition.
- By selecting the scan start conditions for each scan group individually, A/D conversion for each scan group can be started at different times.

### Continuous Scan Mode

- Assign any selected analog input or analog channel to any scan group and repeat A/D conversion in scan group units after the first start condition. Conversion continues until the driver is closed.

### Background Continuous Scan Mode

- Assign any selected analog input or analog channel of the extended analog function to any scan group and repeat A/D conversion in scan group units after the first start condition. The A/D conversion is performed in the background until the driver is closed. In Background Continuous Scan Mode, if the A/D conversion data will be acquired at the point a start condition is entered.

*Note*

*Background Continuous Scan Mode is only available for Hybrid Mode*

### Synchronous-Scan Mode

When synchronous operation is enabled all A/D conversions are guaranteed to begin and end based on a user-configured period. When both conversion units are selected for synchronous scan they run from the same period, allowing for consistent timing of simultaneous conversions. Consult "Synchronous Operation" in the A/D Converter section of the relevant hardware manual.

### ADC_B Conversion Methods

*Note*

*The ADC peripheral supports specific high-speed, high-precision, and normal-precision channels. See Table "A/D conversion characteristics" in the A/D Converter section of the relevant hardware manual for details about what conversion methods are supported by specific physical channels.*

### Successive Approximation Register (SAR) Mode

- A/D Converter samples the signal source once, and convert by Successive Approximation Register method.
- Fast A/D conversion
- Up to 8 channels per 1 scan group.
- Support only single-ended input (excludeing Self-diagnosis function)
- Requires Digital Filter Selection to be disabled

### Oversampling Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- High-accuracy A/D conversion
- Support up to 8 channels per 1 scan group
- Support single-ended input and differential input
- Requires Digital Filter Selection to be enabled

### Hybrid Mode

- A/D Converter oversamples the signal source, and converts analog to digital by Noise Shaping Successive Approximation Register method.
- Background Continuous Scan Mode operation enables both high-precision A/D conversion and fast conversion.
- Support up to 4 channels per 1 scan group
- Support single-ended input and differential input
- Requires Digital Filter Selection to be enabled

### Digital Filter Selection

The following characteristics of the digital filter for the A/D converter unit may be selected:

- Sinc3 Filter (Over Sampling = 8)
- Minimum Phase Filter (Group Delay < 5)

*Note*

*The digital filter must be disabled for ADC units configured to use Successive Approximation Register (SAR) Mode*
*The digital filter must be enabled for ADC units configured to use Oversampling Mode or Hybrid Mode*

### Sample-and-Hold

Enabling sample-and-hold on one or more channels instructs the ADC to perform sampling on all channels as soon as a group scan is started. Internal circuitry holds the sampled voltages until the conversion unit is ready.

*Note*

*Each sample-and-hold unit is connected to two analog channels (0/1, 2/3 etc). When this function is enabled on both members of a pair only one of the two may be scanned at a time.*
*Enabling sample-and-hold functionality reduces maximum scan frequency because the sample hold time is added to each scan. Refer to the hardware manual for details on the sample-and-hold time. Consult section "ADC Characteristics" of the relevant hardware manual for details.*
*If you use the channel-dedicated sample-and-hold circuits in Hybrid mode, the virtual channels and the scan groups are constrained. A dummy channel must be configured as last within the group. The A/D conversion data of the channel used as the dummy conversion channel is not guaranteed. See Operation in Hybrid Mode with Channel-dedicated Sample-and-hold Circuit section in the User Manual for more information.*

### Self-Diagnosis

ADC_B has a built-in self-diagnosis function that can be used to confirm the unit is working correctly. One of three self-diagnosis voltages can be converted and compared to reference values. A self-diagnosis conversion produces a signed data value indicating the ideal A/D converter result. Reference values for 16-bit data format are shown below.

| Self-diagnosis mode | Expected reference data | Accuracy Error |
|---|---|---|
| Self-diagnosis mode 1 | 0x0000 | A/D conversion result becomes +1 or more when a positive accuracy error occurs and -1 or less when a negative accuracy error occurs. |
| Self-diagnosis mode 1 | 0x8000 | A/D conversion result becomes greater than or equal to reference data when an accuracy error occurs. |
| Self-diagnosis mode 1 | 0x7FFF | A/D conversion result becomes less than or equal to reference data when an accuracy error occurs. |

### Add/Average Function

The ADC can be configured to automatically add or average a number of conversions into a single result. When enabled only the result of the operation is returned.

*Note*

*When the A/D-converted value addition/average function is used, overflow of conversion data may occur. However, in certain conditions overflow may not be detected. See the A/D Conversion Overflow section below for details.*

### Data Format

The A/D converter in this peripheral has a resolution of 16 bits. When 14-bit or 12-bit data format is selected, the lower 2 or 4 bits (respectively) of the A/D conversion result are extended for data processing, error calibration (Self-Calibration), gain/offset adjustment and the averaging function before rounding is applied.

### Limiter Clip

The limit clipping function allows for setting upper and lower bounds on converted data. When the A/D conversion data exceeds the specified upper limit value, it is clipped to the upper limit value. If the A/D conversion data falls below the specified lower limit, it is clipped to the lower limit value.

The upper and lower limits are set in one of eight table entries. To perform limit clip functionality, each virtual channel may (optionally) have one of these entries assigned. Interrupts may be enabled for when limiter clip conditions are triggered.

*Note*

*When 14-/12-/10-bit is selected as the data length of the A/D conversion data, the lower bits are cut based on the data-format selection. When 16-bit format is selected, the data length is not rounded.*

### Using the Temperature Sensor with the ADC_B

The ADC_B HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula:

T = (Vs - V1)/slope + T1

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- slope: Temperature gradient of the temperature sensor (V/degrees C), given as (V2 - V1) / (T2 - T1)
    - T2: Temperature at the experimental measurement of another point (degrees C)
    - V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)

*Note*

*The slope value can be obtained from the hardware manual for each device in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.*

### User Offset and Gain

The user offset adjustment function adds or subtracts a constant value to or from the A/D conversion data. Virtual channels select an offset from a table of values specified by the user.

The user gain adjustment function multiplies the A/D conversion data by an arbitrary coefficient value. As with offset adjustment, virtual channels may select a gain value from a table specified by the user.

*Note*

*When the offset or gain adjusting functions are used overflow of A/D conversion data may occur. See the A/D Conversion Overflow section below for details.*
*When 14-/12-/10-bit is selected as the data length of converted data the lower bits of offset values are cut based on the data-format selection.*

### FIFO

The FIFOs consist of 8 stages and can hold up to 8 A/D conversion data. One FIFO is implemented for each scan group. Each FIFO acts as a ring buffer and data will be lost if the FIFO is not read as needed. Interrupts may be enabled for a specific data storage threshold and on overrun.

### Programmable Gain Amplifier

ADC has built-in Programmable Gain Amplifier (PGA). The PGA amplifies an external analog input signal and outputs it to A/D converter, Channel-dedicated sample-and-hold circuit, and High-Speed Analog Comparator (ACMPHS). PGA units are channel specific and utilize two analog input pins per unit. Please refer to the RA Configuration editor in e² studio or the hardware manual for further details.

*Note*

*When PGA is used, the analog input pin assigned to PGAVSS pin cannot be input to A/D conversion or Channel-dedicated sample-and-hold circuit.*

### Single-ended input

In single-ended input mode, PGA amplifies the input from PGAIN pin with the specified gain, between ×2.000 to ×13.333. When operating the PGA in single-ended input mode, PGAIN should be connected to the signal source and PGAVSS should be connected to the analog ground (AVSS0). The input voltage to PGAIN must not exceed the range specified in the Electrical Characteristics.

#### Pseudo-differential input

In pseudo differential input mode, PGA amplifies the difference between PGAIN pin and PGAVSS pin with the specified gain and output the voltage obtained by adding the offset of 0.5 * AVcc. Settable gains are ×1.500, ×2.333, ×4.000, and ×5.667.

When operating the PGA in Pseudo Differential Input Mode, PGAIN should be connected to the signal source, and PGAVSS should be connected to the reference ground of the signal source. The inputs to PGAIN and PGAVSS pins must not exceed the range specified in the Electrical Characteristics.

#### When Interrupts Are Not Enabled

Interrupts are enabled by default. If scan-complete interrupts are disabled,@ ref R_ADC_B_StatusGet() can be used to poll the ADC_B driver to determine when the scan has completed. R_ADC_B_Read() is used to access the converted ADC_B result.

#### A/D Conversion Overflow

A/D conversion overflow is detected when converted data exceeds the range that can be handled in the specified data format. When overflow occurs, data is restricted to the upper or lower limit value of the specified data format. Overflow is detected in the following cases:

- When the input to the A/D converter exceeds VREFH0 or falls below VREFL0
- When overflow occurs by the internal processing (calculation) for the A/D conversion data due to the following: – Gain Error and Offset Error Calibration – User Gain/Offset adjustment function – When using A/D-Converted Value Addition/Averaging Function – Data Formatting Process

## Examples

#### Basic Example

This is a basic example of minimal use of the ADC_B in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_channel_cfg_t elements can be defined
and passed to R_ADC_B_ScanCfg. */
extern const adc_b_scan_cfg_t g_adc_b0_scan_cfg;
void adc_b_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = R_ADC_B_Open(&g_adc_b0_ctrl, &g_adc_b0_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable channels. */

## Data Structure Documentation

### ◆ adc_b_fifo_data_t

| struct adc_b_fifo_data_t | | |
|---|---|---|
| ADC FIFO data type | | |
| Data Fields | | |
| uint32_t | data: 16 | Conversion Data. |
| uint32_t | __pad0__: 8 | |
| adc_channel_t | physical_channel: 7 | Channel number for data. |
| uint32_t | err: 1 | Error bit. |

### ◆ adc_b_fifo_read_t

| struct adc_b_fifo_read_t | | |
|---|---|---|
| ADC FIFO Read data structure | | |
| Data Fields | | |
| uint8_t | count | Number of valid FIFO data read. |
| adc_b_fifo_data_t | fifo_data[8] | FIFO data. |

### ◆ adc_b_group_cfg_t

| struct adc_b_group_cfg_t | | |
|---|---|---|
| ADC Group configuration data | | |
| Data Fields | | |
| adc_group_id_t | scan_group_id | Scan Group ID. |
| adc_b_unit_id_t | converter_selection | Converter selection. |
| bool | scan_group_enable | Scan Group enable state. |
| uint8_t | virtual_channel_count | Virtual Channel count. |
| bool | scan_end_interrupt_enable | Scan End Interrupt enable. |
| adc_b_external_trigger_t | external_trigger_enable_mask | External Trigger mask. |
| elc_peripheral_t | elc_trigger_enable_mask | ELC Trigger mask. |
| adc_b_gpt_trigger_t | gpt_trigger_enable_mask | GPT Trigger mask. |
| uint8_t | conversion_start_delay | Conversion start delay. |
| uint32_t | self_diagnosis_mask | Self-Diagnosis register data. |
| bool | limit_clip_interrupt_enable | Limiter Clip interrupt enable. |
| adc_b_virtual_channel_cfg_t ** | p_virtual_channels | Pointer to virtual channel configuration array of size virtual_channel_count. |

### ◆ adc_b_scan_cfg_t

| struct adc_b_scan_cfg_t | | |
|---|---|---|
| ADC Scan Group configuration | | |
| Data Fields | | |
| uint8_t | group_count | Group Count. |
| adc_b_group_cfg_t ** | p_adc_groups | Pointer to ADC group configuration data. |

### ◆ adc_b_isr_cfg_t

| struct adc_b_isr_cfg_t | | |
|---|---|---|
| ADC ISR configuration structure | | |
| Data Fields | | |
| uint8_t | calibration_end_ipl_adc_0 | Calibration end IPL for A/D converter unit 0. |
| uint8_t | calibration_end_ipl_adc_1 | Calibration end IPL for A/D converter unit 1. |
| uint8_t | conversion_error_ipl_adc_0 | Conversion error IPL for A/D converter unit 0. |
| uint8_t | conversion_error_ipl_adc_1 | Conversion error IPL for A/D converter unit 1. |
| uint8_t | fifo_overflow_ipl | FIFO Overflow IPL. |
| uint8_t | fifo_read_ipl_group_0 | FIFO Read threshold request IPL for Group 0. |
| uint8_t | fifo_read_ipl_group_1 | FIFO Read threshold request IPL for Group 1. |
| uint8_t | fifo_read_ipl_group_2 | FIFO Read threshold request IPL for Group 2. |
| uint8_t | fifo_read_ipl_group_3 | FIFO Read threshold request IPL for Group 3. |
| uint8_t | fifo_read_ipl_group_4 | FIFO Read threshold request IPL for Group 4. |
| uint8_t | fifo_read_ipl_group_5 | FIFO Read threshold request IPL for Group 5 (available on some MCUs) |
| uint8_t | fifo_read_ipl_group_6 | FIFO Read threshold request IPL for Group 6 (available on some MCUs) |
| uint8_t | fifo_read_ipl_group_7 | FIFO Read threshold request IPL for Group 7 (available on some MCUs) |
| uint8_t | fifo_read_ipl_group_8 | FIFO Read threshold request IPL |

| | | |
|---|---|---|
| | | for Group 8 (available on some MCUs) |
| uint8_t | fifo_read_ipl_group_5678 | FIFO Read threshold request IPL for Groups 5, 6, 7, and 8 (available on some MCUs) |
| uint8_t | limit_clip_ipl | Limiter Clip IPL. |
| uint8_t | overflow_error_ipl_adc_0 | Overflow error IPL for A/D converter unit 0. |
| uint8_t | overflow_error_ipl_adc_1 | Overflow error IPL for A/D converter unit 1. |
| uint8_t | scan_end_ipl_group_0 | Scan End IPL for A/D Group 0. |
| uint8_t | scan_end_ipl_group_1 | Scan End IPL for A/D Group 1. |
| uint8_t | scan_end_ipl_group_2 | Scan End IPL for A/D Group 2. |
| uint8_t | scan_end_ipl_group_3 | Scan End IPL for A/D Group 3. |
| uint8_t | scan_end_ipl_group_4 | Scan End IPL for A/D Group 4. |
| uint8_t | scan_end_ipl_group_5 | Scan End IPL for A/D Group 5 (available on some MCUs) |
| uint8_t | scan_end_ipl_group_6 | Scan End IPL for A/D Group 6 (available on some MCUs) |
| uint8_t | scan_end_ipl_group_7 | Scan End IPL for A/D Group 7 (available on some MCUs) |
| uint8_t | scan_end_ipl_group_8 | Scan End IPL for A/D Group 8 (available on some MCUs) |
| uint8_t | scan_end_ipl_group_5678 | Scan End IRQ for A/D Groups 5, 6, 7, and 8 (available on some MCUs) |
| IRQn_Type | calibration_end_irq_adc_0 | Calibration end IRQ for A/D converter unit 0. |
| IRQn_Type | calibration_end_irq_adc_1 | Calibration end IRQ for A/D converter unit 1. |
| IRQn_Type | conversion_error_irq_adc_0 | Conversion error IRQ for A/D converter unit 0. |
| IRQn_Type | conversion_error_irq_adc_1 | Conversion error IRQ for A/D converter unit 1. |
| IRQn_Type | fifo_overflow_irq | FIFO Overflow IRQ. |
| IRQn_Type | fifo_read_irq_group_0 | FIFO Read threshold request IRQ for Group 0. |
| IRQn_Type | fifo_read_irq_group_1 | FIFO Read threshold request IRQ for Group 1. |
| IRQn_Type | fifo_read_irq_group_2 | FIFO Read threshold request IRQ for Group 2. |

| | | |
|---|---|---|
| IRQn_Type | fifo_read_irq_group_3 | FIFO Read threshold request IRQ for Group 3. |
| IRQn_Type | fifo_read_irq_group_4 | FIFO Read threshold request IRQ for Group 4. |
| IRQn_Type | fifo_read_irq_group_5 | FIFO Read threshold request IRQ for Group 5. |
| IRQn_Type | fifo_read_irq_group_6 | FIFO Read threshold request IRQ for Group 6. |
| IRQn_Type | fifo_read_irq_group_7 | FIFO Read threshold request IRQ for Group 7. |
| IRQn_Type | fifo_read_irq_group_8 | FIFO Read threshold request IRQ for Group 8. |
| IRQn_Type | fifo_read_irq_group_5678 | FIFO Read threshold request IRQ for Groups 5, 6, 7, and 8. |
| IRQn_Type | limit_clip_irq | Limiter Clip IRQ. |
| IRQn_Type | overflow_error_irq_adc_0 | Overflow error IRQ for A/D converter unit 0. |
| IRQn_Type | overflow_error_irq_adc_1 | Overflow error IRQ for A/D converter unit 1. |
| IRQn_Type | scan_end_irq_group_0 | Scan End IRQ for A/D Group 0. |
| IRQn_Type | scan_end_irq_group_1 | Scan End IRQ for A/D Group 1. |
| IRQn_Type | scan_end_irq_group_2 | Scan End IRQ for A/D Group 2. |
| IRQn_Type | scan_end_irq_group_3 | Scan End IRQ for A/D Group 3. |
| IRQn_Type | scan_end_irq_group_4 | Scan End IRQ for A/D Group 4. |
| IRQn_Type | scan_end_irq_group_5 | Scan End IRQ for A/D Group 5. |
| IRQn_Type | scan_end_irq_group_6 | Scan End IRQ for A/D Group 6. |
| IRQn_Type | scan_end_irq_group_7 | Scan End IRQ for A/D Group 7. |
| IRQn_Type | scan_end_irq_group_8 | Scan End IRQ for A/D Group 8. |
| IRQn_Type | scan_end_irq_group_5678 | Scan End IRQ for A/D Groups 5, 6, 7, and 8. |

### ◆ adc_b_extended_cfg_t

| struct adc_b_extended_cfg_t | | |
|---|---|---|
| ADC extended configuration data | | |
| Data Fields | | |
| adc_b_pga_gain_t | pga_gain[4] | PGA Gain selection. |
| union adc_b_extended_cfg_t | __unnamed__ | |
| union adc_b_extended_cfg_t | adc_filter_selection[2] | |

| | | |
|---|---|---|
| union adc_b_extended_cfg_t | __unnamed__ | |
| union adc_b_extended_cfg_t | __unnamed__ | |
| union adc_b_extended_cfg_t | __unnamed__ | |
| uint32_t | scan_group_enable | Scan Group enable register data. |
| union adc_b_extended_cfg_t | __unnamed__ | |
| union adc_b_extended_cfg_t | __unnamed__ | |
| uint16_t | fifo_interrupt_enable_mask | FIFO interrupt enable register data. |
| union adc_b_extended_cfg_t | __unnamed__ | |
| union adc_b_extended_cfg_t | __unnamed__ | |
| uint32_t | calibration_adc_state | Calibration State register data. |
| uint32_t | calibration_sample_and_hold | Calibration Sample and Hold register data. |
| const adc_b_isr_cfg_t * | p_isr_cfg | Pointer to ISR configuration. |
| union adc_b_extended_cfg_t | __unnamed__ | |
| uint8_t | sample_and_hold_enable_mask | Sample and Hold enable register data. |
| uint32_t | sample_and_hold_config_012 | Sample and Hold configuration register data. |
| uint32_t | sample_and_hold_config_456 | Sample and Hold configuration register data. |
| uint32_t | conversion_state | ADC 0/1 Successive Approximation Time Configuration. |
| int32_t | user_offset_tables[8] | User Offset Table register data. |
| uint32_t | user_gain_tables[8] | User Gain Table register data. |
| uint32_t | limiter_clip_interrupt_enable_mask | Limiter clip interrupt enable register data. |
| uint32_t | limiter_clip_tables[8] | Limiter clip Table register data. |

### ◆ adc_b_instance_ctrl_t

| struct adc_b_instance_ctrl_t | |
|---|---|
| ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open(). | |
| **Data Fields** | |
| adc_b_converter_state_t | adc_state |
| | ADC 0 converter State. |

| | |
|---|---|
| | |
| uint32_t | cached_adtrgenr |
| | Cached conversion peripheral trigger bits, used when starting and stopping scans. |
| | |
| uint32_t | cached_adsystr |
| | Cached conversion software start bits, used when starting and stopping scans. |
| | |
| uint32_t | trigger_disable_wait_cycles |
| | ADC clock cycles required to wait after disabling trigger input. |
| | |
| adc_cfg_t const * | p_cfg |
| | Boolean to verify that the Unit has been initialized. |
| | |
| void(* | p_callback )(adc_callback_args_t *) |
| | Pointer to callback that is called when an adc_b_event_t occurs. |
| | |
| adc_callback_args_t * | p_callback_memory |
| | Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory. |
| | |
| void * | p_context |
| | User defined context passed into callback function. |
| | |
| uint32_t | initialized |
| | Initialized status of ADC_B. |
| | |
| uint32_t | opened |
| | Open status of ADC_B. |

## Enumeration Type Documentation

### ◆ adc_b_clock_divider_t

| enum adc_b_clock_divider_t | |
|---|---|
| ADC clock divider selection | |
| Enumerator | |
| ADC_B_CLOCK_DIV_1 | ADC Clock Division 1/1. |
| ADC_B_CLOCK_DIV_2 | ADC Clock Division 1/2. |
| ADC_B_CLOCK_DIV_3 | ADC Clock Division 1/3. |
| ADC_B_CLOCK_DIV_4 | ADC Clock Division 1/4. |
| ADC_B_CLOCK_DIV_5 | ADC Clock Division 1/5. |
| ADC_B_CLOCK_DIV_6 | ADC Clock Division 1/6. |
| ADC_B_CLOCK_DIV_7 | ADC Clock Division 1/7. |
| ADC_B_CLOCK_DIV_8 | ADC Clock Division 1/8. |

### ◆ adc_b_converter_mode_t

| enum adc_b_converter_mode_t | |
|---|---|
| ADC_B Conversion Mode | |
| Enumerator | |
| ADC_B_CONVERTER_MODE_SINGLE_SCAN | Single scan mode. |
| ADC_B_CONVERTER_MODE_CONTINUOUS_SCAN | Continuous scan mode. |
| ADC_B_CONVERTER_MODE_BACKGROUND_SCAN | Background continuous scan mode (Valid for Hybrid mode only) |

### ◆ adc_b_conversion_method_t

| enum adc_b_conversion_method_t | |
|---|---|
| ADC_B Conversion Method | |
| Enumerator | |
| ADC_B_CONVERSION_METHOD_SAR | SAR conversion method. |
| ADC_B_CONVERSION_METHOD_OVERSAMPLE | Oversampling conversion method. |
| ADC_B_CONVERSION_METHOD_HYBRID | Hybrid conversion method. |

### ◆ adc_b_data_format_t

| enum adc_b_data_format_t | |
|---|---|
| ADC_B data data format definitions | |
| Enumerator | |
| ADC_B_DATA_FORMAT_16_BIT | 16 bit adc_b data format |
| ADC_B_DATA_FORMAT_14_BIT | 14 bit adc_b data format |
| ADC_B_DATA_FORMAT_12_BIT | 12 bit adc_b data format |
| ADC_B_DATA_FORMAT_10_BIT | 10 bit adc_b data format |

### ◆ adc_b_limit_clip_table_id_t

| enum adc_b_limit_clip_table_id_t | |
|---|---|
| ADC limiter clipping table id selection options | |
| Enumerator | |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_NONE | Limiter Clip Disabled. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_0 | Limiter Clip Table 0. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_1 | Limiter Clip Table 1. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_2 | Limiter Clip Table 2. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_3 | Limiter Clip Table 3. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_4 | Limiter Clip Table 4. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_5 | Limiter Clip Table 5. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_6 | Limiter Clip Table 6. |
| ADC_B_LIMIT_CLIP_TABLE_SELECTION_7 | Limiter Clip Table 7. |

### ◆ adc_b_unit_id_t

| enum adc_b_unit_id_t | |
|---|---|
| ADC unit selection options | |
| Enumerator | |
| ADC_B_UNIT_ID_0 | ADC Unit ID 0. |
| ADC_B_UNIT_ID_1 | ADC Unit ID 1. |

### ◆ adc_b_unit_mask_t

| enum adc_b_unit_mask_t | |
|---|---|
| ADC unit selection options | |
| Enumerator | |
| ADC_B_UNIT_MASK_0 | ADC Unit Mask 0. |
| ADC_B_UNIT_MASK_1 | ADC Unit Mask 1. |
| ADC_B_UNIT_MASK_UNDEFINED | ADC Unit Mask Unknown. |

### ◆ adc_b_add_avg_mode_t

| enum adc_b_add_avg_mode_t | |
|---|---|
| ADC data sample addition and averaging options | |
| Enumerator | |
| ADC_B_ADD_AVERAGE_OFF | Add/Average turned off for channels/sensors. |
| ADC_B_ADD_AVERAGE_ADDITION_ENABLE | Addition Mode Enabled. |
| ADC_B_ADD_AVERAGE_AVERAGE_ENABLE | Average Mode Enabled. |

### ◆ adc_b_add_avg_count_t

| enum adc_b_add_avg_count_t | |
|---|---|
| ADC data sample addition and averaging options | |
| Enumerator | |
| ADC_B_ADD_AVERAGE_1 | Addition turned off for channels/sensors. |
| ADC_B_ADD_AVERAGE_2 | Add/Average 2 samples. |
| ADC_B_ADD_AVERAGE_4 | Add/Average 4 samples. |
| ADC_B_ADD_AVERAGE_8 | Add/Average 8 samples. |
| ADC_B_ADD_AVERAGE_16 | Add/Average 16 samples. |
| ADC_B_ADD_AVERAGE_32 | Add/Average 32 samples. |
| ADC_B_ADD_AVERAGE_64 | Add/Average 64 samples. |
| ADC_B_ADD_AVERAGE_128 | Add/Average 128 samples. |
| ADC_B_ADD_AVERAGE_256 | Add/Average 256 samples. |
| ADC_B_ADD_AVERAGE_512 | Add/Average 512 samples. |
| ADC_B_ADD_AVERAGE_1024 | Add/Average 1024 samples. |

### ◆ adc_b_gpt_trigger_t

| enum adc_b_gpt_trigger_t | |
|---|---|
| ADC GPT Trigger options | |
| Enumerator | |
| ADC_B_GPT_TRIGGER_NONE | GPT Trigger Disabled. |
| ADC_B_GPT_TRIGGER_A0 | GPT Trigger A0. |
| ADC_B_GPT_TRIGGER_A1 | GPT Trigger A1. |
| ADC_B_GPT_TRIGGER_A2 | GPT Trigger A2. |
| ADC_B_GPT_TRIGGER_A3 | GPT Trigger A3. |
| ADC_B_GPT_TRIGGER_A4 | GPT Trigger A4. |

| | |
|---|---|
| ADC_B_GPT_TRIGGER_A5 | GPT Trigger A5. |
| ADC_B_GPT_TRIGGER_A6 | GPT Trigger A6. |
| ADC_B_GPT_TRIGGER_A7 | GPT Trigger A7. |
| ADC_B_GPT_TRIGGER_A8 | GPT Trigger A8. |
| ADC_B_GPT_TRIGGER_A9 | GPT Trigger A9. |
| ADC_B_GPT_TRIGGER_A10 | GPT Trigger A10. |
| ADC_B_GPT_TRIGGER_A11 | GPT Trigger A11. |
| ADC_B_GPT_TRIGGER_A12 | GPT Trigger A12. |
| ADC_B_GPT_TRIGGER_A13 | GPT Trigger A13. |
| ADC_B_GPT_TRIGGER_B0 | GPT Trigger B0. |
| ADC_B_GPT_TRIGGER_B1 | GPT Trigger B1. |
| ADC_B_GPT_TRIGGER_B2 | GPT Trigger B2. |
| ADC_B_GPT_TRIGGER_B3 | GPT Trigger B3. |
| ADC_B_GPT_TRIGGER_B4 | GPT Trigger B4. |
| ADC_B_GPT_TRIGGER_B5 | GPT Trigger B5. |
| ADC_B_GPT_TRIGGER_B6 | GPT Trigger B6. |
| ADC_B_GPT_TRIGGER_B7 | GPT Trigger B7. |
| ADC_B_GPT_TRIGGER_B8 | GPT Trigger B8. |
| ADC_B_GPT_TRIGGER_B9 | GPT Trigger B9. |
| ADC_B_GPT_TRIGGER_B10 | GPT Trigger B10. |
| ADC_B_GPT_TRIGGER_B11 | GPT Trigger B11. |
| ADC_B_GPT_TRIGGER_B12 | GPT Trigger B12. |
| ADC_B_GPT_TRIGGER_B13 | GPT Trigger B13. |

### ◆ adc_b_external_trigger_t

| enum adc_b_external_trigger_t | |
|---|---|
| ADC External Trigger options | |
| Enumerator | |
| ADC_B_EXTERNAL_TRIGGER_NONE | External Trigger Disabled. |
| ADC_B_EXTERNAL_TRIGGER_ADTRG0 | External Trigger ADTRG0 Selection. |
| ADC_B_EXTERNAL_TRIGGER_ADTRG1 | External Trigger ADTRG1 Selection. |

### ◆ adc_b_self_diagnosis_mode_t

| enum adc_b_self_diagnosis_mode_t | |
|---|---|
| ADC Self-Diagnosis mode options | |
| Enumerator | |
| ADC_B_SELF_DIAGNOSIS_DISABLED | Self-Diagnosis Disabled. |
| ADC_B_SELF_DIAGNOSIS_MODE_1 | Self-Diagnosis Mode 1. |
| ADC_B_SELF_DIAGNOSIS_MODE_2 | Self-Diagnosis Mode 2. |
| ADC_B_SELF_DIAGNOSIS_MODE_3 | Self-Diagnosis Mode 3. |

### ◆ adc_b_sample_and_hold_mask_t

| enum adc_b_sample_and_hold_mask_t | |
|---|---|
| ADC Sample-and-Hold unit enable mask | |
| Enumerator | |
| ADC_B_SAMPLE_AND_HOLD_MASK_NONE | Sample-and-Hold Disabled. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_0 | Sample-and-Hold Unit 0. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_1 | Sample-and-Hold Unit 1. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_2 | Sample-and-Hold Unit 2. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_4 | Sample-and-Hold Unit 3. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_5 | Sample-and-Hold Unit 4. |
| ADC_B_SAMPLE_AND_HOLD_MASK_UNIT_6 | Sample-and-Hold Unit 5. |

### ◆ adc_b_pga_gain_t

| enum adc_b_pga_gain_t | |
|---|---|
| ADC PGA Gain | |
| Enumerator | |
| ADC_B_PGA_GAIN_DISABLED | PGA Gain Disabled. |
| ADC_B_PGA_GAIN_DIFFERENTIAL_1_500 | PGA Gain Setting 1.500. |
| ADC_B_PGA_GAIN_DIFFERENTIAL_2_333 | PGA Gain Setting 2.333. |
| ADC_B_PGA_GAIN_DIFFERENTIAL_4_000 | PGA Gain Setting 4.000. |
| ADC_B_PGA_GAIN_DIFFERENTIAL_5_667 | PGA Gain Setting 5.667. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_2_500 | PGA Gain Setting 2.500. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_2_667 | PGA Gain Setting 2.667. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_2_857 | PGA Gain Setting 2.857. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_3_077 | PGA Gain Setting 3.077. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_3_333 | PGA Gain Setting 3.333. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_3_636 | PGA Gain Setting 3.636. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_4_000 | PGA Gain Setting 4.000. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_4_444 | PGA Gain Setting 4.444. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_5_000 | PGA Gain Setting 5.000. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_5_714 | PGA Gain Setting 5.714. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_6_667 | PGA Gain Setting 6.667. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_8_000 | PGA Gain Setting 8.000. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_10_000 | PGA Gain Setting 10.000. |
| ADC_B_PGA_GAIN_SINGLE_ENDED_13_333 | PGA Gain Setting 13.333. |

### ◆ adc_b_digital_filter_selection_t

| enum adc_b_digital_filter_selection_t | |
|---|---|
| ADC Digital Filter Selection | |
| Enumerator | |
| ADC_B_DIGITAL_FILTER_MODE_SINC3 | Digital filter Sinc3 filter (Oversampling Rate = 8) |
| ADC_B_DIGITAL_FILTER_MODE_PHASE | Digital filter Minimum phase filter (Group delay < 2) |

### ◆ adc_b_sampling_state_table_id_t

| enum adc_b_sampling_state_table_id_t | |
|---|---|
| ADC Sampling State table selection options | |
| Enumerator | |
| ADC_B_SAMPLING_STATE_TABLE_0 | Sampling State Table 0. |
| ADC_B_SAMPLING_STATE_TABLE_1 | Sampling State Table 1. |
| ADC_B_SAMPLING_STATE_TABLE_2 | Sampling State Table 2. |
| ADC_B_SAMPLING_STATE_TABLE_3 | Sampling State Table 3. |
| ADC_B_SAMPLING_STATE_TABLE_4 | Sampling State Table 4. |
| ADC_B_SAMPLING_STATE_TABLE_5 | Sampling State Table 5. |
| ADC_B_SAMPLING_STATE_TABLE_6 | Sampling State Table 6. |

## Function Documentation

### ◆ R_ADC_B_Open()

fsp_err_t R_ADC_B_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If provided, the function registers a callback function pointer for notifying the user whenever a scan has completed, error has occurred, FIFO read request is generated, or other ADC interrupt event occurrs. Implements adc_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |

### ◆ R_ADC_B_ScanCfg()

fsp_err_t R_ADC_B_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_scan_cfg* )

Configures the ADC_B scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_b_scan_cfg_t to p_channel_cfg. Implements adc_api_t::scanCfg.

***Note***

*This starts group B scans if adc_b_scan_cfg_t::priority_group_a is set to ADC_B_GROUP_A_GROUP_B_CONTINUOUS_SCAN.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_INVALID_STATE | Invalid Scan Configuration. |
| FSP_ERR_INVALID_CHANNEL | Invalid configured channel for group converter id. |

### ◆ R_ADC_B_CallbackSet()

fsp_err_t R_ADC_B_CallbackSet ( adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void *const *p_context*, adc_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_ADC_B_ScanStart()

fsp_err_t R_ADC_B_ScanStart ( adc_ctrl_t * *p_ctrl*)

Enables the hardware trigger for a scan depending on how the triggers were configured in the R_ADC_B_ScanCfg call. If the unit was configured for ELC, GPT, or external hardware triggering, then this function allows the trigger signal to get to the ADC unit. The function is not able to control the generation of the trigger itself. If the unit was configured for software triggering, This function was added to this ADC version for compatibility with r_adc driver. For additional flexibility, it is recommended to use R_ADC_B_ScanGroupStart.

**Precondition**

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.
Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | No hardware triggers configured for groups. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_STATE | Calibration required. |

### ◆ R_ADC_B_ScanGroupStart()

fsp_err_t R_ADC_B_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_mask* )

Starts a software scan or enables the hardware trigger for a scan depending on how triggers were configured. If the group was configured for ELC, GPT, or external hardware triggering then this function allows the trigger signal to get to the ADC unit. The function itself is not able to control the generation of peripheral triggers. If the unit was configured for software triggering, then this function starts the software triggered scan.

***Note***

*Except for Group Priority Operation, if ADC0 or ADC1 are currently performing an A/D conversion operation, attempting to start another scan group that uses the same A/D converter will be ignored. This also applies to starting multiple groups at one time. When Group Priority Operation is not enabled, only the lowest numbered group will be started (for each ADC converter), other groups will be ignored.*

**Precondition**

Call R_ADC_B_ScanCfg after R_ADC_B_Open before starting a scan.
Call R_ADC_B_Calibrate and wait for calibration to complete before starting a scan.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware triggers enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | An invalid group has been provided. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_STATE | Calibration required. |

### ◆ R_ADC_B_ScanStop()

fsp_err_t R_ADC_B_ScanStop ( adc_ctrl_t * *p_ctrl*)

Disables the hardware trigger for a scan and immediately stops all active converters. This function will abortall active conversions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | All scans stopped. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_ARGUMENT | No hardware triggers configured for groups. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |

### ◆ R_ADC_B_StatusGet()

fsp_err_t R_ADC_B_StatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Provides the status of any scan process that was started, including scans started by ELC or external triggers and calibration scans on MCUs that support calibration.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_B_Read()

fsp_err_t R_ADC_B_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *channel_id*, uint16_t *const *p_data* )

Reads conversion results from a single channel or sensor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_INVALID_DATA | Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel provided. |

### ◆ R_ADC_B_Read32()

fsp_err_t R_ADC_B_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *channel_id*, uint32_t *const *p_data* )

Reads conversion results from a single channel or sensor register into a 32-bit result.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_INVALID_DATA | Accuracy of data cannot be guaranteed. ADC requires calibration or SAR timing settings are irregular. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel provided. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- adc_api_t::read

### ◆ R_ADC_B_FifoRead()

fsp_err_t R_ADC_B_FifoRead ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t const *group_mask*, adc_b_fifo_read_t *const *p_data* )

Reads conversion results from FIFO for the given group mask.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |
| FSP_ERR_INVALID_ARGUMENT | Invalid group provided. |
| FSP_ERR_UNDERFLOW | FIFO empty. |

### ◆ R_ADC_B_InfoGet()

fsp_err_t R_ADC_B_InfoGet ( adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info* )

Provides the temperature sensor slope and the calibration data for the sensor if available on this MCU. Otherwise, invalid calibration data of 0xFFFFFFFF will be returned.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Info is read into p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit not initialized. |

### ◆ R_ADC_B_Close()

fsp_err_t R_ADC_B_Close ( adc_ctrl_t * *p_ctrl*)

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_B_Calibrate()

fsp_err_t R_ADC_B_Calibrate ( adc_ctrl_t *const *p_ctrl*, void const * *p_extend* )

Initiates calibration of the ADC_B. This function must be called before starting a scan and again whenever ADC_B configuration or state is changed.

***Note***

*Self-calibration is a non-blocking operation. The application must wait for calibration to complete before using other ADC_B functionality.*
*The self-calibration process will disable hardware triggers that were previously enabled.*

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to the instance control structure |
| [in] | p_extend | Unused argument. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Calibration successfully initiated. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_ADC_B_OffsetSet()

fsp_err_t R_ADC_B_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset* )

adc_api_t::offsetSet is not supported on the ADC_B.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### Detailed Description

Driver for ADC_D version of the ADC12 peripheral on RA MCUs. This module implements the ADC Interface.

# Overview

### Features

The ADC module supports the following features:

- 8-, 10-, or 12-bit maximum resolution depending on the MCU
- Configure scans to include:
  - Single channel or Scan channels
  - Temperature sensor channel
  - Voltage sensor channel
  - CTSU TSCAP voltage channel (Not available on all MCUs)
- Configurable scan start trigger:
  - Software scan triggers with no-wait mode or wait mode

    - Hardware scan triggers with no-wait mode or wait mode (timer expiration, for example)
- Configurable scan mode:
    - One-shot scan mode, where each trigger starts a single scan
    - Sequential scan mode, where all channels are scanned continuously
- Optional callback when scan completes
    - Generated an interrupt request when ADLL <= ADCRn <= ADUL
    - Generated an interrupt request when ADUL < ADCRn or ADLL > ADCRn
- Test mode support
    - Checking whether the ADC_D converter is operating normally

# Configuration

### Build Time Configurations for r_adc_d

The following build time configurations are defined in fsp_cfg/r_adc_d_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Internal Reference Voltage Support | • Enabled<br>• Disabled | Disabled | Enable Internal Reference Voltage support for the ADC module. |
| Snooze Mode Support | • Enabled<br>• Disabled | Disabled | Enable Snooze Mode Support. |
| Interrupt Support | • Enabled<br>• Disabled | Enabled | Enable Scan End Interrupt support for the ADC module. |

### Configurations for Analog > ADC (r_adc_d)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_adc_d).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_adc0 | Module name |
| Resolution | • 12-Bit<br>• 10-Bit<br>• 8-Bit | 12-Bit | Specifies the conversion resolution for this unit. |
| Conversion operation | • One-shot<br>• Sequential | One-shot | Specifies the conversion operation mode. |
| Operation trigger | • Wait<br>• No-wait | Wait | Specifies the operation trigger mode. |

| | | | |
|---|---|---|---|
| Operation voltage | • Normal 1<br>• Normal 2<br>• Low voltage 1<br>• Low voltage 2 | Normal 1 | Specifies operation voltage mode. |
| Conversion Clock (fAD) | • PCLK<br>• PCLK/2<br>• PCLK/4<br>• PCLK/8<br>• PCLK/16<br>• PCLK/32 | PCLK | Specifies divider for conversion clock (fAD). |
| Input | | | |
| Channel Selection Mode | • Select<br>• Scan | Select | Specifies the channel selection mode. |
| A/D Input channel | MCU Specific Options | | Specifies the input channels. |
| Negative Side Reference Voltage | • VSS<br>• VREFL0 | VSS | Selection of the Negative Side Reference Voltage. |
| Positive Side Reference Voltage | • VCC<br>• VREFH0<br>• Internal Reference Voltage | VCC | Selection of the Positive Side Reference Voltage. |
| Interrupts | | | |
| Interrupts > Conversion Result upper/lower bound value setting | | | |
| Generates an interrupt request (INTAD) | • The interrupt signal is output when the ADLL register <= the ADCRn register <= the ADUL register<br>• The interrupt signal is output when the ADCRn register < the ADLL register or the ADUL register < the ADCRn register | The interrupt signal is output when the ADLL register <= the ADCRn register <= the ADUL register | Specify condition generates an interrupt(INTAD) after each time the ADC scan completes. |
| Upper bound (ADUL) value | Must be a valid integer | 255 | Specify the upper limit conversion value that corresponds to the condition to generate an interrupt request (INTAD). |
| Lower bound (ADLL) | Must be a valid integer | 0 | Specify the lower limit |

| | | | |
|---|---|---|---|
| value | | | conversion value that corresponds to the condition to generate an interrupt request (INTAD). |
| Callback | Name must be a valid C symbol | NULL | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the ADC scan completes. |
| Scan End Interrupt Priority | MCU Specific Options | | Select scan end interrupt priority. |
| Start trigger source | MCU Specific Options | | Specifies the trigger type to be used for this unit. |

### Clock Configuration

The ADC_D conversion clock source may be configured to use ICLK with a selectable division ratio.

The ADC_D clock must be at least 1 MHz when the ADC is used.

### Pin Configuration

The ANxxx pins are analog input channels that can be used with the ADC_D.

## Usage Notes

### ADC_D Operational Conversion

The driver supports two operation conversion mode: One-shot scan and Sequential scan modes. For each time conversion, ADC peripheral only converts for each a pin or group of pins depending on channels selection mode, it can be changed to another pin or group of other pins by calling R_ADC_D_ScanCfg().

### Oneshot-scan Mode

In One-shot scan mode, one or group specified channels are scanned once per trigger.

### Sequential-scan Mode

In Sequential scan mode, a single trigger is required to start the scan. Scans continue until R_ADC_D_ScanStop() is called.

### When Interrupt Is Not Enabled

If interrupts are not enabled, the R_ADC_D_StatusGet API can be used to poll the ADC to determine when the scan has completed. The read API function is used to access the converted ADC result.

### When Interrupt Is Enabled

An interrupt is generated depend on setting condition of converted ADC result is in range or out of range of Upper Bound Value (ADUL) and Low Bound Value (ADLL). Refer to hardware manual: ADC12 > Registers to Control the A/D Converte > Figure "ADRCK Bit Interrupt Signal Generation Range".

### Selecting Reference Voltage

The ADC_D positive and negative side reference voltages may be configured for selected MCU's. Please refer to the RA Configuration editor in e2 studio for further details.

*Note*

*When the internal reference voltage is selected as the positive side reference voltage. Please refer condition as below*

- *Select operation voltage is low-voltage mode 1 or 2.*
- *The conversion clock (fAD) must be range 1 to 2 MHZ.*
- *Do not setting select internal reference voltage or temperature sensor channel as an A/D conversion channel.*

### Selecting Internal Reference Voltage or Temperature Sensor channel

When the internal reference voltage or temperature sensor output voltage is selected as the target for A/D conversion, please setting operation voltage is normal mode 2 or low-voltage mode 2.

*Note*

*when using operation voltage is low-voltage mode 2, setting a conversion clock (fAD) is less than or equal 16 MHz.*

### Selecting Conversion Clock

Range for frequency of Conversion Clock (fAD) depends on frequency of ICK. Please refer table as below.

| Frequency of ICLK | Frequency of Conversion Clock (fAD) |
|---|---|
| 4 MHz < ICLK <= 32 MHz | ICLK to ICLK/32 |
| 1 MHz <= fCLK <= 4 MHz | ICLK to ICLK/4 |

### Selecting Operation Voltage

The operation voltage is selectable depending on the analog input channel, VREFH0 voltage, operation mode, and ICLK. For detail, refer to hardware manual: ADC12 > Registers to Control the A/D Converter > tables "A/D conversion time in Normal mode 1 and 2" and "A/D conversion time in Low voltage mode 1 and 2".

*Note*

*When operation voltage is low-voltage modes 1 or 2, setting frequency of conversion clock (fAD) should be used with a frequency less than or equal 24 MHz. See in hardware manual: Electrical Characteristics > Analog Characteristics > table "A/D conversion characteristics in Low-voltage modes 1 and 2".*

### ADC_D conversion in Test Mode

The conversion target for testing can be selected by using the **Input > A/D Input channel** property in the module configuration.

*Note*

*For more details on the method of checking, refer to hardware manual: ADC12 > Testing of the A/D .*

### Using the Temperature Sensor with the ADC_D

The ADC_D HAL module supports reading the data from the on-chip temperature sensor. The value returned from the sensor can be converted into degrees Celsius or Fahrenheit in the application program using the following formula, T = (Vs - V1)/slope + T1, where:

- T: Measured temperature (degrees C)
- Vs: Voltage output by the temperature sensor at the time of temperature measurement (Volts)
- T1: Temperature experimentally measured at one point (degrees C)
- V1: Voltage output by the temperature sensor at the time of measurement of T1 (Volts)
- T2: Temperature at the experimental measurement of another point (degrees C)
- V2: Voltage output by the temperature sensor at the time of measurement of T2 (Volts)
- Slope: Temperature gradient of the temperature sensor (V/degrees C); slope = (V2 - V1)/(T2 - T1)

*Note*

*The slope value can be obtained for each in the Electrical Characteristics Chapter - TSN Characteristics Table, Temperature slope entry.*

For the setting flow, see in hardware manual: ADC12 > Example of Using the ADC12 when Selecting the Temperature Sensor Output Voltage or Internal Reference Voltage, and Software Trigger No-wait Mode and One-shot Conversion Mode.

# Examples

### Basic Example

This is a basic example of minimal use of the ADC_D in an application.

```
/* A channel configuration is generated by the RA Configuration editor based on the
options selected. If additional
 * configurations are desired additional adc_d_channel_cfg_t elements can be defined
and passed to R_ADC_D_ScanCfg. */
adc_d_channel_cfg_t g_adc_d0_channel_cfg =
{
    .channel_input = ADC_CHANNEL_1,
};
void adc_d_callback (adc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
}
void adc_d_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
```

```
 /* Initializes the module. */
    err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable channels. */
    err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_ADC_D_ScanStart(). In other
modes, enable hardware
  * triggers by calling R_ADC_D_ScanStart(). */
    (void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
    }
 /* Read converted data. */
    uint16_t channel1_conversion_result;
    err = R_ADC_D_Read(&g_adc_d0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
    assert(FSP_SUCCESS == err);
}
```

### Temperature Sensor Example

This example shows how to calculate the MCU temperature using the ADC_D and the temperature sensor.

```
#define ADC_D_EXAMPLE_TEMPERATURE_VOLTAGE_V1 (1050000)
#define ADC_D_EXAMPLE_VCC_MICROVOLT (3300000)
#define ADC_D_EXAMPLE_TEMPERATURE_RESOLUTION (4096)
#define ADC_D_EXAMPLE_ADC_TEST_TEMPERATURE_CELSIUS_T1 (25)
#define ADC_PRV_COEFFICIENT (0.5)
void adc_d_temperature_example (void)
```

```
{
 /* The following example calculates the temperature using the data provided.
  * See in hardware manual: Temperature Sensor (TSN) > Preparation for Using the
Temperature Sensor */
 fsp_err_t err = FSP_SUCCESS;
 /* Using normal mode 2 when configure temperature channel */
    g_adc_d0_cfg_extend.operation_voltage = ADC_D_VOLTAGE_MODE_NORMAL_2;
    g_adc_d0_cfg_extend.operation_trigger = ADC_D_TRIGGER_MODE_NO_WAIT;
 /* Initializes the module. */
    err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Configure temperature channel */
    g_adc_d0_channel_cfg.channel_input = ADC_CHANNEL_TEMPERATURE;
 /* Enable temperature sensor. */
    err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Start of A/D conversion */
    (void) R_ADC_D_ScanStart(&g_adc_d0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_SCAN_IN_PROGRESS;
 while (ADC_STATE_SCAN_IN_PROGRESS == status.state)
    {
       (void) R_ADC_D_StatusGet(&g_adc_d0_ctrl, &status);
    }

### Requesting Snooze mode using ADC_D Hardware Trigger

ADC_D can request snooze mode via a hardware trigger and perform an ADC conversion in the following modes:

- Hardware trigger wait mode (select mode, one-shot conversion mode)
- Hardware trigger wait mode (scan mode, one-shot conversion mode)

In order to enable this functionality, the application must call R_ADC_D_SnoozeModePrepare() immediately before entering software standby mode, and call R_ADC_D_SnoozeModeExit() immediately after returning from software standby mode.

```
void adc_d_snooze_request_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Configure ADC_D with the following settings:
  * - adc_d_extended_cfg_t::trigger_source = [ADC_D_TRIGGER_SOURCE_TAU0_TMI01,
```

```
  * ADC_D_TRIGGER_SOURCE_RTC_ALARM_OR_PERIOD,
  * ADC_D_TRIGGER_SOURCE_TML0_ITL0,
  * ADC_D_TRIGGER_SOURCE_ELC] (Hardware trigger)
  * - adc_d_extended_cfg_t::operation_trigger = ADC_D_TRIGGER_MODE_WAIT (Wait mode)
  * - adc_d_extended_cfg_t::conversion_operation = ADC_D_CONVERSION_MODE_ONESHOT (One
shot conversion mode)
  * - ICLK must be operating off of HOCO or MOCO
  */
    err = R_ADC_D_Open(&g_adc_d0_ctrl, &g_adc_d0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_ADC_D_ScanCfg(&g_adc_d0_ctrl, &g_adc_d0_channel_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure a hardware trigger for ADC_D (Ie. RTC Periodic IRQ). */
    err = R_RTC_C_Open(&g_rtc_ctrl, &g_rtc_cfg);
    assert(FSP_SUCCESS == err);

| Enumerator | |
| ADC_D_CLOCK_DIV_32 | ADC_D clock division ICLK/32. |
| ADC_D_CLOCK_DIV_16 | ADC_D clock division ICLK/16. |
| ADC_D_CLOCK_DIV_8 | ADC_D clock division ICLK/8. |
| ADC_D_CLOCK_DIV_4 | ADC_D clock division ICLK/4. |
| ADC_D_CLOCK_DIV_2 | ADC_D clock division ICLK/2. |
| ADC_D_CLOCK_DIV_1 | ADC_D clock division ICLK/1. |

### ◆ adc_d_trigger_source_t

| enum adc_d_trigger_source_t | |
|---|---|
| Selection trigger signal | |
| Enumerator | |
| ADC_D_TRIGGER_SOURCE_TAU0_TMI01 | Timer channel 01 count or capture end interrupt signal. |
| ADC_D_TRIGGER_SOURCE_RTC_ALARM_OR_PERIOD | Realtime clock interrupt signal. |
| ADC_D_TRIGGER_SOURCE_TML0_ITL0 | 32-bit interval timer interrupt signal |
| ADC_D_TRIGGER_SOURCE_ELC | Event input from ELC. |
| ADC_D_TRIGGER_SOURCE_SOFTWARE | Software trigger, this option is controlled by bit ADCS, ADCE. |

### ◆ adc_d_trigger_mode_t

| enum adc_d_trigger_mode_t | |
|---|---|
| Select trigger mode | |
| Enumerator | |
| ADC_D_TRIGGER_MODE_NO_WAIT | Trigger no-wait mode. |
| ADC_D_TRIGGER_MODE_WAIT | Trigger wait mode. |

### ◆ adc_d_conversion_mode_t

| enum adc_d_conversion_mode_t | |
|---|---|
| Select conversion operation mode | |
| Enumerator | |
| ADC_D_CONVERSION_MODE_SEQUENTIAL | Continuous conversion mode. |
| ADC_D_CONVERSION_MODE_ONESHOT | Single conversion mode. |

### ◆ adc_d_boundary_t

| enum adc_d_boundary_t | |
|---|---|
| Select the upper limit and lower limit conversion result values | |
| Enumerator | |
| ADC_D_BOUNDARY_IN_RANGE | The interrupt signal (INTAD) is output in range ADLL and AULL. |
| ADC_D_BOUNDARY_OUT_OF_RANGE | The interrupt signal (INTAD) is output out of range ADLL and AULL. |

### ◆ adc_d_negative_vref_t

| enum adc_d_negative_vref_t | |
|---|---|
| The negative side reference voltage selection | |
| Enumerator | |
| ADC_D_NEGATIVE_VREF_VSS | Supplied from VSS. |
| ADC_D_NEGATIVE_VREF_VREFL0 | Supplied from VREFL0. |

### ◆ adc_d_positive_vref_t

| enum adc_d_positive_vref_t | |
|---|---|
| The positive side reference voltage selection | |
| Enumerator | |
| ADC_D_POSITIVE_VREF_VCC | Supplied from VSS. |
| ADC_D_POSITIVE_VREF_VREFH0 | Supplied from VREFH0. |
| ADC_D_POSITIVE_VREF_IVREF | Supplied from the internal reference voltage. |

## Function Documentation

### ◆ R_ADC_D_Open()

fsp_err_t R_ADC_D_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Initialize the ADC_D peripheral. If interrupt is enabled, the function registers a callback function for notifying the user when a scan has completed. Implements adc_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |
| FSP_ERR_IRQ_BSP_DISABLED | A callback is provided, but the interrupt is not enabled. |
| FSP_ERR_INVALID_HW_CONDITION | Invalid configuration corresponds to condition HardWare UM. |

### ◆ R_ADC_D_ScanCfg()

fsp_err_t R_ADC_D_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_channel_cfg* )

Configures the ADC_D scan parameters. Channel specific settings are set in this function. Pass a pointer to adc_d_channel_cfg_t to p_channel_cfg.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel specific settings applied. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_INVALID_HW_CONDITION | Invalid configuration corresponds to condition HardWare UM. |
| FSP_ERR_INVALID_STATE | Invalid Scan Configuration. |
| FSP_ERR_INVALID_CHANNEL | Channel is invalid. |

### ◆ R_ADC_D_CallbackSet()

fsp_err_t R_ADC_D_CallbackSet ( adc_ctrl_t *const *p_api_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void *const *p_context*, adc_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements adc_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |

### ◆ R_ADC_D_ScanStart()

fsp_err_t R_ADC_D_ScanStart ( adc_ctrl_t * *p_ctrl*)

Starts a software trigger scan or enables the hardware trigger mode for a scan depending on how the triggers were configured in the R_ADC_D_Open call. If the unit was configured for ELC or interrupt hardware triggering, then this function allows the trigger signal to get to the ADC_D. The function is not able to control the generation of the trigger itself.

**Precondition**

Call R_ADC_D_ScanCfg after R_ADC_D_Open before starting a scan.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started (software trigger) or hardware trigger mode enabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |

### ◆ R_ADC_D_ScanGroupStart()

fsp_err_t R_ADC_D_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id* )

adc_api_t::scanStart is not supported on the ADC_D. Use scanStart instead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_ADC_D_ScanStop()

fsp_err_t R_ADC_D_ScanStop ( adc_ctrl_t * *p_ctrl*)

Disables the hardware trigger for a scan or select mode and immediately stops converters. This function will abort conversions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan stopped (software trigger) or hardware triggers disabled. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |

### ◆ R_ADC_D_StatusGet()

fsp_err_t R_ADC_D_StatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Provides the status of any scan process that was started, including scans started by ELC or interrupts triggers.

***Note***

*In Hardware no-wait mode, ADCS retains the value 1 after conversion end.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |

### ◆ R_ADC_D_Read()

fsp_err_t R_ADC_D_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data* )

Reads conversion results from a channel or sensor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |
| FSP_ERR_NOT_INITIALIZED | Unit is not initialized. |
| FSP_ERR_INVALID_MODE | Invalid configuration for channel_mode. |

### ◆ R_ADC_D_Read32()

fsp_err_t R_ADC_D_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data* )

Reads conversion results from a select/scan channel or sensor register into a 32-bit result.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read into provided p_data. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |
| FSP_ERR_INVALID_MODE | Invalid configuration for channel_mode. |

### ◆ R_ADC_D_InfoGet()

fsp_err_t R_ADC_D_InfoGet ( adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info* )

Get information of address ADCR to reading the data, determine the size of data that must be read, size data of each transfer, name of the ELC event for the peripheral, name of the peripheral in the ELC list

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_NOT_INITIALIZED | ADC_D is not initialized. |

### ◆ R_ADC_D_Close()

fsp_err_t R_ADC_D_Close ( adc_ctrl_t * *p_ctrl*)

This function ends any scan or select mode in progress, disables interrupts, and removes power to the A/D peripheral.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |

### ◆ R_ADC_D_Calibrate()

fsp_err_t R_ADC_D_Calibrate ( adc_ctrl_t *const *p_ctrl*, void const * *p_extend* )

adc_api_t::calibrate is not supported on the ADC_D.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_ADC_D_OffsetSet()

fsp_err_t R_ADC_D_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t *offset* )

adc_api_t::offsetSet is not supported on the ADC_D.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_ADC_D_SnoozeModePrepare()

fsp_err_t R_ADC_D_SnoozeModePrepare ( adc_ctrl_t *const *p_ctrl*)

Prepare ADC_D to enter snooze mode via a hardware trigger. This function must be called immediately before entering software standby mode in order to allow the configured hardware trigger to transition the MCU from software standby mode to snooze mode and perform an ADC conversion.

Supported modes for requesting snooze mode via hardware trigger:

- channel_mode = ADC_D_CHANNEL_MODE_SELECT, conversion_operation = ADC_D_CONVERSION_MODE_ONESHOT
- channel_mode = ADC_D_CHANNEL_MODE_SCAN, conversion_operation = ADC_D_CONVERSION_MODE_ONESHOT

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to the ADC control block |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ADC is configured to request Snooze mode. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | ADC_D is not open. |
| FSP_ERR_INVALID_MODE | ADC is in an invalid mode for requesting Snooze mode. |

### ◆ R_ADC_D_SnoozeModeExit()

| fsp_err_t R_ADC_D_SnoozeModeExit ( adc_ctrl_t *const *p_ctrl*) |
|---|
| After exiting snooze mode, if the ADC_D module was in snooze mode, then this function must be called in order to restore ADC operation to normal mode. |

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to the ADC control block |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ADC is configured to request Snooze mode. |
| FSP_ERR_INVALID_MODE | ADC is in an invalid mode for requesting Snooze mode. |

## 5.2.1.4 Comparator, High-Speed (r_acmphs)

Modules » Analog

### Functions

| | |
|---|---|
| fsp_err_t | R_ACMPHS_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg) |
| fsp_err_t | R_ACMPHS_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info) |
| fsp_err_t | R_ACMPHS_OutputEnable (comparator_ctrl_t *const p_ctrl) |
| fsp_err_t | R_ACMPHS_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status) |
| fsp_err_t | R_ACMPHS_Close (comparator_ctrl_t *p_ctrl) |

### Detailed Description

Driver for the ACMPHS peripheral on RA MCUs. This module implements the Comparator Interface.

# Overview

### Features

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOUT, CMPOUTn[1], or CMPOUT012[1] pin
- ELC event output

*Note*

*1. This output pin is not available on all MCUs.*

# Configuration

### Build Time Configurations for r_acmphs

The following build time configurations are defined in fsp_cfg/r_acmphs_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > Comparator, High-Speed (r_acmphs)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r_acmphs).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comparator0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the hardware channel. |
| Trigger Edge Selector | • Rising<br>• Falling<br>• Both Edge | Both Edge | The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL. |
| Noise Filter | • No Filter<br>• 8<br>• 16<br>• 32 | No Filter | Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update. |
| Maximum status retries (CMPMON) | Must be a valid non-negative integer between 2 and 32-bit maximum value | 1024 | Maximum number of status retries. |

| | | | |
|---|---|---|---|
| Output Polarity | • Not Inverted<br>• Inverted | Not Inverted | When enabled comparator output is inverted. This affects the output read from R_ACMPHS_StatusGet() , the pin output level, and the edge trigger. |
| Pin Output | • Disabled<br>• Enabled | Disabled | Turn this on to enable the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs. |
| Callback | Name must be a valid C symbol | NULL | Define this function in the application. It is called when the Trigger event occurs. |
| Comparator Interrupt Priority | MCU Specific Options | | Select the interrupt priority for the comparator interrupt. |
| Analog Input Voltage Source (IVCMP) | MCU Specific Options | | Select the Analog input voltage source. Channel mentioned in the options represents channel in ACMPHS |
| Reference Voltage Input Source (IVREF) | MCU Specific Options | | Select the Analog reference voltage source. Channel mentioned in the options represents channel in ACMPHS |

**Clock Configuration**

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

**Pin Configuration**

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The IVCMPn pins are used as comparator inputs. The IVREFn pins are used as comparator reference values.

# Usage Notes

### Noise Filter

When the noise filter is enabled, the ACMPHP0/ACMPHP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

### Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the R_ACMPHS_StatusGet() will return an inverted status.

### Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- When the noise filter is not enabled the hardware requires software debouncing of the output (two consecutive equal values). This is automatically managed in R_ACMPHS_StatusGet but may result in delay or an API error in rare edge cases.
- Constraints apply on the simultaneous use of ACMPHS analog input and ADC analog input. Refer to the "Usage Notes" section in your MCU's User's Manual for the ADC unit(s) for more details.
- To allow ACMPHS0 to cancel Software Standby mode or enter Snooze, set the CSTEN bit to 1 and the CDFS bits to 00 in the CMPCTL0 register.

## Examples

### Basic Example

The following is a basic example of using the ACMPHS to detect when the analog voltage input to IVCMP rises above the analog voltage input to IVREF. A GPIO output acts as the comparator input and is externally connected to the IVCMP input of the ACMPHS. An analog voltage input should also be supplied to the IVREF input pin.

```
#define ADC_PGA_BYPASS_VALUE (0x9999)
/* Connect this control pin to the IVCMP input of the comparator. This can be any
GPIO pin
 * that is not input only. */
#define ACMPHS_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_05_PIN_03)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmphs_example_callback (comparator_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmphs_example ()
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Disable pin register write protection, if enabled */
 R_BSP_PinAccessEnable();
 /*
  * Start with the IVCMP pin low. This example assumes the comparator is configured
to trigger
  * when the voltage of the analog input to IVCMP rises above voltage of the analog
input to
  * IVREF.
  */
    (void) R_BSP_PinWrite(ACMPHS_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
 /* Initialize the ACMPHS module */
    err = R_ACMPHS_Open(&g_comparator_ctrl, &g_comparator_cfg);
    assert(FSP_SUCCESS == err);
 /*
  * If an ADC PGA exists for the analog input pin, then the PGA must be manually

### Function Documentation

### ◆ R_ACMPHS_Open()

fsp_err_t R_ACMPHS_Open ( comparator_ctrl_t *const *p_ctrl*, comparator_cfg_t const *const *p_cfg* )

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL |
| FSP_ERR_INVALID_ARGUMENT | An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. |
| FSP_ERR_ALREADY_OPEN | The control block is already open or the hardware lock is taken. |

### ◆ R_ACMPHS_InfoGet()

fsp_err_t R_ACMPHS_InfoGet ( comparator_ctrl_t *const *p_ctrl*, comparator_info_t *const *p_info* )

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPHS_OutputEnable()

fsp_err_t R_ACMPHS_OutputEnable ( comparator_ctrl_t *const *p_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Comparator output is enabled. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPHS_StatusGet()

fsp_err_t R_ACMPHS_StatusGet ( comparator_ctrl_t *const *p_ctrl*, comparator_status_t *const *p_status* )

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operating status of the comparator is provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_TIMEOUT | The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts. |

### ◆ R_ACMPHS_Close()

fsp_err_t R_ACMPHS_Close ( comparator_ctrl_t * *p_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### 5.2.1.5 Comparator, High-Speed (r_acmphs_b)

Modules » Analog

**Functions**

| | |
|---|---|
| fsp_err_t | R_ACMPHS_B_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg) |
| fsp_err_t | R_ACMPHS_B_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info) |
| fsp_err_t | R_ACMPHS_B_OutputEnable (comparator_ctrl_t *const p_ctrl) |
| fsp_err_t | R_ACMPHS_B_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status) |
| fsp_err_t | R_ACMPHS_B_Close (comparator_ctrl_t *p_ctrl) |

**Detailed Description**

Driver for the ACMPHS_B peripheral on RA MCUs. This module implements the Comparator Interface.

# Overview

**Features**

The ACMPHS HAL module supports the following features:

- Callback on rising edge, falling edge or both
- Two independent comparators (Channel 0,Channel 1)
- Configurable debounce filter
- Optional output (VCOUT) for each comparator
- ELC event output for each comparator

# Configuration

**Build Time Configurations for r_acmphs_b**

The following build time configurations are defined in fsp_cfg/r_acmphs_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Analog > Comparator, High-Speed (r_acmphs_b)**

This module can be added to the Stacks tab via New Stack > Analog > Comparator, High-Speed (r_acmphs_b).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comparator0 | Module name. |
| Channel | MCU Specific Options | | Select the hardware channel. |
| Trigger Edge Selector | • Rising<br>• Falling<br>• Both Edge | Both Edge | The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL. |
| Noise Filter | • No sampling (bypass)<br>• Sampling at PCLKB<br>• Sampling at PCLKB/8 | No sampling (bypass) | Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update. |
| Output Polarity | • Not Inverted<br>• Inverted | Not Inverted | When enabled comparator output is inverted. This affects the output read from R_ACMPHS_B_StatusGet(), the pin output level, and the edge trigger. |
| Pin Output | • Disabled<br>• Enabled | Disabled | Turn this on to enable the CMPOUTn signal for this channel. The CMPOUTn signal for each channel is OR'd together and the result is output to VCOUT. More pin output options are available on select MCUs. |
| Callback | Name must be a valid C symbol | NULL | Define this function in the application. It is called when the Trigger event occurs. |
| Comparator Interrupt Priority | MCU Specific Options | | Select the interrupt priority for the comparator interrupt. |
| Analog Input Voltage Source | MCU Specific Options | | Select the Analog input voltage source. Channel mentioned in |

| | | |
|---|---|---|
| | | the options represents channel in ACMPHS_B |
| Reference Voltage Input Source | MCU Specific Options | Select the Analog reference voltage source. Channel mentioned in the options represents channel in ACMPHS_B |

### Clock Configuration

The ACMPHS peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

### Pin Configuration

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

## Usage Notes

### Noise Filter

When the noise filter is enabled for a channel, the comparison is evaluated three times before the output of the comparison in VCOUT or ELC event is affected. The sampling rate is driven by PCLKB. The sampling can be further slowed by adjusting the comparator_filter_t setting. NOTE: The R_ACMPLP_StatusGet reflects the comparison results before the effects of the noise filter.

### Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the R_ACMPHS_StatusGet() will return an inverted status.

### Limitations

Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.

## Examples

### Basic Example

The following is a basic example of minimal use of the ACMPHS_B. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMPHS_B.

```
/* Connect this control pin to the IVCMP input of the comparator. This can be any
GPIO pin
 * that is not input only. */
#define ACMPHS_B_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_01_PIN_00)
```

```
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmphs_b_example_callback (comparator_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmphs_b_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Disable pin register write protection, if enabled */
 R_BSP_PinAccessEnable();
 /*
  * Start with the IVCMP pin low. This example assumes the comparator is configured
to trigger
  * when the voltage of the analog input to IVCMP rises above voltage of the internal
Vref.
  */
    (void) R_BSP_PinWrite(ACMPHS_B_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
 /* Initialize the ACMPHS_B module */
    err = R_ACMPHS_B_Open(&g_comparator_ctrl, &g_comparator_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the minimum stabilization wait time before enabling output. */
 comparator_info_t info;
 R_ACMPHS_B_InfoGet(&g_comparator_ctrl, &info);
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
 /* Enable the comparator output */
    (void) R_ACMPHS_B_OutputEnable(&g_comparator_ctrl);
 /* Set the IVCMP pin high. */
    (void) R_BSP_PinWrite(ACMPHS_B_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
 while (0 == g_comparator_events)
    {
 /* Wait for interrupt. */
    }
```

```
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
   (void) R_ACMPHS_B_StatusGet(&g_comparator_ctrl, &status);
}
```

## Function Documentation

### ◆ R_ACMPHS_B_Open()

fsp_err_t R_ACMPHS_B_Open ( comparator_ctrl_t *const *p_ctrl*, comparator_cfg_t const *const *p_cfg* )

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL |
| FSP_ERR_INVALID_ARGUMENT | An argument is invalid. Filter of 16 (COMPARATOR_FILTER_16), filter of 32 (COMPARATOR_FILTER_32) are not supported in this implementation. |
| FSP_ERR_ALREADY_OPEN | The control block is already open or the hardware lock is taken. |
| FSP_ERR_IN_USE | The channel is already in use. |
| FSP_ERR_INVALID_CHANNEL | Selected channel does not exist. |
| FSP_ERR_UNSUPPORTED | Selected mode not supported by this API |

### ◆ R_ACMPHS_B_InfoGet()

fsp_err_t R_ACMPHS_B_InfoGet ( comparator_ctrl_t *const *p_ctrl*, comparator_info_t *const *p_info* )

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPHS_B_OutputEnable()

fsp_err_t R_ACMPHS_B_OutputEnable ( comparator_ctrl_t *const *p_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Comparator output is enabled. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPHS_B_StatusGet()

fsp_err_t R_ACMPHS_B_StatusGet ( comparator_ctrl_t *const *p_ctrl*, comparator_status_t *const *p_status* )

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operating status of the comparator is provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPHS_B_Close()

fsp_err_t R_ACMPHS_B_Close ( comparator_ctrl_t * *p_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

## 5.2.1.6 Comparator, Low-Power (r_acmplp)

Modules » Analog

### Functions

| | |
|---|---|
| fsp_err_t | R_ACMPLP_Open (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg) |
| fsp_err_t | R_ACMPLP_InfoGet (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info) |
| fsp_err_t | R_ACMPLP_OutputEnable (comparator_ctrl_t *const p_ctrl) |
| fsp_err_t | R_ACMPLP_StatusGet (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status) |
| fsp_err_t | R_ACMPLP_Close (comparator_ctrl_t *p_ctrl) |

### Detailed Description

Driver for the ACMPLP peripheral on RA MCUs. This module implements the Comparator Interface.

# Overview

### Features

The ACMPLP HAL module supports the following features:

- Normal mode or window mode
- Callback on rising edge, falling edge or both
- Configurable debounce filter
- Option for comparator output on VCOUT pin
- ELC event output

# Configuration

### Build Time Configurations for r_acmplp

The following build time configurations are defined in fsp_cfg/r_acmplp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Reference Voltage Selection for ACMPLP1 (Standard mode only) | • IVREF0<br>• IVREF1 | IVREF1 | ACMPLP1 may optionally be configured to use IVREF0 as a reference input instead of IVREF1. Note that if |

| | | | |
|---|---|---|---|
| | | | IVREF0 is selected, ACMPLP0 and ACMPLP1 must use the same setting for IVREF. |

### Configurations for Analog > Comparator, Low-Power (r_acmplp)

This module can be added to the Stacks tab via New Stack > Analog > Comparator, Low-Power (r_acmplp).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comparator0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the hardware channel. |
| Mode | • Standard<br>• Window | Standard | In standard mode, comparator output is high if VCMP > VREF. In window mode, comparator output is high if VCMP is outside the range of VREF0 to VREF1. |
| Trigger | • Rising<br>• Falling<br>• Both Edge | Both Edge | The trigger specifies when a comparator callback event should occur. Unused if the interrupt priority is disabled or the callback is NULL. |
| Filter | • No sampling (bypass)<br>• Sampling at PCLKB<br>• Sampling at PCLKB/8<br>• Sampling at PCLKB/32 | No sampling (bypass) | Select the PCLK divisor for the hardware digital debounce filter. Larger divisors provide a longer debounce and take longer for the output to update. |
| Output Polarity | • Not Inverted<br>• Inverted | Not Inverted | When enabled comparator output is inverted. This affects the output read from R_ACMPLP_StatusGet(), the pin output level, and the edge trigger. |
| Pin Output (VCOUT) | • Disabled<br>• Enabled | Disabled | Turn this on to include the output from this comparator on VCOUT. The comparator output on VCOUT is OR'd with |

| | | | |
|---|---|---|---|
| | | | output from all other ACMPHS and ACMPLP comparators. |
| Vref (Standard mode only) | • Enabled<br>• Disabled | Disabled | If reference voltage selection is enabled then internal reference voltage is used as comparator input |
| Callback | Name must be a valid C symbol | NULL | Define this function in the application. It is called when the Trigger event occurs. |
| Comparator Interrupt Priority | MCU Specific Options | | Select the interrupt priority for the comparator interrupt. |
| Analog Input Voltage Source (IVCMP) | MCU Specific Options | | Select the comparator input source. Only options for the configured channel are valid. |
| Reference Voltage Input Source (IVREF) | MCU Specific Options | | Select the comparator reference voltage source.<br><br>If channel 1 is seleected and the 'Reference Voltage Selection (ACMPLP1)' config option is set to IVREF0, select one of the Channel 0 options. In all other cases, only options for the configured channel are valid. |

**Clock Configuration**

The ACMPLP peripheral is clocked from PCLKB. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

**Pin Configuration**

Comparator output can be enabled or disabled on each channel individually. The VCOUT pin is a logical OR of all comparator outputs.

The CMPINn pins are used as comparator inputs. The CMPREFn pins are used as comparator reference values.

# Usage Notes

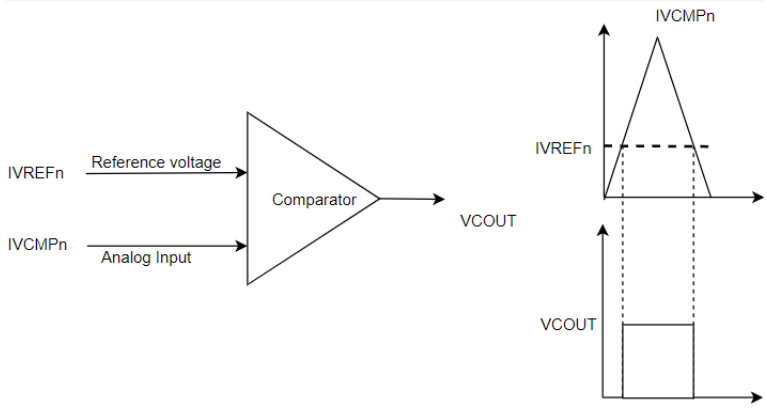

Figure 166: ACMPLP Standard Mode Operation

### Noise Filter

When the noise filter is enabled, the ACMPLP0/ACMPLP1 signal is sampled three times based on the sampling clock selected. The filter clock frequency is determined by PCLKB and the comparator_filter_t setting.

### Output Polarity

If output polarity is configured as "Inverted" then the VCOUT signal will be inverted and the R_ACMPLP_StatusGet() will return an inverted status.

### Window Mode

In window mode, the comparator indicates if the analog input voltage falls within the window (low and high reference voltage) or is outside the window.

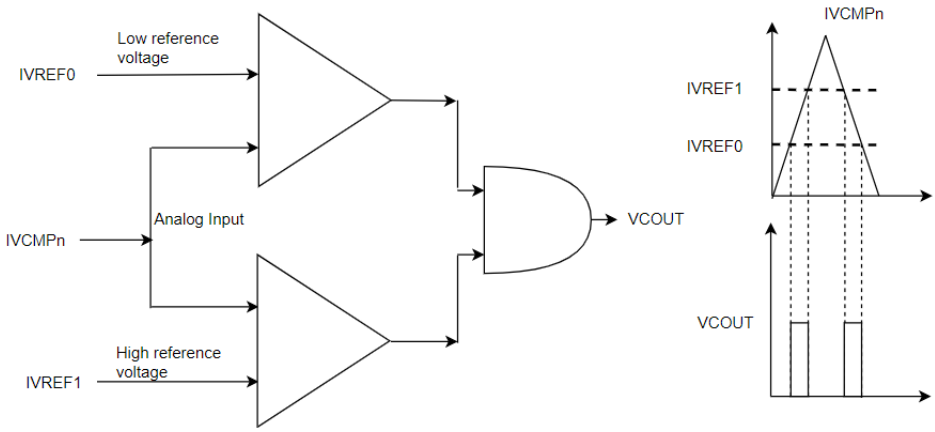

Figure 167: ACMPLP Window Mode Operation

### Limitations

- Once the analog comparator is configured, the program must wait for the stabilization time to elapse before using the comparator.
- Low speed is not supported by the ACMPLP driver.

# Examples

### Basic Example

The following is a basic example of minimal use of the ACMPLP. The comparator is configured to trigger a callback when the input rises above the internal reference voltage (VREF). A GPIO output acts as the comparator input and is externally connected to the CMPIN input of the ACMPLP.

```
/* Connect this control pin to the VCMP input of the comparator. This can be any GPIO
pin
 * that is not input only. */
#define ACMPLP_EXAMPLE_CONTROL_PIN (BSP_IO_PORT_04_PIN_08)
volatile uint32_t g_comparator_events = 0U;
/* This callback is called when a comparator event occurs. */
void acmplp_example_callback (comparator_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_comparator_events++;
}
void acmplp_example ()
{
 fsp_err_t err = FSP_SUCCESS;
 /* Disable pin register write protection, if enabled */
 R_BSP_PinAccessEnable();
 /* Start with the VCMP pin low. This example assumes the comparator is configured to
trigger
  * when VCMP rises above VREF. */
    (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_LOW);
 /* Initialize the ACMPLP module */
    err = R_ACMPLP_Open(&g_comparator_ctrl, &g_comparator_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the minimum stabilization wait time before enabling output. */
 comparator_info_t info;
 R_ACMPLP_InfoGet(&g_comparator_ctrl, &info);
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
 /* Enable the comparator output */
```

```
    (void) R_ACMPLP_OutputEnable(&g_comparator_ctrl);
/* Set VCMP low. */
    (void) R_BSP_PinWrite(ACMPLP_EXAMPLE_CONTROL_PIN, BSP_IO_LEVEL_HIGH);
while (0 == g_comparator_events)
    {
/* Wait for interrupt. */
    }
comparator_status_t status;
/* Check status of comparator, Status will be COMPARATOR_STATE_OUTPUT_HIGH */
    (void) R_ACMPLP_StatusGet(&g_comparator_ctrl, &status);
}
```

## Enumerations

| | |
|---|---|
| enum | acmplp_input_t |
| enum | acmplp_reference_t |

## Enumeration Type Documentation

### ◆ acmplp_input_t

| enum acmplp_input_t | |
|---|---|
| Enumerator | |
| ACMPLP_INPUT_AMPO | Not available on all MCUs. |
| ACMPLP_INPUT_CMPIN_1 | Not available on all MCUs. |

### ◆ acmplp_reference_t

| enum acmplp_reference_t | |
|---|---|
| Enumerator | |
| ACMPLP_REFERENCE_CMPREF_1 | Not available on all MCUs. |

## Function Documentation

### ◆ R_ACMPLP_Open()

fsp_err_t R_ACMPLP_Open ( comparator_ctrl_t *const *p_ctrl*, comparator_cfg_t const *const *p_cfg* )

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL |
| FSP_ERR_INVALID_ARGUMENT | An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation. p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. |
| FSP_ERR_ALREADY_OPEN | The control block is already open or the hardware lock is taken. |
| FSP_ERR_IN_USE | The channel is already in use. |

### ◆ R_ACMPLP_InfoGet()

fsp_err_t R_ACMPLP_InfoGet ( comparator_ctrl_t *const *p_ctrl*, comparator_info_t *const *p_info* )

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPLP_OutputEnable()

fsp_err_t R_ACMPLP_OutputEnable ( comparator_ctrl_t *const *p_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Comparator output is enabled. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPLP_StatusGet()

fsp_err_t R_ACMPLP_StatusGet ( comparator_ctrl_t *const *p_ctrl*, comparator_status_t *const *p_status* )

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operating status of the comparator is provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_ACMPLP_Close()

fsp_err_t R_ACMPLP_Close ( comparator_ctrl_t * *p_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

## 5.2.1.7 DAC (r_dac)

Modules » Analog

### Functions

| | |
|---|---|
| fsp_err_t | R_DAC_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg) |
| fsp_err_t | R_DAC_Write (dac_ctrl_t *p_api_ctrl, uint16_t value) |
| fsp_err_t | R_DAC_Start (dac_ctrl_t *p_api_ctrl) |
| fsp_err_t | R_DAC_Stop (dac_ctrl_t *p_api_ctrl) |
| fsp_err_t | R_DAC_Close (dac_ctrl_t *p_api_ctrl) |

### Detailed Description

Driver for the DAC12 peripheral on RA MCUs. This module implements the DAC Interface.

# Overview

### Features

The DAC module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers
- Supports output amplifiers on selected MCUs
- Supports charge pump on selected MCUs
- Supports synchronization with the Analog-to-Digital Converter (ADC) module

# Configuration

*Note*

*For MCUs supporting more than one channel, the following configuration options are shared by all the DAC channels:*

- *Synchronize with ADC*
- *Data Format*
- *Charge Pump*

### Build Time Configurations for r_dac

The following build time configurations are defined in fsp_cfg/r_dac_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > DAC (r_dac)

This module can be added to the Stacks tab via New Stack > Analog > DAC (r_dac). Non-secure

callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_dac0 | Module name. |
| Channel | Value must be an integer greater than or equal to 0 | 0 | Specify the hardware channel. |
| Synchronize with ADC | MCU Specific Options | | Enable DA/AD synchronization. |
| Data Format | • Right Justified<br>• Left Justified | Right Justified | Specify the DAC data format. |
| Output Amplifier | MCU Specific Options | | Enable the DAC output amplifier. |
| Charge Pump (Requires MOCO active) | MCU Specific Options | | Enable the DAC charge pump. |
| Internal Output | MCU Specific Options | | Enable DAC output to internal modules. |
| ELC Trigger Source | MCU Specific Options | | ELC event source that will trigger the DAC to start a conversion. |
| Reference Voltage | MCU Specific Options | | Select the DAC reference voltage. |

### Clock Configuration

The DAC peripheral module uses PCLKB as its clock source.

### Pin Configuration

The DAn pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

## Usage Notes

### Charge Pump

The charge pump must be enabled when using DAC pin output while operating at $AV_{CC}$ < 2.7V.

*Note*

*The MOCO must be running to use the charge pump.*
*If the DAC output is to be routed to an internal signal, do not enable the charge pump.*

### Output to Internal Modules

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACMPHS, ADC) without outputting the voltage to an external pin.

On some MCUs this functionality must be enabled during configuration using dac_extended_cfg_t::internal_output_enabled. When internal output is enabled, the DAC output will be routed to internal modules. If the DAC output amplifier is enabled or when internal output is disabled, the output will be routed to the DAC output pin (DAn).

### Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC conversion is started it will automatically be delayed until after the ADC conversion is complete.

### Limitations

- For MCUs supporting ADC unit 1:
  - Once synchronization between DAC and ADC unit 1 is turned on during R_DAC_Open synchronization cannot be turned off by the driver. In order to desynchronize DAC with ADC unit 1, manually clear DAADSCR.DAADST to 0 when the ADCSR.ADST bit is 0 and ADC unit 1 is halted.
  - The DAC module can only be synchronized with ADC unit 1.
  - For MCUs having more than 1 DAC channel, both channels are synchronized with ADC unit 1 if synchronization is enabled.

## Examples

### Basic Example

This is a basic example of minimal use of the R_DAC in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint16_t value;
 /* Pin configuration: Output enable DA0 as Analog. */
 /* Initialize the DAC channel */
    err = R_DAC_Open(&g_dac_ctrl, &g_dac_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint16_t) DAC_EXAMPLE_VALUE_ABC;
    err = R_DAC_Write(&g_dac_ctrl, value);
    assert(FSP_SUCCESS == err);
    err = R_DAC_Start(&g_dac_ctrl);
    assert(FSP_SUCCESS == err);
```

```
}
```

## Function Documentation

### ◆ R_DAC_Open()

fsp_err_t R_DAC_Open ( dac_ctrl_t * *p_api_ctrl*, dac_cfg_t const *const *p_cfg* )

Perform required initialization described in hardware manual. Implements dac_api_t::open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg<br>2. data_format value in p_cfg is out of range.<br>3. Extended configuration structure is set to NULL for MCU supporting charge pump. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel ID requested in p_cfg may not available on the devices. |
| FSP_ERR_ALREADY_OPEN | The control structure is already opened. |

### ◆ R_DAC_Write()

fsp_err_t R_DAC_Write ( dac_ctrl_t * *p_api_ctrl*, uint16_t *value* )

Write data to the D/A converter and enable the output if it has not been enabled.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_Start()

fsp_err_t R_DAC_Start ( dac_ctrl_t * *p_api_ctrl*)

Start the D/A conversion output if it has not been started.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is started successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_IN_USE | Attempt to re-start a channel. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_Stop()

fsp_err_t R_DAC_Stop ( dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion and disable the output signal.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The control is successfully stopped. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_Close()

| fsp_err_t R_DAC_Close ( dac_ctrl_t * *p_api_ctrl*) |
|---|
| Stop the D/A conversion, stop output, and close the DAC channel.<br><br>**Return values**<br>FSP_SUCCESS — The channel is successfully closed.<br>FSP_ERR_ASSERTION — p_api_ctrl is NULL.<br>FSP_ERR_NOT_OPEN — Channel associated with p_ctrl has not been opened. |

#### 5.2.1.8 DAC8 (r_dac8)

Modules » Analog

**Functions**

| | |
|---|---|
| fsp_err_t | R_DAC8_Open (dac_ctrl_t *const p_ctrl, dac_cfg_t const *const p_cfg) |
| fsp_err_t | R_DAC8_Write (dac_ctrl_t *const p_ctrl, uint16_t value) |
| fsp_err_t | R_DAC8_Start (dac_ctrl_t *const p_ctrl) |
| fsp_err_t | R_DAC8_Stop (dac_ctrl_t *const p_ctrl) |
| fsp_err_t | R_DAC8_Close (dac_ctrl_t *const p_ctrl) |

**Detailed Description**

Driver for the DAC8 peripheral on RA MCUs. This module implements the DAC Interface.

# Overview

### Features

The DAC8 module outputs one of 256 voltage levels between the positive and negative reference voltages. DAC8 on selected MCUs have below features

- Charge pump control
- Synchronization with the Analog-to-Digital Converter (ADC) module
- Multiple Operation Modes
  - Normal
  - Real-Time (Event Link)

# Configuration

*Note*

*For MCUs supporting more than one channel, the following configuration options are shared by all the DAC8 channels:*

- *Synchronize with ADC*
- *Charge Pump*

### Build Time Configurations for r_dac8

The following build time configurations are defined in fsp_cfg/r_dac8_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > DAC8 (r_dac8)

This module can be added to the Stacks tab via New Stack > Analog > DAC8 (r_dac8).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_dac8_0 | Module name. |
| Channel | Value must be an integer greater than or equal to 0 | 0 | Specify the hardware channel. |
| D/A A/D Synchronous Conversion | MCU Specific Options | | Synchronize the DAC8 update with the ADC to reduce interference with A/D conversions. |
| DAC Mode | MCU Specific Options | | Select the DAC operating mode |
| Real-time Trigger Event | MCU Specific Options | | Specify the event used to trigger conversion in Real-time mode. This setting is only valid when Real-time mode is enabled. |
| Charge Pump (Requires MOCO active) | MCU Specific Options | | Enable the DAC charge pump. |

### Clock Configuration

The DAC8 peripheral module uses the PCLKB as its clock source.

### Pin Configuration

The DA8_n pins are used as analog outputs. Each DAC8 channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply and reference pins for the DAC8.

# Usage Notes

### Charge Pump

The charge pump must be enabled when using DAC8 pin output while operating at $AV_{CC}$ < 2.7V.

*Note*

*The MOCO must be running to use the charge pump.*
*If DAC8 output is to be routed to an internal signal, do not enable the charge pump.*

### Synchronization with ADC

When ADC synchronization is enabled and an ADC conversion is in progress, if a DAC8 conversion is started it will automatically be delayed until after the ADC conversion is complete.

### Real-time Mode

When Real-time mode is selected, the DAC8 will perform a conversion each time the selected ELC event is received.

### Limitations

- Synchronization between DAC8 and ADC is activated when calling R_DAC8_Open. At this point synchronization cannot be deactivated by the driver. In order to desynchronize DAC8 with ADC, manually clear DACADSCR.DACADST to 0 while the ADCSR.ADST bit is 0 and the ADC is halted.
- For MCUs having more than 1 DAC8 channel, both channels are synchronized with ADC if synchronization is enabled.

# Examples

### Basic Example

This is a basic example of minimal use of the R_DAC8 in an application. This example shows how this driver can be used for basic 8 bit Digital to Analog Conversion operations.

```
dac8_instance_ctrl_t g_dac8_ctrl;
dac_cfg_t g_dac8_cfg =
{
    .channel            = 0U,
    .ad_da_synchronized = false,
    .p_extend          = &g_dac8_cfg_extend
};
void basic_example (void)
{
```

```
fsp_err_t err;
   uint16_t value;
/* Pin configuration example: Output enable DA8_0(RA2A1) as Analog. */
/* Initialize the DAC8 channel */
   err = R_DAC8_Open(&g_dac8_ctrl, &g_dac8_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
   value = (uint8_t) DAC8_EXAMPLE_VALUE_ABC;
/* Write value to DAC module */
   err = R_DAC8_Write(&g_dac8_ctrl, value);
   assert(FSP_SUCCESS == err);
/* Start DAC8 conversion */
   err = R_DAC8_Start(&g_dac8_ctrl);
   assert(FSP_SUCCESS == err);
}
```

## Data Structures

| | |
|---|---|
| struct | dac8_instance_ctrl_t |
| struct | dac8_extended_cfg_t |

## Enumerations

| | |
|---|---|
| enum | dac8_mode_t |

## Data Structure Documentation

### ◆ dac8_instance_ctrl_t

| struct dac8_instance_ctrl_t |
|---|
| DAC8 instance control block. DO NOT INITIALIZE. |

### ◆ dac8_extended_cfg_t

| struct dac8_extended_cfg_t | | |
|---|---|---|
| DAC8 extended configuration | | |
| Data Fields | | |
| bool | enable_charge_pump | Enable DAC charge pump. |

## Enumeration Type Documentation

### ◆ dac8_mode_t

| enum dac8_mode_t | |
|---|---|
| Enumerator | |
| DAC8_MODE_NORMAL | DAC Normal mode. |
| DAC8_MODE_REAL_TIME | DAC Real-time (event link) mode. |

## Function Documentation

### ◆ R_DAC8_Open()

fsp_err_t R_DAC8_Open ( dac_ctrl_t *const *p_ctrl*, dac_cfg_t const *const *p_cfg* )

Perform required initialization described in hardware manual.

Implements dac_api_t::open.

Configures a single DAC channel. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | One or both of the following parameters may be NULL: p_ctrl or p_cfg |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | An invalid channel was requested. |
| FSP_ERR_NOT_ENABLED | Setting DACADSCR is not enabled when ADCSR.ADST = 0. |

***Note***

*This function is reentrant for different channels. It is not reentrant for the same channel.*

### ◆ R_DAC8_Write()

fsp_err_t R_DAC8_Write ( dac_ctrl_t *const *p_ctrl*, uint16_t *value* )

Write data to the D/A converter.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |
| FSP_ERR_OVERFLOW | Data overflow when data value exceeds 8-bit limit. |

### ◆ R_DAC8_Start()

fsp_err_t R_DAC8_Start ( dac_ctrl_t *const *p_ctrl*)

Start the D/A conversion output.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is started successfully. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |
| FSP_ERR_IN_USE | Attempt to re-start a channel. |

### ◆ R_DAC8_Stop()

fsp_err_t R_DAC8_Stop ( dac_ctrl_t *const *p_ctrl*)

Stop the D/A conversion and disable the output signal.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The control is successfully stopped. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_instance_ctrl has not been opened. |

### ◆ R_DAC8_Close()

| fsp_err_t R_DAC8_Close ( dac_ctrl_t *const *p_ctrl*) |
|---|
| Stop the D/A conversion, stop output, and close the DAC channel.<br><br>**Return values**<br>FSP_SUCCESS — The channel is successfully closed.<br>FSP_ERR_ASSERTION — p_ctrl is NULL.<br>FSP_ERR_NOT_OPEN — Channel associated with p_instance_ctrl has not been opened. |

#### 5.2.1.9 DAC_B (r_dac_b)

Modules » Analog

**Functions**

| | |
|---|---|
| fsp_err_t | R_DAC_B_Open (dac_ctrl_t *p_api_ctrl, dac_cfg_t const *const p_cfg) |
| fsp_err_t | R_DAC_B_Write (dac_ctrl_t *p_api_ctrl, uint16_t value) |
| fsp_err_t | R_DAC_B_Start (dac_ctrl_t *p_api_ctrl) |
| fsp_err_t | R_DAC_B_Stop (dac_ctrl_t *p_api_ctrl) |
| fsp_err_t | R_DAC_B_Close (dac_ctrl_t *p_api_ctrl) |

**Detailed Description**

Driver for the DAC12 peripheral on RA MCUs. This module implements the DAC Interface.

# Overview

### Features

The DAC_B module outputs one of 4096 voltage levels between the positive and negative reference voltages.

- Supports setting left-justified or right-justified 12-bit value format for the 16-bit input data registers

### Build Time Configurations for r_dac_b

The following build time configurations are defined in fsp_cfg/r_dac_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Analog > DAC (r_dac_b)**

This module can be added to the Stacks tab via New Stack > Analog > DAC (r_dac_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_dac_b0 | Module name. |
| Channel | Value must be an integer greater than or equal to 0 | 0 | Specify the hardware channel. |
| DAC Operating Voltage Mode | • Normal voltage mode (VREFH >= 2.7v)<br>• Low voltage mode (VREFH < 2.7v) | Normal voltage mode (VREFH >= 2.7v) | Select VREFH voltage for optimization of DAC output. |
| Data Format | • Right Justified<br>• Left Justified | Right Justified | Specify the DAC data format. |
| Internal Output | MCU Specific Options | | Enable DAC output to internal modules. |
| ELC Trigger Source | MCU Specific Options | | ELC event source that will trigger the DAC to start a conversion. |

**Clock Configuration**

The DAC peripheral module uses PCLKB as its clock source.

**Pin Configuration**

The DAn pins are used as analog outputs. Each DAC channel has one output pin.

The AVCC0 and AVSS0 pins are power and ground supply pins for the DAC and ADC.

The VREFH and VREFL pins are top and ground voltage reference pins for the DAC and ADC.

# Usage Notes

**Output to Internal Modules**

The DAC output can be used as an analog input to other peripherals on the MCU (eg. ACMPHS, ADC) without outputting the voltage to an external pin.

This functionality must be enabled during configuration using dac_b_extended_cfg_t::internal_output_enabled. When internal output is enabled, the DAC output will be routed to internal modules. If the internal output is disabled, the output will be routed to the DAC output pin (DAn).

# Examples

### Basic Example

This is a basic example of minimal use of the R_DAC_B in an application. This example shows how this driver can be used for basic Digital to Analog Conversion operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint16_t value;
 /* Pin configuration: Output enable DA0 as Analog. */
 /* Initialize the DAC channel */
    err = R_DAC_B_Open(&g_dac_b_ctrl, &g_dac_b_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    value = (uint16_t) DAC_EXAMPLE_VALUE;
    err = R_DAC_B_Write(&g_dac_b_ctrl, value);
    assert(FSP_SUCCESS == err);
    err = R_DAC_B_Start(&g_dac_b_ctrl);
    assert(FSP_SUCCESS == err);
}
```

| DAC_B_VREFH_LOW | VREFH < 2.7v. |

## Function Documentation

### ◆ R_DAC_B_Open()

fsp_err_t R_DAC_B_Open ( dac_ctrl_t * *p_api_ctrl*, dac_cfg_t const *const *p_cfg* )

Perform required initialization described in hardware manual. Implements dac_api_t::open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel was successfully opened. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. One or both of the following parameters may be NULL: p_api_ctrl or p_cfg<br>2. data_format value in p_cfg is out of range.<br>3. Extended configuration structure is set to NULL |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel ID requested in p_cfg may not available on the devices. |
| FSP_ERR_ALREADY_OPEN | The control structure is already opened. |

### ◆ R_DAC_B_Write()

fsp_err_t R_DAC_B_Write ( dac_ctrl_t * *p_api_ctrl*, uint16_t *value* )

Write data to the D/A converter and enable the output if it has not been enabled.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data is successfully written to the D/A Converter. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_B_Start()

fsp_err_t R_DAC_B_Start ( dac_ctrl_t * *p_api_ctrl*)

Start the D/A conversion output if it has not been started.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is started successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_IN_USE | Attempt to re-start a channel. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_B_Stop()

fsp_err_t R_DAC_B_Stop ( dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion and disable the output signal.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The control is successfully stopped. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### ◆ R_DAC_B_Close()

fsp_err_t R_DAC_B_Close ( dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion, stop output, and close the DAC channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The channel is successfully closed. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Channel associated with p_ctrl has not been opened. |

### Detailed Description

Driver for the DSMIF peripheral on RA MCUs. This module implements the ADC Interface.

# Overview

The Delta-Sigma Modulator interface (DSMIF) functions similarly to a normal ADC, however, instead

of sampling an analog signal directly, DSMIF samples a PDM signal that is generated by an externally connected 1-bit Delta-Sigma Modulator.

dsmif-overview-light.drawio.svg
Figure 168: DSMIF Overview

Every instance of the DSMIF peripheral has 3 separate channels that can sample independent PDM signals. Each channel has a pair of sinc filters. One sinc filter is used for normal measurements, and the other sinc filter is used for detecting error conditions. The sinc filter configuration will determine the sample resolution, and the final sample rate for each channel. There are three primary configuration settings for the sinc filters:

- Sample Rate - The frequency that the PDM signal is sampled.
- Decimation Count - Number of samples that are removed between the integration stage and the differentiation stage of the sinc filter.
- Filter order - The filter order of the sinc filter: [1st, 2nd, 3rd] order.

**Features**

The DSMIF module supports the following features:

- Two independent units (3 channels per unit for a total of 6 channels)
- Configurable sinc filter ($1^{st}$, $2^{nd}$, $3^{rd}$ order)
- Configurable decimation count in the range (4,256)
- Support for master and slave modes
- Channel synchronization
- Trigger data capture via ELC events
- Trigger reset of decimation counter via ELC events
- Configurable error detection
  - Overcurrent error detection (Can trigger common error interrupt)
  - Overcurrent sum error detection (Can trigger common error interrupt)
  - Short-circuit detection (Can trigger common error interrupt)
  - Window notification error detection (Can trigger Port Output Enable for GPT (r_poeg))

# Configuration

**Build Time Configurations for r_dsmif**

The following build time configurations are defined in fsp_cfg/r_dsmif_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Error Detection Support | • Enabled<br>• Disabled | Enabled | If selected code for parameter checking is included in the build. |

### Configurations for Analog > DSMIF (r_dsmif)

This module can be added to the Stacks tab via New Stack > Analog > DSMIF (r_dsmif). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_dsmif0 | Module name |
| Clock Selection | • PCLKA<br>• DSMIFCLK<br>• GPTCLK | PCLKA | Select the DSMIF Core Clock. |

| Common Capture A Data Update Interrupt Priority (CDACUPD_COM) | MCU Specific Options | | The Common Capture A Interrupt occurs when a Capture A conversion is completed on all synchronized channels. |
| Common Capture B Data Update Interrupt Priority (CDBCUPD_COM) | MCU Specific Options | | The Common Capture B Interrupt occurs when a Capture B conversion is completed on all synchronized channels. |
| Error Interrupt Priority | MCU Specific Options | | The Error Interrupt occurs when a short-cicuit, overcurrent, overcurrent sum, or window notification error occurs on any channel. |

**Configurations for Analog > DSMIF Channel Configuration (r_dsmif)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_dsmif_channel0 | Module name |
| Clock | | | |
| Clock Direction | • Slave Mode<br>• Master Mode | Slave Mode | Select the conversion clock mode for the DSMIF channel. In master mode the clock is output from the DSMIF channel. In slave mode the clock is input to the DSMIF channel. |
| Clock Edge | • Negative Edge<br>• Positive Edge | Negative Edge | Select the sampling edge of DSMCLKn for |

| | | | |
|---|---|---|---|
| | | | this channel. |
| CKDIV Setting (Master Mode Only) | Must be an integer in the range [2,63]. | 2 | Set the A/D conversion clock division ratio. The clock division ratio is equal to 2 x (CKDIV + 1). This setting is only used in master mode. |
| DSMCLK Frequency (Slave Mode Only) | Must be an integer in the range [0,25000000]. | 25000000 | If slave mode is selected, then manually enter the DSMCLK frequency. This setting is used to calculate the settling time of the DSMIF sinc filters. |
| Filter | | | |
| Filter Order | • First Order<br>• Second Order<br>• Third Order | Third Order | Select 1st, 2nd, or 3rd order sinc filter for current data. |
| Decimation Count | Must be an integer in the range [4,256]. | 256 | Decimation ratio of the current data sinc filter. |
| Trigger | | | |
| Trigger > Filter Initialization | | | |
| Trigger | • No Trigger<br>• Trigger 0 (ELC_DSMIFm_CNT0)<br>• Trigger 1 (ELC_DSMIFm_CNT1)<br>• Trigger 2 (ELC_DSMIFm_CNT2) | No Trigger | Select filter initialization trigger. The filter initialization trigger resets the sinc filter's decimation clock via ELC event. |
| Edge | • Negative<br>• Positive | Positive | Select either a positive or negative edge for the filter initialization trigger. |
| Capture Trigger A | • No Trigger<br>• Trigger 0 (ELC_DSMIFm_CAP0)<br>• Trigger 1 (ELC_DSMIFm_CAP1)<br>• Trigger 2 (ELC_DSMIFm_CAP2)<br>• Trigger 3 (ELC_DSMIFm_CAP3)<br>• Trigger 4 (ELC_DSMIFm_CAP4)<br>• Trigger 5 (ELC_DSMIFm_CAP5) | No Trigger | Current capture trigger A selection. |
| Capture Trigger B | • No Trigger | No Trigger | Current capture trigger |

| | | | |
|---|---|---|---|
| | • Trigger 0 (ELC_DSMIFm_CAP0)<br>• Trigger 1 (ELC_DSMIFm_CAP1)<br>• Trigger 2 (ELC_DSMIFm_CAP2)<br>• Trigger 3 (ELC_DSMIFm_CAP3)<br>• Trigger 4 (ELC_DSMIFm_CAP4)<br>• Trigger 5 (ELC_DSMIFm_CAP5) | | B selection. |
| Error Detection | | | |
| Error Detection > Filter | | | |
| Filter Order | • First Order<br>• Second Order<br>• Third Order | Third Order | Select 1st, 2nd, or 3rd order sinc filter for overcurrent detection. |
| Decimation Count | Must be an integer in the range [4,256]. | 256 | Decimation ratio of the overcurrent detection filter. |
| Error Detection > Overcurrent Detection 0 | | | |
| Error Detection > Overcurrent Detection 0 > Upper Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 0 upper limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0xFFFF | Configure the overcurrent 0 upper limit. Valid settings are in the range [0,65535]. |
| Error Detection > Overcurrent Detection 0 > Lower Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 0 lower limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0 | Configure the overcurrent 0 lower limit. Valid settings are in the range [0,65535]. |
| Error Detection > Overcurrent Detection 1 | | | |
| Error Detection > Overcurrent Detection 1 > Upper Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 1 upper limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0xFFFF | Configure the overcurrent 1 upper limit. Valid settings are |

| | | | |
|---|---|---|---|
| | | | in the range [0,65535]. |
| Error Detection > Overcurrent Detection 1 > Lower Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 1 lower limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0 | Configure the overcurrent 1 lower limit. Valid settings are in the range [0,65535]. |
| Error Detection > Overcurrent Detection 2 | | | |
| Error Detection > Overcurrent Detection 2 > Upper Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 2 upper limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0xFFFF | Configure the overcurrent 2 upper limit. Valid settings are in the range [0,65535]. |
| Error Detection > Overcurrent Detection 2 > Lower Limit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent 2 lower limit. |
| Threshold | Must be an integer in the range [0,65535]. | 0 | Configure the overcurrent 2 lower limit. Valid settings are in the range [0,65535]. |
| Error Detection > Overcurrent Window Notifcation 0 | | | |
| Notification | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent window notification 0. |
| Mode | • Overcurrent Data < Lower Limit 0 or Upper Limit 0 < Overcurrent Data<br>• Lower Limit 0 <= Overcurrent Data <= Upper Limit 0 | Overcurrent Data < Lower Limit 0 or Upper Limit 0 < Overcurrent Data | Select overcurrent window notification 0 mode. |
| Error Detection > Overcurrent Window Notifcation 1 | | | |
| Notification | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent window notification 1. |
| Mode | • Overcurrent | Overcurrent Data < | Select overcurrent |

| | | | |
|---|---|---|---|
| | Data < Lower Limit 1 or Upper Limit 1 < Overcurrent Data<br>• Lower Limit 1 <= Overcurrent Data <= Upper Limit 1 | Lower Limit 1 or Upper Limit 1 < Overcurrent Data | window notification 1 mode. |
| Error Detection > Overcurrent Window Notifcation 2 | | | |
| Notification | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent window notification 2. |
| Mode | • Overcurrent Data < Lower Limit 2 or Upper Limit 2 < Overcurrent Data<br>• Lower Limit 2 <= Overcurrent Data <= Upper Limit 2 | Overcurrent Data < Lower Limit 2 or Upper Limit 2 < Overcurrent Data | Select overcurrent window notification 2 mode. |
| Error Detection > Overcurrent Window Notifcation 3 | | | |
| Notification | • Disabled<br>• Enabled | Disabled | Enable or disable overcurrent window notification 3. |
| Mode | Refer to the RA Configuration tool for available options. | Window notification 0 | Select overcurrent window notification 3 mode. |
| Error Detection > Short Circuit | | | |
| Detection | • Disabled<br>• Enabled | Disabled | Enable or disable short circuit detection. |
| Low Count | Must be an integer in the range [0,8191]. | 0 | Short circuit detection low count. |
| High Count | Must be an integer in the range [0,8191]. | 0 | Short circuit detection high count. |
| Interrupts | | | |
| Current Data Update Interrupt Priority (CDUPD) | MCU Specific Options | | The Current Data Update Interrupt occurs when a conversion is completed. |
| Capture A Data Update Interrupt Priority (CDAUPD) | MCU Specific Options | | The Capture A Data Update Interrupt occurs when a capture A conversion is completed. |

| | | |
|---|---|---|
| Capture B Data Update Interrupt Priority (CDBUPD) | MCU Specific Options | The Capture B Data Update Interrupt occurs when a capture B conversion is completed. |

### Clock Configuration

The DSMIF conversion rate is determined by the **DSMIF Core Clock**, **A/D Conversion Division Ratio (CKDIV)**, and the configured sinc filter's **decimation count**.

The **DSMIF Core Clock** is common to all channels and may be configured to the following settings:

- PCLKA - Peripheral Clock A
- DSMIFCLK - Dedicated DSMIF Clock
- GPTCLK - Dedicated GPT Clock

The **A/D Conversion Division Ratio (CKDIV)** is a channel specific setting that further divides the core clock by the following formula:

```
A/D Conversion Division Ratio = (2 x (CKDIV + 1))
```

*Note*

1. *CKDIV is set in the range [2,63].*
2. *CKDIV is only valid in master mode.*

The **decimation count** is a channel specific sinc filter setting that will determine the final conversion rate of a DSMIF channel.

*Note*

1. *The decimation count is set in the range [4,256].*

### DSMIF Recommended Clock Configuration:

| DSMIF Core Clock (Mhz) | CKDIV | DSMCLKn (Mhz) |
|---|---|---|
| 300 | 0x05 | 25 |
| | 0x08 | 16.67 |
| | 0x09 | 15 |
| | 0x0E | 10 |
| | 0x1D | 5 |
| 200 | 0x03 | 25 |
| | 0x04 | 20 |
| | 0x07 | 12.5 |
| | 0x09 | 10 |
| | 0x0F | 6.25 |

| | |
|---|---|
| 0x13 | 5 |

*Note*

*1. If settings other than the recommended are used, there is an additional clock constraint: DSMIF Core Clock/5 ? PCLKA*

### Pin Configuration

Each DSMIF channel has two pins:

- DSMmCLKn - DSMIF Clock Input/Output. In Master mode the clock pin is an output, in slave mode, the clock is an input.
- DSMmDATn - DSMIF Data Input.

## Usage Notes

### Channel Synchronization

Multiple channels may be optionally synchronized in order to generate common interrupts in response to the following events:

- ADC_EVENT_CONVERSION_COMPLETE
- ADC_EVENT_CAPTURE_A
- ADC_EVENT_CAPTURE_B

The following sets of channels may be synchronized:

- Channel 0 and Channel 1
- Channel 0, Channel 1, and Channel 2

When synchronizing channels, each channel must use the same 'Clock', 'Filter', and 'Trigger' configuration settings. For convenience, channel configurations can be reused between channels of a DSMIF instance instead of creating new channel configurations for each channel.

*Note*

*1. Channel configurations cannot be reused between different DSMIF instances.*
*2. Channel configurations can only be reused between channels that are synchronized.*

### Filter Settling Time

The filter settling time is the time required for the filter results to be valid after the DSMIF channels have been started. The settling time is determined by the DSMCLK period, Decimation Ratio, Filter Order, DSMIF Core Clock period, and Peripheral Clock period.

The following macros are generated by the tooling in order to assist with determining the required settling time:

```
/* Calculated settling time required for DSMIF filters (See "Settling Time" section
in the MCU user manual). */
#define DSMIF0_FILTER_SETTLING_TIME_SYNCHRONOUS_US (...)
#define DSMIF0_FILTER_SETTLING_TIME_ASYNCHRONOUS_US (...)
```

```
#define DSMIF0_FILTER_SETTLING_TIME_GPT_SYNCHRONOUS_US (...)
#define DSMIF0_FILTER_SETTLING_TIME_GPT_ASYNCHRONOUS_US (...)
```

*Note*

*1. For more information on how to calculate the settling time refer to the MCU user manual.*

### Error Detection

There are four different types of error interrupts generated by the DSMIF peripheral:

- **Overcurrent error detection** - Triggered when a conversion result exceeds a configured upper/lower limit on a particular channel.
- **Overcurrent sum error detection** - Triggered when the sum of conversion results from a set of channels exceeds a configured upper/lower limit.
- **Window Notification error detection** - Triggered when a conversion result falls within a set of configurable ranges.
- **Short-circuit detection** - Triggered when a configured number of consecutive '1's or '0's are input on a DSMmDATn pin.

In order to enable error detection, the application must call R_DSMIF_ErrorDetectionEnable after waiting for all DSMIF channel filters to stabilize. The amount of time required for a filter to stabilize is dependent on the filter parameters, and clock settings. Refer to the MCU user manual for determining the filter stabilization time.

Once error detection is enabled, R_DSMIF_ErrorStatusGet can be called to read the error status.

*Note*

*1. Error detection is disabled when channel operation is stopped via R_DSMIF_ScanStop. When starting channel operation again, the same settling time is required before reenabling error detection.*

### Error Interrupt

If the error interrupt is enabled, the following configured error flags will generate an interrupt request:

- Overcurrent error detection
- Overcurrent sum error detection
- Short-circuit detection

*Note*

*1. Since the error interrupt is a level interrupt, R_DSMIF_ErrorStatusGet must be called from the user callback in order to clear the associated error status flags.*
*2. Window Notification error detection does not generate an interrupt request.*

### Limitations

Developers should be aware of the following limitations when using DSMIF:

- The DSMIF peripheral must be stopped prior to entering software standby mode.

# Examples

### Basic Example

This is a basic example of minimal use of the ADC in an application.

```
void dsmif_basic_example (void)
{
 fsp_err_t err = R_DSMIF_Open(&g_dsmif_ctrl, &g_dsmif_cfg);
    assert(FSP_SUCCESS == err);
    err = R_DSMIF_ScanStart(&g_dsmif_ctrl);
    assert(FSP_SUCCESS == err);
 /* The application must wait for the configured filters to stabilize. */
    app_wait_for_filter_stabilization(DSMIF0_FILTER_SETTLING_TIME_SYNCHRONOUS_US);
    err = R_DSMIF_ErrorDetectionEnable(&g_dsmif_ctrl);
    assert(FSP_SUCCESS == err);
}
void dsmif_callback (adc_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case ADC_EVENT_CONVERSION_COMPLETE:
     {
           uint32_t conversion;
 fsp_err_t err = R_DSMIF_Read32(&g_dsmif_ctrl, p_args->channel, &conversion);
 if (FSP_SUCCEESS == err)
     {
 /* Application process the converted data. */
               app_dsmif_data_process(p_args->channel, conversion);
           }
 break;
      }
 case ADC_EVENT_CAPTURE_A:
     {
           uint32_t conversion;
 fsp_err_t err = R_DSMIF_Read32(&g_dsmif_ctrl, p_args->channel, &conversion);
```

```
if (FSP_SUCCEESS == err)
     {
/* Application process the converted capture a data. */
               app_dsmif_capture_a_data_process(p_args->channel, conversion);
           }
break;
      }
case ADC_EVENT_CAPTURE_B:
     {
           uint32_t conversion;
fsp_err_t err = R_DSMIF_Read32(&g_dsmif_ctrl, p_args->channel, &conversion);
if (FSP_SUCCEESS == err)
     {
/* Application process the converted capture b data. */
               app_dsmif_capture_b_data_process(p_args->channel, conversion);
           }
break;
      }
case ADC_EVENT_CONVERSION_ERROR:
     {
dsmif_error_status_t error_status;
fsp_err_t            err = R_DSMIF_ErrorStatusGet(&g_dsmif_ctrl, &error_status);
if (FSP_SUCCESS == err)
     {
/* Application process the error status. */
               app_dsmif_error_process(&error_status);
           }
break;
      }
default:
     {
/* Invalid event. */
break;
      }
```

```
    }
}
```

### Reading Current/Overcurrent/Capture data

This is a basic example of how to read the following types of data by OR'ing the appropriate channel mask:

- Current Data
- Capture A/B Data
- Overcurrent Data
- Overcurrent Capture Data
- Overcurrent Sum Capture Data

```
void dsmif_channel_data_masks_example (void)
{
 fsp_err_t err;
    uint16_t conversion;
 /* Read normal current data from channel 0. */
    err = R_DSMIF_Read32(&g_dsmif_ctrl, ADC_CHANNEL_0, &conversion);
    assert(FSP_SUCCESS == err);
 /* Read capture current data from channel 0. */
    err = R_DSMIF_Read32(&g_dsmif_ctrl, ADC_CHANNEL_0_CAPTURE_A, &conversion);
    assert(FSP_SUCCESS == err);
 /* Read overcurrent data from channel 0. */
    err = R_DSMIF_Read32(&g_dsmif_ctrl, ADC_CHANNEL_0_OVERCURRENT, &conversion);
    assert(FSP_SUCCESS == err);
 /* Read overcurrent capture data 0 from channel 0. */
    err = R_DSMIF_Read32(&g_dsmif_ctrl, ADC_CHANNEL_0_OVERCURRENT0_CAPTURE,
&conversion);
    assert(FSP_SUCCESS == err);
 /* Read overcurrent sum capture data from channel 0. */
    err = R_DSMIF_Read32(&g_dsmif_ctrl, ADC_CHANNEL_0_OVERCURRENT_SUM_CAPTURE,
&conversion);
    assert(FSP_SUCCESS == err);
}
```

## Data Structure Documentation

### ◆ dsmif_clock_cfg_t

| struct dsmif_clock_cfg_t | | |
|---|---|---|
| Channel clock configuration | | |
| Data Fields | | |
| dsmif_clock_direction_t | direction | A/D conversion clock master/slave switching. |
| dsmif_clock_edge_t | edge | Sampling edge selection. |
| uint8_t | divider | A/D conversion clock division ratio. |

### ◆ dsmif_filter_cfg_t

| struct dsmif_filter_cfg_t | | |
|---|---|---|
| Filter configuration | | |
| Data Fields | | |
| dsmif_filter_order_t | filter_order | Sinc filter order (1st, 2nd, or 3rd) |
| dsmif_data_shift_t | data_shift | Data shift setting. |
| uint8_t | decimation_count | Decimation count [0,255]. |

### ◆ dsmif_trigger_cfg_t

| struct dsmif_trigger_cfg_t | | |
|---|---|---|
| Event trigger configuration. | | |
| Data Fields | | |
| dsmif_capture_trigger_t | capture_trigger_a | Current capture trigger A selection. |
| dsmif_capture_trigger_t | capture_trigger_b | Current capture trigger B selection. |
| dsmif_filter_initialization_trigger_t | filter_initialization_trigger | Current measurement filter initialization trigger selection. |
| dsmif_clock_edge_t | filter_initialization_edge | Current measurement filter initialization trigger edge selection. |

### ◆ dsmif_interrupt_cfg_t

| struct dsmif_interrupt_cfg_t |
|---|
| Channel interrupt configuration. |
| Data Fields |

| | | |
|---|---|---|
| IRQn_Type | current_data_update_irq | Channel current data update interrupt request. |
| uint8_t | current_data_update_ipl | Channel current data update interrupt priority. |
| IRQn_Type | capture_data_a_irq | Channel capture data a interrupt request. |
| uint8_t | capture_data_a_ipl | Channel capture data a interrupt priority. |
| IRQn_Type | capture_data_b_irq | Channel capture data b interrupt request. |
| uint8_t | capture_data_b_ipl | Channel capture data b interrupt priority. |

### ◆ dsmif_error_detection_cfg_t

struct dsmif_error_detection_cfg_t

Channel error configuration:

- Overcurrent upper/lower limit error detection 0,1,2
- Overcurrent window notification 0,1,2,3
- Short circuit low/high detection

Data Fields

| | | |
|---|---|---|
| union dsmif_error_detection_cfg_t | __unnamed__ | |
| union dsmif_error_detection_cfg_t | __unnamed__ | |
| union dsmif_error_detection_cfg_t | __unnamed__ | |
| bool | short_circuit_detection_enable | Enable short circuit detection. |
| uint32_t | short_circuit_detection_low_count | Short circuit low count. |
| uint32_t | short_circuit_detection_high_count | Short circuit high count. |
| uint32_t | overcurrent_lower_limit[3] | Overcurrent lower limit settings. |
| uint32_t | overcurrent_upper_limit[3] | Overcurrent upper limit settings. |
| dsmif_filter_cfg_t | overcurrent_filter_cfg | Sinc filter configuration for overcurrent detection. |

### ◆ dsmif_error_status_t

struct dsmif_error_status_t

Error status.

| Data Fields | | |
|---|---|---|
| dsmif_overcurrent_status_t | channel_overcurrent_status | Channel Overcurrent state. |
| dsmif_short_circuit_status_t | channel_short_circuit_status | Channel Short circuit state. |
| dsmif_overcurrent_sum_status_t | overcurrent_sum_status | Overcurrent Sum state. |
| dsmif_overcurrent_window_notification_status_t | channel_overcurrent_window_status | Channel Overcurrent Window State. |

### ◆ dsmif_channel_cfg_t

| struct dsmif_channel_cfg_t | | |
|---|---|---|
| Channel configuration. | | |
| Data Fields | | |
| dsmif_clock_cfg_t | clock_cfg | Channel clock configuration. |
| dsmif_filter_cfg_t | filter_cfg | Channel sinc filter configuration. |
| dsmif_trigger_cfg_t | trigger_cfg | Channel event trigger configuration. |
| dsmif_interrupt_cfg_t | irq_cfg | Channel interrupt configuration. |

### ◆ dsmif_extended_cfg_t

| struct dsmif_extended_cfg_t | | |
|---|---|---|
| DSMIF configuration extension. This extension is required and must be provided in dsmif_cfg_t::p_extend. | | |
| Data Fields | | |
| dsmif_clock_selection_t | clock_selection | DSMIF core clock selection. |
| uint32_t | channel_mask | Channel bitmask. |
| dsmif_channel_cfg_t const * | p_channel_cfgs[DSMIF_MAX_NUM_CHANNELS] | Configuration for each channel, set to NULL if unused. |
| dsmif_channel_synchronization_mode_t | synchronization_mode | Channel synchronization mode. |
| IRQn_Type | common_current_data_irq | Common current data interrupt request. |
| uint8_t | common_current_data_ipl | Common current data interrupt priority. |
| IRQn_Type | common_capture_data_a_irq | Channel capture data a interrupt request. |
| uint8_t | common_capture_data_a_ipl | Channel capture data a interrupt priority. |
| IRQn_Type | common_capture_data_b_irq | Channel capture data b interrupt request. |

| | | |
|---|---|---|
| uint8_t | common_capture_data_b_ipl | Channel capture data b interrupt priority. |

### ◆ dsmif_instance_ctrl_t

| struct dsmif_instance_ctrl_t |
|---|
| DSMIF instance control block. DO NOT INITIALIZE. |

## Enumeration Type Documentation

### ◆ dsmif_clock_selection_t

| enum dsmif_clock_selection_t | |
|---|---|
| DSMIF clock selection. | |
| Enumerator | |
| DSMIF_CLOCK_SELECTION_PCLKA | Select PCLKA as the DSMIF clock. |
| DSMIF_CLOCK_SELECTION_DSMIFCLK | Select DSMIFCLK as the DSMIF clock. |
| DSMIF_CLOCK_SELECTION_GPTCLK | Select GPTCLK as the DSMIF clock. |

### ◆ dsmif_overcurrent_sum_error_channel_t

| enum dsmif_overcurrent_sum_error_channel_t | |
|---|---|
| Select the channel(s) for overcurrent sum error detection. | |
| Enumerator | |
| DSMIF_OVERCURRENT_SUM_ERROR_CHANNEL_0_2 | Detects error of sum value of overcurrent data of CH0, CH1, CH2. |
| DSMIF_OVERCURRENT_SUM_ERROR_CHANNEL_0_1 | Detects error of sum value of overcurrent data of CH0, CH1. |
| DSMIF_OVERCURRENT_SUM_ERROR_CHANNEL_0 | Detects error of overcurrent data of CH0. |
| DSMIF_OVERCURRENT_SUM_ERROR_CHANNEL_1 | Detects error of overcurrent data of CH1. |
| DSMIF_OVERCURRENT_SUM_ERROR_CHANNEL_2 | Detects error of overcurrent data of CH2. |

### ◆ dsmif_channel_synchronization_mode_t

| enum dsmif_channel_synchronization_mode_t | |
|---|---|
| Select the channel(s) that are synchronized. | |
| Enumerator | |
| DSMIF_CHANNEL_SYNCHRONIZATION_MODE_DISABLED | Channels are not synchronized. |
| DSMIF_CHANNEL_SYNCHRONIZATION_MODE_CHANNEL_0_2 | Channel 0 and Channel 1 and Channel 2 are synchronized. |
| DSMIF_CHANNEL_SYNCHRONIZATION_MODE_CHANNEL_0_1 | Channel 0 and Channel 1 are synchronized. |

### ◆ dsmif_clock_direction_t

| enum dsmif_clock_direction_t | |
|---|---|
| Enumerator | |
| DSMIF_CLOCK_DIRECTION_SLAVE | Clock signal is input (slave operation) |
| DSMIF_CLOCK_DIRECTION_MASTER | Clock signal is output (master operation) |

### ◆ dsmif_clock_edge_t

| enum dsmif_clock_edge_t | |
|---|---|
| Select the clock edge for sampling DSMIF data. | |
| Enumerator | |
| DSMIF_CLOCK_EDGE_NEGATIVE | Data is sampled on the negative edge of clock signal. |
| DSMIF_CLOCK_EDGE_POSITIVE | Data is sampled on the positive edge of clock signal. |

### ◆ dsmif_filter_order_t

| enum dsmif_filter_order_t | |
|---|---|
| Select the DSMIF filter order. | |
| Enumerator | |
| DSMIF_FILTER_ORDER_3RD | Filter order setting 3rd order. |
| DSMIF_FILTER_ORDER_1ST | Filter order setting 1st order. |
| DSMIF_FILTER_ORDER_2ND | Filter order setting 2nd order. |

### ◆ dsmif_data_shift_t

| enum dsmif_data_shift_t | |
|---|---|
| Select the [MSB,LSB] that are copied from the filter output into the data register. | |
| Enumerator | |
| DSMIF_DATA_SHIFT_23_8 | Data shift setting [23:8]. |
| DSMIF_DATA_SHIFT_22_7 | Data shift setting [22:7]. |
| DSMIF_DATA_SHIFT_21_6 | Data shift setting [21:6]. |
| DSMIF_DATA_SHIFT_20_5 | Data shift setting [20:5]. |
| DSMIF_DATA_SHIFT_19_4 | Data shift setting [19:4]. |
| DSMIF_DATA_SHIFT_18_3 | Data shift setting [18:3]. |
| DSMIF_DATA_SHIFT_17_2 | Data shift setting [17:2]. |
| DSMIF_DATA_SHIFT_16_1 | Data shift setting [16:1]. |
| DSMIF_DATA_SHIFT_15_0 | Data shift setting [15:0]. |
| DSMIF_DATA_SHIFT_14_0 | Data shift setting [14:0]. |
| DSMIF_DATA_SHIFT_13_0 | Data shift setting [13:0]. |
| DSMIF_DATA_SHIFT_12_0 | Data shift setting [12:0]. |
| DSMIF_DATA_SHIFT_11_0 | Data shift setting [11:0]. |
| DSMIF_DATA_SHIFT_10_0 | Data shift setting [10:0]. |
| DSMIF_DATA_SHIFT_9_0 | Data shift setting [9:0]. |
| DSMIF_DATA_SHIFT_8_0 | Data shift setting [8:0]. |
| DSMIF_DATA_SHIFT_7_0 | Data shift setting [7:0]. |
| DSMIF_DATA_SHIFT_6_0 | Data shift setting [6:0]. |
| DSMIF_DATA_SHIFT_5_0 | Data shift setting [5:0]. |
| DSMIF_DATA_SHIFT_4_0 | Data shift setting [4:0]. |

### ◆ dsmif_capture_trigger_t

| enum dsmif_capture_trigger_t | |
|---|---|
| Enumerator | |
| DSMIF_CAPTURE_TRIGGER_NONE | Do not capture. |
| DSMIF_CAPTURE_TRIGGER_0 | Select current data capture trigger 0. |
| DSMIF_CAPTURE_TRIGGER_1 | Select current data capture trigger 1. |
| DSMIF_CAPTURE_TRIGGER_2 | Select current data capture trigger 2. |
| DSMIF_CAPTURE_TRIGGER_3 | Select current data capture trigger 3. |
| DSMIF_CAPTURE_TRIGGER_4 | Select current data capture trigger 4. |
| DSMIF_CAPTURE_TRIGGER_5 | Select current data capture trigger 5. |

### ◆ dsmif_filter_initialization_trigger_t

| enum dsmif_filter_initialization_trigger_t | |
|---|---|
| Enumerator | |
| DSMIF_FILTER_INITIALIZATION_TRIGGER_NONE | Do not initialize. |
| DSMIF_FILTER_INITIALIZATION_TRIGGER_0 | Select decimation dividing counter initialization trigger 0. |
| DSMIF_FILTER_INITIALIZATION_TRIGGER_1 | Select decimation dividing counter initialization trigger 1. |
| DSMIF_FILTER_INITIALIZATION_TRIGGER_2 | Select decimation dividing counter initialization trigger 2. |

### ◆ dsmif_overcurrent_window_notification_mode_t

| enum dsmif_overcurrent_window_notification_mode_t | |
|---|---|
| Overcurrent window notification window mode setting [0,2]. | |
| Enumerator | |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE_OUTSIDE | Overcurrent data <= lower limit, upper limit <= overcurrent data. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE_INSIDE | lower limit < overcurrent data < upper limit. |

### ◆ dsmif_overcurrent_window_notification_mode3_t

| enum dsmif_overcurrent_window_notification_mode3_t | |
|---|---|
| Overcurrent window detection window mode setting for window notification 3. | |
| Enumerator | |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0 | Overcurrent detection window notification 0. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_1 | Overcurrent detection window notification 1. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_2 | Overcurrent detection window notification 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_OR_1 | Overcurrent detection window notification 0 OR 1. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_AND_1 | Overcurrent detection window notification 0 AND 1. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_OR_2 | Overcurrent detection window notification 0 OR 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_AND_2 | Overcurrent detection window notification 0 AND 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_1_OR_2 | Overcurrent detection window notification 1 OR 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_1_AND_2 | Overcurrent detection window notification 1 AND 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_OR_1_OR_2 | Overcurrent detection window notification 0 OR 1 OR 2. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_MODE3_0_AND_1_AND_2 | Overcurrent detection window notification 0 AND 1 AND 2. |

### ◆ dsmif_overcurrent_status_t

| enum dsmif_overcurrent_status_t | |
|---|---|
| DSMIF Channel Overcurrent detect status. | |
| Enumerator | |
| DSMIF_OVERCURRENT_STATUS_CH0_LOWER_LIMIT_0 | Channel 0 overcurrent lower limit detection 0 flag. |
| | |

| | |
|---|---|
| DSMIF_OVERCURRENT_STATUS_CH1_LOWER_LIMIT_0 | Channel 1 overcurrent lower limit detection 0 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_LOWER_LIMIT_0 | Channel 2 overcurrent lower limit detection 0 flag. |
| DSMIF_OVERCURRENT_STATUS_CH0_UPPER_LIMIT_0 | Channel 0 overcurrent upper limit exceeded 0 flag. |
| DSMIF_OVERCURRENT_STATUS_CH1_UPPER_LIMIT_0 | Channel 1 overcurrent upper limit exceeded 0 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_UPPER_LIMIT_0 | Channel 2 overcurrent upper limit exceeded 0 flag. |
| DSMIF_OVERCURRENT_STATUS_CH0_LOWER_LIMIT_1 | Channel 0 overcurrent lower limit detection 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH1_LOWER_LIMIT_1 | Channel 1 overcurrent lower limit detection 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_LOWER_LIMIT_1 | Channel 2 overcurrent lower limit detection 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH0_UPPER_LIMIT_1 | Channel 0 overcurrent upper limit exceeded 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH1_UPPER_LIMIT_1 | Channel 1 overcurrent upper limit exceeded 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_UPPER_LIMIT_1 | Channel 2 overcurrent upper limit exceeded 1 flag. |
| DSMIF_OVERCURRENT_STATUS_CH0_LOWER_LIMIT_2 | Channel 0 overcurrent lower limit detection 2 flag. |
| DSMIF_OVERCURRENT_STATUS_CH1_LOWER_LIMIT_2 | Channel 1 overcurrent lower limit detection 2 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_LOWER_LIMIT_2 | Channel 2 overcurrent lower limit detection 2 flag. |
| DSMIF_OVERCURRENT_STATUS_CH0_UPPER_LIMIT_2 | Channel 0 overcurrent upper limit exceeded 2 flag. |
| DSMIF_OVERCURRENT_STATUS_CH1_UPPER_LIMIT_2 | Channel 1 overcurrent upper limit exceeded 2 flag. |
| DSMIF_OVERCURRENT_STATUS_CH2_UPPER_LIMIT_2 | Channel 2 overcurrent upper limit exceeded 2 flag. |

### ◆ dsmif_short_circuit_status_t

| enum dsmif_short_circuit_status_t | |
|---|---|
| DSMIF Channel Short circuit detect status. | |
| Enumerator | |
| DSMIF_SHORT_CIRCUIT_STATUS_CH0 | Channel 0 short circuit detection flag. |
| DSMIF_SHORT_CIRCUIT_STATUS_CH1 | Channel 1 short circuit detection flag. |
| DSMIF_SHORT_CIRCUIT_STATUS_CH2 | Channel 2 short circuit detection flag. |

### ◆ dsmif_overcurrent_sum_status_t

| enum dsmif_overcurrent_sum_status_t | |
|---|---|
| DSMIF Overcurrent Sum detect status. | |
| Enumerator | |
| DSMIF_OVERCURRENT_SUM_STATUS_LOWER_LIMIT | Overcurrent sum error lower limit detection flag. |
| DSMIF_OVERCURRENT_SUM_STATUS_UPPER_LIMIT | Overcurrent sum error upper limit detection flag. |

### ◆ dsmif_overcurrent_window_notification_status_t

| enum dsmif_overcurrent_window_notification_status_t | |
|---|---|
| DSMIF Overcurrent Window detect status. | |
| Enumerator | |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH0_0 | Channel 0 overcurrent detection window notification 0 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH1_0 | Channel 1 overcurrent detection window notification 0 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH2_0 | Channel 2 overcurrent detection window notification 0 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH0_1 | Channel 0 overcurrent detection window notification 1 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH1_1 | Channel 1 overcurrent detection window notification 1 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH2_1 | Channel 2 overcurrent detection window notification 1 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH0_2 | Channel 0 overcurrent detection window notification 2 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH1_2 | Channel 1 overcurrent detection window notification 2 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH2_2 | Channel 2 overcurrent detection window notification 2 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH0_3 | Channel 0 overcurrent detection window notification 3 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH1_3 | Channel 1 overcurrent detection window notification 3 flag. |
| DSMIF_OVERCURRENT_WINDOW_NOTIFICATION_STATUS_CH2_3 | Channel 2 overcurrent detection window notification 3 flag. |

## Function Documentation

### ◆ R_DSMIF_Open()

fsp_err_t R_DSMIF_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Applies power to the DSMIF and initializes the hardware based on the user configuration. As part of this initialization, set interrupts, set DSMIF error interrupt registers, etc.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block is already open. |
| FSP_ERR_IRQ_BSP_DISABLED | A required interrupt is disabled |
| FSP_ERR_IP_UNIT_NOT_PRESENT | The Unit requested in the p_cfg parameter is not available on this device. |

### ◆ R_DSMIF_ScanCfg()

fsp_err_t R_DSMIF_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_extend* )

adc_api_t::scanCfg is not supported on DSMIF.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported by the DSMIF instance. |

### ◆ R_DSMIF_ScanStart()

fsp_err_t R_DSMIF_ScanStart ( adc_ctrl_t * *p_ctrl*)

Starts all configured DSMIF channels

***Note***

*After executing R_DSMIF_ScanStart, it is necessary to wait until the filter result is output stably.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started or hardware triggers enabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_ScanGroupStart()

fsp_err_t R_DSMIF_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_mask* )

adc_api_t::scanGroupStart is not supported on DSMIF.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported by the DSMIF instance. |

### ◆ R_DSMIF_ScanStop()

fsp_err_t R_DSMIF_ScanStop ( adc_ctrl_t * *p_ctrl*)

Stops any in-progress scan started by software.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan stopped or hardware triggers disabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_TIMEOUT | Timeout error. |

### ◆ R_DSMIF_ScanStatusGet()

fsp_err_t R_DSMIF_ScanStatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Returns the status of a scan started by software.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | No software scan is in progress. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_Read()

fsp_err_t R_DSMIF_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data* )

Reads the most recent result from a channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_Read32()

fsp_err_t R_DSMIF_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data* )

Reads the most recent conversion result from a single channel into a 32-bit result.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_Calibrate()

fsp_err_t R_DSMIF_Calibrate ( adc_ctrl_t * *p_ctrl*, void const * *p_extend* )

adc_api_t::calibrate is not supported on DSMIF.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported by the DSMIF instance. |

### ◆ R_DSMIF_OffsetSet()

fsp_err_t R_DSMIF_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t const *offset* )

adc_api_t::offsetSet is not supported on DSMIF.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported by the DSMIF instance. |

### ◆ R_DSMIF_CallbackSet()

fsp_err_t R_DSMIF_CallbackSet ( adc_ctrl_t *const *p_ctrl*, void(*)(adc_callback_args_t *) *p_callback*, void *const *p_context*, adc_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_DSMIF_Close()

fsp_err_t R_DSMIF_Close ( adc_ctrl_t * *p_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the DSMIF peripheral.

***Note***

*This function is delayed at least until the outage is complete, as required by the DSMIF outage procedure.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_InfoGet()

fsp_err_t R_DSMIF_InfoGet ( adc_ctrl_t *const *p_ctrl*, adc_info_t *const *p_adc_info* )

adc_api_t::infoGet is not supported on DSMIF.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported by the DSMIF instance. |

### ◆ R_DSMIF_ErrorDetectionEnable()

fsp_err_t R_DSMIF_ErrorDetectionEnable ( adc_ctrl_t * *p_ctrl*)

Enable error detection.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration setting successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_DSMIF_ErrorStatusGet()

fsp_err_t R_DSMIF_ErrorStatusGet ( adc_ctrl_t * *p_ctrl*, dsmif_error_status_t * *p_error_status* )

Returns the error status of a scan started by software.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | No software scan is in progress. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

## 5.2.1.11 Operational Amplifier (r_opamp)

Modules » Analog

### Functions

| | |
|---|---|
| fsp_err_t | R_OPAMP_Open (opamp_ctrl_t *const p_api_ctrl, opamp_cfg_t const *const p_cfg) |

| | |
|---|---|
| fsp_err_t | R_OPAMP_InfoGet (opamp_ctrl_t *const p_api_ctrl, opamp_info_t *const p_info) |

| fsp_err_t | R_OPAMP_Close (opamp_ctrl_t *const p_api_ctrl) |

### Detailed Description

Driver for the OPAMP peripheral on RA MCUs. This module implements the OPAMP Interface.

# Overview

The OPAMP HAL module provides a high level API for signal amplification applications and supports the OPAMP peripheral available on RA MCUs.

### Features

- Low power or high-speed mode
- Start by software or AGT compare match
- Stop by software or ADC conversion end (stop by ADC conversion end only supported on op-amp channels configured to start by AGT compare match)
- Trimming available on some MCUs (see hardware manual)

# Configuration

### Build Time Configurations for r_opamp

The following build time configurations are defined in fsp_cfg/r_opamp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > Operational Amplifier (r_opamp)

This module can be added to the Stacks tab via New Stack > Analog > Operational Amplifier (r_opamp).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_opamp0 | Module name. |
| AGT Start Trigger Configuration (N/A unless AGT Start Trigger is Selected for the Channel) | • AGT1 Compare Match Starts OPAMPs 0 and 2 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 1 and 3 if configured for AGT Start<br>• AGT1 Compare Match Starts OPAMPs 0 and 1 if configured for AGT Start, AGT0 Compare Match Starts OPAMPs 2 and 3 if configured for AGT Start<br>• AGT1 Compare Match Starts all OPAMPs configured for AGT Start | AGT1 Compare Match Starts all OPAMPs configured for AGT Start | Configure which AGT channel event triggers which op-amp channel. The AGT compare match event only starts the op-amp channel if the AGT Start trigger is selected in the Trigger configuration for the channel. |
| Power Mode | MCU Specific Options | | Configure the op-amp based on power or speed requirements. This setting affects the minimum required stabilization time. Middle speed is not available for all MCUs. |
| Trigger Channel 0 | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 0. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| Trigger Channel 1 | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 1. If the event trigger is |

| | | | |
|---|---|---|---|
| | | | selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| Trigger Channel 2 | • Software Start Software Stop<br>• AGT Start Software Stop<br>• AGT Start ADC Stop | Software Start Software Stop | Select the event triggers to start or stop op-amp channel 2. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| Trigger Channel 3 | MCU Specific Options | | Select the event triggers to start or stop op-amp channel 3. If the event trigger is selected for start, the start() API enables the event trigger for this channel. If the event trigger is selected for stop, the stop() API disables the event trigger for this channel. |
| OPAMP AMP0OS | MCU Specific Options | | Select output to connect to AMP0O pin |
| OPAMP AMP0PS | MCU Specific Options | | Select input to connect to AMP0+ pin |
| OPAMP AMP0MS | MCU Specific Options | | Select input to connect to AMP0- pin |
| OPAMP AMP1PS | MCU Specific Options | | Select input to connect to AMP1+ pin |
| OPAMP AMP1MS | MCU Specific Options | | Select input to connect to AMP1- pin |
| OPAMP AMP2PS | MCU Specific Options | | Select input to connect to AMP2+ pin |
| OPAMP AMP2MS | MCU Specific Options | | Select input to connect to AMP2- pin |

### Clock Configuration

The OPAMP runs on PCLKB.

### Pin Configuration

To use the OPAMP HAL module, the port pins for the channels receiving the analog input must be set as inputs on the **Pins** tab of the RA Configuration editor.

Refer to the most recent FSP Release Notes for any additional operational limitations for this module.

# Usage Notes

### Trimming the OPAMP

- On MCUs that support trimming, the op-amp trim register is set to the factory default after the Open API is called.
- This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default trim values.
- Supported on selected MCUs. See hardware manual for details.
- Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).
- This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling the trim API with the command OPAMP_TRIM_CMD_START again.
    - The trim procedure works as follows:
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
    - Connect a fixed voltage to the Pch (+) input.
    - Connect the Nch (-) input to the op-amp output to create a voltage follower.
    - Ensure the op-amp is operating and stabilized.
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
    - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
    - Iterate over the following loop 5 times:
        - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
        - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
        - If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
    - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
    - Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
    - Iterate over the following loop 5 times:
        - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
        - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
        - If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

### Examples

### Basic Example

This is a basic example of minimal use of the R_OPAMP in an application. The example demonstrates configuring OPAMP channel 0 for high speed mode, starting the OPAMP and reading the status of the OPAMP channel running. It also verifies that the stabilization wait time is the expected time for

selected power mode

```
#define OPAMP_EXAMPLE_CHANNEL (0U)
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the OPAMP module. */
    err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
    assert(FSP_SUCCESS == err);
 /* Look up the required stabilization wait time. */
 opamp_info_t info;
    err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
    assert(FSP_SUCCESS == err);
 /* Wait for the OPAMP to stabilize. */
 R_BSP_SoftwareDelay(info.min_stabilization_wait_us, BSP_DELAY_UNITS_MICROSECONDS);
}
```

### Trim Example

This example demonstrates the typical trimming procedure for opamp channel 0 using R_OPAMP_Trim() API.

```
#ifndef OPAMP_EXAMPLE_CHANNEL
 #define OPAMP_EXAMPLE_CHANNEL (0U)
#endif
#ifndef OPAMP_EXAMPLE_ADC_CHANNEL
 #define OPAMP_EXAMPLE_ADC_CHANNEL (ADC_CHANNEL_2)
#endif
#define ADC_SCAN_END_DELAY (100U)
#define OPAMP_TRIM_LOOP_COUNT (5)
#define ADC_SCAN_END_MAX_TIMEOUT (0xFFFF)
uint32_t          g_callback_event_counter = 0;
```

```
opamp_trim_args_t trim_args_ch =
{
    .channel = OPAMP_EXAMPLE_CHANNEL,
    .input   = OPAMP_TRIM_INPUT_PCH
};
/* This callback is called when ADC Scan Complete event is generated. */
void adc_callback (adc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void trimming_example (void)
{
 fsp_err_t err;
 /* On RA2A1, configure negative feedback and put DAC12 signal on AMP0+ Pin. */
    g_opamp_cfg_extend.plus_input_select_opamp0 = OPAMP_PLUS_INPUT_AMPPS7;
    g_opamp_cfg_extend.minus_input_select_opamp0 = OPAMP_MINUS_INPUT_AMPMS7;
 /* Initialize the OPAMP module. */
    err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start the OPAMP module. */

## Data Structure Documentation

### ◆ opamp_extended_cfg_t

| struct opamp_extended_cfg_t | | |
|---|---|---|
| OPAMP configuration extension. This extension is required and must be provided in opamp_cfg_t::p_extend. | | |
| Data Fields | | |
| opamp_agt_link_t | agt_link | Configure which AGT links are paired to which channel. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. |
| opamp_mode_t | mode | Low power, middle speed, or high speed mode. |
| opamp_trigger_t | trigger_channel_0 | Start and stop triggers for |

| | | |
|---|---|---|
| | | channel 0. |
| opamp_trigger_t | trigger_channel_1 | Start and stop triggers for channel 1. |
| opamp_trigger_t | trigger_channel_2 | Start and stop triggers for channel 2. |
| opamp_trigger_t | trigger_channel_3 | Start and stop triggers for channel 3. |
| opamp_plus_input_t | plus_input_select_opamp0 | OPAMP0+ connection. |
| opamp_minus_input_t | minus_input_select_opamp0 | OPAMP0- connection. |
| opamp_output_t | output_select_opamp0 | OPAMP0O connection. |
| opamp_plus_input_t | plus_input_select_opamp1 | OPAMP1+ connection. |
| opamp_minus_input_t | minus_input_select_opamp1 | OPAMP1- connection. |
| opamp_plus_input_t | plus_input_select_opamp2 | OPAMP2+ connection. |
| opamp_minus_input_t | minus_input_select_opamp2 | OPAMP2- connection. |

### ◆ opamp_instance_ctrl_t

| struct opamp_instance_ctrl_t |
|---|
| OPAMP instance control block. DO NOT INITIALIZE. Initialized in opamp_api_t::open(). |

## Macro Definition Documentation

### ◆ OPAMP_MASK_CHANNEL_0

| #define OPAMP_MASK_CHANNEL_0 |
|---|
| Version of code that implements the API defined in this file |

## Enumeration Type Documentation

### ◆ opamp_trigger_t

| enum opamp_trigger_t | |
|---|---|
| Start and stop trigger for the op-amp. | |
| Enumerator | |
| OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP | Start and stop with APIs. |
| OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP | Start by AGT compare match and stop with API. |
| OPAMP_TRIGGER_AGT_START_ADC_STOP | Start by AGT compare match and stop after ADC conversion. |

### ◆ opamp_agt_link_t

| enum opamp_agt_link_t | |
|---|---|
| Which AGT timer starts the op-amp. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. If OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP is selected for a channel, then no AGT compare match event will start that op-amp channel. | |
| Enumerator | |
| OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPAMP_1_3 | OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match. |
| OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPAMP_2_3 | OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match. |
| OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3 | All OPAMP channels are started by AGT1 compare match. |

### ◆ opamp_mode_t

| enum opamp_mode_t | |
|---|---|
| Op-amp mode. | |
| Enumerator | |
| OPAMP_MODE_LOW_POWER | Low power mode. |
| OPAMP_MODE_MIDDLE_SPEED | Middle speed mode (not supported on all MCUs) |
| OPAMP_MODE_HIGH_SPEED | High speed mode. |

### ◆ opamp_plus_input_t

| enum opamp_plus_input_t | |
|---|---|
| Options to connect AMPnPS pins. | |
| Enumerator | |
| OPAMP_PLUS_INPUT_NONE | No Connection. |
| OPAMP_PLUS_INPUT_AMPPS0 | Set AMPPS0. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS1 | Set AMPPS1. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS2 | Set AMPPS2. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS3 | Set AMPPS3. See hardware manual for channel specific options. |
| OPAMP_PLUS_INPUT_AMPPS7 | Set AMPPS7. See hardware manual for channel specific options. |

### ◆ opamp_minus_input_t

| enum opamp_minus_input_t | |
|---|---|
| Options to connect AMPnMS pins. | |
| Enumerator | |
| OPAMP_MINUS_INPUT_NONE | No Connection. |
| OPAMP_MINUS_INPUT_AMPMS0 | Set AMPMS0. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS1 | Set AMPMS1. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS2 | Set AMPMS2. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS3 | Set AMPMS3. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS4 | Set AMPMS4. See hardware manual for channel specific options. |
| OPAMP_MINUS_INPUT_AMPMS7 | Set AMPMS7. See hardware manual for channel specific options. |

### ◆ opamp_output_t

| enum opamp_output_t | |
|---|---|
| Options to connect AMP0OS pin. | |
| Enumerator | |
| OPAMP_OUTPUT_NONE | No Connection. |
| OPAMP_OUTPUT_AMPOS0 | Set AMPOS0. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS1 | Set AMPOS1. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS2 | Set AMPOS2. See hardware manual for channel specific options. |
| OPAMP_OUTPUT_AMPOS3 | Set AMPOS3. See hardware manual for channel specific options. |

## Function Documentation

### ◆ R_OPAMP_Open()

fsp_err_t R_OPAMP_Open ( opamp_ctrl_t *const *p_api_ctrl*, opamp_cfg_t const *const *p_cfg* )

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements opamp_api_t::open.

The op-amp is not operational until the opamp_api_t::start is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until opamp_api_t::start and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open and before opamp_api_t::start.

Example:

```
/* Initialize the OPAMP module. */
   err = R_OPAMP_Open(&g_opamp_ctrl, &g_opamp_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block is already opened. |
| FSP_ERR_INVALID_ARGUMENT | An attempt to configure OPAMP in middle speed mode on MCU that does not support middle speed mode. |

### ◆ R_OPAMP_InfoGet()

fsp_err_t R_OPAMP_InfoGet ( opamp_ctrl_t *const *p_api_ctrl*, opamp_info_t *const *p_info* )

Provides the minimum stabilization wait time in microseconds. Implements opamp_api_t::infoGet.

- Example:

```
/* Look up the required stabilization wait time. */
opamp_info_t info;
   err = R_OPAMP_InfoGet(&g_opamp_ctrl, &info);
   assert(FSP_SUCCESS == err);
/* Wait for the OPAMP to stabilize. */
R_BSP_SoftwareDelay(info.min_stabilization_wait_us,
BSP_DELAY_UNITS_MICROSECONDS);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | information on opamp_power_mode stored in p_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_OPAMP_Start()

fsp_err_t R_OPAMP_Start ( opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask* )

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements opamp_api_t::start.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open and before opamp_api_t::start.

Example:

```
/* Start the OPAMP module. */
   err = R_OPAMP_Start(&g_opamp_ctrl, 1 << OPAMP_EXAMPLE_CHANNEL);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Op-amp started or hardware triggers enabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_ARGUMENT | channel_mask includes a channel that does not exist on this MCU. |

### ◆ R_OPAMP_Stop()

fsp_err_t R_OPAMP_Stop ( opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask* )

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements opamp_api_t::stop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Op-amp stopped or hardware triggers disabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_ARGUMENT | channel_mask includes a channel that does not exist on this MCU. |

### ◆ R_OPAMP_StatusGet()

fsp_err_t R_OPAMP_StatusGet ( opamp_ctrl_t *const *p_api_ctrl*, opamp_status_t *const *p_status* )

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements opamp_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operating status of each op-amp provided in p_status. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_OPAMP_Trim()

fsp_err_t R_OPAMP_Trim ( opamp_ctrl_t *const *p_api_ctrl*, opamp_trim_cmd_t const *cmd*, opamp_trim_args_t const *const *p_args* )

On MCUs that support trimming, the op-amp trim register is set to the factory default after open(). This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling trim() with command OPAMP_TRIM_CMD_START again.

Implements opamp_api_t::trim.

See "User Offset Trimming" in the OPAMP section of the relevant hardware manual. The trim procedure works as follows:

- Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
- Connect a fixed voltage to the Pch (+) input.
- Connect the Nch (-) input to the op-amp output to create a voltage follower.
- Ensure the op-amp is operating and stabilized.
- Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    - Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    - If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.
- Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
- Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
- Iterate over the following loop 5 times:
    - Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.

- Measure the op-amp output using the SAR ADC (referred to as B in the next step).
- If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_UNSUPPORTED | Trimming is not supported on this MCU. |
| FSP_ERR_INVALID_STATE | The command is not valid in the current state of the trim state machine. |
| FSP_ERR_INVALID_ARGUMENT | The requested channel is not operating or the trim procedure is not in progress for this channel/input combination. |
| FSP_ERR_INVALID_MODE | Trim is not allowed in low power mode. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_OPAMP_Close()

fsp_err_t R_OPAMP_Close ( opamp_ctrl_t *const *p_api_ctrl*)

Stops the op-amps. Implements opamp_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

## Variable Documentation

### ◆ g_opamp_on_opamp

const opamp_api_t g_opamp_on_opamp

OPAMP Implementation of OPAMP interface.

### Detailed Description

Driver for the SDADC24 peripheral on RA MCUs. This module implements the ADC Interface.

# Overview

### Features

The SDADC module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
  - Multiple analog channels
  - Outputs of OPAMP0 (P side) and OPAMP1 (N side) of SDADC channel 4
- Configurable scan start trigger:
  - Software scan triggers
  - Hardware scan triggers (timer expiration, for example)
- Configurable scan mode:
  - Single scan mode, where each trigger starts a single scan
  - Continuous scan mode, where all channels are scanned continuously
- Supports averaging converted samples
- Optional callback when single conversion, entire scan, or calibration completes
- Supports reading converted data
- Sample and hold support

### Selecting an ADC

All RA MCUs have an ADC (r_adc). Only select RA MCUs have an SDADC. When selecting between them, consider these factors. Refer to the hardware manual for details.

| | ADC | SDADC |
|---|---|---|
| Availability | Available on all RA MCUs. | Available on select RA MCUs. |
| Resolution | The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU. | The SDADC has a maximum accuracy of 24 bits. |
| Number of Channels | The ADC has more channels than the SDADC. | The SDADC 5 channels, one of which is tied to OPAMP0 and OPAMP1. |
| Frequency | The ADC sampling time is shorter (more samples per second). | The SDADC sampling time is longer (fewer samples per second). |
| Settling Time | The ADC does not have a settling time when switching between channels. | The SDADC requires a settling time when switching between channels. |

# Configuration

### Build Time Configurations for r_sdadc

The following build time configurations are defined in fsp_cfg/r_sdadc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Analog > ADC (r_sdadc)

This module can be added to the Stacks tab via New Stack > Analog > ADC (r_sdadc).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_adc0 | Module name. |
| Mode | • Single Scan<br>• Continuous Scan | Continuous Scan | In single scan mode, all channels are converted once per start trigger, and conversion stops after all enabled channels are scanned. In continuous scan mode, conversion starts after a start |

| | | | |
|---|---|---|---|
| | | | trigger, then continues until stopped in software. |
| Resolution | • 16 Bit<br>• 24 Bit | 24 Bit | Select 24-bit or 16-bit resolution. |
| Alignment | • Right<br>• Left | Right | Select left or right alignment. |
| Trigger | MCU Specific Options | | Select conversion start trigger. Conversion can be started in software, or conversion can be started when a hardware event occurs if the hardware event is linked to the SDADC peripheral using the ELC API. |
| Vref Source | • Internal<br>• External | Internal | Vref can be source internally and output on the SBIAS pin, or Vref can be input from VREFI. |
| Vref Voltage | • 0.8 V<br>• 1.0 V<br>• 1.2 V<br>• 1.4 V<br>• 1.6 V<br>• 1.8 V<br>• 2.0 V<br>• 2.2 V<br>• 2.4 V | 1.0 V | Select Vref voltage. If Vref is input externally, the voltage on VREFI must match the voltage selected within 3%. |
| Callback | Name must be a valid C symbol | NULL | Enter the name of the callback function to be called when conversion completes or a scan ends. |
| Conversion End Interrupt Priority | MCU Specific Options | | [Required] Select the interrupt priority for the conversion end interrupt. |
| Scan End Interrupt Priority | MCU Specific Options | | [Optional] Select the interrupt priority for the scan end interrupt. |
| Calibration End Interrupt Priority | MCU Specific Options | | [Optional] Select the interrupt priority for the calibration end interrupt. |

**Configurations for Analog > SDADC Channel Configuration (r_sdadc)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Input | • Differential<br>• Single Ended | Differential | Select differential or single-ended input. |
| Stage 1 Gain | • 1<br>• 2<br>• 3<br>• 4<br>• 8 | 1 | Select the gain for stage 1 of the PGA. Must be 1 for single-ended input. |
| Stage 2 Gain | • 1<br>• 2<br>• 4<br>• 8 | 1 | Select the gain for stage 2 of the PGA. Must be 1 for single-ended input. |
| Oversampling Ratio | • 64<br>• 128<br>• 256<br>• 512<br>• 1024<br>• 2048 | 256 | Select the oversampling ratio for the PGA. Must be 256 for single-ended input. |
| Polarity (Valid for Single-Ended Input Only) | • Positive<br>• Negative | Positive | Select positive or negative polarity for single-ended input. VBIAS (1.0 V typical) is connected on the opposite input. |
| Conversions to Average per Result | • Do Not Average (Interrupt after Each Conversion)<br>• Average 8<br>• Average 16<br>• Average 32<br>• Average 64 | Do Not Average (Interrupt after Each Conversion) | Select the number of conversions to average for each result. The ADC_EVENT_CONVERSION_END event occurs after each average, or after each individual conversion if averaging is disabled. |
| Invert (Valid for Negative Single-Ended Input Only) | • Result Not Inverted<br>• Result Inverted | Result Not Inverted | Select whether to invert negative single-ended input. When the result is inverted, the lowest measurable voltage gives a result of 0, and the highest measurable voltage gives a result of 2^resolution - 1. |
| Number of Conversions Per Scan | Refer to the RA Configuration tool for available options. | 1 | Number of conversions on this channel before AUTOSCAN moves to the next channel. When all conversions of all channels are complete, the |

ADC_EVENT_SCAN_END event occurs.

### Clock Configuration

The SDADC clock clock is configurable on the clocks tab.

The SDADC clock must be 4 MHz when the SDADC is used.

### Pin Configuration

The ANSDnP (n = 0-3) pins are analog input channels that can be used with the SDADC.

# Usage Notes

### Scan Procedure

In this document, the term "scan" refers to the AUTOSCAN feature of the SDADC, which works as follows:

1. Conversions are performed on enabled channels in ascending order of channel number. All conversions required for a single channel are completed before the sequencer moves to the next channel.
2. Conversions are performed at the rate (in Hz) of the SDADC oversampling clock frequency / oversampling ratio (configured per channel). FSP uses the normal mode SDADC oversampling clock frequency.
3. If averaging is enabled for the channel, the number of conversions to average are performed before each conversion end interrupt occurs.

4. If the number of conversions for the channel is more than 1, SDADC performs the number of conversions requested. These are performed consecutively. There is a settling time associated with switching channels. Performing all of the requested conversions for each channel at a time avoids this settling time after the first conversion.

   If averaging is enabled for the channel, each averaged result counts as a single conversion.

5. Continues to the next enabled channel only after completing all conversions requested.
6. After all enabled channels are scanned, a scan end interrupt occurs. The driver supports single-scan and continuous scan operation modes.
   - Single-scan mode performs one scan per trigger (hardware trigger or software start using R_SDADC_ScanStart).
   - In continuous scan mode, the scan is restarted after each scan completes. A single trigger is required to start continuous operation of the SDADC.

### When Interrupts Are Not Enabled

If interrupts are not enabled, the R_SDADC_StatusGet() API can be used to poll the SDADC to determine when the scan has completed. The R_SDADC_Read() API function is used to access the converted SDADC result. This applies to both normal scans and calibration scans.

### Calibration

Calibration is required to use the SDADC if any channel is configured for differential mode. Call R_SDADC_Calibrate() after open, and prior to any other function, then wait for a calibration complete

event before using the SDADC. R_SDADC_Calibrate() should not be called if all channels are configured for single-ended mode.

# Examples

### Basic Example

This is a basic example of minimal use of the SDADC in an application.

```
void sdadc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Calibrate all differential channels. */
 sdadc_calibrate_args_t calibrate_args;
    calibrate_args.mode    = SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET;
    calibrate_args.channel = ADC_CHANNEL_0;

}
```

### Using DTC or DMAC with the SDADC

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC is
 * configured to scan channel 1 three times, then channel 2 and channel 4 once, for a
total of 5 conversions. */
#define SDADC_EXAMPLE_TRANSFER_LENGTH (5)
uint32_t g_sdadc_example_buffer[SDADC_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_transfer_info DTC_TRANSFER_INFO_ALIGNMENT =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq            = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode     = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode           = TRANSFER_MODE_REPEAT,
 /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
Bit 24 contains a status flag
  * indicating if the result overflowed or not. Bits 27:25 contain the channel number
+ 1. The settings for
  * resolution and alignment and ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size           = TRANSFER_SIZE_4_BYTE,
 /* NOTE: It is strongly recommended to enable averaging on all channels or no
channels when using DTC with SDADC
```

```
  * because the result register is different when averaging is used. If averaging is
enabled on all channels,
  * set transfer_info_t::p_src to &R_SDADC->ADAR. */
    .p_src = (void const *) &R_SDADC0->ADCR,
    .p_dest = &g_sdadc_example_buffer[0],
    .length = SDADC_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_dtc_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Calibrate all differential channels. */

## Data Structure Documentation

### ◆ sdadc_calibrate_args_t

| struct sdadc_calibrate_args_t | | |
|---|---|---|
| Structure to pass to the adc_api_t::calibrate p_extend argument. | | |
| Data Fields | | |
| adc_channel_t | channel | Which channel to calibrate. |
| sdadc_calibration_t | mode | Calibration mode. |

### ◆ sdadc_channel_cfg_t

| struct sdadc_channel_cfg_t |
|---|
| SDADC per channel configuration. |

### ◆ sdadc_scan_cfg_t

| struct sdadc_scan_cfg_t | | |
|---|---|---|
| SDADC active channel configuration | | |
| Data Fields | | |
| uint32_t | scan_mask | Channels/bits: bit 0 is ch0; bit 15 is ch15. |

### ◆ sdadc_extended_cfg_t

| struct sdadc_extended_cfg_t | | |
|---|---|---|
| SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend. | | |
| Data Fields | | |
| uint8_t | conv_end_ipl | Conversion end interrupt priority. |
| IRQn_Type | conv_end_irq | |
| sdadc_vref_src_t | vref_src | Source of Vref (internal or external) |

| | | |
|---|---|---|
| sdadc_vref_voltage_t | vref_voltage | Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%. |
| sdadc_channel_cfg_t const * | p_channel_cfgs[SDADC_MAX_NUM_CHANNELS] | Configuration for each channel, set to NULL if unused. |

### ◆ sdadc_instance_ctrl_t

| struct sdadc_instance_ctrl_t |
|---|
| ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open(). |

## Enumeration Type Documentation

### ◆ sdadc_vref_src_t

| enum sdadc_vref_src_t | |
|---|---|
| Source of Vref. | |
| Enumerator | |
| SDADC_VREF_SRC_INTERNAL | Vref is internally sourced, can be output as SBIAS. |
| SDADC_VREF_SRC_EXTERNAL | Vref is externally sourced from the VREFI pin. |

### ◆ sdadc_vref_voltage_t

| enum sdadc_vref_voltage_t | |
|---|---|
| Voltage of Vref. | |
| Enumerator | |
| SDADC_VREF_VOLTAGE_800_MV | Vref is 0.8 V. |
| SDADC_VREF_VOLTAGE_1000_MV | Vref is 1.0 V. |
| SDADC_VREF_VOLTAGE_1200_MV | Vref is 1.2 V. |
| SDADC_VREF_VOLTAGE_1400_MV | Vref is 1.4 V. |
| SDADC_VREF_VOLTAGE_1600_MV | Vref is 1.6 V. |
| SDADC_VREF_VOLTAGE_1800_MV | Vref is 1.8 V. |
| SDADC_VREF_VOLTAGE_2000_MV | Vref is 2.0 V. |
| SDADC_VREF_VOLTAGE_2200_MV | Vref is 2.2 V. |
| SDADC_VREF_VOLTAGE_2400_MV | Vref is 2.4 V (only valid for external Vref) |

### ◆ sdadc_channel_input_t

| enum sdadc_channel_input_t | |
|---|---|
| Per channel input mode. | |
| Enumerator | |
| SDADC_CHANNEL_INPUT_DIFFERENTIAL | Differential input. |
| SDADC_CHANNEL_INPUT_SINGLE_ENDED | Single-ended input. |

### ◆ sdadc_channel_stage_1_gain_t

| enum sdadc_channel_stage_1_gain_t | |
|---|---|
| Per channel stage 1 gain options. | |
| Enumerator | |
| SDADC_CHANNEL_STAGE_1_GAIN_1 | Gain of 1. |
| SDADC_CHANNEL_STAGE_1_GAIN_2 | Gain of 2. |
| SDADC_CHANNEL_STAGE_1_GAIN_3 | Gain of 3 (only valid for stage 1) |
| SDADC_CHANNEL_STAGE_1_GAIN_4 | Gain of 4. |
| SDADC_CHANNEL_STAGE_1_GAIN_8 | Gain of 8. |

### ◆ sdadc_channel_stage_2_gain_t

| enum sdadc_channel_stage_2_gain_t | |
|---|---|
| Per channel stage 2 gain options. | |
| Enumerator | |
| SDADC_CHANNEL_STAGE_2_GAIN_1 | Gain of 1. |
| SDADC_CHANNEL_STAGE_2_GAIN_2 | Gain of 2. |
| SDADC_CHANNEL_STAGE_2_GAIN_4 | Gain of 4. |
| SDADC_CHANNEL_STAGE_2_GAIN_8 | Gain of 8. |

### ◆ sdadc_channel_oversampling_t

| enum sdadc_channel_oversampling_t | |
|---|---|
| Per channel oversampling ratio. | |
| Enumerator | |
| SDADC_CHANNEL_OVERSAMPLING_64 | Oversampling ratio of 64. |
| SDADC_CHANNEL_OVERSAMPLING_128 | Oversampling ratio of 128. |
| SDADC_CHANNEL_OVERSAMPLING_256 | Oversampling ratio of 256. |
| SDADC_CHANNEL_OVERSAMPLING_512 | Oversampling ratio of 512. |
| SDADC_CHANNEL_OVERSAMPLING_1024 | Oversampling ratio of 1024. |
| SDADC_CHANNEL_OVERSAMPLING_2048 | Oversampling ratio of 2048. |

### ◆ sdadc_channel_polarity_t

| enum sdadc_channel_polarity_t | |
|---|---|
| Per channel polarity, valid for single-ended input only. | |
| Enumerator | |
| SDADC_CHANNEL_POLARITY_POSITIVE | Positive-side single-ended input. |
| SDADC_CHANNEL_POLARITY_NEGATIVE | Negative-side single-ended input. |

### ◆ sdadc_channel_average_t

| enum sdadc_channel_average_t | |
|---|---|
| Per channel number of conversions to average before conversion end callback. | |
| Enumerator | |
| SDADC_CHANNEL_AVERAGE_NONE | Do not average (callback for each conversion) |
| SDADC_CHANNEL_AVERAGE_8 | Average 8 samples for each conversion end callback. |
| SDADC_CHANNEL_AVERAGE_16 | Average 16 samples for each conversion end callback. |
| SDADC_CHANNEL_AVERAGE_32 | Average 32 samples for each conversion end callback. |
| SDADC_CHANNEL_AVERAGE_64 | Average 64 samples for each conversion end callback. |

### ◆ sdadc_channel_inversion_t

| enum sdadc_channel_inversion_t | |
|---|---|
| Per channel polarity, valid for negative-side single-ended input only. | |
| Enumerator | |
| SDADC_CHANNEL_INVERSION_OFF | Do not invert conversion result. |
| SDADC_CHANNEL_INVERSION_ON | Invert conversion result. |

### ◆ sdadc_channel_count_formula_t

| enum sdadc_channel_count_formula_t | |
|---|---|
| Select a formula to specify the number of conversions. The following symbols are used in the formulas:<br>• N: Number of conversions<br>• n: sdadc_channel_cfg_t::coefficient_n, do not set to 0 if m is 0<br>• m: sdadc_channel_cfg_t::coefficient_m, do not set to 0 if n is 0<br>Either m or n must be non-zero. | |
| Enumerator | |
| SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL | N = 32 * (2 ^ n - 1) + m * 2 ^ n. |
| SDADC_CHANNEL_COUNT_FORMULA_LINEAR | N = (32 * n) + m. |

### ◆ sdadc_calibration_t

| enum sdadc_calibration_t | |
|---|---|
| Calibration mode. | |
| Enumerator | |
| SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET | Use internal reference to calibrate offset and gain. |
| SDADC_CALIBRATION_EXTERNAL_OFFSET | Use external reference to calibrate offset. |
| SDADC_CALIBRATION_EXTERNAL_GAIN | Use external reference to calibrate gain. |

## Function Documentation

### ◆ R_SDADC_Open()

fsp_err_t R_SDADC_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. R_SDADC_Calibrate() must be called after this function before using the SDADC if any channels are used in differential mode. Implements adc_api_t::open().

***Note***

*This function delays at least 2 ms as required by the SDADC power on procedure.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block is already open. |
| FSP_ERR_IRQ_BSP_DISABLED | A required interrupt is disabled |

### ◆ R_SDADC_ScanCfg()

fsp_err_t R_SDADC_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_extend* )

Configures the enabled channels of the ADC. Pass a pointer to sdadc_scan_cfg_t to p_extend. Implements adc_api_t::scanCfg().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_InfoGet()

fsp_err_t R_SDADC_InfoGet ( adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info* )

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements adc_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_ScanStart()

fsp_err_t R_SDADC_ScanStart ( adc_ctrl_t * *p_ctrl*)

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements adc_api_t::scanStart().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan started or hardware triggers enabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |

### ◆ R_SDADC_ScanGroupStart()

fsp_err_t R_SDADC_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id* )

adc_api_t::scanStart is not supported on the SDADC. Use scanStart instead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SDADC_ScanStop()

fsp_err_t R_SDADC_ScanStop ( adc_ctrl_t * *p_ctrl*)

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements adc_api_t::scanStop().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Scan stopped or hardware triggers disabled successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_StatusGet()

fsp_err_t R_SDADC_StatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements adc_api_t::scanStatusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | No software scan or calibration is in progress. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_Read()

fsp_err_t R_SDADC_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data* )

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements adc_api_t::read().

***Note***

*The result stored in p_data is signed when the SDADC channel is configured in differential mode.*
*Do not use this API if the conversion end interrupt (SDADC0_ADI) is used to trigger the DTC unless the interrupt mode is set to TRANSFER_IRQ_EACH.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_Read32()

fsp_err_t R_SDADC_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data* )

Reads the most recent conversion result from a channel. Implements adc_api_t::read32().

***Note***

*The result stored in p_data is signed when the SDADC channel is configured in differential mode. When the SDADC is configured for 24-bit resolution and right alignment, the sign bit is bit 23, and the upper 8 bits are 0. When the SDADC is configured for 16-bit resolution and right alignment, the sign bit is bit 15, and the upper 16 bits are 0.*
*Do not use this API if the conversion end interrupt (SDADC0_ADI) is used to trigger the DTC unless the interrupt mode is set to TRANSFER_IRQ_EACH.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_OffsetSet()

fsp_err_t R_SDADC_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t const *offset* )

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements adc_api_t::offsetSet().

Note: The offset is cleared if adc_api_t::calibrate() is called. The offset can be re-applied if necessary after the the callback with event ADC_EVENT_CALIBRATION_COMPLETE is called.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | See p_instance_ctrl in adc_api_t::offsetSet(). |
| [in] | reg_id | See reg_id in adc_api_t::offsetSet(). |
| [in] | offset | Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Offset updated successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_Calibrate()

fsp_err_t R_SDADC_Calibrate ( adc_ctrl_t *const *p_ctrl*, void const * *p_extend* )

Requires sdadc_calibrate_args_t passed to p_extend. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Calibration must be completed for differential mode before using the SDADC. A callback with the event ADC_EVENT_CALIBRATION_COMPLETE is called when calibration completes. Implements adc_api_t::calibrate().

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between 0.4 V / total_gain and 0.8 V / total_gain. The differential voltage applied during calibration is corrected to a conversion result of 0x7FFFFF, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using adc_api_t::offsetSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Calibration began successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_IN_USE | A conversion or calibration is in progress. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SDADC_Close()

fsp_err_t R_SDADC_Close ( adc_ctrl_t * *p_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral. Implements adc_api_t::close().

***Note***

*This function delays at least 3 us as required by the SDADC24 stop procedure.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### Detailed Description

Driver for the SDADC_B peripheral on RA MCUs. This module implements the ADC Interface.

# Overview

### Features

The SDADC_B module supports the following features:

- 24 bit maximum resolution
- Configure scans to include:
  - Multiple analog channels
- Configurable sampling mode:
  - 4 kHz sampling mode
  - 8 kHz sampling mode
  - 8 kHz/4 kHz Hybrid sampling mode
- Configurable Cut-off frequency of high-pass filter
- Configurable preamplifier gain for each channel
- Configurable phase adjustment for each channel

- Optional callback when conversion completes or zero-cross is detected
- Supports reading converted data
- Supports positive and negative input voltage

### Selecting an ADC

All RA MCUs have an ADC (r_adc). Only select RA MCUs have an SDADC_B. When selecting between them, consider these factors. Refer to the hardware manual for details.

| | ADC | SDADC_B |
|---|---|---|
| Availability | Available on all RA MCUs. | Available on select RA MCUs. |
| Resolution | The ADC has a maximum resolution of 12, 14, or 16 bits depending on the MCU. | The SDADC_B has a maximum accuracy of 24 bits. |
| Number of Channels | The ADC has 4 channels. | The SDADC_B has up to 7 channels. |
| Frequency | The ADC sampling time is shorter (more samples per second). | The SDADC sampling time is longer (fewer samples per second). |

# Configuration

### Build Time Configurations for r_sdadc_b

The following build time configurations are defined in fsp_cfg/r_sdadc_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Clock Configuration

The SDADC_B clock is configurable on the clocks tab.

The SDADC_B clock must be 12 MHz, 12.8 MHz or 16 MHz when the SDADC_B is used.

### Pin Configuration

The ANINn/ANIPn (n = 0-6) pins are analog input channels that can be used with the SDADC_B.

### Virtual Channel Configuration

- When 8KHz/4KHz Hybrid Mode is enabled, selected Virtual Channels 0 to 3 are converted at an 8KHz rate and corresponding Virtual Channels 4 to 7 are converted at a 4KHz rate.
- In some locations, 4KHz Hybrid Mode conversions may be referred to 'Type 2'. All other conversions may be referred to as 'Type 1'. The SDADC_B driver abstracts 'Type 1' and 'Type 2' and populates the user callback arguments with a mask of converted channel IDs. It is the responsibility of the application to know the configuration of provided channel IDs.

- Configuration of enabled virtual channels corresponding to Sampling mode is subject to below constraints:
  - Analog input n (n = 0 to 3) must be configured for Virtual Channel m (m = 4 to 7) if corresponding Analog input n is configured for Virtual Channel n and Hybrid mode is enabled
  - Analog input 4 to 6 cannot be configured for Virtual Channel 4 to 6 when Hybrid mode is enabled
  - Virtual Channel 7 can only be configured when Hybrid mode is enabled

# Usage Notes

### Cut-off frequency of HPF

Cut-off frequency of HPF (High Pass Filter) is selectable by setting SDADHPFCR.COF bit. Value of cut-off frequency of HPF corresponding to each COF value is as below table:

| COF | 4 kHz sampling mode fos = 1.5 MHz | 4 kHz sampling mode fos = 1.6 MHz | 8 kHz sampling mode fos = 3.0 MHz | 8 kHz sampling mode fos = 3.2 MHz | 8 kHz/4 kHz hybrid sampling mode fos = 3.0 MHz | 8 kHz/4 kHz hybrid sampling mode fos = 3.2 MHz |
|---|---|---|---|---|---|---|
| COF 0 | 0.607 Hz | 0.647 Hz | 1.214 Hz | 1.295 Hz | 1.214 Hz | 1.295 Hz |
| COF 1 | 1.214 Hz | 1.295 Hz | 2.427 Hz | 2.589 Hz | 2.427 Hz | 2.589 Hz |
| COF 2 | 2.427 Hz | 2.589 Hz | 4.855 Hz | 5.179 Hz | 4.855 Hz | 5.179 Hz |
| COF 3 | 4.855 Hz | 5.179 Hz | 9.710 Hz | 10.357 Hz | 1.214 Hz (Type 1) 0.607 Hz (Type 2) | 1.295 Hz (Type 1) 0.647 Hz (Type 2) |

### Channel ID used in driver

Channel ID input to R_SDADC_B_Read and R_SDADC_B_Read32 API and Channel Mask provided to user callback is the virtual channel ID and does not necessarily correspond to a physical input channel number. When Hybrid sampling mode is enabled, reading conversion result for channel 4 to 7 returns the 4 kHz conversion (Type 2) result of corresponding channel 0 to 3.

### Scan Procedure

Operation of 24-bit Sigma-Delta A/D Converter is as below:

1. Conversions are performed on enabled channels in ascending order of channel number after software trigger is started using R_SDADC_B_ScanStart() API.
2. Conversions are performed at the rate (in Hz) of the SDADC_B sampling clock frequency.
3. The user callback function will be invoked after enabled channels are scanned.
4. If zero-cross detection interrupt is enabled, a zero-cross detection interrupt occurs in synchronization with the rising edge of the SDADC conversion end interrupt.

### Triggering ELC Events with SDADC_B

- The interrupt signals SDADC_B can trigger the start of other peripherals. The Event Link Controller (r_elc) guide provides a list of all available peripherals.

*Note*

*When using ELC events to directly read converted data, it is the responsibility of the application to ensure that the stabilization period of 80 conversions has passed since starting the converter by using R_SDADC_B_StatusGet() API.*

### Limitations

- After powering on, an internal setup time is necessary. During this time R_SDADC_B_StatusGet() will return ADC_STATE_CALIBRATION_IN_PROGRESS.
- SDADC_B does not operate in software standby mode. To reduce current comsumption, stop and close the SDADC_B module before entering software standby.
- After stopping the conversion using R_SDADC_B_ScanStop() API, it is necessary to wait at least 1.4us before performing conversion again.

## Examples

### Basic Example

This is a basic example of minimal use of the SDADC_B in an application.

```
void sdadc_b_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* In software trigger mode, start a scan by calling R_SDADC_B_ScanStart(). In other
modes, enable external
  * triggers by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
 while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
 R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }
 /* Read converted data. */
    uint32_t channel1_conversion_result;
 R_SDADC_B_Read32(&g_adc0_ctrl, ADC_CHANNEL_1, &channel1_conversion_result);
```

```
}
```

### Using DTC or DMAC with the SDADC_B

If desired, the DTC or DMAC can be used to store each conversion result in a circular buffer. An example configuration is below.

```
/* Example DTC transfer settings to used with SDADC_B. */
/* The transfer length should match the total number of conversions per scan. This
example assumes the SDADC_B is
 * configured to scan all 7 channels. */
#define SDADC_B_EXAMPLE_TRANSFER_LENGTH (7)
uint32_t g_sdadc_b_example_buffer[SDADC_B_EXAMPLE_TRANSFER_LENGTH];
transfer_info_t g_sdadc_b_transfer_info DTC_TRANSFER_INFO_ALIGNMENT =
{
    .transfer_settings_word_b.dest_addr_mode = TRANSFER_ADDR_MODE_INCREMENTED,
    .transfer_settings_word_b.repeat_area    = TRANSFER_REPEAT_AREA_DESTINATION,
    .transfer_settings_word_b.irq            = TRANSFER_IRQ_END,
    .transfer_settings_word_b.chain_mode     = TRANSFER_CHAIN_MODE_DISABLED,
    .transfer_settings_word_b.src_addr_mode = TRANSFER_ADDR_MODE_FIXED,
    .transfer_settings_word_b.mode           = TRANSFER_MODE_REPEAT,
 /* NOTE: The data transferred will contain a 24-bit converted value in bits 23:0.
The settings for
  * resolution and alignment are ignored when DTC or DMAC is used. */
    .transfer_settings_word_b.size           = TRANSFER_SIZE_4_BYTE,
    .p_src = (void const *) &R_SDADC_B->SDADCR0,
    .p_dest = &g_sdadc_b_example_buffer[0],
    .length = SDADC_B_EXAMPLE_TRANSFER_LENGTH,
};
void sdadc_b_dtc_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = R_SDADC_B_Open(&g_adc0_ctrl, &g_adc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Start a scan by calling R_SDADC_B_ScanStart(). */
    (void) R_SDADC_B_ScanStart(&g_adc0_ctrl);
 /* Wait for conversion to complete. */
 adc_status_t status;
    status.state = ADC_STATE_CALIBRATION_IN_PROGRESS;
 while (ADC_STATE_CALIBRATION_IN_PROGRESS == status.state)
    {
 R_SDADC_B_StatusGet(&g_adc0_ctrl, &status);
    }
 /* After each conversion, the converted data is transferred to the next index in
g_sdadc_b_example_buffer. After
  * the entire scan completes, the index in g_sdadc_b_example_buffer resets. The data
in g_sdadc_b_example_buffer
  * is:
  * - g_sdadc_b_example_buffer[0] = SDADC_B channel 0
  * - g_sdadc_b_example_buffer[1] = SDADC_B channel 1
  * - g_sdadc_b_example_buffer[2] = SDADC_B channel 2
  * - g_sdadc_b_example_buffer[3] = SDADC_B channel 3
  * - g_sdadc_b_example_buffer[4] = SDADC_B channel 4
  * - g_sdadc_b_example_buffer[5] = SDADC_B channel 5
  * - g_sdadc_b_example_buffer[6] = SDADC_B channel 6
  *//* At any point in the application after the first scan completes, the most
recent data for channel 2 can be read
  * from the buffer like this. Conversion data is signed integer value. */
    int32_t channel_2_data = (int32_t) g_sdadc_b_example_buffer[2];
 FSP_PARAMETER_NOT_USED(channel_2_data);
}
```

## Data Structures

| | |

## Data Structure Documentation

### ◆ sdadc_b_scan_cfg_t

| struct sdadc_b_scan_cfg_t | | |
|---|---|---|
| SDADC_B active channel configuration. | | |
| Data Fields | | |
| union sdadc_b_scan_cfg_t | __unnamed__ | |
| sdadc_b_cutoff_t | hpf_cutoff | Cut-off frequency of HPF. |
| sdadc_b_channel_gain_t | gain_setting[SDADC_B_MAX_NUM_CHANNELS - 1] | Gain setting. |
| sdadc_b_channel_hpf_t | hpf_setting[SDADC_B_MAX_NUM_CHANNELS] | High pass filter on-off. |
| uint16_t | phase_adjustment[SDADC_B_MAX_NUM_CHANNELS] | Phase adjustment for each channels. |

### ◆ sdadc_b_extended_cfg_t

| struct sdadc_b_extended_cfg_t |
|---|
| SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend. |
| Data Fields |

| | | |
|---|---|---|
| sdadc_b_oper_clk_t | oper_clk | Operating clock of the digital block. |
| sdadc_b_samp_mode_t | sampling_mode | Sampling mode select. |
| sdadc_b_scan_cfg_t const * | p_channel_cfg | Pointer to original channel config data. |
| uint8_t | conv_end_ipl | Conversion end interrupt priority. |
| IRQn_Type | conv_end_irq | Conversion type 1 end IRQ number. |
| IRQn_Type | conv_end_irq2 | Conversion type 2 end IRQ number. |
| uint8_t | zc_ipl | Zero-cross detection 0 interrupt priority. |
| IRQn_Type | zc_irq | Zero-cross detection 0 IRQ number. |
| uint8_t | zc_ipl2 | Zero-cross detection 1 interrupt priority. |
| IRQn_Type | zc_irq2 | Zero-cross detection 1 IRQ number. |
| union sdadc_b_extended_cfg_t | __unnamed__ | |

### ◆ sdadc_b_instance_ctrl_t

| struct sdadc_b_instance_ctrl_t | | |
|---|---|---|
| SDADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open(). | | |
| Data Fields | | |
| adc_cfg_t const * | p_cfg | |
| uint32_t | opened | Boolean to verify that the Unit has been initialized. |
| uint32_t | channel_mask | Channel mask to keep track of channels enabled in scanCfg. |
| struct sdadc_b_instance_ctrl_t | results | |
| uint32_t | setup_time_cnt | Period of 80 conversions for internal setup time. |
| uint8_t | calibration_complete | Calibration is completed if set. |

## Enumeration Type Documentation

### ◆ sdadc_b_oper_clk_t

| enum sdadc_b_oper_clk_t | |
|---|---|
| Operating clock of the digital block. | |
| Enumerator | |
| SDADC_B_CLOCK_DISABLE | Disable operating clock. |
| SDADC_B_CLOCK_IS_12MHZ | Clock frequency is 12MHz or 12.8MHz. |
| SDADC_B_CLOCK_IS_16MHZ | Clock frequency is 16MHz. |

### ◆ sdadc_b_channel_mode_t

| enum sdadc_b_channel_mode_t | |
|---|---|
| Per channel operation mode. | |
| Enumerator | |
| SDADC_B_ELECTRIC_CHARGE_RESET | Electric charge reset. |
| SDADC_B_NORMAL_OPERATION | Normal operation. |

### ◆ sdadc_b_channel_power_t

| enum sdadc_b_channel_power_t | |
|---|---|
| Per channel power-on control. | |
| Enumerator | |
| SDADC_B_CHANNEL_POWER_OFF | Power off. |
| SDADC_B_CHANNEL_POWER_ON | Power on. |

### ◆ sdadc_b_samp_mode_t

| enum sdadc_b_samp_mode_t | |
|---|---|
| Sampling mode select. | |
| Enumerator | |
| SDADC_B_4KHZ_SAMPLING_MODE | 4 kHz sampling mode |
| SDADC_B_8KHZ_SAMPLING_MODE | 8 kHz sampling mode |
| SDADC_B_HYBRID_SAMPLING_MODE | 8 kHz / 4 kHz hybird sampling mode |

### ◆ sdadc_b_channel_gain_t

| enum sdadc_b_channel_gain_t | |
|---|---|
| Per channel preamplifier gain options. | |
| Enumerator | |
| SDADC_B_CHANNEL_GAIN_1 | Gain of 1. |
| SDADC_B_CHANNEL_GAIN_2 | Gain of 2. |
| SDADC_B_CHANNEL_GAIN_4 | Gain of 4. |
| SDADC_B_CHANNEL_GAIN_8 | Gain of 8. |
| SDADC_B_CHANNEL_GAIN_16 | Gain of 16. |
| SDADC_B_CHANNEL_GAIN_32 | Gain of 32. |

### ◆ sdadc_b_channel_hpf_t

| enum sdadc_b_channel_hpf_t | |
|---|---|
| Per channel HPF bypass. | |
| Enumerator | |
| SDADC_B_CHANNEL_HPF_ENABLE | HPF enable. |
| SDADC_B_CHANNEL_HPF_DISABLE | HPF disable. |

### ◆ sdadc_b_resolution_t

| enum sdadc_b_resolution_t | |
|---|---|
| SDADC data resolution definitions | |
| Enumerator | |
| SDADC_B_RESOLUTION_24_BIT | 24 bit resolution |
| SDADC_B_RESOLUTION_16_BIT | 16 bit resolution |

### ◆ sdadc_b_zc_channel_t

| enum sdadc_b_zc_channel_t | |
|---|---|
| Zero-cross detection channel | |
| Enumerator | |
| SDADC_B_ZC_CHANNEL_2_OR_3 | Detect channel 2 (ZCCTL0) or channel 3 (ZCCTL1) |
| SDADC_B_ZC_CHANNEL_1_OR_0 | Detect channel 1 (ZCCTL0) or channel 0 (ZCCTL1) |

### ◆ sdadc_b_zc_output_mode_t

| enum sdadc_b_zc_output_mode_t | |
|---|---|
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_PULSE_OUTPUT_MODE | Pulse output mode. |
| SDADC_B_ZC_LEVEL_OUTPUT_MODE | Level output mode. |

### ◆ sdadc_b_zc_falling_edge_detection_t

| enum sdadc_b_zc_falling_edge_detection_t | |
|---|---|
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_FALLING_EDGE_DETECTION_DISABLE | Disabled. |
| SDADC_B_ZC_FALLING_EDGE_DETECTION_ENABLE | Enabled. |

### ◆ sdadc_b_zc_rising_edge_detection_t

| enum sdadc_b_zc_rising_edge_detection_t | |
|---|---|
| Zero-cross detection output mode. | |
| Enumerator | |
| SDADC_B_ZC_RISING_EDGE_DETECTION_DISABLE | Disabled. |
| SDADC_B_ZC_RISING_EDGE_DETECTION_ENABLE | Enabled. |

### ◆ sdadc_b_cutoff_t

| enum sdadc_b_cutoff_t | |
|---|---|
| HPF cut off. The enum value is to set to SDADHPFCR register. See table "Cut-off frequency of HPF" in the SDADC section of the relevant hardware manual | |
| Enumerator | |
| SDADC_B_CUTOFF_00B | Cut-off frequency 0. |
| SDADC_B_CUTOFF_01B | Cut-off frequency 1. |
| SDADC_B_CUTOFF_10B | Cut-off frequency 2. |
| SDADC_B_CUTOFF_11B | Cut-off frequency 3. |

## Function Documentation

### ◆ R_SDADC_B_Open()

fsp_err_t R_SDADC_B_Open ( adc_ctrl_t * *p_ctrl*, adc_cfg_t const *const *p_cfg* )

Applies power to the SDADC_B and initializes the hardware based on the user configuration. Enabling interrupts which will call a callback to notify the user when a conversion is completed or a zero-cross is detected. Implements adc_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration successful. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block is already open. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel configuration |

### ◆ R_SDADC_B_ScanCfg()

fsp_err_t R_SDADC_B_ScanCfg ( adc_ctrl_t * *p_ctrl*, void const *const *p_extend* )

Configures the enabled channels of the ADC. Implements adc_api_t::scanCfg().

***Note***

*This function is not compatible with Hybrid Mode operation.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_adc_info. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_MODE | Hybrid mode channel configuration is invalid |
| FSP_ERR_INVALID_CHANNEL | Invalid channel configuration |
| FSP_ERR_INVALID_STATE | Converter operation must be stopped before reconfiguring |

### ◆ R_SDADC_B_InfoGet()

fsp_err_t R_SDADC_B_InfoGet ( adc_ctrl_t * *p_ctrl*, adc_info_t * *p_adc_info* )

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements adc_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

### ◆ R_SDADC_B_ScanStart()

fsp_err_t R_SDADC_B_ScanStart ( adc_ctrl_t * *p_ctrl*)

adc_api_t::scanStart().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

### ◆ R_SDADC_B_ScanGroupStart()

fsp_err_t R_SDADC_B_ScanGroupStart ( adc_ctrl_t * *p_ctrl*, adc_group_mask_t *group_id* )

adc_api_t::scanGroupStart is not supported on the SDADC_B. Use scanStart instead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SDADC_B_ScanStop()

fsp_err_t R_SDADC_B_ScanStop ( adc_ctrl_t * *p_ctrl*)

adc_api_t::scanStop().

***Note***

*According to Hardware specification, after stopping the conversion, it is necessary to wait at least 1.4us before performing conversion again.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion is started successfully. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_ASSERTION | An input pointer is NULL or an input parameter is invalid. |

### ◆ R_SDADC_B_StatusGet()

fsp_err_t R_SDADC_B_StatusGet ( adc_ctrl_t * *p_ctrl*, adc_status_t * *p_status* )

Returns the status of a scan including calibration scans. Implements adc_api_t::scanStatusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module status stored in the provided pointer p_status |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ R_SDADC_B_Read()

fsp_err_t R_SDADC_B_Read ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint16_t *const *p_data* )

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. When the SDADC_B is configured for 16-bit resolution, the sign bit is bit 15 and the upper 16 bits are 0. Implements adc_api_t::read().

***Note***

*The result stored in p_data is signed.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_DATA | Result buffer has not been updated with valid data. |

### ◆ R_SDADC_B_Read32()

fsp_err_t R_SDADC_B_Read32 ( adc_ctrl_t * *p_ctrl*, adc_channel_t const *reg_id*, uint32_t *const *p_data* )

Reads the most recent conversion result from a channel. Implements adc_api_t::read32().

***Note***

*The result stored in p_data is signed.*
*When the SDADC is configured for 24-bit resolution, the upper 8 bits are sign extended.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Conversion result in p_data. |
| FSP_ERR_ASSERTION | An input pointer was NULL or an input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_INVALID_DATA | Result buffer has not been updated with valid data. |

### ◆ R_SDADC_B_OffsetSet()

fsp_err_t R_SDADC_B_OffsetSet ( adc_ctrl_t *const *p_ctrl*, adc_channel_t const *reg_id*, int32_t const *offset* )

adc_api_t::offsetSet is not supported on the SDADC_B.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SDADC_B_Calibrate()

fsp_err_t R_SDADC_B_Calibrate ( adc_ctrl_t *const *p_ctrl*, void const * *p_extend* )

Calibration is performed automatically each time a scan is started. adc_api_t::calibrate is not supported on the SDADC_B.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SDADC_B_Close()

fsp_err_t R_SDADC_B_Close ( adc_ctrl_t * *p_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the SDADC_B peripheral. Implements adc_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Instance control block closed successfully. |
| FSP_ERR_ASSERTION | An input pointer was NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

## 5.2.2 AI

Modules

### Detailed Description

Artificial Intelligence Modules.

**Modules**

| | |
|---|---|
| | Ethos-U (rm_ethosu)<br>Middleware to support Ethos-U NPU driver. This module implements the Ethos-U Interface. |
| | Reality AI Data Collector (rm_rai_data_collector)<br>Middleware to implement the Data Collector for Reality AI applications. This module implements the Data Collector Interface. |
| | Reality AI Data Shipper (rm_rai_data_shipper)<br>Middleware to implement the Data Shipper for Reality AI applications. This module implements the Data Shipper Interface. |

### 5.2.2.1 Ethos-U (rm_ethosu)

Modules » AI

**Functions**

| | |
|---|---|
| fsp_err_t | RM_ETHOSU_Open (rm_ethosu_ctrl_t *p_api_ctrl, rm_ethosu_cfg_t const *const p_cfg) |
| fsp_err_t | RM_ETHOSU_CallbackSet (rm_ethosu_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_ethosu_callback_args_t *), void *const p_context, rm_ethosu_callback_args_t *const p_callback_memory) |
| fsp_err_t | RM_ETHOSU_Close (rm_ethosu_ctrl_t *p_api_ctrl) |

**Detailed Description**

Middleware to support Ethos-U NPU driver. This module implements the Ethos-U Interface.

# Overview

RM_ETHOSU module is a wrapper of the Ethos-U core driver.

**Features**

- Initialization Ethos-U core driver
- NPU secure and privilege level can be configured
- Callback Events
    - NPU finishes inference job

# Configuration

### Build Time Configurations for rm_ethosu

The following build time configurations are defined in fsp_cfg/rm_ethosu_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |
| Debug log level | • RM_ETHOSU_LOG_LEVEL_OFF<br>• RM_ETHOSU_LOG_LEVEL_ERROR<br>• RM_ETHOSU_LOG_LEVEL_WARNING<br>• RM_ETHOSU_LOG_LEVEL_INFO<br>• RM_ETHOSU_LOG_LEVEL_DEBUG | RM_ETHOSU_LOG_LEVEL_OFF | Defines ethosu log level. |

### Configurations for AI > Arm Ethos-U Core Driver Wrapper (rm_ethosu)

This module can be added to the Stacks tab via New Stack > AI > Arm Ethos-U Core Driver Wrapper (rm_ethosu).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_ethosu0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function that will be called from the interrupt service routine (ISR). |
| NPU Interrupt Priority | MCU Specific Options | | Select the NPU interrupt priority. |
| Enable Secure Mode | • Disabled<br>• Enabled | Enabled | Set Ethos-U NPU secure mode. |
| Enable Privilege Mode | • Disabled<br>• Enabled | Enabled | Set Ethos-U NPU privilege mode. |

### Clock Configuration

The NPU clock is configurable on the clocks tab.

# Usage Notes

Here are the steps to create an AI application in e2studio. Please refer to the example code for details.

### Getting Started: Creating an AI Project with NPU stacks

Start by creating a new C++ project in e² studio. On the Stacks tab, add New Stack > AI > TFLM Core Lib. On the BSP tab, stack and heap need to be configured. On the Clocks tab, NPU clock needs to be configured. Generate the project content. Please note an Ethos-U core driver instance will be automatically created. It will be used by RM_ETHOSU API to initialize/deinitialize Ethos-U driver.The application must also use the same instance to call other Ethos-U core driver API if needed.

### Getting Started: Confirming operators used in the model

Users can use tools like Netron to find out what operators are used by the model (.tflite). If there are operators not yet supported by Ethos-U55, then they need to be run on MCU. There are two types of kernels: optimized kernel based on CMSIS-NN, and reference kernel. Optimized kernel (CMSIS-NN kernel) should always be preferred on ARM MCUs. Please refer to https://github.com/tensorflow/tflite-micro/blob/main/tensorflow/lite/micro/docs/optimized_kernel_implementations.md for more information.

### Getting Started: Learning inference process framework

Users can refer to inference process https://gitlab.arm.com/artificial-intelligence/ethos-u/ethos-u-core-software/-/tree/main/applications for how to integrate TFLM inference functions, e.g parsing model, creating interpreter, allocating tensors and running inference. Please note by default lots of operators are registered to micro_op_resolver in micro_mutable_all_ops_resolver.h. What operators are needed should be determined by your model.

### Getting Started: Defining functions and PMU events for MCU performance profiling

ticks_per_second() and GetCurrentTimeTicks() need to be defined for MCU profiling. Here is an example

```
namespace tflite {
    uint32_t ticks_per_second();
    uint32_t GetCurrentTimeTicks();
    uint32_t ticks_per_second() { return US_IN_SECOND; }
    uint32_t GetCurrentTimeTicks() {
       static bool is_initialized = false;
       if (!is_initialized) {
            ARM_PMU_Enable();
            DCB->DEMCR |= DCB_DEMCR_TRCENA_Msk;
            ARM_PMU_CYCCNT_Reset();
            ARM_PMU_CNTR_Enable(PMU_CNTENSET_CCNTR_ENABLE_Msk);
            is_initialized = true;
```

```
        }
        return ARM_PMU_Get_CCNTR();
    }
}
```

There are 4 PMU event counters. Each can be used to monitor an event, e.g

```
#define ETHOSU_PMU_EVENT_0 ETHOSU_PMU_CYCLE
#define ETHOSU_PMU_EVENT_1 ETHOSU_PMU_NPU_ACTIVE
```

### Getting Started: Overriding weak functions in application

There are weak functions that need to be overridden if necessary.

| Module | Function | Description |
|---|---|---|
| NPU Driver | ethosu_flush_dcache | Flush/clean the data cache by address and size. Passing NULL as p argument expects the whole cache to be flushed. |
| NPU Driver | ethosu_invalidate_dcache | Invalidate the data cache by address and size. Passing NULL as p argument expects the whole cache to be invalidated. |
| NPU Driver | ethosu_mutex_create | define mutex API based on RTOS |
| NPU Driver | ethosu_mutex_destroy | define mutex API based on RTOS |
| NPU Driver | ethosu_mutex_lock | define mutex API based on RTOS |
| NPU Driver | ethosu_mutex_unlock | define mutex API based on RTOS |
| NPU Driver | ethosu_semaphore_create | define semaphore API based on RTOS |
| NPU Driver | ethosu_semaphore_destroy | define semaphore API based on RTOS |
| NPU Driver | ethosu_semaphore_take | define semaphore API based on RTOS |
| NPU Driver | ethosu_semaphore_give | define semaphore API based on RTOS |
| NPU Core | ethosu_inference_begin | Callback invoked just before the |

| | | |
|---|---|---|
| | | inference is started. |
| NPU Core | ethosu_inference_end | Callback invoked just after the inference has completed. |

### Getting Started: Creating AI inference

Create inference job and run, e.g

```
InferenceJob job(std::string(modelName),
                DataPtr(networkModelData, networkModelDataLen),
                {DataPtr(inputData, inputDataLen)},
                {DataPtr(outputData, outputDataLen)},
                {DataPtr(expectedOutputData, expectedOutputDataLen)},
                numBytesToPrint);
// Run job
bool failed = inferenceProcess.runJob(job);
```

### Limitations

Users have to implement weak functions if needed. Please refer to https://git.mlplatform.org/ml/ethos-u/ethos-u-core-driver.git/tree/README.md for further information.

Users have to update linker script if they want to save AI model and data to external memories.

## Examples

### Basic Example

This is a basic example of Ethos-U NPU application.

```
/* These variables are auto generated. */
extern struct ethosu_driver g_ethosu_dev;
extern rm_ethosu_cfg_t g_ethosu_cfg;
extern rm_ethosu_instance_ctrl_t g_ethosu_ctrl;
extern "C"
{
 /* Override the SysTick Handler. */
 extern void SysTick_Handler(void);
 void SysTick_Handler(void)
    {
 // Disable systick, preventing new systick interrupt to fire while we call the Ethos-
```

```
U monitor
      SysTick->CTRL = 0;
 if (ethosuDrv != NULL) {
           ethosuMonitor.monitorSample(ethosuDrv);
 // Restart the systick timer
           SysTick_Config(usDelay);
      }
   }
 void ethosu_inference_begin(struct ethosu_driver *drv, void *)
   {
      ethosuDrv = drv;
      ethosuMonitor.configure(drv, pmuEventConfig);
      SysTick_Config(usDelay);
   }
 void ethosu_inference_end(struct ethosu_driver *drv, void *)
   {
 // Disable polling
      SysTick->CTRL = 0;
      ethosuDrv = NULL;
      ethosuMonitor.monitorSample(drv);
      ethosuMonitor.release(drv);
   }
}
void rm_ethosu_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
   err = RM_ETHOSU_Open(&g_ethosu_ctrl, &g_ethosu_cfg);
 if (FSP_SUCCESS != err)
   {
 /* Handle any errors. */
   }
 /* Initialize event recorder */
   EventRecorderInitialize(EventRecordAll, 1);
   InferenceJob job(std::string(modelName),
```

```
                DataPtr(networkModelData, networkModelDataLen),
                {DataPtr(inputData, inputDataLen)},
                {DataPtr(outputData, outputDataLen)},
                {DataPtr(expectedOutputData, expectedOutputDataLen)},
                numBytesToPrint);
 // Run job
 bool failed = inferenceProcess.runJob(job);
    printf("Status of executed job: %s\n", failed ? "Failed\n" : "Success\n");
    err = RM_ETHOSU_Close(&g_ethosu_ctrl);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
}
```

## Data Structures

| | |
|---|---|
| struct | rm_ethosu_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_ethosu_instance_ctrl_t

| struct rm_ethosu_instance_ctrl_t |
|---|
| Instance control block. This is private to the FSP and should not be used or modified by the application. |

## Function Documentation

### ◆ RM_ETHOSU_Open()

fsp_err_t RM_ETHOSU_Open ( rm_ethosu_ctrl_t * *p_api_ctrl*, rm_ethosu_cfg_t const *const *p_cfg* )

Enable Ethos-U NPU and initialize driver. Implements rm_ethosu_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables NPU module
- Initializes Ethos-U NPU driver.
- Provides the handle for use with other API functions.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | NPU initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_INVALID_ARGUMENT | Failed to initialize ethosu driver |

### ◆ RM_ETHOSU_CallbackSet()

fsp_err_t RM_ETHOSU_CallbackSet ( rm_ethosu_ctrl_t *const *p_api_ctrl*, void(*)(rm_ethosu_callback_args_t *) *p_callback*, void *const *p_context*, rm_ethosu_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements rm_ethosu_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ RM_ETHOSU_Close()

| fsp_err_t RM_ETHOSU_Close ( rm_ethosu_ctrl_t * *p_api_ctrl*) |
|---|
| Disable NPU and set the instance as not open. Implements rm_ethosu_api_t::close. |

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to an opened instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

| | |
|---|---|
| fsp_err_t | RM_RAI_DATA_COLLECTOR_Close (rai_data_collector_ctrl_t *const p_api_ctrl) |

### Detailed Description

Middleware to implement the Data Collector for Reality AI applications. This module implements the Data Collector Interface.

# Overview

Data Collector is to abstract the collection of data from sensors so that data samples are accumulated into fixed length frames before being made available to application. Support of "snapshot" mode and "data feed" mode are required to accommodate for background and cooperative data collection. Each mode supports 8 sensor channels maximally. Each sensor channel will be captured into a separate frame buffer. Frame buffers shall have the same amount of data samples, however, data type can be different(int32_t, float, uint8_t etc). Users have to make sure that frame buffers will be filled up at the same rate.

When all frame buffers are filled up, they will be provided to the application via data ready callback. After they are consumed, application has to release them by calling RM_RAI_DATA_COLLECTOR_BufferRelease(). For seamless operation, PING-PONG buffer will be used. Ideally buffers will be released before the other set of buffers are filled up. However, it is possible that frame buffers will overrun due to the fact that application may take longer time to process the data in some cases. If it happens, application will be notified with a buffer-overrun event via the error callback. No intervention is required from user side in this case. Buffer overrun will disappear when frame buffers are released. However, if not all sensor channels are configured to work at the same pace, application will get a buffer-out-of-sync error. Users have to reconfigure sensor channels and ensure all of them will work at the same pace. If sensor channels can't work at the same rate, then multiple data collector instances are required.

### Features

- Snapshot mode and data feed mode are supported
- Maximally 8 sensors are supported for each mode
- Mix mode is supported (both snapshot mode and data feed mode are enabled)

### Snapshot Mode

Snapshot mode will periodically pull data from the user-specified places and save to designated frame buffers. It requires a DTC module and a timer module. DTC will work in chain mode, which enables data collection from various, potentially non-linear and different-sized sources. Timer, either General PWM Timer (GPT) or Asynchronous General Purpose Timer, provides activation source for DTC to work periodically. To select this activation source, relevant interrupt has to be configured in the timer module. Application has to start the timer to enable DTC after sensor source addresses are registered.

### Data Feed Mode

Data feed mode will require data producer to push data directly to the designated frame buffer whenever data is ready. Data can be pushed synchronously or asynchronously. Synchronous mode is for use cases that the data producer has a short amount of data to be copied to the frame buffer. Asynchronous mode is to use DTC/DMAC for data transfer. Application has to add DTC/DMAC

modules and initialize transfer descriptors for asynchronous transfer.

**Usage Notes**

1. Do not add DTC stack and timer stack to data collector instance for data feed mode.
2. Users must take care to make sure all channels of a data collector instance will work at the same pace.
3. Interrupt priority level of the timer stack in the data collector instance must be higher (numerically lower) than that of RM COMMS USB PCDC GPT Overflow interrupt.

# Configuration

### Build Time Configurations for rm_rai_data_collector

The following build time configurations are defined in fsp_cfg/rm_rai_data_collector_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Max Number Of Channels | Value must be a positive integer less than or equal to 16 | 16 | Max number of channels. |

### Configurations for AI > Data Collector (rm_rai_data_collector)

This module can be added to the Stacks tab via New Stack > AI > Data Collector (rm_rai_data_collector).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_rai_data_collector0 | Module name. |
| ID | Value must be a positive integer. | 0 | Instance ID |
| Frame Buffer Length | Value must be a positive integer greater than 0 | 100 | Length of frame buffers in data samples. |
| Data Ready Callback | Name must be a valid C symbol | rai_data_collector0_callback | Callback function on data ready. |
| Error Callback | Name must be a valid C symbol | rai_data_collector0_error_callback | Callback function for error events. |
| Data Feed Mode | | | |
| Data Feed Mode > Channel 0 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch0 | Channel name |

| | | | |
|---|---|---|---|
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 1 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch1 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 2 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch2 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 3 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch3 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 4 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch4 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 5 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch5 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 6 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch6 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Data Feed Mode > Channel 7 | | | |
| Name | Must be valid C variable name | dc0_data_feed_ch7 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Channels | Value must be an integer between 0 and 8 | 0 | Number of Data Feed Mode channels. |
| Snapshot Mode | | | |
| Snapshot Mode > Channel 0 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch0 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 1 | | | |

| | | | |
|---|---|---|---|
| Name | Must be valid C variable name | dc0_snapshot_ch1 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 2 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch2 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 3 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch3 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 4 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch4 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 5 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch5 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 6 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch6 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Snapshot Mode > Channel 7 | | | |
| Name | Must be valid C variable name | dc0_snapshot_ch7 | Channel name |
| Data Type | MCU Specific Options | | Channel Data Type |
| Channels | Value must be an integer between 0 and 8 | 0 | Number of snapshot mode channels. |
| DTC Transfer Count | Value must be a positive integer greater than 0 | 1 | DTC transfer count on each activation |

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

# Examples

### Snapshot Mode Example

```
extern rai_data_collector_cfg_t g_dc_cfg;
extern rai_data_collector_instance_t g_dc_ctrl;
static rai_data_collector_frame_buffer_t g_frame_buf[DC_TEST_CHAN_COUNT];
static uint8_t g_sensor_buf[DC_TEST_CHAN_COUNT][DC_TEST_CHAN_BUFFER_LEN];
static bool g_data_ready = false;
static bool g_exit = false;
static rai_data_collector_error_event_t g_dc_error_event =
RAI_DATA_COLLECTOR_ERROR_TYPE_NONE;
static rai_data_collector_callback_args_t g_data_ready_callback_arg;
/* Data ready callback called when all sensor data are ready. */
void data_ready_callback_test (const rai_data_collector_callback_args_t * p_args)
{
 /* Time consuming job should be done in the application. Just save a copy here. */
    g_data_ready_callback_arg.frame_buf_len = p_args->frame_buf_len;

   assert(FSP_SUCCESS == err);
}
```

### Data Feed Synchronous Mode Example

*Note*

*The data collector callback functions from the first example apply to this example as well.*

```
extern const timer_cfg_t g_timer1_cfg;
extern gpt_instance_ctrl_t g_timer1_ctrl;
static uint8_t
g_data_feed_sync_mode_buf[DC_TEST_CHAN_COUNT][DC_TEST_CHAN_BUFFER_LEN];
void timer_callback (const timer_callback_args_t * p_args)
{
 fsp_err_t err;
 FSP_PARAMETER_NOT_USED(p_args);
 for (uint8_t i = 0; i < DC_TEST_CHAN_COUNT; i++)
    {
       err = RM_RAI_DATA_COLLECTOR_ChannelWrite(&g_dc_ctrl,
                                                i,
                                                (void *)
g_data_feed_sync_mode_buf[i],
                                                DC_TEST_CHAN_BUFFER_LEN);
      assert(FSP_SUCCESS == err);
    }
}
void rm_rai_data_collector_data_feed_mode_synchronous_example ()
{
 fsp_err_t err;
    err = RM_RAI_DATA_COLLECTOR_Open(&g_dc_ctrl, &g_dc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 R_GPT_Open(&g_timer1_ctrl, &g_timer1_cfg);
 R_GPT_Reset(&g_timer1_ctrl);
 R_GPT_Start(&g_timer1_ctrl);
 do
    {
```

```
 /* Process error event */
 if (RAI_DATA_COLLECTOR_ERROR_TYPE_BUF_OUT_OF_SYNC & g_dc_error_event)
      {
 /* Error! Please reconfigure sensors to make sure they all work at the same pace.*/
            g_dc_error_event = RAI_DATA_COLLECTOR_ERROR_TYPE_NONE;
      }
 if (g_data_ready)
      {
 /* Process collected data saved in g_frame_buf */
            do_data_process(g_data_ready_callback_arg.instance_id,
                            g_data_ready_callback_arg.frames,
                            g_data_ready_callback_arg.frame_buf_len,
                            g_data_ready_callback_arg.p_frame_buf);
            g_data_ready = false;
 /* Release buffer when done */
 RM_RAI_DATA_COLLECTOR_BufferRelease(&g_dc_ctrl);
      }
    } while (!g_exit);
 R_GPT_Stop(&g_timer1_ctrl);
 R_GPT_Close(&g_timer1_ctrl);
    err = RM_RAI_DATA_COLLECTOR_Close(&g_dc_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Data Feed Asynchronous Mode Example

*Note*

*The data collector callback functions from the first example apply to this example as well.*

```
extern const transfer_cfg_t g_dmac_cfg[DC_TEST_CHAN_COUNT];
extern dmac_instance_ctrl_t g_dmac_ctrl[DC_TEST_CHAN_COUNT];
static uint16_t g_data_feed_async_mode_cnt[DC_TEST_CHAN_COUNT];
static uint8_t * g_data_feed_async_mode_buf[DC_TEST_CHAN_COUNT];
void dma_callback (const dmac_callback_args_t * p_args)
{
```

```
    uint8_t chan = *(uint8_t *) p_args->p_context;
    g_data_feed_async_mode_cnt[chan]++;
    if (DC_TEST_REQUIRED_FRAME_LEN == g_data_feed_async_mode_cnt[chan])
    {
 fsp_err_t err =
 RM_RAI_DATA_COLLECTOR_ChannelBufferGet(&g_dc_ctrl, chan, (void **)
&g_data_feed_async_mode_buf[chan]);
      assert(FSP_SUCCESS == err);
       g_data_feed_async_mode_cnt[chan] = 0;
    }

## Data Structures

| | |
|---|---|
| struct | rai_data_collector_instance_ctrl_t |

## Data Structure Documentation

### ◆ rai_data_collector_instance_ctrl_t

| struct rai_data_collector_instance_ctrl_t |
|---|
| RAI_DATA_COLLECTOR instance control block. Initialization occurs when RM_RAI_DATA_COLLECTOR_Open() is called. |

## Function Documentation

### ◆ RM_RAI_DATA_COLLECTOR_Open()

fsp_err_t RM_RAI_DATA_COLLECTOR_Open ( rai_data_collector_ctrl_t *const *p_api_ctrl*, rai_data_collector_cfg_t const *const *p_cfg* )

Opens and configures the Data Collector module.

Implements rai_data_collector_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data Collector successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotChannelRegister ( rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, void const * *p_src* )

Config transfer src address for snapshot mode channel

Implements rai_data_collector_api_t::snapshotChannelRegister().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Src addresses are set. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_COLLECTOR_BufferReset()

fsp_err_t RM_RAI_DATA_COLLECTOR_BufferReset ( rai_data_collector_ctrl_t *const *p_api_ctrl*)

Reset to discard accumulated data and start with PING buffer.

***Note***

*Application must stop data transfer on all channels first.*

Implements rai_data_collector_api_t::bufferReset().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data Collector module internal buffers reset. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_COLLECTOR_BufferRelease()

fsp_err_t RM_RAI_DATA_COLLECTOR_BufferRelease ( rai_data_collector_ctrl_t *const *p_api_ctrl*)

Release frame buffer

Implements rai_data_collector_api_t::bufferRelease().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Buffer released. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_COLLECTOR_ChannelBufferGet()

fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelBufferGet ( rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, void ** *pp_buf* )

Get channel destination buffer address for asynchronous data transfer.

Implements rai_data_collector_api_t::channelBufferGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Buffer available. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_COLLECTOR_ChannelWrite()

fsp_err_t RM_RAI_DATA_COLLECTOR_ChannelWrite ( rai_data_collector_ctrl_t *const *p_api_ctrl*, uint8_t *channel*, const void * *p_buf*, uint32_t *len* )

Synchronouse data transfer using CPU copy.

Implements rai_data_collector_api_t::channelWrite().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data copy completed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_COLLECTOR_SnapshotStart()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStart ( rai_data_collector_ctrl_t *const *p_api_ctrl*)

Starts snapshot mode channels

Implements rai_data_collector_api_t::snapshotStart().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Snapshot mode started. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |
| FSP_ERR_UNSUPPORTED | No snapshot mode channel |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_RAI_DATA_COLLECTOR_SnapshotStop()

fsp_err_t RM_RAI_DATA_COLLECTOR_SnapshotStop ( rai_data_collector_ctrl_t *const *p_api_ctrl*)

Stops snapshot mode channels

Implements rai_data_collector_api_t::snapshotStop().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Snapshot mode stopped. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |
| FSP_ERR_UNSUPPORTED | No snapshot mode channel |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_RAI_DATA_COLLECTOR_Close()

fsp_err_t RM_RAI_DATA_COLLECTOR_Close ( rai_data_collector_ctrl_t *const *p_api_ctrl*)

Closes Data Collector module instance.

Implements rai_data_collector_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data Collector module closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

## 5.2.2.3 Reality AI Data Shipper (rm_rai_data_shipper)

Modules » AI

**Functions**

| | |
|---|---|
| fsp_err_t | RM_RAI_DATA_SHIPPER_Open (rai_data_shipper_ctrl_t *const p_api_ctrl, rai_data_shipper_cfg_t const *const p_cfg) |
| fsp_err_t | RM_RAI_DATA_SHIPPER_Read (rai_data_shipper_ctrl_t *const p_api_ctrl, void *const p_buf, uint32_t *const buf_len) |

| | |
|---|---|
| fsp_err_t | RM_RAI_DATA_SHIPPER_Write (rai_data_shipper_ctrl_t *const p_api_ctrl, rai_data_shipper_write_params_t const *p_write_params) |
| fsp_err_t | RM_RAI_DATA_SHIPPER_Close (rai_data_shipper_ctrl_t *const p_api_ctrl) |

### Detailed Description

Middleware to implement the Data Shipper for Reality AI applications. This module implements the Data Shipper Interface.

# Overview

RAI Data Shipper is mainly for sending data collected by RAI Data Collector to PC so that they can be used for Reality AI model training. It utilizes the Communications Middleware Interface and all communications are fully asynchronous. The data being transported may be any combination of the following:

- Sensor data
- System events/errors
- Debug data and diagnostic information, including RAI runtime output

Sensor data is provided by Data Collector via data ready callback. System events and debug data are filled up by application. A callback is used to notify application that communication is finished. RM_COMMS_EVENT_ERROR will be returned if there is any error during data transmission. Please note sensor data buffer must be released back to data collector when data is no longer used by application. If data shipper is the only data consumer, then RM_RAI_DATA_COLLECTOR_BufferRelease must be called on write error, or in the data shipper callback.

*Note*

*Debug data, diagnostic information, and associated events are provided for debug purposes only and are not tracked by upstream Reality AI tools.*

### Features

1. The RAI Data Shipper module supports up to 8 Data Collector instances.
2. The RAI Data Shipper module supports the following interface:
    - RM_COMMS_UART with/without CRC-8
    - RM_COMMS_USB_PCDC with/without CRC-8

# Configuration

### Build Time Configurations for rm_rai_data_shipper

The following build time configurations are defined in fsp_cfg/rm_rai_data_shipper_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

| | | | |
|---|---|---|---|
| Max Number Of DC Instances | Value must be a positive integer between 1 and 8 | 8 | Max number of DC instances to be sent. |

**Configurations for AI > Data Shipper (rm_rai_data_shipper)**

This module can be added to the Stacks tab via New Stack > AI > Data Shipper (rm_rai_data_shipper).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rai_data_shipper0 | Module name |
| Frame Rate Divider | Value must be non-negative | 0 | Skip write requests |
| Callback | Name must be a valid C symbol | rai_data_shipper0_callback | A user callback function on data sent or error. |

**Clock Configuration**

This module has no required clock configurations.

**Pin Configuration**

This module does not use I/O pins.

**Limitations**

1. 2-way communication hasn't been supported yet - data is always sent from device to host.
2. Users shall take care to avoid race condition in the case of multiple data collector instances.
3. To use RM COMMS USB PCDC with Full Speed mode and DMA, frame buffer length needs to be multiple of 2 when 8-bit channel is used.
4. To use RM COMMS USB PCDC with High Speed mode and DMA, frame buffer length needs to be multiple of 2 when 16-bit channel is used. If 8-bit channel is used, its frame buffer length needs to be a multiple of 4.
5. RAI Data Collector (snapshot mode) and RM COMMS USB PCDC must use different timers. They are independent of each other.

# Examples

**Basic Example**

This is a basic example of minimal use of the Data Shipper implementation in an application.

```
void RM_RAI_DATA_SHIPPER_example();

void data_shipper_callback(rai_data_shipper_callback_args_t * p_args);

extern rai_data_shipper_cfg_t g_ds_cfg;

extern rai_data_shipper_instance_ctrl_t g_ds_ctrl;

extern rai_data_collector_instance_ctrl_t g_dc_ctrl;
```

```
static bool g_exit = false;
extern bool g_data_ready;
extern rai_data_collector_callback_args_t g_data_ready_callback_arg;
void RM_RAI_DATA_SHIPPER_example ()
{
 fsp_err_t err;
    err = RM_RAI_DATA_SHIPPER_Open(&g_ds_ctrl, &g_ds_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!g_exit)
    {
 if (g_data_ready)
      {
 rai_data_shipper_write_params_t g_write_params;
            g_write_params.p_sensor_data = &g_data_ready_callback_arg;
 /* Application is responsible to initialize diagnostic information and events. */
 /* Application has no diagnostic information/events to report. */
            g_write_params.diagnostic_data_len = 0;
            g_write_params.events             = 0;
            g_write_params.p_diagnostic_data   = NULL;
            err = RM_RAI_DATA_SHIPPER_Write(&g_ds_ctrl, &g_write_params);
 if (FSP_SUCCESS != err)
      {
 /* Please note callback won't be called on write error */
 /* Release data buffer only when data is no longer used by application. */
 RM_RAI_DATA_COLLECTOR_BufferRelease(&g_dc_ctrl);
            }
            g_data_ready = false;
       }
    }
    err = RM_RAI_DATA_SHIPPER_Close(&g_ds_ctrl);
    assert(FSP_SUCCESS == err);
}
/* Called when all sensor data are sent or there is an error */
```

```
void data_shipper_callback (rai_data_shipper_callback_args_t * p_args)
{
 if (RM_COMMS_EVENT_ERROR == p_args->result)
    {
 /* Communication error */
    }
 /* Release data buffer only when data is no longer used by application. */
 RM_RAI_DATA_COLLECTOR_BufferRelease(&g_dc_ctrl);
}
```

### Data Structures

| | |
|---|---|
| struct | rai_data_shipper_instance_ctrl_t |

## Data Structure Documentation

### ◆ rai_data_shipper_instance_ctrl_t

| struct rai_data_shipper_instance_ctrl_t |
|---|
| RAI_DATA_SHIPPER instance control block. Initialization occurs when RM_RAI_DATA_SHIPPER_Open() is called. |

## Function Documentation

### ◆ RM_RAI_DATA_SHIPPER_Open()

fsp_err_t RM_RAI_DATA_SHIPPER_Open ( rai_data_shipper_ctrl_t *const *p_api_ctrl*, rai_data_shipper_cfg_t const *const *p_cfg* )

Opens and configures the Data Shipper module.

Implements rai_data_shipper_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data Shipper successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_RAI_DATA_SHIPPER_Read()

fsp_err_t RM_RAI_DATA_SHIPPER_Read ( rai_data_shipper_ctrl_t *const *p_api_ctrl*, void *const *p_buf*, uint32_t *const *buf_len* )

Read data.

Implements rai_data_shipper_api_t::read().

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Data Shipper module read not supported |

### ◆ RM_RAI_DATA_SHIPPER_Write()

fsp_err_t RM_RAI_DATA_SHIPPER_Write ( rai_data_shipper_ctrl_t *const *p_api_ctrl*, rai_data_shipper_write_params_t const * *p_write_params* )

Write data. Note this function may be called in ISR.

Implements rai_data_shipper_api_t::write().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Tx buf list created and transmission starts, or write request skipped. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

### ◆ RM_RAI_DATA_SHIPPER_Close()

fsp_err_t RM_RAI_DATA_SHIPPER_Close ( rai_data_shipper_ctrl_t *const *p_api_ctrl*)

Closes Data Shipper module instance.

Implements rai_data_shipper_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data Shipper module closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

## 5.2.3 Audio

Modules

### Detailed Description

Audio Modules.

### Modules

| fsp_err_t | RM_ADPCM_DECODER_Close (adpcm_decoder_ctrl_t *p_ctrl) |

### Detailed Description

Middleware to implement the ADPCM Audio Decoder. This module implements the ADPCM Decoder Interface.

# Overview

### Features

The ADPCM Audio Decoder has the following key features:

- Decodes 4-bit ADPCM input to 16-bit PCM output

# Configuration

### Build Time Configurations for rm_adpcm_decoder

The following build time configurations are defined in fsp_cfg/rm_adpcm_decoder_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Audio > ADPCM Decoder (rm_adpcm_decoder)

This module can be added to the Stacks tab via New Stack > Audio > ADPCM Decoder (rm_adpcm_decoder).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_adpcm_decoder0 | Module name. |

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

# Examples

### Basic Example

This is a basic example of minimal use of the ADPCM Audio Decoder implementation in an application.

```
void rm_adpcm_decoder_example ()
{
```

```
 /* Open the ADPCM audio decoder instance. */
 fsp_err_t err = RM_ADPCM_DECODER_Open(&g_adpcmdec_ctrl, &g_adpcmdec_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Decode the data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream1, g_pcm_stream,
ADPCM_BUFFER_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Reset the ADPCM audio decoder instance before decoding a new stream. */
    err = RM_ADPCM_DECODER_Reset(&g_adpcmdec_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decode the first chunk of ADPCM data */
    err = RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, g_adpcm_stream2, g_pcm_stream,
(ADPCM_BUFFER_SIZE_BYTES / 2));
    assert(FSP_SUCCESS == err);
 /* Decode the second chunk of ADPCM data */
    err =
 RM_ADPCM_DECODER_Decode(&g_adpcmdec_ctrl, &g_adpcm_stream2[ADPCM_BUFFER_SIZE_BYTES /
2], g_pcm_stream,
                            (ADPCM_BUFFER_SIZE_BYTES / 2));
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

| | |
|---|---|
| struct | adpcm_decoder_instance_ctrl_t |

## Data Structure Documentation

### ◆ adpcm_decoder_instance_ctrl_t

| struct adpcm_decoder_instance_ctrl_t |
|---|
| RM_ADPCM_DECODER instance control block. DO NOT INITIALIZE. Initialized in adpcm_decoder_api_t::open(). |

## Function Documentation

### ◆ RM_ADPCM_DECODER_Open()

fsp_err_t RM_ADPCM_DECODER_Open ( adpcm_decoder_ctrl_t * *p_ctrl*, adpcm_decoder_cfg_t const *const *p_cfg* )

Initializes ADPCM audio decoder device.

Implements adpcm_decoder_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is ready for use. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_ALREADY_OPEN | The instance control structure has already been opened. |

### ◆ RM_ADPCM_DECODER_Decode()

fsp_err_t RM_ADPCM_DECODER_Decode ( adpcm_decoder_ctrl_t *const *p_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t *src_len_bytes* )

Decodes 4bit ADPCM data to 16bit PCM data. It reads ADPCM data from area pointed by inputAddr pointer, decodes the number of samples specified and stores the decoded data in buffer pointed with outputAddr pointer.

Implements adpcm_decoder_api_t::decode().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Decode operation successfully completed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ RM_ADPCM_DECODER_Reset()

fsp_err_t RM_ADPCM_DECODER_Reset ( adpcm_decoder_ctrl_t * *p_ctrl*)

This function resets the ADPCM decoder device.

Implements adpcm_decoder_api_t::reset().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

### ◆ RM_ADPCM_DECODER_Close()

fsp_err_t RM_ADPCM_DECODER_Close ( adpcm_decoder_ctrl_t * *p_ctrl*)

This function closes the ADPCM decoder device.

Implements adpcm_decoder_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module closed. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | Unit is not open. |

## 5.2.3.2 Audio Playback PWM (rm_audio_playback_pwm)

Modules » Audio

### Functions

| | |
|---|---|
| fsp_err_t | RM_AUDIO_PLAYBACK_PWM_Open (audio_playback_ctrl_t *const p_api_ctrl, audio_playback_cfg_t const *const p_cfg) |
| fsp_err_t | RM_AUDIO_PLAYBACK_PWM_Close (audio_playback_ctrl_t *const p_api_ctrl) |

| fsp_err_t | RM_AUDIO_PLAYBACK_PWM_Play (audio_playback_ctrl_t *const p_api_ctrl, void const *const p_buffer, uint32_t length) |

### Detailed Description

Driver for the Audio Playback middleware on RA MCUs. This module implements the AUDIO PLAYBACK Interface.

# Overview

### Features

The Audio Playback with PWM middleware is used to play audio streams at user selected playback rate using Pulse Width Modulation hardware on GPT or AGT timers. This module can play 16-bit or 32-bit(available on selected MCUs) uncompressed, unsigned PCM audio stream when AGT is selected

as PWM interface, and can play 32-bit uncompressed, unsigned PCM audio stream when GPT is used as PWM interface. Note some MCUs have 16-bit GPT timers/channels. In this case audio stream still needs to be 32 bits because the duty cycle register is 32-bit - just the upper 16 bits are ignored. The application code is expected to convert the signed PCM data to unsigned PCM data and scale it with the playback rate before starting the playback.

# Configuration

### Build Time Configurations for rm_audio_playback_pwm

The following build time configurations are defined in fsp_cfg/rm_audio_playback_pwm_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | • Enabled<br>• Disabled | Disabled | Select if DMAC will be used. |

### Configurations for Audio > Audio Playback PWM (rm_audio_playback_pwm)

This module can be added to the Stacks tab via New Stack > Audio > Audio Playback PWM (rm_audio_playback_pwm).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_rm_audio_playback0 | Module name. |
| Playback Speed (Hz) | Must be an integer and greater than 0 | 44100 | Enter playback sample rate in Hz. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | g_rm_audio_playback0_callback | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the playback completes. |
| PWM Output Pin | • Pin A<br>• Pin B | Pin A | Select which timer output pin should be used for audio output. |

### Clock Configuration

The Audio Playback with PWM module does not require a specific clock configuration.

### Pin Configuration

Configure the PWM output pins for selected PWM HAL layer peripheral (AGT/GPT). One of the following pins needs to be selected and enabled as PWM output for selected channel n,

If GPT is used as PWM interface,

- GTIOCAn
- GTIOCBn

If AGT is used as PWM interface,

- AGTOAn
- AGTOBn

## Usage Notes

### DMAC/DTC Integration

DMAC/DTC is used as a lower level transfer instance with this module and is operated in Normal mode to transfer 16 bit or 32 bit data from the audio stream buffer to the PWM peripheral AGT or GPT respectively. Destination address for transfer instance needs to be the Duty Cycle setting register GTCCR for GPT as PWM driver or AGTMA/AGTCMB in case of AGT as PWM driver. The Audio Playback with PWM module internally configures 'Transfer Size' as 2 Bytes if AGT is used for PWM generation, otherwise it configures 'Transfer Size" as 4 Bytes if GPT or AGTW is used for PWM generation. Refer the hardware manual to check whether the MCU supports AGT or the AGTW peripheral.

## Examples

### Basic Example

This is a basic example of minimal use of the RM_AUDIO_PLAYBACK_PWM in an application. This example shows how this driver can be used for playing a 16 bit uncompressed PCM audio from a single input buffer.

```
int16_t play_buffer[AUDIO_EXAMPLE_LENGTH];
uint32_t g_audio_callback_counter = 0;
void g_audio_example_counter_callback (audio_playback_callback_args_t * p_args)
{
 if (AUDIO_PLAYBACK_EVENT_PLAYBACK_COMPLETE == (p_args->event))
    {
       g_audio_callback_counter++;
    }
}
void basic_example (void)
{
```

```
 fsp_err_t err;
 /* Initialize the Audio Playback module for playing an audio stream. */
    err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set the 16 Bit PCM audio stream to play next */
    err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start to the play the selected audio stream*/
    err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait till the playback is completed */
 while (g_audio_callback_counter == 0)
    {
       ;
    }
 /* Stop playing. */
    err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

### Streaming Example

This is an example of using Audio Playback module to play audio stream. This application uses a double buffer to store PCM sine wave data. It starts playing in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart playing in the main loop. This example also demonstrates conversion of signed PCM format data to unsigned PWM format data along with scaling the data samples for optimum PWM wave generation.

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_PERIOD_VALUE_AT_22050HZ (0x11B7U)
```

```
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER (1024U)
#define AUDIO_PLAYBACK_PWM_EXAMPLE_CONVERT_TO_PWM_SAMPLES (32768U)
#define AUDIO_PLAYBACK_PWM_STREAMING_EXAMPLE_DATA_BIT_SIZE (16U)
int16_t       g_stream_src[2][AUDIO_PLAYBACK_PWM_EXAMPLE_SAMPLES_TO_TRANSFER];

### Data Structures

| | |
|---|---|
| struct | audio_playback_pwm_instance_ctrl_t |

## Data Structure Documentation

### ◆ audio_playback_pwm_instance_ctrl_t

| struct audio_playback_pwm_instance_ctrl_t | |
|---|---|
| AUDIO_PLAYBACK_PWM instance control block. DO NOT MODIFY. Initialization occurs when RM_AUDIO_PLAYBACK_PWM_Open() is called. | |
| **Data Fields** | |
| void(* | p_callback )(audio_playback_callback_args_t *p_args) |
| | |
| void * | p_context |
| | |
| audio_playback_cfg_t const * | p_cfg |
| | Pointer to the configuration structure. |
| | |
| uint32_t | open |
| | Used by driver to check if the control structure is valid. |
| | |
| timer_instance_t const * | p_lower_lvl_timer |
| | Timer API used to generate sampling frequency and GPT/AGT API used to access PWM hardware. |
| | |
| transfer_instance_t const * | p_lower_lvl_transfer |
| | Transfer API used to transfer data each sampling frequency. |

## Field Documentation

### ◆ p_callback

void(* audio_playback_pwm_instance_ctrl_t::p_callback) (audio_playback_callback_args_t *p_args)

Callback called when play is complete.

### ◆ p_context

void* audio_playback_pwm_instance_ctrl_t::p_context

Placeholder for user data. Passed to the user callback in audio_playback_callback_args_t.

## Function Documentation

### ◆ RM_AUDIO_PLAYBACK_PWM_Open()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Open ( audio_playback_ctrl_t *const *p_api_ctrl*, audio_playback_cfg_t const *const *p_cfg* )

Opens and configures the Audio Playback with PWM driver. Sets playback speed and transfer rate to read the audio buffer.

Example:

```
/* Initialize the Audio Playback module for playing an audio stream. */
   err = RM_AUDIO_PLAYBACK_PWM_Open(&g_audio_playback_pwm_ctrl,
&g_audio_playback_pwm_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Audio Playback module successfully configured. |
| FSP_ERR_ALREADY_OPEN | Module already open. |
| FSP_ERR_ASSERTION | One or more pointers point to NULL or callback is NULL. |

### ◆ RM_AUDIO_PLAYBACK_PWM_Close()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Close ( audio_playback_ctrl_t *const *p_api_ctrl*)

Closes the module driver. Enables module stop mode.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module successfully closed. |
| FSP_ERR_NOT_OPEN | Driver not open. |
| FSP_ERR_ASSERTION | Pointer pointing to NULL. |

***Note***

*This function will close all the lower level HAL drivers as well.*

### ◆ RM_AUDIO_PLAYBACK_PWM_Start()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Start ( audio_playback_ctrl_t *const *p_api_ctrl*)

Start the PWM HAL driver (AGT or GPT) and timer HAL (AGT or GPT) drivers.

- Example:

```
/* Start to the play the selected audio stream*/
   err = RM_AUDIO_PLAYBACK_PWM_Start(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Audio playback hardware started successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not open. This function calls<br>• timer_api_t::start |

### ◆ RM_AUDIO_PLAYBACK_PWM_Stop()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Stop ( audio_playback_ctrl_t *const *p_api_ctrl*)

Stop the PWM HAL driver (AGT or GPT) and timer HAL driver (AGT or GPT).

- Example:

```
/* Stop playing. */
   err = RM_AUDIO_PLAYBACK_PWM_Stop(&g_audio_playback_pwm_ctrl);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Audio playback hardware stopped successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not open. This function calls<br>• timer_api_t::stop |

### ◆ RM_AUDIO_PLAYBACK_PWM_Play()

fsp_err_t RM_AUDIO_PLAYBACK_PWM_Play ( audio_playback_ctrl_t *const *p_api_ctrl*, void const *const *p_buffer*, uint32_t *length* )

Play a single audio buffer by input samples to the PWM HAL (AGT or GPT) at the sampling frequency configured by the timer.

- Example:

```
/* Set the 16 Bit PCM audio stream to play next */
   err = RM_AUDIO_PLAYBACK_PWM_Play(&g_audio_playback_pwm_ctrl, play_buffer,
AUDIO_EXAMPLE_LENGTH);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Buffer playback began successfully. |
| FSP_ERR_ASSERTION | The parameter p_ctrl or p_buffer is NULL or buffer length is greater than 0x10000. |
| FSP_ERR_NOT_OPEN | Driver not open.. This function calls<br>• transfer_api_t::reset |

#### 5.2.3.3 Minimp3 Library

Modules » Audio

Minimalistic, single-header library for decoding MP3.

# Overview

Integration of minimp3 library with FSP RA.

# Usage

For detailed usage of minimp3, please visit https://github.com/lieff/minimp3.

**ARM Helium Support**

Helium (with SIMD support) can be enabled to accelerate the decoding process on devices that

support it.

**Limitations**

**Minimp3** requires a MCU with 32KB of RAM size or more to function properly.

Minimum stack usage is 18KB that must be considered the stack size under BSP configuration tab to ensure provide enough stack for the software operation.

This library uses floating-point numbers in its operation, therefore it shall be used on MCUs that have FPU. Non-FPUs are still able to use this library but the performance will be significantly degraded.

**How to use**

To use minimp3 library, follow the steps below:

- In e2studio, add minimp3 stack by selecting **New Stack -> Audio -> Minimp3 Library Source**.
- Fix stack constraints and choose **Generate Project Content**.
- In your source code, remember to include **minimp3.h** or **minimp3_ex.h**.

# Configuration

### Build Time Configurations for Lib

The following build time configurations are defined in fsp_cfg/minimp3/minimp3_config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Float Output | • Enabled<br>• Disabled | Disabled | Output PCM as float instead of short |
| SIMD Optimization | • Enabled<br>• Disabled | Disabled | Enable SIMD optimization for MP3 decoding using Arm Helium (MVE). |
| Decode MP3 only | • Enabled<br>• Disabled | Disabled | Enable this option to skip MP1/MP2 and only support MP3 decoding. |

# Examples

### Minimp3 Basic Example

This is a basic example demonstrating minimal usage of the minimp3 library implementation in an application.

```
void minimp3_basic_example ()
{
    uint32_t            mp3_offset = 0;
    uint32_t            pcm_offset = 0;
```

```
    mp3dec_frame_info_t frame_info;
    mp3dec_t            mp3dec;
 /* Initialize for decoding a new position */
    mp3dec_init(&mp3dec);
 /* Decode MP3 data frame by frame */
 do
    {
 /* Decode a frame */
 int samples = mp3dec_decode_frame(&mp3dec,
                                        g_mp3_buf + mp3_offset,
                                        (int) (MP3_BUFFER_SIZE_BYTES - mp3_offset),
                                        g_pcm_buf + pcm_offset,
                                        &frame_info);
 /* Update position offset of MP3 and PCM data */
       mp3_offset += (uint32_t) (frame_info.frame_bytes);
       pcm_offset += (uint32_t) (samples * frame_info.channels);
    } while (MP3_BUFFER_SIZE_BYTES != mp3_offset);
}
```

### Minimp3 Streaming Example

This example demonstrates streaming usage of the minimp3 library implementation in an application.

```
void minimp3_streaming_example ()
{
    uint8_t          * p_mp3_feed_pos;
    uint32_t            mp3_feed_size;
    mp3d_sample_t       pcm_data[MINIMP3_MAX_SAMPLES_PER_FRAME];
    mp3dec_frame_info_t frame_info;
    mp3dec_t            mp3dec;
 /* Initialize for decoding a new position */
    mp3dec_init(&mp3dec);
 /* Stream MP3 data frame by frame */
 do
```

```
    {
 /* Update MP3 data position and MP3 data size.
  * This is a user-defined function for providing continuous MP3 data for streaming.
*/
       mp3_read(&p_mp3_feed_pos, &mp3_feed_size);
 /* Decode one frame */
 int samples = mp3dec_decode_frame(&mp3dec, p_mp3_feed_pos, (int) mp3_feed_size,
pcm_data, &frame_info);
 /* Get PCM data output size. */
       uint32_t pcm_size = (uint32_t) (samples * frame_info.channels);
 /* Handle PCM data output.
  * This is a user-defined function for handling PCM data output after each frame is
decoded. */
       pcm_progress(pcm_data, pcm_size);
    } while (mp3_feed_size);
}
```

### Detailed Description

Driver for the PDM peripheral on RA MCUs. This module implements the PDM Interface.

# Overview

The Pulse Density Modulation Interface (PDM-IF) has channels that are connectable with external microphone which outputs the pulse density modulated signal. PDM-IF can filter and convert 1-bit digital data streams that were pulse density modulated at a high sampling rate into 20-bit or 16-bit digital data at a lower sampling rate.

### Features

- Capable of filtering 1-bit digital input data and converting them into 20-bit or 16-bit digital data. The bit order is little-endian.
- Sound detection can be enabled for each channel. A moving average filter can be enabled for sound detection. Sound detection can be used to wake up the MCU from software standby mode.
- Each channel of IP includes programmable filters: 4th order sinc filter, high-pass filter (for suppression of DC bias), correction filter (for sinc passband distortion), and half-band decimation filter (for aliasing distortion). – IP supports programmable and flexible decimation ratios. – The sinc filter is selectable as first-, second-, third-, fourth-order.
- IP supports DMA operation through APB. – Each channel has a 32 stage FIFO for receiving converted PDM data.
- Configurable callback for each channel which notifies of received data based on a configurable threshold as well as sound detection and error events.

# Configuration

### Build Time Configurations for r_pdm

The following build time configurations are defined in fsp_cfg/r_pdm_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | • Enabled<br>• Disabled | Disabled | If enabled code for DMAC transfer support is included in the build. |

### Configurations for Audio > PDM (r_pdm)

This module can be added to the Stacks tab via New Stack > Audio > PDM (r_pdm).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Input | | | |
| Edge | • Rising<br>• Falling | Rising | Select the edge of input audio data. |
| PDM_CLK Frequency | Refer to the RA Configuration tool for available options. | module.driver.pdm.clock_div.clock_div_2 | Select PDM_CLK Frequency (Hz). |
| Output | | | |
| Bit Format | • 20 Bits mode {1 Sign bit and [18:0] bits of the buffer}<br>• 20 Bits mode {2 Sign bits and [18:1] bits of the buffer}<br>• 20 Bits mode {3 Sign bits and [18:2] bits of the buffer}<br>• 20 Bits mode {4 Sign bits and [18:3] bits of the buffer}<br>• 16 Bits mode {1 Sign bit and [18:4] bits of the buffer}<br>• 16 Bits mode {1 Sign bit and [17:3] bits of the buffer}<br>• 16 Bits mode {1 Sign bit and [16:2] bits of the buffer}<br>• 16 Bits mode {1 Sign bit and [15:1] bits of the buffer}<br>• 16 Bits mode {1 Sign bit and [14:0] bits of the buffer} | module.driver.pdm.pcm_width.pcm_width_20bits_0_18 | Select the bit format of the PCM data stored into the data FIFO. |
| Target Sampling Frequency (Hz) | Manual Entry | 32000 | Select Target sampling Frequency (Hz). |
| Filter | | | |

Filter > Low-pass Filter

| | | | |
|---|---|---|---|
| Low-pass Filter Input Shift | • No shift<br>• 1-bit right shift<br>• 2-bits right shift<br>• 3-bits right shift | No shift | Select the low-pass (half-band decimation) filter input shift setting. |
| LPF Coefficient h0(10) | Value must be an integer between 0x0000 and 0x1FFF | 0x0400 | Specify the Low-Pass Filter Coefficient h0(10) |
| LPF Coefficient h1(0) | Value must be an integer between 0x0000 and 0x1FFF | 0x1FF8 | Specify the Low-Pass Filter Coefficient h1(0) |
| LPF Coefficient h1(1) | Value must be an integer between 0x0000 and 0x1FFF | 0x000A | Specify the Low-Pass Filter Coefficient h1(1) |
| LPF Coefficient h1(2) | Value must be an integer between 0x0000 and 0x1FFF | 0x1FF0 | Specify the Low-Pass Filter Coefficient h1(2) |
| LPF Coefficient h1(3) | Value must be an integer between 0x0000 and 0x1FFF | 0x0018 | Specify the Low-Pass Filter Coefficient h1(3) |
| LPF Coefficient h1(4) | Value must be an integer between 0x0000 and 0x1FFF | 0x1FDC | Specify the Low-Pass Filter Coefficient h1(4) |
| LPF Coefficient h1(5) | Value must be an integer between 0x0000 and 0x1FFF | 0x0034 | Specify the Low-Pass Filter Coefficient h1(5) |
| LPF Coefficient h1(6) | Value must be an integer between 0x0000 and 0x1FFF | 0x1FB3 | Specify the Low-Pass Filter Coefficient h1(6) |
| LPF Coefficient h1(7) | Value must be an integer between 0x0000 and 0x1FFF | 0x0076 | Specify the Low-Pass Filter Coefficient h1(7) |

| Name | Name must be a valid C symbol | g_pdm0 | Module name. |

| | | | |
|---|---|---|---|
| Channel | Value must be an non-negative integer | 0 | Specify the PDM channel. |

# Usage Notes

### Startup and Settling Time

Upon calling R_PDM_Open the user must wait for the filters to settle and any connected microphones to startup, otherwise PDM data may not be correct upon calling R_PDM_Start.

A macro G_PDMn_FILTER_SETTLING_TIME_US (where n is the channel number) is generated for the settling time. The user can use this macro to delay for the settling time via their preferred method of doing a delay.

In addition to the filter settling time any connected microphone startup time should be accounted for. This can be found in the connected microphone's datasheet.

### Audio Data

PDM hardware converts PDM data to PCM data.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

| Bit Depth | Array Data Type | Required Alignment |
|---|---|---|
| 16 Bits | 32-bit integer, right justified | 4 byte alignment |
| 20 Bits | 32-bit integer, right justified | 4 byte alignment |

### Data Format for 16 Bits

| Bit | Description |
|---|---|
| 31-20 | Fixed to 0 |
| 19-16 | Sign bits |
| 15-0 | Fixed-point data |

### Data Format for 20 Bits

| Bit | Description |
|---|---|
| 31-20 | Fixed to 0 |
| 19-0 | Fixed-point data |

### Modes of Operation

In addition to calling R_PDM_Open, other APIs need to be called to activate certain features of PDM. The following table lists what each API controls:

| API | Features Enabled by API |
|---|---|
| R_PDM_Open | over/undervoltage detection, short circuit detection |

| | |
|---|---|
| R_PDM_Start | data reception via interrupts or DMAC depending configuration, error interrupts |
| R_PDM_SoundDetectionEnable | sound detection, sound detection thresholds, error interrupts |

### Error Interrupts

Error interrupts are only enabled when data reception is enabled (R_PDM_Start has been called) OR sound detection is enabled (R_PDM_SoundDetectionEnable has been called).

R_PDM_StatusGet can be called to get error statuses if error interrupts are not enabled (e.g. if only R_PDM_Open has been called).

### Low Power Mode

*Note*

*In order to use PDM during low power mode MOCO must be enabled for software standby mode (see MOCOSCR register).*

Some microphones support going into a low power mode by changing the PDM clock to a low frequency. In order to do this with r_pdm the module instance should be closed and reopened with a separate configuration that uses a lower PDM clock.

### Limitations

- Stereo mode is not fully supported. Two r_pdm driver instances can be used in combination with the pcm_edge configuration to get left/right stereo output from an appropriately configured PDM data stream, however, the data from these two instances will not be synchronized. Full synchronization of PDM channels requires using PDM mirror registers and starting data reading at the same time between channels. In the future a stereo-specific driver may be implemented using the r_pdm driver as a lower level driver to cover this use case.
- When calling R_PDM_Start any data in the FIFO before DATRE is enabled will be discarded.

## Examples

### Basic Example

```
#define PDM_BUFFER_NUM_SAMPLES 1024 // Number of samples to store in data buffer
#define PDM_CALLBACK_NUM_SAMPLES PDM_BUFFER_NUM_SAMPLES / 2 // Number of samples to
store in data buffer before getting a callback
#define PDM_MIC_STARTUP_TIME_US 35000 // PDM microphone startup time, RA8P1_EK mic
startup time is 35ms
#define PDM_SDE_UPPER_LIMIT 5000 // Detect sound above this value
#define PDM_SDE_LOWER_LIMIT 0xFFF80000 // Detect sound below this value
uint32_t g_pdm0_buffer[PDM_BUFFER_NUM_SAMPLES];
void r_pdm_basic_messaging_core0_example (void)
{
```

```
 /* Open PDM instance. */
 fsp_err_t err = R_PDM_Open(&g_pdm0_ctrl, &g_pdm0_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for PDM filters to settle. Use settling time calculated by e2 studio.
  * Also wait for PDM mic to startup. */
 R_BSP_SoftwareDelay(G_PDM0_FILTER_SETTLING_TIME_US + PDM_MIC_STARTUP_TIME_US,
BSP_DELAY_UNITS_MICROSECONDS);
 /* Enable sound detection (if desired). */
 pdm_sound_detection_setting_t sound_detection_setting =
    {
       .sound_detection_lower_limit = PDM_SDE_LOWER_LIMIT,
       .sound_detection_upper_limit = PDM_SDE_UPPER_LIMIT
    };
 fsp_err_t err = R_PDM_SoundDetectionEnable(&g_pdm0_ctrl, sound_detection_setting);
    assert(FSP_SUCCESS == err);
 /* Start receiving PDM data. */
    err = R_PDM_Start(&g_pdm0_ctrl, g_pdm0_buffer, sizeof(g_pdm0_buffer),
PDM_CALLBACK_NUM_SAMPLES);
    assert(FSP_SUCCESS == err);
 /* DATA PROCESSING HERE */
 /* Stop receiving PDM data. */
    err = R_PDM_Stop(&g_pdm0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Close PDM instance. */
    err = R_PDM_Close(&g_pdm0_ctrl);
    assert(FSP_SUCCESS == err);
}
void pdm_example_callback (pdm_callback_args_t * p_args)

| PDM_CLOCK_DIV_32 | 1111b: 1/32 |

### ◆ pdm_moving_average_mode_t

| enum pdm_moving_average_mode_t | |
|---|---|
| Moving average mode for sound detection data. | |
| Enumerator | |
| PDM_MOVING_AVERAGE_MODE_1_ORDER | 1-order |
| PDM_MOVING_AVERAGE_MODE_2_ORDER | 2-order |
| PDM_MOVING_AVERAGE_MODE_4_ORDER | 4-order |

### ◆ pdm_low_pass_filter_shift_t

| enum pdm_low_pass_filter_shift_t | |
|---|---|
| Low-pass (half-band decimation) filter input shift setting. | |
| Enumerator | |
| PDM_LPF_RIGHT_SHIFT_0 | No shift. |
| PDM_LPF_RIGHT_SHIFT_1 | 1-bit right shift |
| PDM_LPF_RIGHT_SHIFT_2 | 2-bit right shift |
| PDM_LPF_RIGHT_SHIFT_3 | 3-bit right shift |

### ◆ pdm_compensation_filter_shift_t

| enum pdm_compensation_filter_shift_t | |
|---|---|
| Compensation filter input shift setting. | |
| Enumerator | |
| PDM_COMPENSATION_FILTER_RIGHT_SHIFT_0 | No shift. |
| PDM_COMPENSATION_FILTER_RIGHT_SHIFT_1 | 1-bit right shift |
| PDM_COMPENSATION_FILTER_RIGHT_SHIFT_2 | 2-bit right shift |
| PDM_COMPENSATION_FILTER_RIGHT_SHIFT_3 | 3-bit right shift |

### ◆ pdm_high_pass_filter_shift_t

| enum pdm_high_pass_filter_shift_t | |
|---|---|
| High-pass filter input shift setting. | |
| Enumerator | |
| PDM_HPF_RIGHT_SHIFT_0 | No shift. |
| PDM_HPF_RIGHT_SHIFT_1 | 1-bit right shift |
| PDM_HPF_RIGHT_SHIFT_2 | 2-bit right shift |
| PDM_HPF_RIGHT_SHIFT_3 | 3-bit right shift |

### ◆ pdm_sinc_filter_mode_t

| enum pdm_sinc_filter_mode_t | |
|---|---|
| Sinc filter mode setting. | |
| Enumerator | |
| PDM_SINC_FILTER_MODE_1 | 1-order |
| PDM_SINC_FILTER_MODE_2 | 2-order |
| PDM_SINC_FILTER_MODE_3 | 3-order |
| PDM_SINC_FILTER_MODE_4 | 4-order |

### ◆ pdm_interrupt_threshold_t

| enum pdm_interrupt_threshold_t | |
|---|---|
| Data reception interrupt threshold. | |
| Enumerator | |
| PDM_INTERRUPT_THRESHOLD_1 | 000b: Output interrupt when receiving 1 or more data |
| PDM_INTERRUPT_THRESHOLD_2 | 001b: Output interrupt when receiving 2 or more data |
| PDM_INTERRUPT_THRESHOLD_4 | 010b: Output interrupt when receiving 4 or more data |
| PDM_INTERRUPT_THRESHOLD_8 | 011b: Output interrupt when receiving 8 or more data |
| PDM_INTERRUPT_THRESHOLD_16 | 100b: Output interrupt when receiving 16 or more data |

### ◆ pdm_short_circuit_enable_t

| enum pdm_short_circuit_enable_t | |
|---|---|
| Short circuit detection enable setting. | |
| Enumerator | |
| PDM_SHORT_CIRCUIT_DISABLED | Short circuit disabled. |
| PDM_SHORT_CIRCUIT_ENABLED | Short circuit enabled. |

### ◆ pdm_overvoltage_lower_limit_enable_t

| enum pdm_overvoltage_lower_limit_enable_t | |
|---|---|
| Overvoltage lower limit enable setting. | |
| Enumerator | |
| PDM_OVERVOLTAGE_LOWER_LIMIT_DISABLED | Overvoltage lower limit disabled. |
| PDM_OVERVOLTAGE_LOWER_LIMIT_ENABLED | Overvoltage lower limit enabled. |

### ◆ pdm_overvoltage_upper_limit_enable_t

| enum pdm_overvoltage_upper_limit_enable_t | |
|---|---|
| Overvoltage upper limit enable setting. | |
| Enumerator | |
| PDM_OVERVOLTAGE_UPPER_LIMIT_DISABLED | Overvoltage upper limit disabled. |
| PDM_OVERVOLTAGE_UPPER_LIMIT_ENABLED | Overvoltage upper limit enabled. |

### ◆ pdm_buffer_overwrite_detection_enable_t

| enum pdm_buffer_overwrite_detection_enable_t | |
|---|---|
| Buffer overwrite detection enable setting. | |
| Enumerator | |
| PDM_BUFFER_OVERWRITE_DETECTION_DISABLED | Buffer overwrite detection disabled. |
| PDM_BUFFER_OVERWRITE_DETECTION_ENABLED | Buffer overwrite detection enabled. |

## Function Documentation

### ◆ R_PDM_Open()

fsp_err_t R_PDM_Open ( pdm_ctrl_t *const *p_ctrl*, pdm_cfg_t const *const *p_cfg* )

Opens the PDM. Implements pdm_api_t::open.

This function sets this clock divisor and the configurations specified in pdm_cfg_t.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Ready for PDM communication. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl or p_cfg is null. |
| FSP_ERR_ALREADY_OPEN | The control block has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel number is not available on this device. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_PDM_Start()

fsp_err_t R_PDM_Start ( pdm_ctrl_t *const *p_ctrl*, void *const *p_buffer*, size_t const *buffer_size*, uint32_t const *number_of_data_to_callback* )

Starts PDM. Implements pdm_api_t::start.

This function enables reception, and enables any transfer instances used.

The PDM will start on the next frame boundary.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PDM communication stop request issued. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_INVALID_SIZE | The size of buffer is not a multiple of pdm_interrupt_threshold_t. |
| FSP_ERR_INVALID_ALIGNMENT | The alignment of argument buffer_size is not matched with hardware specification. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Returns**

See Common Error Codes or lower level drivers for other possible return codes.

### ◆ R_PDM_Stop()

fsp_err_t R_PDM_Stop ( pdm_ctrl_t *const *p_ctrl*)

Stops PDM. Implements pdm_api_t::stop.

This function disables reception, and disables any transfer instances used.

The PDM will stop on the next frame boundary.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PDM communication stop request issued. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Returns**

See Common Error Codes or lower level drivers for other possible return codes.

### ◆ R_PDM_SoundDetectionEnable()

fsp_err_t R_PDM_SoundDetectionEnable ( pdm_ctrl_t *const *p_ctrl*, pdm_sound_detection_setting_t *sound_detection_setting* )

Configures and enables sound detection. Implements pdm_api_t::soundDetectionEnable.

This function configures sound detection based on the passed in settings. It then enables sound detection.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Sound detection configured and enabled. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Returns**

See Common Error Codes or lower level drivers for other possible return codes.

### ◆ R_PDM_SoundDetectionDisable()

fsp_err_t R_PDM_SoundDetectionDisable ( pdm_ctrl_t *const *p_ctrl*)

Disables sound detection. Implements pdm_api_t::soundDetectionDisable.

This function disables sound detection.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Sound detection disabled. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Returns**

See Common Error Codes or lower level drivers for other possible return codes.

### ◆ R_PDM_Read()

fsp_err_t R_PDM_Read ( pdm_ctrl_t *const *p_ctrl*, void *const *p_dest*, uint32_t const *bytes* )

This function is not supported. Implements pdm_api_t::read.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | This function is not supported. |

### ◆ R_PDM_StatusGet()

fsp_err_t R_PDM_StatusGet ( pdm_ctrl_t *const *p_ctrl*, pdm_status_t *const *p_status* )

Gets PDM status and stores it in provided pointer p_status. Implements pdm_api_t::statusGet.

Calling this function will clear any set error flags in the hardware.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored successfully. |
| FSP_ERR_ASSERTION | The p_ctrl or p_status parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

### ◆ R_PDM_Close()

fsp_err_t R_PDM_Close ( pdm_ctrl_t *const *p_ctrl*)

Closes PDM. Implements pdm_api_t::close.

This function powers down the PDM and closes the lower level timer and transfer drivers if they are used.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

### ◆ R_PDM_CallbackSet()

fsp_err_t R_PDM_CallbackSet ( pdm_ctrl_t *const *p_ctrl*, void(*)(pdm_callback_args_t *) *p_callback*, void *const *p_context*, pdm_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements pdm_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

## 5.2.4 Bootloader

Modules

### Detailed Description

Bootloader Modules.

### Modules

| | |
|---|---|
| MCUboot Port (rm_mcuboot_port) | MCUboot Port for RA MCUs. |

### 5.2.4.1 MCUboot Port (rm_mcuboot_port)

Modules » Bootloader

MCUboot Port for RA MCUs.

# Overview

*Note*

*The MCUboot Port does not provide any interfaces to the user. Consult the MCUboot documentation at https://mcu-tools.github.io/mcuboot/ for further information.*
*FSP 6.0.0 changes the way linker scripts are handled which in turn will change how the user configures MCUboot. Where applicable, the documentation below will have a separate section if the usage is markedly different in 6.0.0.*

# Configuration

### Build Time Configurations for MCUboot

The following build time configurations are defined in mcu-tools/include/mcuboot_config/mcuboot_config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Custom mcuboot_config.h | Manual Entry | | Add a path to your custom mcuboot_config.h file. It can be used to override some or all of the configurations |

| | | | |
|---|---|---|---|
| | | | defined here, and to define additional configurations. |
| Upgrade Mode | • Swap<br>• Overwrite Only<br>• Overwrite Only Fast<br>• Direct XIP | Overwrite Only | Swap supports A/B image swapping with rollback. Other modes with simpler code path, which only supports overwriting the existing image with the update image (Overwrite Only) or running the newest image directly from its flash partition (Direct XIP), are also available. |
| Validate Primary Image | • Enabled<br>• Disabled | Enabled | Always check the signature of the image in the primary slot before booting, even if no upgrade was performed. This is recommended if the boot time penalty is acceptable. |
| Downgrade Prevention (Overwrite Only) | • Enabled<br>• Disabled | Disabled | Prevent downgrades by enforcing incrementing version numbers. When this option is set, any upgrade must have greater major version or greater minor version with equal major version. This mechanism only protects against some attacks against version downgrades (for example, a JTAG could be used to write an older version). |
| Watchdog Feed | Manual Entry | | This function might be implemented if the OS / HW watchdog is enabled while doing a swap upgrade and the time it takes for a swapping is long enough to cause an unwanted reset. If implementing this, the OS main.c must also enable the watchdog (if |

| | | | |
|---|---|---|---|
| | | | required)! |
| Measured Boot | • Enabled<br>• Disabled | Disabled | Copies the boot data into the secure RAM, intended to be used by the secure App. |
| Data Sharing | • Enabled<br>• Disabled | Disabled | Copies the user data into the secure RAM, intended to be used by the secure App. |
| Signing and Encryption Options | | | |
| Signing and Encryption Options > TrustZone | | | |
| Boot Record (Image 2) | String length must be 12 characters or less. | | Create CBOR encoded boot record TLV for Image 2. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters] |
| Custom (Image 2) | Manual Entry | --confirm | Add any custom options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent. |
| Signature Type | • None<br>• ECDSA P-256<br>• ECDSA P-384<br>• RSA 2048<br>• RSA 3072 | ECDSA P-256 | Configure the signature type. |
| Boot Record | String length must be 12 characters or less. | | Create CBOR encoded boot record TLV. Represents the role of the software component (e.g. CoFM for coprocessor firmware). [max. 12 characters] |
| Custom | Manual Entry | --confirm | Add any custom |

| | | | |
|---|---|---|---|
| | | | options to pass to imgtool.py here. --pad places a trailer on the image that indicates that the image should be considered an upgrade. Writing this image in the secondary slot will then cause the bootloader to upgrade to it. --confirm marks the image as confirmed, which causes the upgrade to be permanent. |
| Python | Manual Entry | python | Name of the python command to use. Default is python, but can be updated to python3 for Linux or an absolute path if needed. |
| Encryption Scheme | • ECIES-P256<br>• RSA-OAEP (RSA 2048 only)<br>• Encryption Disabled | Encryption Disabled | Choose the encryption scheme. |
| Flash Configuration | | | |
| Dual Bank Mode | MCU Specific Options | | Enable dual bank mode for Direct XIP. |
| Memory Mirror Function (MMF) support | MCU Specific Options | | Use MMF for MCUBoot dxip mode |
| Data Sharing | | | |
| Maximum Measured Boot Record Size (Bytes) | Value must be an integer. | 0x64 | Maximum size of the boot record. |
| Shared Data Size (Bytes) | Value must be an integer. | 0x380 | Size of the shared RAM area. Required for Measured Boot. |
| Shared Data Address | Value must be an integer | 0x20000000 | Shared RAM start address. Required for Measured Boot. |

### Clock Configuration

- This module does not use peripheral clocks.
- For best performance it is recommended to use the fastest clock settings supported by the device in order to reduce boot times.
- **The bootloader must not disable the MOCO prior to calling the application. If the**

**bootloader disables the MOCO, then operation cannot be guaranteed.**

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Getting Started: Creating an MCUboot Project

Start by creating a new project in e² studio or RASC. Select 'Flat Project' template for single-image projects. For TrustZone based projects, select 'TrustZone Secure Project' template and set the clock circuit under the clocks tab to secure. On the Stacks tab, add New > Bootloader > MCUboot. Resolve any constraint errors and edit configurations as desired. Add either the example keys or generate your own key. The MCUboot key generation tool is provided at ra/mcu-tools/MCUboot/scripts/imgtool.py and documented at https://github.com/mcu-tools/mcuboot/blob/master/docs/imgtool.md. Install the following required python packages to use imgtool.py: https://github.com/mcu-tools/mcuboot/blob/master/scripts/requirements.txt.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot > Quick Setup > Call Quick Setup. Add a call to mcuboot_quick_setup() in the application and make any desired updates.

*Note*

*MCUboot will contain either the verification public key or its hash. During production it is necessary to permanently lock the flash region where MCUboot is programmed to prevent the keys or the code from being modified.*

### MCUboot Layout

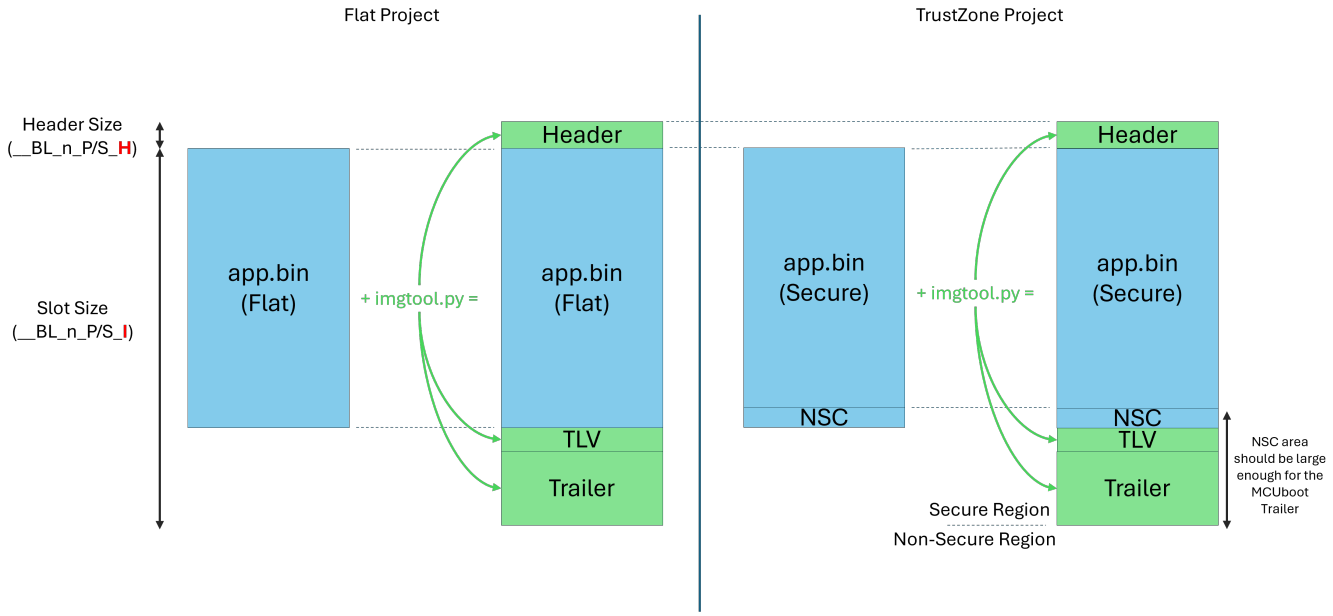

Figure 169: imgtool.py siging script adds header and trailer to user binary

### Getting Started: Signing Tool Prerequisite

To use the MCUboot signing tool, ensure you have Python 3.x installed on your system. Then install the Python packages required for the signing tool with the following command (modifying the path

as needed depending on current directory):

pip3 install --user -r ra/mcu-tools/MCUboot/scripts/requirements.txt

**Getting Started: Converting an Application Project to an MCUboot Image**

MCUboot application images must execute from the image slot defined by the MCUboot project. They are also limited to a single downloadable flash region. All of this is configured in the MCUboot module and the information is added to the generated SecureBundle (.sbd) file in the MCUboot project.

Any existing project can be converted to an MCUboot image.

1. If the project was created with a version prior to FSP v3.0.0, update the linker script to the v3.0.0 version before using it as an MCUboot application image.
2. Right click the project to convert in e² studio or RASC and select Properties.
3. Open C/C++ Build and select Build Variables.
4. Click Add...
5. For Variable Name, enter SmartBundle. For Type, select File. Browse to the *.sbd file created alongside the *.elf file for the associated MCUboot project. If the MCUboot project was specified as the Preceding Project during project creation, this step is done automatically.
6. Click OK, then Apply and Close.

To convert a TrustZone image, follow the steps above for the Secure project. The Non-Secure project will already use the SmartBundle from the Secure project which will inherit required data from the MCUboot SmartBundle.

MCUboot application images must also be signed to work with MCUboot. At a minimum, this involves adding a SHA and MCUboot specific constant data called boot magic in the image trailer. The size of the image trailer is (5 * BOOT_MAX_ALIGN) + (BOOT_MAX_IMG_SECTORS * min-write-size * 3).

Signing can be done on the as a post-build step in e² studio. To sign the image as a post-build step:

1. If Linux is used to develop the application image, change the MCUboot property Signing > Python to python3.
2. Build the bootloader project to generate the *.bld file. Make sure to build the bootloader project on the same computer as the application image to ensure the path to the signing script is correct.
3. Define environment variables in the Properties of the application image project in e² studio.
    a. Right click the application image project, and select **Properties**.
    b. Select **C/C++ Build > Environment** on the left.
    c. Click **Add...**
    d. Define the following environment variables one at a time:
        - MCUBOOT_IMAGE_VERSION: Set to the version of the application image.
        - MCUBOOT_IMAGE_SIGNING_KEY: Set the path to the key used for signing. If signing is not required, do not set this variable. If example keys are used, set MCUBOOT_IMAGE_SIGNING_KEY as follows (replace <boot_project> with the bootloader project path):
            - ECC 256: <boot_project>/ra/mcu-tools/MCUboot/root-ec-p256.pem
            - ECC 384: <boot_project>/ra/mcu-tools/MCUboot/root-ec-p384.pem
            - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-2048.pem

        - RSA 3K: <boot_project>/ra/mcu-tools/MCUboot/root-rsa-3072.pem
    - MCUBOOT_IMAGE_ENC_KEY: Set the path to the key used for encryption. If encryption is not required, do not set this variable. If example keys are used, set MCUBOOT_IMAGE_ENC_KEY as follows (replace <boot_project> with the bootloader project path):
        - ECIES: <boot_project>/ra/mcu-tools/MCUboot/enc-ec256-pub.pem
        - RSA 2K: <boot_project>/ra/mcu-tools/MCUboot/enc-rsa2048-pub.pem
    - MCUBOOT_APP_BIN_CONVERTER: Optional. Set to path to objcopy, arm-none-eabi-objcopy, fromelf, or ielftool. Not required if one of these tools is on the path.
4. Build the project.
5. The signed image is output next to the application <project>.elf file with the name <project>bin.signed.

**FSP 6.0.0 and newer**

An FSP Solution project must be created in order to set up the bootloader slots; the slot size and header information was previously in the MCUboot module.

## Bootloader region encoding in FSP 6.0.0

The header and image regions have to be named in the manner described below in the Solution project:

- FLASH_<core>_(B|S| ) - Indicates bootloader area or primary area. These are created by default and cannot be renamed.
- Examples:
    - FLASH_CM85_B: CM85 Bootloader area.
    - FLASH_CM85_S: CM85 Primary area.
    - FLASH_CM23 : CM23 Primary area.
- __BL: Indicates this is a bootloader symbol.
- _: delimiter between fields.
- ([0-9])|S: Image definitions field.
    - S indicates the Scratch area.
    - 0-9 correspond to traditional image IDs (only using 0/1 in legacy).
- _: delimiter between fields.
- (P|S): Indicates Primary or Secondary area.
    - S Secondary areas must have both Header (H) and Image (I) component.
    - P Primary areas must not have an I component (as the Image component is defined by the solution application region).
    - Secondary header must be the same size as Primary header.
    - Secondary images must be the same size as the area allocated for the project (Primary Image).
    - Headers must immediately precede the Image/application space.
- _: delimiter between fields
- (H|I): Indicates bootloader Header or Image component (not used with Scratch).
    - H indicates the MCUboot Header for Primary or Secondary (P/S) areas (use 0x200 for compatibility).
    - I indicates the MCUboot Secondary (S) Image allocation space (not used with Primary images).
- Primary or Secondary area size (including header and trailer) must be an integer multiple of the largest erase size on the mcu.

- Examples:
  - __BL_0_P_H: Image 0 Primary Header.
  - __BL_0_S_H: Image 0 Secondary Header.
  - __BL_1_S_I: Image 1 Secondary Image.
  - __BL_S : Scratch area.

1. Create the bootloader and set up any required configurations.
2. Build the bootloader project.
3. Create the application project, selecting the bootloader project as the "Preceding project" in the e2 studio wizard. The SmartBundle (.sbd) will be automatically linked.
4. Build the application project.
5. Create an "FSP Solution Project (Advanced)" and chose the final project in the chain (typically the application project).
6. Create the Header and Image regions according to the encoding described above.
7. Build the Solution project.

### Getting Started: Download and Debug

For projects that do not use TrustZone, debug the MCUboot project using the default configuration. Before running, load the signed image to the address specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

*Note*

*e² studio projects targeting RA8 devices that do not use TrustZone must disable the "Set TrustZone secure/non-secure boundaries" setting (Debug Configurations > Debugger > Connection Settings > TrustZone > Set TrustZone secure/non-secure boundaries).*

For TrustZone projects, debug using the Secure project to ensure the IDAU is partitioned correctly when debugging in e² studio. Make the following modifications before debugging in e² studio:

1. In the Debug Configurations for your project, on the Startup tab, click Add... to add the MCUboot project *.elf file (Image and Symbols), and optionally the Non-Secure project *.elf file.
2. For the Secure and Non-Secure project *.elf file, load Symbols Only.
3. After starting to debug, load the signed Secure image and the signed Non-Secure image into the addresses specified in the signing comment in ra_cfg/mcu-tools/include/mcuboot_config/mcuboot_config.h. This can be done with the Load Ancillary File button when debugging in e² studio. Upgrade images can be loaded to the upgrade image slots using the same method.

### Confirming Upgrade in Swap Mode

In Swap Mode operation, if the upgrade image is signed with the –pad option, MCUboot will install that image as a temporary update where if nothing else is done, a reboot will cause MCUboot to revert to the image version that was swapped out during the upgrade. In order for the updated image to prevent this reversion and make the update permanent, the boot_set_confirmed() must be called from the application.

To avail this capability in the application image, from the Stacks tab, add New > Bootloader > MCUboot Image Utilities (Swap Mode). Resolve any constraint errors and edit configurations as desired.

In src/hal_entry.c, drag in Developer Assistance > HAL/Common > MCUboot Image Utilities > Quick

Setup > Confirm Primary Image. Add a call to boot_set_confirmed() in the application and confirm the image in the primary slot.

### XIP Mode operation

XIP mode is enabled selecting "Direct XIP" as the Upgrade Mode option in the configurator or by defining "MCUBOOT_DIRECT_XIP" in the mcuboot config file. The linker script defines the symbol "XIP_SECONDARY_SLOT_IMAGE" by default to 0. To link an application to the secondar slot in XIP mode, set XIP_SECONDARY_SLOT_IMAGE to 1 in the application linker script. Direct XIP mode does not support TrustZone projects.

### XIP Mode with Memory Mirror Function (MMF)

*Note*

*Memory Mirror Functions is available on some MCUs, please check the hardware user manual for the availability. This mode only available in linear memory mode.*

When "Memory Mirror Function (MMF) support" under Common > Flash Layout is enabled, MCUBoot decides which image will be "mirrored". After the image is reflected on MMF region, the MCUBoot will start booting the application from start address of MMF.

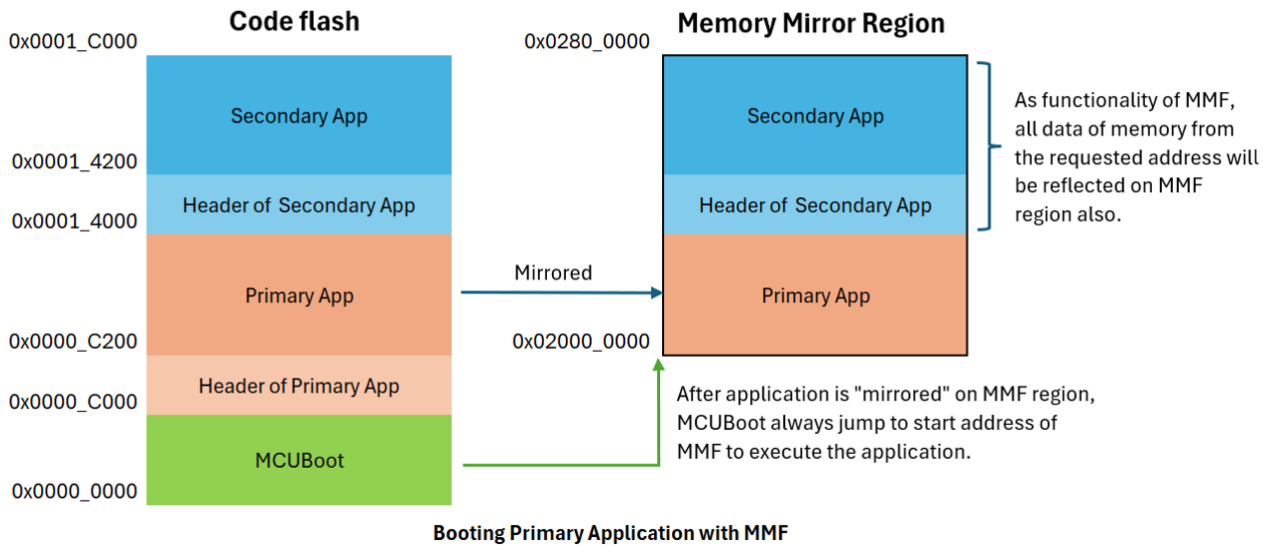

Figure 170: Booting Primary Application with MMF

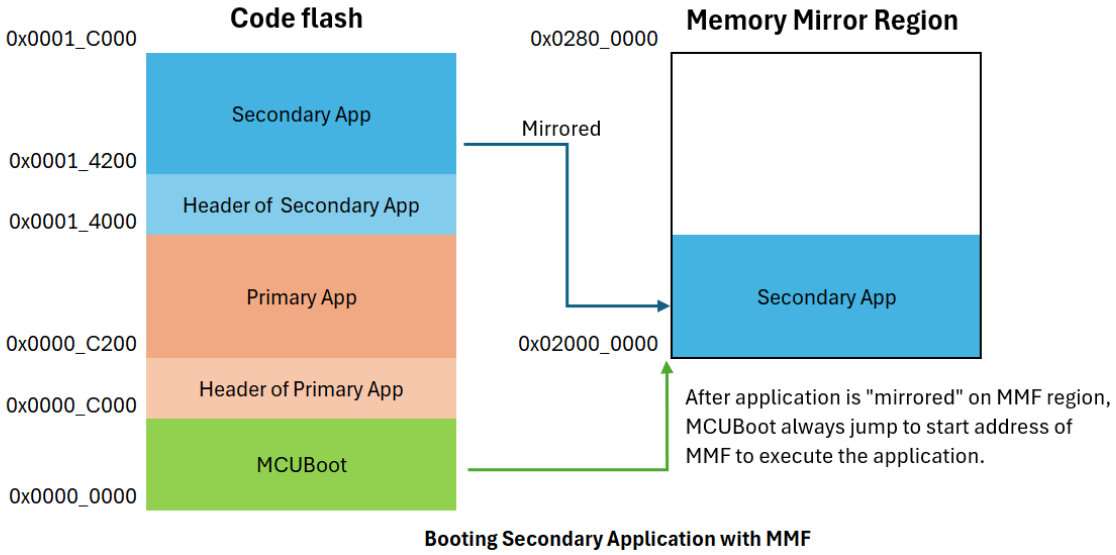

Figure 171: Booting Secondary Application with MMF

### Dual Bank operation

MCUboot can be used with Dual bank mode (with Flash HP or Flash LP) to leverage the advantages of dual bank flash operation. When Dual Bank mode is enabled, only the XIP upgrade mode can be used.

*Note*

*Unlike in normal XIP Mode operation, the linker script symbol "XIP_SECONDARY_SLOT_IMAGE" must be undefined in Dual Bank mode. An example flash layout in this configuration for a 1 MB is shown below. Note that there are 2 copies of the bootloader, one in Bank 0 and another in Bank 1.*

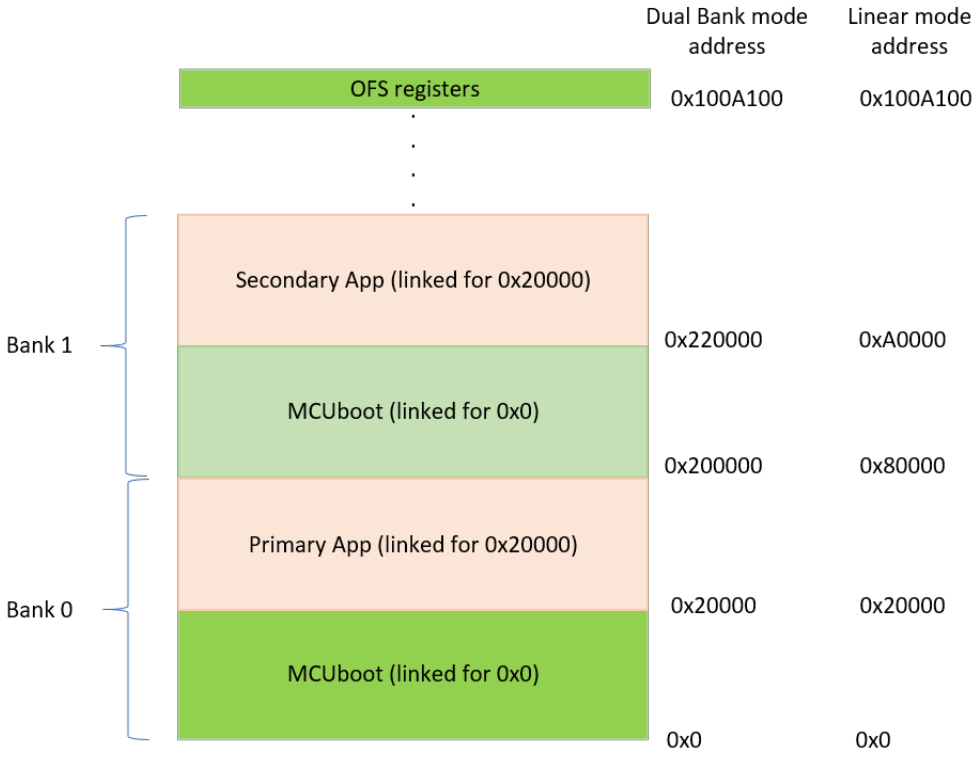

Figure 172: MCUboot Dual Bank layout of Flash HP for 1 MB Memory

For this example layout, the following files are generated when Dual Bank mode with XIP is enabled:

1. Bootloader Project: srec file linked to address 0 and includes the OFS region.
2. Application Project (Primary): signed bin file linked to address 0x20000.
3. Application Project (Secondary): signed bin file linked to address 0x20000.

With Flash HP in Dual Bank mode, the available flash memory is split into two halves and referred to as Bank 0 and 1. In this example Bank 0 would span from address 0x0 - 0x7FFFF and Bank 1 from 0x200000 - 0x27FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x80000 - 0xFFFFF.

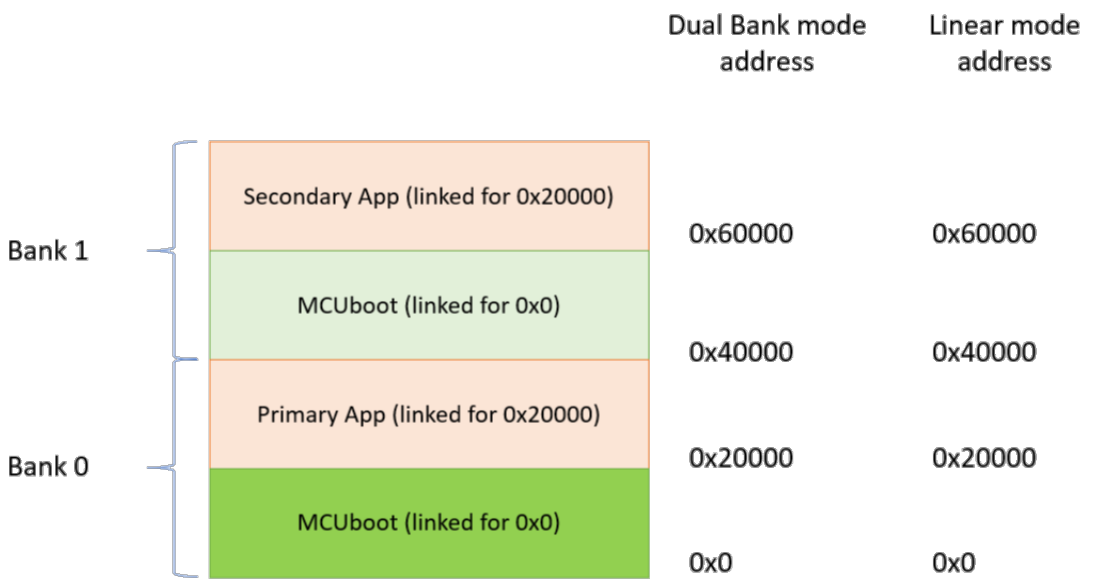

Figure 173: MCUboot Dual Bank layout of Flash LP for 512 KB Memory

With Flash LP in Dual Bank mode, the available flash memory is also split into two bank areas and referred to as Bank 0 and 1. In this example Bank 0 would span from address 0x0 - 0x3FFFF and Bank 1 from 0x40000 - 0x7FFFF. In Linear mode, it is possible to program the Bank 1 area by programming to 0x40000 - 0x7FFFF.

**Programming in Dual Bank Mode with Flash HP**

The bootloader must be duplicated in Dual Bank mode. Bank 0 can be programmed using the srec file generated from the MCUboot project; this will also program the OFS region which contains the dual bank enable bit, so it must either be programmed last if each file is programmed independently. Another option is to combine all images: MCUboot in Bank 0, primary image, MCUboot in Bank 1 (no OFS), and secondary image (optional). To program MCUboot to Bank 1, offset MCUboot by half the flash size and cut off the OFS region (0x0100A100 to address 0x0100A2FF on CM33 MCUs that support dual bank). Using srec-cat for a 1 MB flash MCU (0x80000 flash per bank), an example command to create the bootloader image for Bank 1: "srec_cat MCUboot_dualbank.srec -crop 0 0x80000 -offset 0x80000 -o MCUboot_dualbank_offset.srec". The application project for Bank 1 can be similarly offset using srec_cat: "srec_cat app1.bin.signed -binary -offset 0xA0000 -o app1_offset.srec", where 0xA0000 is 0x80000 (half the flash) + 0x20000 (MCUboot size). The signed binary file for Bank 0 can be converted to srec format using srec_cat: "srec_cat app0.bin.signed -binary -offset 0x20000 -o app0.srec"

To combine all the files into one srec file, use "srec_cat MCUboot_dualbank.srec MCUboot_dualbank_offset.srec app0.srec app1_offset.srec -o combined_srec".

**Programming in Dual Bank Mode with Flash LP**

To use Dual Bank Mode with Flash LP, enable Dual Bank Mode (Flash LP) in the MCUboot stack under Property > Common > General.

Similar to Dual Bank Mode with Flash HP, the bootloader must also be duplicated in Dual Bank mode. But the MCUBoot project does not need to be programmed last, because Flash LP does not use the

OFS region to enable/disable the dual bank mode.

### Dual bank booting without reset

*Note*

*This feature only available on MCUs which support flash_lp and Instant Bank Swap.*

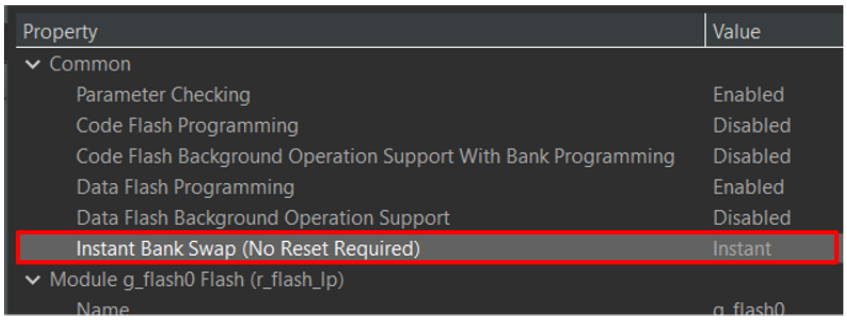

Figure 174: Instant Bank Swap option under Flash stack

The picture below shows the execution sequence with Reset and Without Reset (Instant Bank Swap).

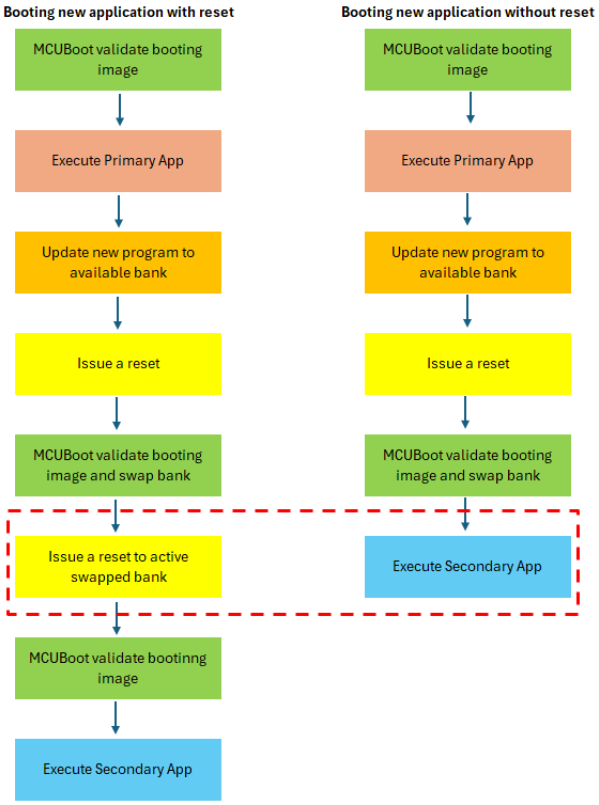

Figure 175: Software flow differences between booting with and without reset

### External Memory Support

# QSPI

QSPI support for secondary image storage can be enabled in the configurator. The bootloader expects the QSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has configured the QSPI in Extended-SPI mode and that R_QSPI_Open() has been called prior to invoking boot_go();. For example, on the EK_RA6M4 which has the MX25L25645G QSPI flash, after adding the QSPI module to the project, calling the following snippet will configure the QSPI for read/write operation:

```
/* Status Register (SREG) payload size */
# define SREG_SIZE 0x03
# define QSPI_COMMAND_WRITE_STATUS_REGISTER 0x01
# define QSPI_DEFAULT_SR1 0x40
# define QSPI_DEFAULT_SR2 0x00
/* Status register payload */
uint8_t   data_sreg[SREG_SIZE]                = {QSPI_COMMAND_WRITE_STATUS_REGISTER,
QSPI_DEFAULT_SR1, QSPI_DEFAULT_SR2};
R_QSPI_Open(&g_qspi0_ctrl, &g_qspi0_cfg);
/* Configure for Extended SPI Read/Write Mode */
R_QSPI_DirectWrite(&g_qspi0_ctrl, &(g_qspi0_cfg.write_enable_command), 1, false);
R_QSPI_DirectWrite(&g_qspi0_ctrl, data_sreg, SREG_SIZE, false);
```

For a more detailed example on how to initialize the QSPI device, refer to the QSPI module. The QSPI sector size must be the same as that of the MCU internal flash (BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE) for swap mode operation.

# OSPI_B

OSPI_B support for secondary image storage can be enabled in the configurator for RA8: The bootloader expects the OSPI memory to be pre-configured by user code in the bootloader for read/write operation. The bootloader code operates under the assumption that the user has initialized the OSPI_B by calling R_OSPI_B_Open() prior to invoking boot_go();.

The OSPI sector size must be the same as that of the MCU internal flash (BSP_FEATURE_FLASH_HP_CF_REGION1_BLOCK_SIZE) for swap mode operation.

*Note*

*: The user can specify the OSPI erase block size for the area that will be erased/written to by MCUBoot. Do not use OSPI regions that span multiple block erase sizes or block erase sizes larger than the code flash erase size of 32K.*

***MCUboot Memory Map***

For single image projects with no external memory support, the default memory map looks like:

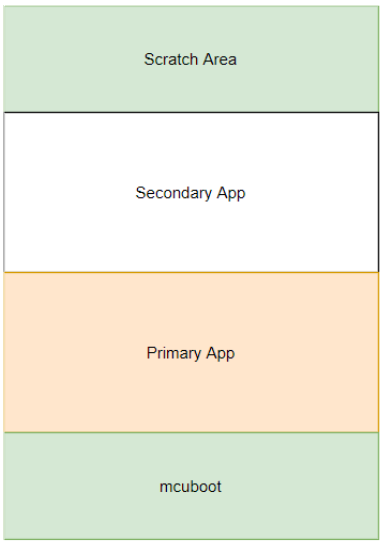

Figure 176: MCUboot Memory Map

For projects with 2 separately updateable images (used for TrustZone applications where the Secure and Non-Secure images can be updated separately), the default memory map with no external memory support looks like:

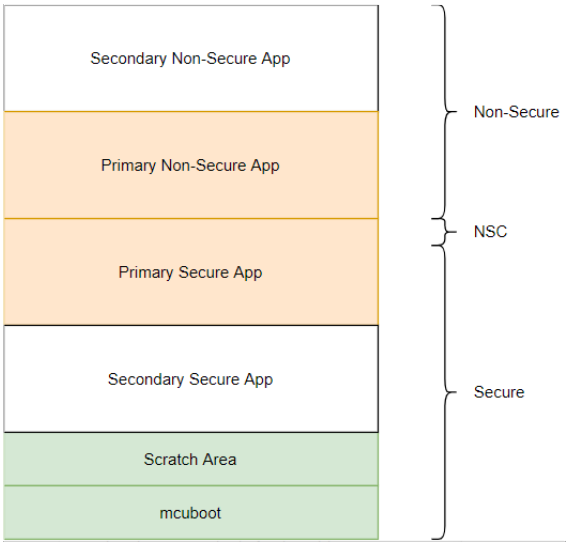

Figure 177: MCUboot Memory Map (TrustZone)

For single image projects with QSPI, the default memory map looks like:

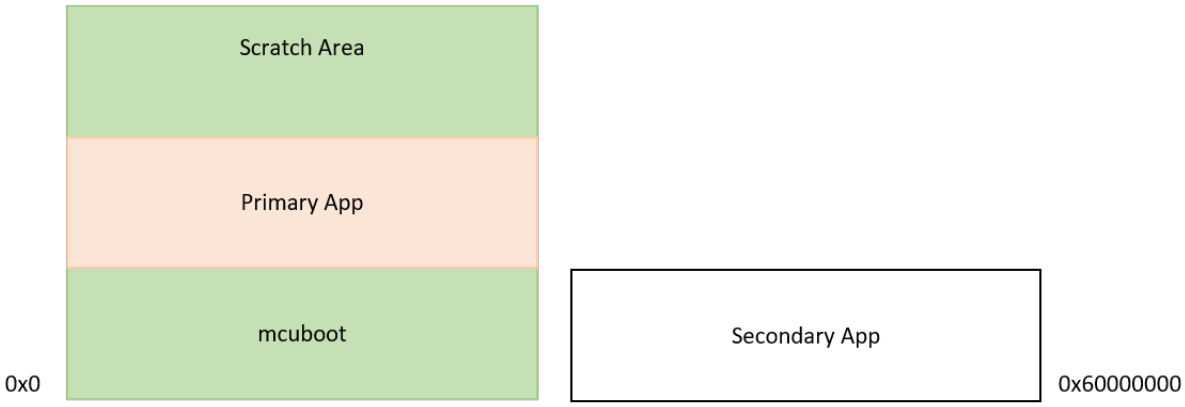

Figure 178: MCUboot Memory Map with QSPI

### MCUboot verification options

MCUboot in FSP supports the following secure image verification options

1. Hash verification only (SHA256).
2. Hash and signature verification (ECDSA-P256, ECDSA-P384, RSA-2048 and RSA-3072).
3. Hash, signature verification and image encryption (ECIES-P256 and RSA-OAEP-2048 with AES-128).
4. Hash and image encryption only.

MCUboot also supports signature verification using EdDSA-25519 and image encryption using AES-KW-128 and AES-KW-256 but those are currently not supported in FSP.

### Limitations

MCUboot swap mode is not functional with OSPI_B external storage.

### Notes

When encryption is enabled, MCUboot requires the image in the primary slot to be unencrypted. Only the image loaded in the secondary slot can be encrypted.

### MCUboot Crypto Stack Options

The following crypto stacks can be used with MCUboot in FSP:

1. MbedTLS, which is hardware accelerated on all RA devices. On the RA2 which has an AES engine only, ECC/RSA/SHA operations are in software.
2. TinyCrypt (S/W Only) can be used with all devices.
3. TinyCrypt (H/W Accelerated) has AES operations accelerated for the RA2 family only. When using MCUboot without encryption there is no difference between using this or the S/W only version.
4. SCE9 Protected Mode on devices that have the SCE9 (eg: RA6M4, RA4M3, RA4M2)

MbedTLS provides the best performance for MCUBoot signature verification on the RA6 and RA4 devices but has a much larger code footprint compared to TinyCrypt. For RA2 devices TinyCrypt is the best option.

### MCUboot boot time

The time from Reset to executing the application will depend on how quickly MCUboot finishes execution. This is dependent on a variety of factors including

1. The crypto algorithms chosen for image verification and whether hardware acceleration is enabled. Hardware accelerated SHA256 will be the fastest while encryption enabled modes will be the slowest.
2. The operating clock speeds.
3. Whether flash programming was required.

### Using SCE9 Protected Mode Crypto Stack

Using this crypto stack with MCUBoot provides additional security by ensuring that any keys that are used were securely provisioned for the specific device. The Application Note "Installing and Updating Secure Keys for RA Family" (R11AN0496) provides detailed steps on how to go about installing these keys. Since the section "Preparing Keys for Installation and Update Using RFP" document currently only provides information on how to install an AES key, this section will provide information on how to install an ECC public key. These steps can be used to install the public keys used for image verification or the keys used for image encryption.

*Note*

*When using the SCE9 Protected Mode Stack with MCUboot it is required that the public keys in the format described in the "MCUboot Example Keys" module in the stack is also provided in the project.*

### Installing public keys used for signature verification

1. Generate an ECC key pair. There are various ways to do this but you can use openSSL to do so: "openssl ecparam -name secp256k1 -genkey -noout -out my_ecc_secp256k1_key.pem".
2. Once the key is generated, in order to install the public key using RFP (Renesas Flash Programmer) the user needs to have their own UFPK (User Factory Programming Key) and W-UFPK (Wrapped User Factory Programming Key). Refer to R11AN0496 on how to obtain these keys.
3. Once the UFPK and W-UFPK are available, we need to extract the public key from the pem file. The public key can be viewed by using "openssl ec -noout -text -in my_ecc_secp256k1_key.pem". Note that when the ECC public key is printed out this way, it will contain a 0x04 ASN.1 prefix at the start, which should be discarded.
4. Use the rfp-util.exe utility from the RFP installation folder to wrap the public key using the UFPK and W-UFPK into a format that can be installed by RFP and the factory bootloader on the MCU.
5. Use RFP as described in R11AN0496 to install the key to the location of mcuboot_sce9_key section.

These are examples that install the default keys provided with MCUboot in ra/mcu-tools/MCUboot/. The examples assume that UFPK and W-UFPK are already available.

```
  //Print out the EC-P256 Public Key using openSSL

// From the bootloader map file determine the address of mcuboot_sce9_key section
Use RFP to install "RSA_3072_pub_install.rkey" as described in "Installing and
Updating Secure Keys for RA Family" (R11AN0496) to the address where the
mcuboot_sce9_key section is located.
```

# Examples

### Basic Example

This is an example of using MCUboot in an application.

```
void rm_mcuboot_port_example (void)
{
#ifdef MCUBOOT_USE_MBED_TLS
 /* Initialize mbedtls. */
 mbedtls_platform_context ctx = {0};
    assert(0 == mbedtls_platform_setup(&ctx));
#elif defined(MCUBOOT_USE_OCRYPTO)
 /* Initialize TinyCrypt port. */
```

```
    assert(FSP_SUCCESS == RM_OCRYPTO_PORT_Init());
#elif defined(MCUBOOT_USE_TINYCRYPT)
 /* Initialize TinyCrypt port. */
    assert(FSP_SUCCESS == RM_TINCYRYPT_PORT_Init());
#else
 /* Initialize SCE9 Protected Mode driver. */
 sce_instance_ctrl_t sce_ctrl;
 const sce_cfg_t    sce_cfg =
    {.lifecycle = SCE_SSD};
    assert(FSP_SUCCESS == R_SCE_Open(&sce_ctrl, &sce_cfg));
#endif
 /* (Optional) To check for updates, call boot_set_pending. */
 bool update = 0;
 if (update)
    {
       boot_set_pending(0);
    }
 /* Verify the boot image and get its location. */
 struct boot_rsp rsp;
    assert(0 == boot_go(&rsp));
 /* Enter the application. */
    RM_MCUBOOT_PORT_BootApp(&rsp);
}
```

## 5.2.5 CapTouch

### Detailed Description

This HAL driver supports the Capacitive Touch Sensing Unit (CTSU). It implements the CTSU Interface .

# Overview

The capacitive touch sensing unit HAL driver (r_ctsu) provides an API to control the CTSU peripheral. This module performs capacitance measurement based on various settings defined by the configuration. This module is configured via the QE for Capacitive Touch.

### Features

- Supports multiple scan modes
  - Self-capacitance multi scan mode (CTSU2 support active shield)
  - Mutual-capacitance full scan mode
  - Mutual-capacitance parallel scan mode (CTSU2)
  - Current Measurement mode (CTSU2)
  - Diagnosis scan mode
- Scans may be started by software or an external trigger
- Returns measured capacitance data on scan completion
- Support DTC transfer of scanned data
- Supports TrustZone
- Corrects accuracy for temperature drift (CTSU2)

# Configuration

*Note*

***This module is configured via the QE for Capacitive Touch. For information on how to use the QE tool, once the tool is installed click Help -> Help Contents in e² studio and search for "QE".***

### Build Time Configurations for r_ctsu

The following build time configurations are defined in fsp_cfg/r_ctsu_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Support for using DTC | • Enabled<br>• Disabled | Disabled | Enable DTC support for the CTSU module. |
| Enable automatic judgment mode | • Enabled<br>• Disabled | Disabled | Enable or Disable automatic judgment mode. This feature is only for RA4L1 and RA0L1. |
| Interrupt priority level | MCU Specific Options | | Priority level of all CTSU interrupt (CSTU_WR,CTSU_RD,CTSU_FN) |

### Configurations for CapTouch > CTSU (r_ctsu)

This module can be added to the Stacks tab via New Stack > CapTouch > CTSU (r_ctsu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Scan Start Trigger | MCU Specific Options | | CTSU Scan Start Trigger Select |

**Interrupt Configuration**

The first R_CTSU_Open function call sets CTSU peripheral interrupts. The user should provide a callback function to be invoked at the end of the CTSU scan sequence. The callback argument will contain information about the scan status.

**Clock Configuration**

The CTSU peripheral module uses PCLKB as its clock source. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

*Note*

*The CTSU Drive pulse will be calculated and set by the tooling depending on the selected transfer rate.*

**Pin Configuration**

The TSn pins are sensor pins for the CTSU.

The TSCAP pin is used for an internal low-pass filter and must be connected to an external decoupling capacitor.

# Usage Notes

The CTSU module is a CTSU driver for the Touch module. The CTSU module assumes the access from the Touch middleware layer, and it is also accessible from an user application.
The CTSU peripheral installed on RA family has three versions: CTSU, CTSU2, and CTSU2SLa. Each MCU devices are equipped with the following version of CTSU peripherals.

- CTSU2SLa : RA4L1, RA0L1
- CTSU2 : RA2E1, RA2L1
- CTSU : RA2A1, RA4M1, RA4M2, RA4M3, RA4W1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5,

CTSU, CTSU2 and CTSU2SLa are functionally different, so CTSU, CTSU2 and CTSU2SLa are described in this application note as below.
Common description for CTSU and CTSU2 -> CTSU
Description only for CTSU -> CTSU1
Description only for CTSU2 and CTSU2SLa -> CTSU2
Description only for CTSU2SLa -> CTSU2SLa
Without mention, it means the common description for CTSU, CTSU2 and CTSU2SLa.

**Functions**

The CTSU module supports the following functions.

**Touch judgement Type**

CTSU2 has two judgement type, which differ in processing and output data.
It is common to get three raw value for each element and calculate CCO correction, and then performs different processing.

1. Value Majority Mode(VMM)
   Calculate three frequency correction value from three CCO correction values. Calculate the sum of the two closest values of the three frequency correction value. Outputs the moving average of this added value.

2. judgement Majority Mode (JMM)
   This mode is supported from FSP V5.6.0 or later.
   Outputs the moving average of three CCO correction values.

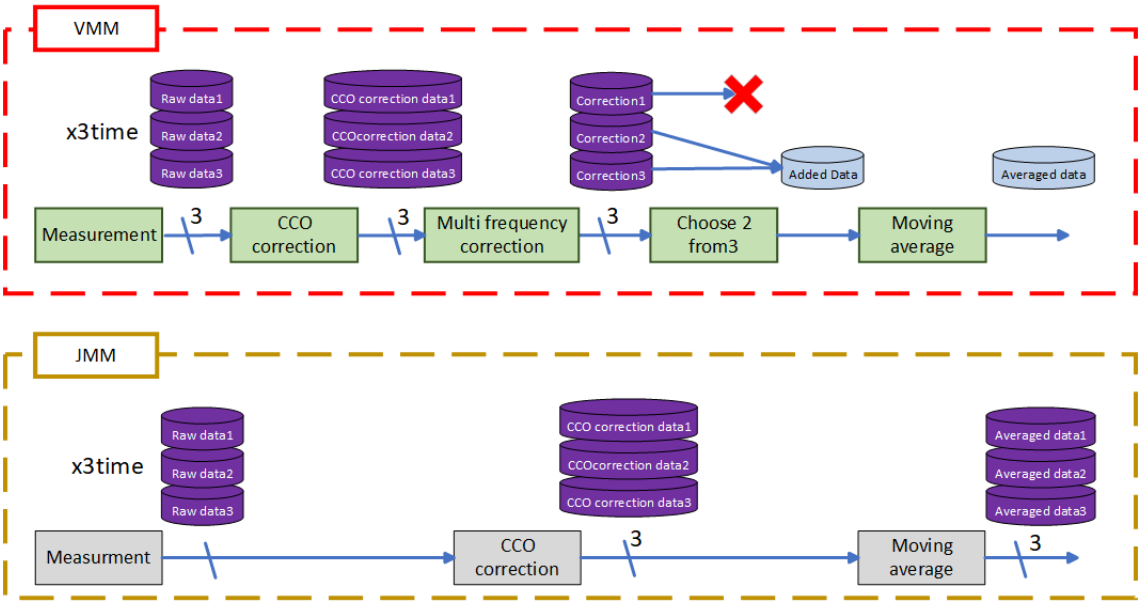

Figure 179: Data flow Comparison of JMM and VMM

### Measurements and Obtaining Data

Measurements can be started by a software trigger or by an external event triggered by the Event Link Controller (ELC).
As the measurement process is carried out by the CTSU2 peripheral, it does not use up main processor processing time.
The CTSU module processes INTCTSUWR and INTCTSURD if generated during a measurement. The data transfer controller (DTC) can also be used for these processes.
When the measurement complete interrupt (INTCTSUFN) process is complete, the application is notified in a callback function. Make sure you obtain the measurement results before the next measurement is started as internal processes are also executed when a measurement is completed.
Start the measurement with API function R_CTSU_ScanStart().
Obtain the measurement results with API function R_CTSU_DataGet().
The number of arrays in the second argument of R_CTSU_DataGet() is different between VMM and JMM.
VMM returns one measurement result for each element.
JMM returns three measurement results for each element.

### Sensor CCO Correction function

The CTSU2 peripheral has a built-in correction circuit to handle the potential microvariations related to the manufacturing process of the sensor CCO MCU.
The module temporarily transitions to the correction process during initialization after power is turned on. In the correction process, the correction circuit is used to generate a correction coefficient (factor) to ensure accurate sensor measurement values.
When temperature correction is enabled, an external resistor connected to a TS terminal is used to periodically update the correction coefficient. By using an external resistor that is not dependent on temperature, you can even correct the temperature drift of the sensor CCO.

### Initial Offset Adjustment

The CTSU2 peripheral was designed with a built-in offset current circuit in consideration of the amount of change in current due to touch. The offset current circuit cancels enough of the parasitic capacitance for it to fit within the sensor CCO dynamic range.
This module automatically adjusts the offset current setting. As the adjustment uses the normal measurement process, the combination of R_CTSU_ScanStart() and R_CTSU_DataGet() or the combination of R_CTSU_ScanStart() and R_CTSU_OffsetTuning() must be repeated several times after startup. Because the ctsu_element_cfg_t member "so" is the starting point for adjustments, you can set the appropriate value for "so" in order to reduce the number of times the two functions must be run to complete the adjustment. Normally, the value used for "so" is a value adjusted by QE for Capacitive Touch.
R_CTSU_OffsetTuning() was added in FSP 3.8.0. This API can also be used for initial offset adjustment, and offset adjustment can be performed again at any time. See example code of R_CTSU_OffsetTuning() for details.

| Mode | CTSU1 target value | CTSU2 target value |
|---|---|---|
| Self-capacitance | 15360 (37.5%) | 11520 (37.5%) |
| Self-capacitance using active shield | - | 4608 (15%) |
| Mutual-capacitance | 10240 (25%) | 7680 (25%) |

The percentage is based on 100% being the maximum input current applied to the CCO.
CTSU1: 100% is the measured value 40960 when the measurement time is 526us(base time).
CTSU2: 100% is the measured value 30720 when the measurement time is 256us(base time).
When the measurement time is changed, the target value is adjusted by the ratio with the base time.

Example of target value in combination of CTSUSNUM and CTSUSDPA.
CTSU1 (CTSU clock = 32MHz, Self-capacitance mode)

| Target value | CTSUSNUM | CTSUSDPA | Measurement time |
|---|---|---|---|
| 15360 | 0x3 | 0x7 | 526usec |
| 30720 | 0x7 | 0x7 | 1052usec |
| 30720 | 0x3 | 0xF | 1052usec |
| 7680 | 0x1 | 0x7 | 263usec |

| | | | |
|---|---|---|---|
| 7680 | 0x3 | 0x3 | 263usec |

The measurement time changes depending on the combination of CTSUSNUM and CTSUSDPA. When changing CTSUPRRATIO and CTSUPRMODE from the recommended values, follow the Hardware Manual for the measurement time.

CTSU2 (Self-capacitance mode)

| Target value | Target value (multi frequency) | CTSUSNUM | Measurement time |
|---|---|---|---|
| 5760 | 11520 (128us + 128us) | 0x7 | 128usec |
| 11520 | 23040 (256us + 256us) | 0xF | 256usec |
| 2880 | 5460 (64us + 64us) | 0x3 | 64usec |

The measurement time changes depending on CTSUSNUM. If STCLK cannot be set to 0.5MHz, it will not support the table above. Regarding STCLK, refer to the hardware manual.

### Random Pulse Frequency Measurement (CTSU1)

The CTSU1 peripheral measures at one drive frequency.
The drive frequency determines the amperage to the electrode and generally uses the value tuned with QE for Capacitive Touch.
The drive frequency is calculated as below.
It is determined by PCLK frequency input to CTSU, CTSU Count Source Select bit(CTSUCLK), and CTSU Sensor Drive pulse Division Control bit(CTSUSDPA). For example, If it is set PCLK =32MHz, CTSUCLK = PLCK/2, and CTSUSDPA = 1/16, then drive frequency is 0.5MHz. CTSUSDPA can change for each TS port.

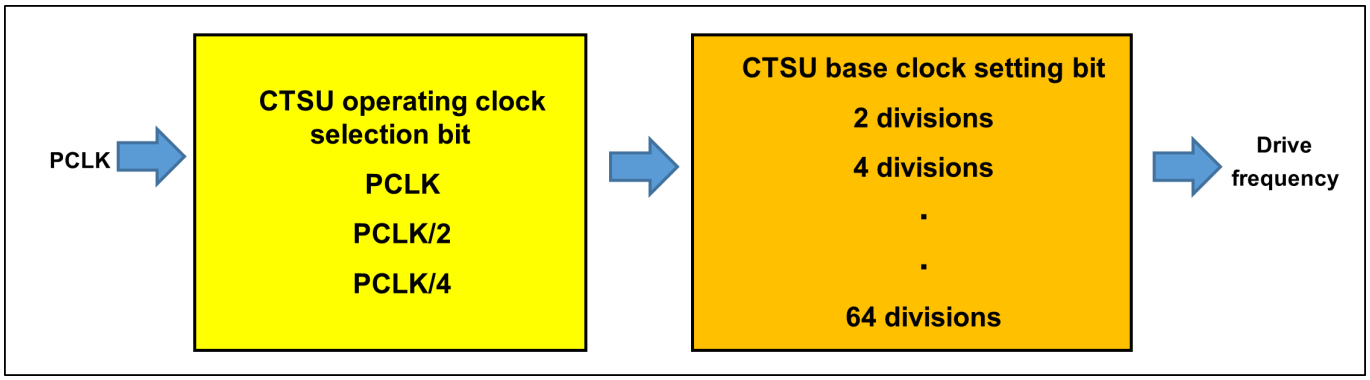

Figure 180: Drive Frequency Settings

The actual drive pulse is phase-shifted and frequency-spread with respect to the clock based on the drive frequency as a measure against external environmental noise. This module is fixed at initialization and sets the following.
CTSUSOFF = 0,CTSUSSMOD = 0,CTSUSSCNT = 3

### Multi-frequency Measurements (CTSU2)

The CTSU2 peripheral can measure in one of four drive frequencies to avoid synchronous noise.

With the default settings, the module takes measurements at three different frequencies. This data are called raw data. And calculate CCO correction. This data are called CCO correction data.
In VMM, After standardizing the results obtained at the three frequencies in accordance with the first frequency reference value, the measured value is determined based on majority in a process referred to as "normalization."
The three values standardized to the first frequency reference value are called frequency correction data.
You can get the three correction data with R_CTSU_SpecificDataGet().
In VMM, three raw data, CCO correction data, and frequency correction data can be obtained with R_CTSU_SpecificDataGet().
In JMM, three raw data and three CCO correction data can be obtained with R_CTSU_SpecificDataGet().

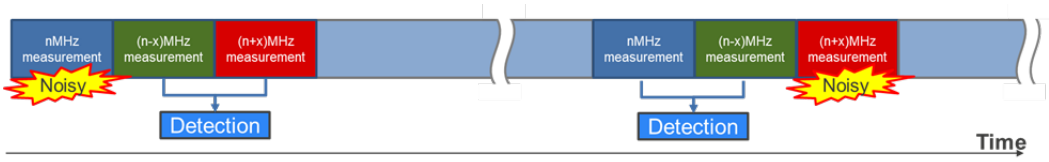

Figure 181: Multi-frequency Measurements

Drive frequency is determined based on the config settings. The module sets registers according to the config settings, and sets the three drive frequencies.
Drive frequency is calculated in the following equation:
(PCLKB frequency / CLK / STCLK) x SUMULTIn / 2 / SDPA : n = 0, 1, 2
The figure below shows the settings for generating a 2MHz drive frequency when the PCLKB frequency is 32 MHz. SDPA can be set for each touch interface configuration.

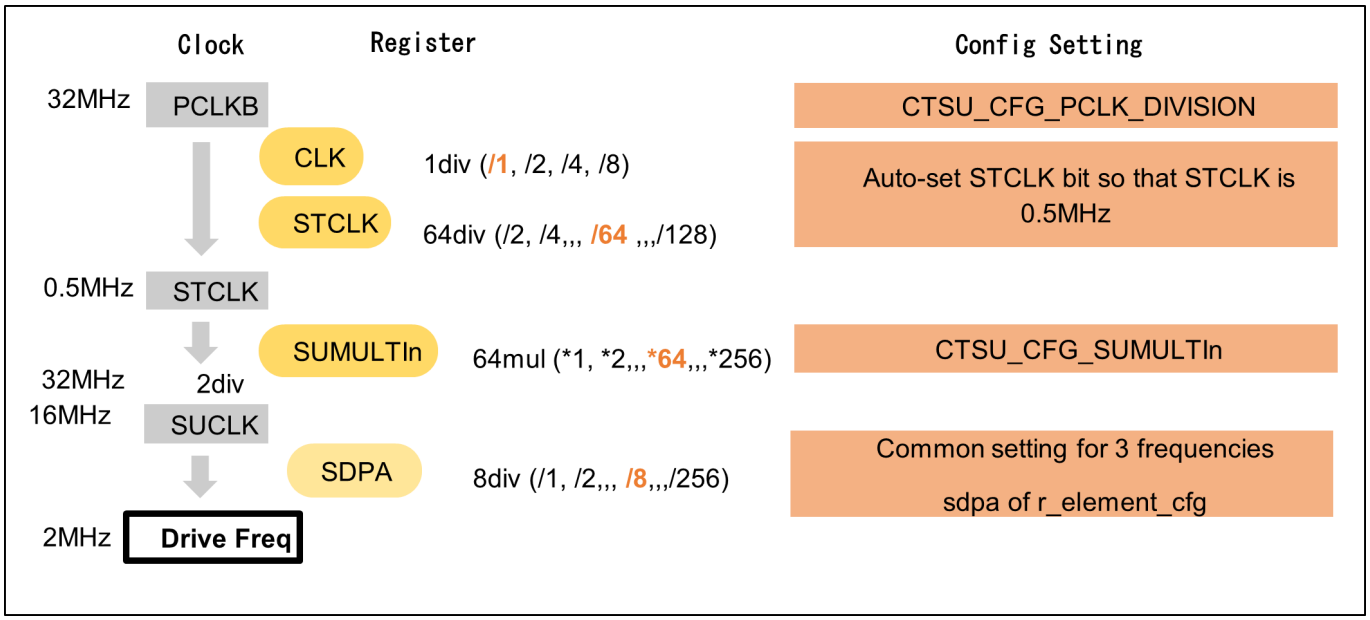

Figure 182: Drive Frequency Settings

### Shield Function(CTSU2)

The CTSU2 peripheral has a built-in function that outputs a shield signal in phase with the drive pulse from the shield terminal and the non-measurement terminal in order to shield against external

influences while suppressing any increase in parasitic capacitance. This function can only be used during self-capacitance measurements.
This module allows the user to set a shield for each touch interface configuration.
For example, for the electrode configuration shown in , the members of ctsu_cfg_t should be set as follows. Other members have been omitted for the example.
.txvsel = CTSU_TXVSEL_INTERNAL_POWER,
.txvsel2 = CTSU_TXVSEL_MODE,
.md = CTSU_MODE_SELF_MULTI_SCAN,
.posel = CTSU_POSEL_SAME_PULSE,
.ctsuchac0 = 0x0F,
.ctsuchtrc0 = 0x08,

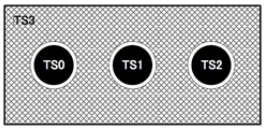

Figure 183: Example of Shield Electrode Structure

### Measurement Error Message

When the CTSU2 peripheral detects an abnormal measurement, it sets the status register bit to 1. In the measurement complete interrupt process, the module reads ICOMP1, ICOMP0, and SENSOVF of the status register and notifies the results in the callback function. The status register is reset after the contents are read. For more details on abnormal measurements, refer to "member event" in the ctsu_callback_args_t callback function argument.

### Moving Average

This function calculates the moving average of the measured results.
Set the number of times the moving average should be calculated in the config settings.

### Diagnosis Function

The CTSU peripheral has a built-in function that diagnoses its own inner circuit. This diagnosis function provides the API for diagnosing the inner circuit.
The diagnostic requirements are different for CTSU1 and CTSU2 providing 5 types of diagnosis for CTSU1 and 9 types for CTSU2.
The diagnosis function is executed by calling the API function. This is executed independently from the other measurements and does not affect them.
To enable the diagnosis function, set CTSU_CFG_DIAG_SUPPORT_ENABLE to 1.
For CTSU1, a 27pF condenser should be connected externally.
For CTSU2, Diagnosis function uses the ADC module.
If an error occurs in the ADC module used for Diagnosis mode, return FSP_ERR_ABORTED as the return value of R_CTSU_DataGet().
If an ADC error is returned, exit the function so as not to measure or close the ADC.
See ADC (r_adc) for ADC module errors.
Please pay particular attention to the following three points.

1. Be sure to measure the ADC module when using the Diagnosis mode function of the CTSU module. Therefore, in order for the user to use it with Dignosis, please close the user's ADC. After closing, please use the Diagnosis mode function of the CTSU module.
2. When creating an application with RTOS, please be careful about the scheduling of the

CTSU module's Diagnosis mode function task and the user's ADC task.
3. If FSP_ERR_ABORTED occurs, please call the user's ADC again when using the user's ADC.

### MEC Function (CTSU2SLa)

The CTSU2SLa peripheral has MEC (Multiple Electrode Connection) function that connects multiple electrodes and measures them as a single electrode. This feature is only available in self capacitance mode.
This is an example when using three electrodes. In normal times, normal measurement is performed, and 3 channels are measured to get each measured value. In power saving, MEC measurement is performed, and one channel is measured by combining three channels to acquire one measured value.
The figure below shows a compare of time of normal measurement and MEC measurement. Since multi channels are measured at the same time, the measurement time is shortened.

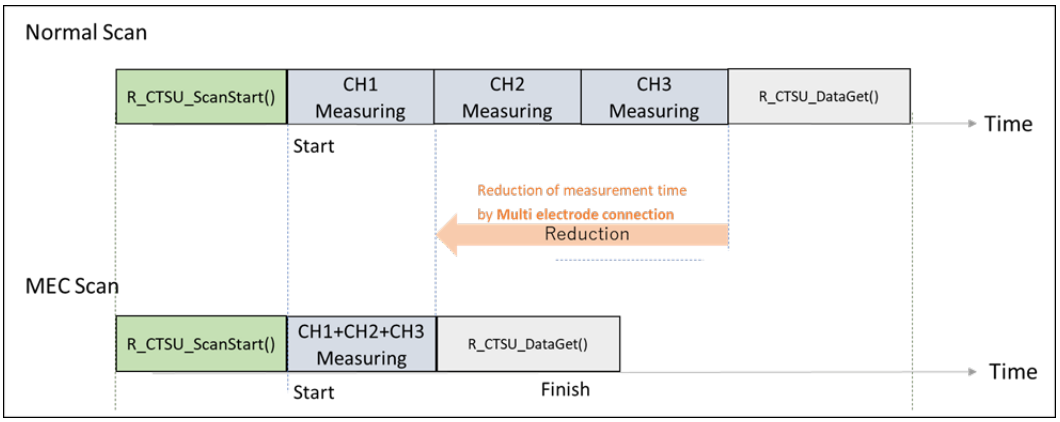

Figure 184: Comparison of time between normal measurement and MEC measurement

To enable the code for the MEC feature, set CTSU_CFG_MULTIPLE_ELECTRODE_CONNECTION_ENABLE to 1.
When using MEC, create a touch interface configuration different from the normal touch interface configuration for the same TS.
The following settings are required for the touch interface configuration for MEC measurement.
To enable MEC for touch interface configurations by setting tsod in ctsu_cfg_t to 1.
Set mec_ts of ctsu_cfg_t to one of the TS numbers to be measured.
If you want to use the shield function at the same time, set the TS number of the shield terminal in mec_shield_ts of ctsu_cfg_t.
In this case, only one TS can be used as a shield terminal. Set num_rx of ctsu_cfg_t to 1.
For example, in the case of the electrode configuration shown below, set the members of ctsu_cfg_t as shown below. Other members are omitted here.
.tsod = 1,
.mec_ts = 0,
.mec_shield_ts = 3,
.num_rx = 1,

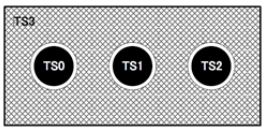

Figure 185: Example of MEC and shield electrode configuration

### Automatic CCO Correction (CTSU2SLa)

CTSU2SL peripheral has an automatic correction that correct the sensor CCO by hardware. Refer to Sensor CCO Correction function for more information on sensor CCO correction.
CTSU2SL peripheral processes the correction calculation. CCO correction data can be calculated without using the correction calculation processing of the software.
The processing time of the main processor is not consumed.

Set CTSU_CFG_AUTO_CORRECTION_ENABLE to 1 to enable this feature.

### Automatic Frequency Correction (CTSU2SLa)

CTSU2SLa peripheral has an automatic frequency correction that correct the calculation by hardware.
CTSU2SLa peripheral processes the correction calculation. Frequency correction data can be calculated without using the correction calculation processing of the software.
The processing time of the main processor is not consumed.

Set CTSU_CFG_AUTO_MULTI_CLOCK_CORRECTION_ENABLE to 1 to enable this feature.

### Automatic Judgement (CTSU2SLa)

CTSU2SLa peripheral has an automatic judgement that judges the touch of a button by hardware.
CTSU2SLa peripheral processes the touch judgement of the button. The processing time of the main processor is not consumed.
Measurements and Judgements can be initiated either by software triggers or external events triggered by the Event Link Controller (ELC).
Please use the API function R_CTSU_ScanStart().
This module processes INTCTSUWR and INTCTSURD generated during measurement. Since DTC is used for these processes, DTC is required.

A callback function notifies the application when the processing of INTCTSUFN is completed. Get the judgement result before the next measurement.
Please use the API function R_CTSU_AutoJudgeDataGet().
Select either JMM or VMM as the majority voting method. Below is an example of the ctsu_cfg_t member settings for JMM. For VMM, set "jc" to 0 and "majirimd" to 1.
.tlot = 2, // Non-touch judgement continuous count : 3 times
.thot = 2, // Touch judgement continuous count : 3 times
.jc = 1, // Judgement by two frequency
.ajmmat = 2, // Moving average : 22times
.ajbmat = 7, // Baseline average count : 27+1times
.majirimd = 0, // JMM
.mtucfen = 1, // Mutual-capacitance
.ajfen = 1, // Enable automatic judgement

Set "CTSU_CFG_AUTO_JUDGE_ENABLE = 1" to enable the automatic judgement. In this case, set "CTSU_CFG_AUTO_CORRECTION_ENABLE = 1" to enable the automatic CCO correction function as well.
For VMM, set "CTSU_CFG_AUTO_MULTI_CLOCK_CORRECTION_ENABLE = 1" to enable the automatic frequency correction function as well.

The following (a) to (e) describe the automatic judgement and its setting. In the case of JMM, (a) ~ (e) settings are set for each multi-frequency measurement.

- (a) Measurement mode
  Select self-capacitance or mutual-capacitance with "mtucfen" of ctsu_auto_button_cfg_t. Set the self-capacitance to 0. Set the mutual-capacitance to 1.

- (b) Baseline
  Set the baseline from the measurement result in the non-touch state. After completing the initial offset adjustment with R_CTSU_OffsetTuning (), the baseline is initially set (set BLINI bit) when R_CTSU_ScanStart () is called for the first time.
  After that, when R_CTSU_AutoJudgementDataGet () is called, the baseline initialization is canceled (clear BLINI bit) and the baseline update process is started.
  The baseline is updated every set number of measurements to follow changes in the surrounding environment.
  If "non-touch" state continues for the set number of measurements, the baseline is updated to the average value. When judgement result is "touch", the number of counts is cleared.
  Set the number of measurements (baseline update interval) with "ajbmat" of ctsu_cfg_t.
  Common to all buttons in the touch interface configuration.
  Adjusts the ability to follow changes in the surrounding environment.

- (c) Threshold
  judgement is made using a threshold with an arbitrary offset from the baseline. The threshold is set by adding hysteresis.
  Chattering is prevented by giving hysteresis to the transition from "touch" to "non-touch". Increasing the hysteresis value is more effective in preventing chattering, but be aware that it will be more difficult to transition from "touch" to "non-touch".
  Set the threshold and hysteresis for each button with threshold and hysteresis of ctsu_auto_button_cfg_t.
  This module calculates the upper threshold and the lower threshold from these and sets them in the CTSUAJTHR register.
  The figure below shows the self-capacitance judgement. Since the electrode capacitance of the self-capacitance button increases when touched, it is judged "touch" when the upper threshold is exceeded.

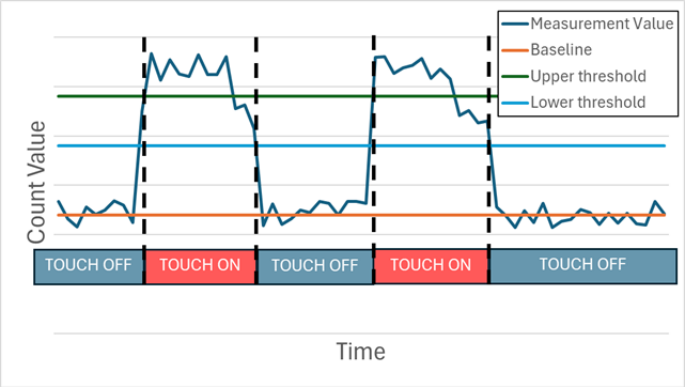

Figure 186: Self-capacitance judgement

The figure below shows the mutual-capacitance judgement. Since the mutual capacitance button reduces the capacitance between electrodes when touched, it is judged as "touch" when the lower threshold is exceeded.

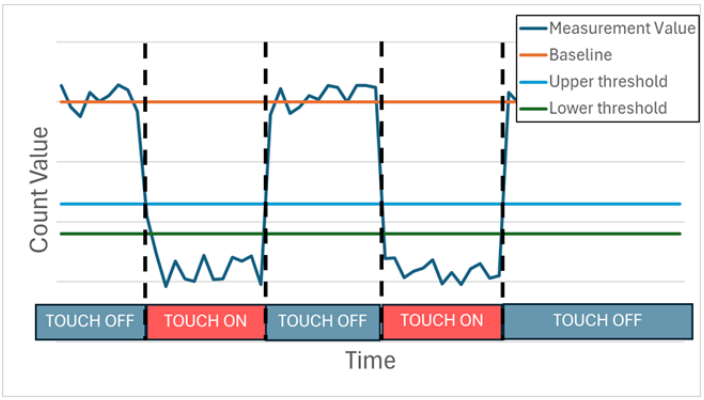

Figure 187: Mutual-capacitance judgement

- (d) The number of consecutive "non-touch" and "touch" detections
  This is a filter function to judge "touch" or "non-touch" when "touch" or "non-touch" state continues for a certain number of times.
  Set the number of times with "tlot" and "thot" of ctsu_cfg_t. Common to all buttons in the touch interface configuration.
  Increasing the number of consecutive times will be more effective against chattering, but be aware that the reaction speed will decrease.

- (e) Moving average
  With the automatic judgement function, Set the number of moving averages with "ajmmat" of ctsu_cfg_t.Common to all buttons in the touch interface configuration.
  The figure below shows the button judgement operation described above.

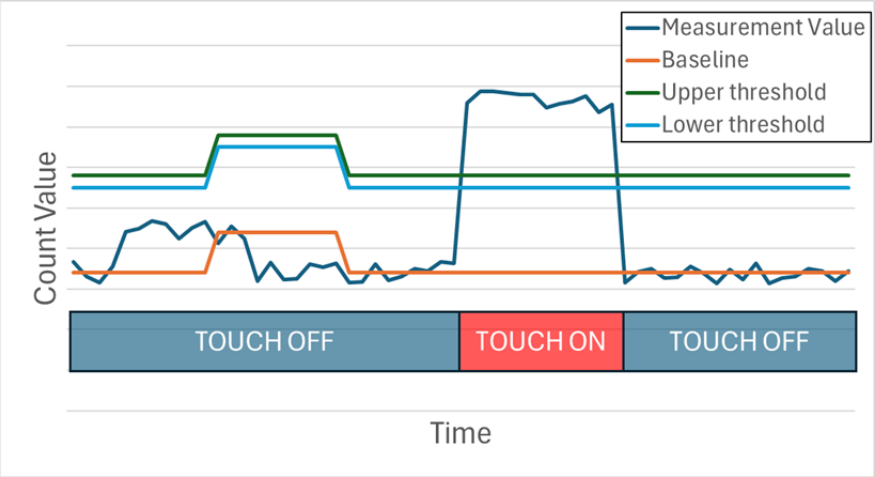

Figure 188: Button judgement

### Measurement Mode

This module supports all three modes offered by the CTSU2 peripheral: self-capacitance, mutual-capacitance, and current measurement modes. The temperature correction mode is also offered as a mode for updating the correction coefficient.

### Self-capacitance Mode

The self-capacitance mode is used to measure the capacitance of each terminal (TS).
The CTSU2 peripheral measures the terminals in ascending order according to the TS numbers, then stores the data. For example, even if you want to use TS5, TS8, TS2, TS3 and TS6 in your application in that order, they will still be measured and stored in the order of TS2, TS3, TS5, TS6, and TS8. Therefore, you will need to reference buffer indexes [2], [4], [0], [1], and [3].
VMM returns one measurement result for each element.
JMM returns three measurement results for each element.

[CTSU1]
In default settings, the measurement period for each TS is wait-time plus approximately 526us.

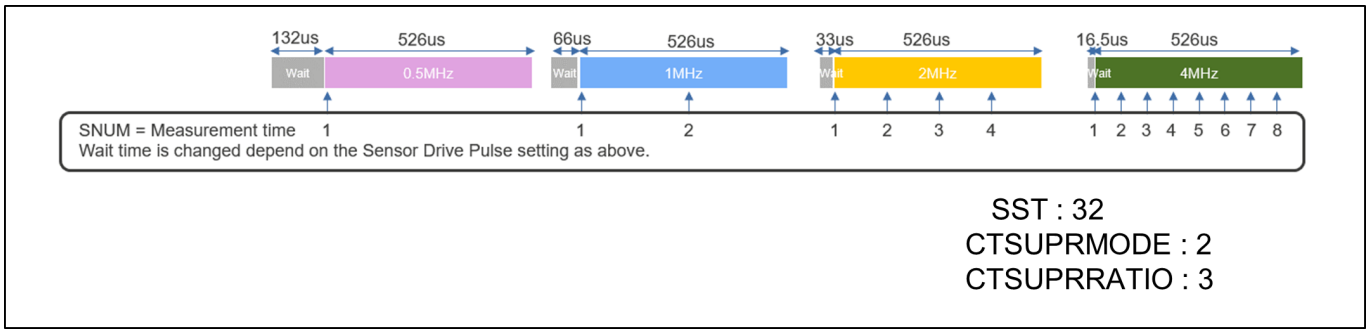

Figure 189: Self-capacitance Measurement Period (CTSU1)

[CTSU2]
In default settings, the measurement period for each TS is approximately 576us.

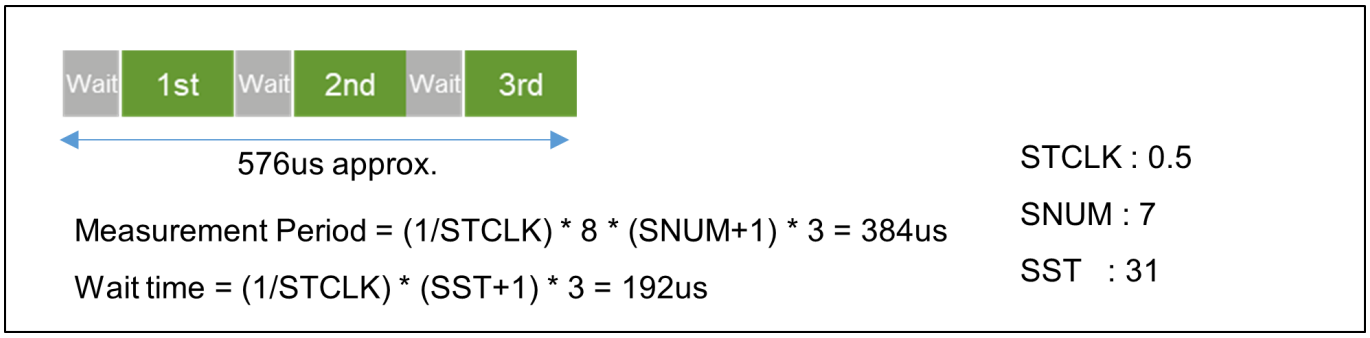

Figure 190: Self-capacitance Measurement Period (CTSU2)

### Mutual-Capacitance Mode

The mutual-capacitance mode is used to measure the capacitance generated between the receive TS (Rx) and transmit TS (Tx), and therefore requires at least two terminals.
The CTSU2 peripheral measures all specified combinations of Rx and Tx. For example, when Rx is TS1 and TS3, and Tx is TS2, TS7 and TS4, the combinations are measured in the following order and the data is stored.
TS3-TS2, TS3-TS4, TS3-TS7, TS10-TS2, TS10-TS4, TS10-TS7
To measure the mutual-capacitance generated between electrodes, the CTSU2 peripheral performs the measurement process on the same electrode twice.
The mutual-capacitance is obtained by inverting the phase relationship of the pulse output and switched capacitor in the primary and secondary measurements, and calculating the difference between the two measurements. This module does not calculate the difference, but outputs both primary and secondary measured result.
VMM returns two measurement results(one primary and one secondary) for each element.
JMM returns six measurement results(three primary and three secondary) for each element.
[CTSU1]
In default settings, the measurement period for each TS is twice of wait-time plus approximately 526us.
[CTSU2]
In default settings, the measurement period for each TS is approximately 1152us.

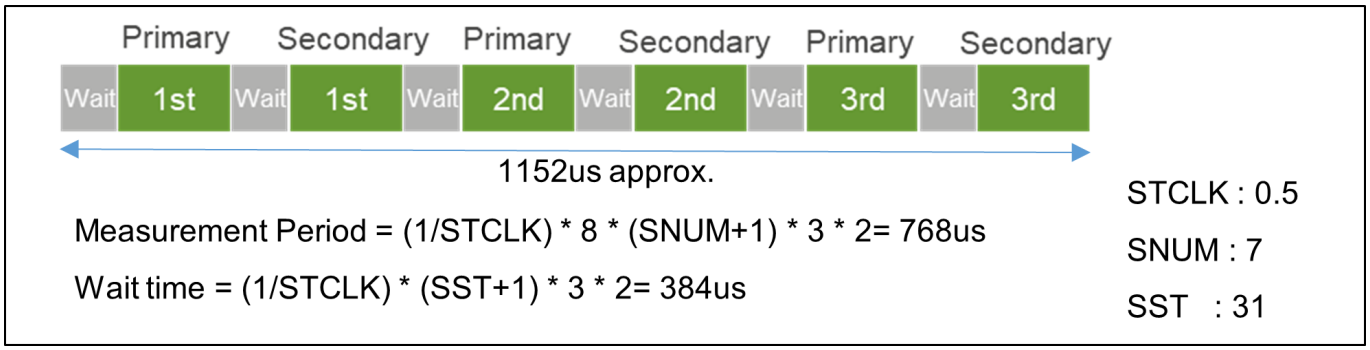

Figure 191: Mutual-capacitance Measurement Period

### Mutual-capacitance parallel scan mode(CTSU2)

This mode provides fast measurement time by parallel scanning the RX lines with a CFC circuit. Operation is otherwise identical to normal CTSU mutual scanning.

- Scan Order
  - The hardware scans all RX pins simultaneously for each TX pin.
  - For example, if sensors TS10, TS11, and TS03 are specified as RX sensors, and sensors TS02, TS07, and TS04 are specified as TX sensors, the hardware will scan them in the following sensor-pair order:
    TS02-(TS03, TS10, TS11), TS04-(TS03, TS10, TS11), TS07-(TS03, TS10, TS11)
- Element
  - An element refers to the index of a sensor-pair within the scan order. Using the previous example, TS07-TS10 is element 7.
- Scan Time
  - Because the RX lines are scanned in parallel, CFC mutual-capacitance scan is the same amount of times faster than a basic mutual matrix scan as the number of RX lines. In other words, on a matrix with N receive lines, CFC mutual scanning is N times faster than basic mutual scanning. Set CTSU_MODE_MUTUAL_CFC_SCAN to "md" of ctsu_cfg_t.
    Also, add the number of matrix used for this measurement to CTSU_CFG_NUM_MUTUAL_ELEMENTS. In addition, set the number of CTSU_CFG_NUM_CFC and CTSU_CFG_NUM_CFC_TX.
    For details, refer to the configuration and sample application output by QE for Capacitive Touch.

**Current Measurement Mode(CTSU2)**

The current measurement mode is used to measure the minute current input to the TS terminal. The order of measurement and data storage is the same as that of the self-capacitance mode. As this does not involve the switched capacitor operation, the measurement is only performed once. The measurement period for one TS under default settings is approximately 256us. The current measurement mode requires a longer stable wait time than the other modes, so the SST is set to 63.

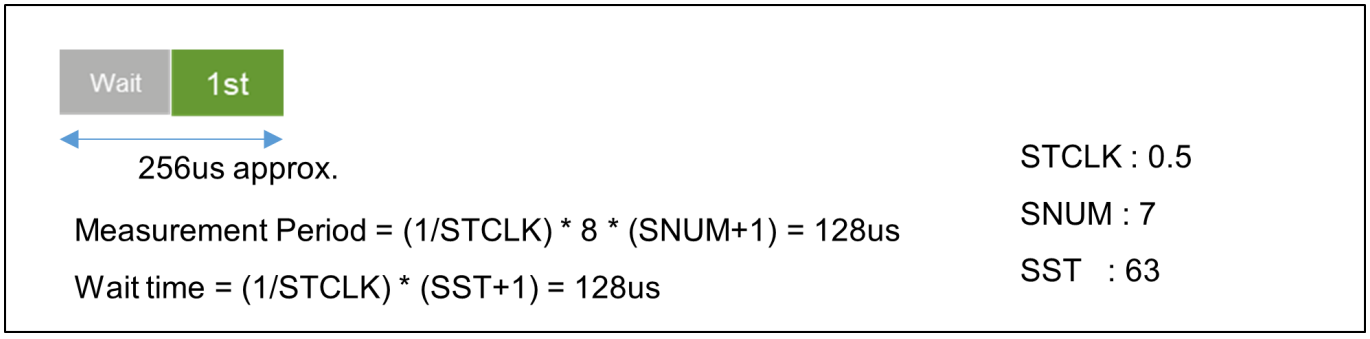

Figure 192: Current Measurement Period

**Temperature Correction Mode(CTSU2)**

The temperature correction mode is used to periodically update the correction coefficient using an external resistor connected to a TS terminal. This involves three processes as described below. Also refer to the timing chart in Figure of Temperature Correction Measurement Timing Chart.

1. Measure the correction circuit. One set comprises twelve measurements.
2. Measure the current when TSCAP voltage is applied to the external resistor to create a

correction coefficient based on an external resistor that does not depend on temperature. Execute the next measurement after the previous measurement set is completed (as described in step 1).
3. Flow offset current to the external resistor and measure the voltage with the ADC. This will adjust the RTRIM register and handle the temperature drift of the internal reference resistor. In the config settings, set the number of times step 2 should be executed before carrying out this measurement.

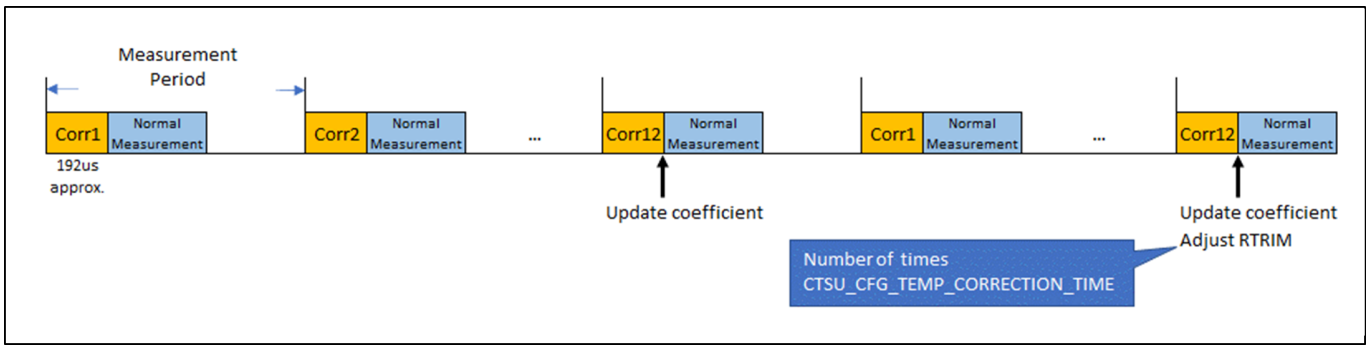

Figure 193: Temperature Correction Measurement Timing Chart

Temperature correction uses the ADC module.
If an error occurs in the ADC module used for temperature correction, return FSP_ERR_ABORTED as the return value of R_CTSU_DataGet().
If an ADC error is returned, exit the function so as not to measure or close the ADC.
See ADC (r_adc) for ADC module errors.
Please pay articular attention to the following three points.

1. When using the temperature correction of the CTSU module, be sure to measure the ADC module. Therefore, please close the user's ADC for use in temperature correction. After closing, please use temperature correction of CTSU module.
2. When creating an RTOS, please be careful about the scheduling of the CTSU module's temperature correction task and the user's ADC task when creating an application.
3. If FSP_ERR_ABORTED occurs, please call the user's ADC again when using the user's ADC.

**Diagnosis Mode**

The diagnosis mode is a mode in which various internal measurement values are scanned by using this diagnosis function R_CTSU_Diagnosis().

**Measurement Timing**

Measurements are initiated by a software trigger or an external event which is triggered by the Event Link Controller (ELC).
The most common method is using a timer to carry out periodic measurements. Make sure to set the timer interval to allow the measurement and internal value update processes to complete before the next measurement period. The measurement period differs according to touch interface configuration and measurement mode.
The execution timing of software triggers and external triggers differ slightly.
Since a software trigger sets the start flag after setting the touch interface configuration with R_CTSU_ScanStart(), there is a slight delay after the timer event occurrence. However, as the delay is much smaller than the measurement period, a software trigger is recommended for most instances as it is easy to set.

An external trigger is recommended for applications in which this slight delay is not acceptable or that require low-power consumption operations. When using an external trigger with multiple touch interface configurations, use R_CTSU_ScanStart() to set another touch interface configuration after one measurement is completed.

### TrustZone Support

In r_ctsu and rm_touch module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

### Data flow

The flow of storing data in RAM is as follows.

(CTSU1)

1. Read registers and stored in RAM as raw data.
2. ICO correction calculation of raw data and stored in RAM as correction data.
3. The correction data is calculated by moving average and stored in RAM as measurement results.

(CTSU2 VMM)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Calculate CCO correction from three raw data and stored three CCO correction values in RAM.
3. Calculate three frequency correction values from three CCO correction values.
4. Three frequency correction data are calculated by majority decision and moving average, and stored in RAM as measurement results.

(CTSU2 JMM)

1. Reads a register and stores raw data measured at three different frequencies in RAM.
2. Calculate CCO correction from three raw data and stored three CCO correction values in RAM.
3. Three CCO correction data is calculated by moving average and stored three measurement results in RAM.

### Add user's filter

There are two ways to add the user's filter.

1. Instead of filter calculation of R_CTSU_DataGet(), perform user filter calculation and use R_CTSU_DataInsert() to input user filter calculation result.
   R_CTSU_DataInsert()
   In VMM, the second argument p_insert_data stores one data for each element.
   In JMM, the second argument p_insert_data stores three data for each element.

2. Using the correction data obtained by R_CTSU_SpecificDataGet(), instead of majority

decision calculation and filter calculation of R_CTSU_DataGet(), perform user majority decision calculation & filter calculation and use R_CTSU_DataInsert() to input user majority decision calculation & filter calculation result.

Please check example.
User's filter additional Example

### Limitations

Developers should be aware of the following limitations when using CTSU with FSP :

- CTSU doesn't support Diagnosis for CTSU2SLa.

## Examples

### Basic Example

This is a basic example of minimal use of the CTSU in an application.

```
volatile bool g_scan_flag = false;
void ctsu_callback (ctsu_callback_args_t * p_args)
{
 if (CTSU_EVENT_SCAN_COMPLETE == p_args->event)
    {
       g_scan_flag = true;
    }
}
void ctsu_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
 while (!g_scan_flag)
      {
```

```
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
    }
}
```

### Multi-configuration Example

This is a optional example of using both Self-capacitance and Mutual-capacitance configurations in the same project.

```
void ctsu_optional_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS + (CTSU_CFG_NUM_MUTUAL_ELEMENTS * 2)];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
    err = R_CTSU_Open(&g_ctsu_ctrl_mutual, &g_ctsu_cfg_mutual);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
 R_CTSU_ScanStart(&g_ctsu_ctrl_mutual);
 while (!g_scan_flag)
      {
```

```
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
       err = R_CTSU_DataGet(&g_ctsu_ctrl_mutual, data);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
      }
    }
}
```

### Offset Adjustment Example

This is an example of offset adjustment using R_CTSU_OffsetTuning().
After completing R_CTSU_Open (), perform initial offset adjustment.
Offset adjustment is performed again when the parasitic capacitance changes significantly due to changes in the surrounding environment and the count value becomes an abnormal value.

```
void ctsu_offsettuning_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
 /* Initial offset tuning */
 do
    {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
```

```
     {
 /* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
   } while (FSP_SUCCESS != err);
 while (true)
   {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
     {
 /* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
     assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
     {
 /* Re-offset tuning is performed when the parasitic capacitance changes
significantly due   */
 /* to changes in the surrounding environment and the count value becomes an abnormal
value. */
 /*
       */
 /* if (abnormal value detection
conditions)                                                */
 /* {
       */
 /* Re-offset tuning */
 do
     {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
     {
```

```
 /* Wait for scan end callback */
      }
         g_scan_flag = false;
         err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
      } while (FSP_SUCCESS != err);
 /* }
        */
      }
    }
}
```

### Diagnosis function Example

This is a Diagnosis function example of using the configuration in the basic example.

```
void ctsu_diag_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t dummy;
 R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
    assert(FSP_SUCCESS == err);
 R_CTSU_Open(&g_ctsu_ctrl_diagnosis, &g_ctsu_cfg_diagnosis);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
      assert(FSP_SUCCESS == err);
 R_CTSU_ScanStart(&g_ctsu_ctrl_diagnosis);
```

```
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl_diagnosis, &dummy);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
            err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
      assert(FSP_SUCCESS == err);
 if (FSP_SUCCESS == err)
      {
 break;
      }
      }
    }
}
```

### User's filter additional Example

This is a user's filter additiional example of using the configuration in the basic example.
To perform user's filter calculation, change the num_moving_average of the element in the target ctsu_cfg_t to 1.

Perform user filter calculation and use R_CTSU_DataInsert() to input user filter calculation result.

```
void ctsu_user_filter_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];
 /* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
```

```
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
 /* User original function. */
            ctsu_user_filter(data, filter_data);
            err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
      assert(FSP_SUCCESS == err);
 /* Call RM_TOUCH_DataGet() to make a touch decision. */
      }
    }
}
```

Using the correction data obtained by R_CTSU_SpecificDataGet(). Perform user majority decision calculation & filter calculation and use R_CTSU_DataInsert() to input user majority decision calculation & filter calculation result.

```
void ctsu_user_majority_decition_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    uint16_t data[CTSU_CFG_NUM_SELF_ELEMENTS];
    uint16_t corr_data[CTSU_CFG_NUM_SELF_ELEMENTS * CTSU_CFG_NUM_SUMULTI];
```

```
    uint16_t filter_data[CTSU_CFG_NUM_SELF_ELEMENTS];
 /* If you want to make a touch judgment, call RM_TOUCH_Open()instead of the
following. */
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* If you want to make a touch judgment, call RM_TOUCH_ScanStart()instead of the
following. */
       err = R_CTSU_ScanStart(&g_ctsu_ctrl);
      assert(FSP_SUCCESS == err);
 while (!g_scan_flag)
      {
 /* Wait for scan end callback */
      }
       g_scan_flag = false;
       err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
 if (FSP_SUCCESS == err)
      {
            err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
      assert(FSP_SUCCESS == err);
 /* User original function */
            ctsu_user_filter(corr_data, filter_data);
            err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
      assert(FSP_SUCCESS == err);
 /* Call RM_TOUCH_DataGet() to make a touch decision. */
      }
    }
}
```

## Enumeration Type Documentation

### ◆ ctsu_state_t

| enum ctsu_state_t | |
|---|---|
| CTSU run state | |
| Enumerator | |
| CTSU_STATE_INIT | Not open. |
| CTSU_STATE_IDLE | Opened. |
| CTSU_STATE_SCANNING | Scanning now. |
| CTSU_STATE_SCANNED | Scan end. |

### ◆ ctsu_tuning_t

| enum ctsu_tuning_t | |
|---|---|
| CTSU Initial offset tuning status | |
| Enumerator | |
| CTSU_TUNING_INCOMPLETE | Initial offset tuning incomplete. |
| CTSU_TUNING_COMPLETE | Initial offset tuning complete. |

### ◆ ctsu_correction_status_t

| enum ctsu_correction_status_t | |
|---|---|
| CTSU Correction status | |
| Enumerator | |
| CTSU_CORRECTION_INIT | Correction initial status. |
| CTSU_CORRECTION_RUN | Correction scan running. |
| CTSU_CORRECTION_COMPLETE | Correction complete. |
| CTSU_CORRECTION_ERROR | Correction error. |

### ◆ ctsu_range_t

| enum ctsu_range_t | |
|---|---|
| CTSU range definition | |
| Enumerator | |
| CTSU_RANGE_20UA | 20uA mode |
| CTSU_RANGE_40UA | 40uA mode |
| CTSU_RANGE_80UA | 80uA mode |
| CTSU_RANGE_160UA | 160uA mode |
| CTSU_RANGE_NUM | number of range |

## Function Documentation

### ◆ R_CTSU_Open()

fsp_err_t R_CTSU_Open ( ctsu_ctrl_t *const *p_ctrl*, ctsu_cfg_t const *const *p_cfg* )

Opens and configures the CTSU driver module. Implements ctsu_api_t::open.

Example:

```
    err = R_CTSU_Open(&g_ctsu_ctrl, &g_ctsu_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

***Note***

- *In the first Open, measurement for correction works, and it takes several tens of milliseconds.*
- *When the touch interface configuration is diagnosis mode, execute the R_CTSU_Open() of the other touch interface configuration first.*

### ◆ R_CTSU_ScanStart()

fsp_err_t R_CTSU_ScanStart ( ctsu_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with R_CTSU_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements ctsu_api_t::scanStart.

Example:

```
while (true)
   {
      err = R_CTSU_ScanStart(&g_ctsu_ctrl);
     assert(FSP_SUCCESS == err);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
     }
   }
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance or other. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |

### ◆ R_CTSU_DataGet()

fsp_err_t R_CTSU_DataGet ( ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_data* )

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements ctsu_api_t::dataGet.

Example:

```
while (true)
   {
      err = R_CTSU_ScanStart(&g_ctsu_ctrl);
     assert(FSP_SUCCESS == err);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
     }
   }
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |
| FSP_ERR_CTSU_DIAG_NOT_YET | Diagnosis of data collected no yet. |
| FSP_ERR_INVALID_MODE | The mode of automatic judgement on is invalid. |
| FSP_ERR_ABORTED | Operate error of Diagnosis ADC data collection ,since ADC use other |

### ◆ R_CTSU_AutoJudgementDataGet()

fsp_err_t R_CTSU_AutoJudgementDataGet ( ctsu_ctrl_t *const *p_ctrl*, uint64_t * *p_button_status* )

This function gets the result of automatic judgement button. Call after the scan is completed. The result is 64-bit bitmaps and is stored in order of TS number for specified ctsu control. After the initial judgement, the baseline initialization bit is set and the automatic judgement threshold is set. This function is called only for automatic judgement. Implements ctsu_api_t::autoJudgementDataGet.

Example:

```
/* Main loop */
while (true)
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_AutoJudgementDataGet(&g_ctsu_ctrl, &button_status);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
     }
   }
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_INVALID_MODE | The mode of automatic judgement off is invalid. |

### ◆ R_CTSU_OffsetTuning()

fsp_err_t R_CTSU_OffsetTuning ( ctsu_ctrl_t *const *p_ctrl*)

This function tunes the offset register(SO). Call after the measurement is completed. If the return value is FSP_ERR_CTSU_INCOMPLETE_TUNING, tuning is not complete. Execute the measurement and this function call routine until the return value becomes FSP_SUCCESS. It is recommended to run this routine after R_CTSU_Open(). It can be recalled and tuned again. When the automatic judgement is enabled, after the offset tuning is completed,the baseline initialization bit flag is set. Implements ctsu_api_t::offsetTuning.

Example:

```
/* Initial offset tuning */
do
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
   } while (FSP_SUCCESS != err);
while (true)
   {
R_CTSU_ScanStart(&g_ctsu_ctrl);
while (!g_scan_flag)
     {
/* Wait for scan end callback */
     }
      g_scan_flag = false;
      err = R_CTSU_DataGet(&g_ctsu_ctrl, data);
     assert(FSP_SUCCESS == err);
if (FSP_SUCCESS == err)
     {
/* Re-offset tuning is performed when the parasitic capacitance changes
significantly due   */
/* to changes in the surrounding environment and the count value becomes an abnormal
```

```
value. */
 /*
        */
 /* if (abnormal value detection
conditions)                                                */
 /* {
        */
 /* Re-offset tuning */
 do
     {
 R_CTSU_ScanStart(&g_ctsu_ctrl);
 while (!g_scan_flag)
     {
 /* Wait for scan end callback */
     }
        g_scan_flag = false;
        err = R_CTSU_OffsetTuning(&g_ctsu_ctrl);
     } while (FSP_SUCCESS != err);
 /* }
        */
     }
   }
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

### ◆ R_CTSU_ScanStop()

fsp_err_t R_CTSU_ScanStop ( ctsu_ctrl_t *const *p_ctrl*)

This function scan stops the sensor as scanning by the CTSU. Implements ctsu_api_t::scanStop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully scan stop. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ R_CTSU_CallbackSet()

fsp_err_t R_CTSU_CallbackSet ( ctsu_ctrl_t *const *p_api_ctrl*, void(*)(ctsu_callback_args_t *) *p_callback*, void *const *p_context*, ctsu_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements ctsu_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_CTSU_Close()

fsp_err_t R_CTSU_Close ( ctsu_ctrl_t *const *p_ctrl*)

Disables specified CTSU control block. Implements ctsu_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ R_CTSU_SpecificDataGet()

fsp_err_t R_CTSU_SpecificDataGet ( ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_specific_data*, ctsu_specific_data_type_t *specific_data_type* )

This function gets the sensor specific data values as scanned by the CTSU. Call this function after calling the R_CTSU_DataGet() function.

By setting the third argument to CTSU_SPECIFIC_RAW_DATA, RAW data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CCO_CORRECTION_DATA, the cco corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_CORRECTION_DATA, the frequency corrected data can be output from the second argument.

By setting the third argument to CTSU_SPECIFIC_SELECTED_FREQ, Get bitmap of the frequency values used in majority decision from the second argument.(CTSU2 Only) The bitmap is shown as follows.

| 2bit | 1bit | 0bit |
|---|---|---|
| 3rd frequency value | 2nd frequency value | 1st frequency value |

Implements ctsu_api_t::specificDataGet.

Example:

```
            err = R_CTSU_SpecificDataGet(&g_ctsu_ctrl, corr_data,
CTSU_SPECIFIC_CORRECTION_DATA);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |
| FSP_ERR_NOT_ENABLED | CTSU_SPECIFIC_SELECTED_FREQ is not enabled in CTSU1.(CTSU2 Only) |

### ◆ R_CTSU_DataInsert()

fsp_err_t R_CTSU_DataInsert ( ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_insert_data* )

This function inserts the value of the second argument as the measurement result value. Call this function after calling the R_CTSU_DataInsert() function. Implements ctsu_api_t::dataInsert.

Example:

```
err = R_CTSU_DataInsert(&g_ctsu_ctrl, filter_data);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

### ◆ R_CTSU_Diagnosis()

fsp_err_t R_CTSU_Diagnosis ( ctsu_ctrl_t *const *p_ctrl*)

Diagnosis the CTSU peripheral. Implements ctsu_api_t::diagnosis.

Example:

```
            err = R_CTSU_Diagnosis(&g_ctsu_ctrl_diagnosis);
        assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CTSU successfully configured. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |
| FSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE | Diagnosis of LDO over voltage failed. |
| FSP_ERR_CTSU_DIAG_CCO_HIGH | Diagnosis of CCO into 19.2uA failed. |
| FSP_ERR_CTSU_DIAG_CCO_LOW | Diagnosis of CCO into 2.4uA failed. |
| FSP_ERR_CTSU_DIAG_SSCG | Diagnosis of SSCG frequency failed. |
| FSP_ERR_CTSU_DIAG_DAC | Diagnosis of non-touch count value failed. |
| FSP_ERR_CTSU_DIAG_OUTPUT_VOLTAGE | Diagnosis of LDO output voltage failed. |
| FSP_ERR_CTSU_DIAG_OVER_VOLTAGE | Diagnosis of over voltage detection circuit failed. |
| FSP_ERR_CTSU_DIAG_OVER_CURRENT | Diagnosis of over current detection circuit failed. |
| FSP_ERR_CTSU_DIAG_LOAD_RESISTANCE | Diagnosis of LDO internal resistance value failed. |
| FSP_ERR_CTSU_DIAG_CURRENT_SOURCE | Diagnosis of LDO internal resistance value failed. |
| FSP_ERR_CTSU_DIAG_SENSCLK_GAIN | Diagnosis of SENSCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_SUCLK_GAIN | Diagnosis of SUCLK frequency gain failed. |
| FSP_ERR_CTSU_DIAG_CLOCK_RECOVERY | Diagnosis of SUCLK clock recovery function failed. |
| FSP_ERR_CTSU_DIAG_CFC_GAIN | Diagnosis of CFC oscillator gain failed. |

### Detailed Description

This module supports the Capacitive Touch Sensing Unit (CTSU). It implements the Touch Middleware Interface.

# Overview

The Touch Middleware uses the CTSU (r_ctsu) API and provides application-level APIs for scanning touch buttons, sliders, and wheels. This module is configured via the QE for Capacitive Touch.

### Features

- Supports touch buttons (Self and Mutual), sliders, and wheels
- Can retrieve the status of up to 64 buttons at once
- Software and external triggering
- Callback on scan end
- Collects and calculates usable scan results:
  - Slider position from 1 to 100 (percent)
  - Wheel position from 1 to 360 (degrees)
- Dynamic touch-judgment-threshold adjustment
- Calculate the XY coordinates of the pad(CTSU2)
- Optional (build time) support for real-time monitoring functionality through the QE tool over UART

- Optional (build time) support for tuning function through the QE Standalone Version tool over UART
- TrustZone Support

# Configuration

*Note*

***This module is configured via the QE for Capacitive Touch. For information on how to use the QE tool, once the tool is installed click Help -> Help Contents in e² studio and search for "QE".***

This module supports the QE monitor function. The monitor determines whether to use debugger or serial communications, determines the type of the information from QE and sends only the necessary information. This module supports the serial tuning function with the standalone version of QE. Generates a configuration configuration file by UART communication with QE.

*Note*

*Multiple configurations can be defined within a single project allowing for different scan procedures or button layouts.*

### Build Time Configurations for rm_touch

The following build time configurations are defined in fsp_cfg/rm_touch_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Support for QE monitoring using UART | • Enabled<br>• Disabled | Disabled | Enable UART support for QE monitoring. |
| Support for QE Tuning using UART | • Enabled<br>• Disabled | Disabled | Enable UART support for QE Tuning. |
| Type of chattering suppression | • TypeA : Counter of exceed threshold is hold within hysteresis range<br>• TypeB : Counter of exceed threshold is reset within hysteresis range. | TypeA : Counter of exceed threshold is hold within hysteresis range | TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range. / TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range. |

### Configurations for CapTouch > Touch (rm_touch)

This module can be added to the Stacks tab via New Stack > CapTouch > Touch (rm_touch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|

### Interrupt Configuration

Refer to the CTSU (r_ctsu) section for details.

### Clock Configuration

Refer to the CTSU (r_ctsu) section for details.

### Pin Configuration

Refer to the CTSU (r_ctsu) section for details.

## Usage Notes

### Measurements and Data Processing

The module determines whether the button has been touched based on the change in capacitance and detects the position of the slider or wheel. This requires continued periodic measurements of capacitance. When developing your application, make sure to periodically call RM_TOUCH_ScanStart() and RM_TOUCH_DataGet(). For more details, refer to the sample application.

### Button Touch Determination

### Touch judgment type

Touch detection of each method can be set to Value Majority Mode(VMM) or Judgment Majority Mode(JMM).
Multiple methods can be configured in touch interface configurations and each method can be independently configured in VMM or JMM.

1. Value Majority Mode (VMM)
   Touch module obtains one measurement result by combining the two measured value which have less noise out of three measured value for each button from CTSU module and outputs the touch judgment result.
   As a result, the measurement results has been noise-reduced in CTSU (r_ctsu) module.
2. Judgment Majority Mode (JMM)
   This mode supported from FSP V5.6.0 or later.
   Touch module obtains three measurement results for each button from CTSU module, judges each touch, and outputs the final touch judgment result by majority vote. This mode can be only applied to a method which contains button only.

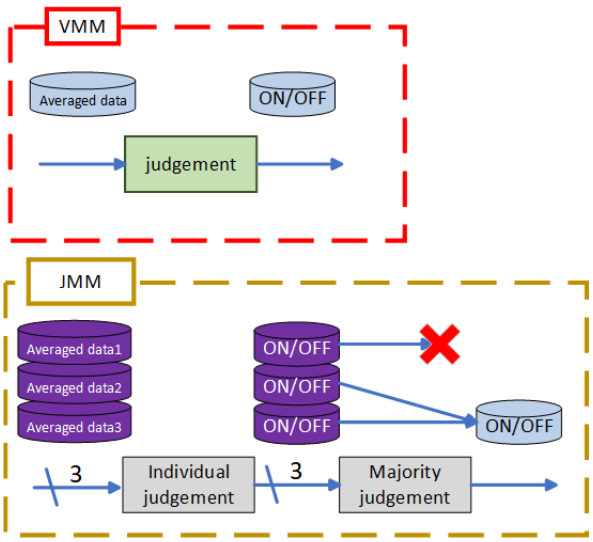

Figure 194: Data flow comparison of VMM and JMM

### Creating reference value and threshold

A touch button is not a mechanical button in which the ON/OF state is switched by hardware. The ON/OFF state is determined via software.
First, a reference value is created based on measurement results in the non-touch state. The initial reference value is the first measured value. The threshold is then determined with an arbitrary offset. If a measured value exceeds the threshold, the button is determined to be in the ON state, if it does not exceed the threshold, it is in the OFF state.
Processing for self-capacitance and mutual capacitance are basically the same. However, because the amount of capacitance decreases when a mutual capacitance button is touched, the user needs to set the threshold based on decreasing measured values to determine the ON/OFF state.
You can set the threshold for each button separately in the configuration settings (threshold in touch_button_cfg_t). The following functions are also included to deal with issues such as chattering suppression and changes in the external environment which affect actual touch recognition.
VMM : Creates one reference value and one threshold value for each button.
JMM : Creates three reference values and three threshold values for each button.

### Positive Noise Filter/Negative Noise Filter

As a chattering countermeasure, you can confirm the ON/OFF state after a set number of consecutive ON or OFF determinations.
In the configuration settings (on_freq and off_freq in touch_cfg_t) set the number of consecutive ON or OFF states. You can do this for all buttons in the touch interface configuration. Be aware that, although this is an effective solution to improving chattering, the greater the number of consecutive states, the slower the response to actual touch.

### Hysteresis

This is another chattering countermeasure. Offset the constant to the threshold after the state goes to ON, and prevent chattering by using hysteresis as the OFF-to-ON and ON-to-OFF threshold.
You can set the hysteresis value for each button in the configuration settings (hysteresis in touch_button_cfg_t). The larger the hysteresis, the more effective the countermeasure is in suppressing chattering. However, keep in mind that this will make it more difficult to return the state

from ON-to-OFF of OFF-to-ON.
VMM : One hysteresis for each button.
JMM : Three hysteresis for each button.

### Drift Correction Process

As a countermeasure for changes in the external environment, the drift correction process refreshes the reference value.
After averaging the measured value in the OFF state over a set period, if the button is in the touch OFF state after a set period, the reference value is refreshed. The drift correction is only executed in the OFF state and is cleared when touch ON is determined.
Set the period in the configuration settings (drift_freq in touch_cfg_t). You can do this for all buttons in the touch interface configuration. This allows you to adjust the ability to determine the touch state despite changes in the external environment.
VMM : Drift corrects one baseline value per button.
JMM : Drift corrects three baseline value per button.

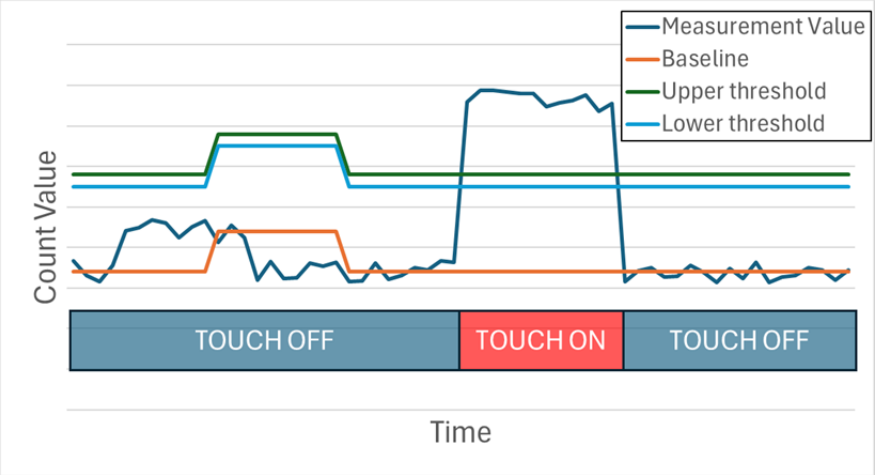

Figure 195: Button Touch Determination

### Press and hold cancel

Strong noise or other sudden environment changes can disable the drift correction process, preventing return from the ON state. The press and hold cancel function implements the drift correction process and returns the button from the ON state by forcibly turning the state to OFF after a certain number of consecutive ON state periods.
Set the number of consecutive ON periods required for the press and hold cancel function to return the button to the OFF state in the configuration settings (cancel_freq in touch_cfg_t). You can do this for all buttons in the touch interface configuration.

### Chattering suppression type (Build option)

This build option is a function to supplement the above functions (Positive Noise Filter/Negative Noise Filter and Hysteresis) for performing touch judgment.
This build option changes the processing method for Counter of exceed threshold to TypeA or TypeB.
TypeA of chattering suppression : Counter of exceed threshold is hold within hysteresis range.
TypeB of chattering suppression : Counter of exceed threshold is reset within hysteresis range.

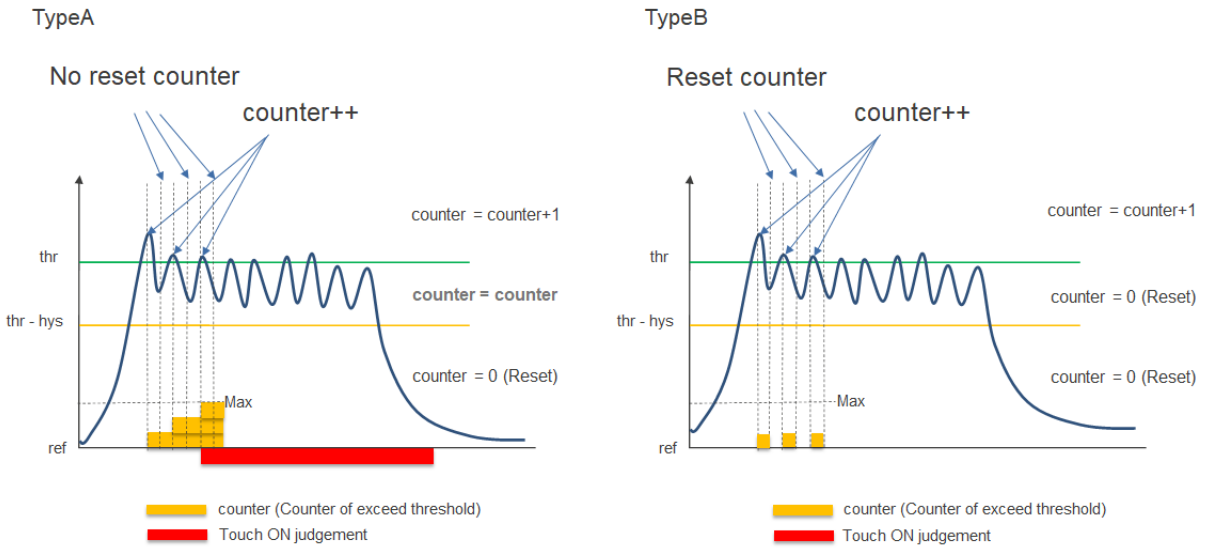

Figure 196: Chattering suppression type

### Touch Position Detection of Slider/Wheel

Configure a slider with multiple terminals to be measured (TS) physically arranged in a straight line.
Configure a wheel with multiple terminals physically arranged in a circle.
The touch position is calculated from the measured values of the TS in the configuration. The calculation method for sliders and wheels is fundamentally the same.

1. Detect the maximum value (TS_MAX) among the terminals in the configuration.
2. Calculate the difference (d1, d2) between TS_MAX and the terminals on either side. (If the TS_MAX terminal is at one end of the slider, use the values of the two terminals to the right or left, accordingly.)
3. If the total of d1 and d2 exceeds the threshold, position calculation is initiated. If the total amount does not exceed the threshold, the position calculation process is ended.
4. With TS_MAX as the middle position, the ratio of d1 to d2 is used to calculate the position. The slider has a range of 1 to 100, and the while has a range of 1 to 360.

| | Slider | Wheel |
|---|---|---|
| Electrode type | Self capacitance only | Self capacitance only |
| Number of electrodes | 3-10 | 4+ |
| Touch position output range | 1-100 | 1-360 |
| Default value (no touch) | 0xFFFF | 0xFFFF |

### Tuning the Touch Determination Adjustment

When QE tuning, a measurement is performed with a finger touching the button and the tuned parameters are output in the configuration file. The setting value of the threshold is 60% of the touch sensitivity between touch and non-touch state, and the setting value of the hysteresis coefficient is 5% of the threshold.
This module provides the functions for dynamic adjusting of these threshold and hysteresis coefficient.
They are two functions as below.

**Adjusting the threshold and hysteresis coefficient to an arbitrary ratio.**
**Use RM_TOUCH_ThresholdAdjust().**

When changing the touch determination threshold ratio from 60% QE set to 70% user specified, the touch determination thresholds are as below.
If you want to make this setting, set the member of the second argument as follows. It is also necessary to set the ratio of the amount of touch change and the hysteresis value.

*p_touch_sensitivity_ratio = 100,
old_threshold_ratio = 60,
new_threshold_ratio = 70,
new_hysteresis_ratio = 5

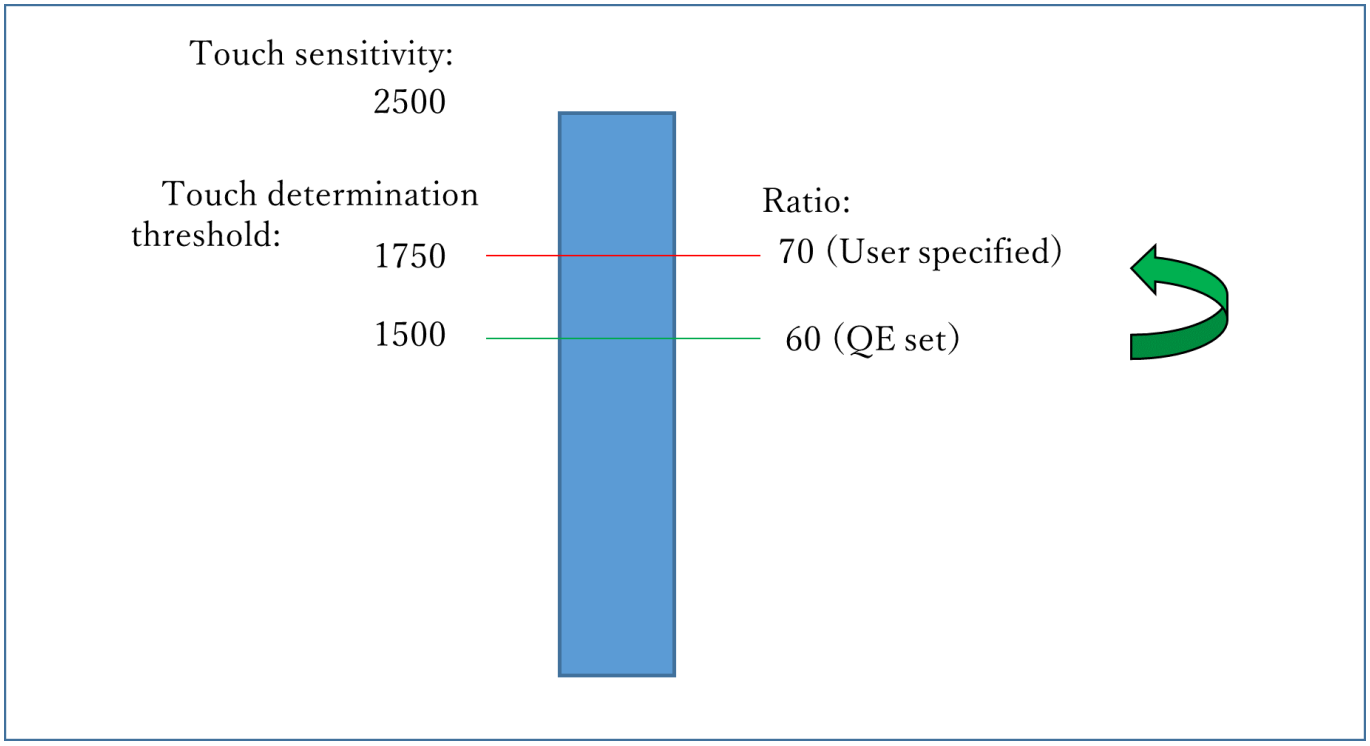

Figure 197: Example of changing the threshold ratio

**Adjusting the threshold and hysteresis coefficient according to the current touch sensitivity.**
**Use RM_TOUCH_SensitivityRatioGet(), RM_TOUCH_ThresholdAdjust(), and RM_TOUCH_DriftControl().**

When changing the kind of the overlay panel, the touch sensitivity differs from the one QE tuned. Wanting to use the software as it is without re-tuning. If you use a thicker overlay than that at QE tuning, the touch sensitivity decreases, and a touch may not be determined because of the same touch determination threshold. This function adjusts the touch determination threshold based on the ratio of the touch sensitivity after changing the overlay to the touch sensitivity at the QE tuning.

RM_TOUCH_SensitivityRatioGet() outputs the ratio of the current touch sensitivity assuming that the touch sensitivity at the QE setting is 100%.
The following figure shows the case where an overlay panel is thinner and the touch sensitivity increases.

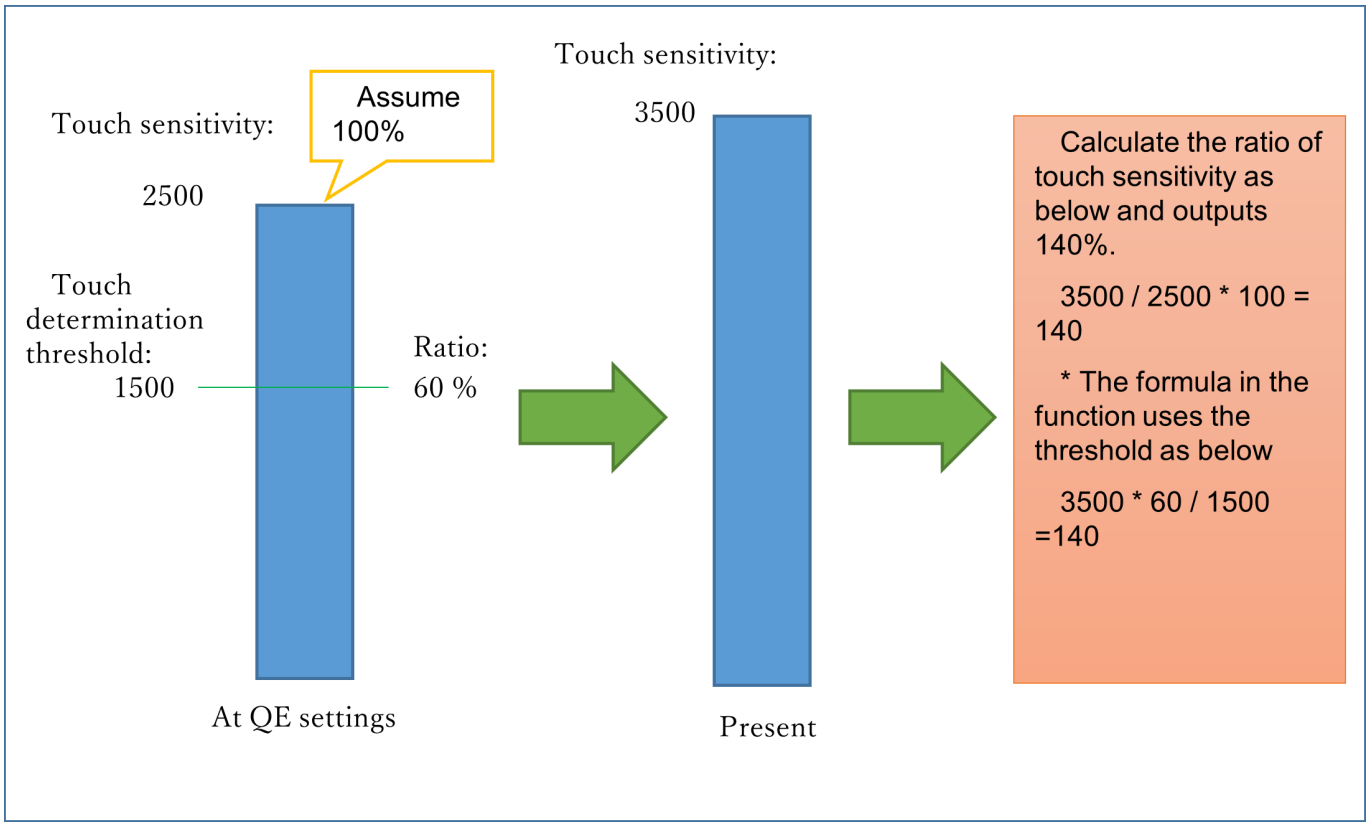

Figure 198: Example of increase touch sensitivity for thin overlay panels

Following figure shows the case where an overlay panel is thicker and the touch sensitivity decreases.

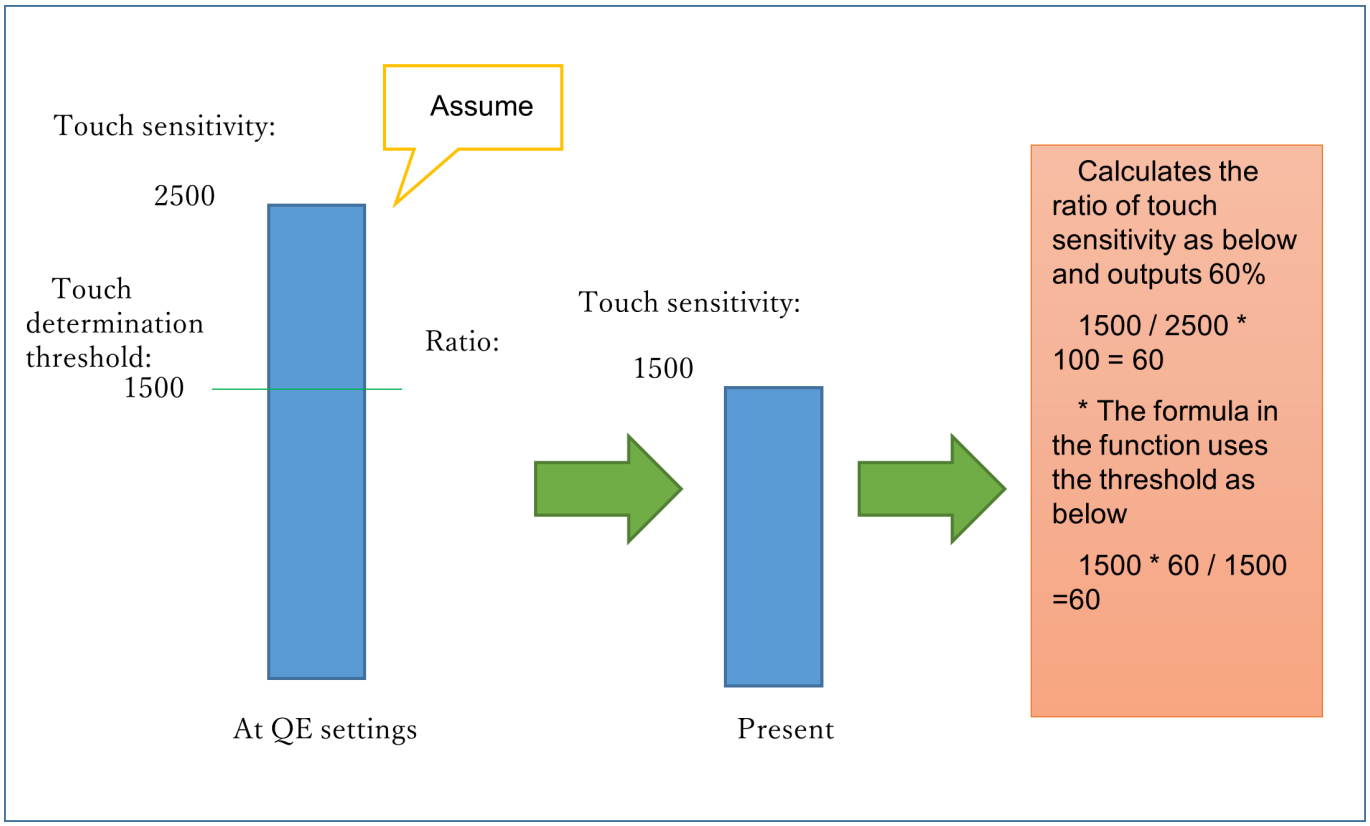

Figure 199: Example of decrease touch sensitivity for thicker overlay panels

RM_TOUCH_ThresholdAdjust() sets the new touch determination threshold and the hysteresis value by using the touch sensitivity ratio obtained with RM_TOUCH_SensitivityRatioGet() as arguments.

Example of calculation 1:
The touch sensitivity ratio is 140%, and the threshold set by QE is 1500.
Threshold = 140 * 1500 / 100 = 2100

*p_touch_sensitivity_ratio = 140,
old_threshold_ratio = 60,
new_threshold_ratio = 60,
new_hysteresis_ratio = 5

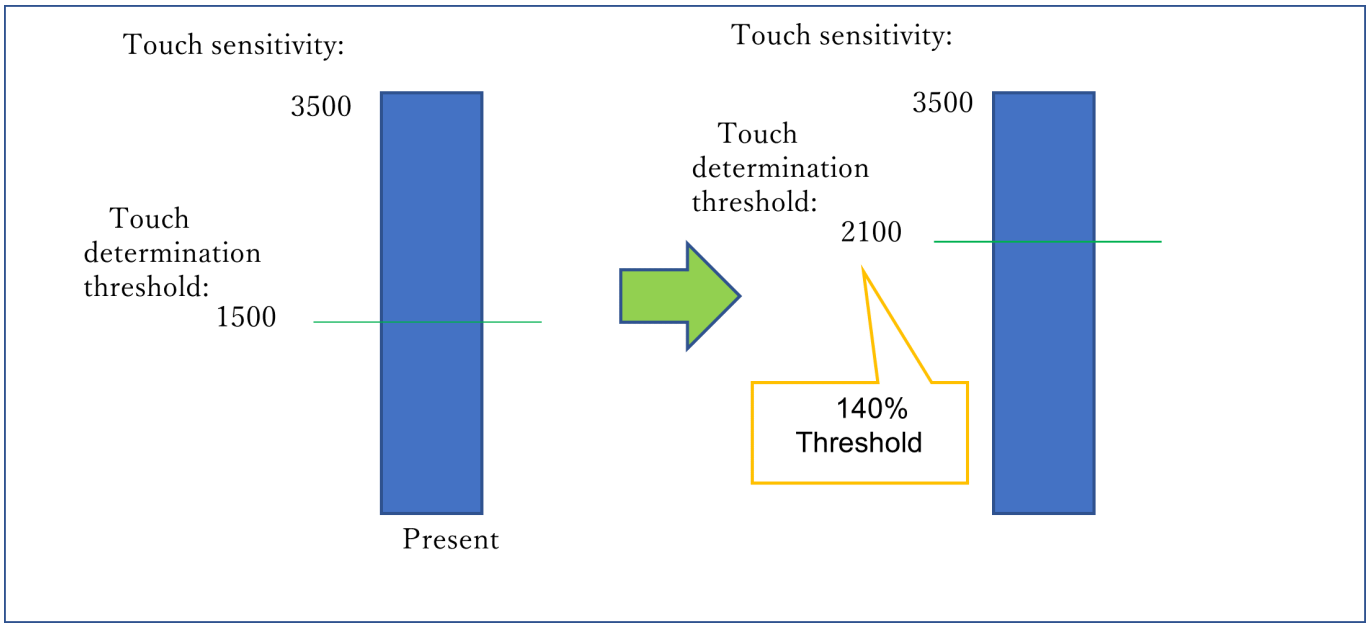

Figure 200: Example of calculation 1

Example of calculation 2:
The touch sensitivity ratio is 60%, and the threshold set by QE is 1500.
Threshold = 60 * 1500 / 100 = 900

*p_touch_sensitivity_ratio = 60,
old_threshold_ratio = 60,
new_threshold_ratio = 60,
new_hysteresis_ratio = 5

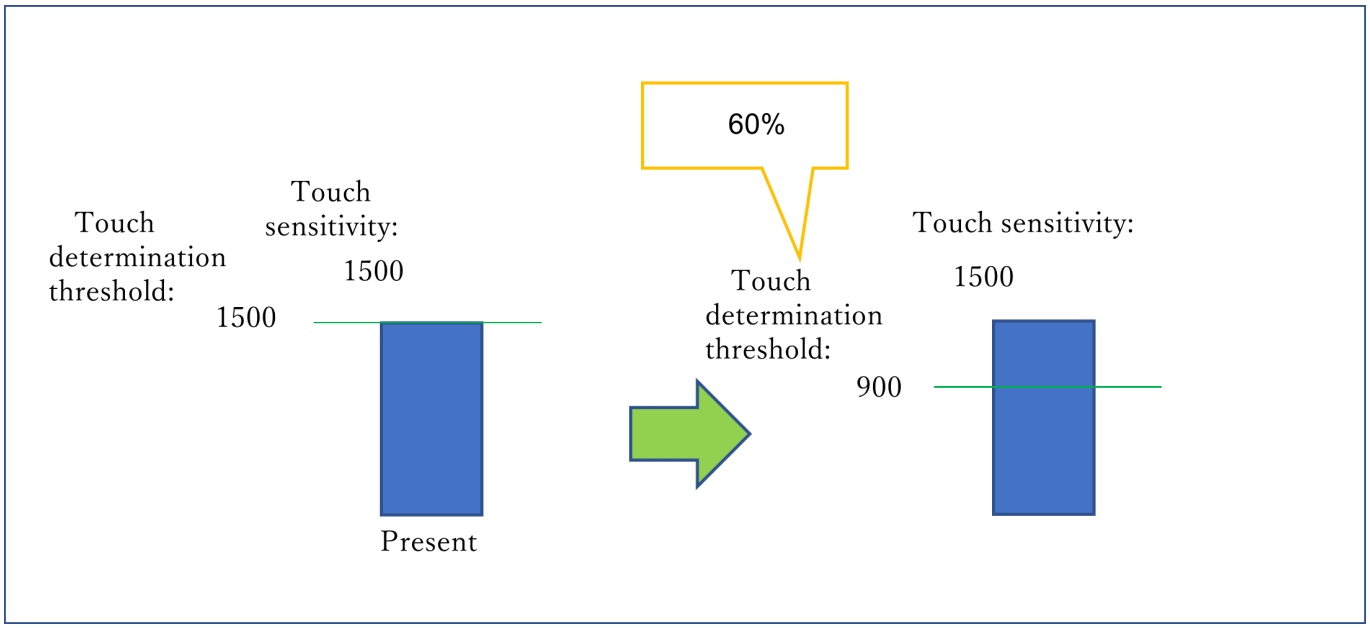

Figure 201: Example of calculation 2

RM_TOUCH_DriftContorol() set the second argument to 0 to stop the drift correction function.

When calculating the ratio of the touch change amount using RM_TOUCH_SensitivityRatioGet(), the touch change amount decreases due to the thick overlay, and the threshold value is not exceeded even if touched. Prevents the reference value from drifting.

**Example of the application for adjustment using data flash without re-tuning or software rewriting**

Enable UART communication to PC and 'tuning mode'. In tuning mode, the MCU transmits the ratio of the touch sensitivity in the touch state to the PC in real time. A user sends a command to decide the ratio while monitoring on the PC. The MCU stores the received ratio in the data flash. Make sure that the ratio stored in the data flash is read at the software activation, and the touch determination threshold is adjusted based on this stored value.

**Pad**

Configure a pad with multiple terminals physically arranged in cross.
The current position is Calculated from the measured values of the CTSU mutual scanning in the configuration.
Use RM_TOUCH_PadDataGet().
Pad is subject so some limitations:

| | Pad |
|---|---|
| Electrode type | CFC mutual capacitance only |
| Number of electrodes | RX(TS-CFC)3+, TX(Any TS)3+ |
| Touch position output range | rx_coodinate:(0 ~ rx_pixel), tx_coodinate:(0 ~ tx_pixsel) |
| Default value (no touch) | rx_coodinate:0xFFFF, tx_coodinate:0xFFFF |
| Pixel range | rx_pixel:(1 ~ 65535), tx_pixsel:(1 ~ 65535) |

Pitch for each terminal can be set with QE. Pitch's default value is 64.
The relationship between pixel and pitch : Pixel = Pitch × number of TS - 1

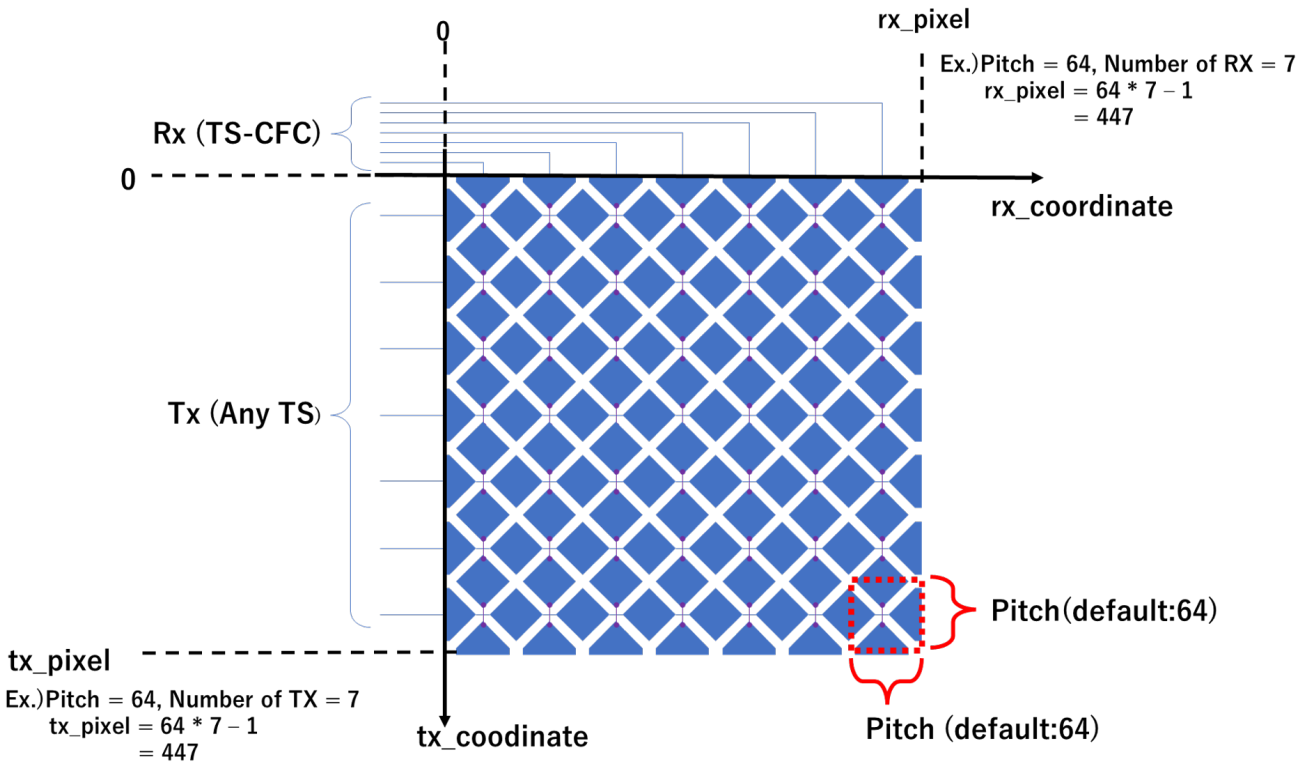

Figure 202: Example of Pad

### TrustZone Support

In r_ctsu and rm_touch module, Non-Secure Callable Guard Functions are only generated from QE for Capacitive Touch. QE can be used for tuning in secure or flat project, but not in non-secure project. If you want to use in non-secure project, copy the output file from secure or flat project. Refer to QE Help for more information.

## Examples

### Basic Example

This is a basic example of minimal use of the TOUCH in an application.

```
void touch_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 RM_TOUCH_ScanStart(&g_touch_ctrl);
```

```
 while (0 == g_flag)
      {
 /* Wait scan end callback */
       }
       g_flag = 0;
       err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
 if (FSP_SUCCESS == err)
      {
 /* Application specific data processing. */
       }
    }
}
```

### Multi Mode Example

This is a optional example of using both Self-capacitance and Mutual-capacitance. Refer to the Multi Mode Example in CTSU usage notes.

```
void touch_optional_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
    assert(FSP_SUCCESS == err);
    err = RM_TOUCH_Open(&g_touch_ctrl_mutual, &g_touch_cfg_mutual);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 RM_TOUCH_ScanStart(&g_touch_ctrl);
 while (0 == g_flag)
      {
 /* Wait scan end callback */
       }
       g_flag = 0;
 RM_TOUCH_ScanStart(&g_touch_ctrl_mutual);
 while (0 == g_flag)
```

```
     {
/* Wait scan end callback */
      }
      g_flag = 0;
      err = RM_TOUCH_DataGet(&g_touch_ctrl, &button, slider, wheel);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
      }
      err = RM_TOUCH_DataGet(&g_touch_ctrl_mutual, &button, slider, wheel);
if (FSP_SUCCESS == err)
     {
/* Application specific data processing. */
      }
   }
}
```

## Data Structures

| | |
|---|---|
| struct | touch_button_info_t |
| struct | touch_slider_info_t |
| struct | touch_wheel_info_t |
| struct | touch_pad_info_t |
| struct | touch_mm_info_t |
| struct | touch_instance_ctrl_t |

## Data Structure Documentation

### ◆ touch_button_info_t

| struct touch_button_info_t | | |
|---|---|---|
| Information of button | | |
| Data Fields | | |
| uint64_t | status | Touch result bitmap. |
| uint16_t * | p_threshold | Pointer to Threshold value array. |

| | | |
|---|---|---|
| | | g_touch_button_threshold[] is set by Open API. |
| uint16_t * | p_hysteresis | Pointer to Hysteresis value array. g_touch_button_hysteresis[] is set by Open API. |
| uint16_t * | p_reference | Pointer to Reference value array. g_touch_button_reference[] is set by Open API. |
| uint16_t * | p_on_count | Continuous touch counter. g_touch_button_on_count[] is set by Open API. |
| uint16_t * | p_off_count | Continuous non-touch counter. g_touch_button_off_count[] is set by Open API. |
| uint32_t * | p_drift_buf | Drift reference value. g_touch_button_drift_buf[] is set by Open API. |
| uint16_t * | p_drift_count | Drift counter. g_touch_button_drift_count[] is set by Open API. |
| uint8_t | on_freq | Copy from config by Open API. |
| uint8_t | off_freq | Copy from config by Open API. |
| uint16_t | drift_freq | Copy from config by Open API. |
| uint16_t | cancel_freq | Copy from config by Open API. |

### ◆ touch_slider_info_t

| struct touch_slider_info_t | | |
|---|---|---|
| Information of slider | | |
| Data Fields | | |
| uint16_t * | p_position | Calculated Position data. g_touch_slider_position[] is set by Open API. |
| uint16_t * | p_threshold | Copy from config by Open API. g_touch_slider_threshold[] is set by Open API. |

### ◆ touch_wheel_info_t

| struct touch_wheel_info_t | | |
|---|---|---|
| Information of wheel | | |
| Data Fields | | |
| uint16_t * | p_position | Calculated Position data. |

| | | |
|---|---|---|
| | | g_touch_wheel_position[] is set by Open API. |
| uint16_t * | p_threshold | Copy from config by Open API. g_touch_wheel_threshold[] is set by Open API. |

### ◆ touch_pad_info_t

| struct touch_pad_info_t | | |
|---|---|---|
| Information of pad | | |
| Data Fields | | |
| uint16_t * | p_rx_coordinate | RX coordinate. |
| uint16_t * | p_tx_coordinate | TX coordinate. |
| uint16_t * | p_num_touch | number of touch |
| uint16_t * | p_threshold | Coordinate calculation threshold value. |
| uint16_t * | p_base_buf | ScanData Base Value Buffer. |
| uint16_t * | p_rx_pixel | X coordinate resolution. |
| uint16_t * | p_tx_pixel | Y coordinate resolution. |
| uint8_t * | p_max_touch | Maximum number of touch judgments used by the pad. |
| int32_t * | p_drift_buf | Drift reference value. g_touch_button_drift_buf[] is set by Open API. |
| uint16_t * | p_drift_count | Drift counter. g_touch_button_drift_count[] is set by Open API. |
| uint8_t | num_drift | Copy from config by Open API. |

### ◆ touch_mm_info_t

| struct touch_mm_info_t |
|---|
| Information of touch button judge(CTSU2) |

### ◆ touch_instance_ctrl_t

| struct touch_instance_ctrl_t | | |
|---|---|---|
| TOUCH private control block. DO NOT MODIFY. Initialization occurs when RM_TOUCH_Open() is called. | | |
| Data Fields | | |
| uint32_t | open | Whether or not driver is open. |
| touch_button_info_t | binfo | Information of button. |

| | | |
|---|---|---|
| touch_slider_info_t | sinfo | Information of slider. |
| touch_wheel_info_t | winfo | Information of wheel. |
| bool | serial_tuning_enable | Flag of serial tuning status. |
| touch_pad_info_t | pinfo | Information of pad. |
| touch_cfg_t const * | p_touch_cfg | Pointer to initial configurations. |
| ctsu_instance_t const * | p_ctsu_instance | Pointer to CTSU instance. |
| touch_mm_info_t * | p_touch_mm_info | Pointer to information of touch button judge. |

### Function Documentation

#### ◆ RM_TOUCH_Open()

fsp_err_t RM_TOUCH_Open ( touch_ctrl_t *const *p_ctrl*, touch_cfg_t const *const *p_cfg* )

Opens and configures the TOUCH Middle module. Implements touch_api_t::open.

Example:

```
    err = RM_TOUCH_Open(&g_touch_ctrl, &g_touch_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | TOUCH successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_ARGUMENT | Configuration parameter error. |

### ◆ RM_TOUCH_ScanStart()

fsp_err_t RM_TOUCH_ScanStart ( touch_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with RM_TOUCH_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements touch_api_t::scanStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance or other. |
| FSP_ERR_CTSU_NOT_GET_DATA | The previous data has not been retrieved by DataGet. |

### ◆ RM_TOUCH_DataGet()

fsp_err_t RM_TOUCH_DataGet ( touch_ctrl_t *const *p_ctrl*, uint64_t * *p_button_status*, uint16_t * *p_slider_position*, uint16_t * *p_wheel_position* )

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements touch_api_t::dataGet.

***Note***

*FSP v4.0.0 or later,*

- *The value of 'Secondary - Primary' is modified from uint16_t to int16_t. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return FSP_ERR_INVALID_DATA.*
- *An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return FSP_ERR_INVALID_DATA.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

### ◆ RM_TOUCH_PadDataGet()

fsp_err_t RM_TOUCH_PadDataGet ( touch_ctrl_t *const *p_ctrl*, uint16_t * *p_pad_rx_coordinate*, uint16_t * *p_pad_tx_coordinate*, uint8_t * *p_pad_num_touch* )

This function gets the current position of pad is being pressed. Implements touch_api_t::padDataGet , g_touch_on_ctsu.

***Note***

*FSP v4.0.0 or later,*

- *The value of 'Secondary - Primary' is modified from uint16_t to int16_t. When the value of 'Secondary - Primary' is larger than 32767 and less than -32767, this API return FSP_ERR_INVALID_DATA.*
- *An upper limit is set for the value of Secondary. When the value of Secondary is larger than 45000, this API return FSP_ERR_INVALID_DATA.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |

### ◆ RM_TOUCH_ScanStop()

fsp_err_t RM_TOUCH_ScanStop ( touch_ctrl_t *const *p_ctrl*)

Scan stop specified TOUCH control block. Implements touch_api_t::scanStop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_TOUCH_CallbackSet()

fsp_err_t RM_TOUCH_CallbackSet ( touch_ctrl_t *const *p_api_ctrl*, void(*)(touch_callback_args_t *) *p_callback*, void *const *p_context*, touch_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements touch_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ RM_TOUCH_Close()

fsp_err_t RM_TOUCH_Close ( touch_ctrl_t *const *p_ctrl*)

Disables specified TOUCH control block. Implements touch_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_TOUCH_SensitivityRatioGet()

fsp_err_t RM_TOUCH_SensitivityRatioGet ( touch_ctrl_t *const *p_ctrl*, touch_sensitivity_info_t * *p_touch_sensitivity_info* )

Get the touch sensitivity ratio. Implements touch_api_t::sensitivityRatioGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully touch sensitivity ratio got. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CTSU_SCANNING | Scanning this instance. |
| FSP_ERR_CTSU_INCOMPLETE_TUNING | Incomplete initial offset tuning. |

### ◆ RM_TOUCH_ThresholdAdjust()

fsp_err_t RM_TOUCH_ThresholdAdjust ( touch_ctrl_t *const *p_ctrl*, touch_sensitivity_info_t * *p_touch_sensitivity_info* )

Adjust the touch judgment threshold. Implements touch_api_t::thresholdAdjust.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully touch judgment threshold was adjusted. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_TOUCH_DriftControl()

fsp_err_t RM_TOUCH_DriftControl ( touch_ctrl_t *const *p_ctrl*, uint16_t *input_drift_freq* )

Control drift correction. Implements touch_api_t::driftControl.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully drift correction was controlled. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_TOUCH_MonitorAddressGet()

fsp_err_t RM_TOUCH_MonitorAddressGet ( touch_ctrl_t *const *p_ctrl*, uint8_t ** *pp_monitor_buf*, uint8_t ** *pp_monitor_id*, uint16_t ** *pp_monitor_size* )

This function get the variable address of QE Monitor. This function is used for QE Monitor when both automatic judgement and software judgement are operated.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully QE monitor variable address was got. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened. |
| FSP_ERR_NOT_ENABLED | Requested operation is not enabled. |

## 5.2.6 Connectivity

Modules

### Detailed Description

Connectivity Modules.

### Modules

| | |
|---|---|
| | Azure RTOS USBX Port (rm_usbx_port) |
| | CAN (r_can)<br>Driver for the CAN peripheral on RA MCUs. This module implements the CAN Interface. |
| | CAN FD (r_canfd)<br>Driver for the CANFD peripheral on RA MCUs. This module implements the CAN Interface. |
| | CEC (r_cec)<br>Driver for the CEC peripheral on RA MCUs. This module implements the CEC Interface. |
| | I2C Communication Device (rm_comms_i2c)<br>Middleware to implement the I2C communications interface. This module implements the Communications Middleware Interface. |
| | I2C Master (r_iic_b_master)<br>I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Master Interface. |
| | I2C Master (r_iic_master)<br>Driver for the IIC peripheral on RA MCUs. This module implements the I2C Master Interface. |
| | I2C Master (r_iica_master)<br>Driver for the IICA peripheral on RA MCUs. This module implements the I2C Master Interface. |

| | |
|---|---|

| | USB Composite (r_usb_composite) |
| | USB HAUD (r_usb_haud)<br>This module provides a USB Peripheral Audio Device Class Driver (HAUD). It implements the USB HAUD Interface. |
| | USB HCDC (r_usb_hcdc)<br>This module provides a USB Host Communications Device Class (HCDC) driver. It implements the USB HCDC Interface. |
| | |

| | |
|---|---|
| | USB HCDC_ECM (r_usb_hcdc_ecm)<br><br>This module provides a USB Host Communications Device Class (HCDC-ECM) driver. It implements the USB HCDC_ECM (r_usb_hcdc_ecm). |
| | USB HHID (r_usb_hhid)<br><br>This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the USB HHID Interface. |
| | USB HMSC (r_usb_hmsc)<br><br>This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the USB HMSC Interface. |
| | USB Host Vendor class (r_usb_hvnd) |
| | USB PAUD (r_usb_paud)<br><br>This module provides a USB Peripheral Audio Device Class Driver (PAUD). It implements the USB PAUD Interface. |
| | USB PCDC (r_usb_pcdc)<br><br>This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the USB PCDC Interface. |
| | USB PHID (r_usb_phid)<br><br>This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the USB PHID Interface. |
| | USB PMSC (r_usb_pmsc)<br><br>This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the USB PMSC Interface. |
| | USB PPRN (r_usb_pprn)<br><br>This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the USB PPRN Interface. |
| | USB Peripheral Vendor class (r_usb_pvnd) |
| | USB-TYPEC (r_usb_typec) |

| | |
|---|---|
| | Driver for the USB_TYPEC peripheral on RA MCUs. This module implements the USB TYPEC Interface. |
| | USB_PCDC Communication Device (rm_comms_usb_pcdc)<br><br>Middleware to implement a generic communications interface over USB_PCDC. This module implements the Communications Middleware Interface. |

#### 5.2.6.1 Azure RTOS USBX Port (rm_usbx_port)

Modules » Connectivity

**Functions**

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

# Overview

This USB driver works by combining USBX and r_usb_basic module.

# How to Configuration

**Using a class other than Composite(Pereipheral), HMSC and OTG.**

The following describes how to configure USBX using PCDC as an example.

- Select [New Stack]->[Connectivity]->[Azure RTOS PCDC]

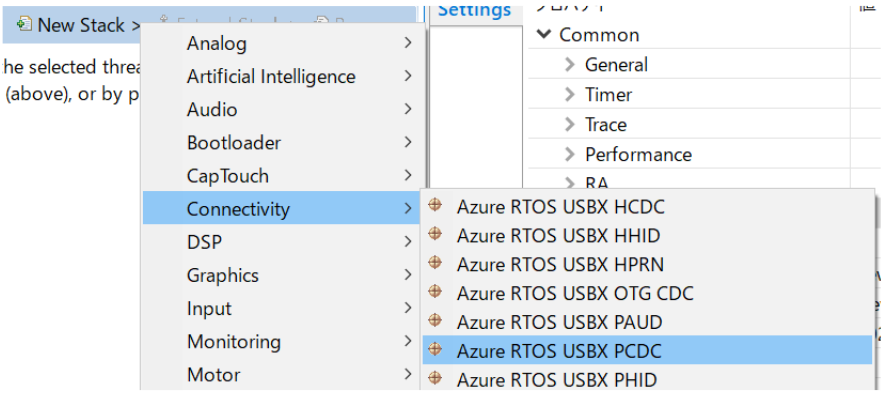

Figure 203: Select USB Device Class

**Using Composite (Peripheral)**

- Select [New Stack]->[Connectivity]->[USB Composite]

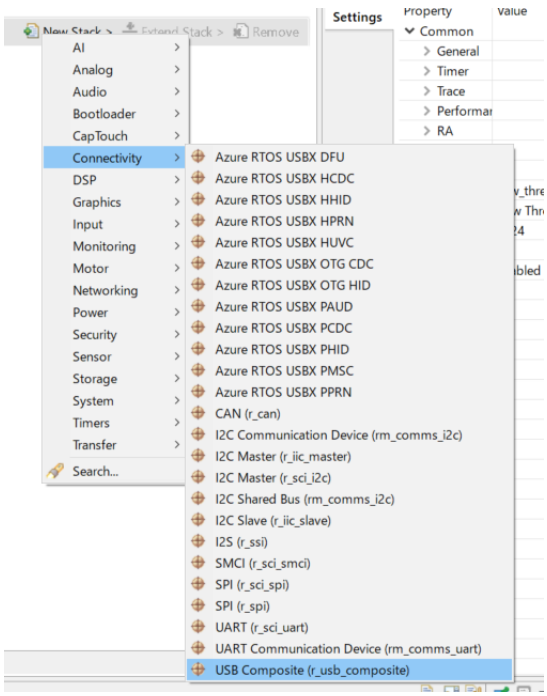

Figure 204: Select USB Composite

- The following is displayed when selecting [USB Composite].

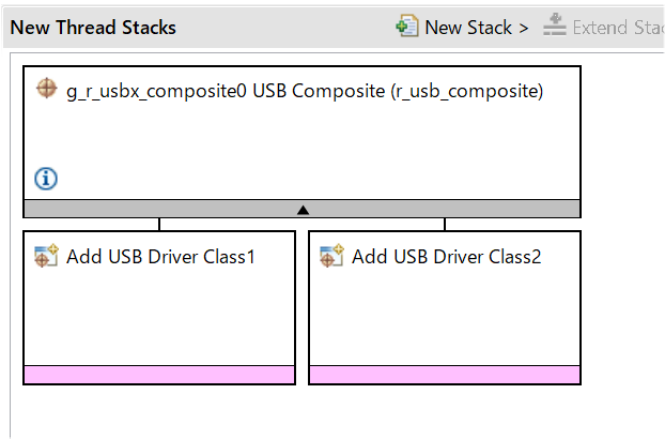

Figure 205: USB Composite Stack

- Select the supported 2 device classes as follows.

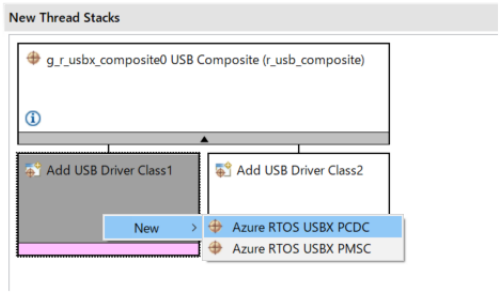

Figure 206: Select Device Classes

- Delete the "g_basic1" instance manually.

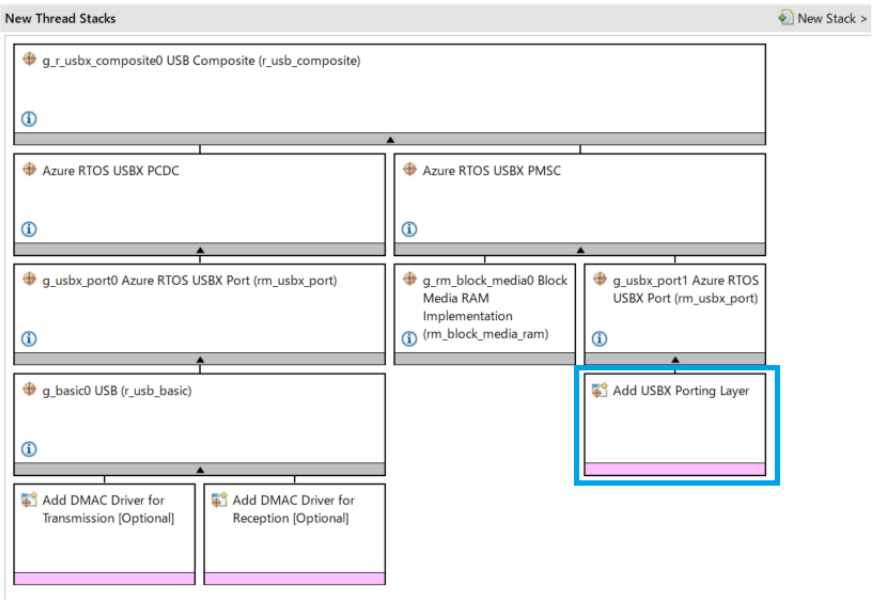

Figure 207: Delete USB Basic instance

### Using HMSC.

Since HMSC is used in a different way from other USBX modules, the usage is described below.

- Select [New Stack]->[Storage]->[Azure RTOS FileX on USBX]

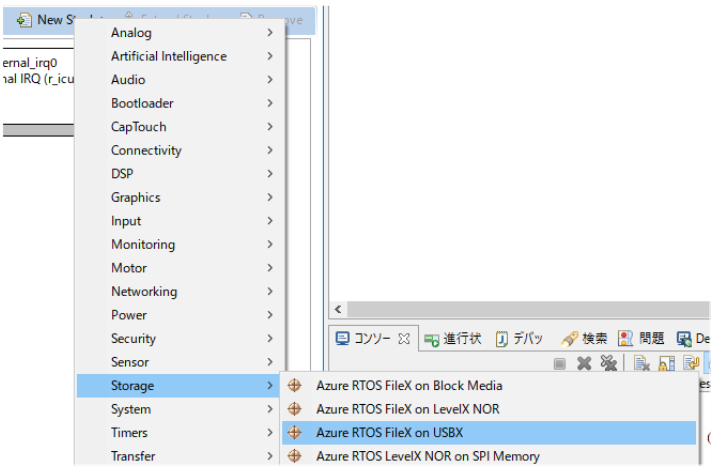

Figure 208: Select USB Device Class

- The following is displayed when selecting Filex on USBX.

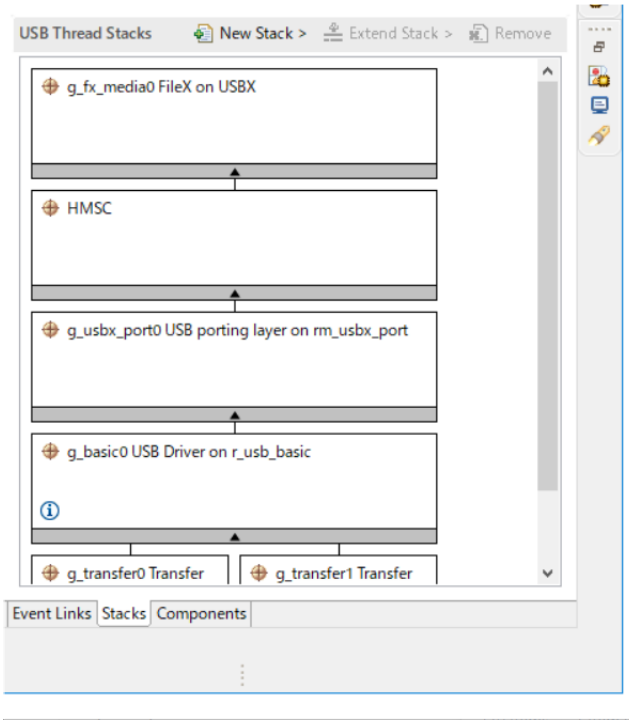

Figure 209: FileX on USBX Stack

### Using OTG.

The following describes how to configure USBX OTG.

- When using CDC / HID class
  - [New Stack]->[Connectivity]->[Azure RTOS USBX OTG CDC] or [Azure RTOS USBX OTG HID])
- When using MSC class
  - [New Stack]->[Storage]->[Azure RTOS FileX on USBX])
  - [New]->[Azure RTOS USBX OTG MSC]

- Select [New Stack]->[Input] -> [External IRQ(r_icu)]

  Be sure to select "r_icu" in OTG. The "r_icu" is used to detect the attaching of A cable.

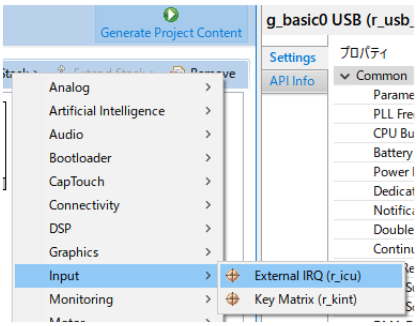

Figure 210: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_icu".
  - Set "7" to "Channel" item.
  - Set "Both Edges" to "Trigger" item.
  - Set "Enabled" to "Digital Filtering" item.
  - Set "usb_otg_irq_callback" to "Callback" item.

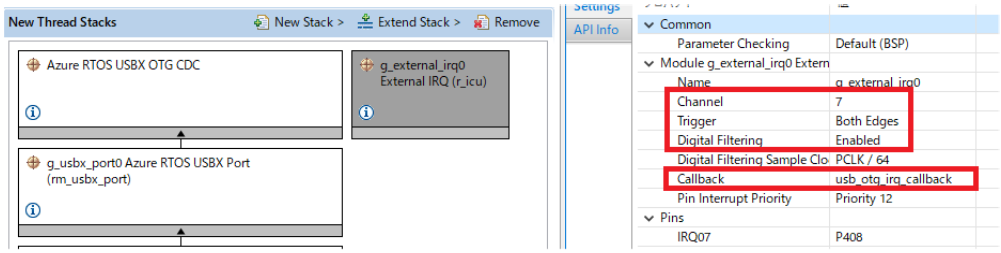

Figure 211: Select USB Device Class for OTG

- Be sure to set the following to each item in "r_usb_basic".
  - Set "Full Speed" to "USB Speed" item.
  - Set "USB_IP0 Port" to "USB Module Number".
  - Set "Not Supported" to "USBFS Resume Priority".

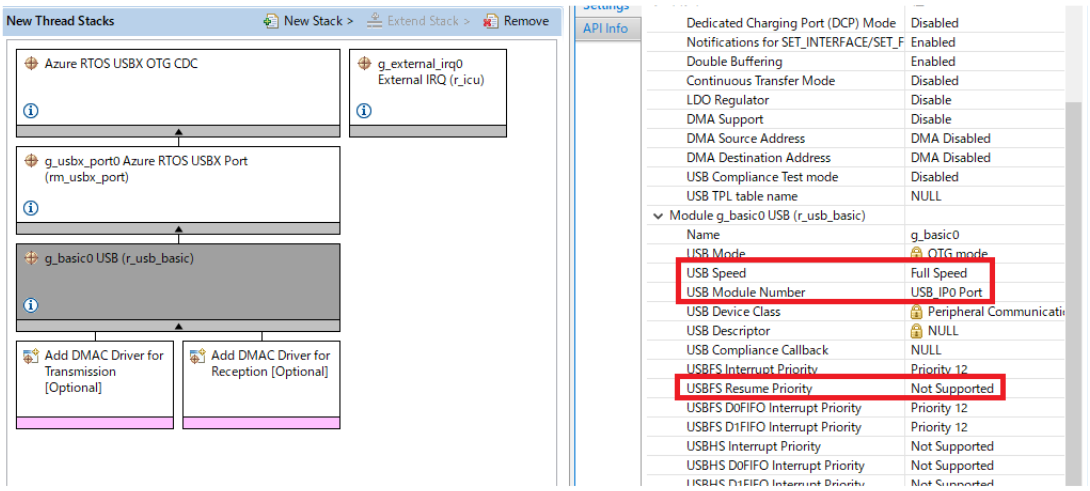

Figure 212: Select USB Device Class

- Set the following pins for USB (r_usb_basic)
  - VBUSEN
  - VBUS
  - EXICEN

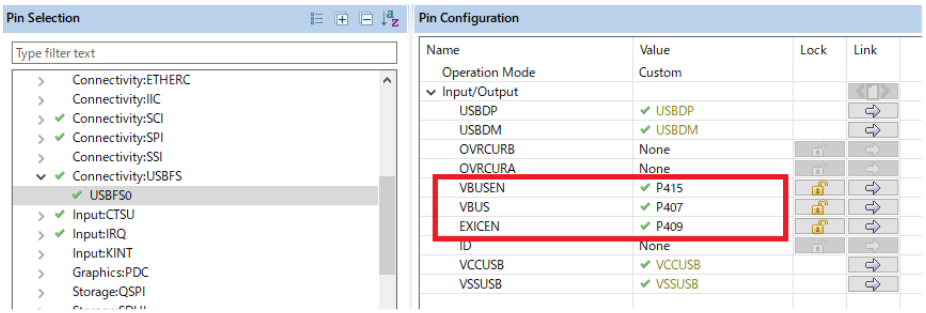

Figure 213: USB Pin Setting

- Set the following pins for IRQ (r_icu)
  - IRQ07

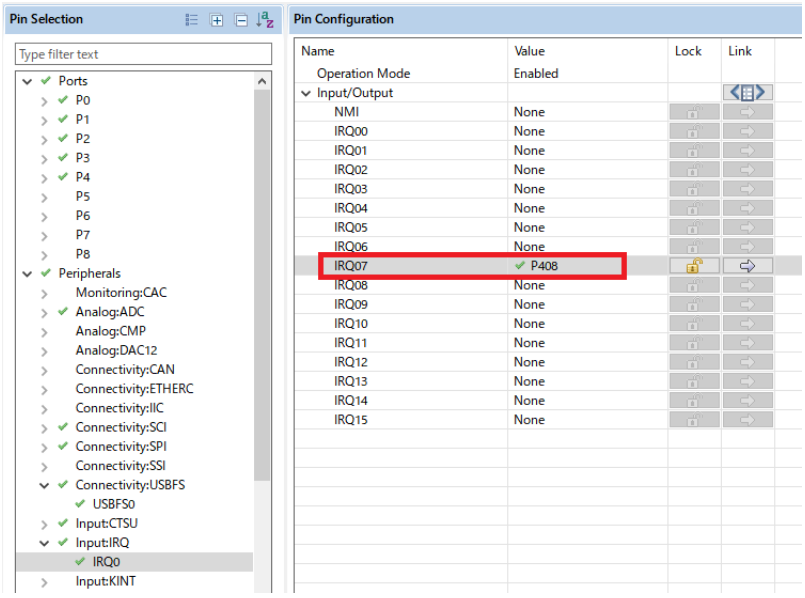

Figure 214: IRQ Pin Setting

## Using Hub

- When the user uses the following device class, the user can use USB Hub.
  - Host Communication Device Class (HCDC)
  - Host Human Interface Device Class (HHID)
  - Host Mass Storage Class (HMSC)
  - Host Printer Class (HPRN)
- Also be sure to set Enable using HUB.

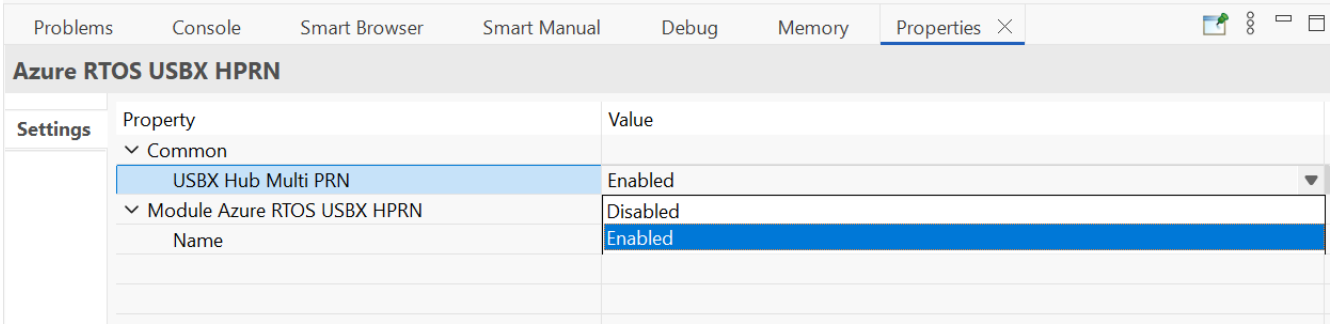

Figure 215: Enable Using Hub PRN-PRN

## Note

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- The following are notes on using the ux_host_class_cdc_acm_read function or the ux_device_class_cdc_acm_read function
  - Please specify a multiple of MaxPacketSize to the 3rd argument(requested_length) since if the value of the 3rd argument is not multiple of MaxPacketSize, all data sent by USB Host or USB Peripheral may not be received correctly.
  - Please specify start address of the area allocated a size larger than 3rd argument(requested_length) to the 2nd argument(data_pointer or buffer).

- There is no stack for the Hub; please select the stack for USB Host even when using the Hub.
- Depending on the Hub used, it may be necessary to supply power to the Hub.
- HUVC does not support USB Hub.

**HMSC uses FileX.**

For more information on FileX, please refer to the following URL.

https://docs.microsoft.com/en-us/azure/rtos/filex/

**OTG**

- Be able to set UX_OTG_HOST_REQUEST_FLAG in USB Peripheral mode or call ux_host_stack_role_swap() function in USB Host mode when data other than control transfer is not being transferred.
- Register the callback function for the application using R_USB_OtgCallbackSet() function. This callback function is called when switching the operation mode(UX_OTG_MODE_IDLE/UX_OTG_MODE_SLAVE/UX_OTG_MODE_HOST).
- Use R_USB_OtgSRP() function when doing SRP(Session Request Protocol). The R_USB_OtgSRP() function does not support VBUS pulsing.
- After starting up MCU, USB is initialized as USB peripheral mode until connecting A cable.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.
- When A cable is connected, USB module is initialized as USB Host mode.
- Call R_ICU_ExternalIrqOpen() and R_ICU_ExternalIrqEnable() function in the application program since the IRQ interrupt is used to detect attaching or detaching of A cable.
- Add the OTG descriptor in the configuration descriptor in each descriptor file.

| Offset | Field | Size | Value | Description |
|---|---|---|---|---|
| 0 | bLength | 1 | 5 | Size of Descriptor |
| 1 | bDescriptor Type | 1 | 9 | OTG type = 9 |
| 2 | bmAttribute | 1 | 3 or 2 | D1: HNP support<br>D0: SRP support |
| 3 | bcdOTG | 2 | 0x200 | Binary Code Descimal |

**Known Issues**

- There is compatibility issue for FileX on USBX stack in FSP 5.0.0 while importing from FSP 4.6.0 or earlier. Please refer to "GitHub Issue" about this workaround.

**Limitations**

- This USB driver does not support the multiple device class in Host mode.

- Please call the initialization function in the application program.

  Please be sure to call R_USB_Open() function after calling the following functions.

  - Peripheral

        - PCDC / PHID / PAUD / PPRN / DFU / OTG
            - ux_system_initialize
            - ux_device_stack_initialize
            - ux_device_stack_class_register
        - PMSC
            - ux_system_initialize
            - ux_device_stack_initialize
    - Host
        - HCDC / HHID / HPRN / HUVC / HAUD / OTG
            - ux_system_initialize
            - ux_host_stack_initialize
        - HMSC
            - ux_system_initialize
            - ux_host_stack_initialize
            - fx_system_initialize
- Set the value for 1000 Ticks per second in the "Timer Ticks Per Second" item.

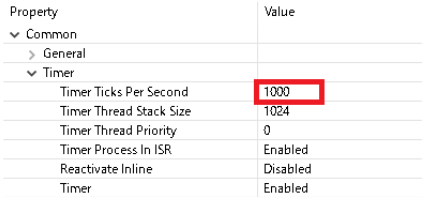

Figure 216: Specify value of Timer Ticks Per Second

- Set the Thread priority to a value of 21.

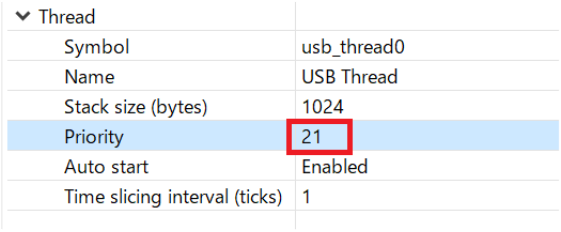

Figure 217: Specify value of Thread priority

- Call the following functions in the following order after calling the R_USB_Close() function.
    - Peripheral
        - PCDC / PHID / PPRN
            - ux_device_stack_class_unregister
            - ux_device_stack_uninitialize
        - PMSC
            - ux_device_stack_uninitialize
    - Host
        - ux_host_stack_uninitialize
- USBX Composite (Peripheral) supports the following composite device.
    - PCDC + PMSC
- USBX Composite (PCDC + PMSC) has the following notes.
    - When the user select "Safely Remove Hardware and Eject Media" on Windows and eject the mass storage (PMSC), the Windows Explorer for PMSC does not disappear. But PMSC driver works properly.

    - PMSC may not work properly when USBX Composite Device(PCDC+PMSC) is connected to linux machine (USB Host).If the user encounter this issue, please update Linux OS.
- The FAT file format that HMSC supports is FAT32, FAT16 and FAT12.
- When using USBX HMSC, please be sure to check the "fx" checkbox(red frame) of the pack the user is using in the "Components" tab(green frame) as shown below.

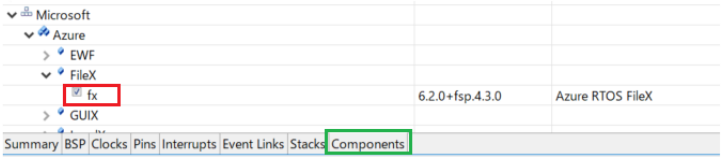

Figure 218: Check the fx checkbox

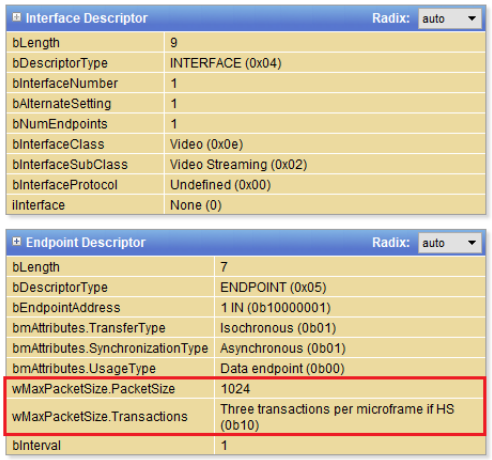
- When using USBX HPRN, if the internal buffer of the printer is full, USB data transfer speed drops significantly.
- When using USBX HHID, please use Wired device.
- USBX HUVC driver does not support Full-speed.
- USBX HUVC driver does not support the following APIs.
    - ux_host_class_video_transfer_buffers_add
    - ux_host_class_video_read
- Note the following when using *ux_host_class_video_transfer_buffer_add* function (USBX HUVC API)
    - Please call *ux_host_class_video_transfer_buffer_add* function after cofirming that the callback function for data reception completion is called when calling this API again. This callback function is registered by *ux_host_class_video_transfer_callback_set* function in the application program.
    - Please specify a 4-byte alignment address for the 2nd argument (*buffer*) of *ux_host_class_video_transfer_buffer_add* function when using DMA transfer.
- Note the following when using *ux_host_class_video_start* function (USBX HUVC API)
    - Please be sure to confirm return value of the *ux_host_class_video_max_payload_get* function is less than or equal to 1024. If the return value is greater than 1024, start video streaming by referring to the following.

```
channel.ux_host_class_video_parameter_channel_bandwidth_selection = 1
024;
status = ux_host_class_video_ioctl(video, UX_HOST_CLASS_VIDEO_IOCTL_C
HANNEL_START, &channel);
```

- The USBHS module does not support the high-bandwidth isochronous transfer (image below), the maximum packet size for isochronous transfer is 1024 bytes and supports only one transaction per microframe.



| Interface Descriptor | Radix: auto |
|---|---|
| bLength | 9 |
| bDescriptorType | INTERFACE (0x04) |
| bInterfaceNumber | 1 |
| bAlternateSetting | 1 |
| bNumEndpoints | 1 |
| bInterfaceClass | Video (0x0e) |
| bInterfaceSubClass | Video Streaming (0x02) |
| bInterfaceProtocol | Undefined (0x00) |
| iInterface | None (0) |

| Endpoint Descriptor | Radix: auto |
|---|---|
| bLength | 7 |
| bDescriptorType | ENDPOINT (0x05) |
| bEndpointAddress | 1 IN (0b10000001) |
| bmAttributes.TransferType | Isochronous (0b01) |
| bmAttributes.SynchronizationType | Asynchronous (0b01) |
| bmAttributes.UsageType | Data endpoint (0b00) |
| wMaxPacketSize.PacketSize | 1024 |
| wMaxPacketSize.Transactions | Three transactions per microframe if HS (0b10) |
| bInterval | 1 |

Figure 219: High Bandwidth Isochronous Transfer

- This module does not support the MCU(RA4M1 and RA2A1) since the RAM size is small.
- Please specify the correct framework size to the 2nd argument(device_framework_length_high_speed) and the 4th argument(device_framework_length_full_speed) in "ux_device_stack_initialize" function. If incorrect size is specified, USB driver does not work properly.
- The following is the limitation when using OTG.
    - The user can not use High-speed module(USB_IP1).
    - The DMA transfer is not supported.
    - The MSC is not supported.
    - The user can not use USB Hub.
- The followings are the limitation when using USB Hub.
    - The USB driver allocates USB PIPE9 for USB Hub.
    - The user can not connect the Hub device under the Hub down port.
    - For HCDC, the user can not connect more than 2 CDC devices to USB Hub.
    - For HPRN, the user can not connect more than 2 PRN devices to USB Hub.
    - For HHID, the user can not connect more than 3 HID devices to USB Hub.
    - For HMSC, the user can not connect more than 3 MSC devices to USB Hub.

- Please use USB Host DFU tool described in the chapter "USB Device DFU Class" in the following page.

  https://learn.microsoft.com/en-us/azure/rtos/usbx/usbx-device-stack-supplemental-2

- USBX DFU can upgrade the firmware only once after resetting MCU.
- USBX DFU does not support the upload feature.

- ux_device_class_cdc_acm_read() API, throughput/speed may be similar in following cases.

    - Read operation in double buffer mode when compared to single buffer mode.
    - Read operation in continuous transfer mode when compared to non-continuous transfer mode.

  Because of the USBX CDC device stack limits the read transfer size buffer to single packet (ie. wMaxPacketSize as per Full-speed or High-speed USB port). Please refer Azure RTOS USBX documentation for more information.

- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed on high-speed port may be similar for CPU read and write operation in double buffer mode when compared to single buffer mode because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation when compared to CPU mode because of the FSP driver limits the maximum transfer request length size to 512 bytes(UX_FSP_MAX_BULK_PAYLOAD).
- ux_host_class_cdc_acm_write() and ux_host_class_cdc_acm_read() API, throughput/speed may be less for DMA read and write operation compared to USB FreeRTOS HCDC DMA because of the FSP driver limits the maximum transfer request length size to 512 bytes (UX_FSP_MAX_BULK_PAYLOAD).

# Descriptor

Templates for USBX descriptors can be found in ra/fsp/src/rm_usbx_port folder. Also, please be sure to use your vendor ID.
Change the descriptor.c.template file for each class as follows if High-speed mode is used.

- rm_usbx_pcdc_descriptor.c.template
    - Comment on lines 108 and 243.
    - Delete the "//" on lines 109 and 242.
- rm_usbx_pmsc_descriptor.c.template
    - Comment on lines 78 and 153.
    - Delete the "//" on lines 79 and 152.
- rm_usbx_paud_descriptor.c.template
    - Comment on lines 167 and 485.
    - Delete the "//" on lines 168 and 486.

There are two types of templates for PHID descriptor.
Keyboard templates should be referred to rm_usbx_phid_descriptor_keyboard.c.template.
Mouse templates should be referred to rm_usbx_phid_descriptor_mouse.c.template.

# Examples

### USBX PCDC Example

PCDC loopback example is as follows.

```
#define VALUE_105 (105)
#define VALUE_2 (2)
#define VALUE_103 (103)
#define VALUE_93 (93)
/**********************************************************************************
* Function Name : ux_cdc_device0_instance_activate
* Description : Get instance
```

```
 * Arguments : void * cdc_instance : Pointer to the area store the instance pointer
 * Return value : none
 ***********************************************************************************/
static void ux_cdc_device0_instance_activate (void * cdc_instance)
{
 /* Save the CDC instance. */
    g_cdc = (UX_SLAVE_CLASS_CDC_ACM *) cdc_instance;
}
/***********************************************************************************
 * End of function ux_cdc_device0_instance_activate
 ***********************************************************************************/
/***********************************************************************************
 * Function Name : ux_cdc_device0_instance_deactivate

     }
     }
     }
    }
}
```

```
/**************************************************************************
 * End of function usbx_pcdc_sample
 **************************************************************************/
```

### USBX HCDC Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

```
 #define VALUE_100 (100)
UINT ux_host_usr_event_notification (ULONG event, UX_HOST_CLASS * host_class, VOID *
instance)
{
 FSP_PARAMETER_NOT_USED(host_class);

     } /* UX_NULL != p_cdc_acm */
     }
     } /* UX_NULL != p_cdc_acm */
     }
   }
}
```

### USBX PMSC Example

PMSC storage example is as follows.

```
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = NULL, .p_context = NULL, };
rm_block_media_info_t g_rm_block_info0 =
{.sector_size_bytes = STRG_MEDIASIZE, .num_sectors = STRG_TOTALSECT, .reentrant =
false, .write_protected = false, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = &g_rm_block_info0, .p_cfg =
&g_rm_block_media0_cfg, };
```

```
/***********************************************************************************
 * Function Name : usbx_pmsc_sample
 * Description : Application task (loopback processing)
 * Arguments : none
 * Return value : none
 ***********************************************************************************/
void usbx_pmsc_sample (void)
{
 fsp_err_t err;
    UINT      ret;
    ULONG    size;
    ux_system_initialize((CHAR *) g_ux_pool_memory, MEMPOOL_SIZE, UX_NULL, 0);
    ux_device_stack_initialize(g_device_framework_hi_speed,
                               60,
                               g_device_framework_full_speed,
                               50,
                               g_string_framework,
                               93,
                               g_language_id_framework,
                               2,

### Detailed Description

Driver for the CAN peripheral on RA MCUs. This module implements the CAN Interface.

# Overview

The Controller Area network (CAN) HAL module provides a high-level API for CAN applications and supports the CAN peripherals available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when transmit, receive or error interrupts are received. The callback is passed a parameter which indicates the channel, mailbox and event as well as the received data (if available).

### Features

- Supports both standard (11-bit) and extended (29-bit) messaging formats
- Supports speeds upto 1 Mbps
- Support for bit timing configuration as defined in the CAN specification
- Supports up to 32 transmit or receive mailboxes with standard or extended ID frames
- Optional support for a 4-stage transmit and receive FIFO
- Receive mailboxes can be configured to capture either data or remote CAN Frames
- Receive mailboxes can be configured to receive a range of IDs using mailbox masks
- Mailboxes can be configured with Overwrite or Overrun mode
- Supports a user-callback function when transmit, receive, or error interrupts are received

# Configuration

### Build Time Configurations for r_can

The following build time configurations are defined in fsp_cfg/r_can_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| FIFO Support | • Disabled<br>• Enabled | Disabled | When FIFOs are enabled, a transmit FIFO replaces mailboxes 24-27 and a receive FIFO replaces mailboxes 28-31. |

### Configurations for Connectivity > CAN (r_can)

This module can be added to the Stacks tab via New Stack > Connectivity > CAN (r_can). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_can0 | Module name. |
| Channel | Channel should be 0 or 1 | 0 | Specify the CAN channel to use. |
| Clock Source | MCU Specific Options | | Select the CAN clock source. |
| Overwrite/Overrrun Mode | • Overwrite Mode<br>• Overrrun Mode | Overwrite Mode | Select whether receive mailbox will be overwritten or overrun if data is not read in time. |
| Global ID Mode | • Standard ID Mode<br>• Extended ID Mode<br>• Mixed ID Mode | Standard ID Mode | Select whether the driver will use CAN Standard IDs, Extended IDs or a mix of both. |
| Number of Mailboxes | • 4 Mailboxes<br>• 8 Mailboxes<br>• 16 Mailboxes<br>• 24 Mailboxes<br>• 32 Mailboxes | 32 Mailboxes | Select 4, 8, 16, 24 or 32 mailboxes. In FIFO mailbox mode up to 24 mailboxes are available. |
| Baud Rate Settings | | | |
| Baud Rate Settings > Auto-generated Settings | | | |
| Sample-Point (%) | Must be a valid integer between 0 and 100. Ignore when Override Baud Settings is Enabled. | 75 | Sample-Point = (TSEG1 + 1) / (TSEG1 + TSEG2 + 1). |
| CAN Baud Rate (Hz) | Must be a valid integer configurable upto maximum 1MHz. Ignore when Override Baud Settings is Enabled. | 500000 | Specify baud rate in Hz.<br><br>If the requested baud rate cannot be achieved, the settings with the largest possible baud rate that is less than or equal to the requested baud rate is used. If multiple combinations would result in the best baud rate, the combination with the least absolute error for the ratio is chosen. The theoretical calculated baud rate |

| | | | |
|---|---|---|---|
| | | | and ratio are printed in a comment in the generated can_bit_timing_cfg_t structure. |
| Baud Rate Settings > Override Auto-generated Settings | | | |
| Override Baud Settings | • Enabled<br>• Disabled | Disabled | Override calculated baudrate parameters and instead use the ones specified below. This option ignores the parameters specified under Sample-Point (%) and CAN Baud Rate (Hz) |
| Baud Rate Prescaler | Value must be a non-negative integer between 1 and 1024. | 1 | Specify division value of baud rate prescaler (baud rate prescalar + 1). |
| Time Segment 1 | Refer to the RA Configuration tool for available options. | 4 Time Quanta | Select the time segment 1 value. (4-16). Check module usage notes for how to calculate this value. |
| Time Segment 2 | • 2 Time Quanta<br>• 3 Time Quanta<br>• 4 Time Quanta<br>• 5 Time Quanta<br>• 6 Time Quanta<br>• 7 Time Quanta<br>• 8 Time Quanta | 2 Time Quanta | Select the time segment 2 value (2-8). Check module usage notes for how to calculate this value. |
| Synchronization Jump Width | • 1 Time Quanta<br>• 2 Time Quanta<br>• 3 Time Quanta<br>• 4 Time Quanta | 1 Time Quanta | Select the Synchronization Jump Width value (1-4). Check module usage notes for how to calculate this value. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | can_callback | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Interrupt Priority Level | MCU Specific Options | | Transmit/Receive/Error interrupt priority. |
| Transmit FIFO Interrupt Mode | • Every Message<br>• Empty | Every Message | Select whether the receive FIFO should |

| | | | |
|---|---|---|---|
| | | | throw an interrupt on every received message or when it becomes empty. |
| Input | | | |
| Input > Receive FIFO | | | |
| Input > Receive FIFO > Receive ID 1 | | | |
| ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0 | Select the first ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. |
| ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Frame Type | • Data Mailbox<br>• Remote Mailbox | Remote Mailbox | Select whether the receive FIFO is used to capture data frames or remote frames. |
| Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |
| Input > Receive FIFO > Receive ID 2 | | | |
| ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0 | Select the second ID for the receive FIFO, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. |
| ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the receive FIFO is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |

| | | | |
|---|---|---|---|
| Frame Type | • Data Mailbox<br>• Remote Mailbox | Remote Mailbox | Select whether the receive FIFO is used to capture data frames or remote frames. |
| Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for the receive FIFO. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |

Input > Mailbox 0-3 Group

Input > Mailbox 0-3 Group > Mailbox ID

| | | | |
|---|---|---|---|
| Mailbox 0 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0 | Select the receive ID for mailbox 0, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 1 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 1 | Select the receive ID for mailbox 1, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 2 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 2 | Select the receive ID for mailbox 2, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 3 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 3 | Select the receive ID for mailbox 3, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |

Input > Mailbox 0-3 Group > Mailbox ID Mode

| | | | |
|---|---|---|---|
| Mailbox 0 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 1 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 2 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 3 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Input > Mailbox 0-3 Group > Mailbox Type | | | |
| Mailbox 0 Type | • Receive Mailbox<br>• Transmit Mailbox | Transmit Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 1 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 2 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 3 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |

Input > Mailbox 0-3 Group > Mailbox Frame Type

| | | | |
|---|---|---|---|
| Mailbox 0 Frame Type | • Data Mailbox<br>• Remote Mailbox | Remote Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 1 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 2 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 3 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 0-3 Group Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for mailboxes 0-3. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |

Input > Mailbox 4-7 Group

Input > Mailbox 4-7 Group > Mailbox ID

| | | | |
|---|---|---|---|
| Mailbox 4 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 4 | Select the receive ID for mailbox 4, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 5 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 5 | Select the receive ID for mailbox 5, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used |

| | | | |
|---|---|---|---|
| | | | when the mailbox is set as transmit type. |
| Mailbox 6 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 6 | Select the receive ID for mailbox 6, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 7 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 7 | Select the receive ID for mailbox 7, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Input > Mailbox 4-7 Group > Mailbox ID Mode | | | |
| Mailbox 4 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 5 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 6 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 7 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID |

| | | | |
|---|---|---|---|
| | | | Mode is set to 'Mixed ID Mode'. |
| Input > Mailbox 4-7 Group > Mailbox Type | | | |
| Mailbox 4 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 5 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 6 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 7 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Input > Mailbox 4-7 Group > Mailbox Frame Type | | | |
| Mailbox 4 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 5 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 6 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 7 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 4-7 Group Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | >Select the Mask for mailboxes 4-7. In Mixed ID Mode the Standard ID mask is the upper |

| | | | |
|---|---|---|---|
| | | | 11 bits of the full 29-bit mask value. |
| Input > Mailbox 8-11 Group | | | |
| Input > Mailbox 8-11 Group > Mailbox ID | | | |
| Mailbox 8 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 8 | Select the receive ID for mailbox 8, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 9 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 9 | Select the receive ID for mailbox 9, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 10 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 10 | Select the receive ID for mailbox 10, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 11 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 11 | Select the receive ID for mailbox 11, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Input > Mailbox 8-11 Group > Mailbox ID Mode | | | |
| Mailbox 8 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed |

| | | | |
|---|---|---|---|
| | | | ID Mode'. |
| Mailbox 9 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 10 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 11 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Input > Mailbox 8-11 Group > Mailbox Type | | | |
| Mailbox 8 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 9 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 10 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Mailbox 11 Type | • Receive Mailbox<br>• Transmit Mailbox | Receive Mailbox | Select whether the mailbox is used for receive or transmit. |
| Input > Mailbox 8-11 Group > Mailbox Frame Type | | | |
| Mailbox 8 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |

| | | | |
|---|---|---|---|
| Mailbox 9 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 10 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 11 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 8-11 Group Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for mailboxes 8-11. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |

Input > Mailbox 12-15 Group

Input > Mailbox 12-15 Group > Mailbox ID

| | | | |
|---|---|---|---|
| Mailbox 12 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 12 | Select the receive ID for mailbox 12, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 13 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 13 | Select the receive ID for mailbox 13, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 14 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 14 | Select the receive ID for mailbox 14, between 0 and 0x7ff when using standard |

| | | | |
|---|---|---|---|
| | | | IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Mailbox 15 ID | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 15 | Select the receive ID for mailbox 15, between 0 and 0x7ff when using standard IDs, between 0 and 0x1FFFFFFF when using extended IDs. Value is not used when the mailbox is set as transmit type. |
| Input > Mailbox 12-15 Group > Mailbox ID Mode | | | |
| Mailbox 12 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |
| Mailbox 13 ID Mode | • Standard ID<br>• Extended ID | Standard ID | Select whether the mailbox is used to receive Standard or Extended ID messages. This setting is only valid when Global ID Mode is set to 'Mixed ID Mode'. |

| Mailbox 28 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 29 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 30 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 31 Frame Type | • Data Mailbox<br>• Remote Mailbox | Data Mailbox | Select whether the mailbox is used to capture data frames or remote frames (ignored for transmit mailboxes). |
| Mailbox 28-31 Group Mask | Value must be decimal or HEX integer of 0x1FFFFFFF or less. | 0x1FFFFFFF | Select the Mask for mailboxes 28-31. In Mixed ID Mode the Standard ID mask is the upper 11 bits of the full 29-bit mask value. |

### Clock Configuration

The CAN peripheral uses the CANMCLK (main-clock oscillator) or PCLKB as its clock source (fCAN, CAN System Clock.) The default CAN configuration will provide a CAN bit rate of 500 Kbit using

CANMCLK as the clock source. To set the PCLKB frequency, use the **Clocks** tab of the RA Configuration editor. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

Warning

RA2 devices only support CANMCLK (MOSC/XTAL) for the CAN clock source. If MOSC is not used as the main clock source it will not be started automatically. In this case, be sure to start it before opening the CAN driver.

### Clock Limitations

The following clock limitations apply when using the CAN peripheral:

- When using the main oscillator (CANMCLK) as the clock source:
  - fPCLKB >= fCANCLK (fCANCLK = XTAL / Baud Rate Prescaler)
  - The user application must start the main-clock oscillator (XTAL) at run-time using the CGC Interface if it has not already started (for example, if it is not used as the MCU clock source.)
- When using PCLKB as the clock source:
  - For RA6 and RA4 MCUs, the source of the peripheral module clocks must be PLL for the CAN HAL module.
- For RA4M1 and RA4W1 MCUs, the clock frequency ratio of PCLKA and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.
- For RA2 MCUs only CANMCLK (XTAL) may be used as a clock source. The clock frequency ratio of ICLK and PCLKB must be 2:1 when using the CAN HAL module. Operation is not guaranteed for other settings.

  *Note*

  *When using CANMCLK (XTAL) as the CAN clock source while running at a reduced main clock speed (under 2x XTAL) be sure to confirm that the XTAL frequency divided by the baud rate prescaler is equal to or less than PCLKB.*

### Pin Configuration

The CAN peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. A CAN channel would consist of two pins - CRX and CTX for data transmission/reception.

## Usage Notes

### Bit Rate Calculation

For convenience, the baudrate of the CAN peripheral is automatically set through the RA Configuration editor using a best effort approach. If the auto-generated baud settings cause deviation that is not tolerable by the application, the user can override the auto-generated settings and put in manually calculated values through RA Configuration editor. For more details on how the baudrate is set refer to section "Data Transfer Rate Configuration" in the CAN section of the relevant hardware manual.

### FIFO Support

When FIFO Support is enabled, mailboxes 24-27 form a 4-stage transmit FIFO and mailboxes 28-31 form a 4-stage receive FIFO. The receive FIFO supports two independent ID/mask settings for acceptance filtering.

*Note*

*Only the base mailbox of each FIFO may be accessed. When writing to the TX FIFO it is recommended to use CAN_MAILBOX_ID_TX_FIFO.*

### Limitations

Developers should be aware of the following limitations when using CAN:

- The can_frame_t::id_mode field is only used when Global ID Mode is set to Mixed ID. It is ignored in all other modes.

## Examples

### Basic Example

This is a basic example of minimal use of the CAN in an application.

```
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile bool     g_rx_flag = false;
volatile bool     g_tx_flag = false;
volatile bool     g_err_flag = false;
volatile uint32_t g_rx_id;
void can_callback (can_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
     {
           g_rx_flag = true;
           g_rx_id   = p_args->frame.id;
 /* Read received frame */
           g_can_rx_frame = p_args->frame;
 break;
      }
 case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
     {
           g_tx_flag = true;
 break;
      }
```

```
 case CAN_EVENT_ERR_BUS_OFF:          /* Bus error event. (bus off) */
 case CAN_EVENT_ERR_PASSIVE:          /* Bus error event. (error passive) */
 case CAN_EVENT_ERR_WARNING:          /* Bus error event. (error warning) */
 case CAN_EVENT_BUS_RECOVERY:         /* Bus error event. (bus recovery) */
 case CAN_EVENT_MAILBOX_MESSAGE_LOST: /* Overwrite/overrun error */
      {
 /* Set error flag */
            g_err_flag = true;
 break;
       }
 default:
      {
 break;
       }
    }
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = CAN_BUSY_DELAY;
 /* Initialize the CAN module */
    err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    g_can_tx_frame.id              = CAN_DESTINATION_DEVICE_MAILBOX_NUMBER; /* CAN
Destination Device ID */
    g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;

      __BKPT(0);
   }
}
```

### External Loop-back Test

This example requires the CTX and CRX pins to be connected. If a CAN tranciever is onboard a 120 Ohm resistor should be connected across CANH and CANL instead. The mailbox numbers are arbitrarily chosen.

```
void can_external_loopback_example (void)
{
fsp_err_t            err;
   uint32_t             timeout_ms    = CAN_BUSY_DELAY;
can_operation_mode_t operation_mode = CAN_OPERATION_MODE_NORMAL;
can_test_mode_t      test_mode      = CAN_TEST_MODE_LOOPBACK_EXTERNAL;
int      diff = 0;
   uint32_t i    = 0;
   err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
   err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
   assert(FSP_SUCCESS == err);
```

```
 /* Clear the data part of receive frame */
    memset(g_can_rx_frame.data, 0, CAN_FRAME_TRANSMIT_DATA_BYTES);
 /* CAN Destination Device ID, in this case it is the same device with another
mailbox */

| enum | can_mailbox_number_t |
| enum | can_mailbox_send_receive_t |
| enum | can_global_id_mode_t |
| enum | can_message_mode_t |
| enum | can_clock_source_t |
| enum | can_fifo_interrupt_mode_t |

## Data Structure Documentation

### ◆ can_mailbox_t

| struct can_mailbox_t | | |
|---|---|---|
| CAN Mailbox | | |
| Data Fields | | |
| uint32_t | mailbox_id | Mailbox ID. |
| can_id_mode_t | id_mode | Standard or Extended ID. Only used in Mixed ID mode. |
| can_frame_type_t | frame_type | Frame type for receive mailbox. |
| can_mailbox_send_receive_t | mailbox_type | Receive or Transmit mailbox type. |

### ◆ can_fifo_interrupt_cfg_t

| struct can_fifo_interrupt_cfg_t |
|---|
| |

| CAN FIFO interrupt configuration | | |
|---|---|---|
| Data Fields | | |
| can_fifo_interrupt_mode_t | fifo_int_mode | FIFO interrupts mode (RX and TX combined). |
| IRQn_Type | tx_fifo_irq | TX FIFO IRQ. |
| IRQn_Type | rx_fifo_irq | RX FIFO IRQ. |

### ◆ can_rx_fifo_cfg_t

| struct can_rx_fifo_cfg_t | | |
|---|---|---|
| CAN RX FIFO configuration | | |
| Data Fields | | |
| uint32_t | rx_fifo_mask1 | RX FIFO acceptance filter mask 1. |
| uint32_t | rx_fifo_mask2 | RX FIFO acceptance filter mask 1. |
| can_mailbox_t | rx_fifo_id1 | RX FIFO acceptance filter ID 1. |
| can_mailbox_t | rx_fifo_id2 | RX FIFO acceptance filter ID 2. |

### ◆ can_extended_cfg_t

| struct can_extended_cfg_t | | |
|---|---|---|
| CAN extended configuration | | |
| Data Fields | | |
| can_clock_source_t | clock_source | Source of the CAN clock. |
| uint32_t * | p_mailbox_mask | Mailbox mask, one for every 4 mailboxes. |
| can_mailbox_t * | p_mailbox | Pointer to mailboxes. |
| can_global_id_mode_t | global_id_mode | Standard or Extended ID mode. |
| uint32_t | mailbox_count | Number of mailboxes. |
| can_message_mode_t | message_mode | Overwrite message or overrun. |
| can_fifo_interrupt_cfg_t const * | p_fifo_int_cfg | Pointer to FIFO interrupt configuration. |
| can_rx_fifo_cfg_t * | p_rx_fifo_cfg | Pointer to RX FIFO configuration. |

## Enumeration Type Documentation

### ◆ can_status_t

| enum can_status_t | |
|---|---|
| CAN Status | |
| Enumerator | |
| CAN_STATUS_NEW_DATA | New Data status flag. |
| CAN_STATUS_SENT_DATA | Sent Data status flag. |
| CAN_STATUS_RECEIVE_FIFO | Receive FIFO status flag. |
| CAN_STATUS_TRANSMIT_FIFO | Transmit FIFO status flag. |
| CAN_STATUS_NORMAL_MBOX_MESSAGE_LOST | Normal mailbox message lost status flag. |
| CAN_STATUS_FIFO_MBOX_MESSAGE_LOST | FIFO mailbox message lost status flag. |
| CAN_STATUS_TRANSMISSION_ABORT | Transmission abort status flag. |
| CAN_STATUS_ERROR | Error status flag. |
| CAN_STATUS_RESET_MODE | Reset mode status flag. |
| CAN_STATUS_HALT_MODE | Halt mode status flag. |
| CAN_STATUS_SLEEP_MODE | Sleep mode status flag. |
| CAN_STATUS_ERROR_PASSIVE | Error-passive status flag. |
| CAN_STATUS_BUS_OFF | Bus-off status flag. |

### ◆ can_error_t

| enum can_error_t | |
|---|---|
| CAN Error Code | |
| Enumerator | |
| CAN_ERROR_STUFF | Stuff Error. |
| CAN_ERROR_FORM | Form Error. |
| CAN_ERROR_ACK | ACK Error. |
| CAN_ERROR_CRC | CRC Error. |
| CAN_ERROR_BIT_RECESSIVE | Bit Error (recessive) Error. |
| CAN_ERROR_BIT_DOMINANT | Bit Error (dominant) Error. |
| CAN_ERROR_ACK_DELIMITER | ACK Delimiter Error. |

### ◆ can_mailbox_number_t

| enum can_mailbox_number_t |
|---|
| CAN Mailbox IDs (MB + FIFO) |

### ◆ can_mailbox_send_receive_t

| enum can_mailbox_send_receive_t | |
|---|---|
| CAN Mailbox type | |
| Enumerator | |
| CAN_MAILBOX_RECEIVE | Mailbox is for receiving. |
| CAN_MAILBOX_TRANSMIT | Mailbox is for sending. |

### ◆ can_global_id_mode_t

| enum can_global_id_mode_t | |
|---|---|
| Global CAN ID mode settings | |
| Enumerator | |
| CAN_GLOBAL_ID_MODE_STANDARD | Standard IDs of 11 bits used. |
| CAN_GLOBAL_ID_MODE_EXTENDED | Extended IDs of 29 bits used. |
| CAN_GLOBAL_ID_MODE_MIXED | Both Standard and Extended IDs used. |

### ◆ can_message_mode_t

| enum can_message_mode_t | |
|---|---|
| CAN Message Modes | |
| Enumerator | |
| CAN_MESSAGE_MODE_OVERWRITE | Receive data will be overwritten if not read before the next frame. |
| CAN_MESSAGE_MODE_OVERRUN | Receive data will be retained until it is read. |

### ◆ can_clock_source_t

| enum can_clock_source_t | |
|---|---|
| CAN Source Clock | |
| Enumerator | |
| CAN_CLOCK_SOURCE_PCLKB | PCLKB is the source of the CAN Clock. |
| CAN_CLOCK_SOURCE_CANMCLK | CANMCLK is the source of the CAN Clock. |

### ◆ can_fifo_interrupt_mode_t

| enum can_fifo_interrupt_mode_t |
|---|
| CAN FIFO Interrupt Modes |

## Function Documentation

### ◆ R_CAN_Open()

fsp_err_t R_CAN_Open ( can_ctrl_t *const *p_api_ctrl*, can_cfg_t const *const *p_cfg* )

Open and configure the CAN channel for operation.

Example:

```
/* Initialize the CAN module */
   err = R_CAN_Open(&g_can0_ctrl, &g_can0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_CAN_INIT_FAILED | Channel failed to initialize. |
| FSP_ERR_ASSERTION | Null pointer presented. |

### ◆ R_CAN_Close()

fsp_err_t R_CAN_Close ( can_ctrl_t *const *p_api_ctrl*)

Close the CAN channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented. |

### ◆ R_CAN_Write()

fsp_err_t R_CAN_Write ( can_ctrl_t *const *p_api_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame* )

Write data to the CAN channel. Write up to eight bytes to the channel mailbox.

Example:

```
err = R_CAN_Write(&g_can0_ctrl, CAN_MAILBOX_NUMBER_31, &g_can_tx_frame);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_CAN_TRANSMIT_NOT_READY | Transmit in progress, cannot write data at this time. |
| FSP_ERR_CAN_TRANSMIT_FIFO_FULL | Transmit FIFO is full. |
| FSP_ERR_CAN_RECEIVE_MAILBOX | Mailbox is setup for receive and cannot send. |
| FSP_ERR_INVALID_ARGUMENT | Data length or frame type invalid. |
| FSP_ERR_ASSERTION | Null pointer presented |

### ◆ R_CAN_Read()

fsp_err_t R_CAN_Read ( can_ctrl_t *const *p_api_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame* )

Read data from a mailbox or FIFO.

***Note***

*This function is not supported.*

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported. |

### ◆ R_CAN_ModeTransition()

fsp_err_t R_CAN_ModeTransition ( can_ctrl_t *const *p_api_ctrl*, can_operation_mode_t *operation_mode*, can_test_mode_t *test_mode* )

CAN Mode Transition is used to change CAN driver state.

Example:

```
err = R_CAN_ModeTransition(&g_can0_ctrl, operation_mode, test_mode);
assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

### ◆ R_CAN_InfoGet()

fsp_err_t R_CAN_InfoGet ( can_ctrl_t *const *p_api_ctrl*, can_info_t *const *p_info* )

Get CAN state and status information for the channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

### ◆ R_CAN_CallbackSet()

| fsp_err_t R_CAN_CallbackSet ( can_ctrl_t *const *p_api_ctrl*, void(*)(can_callback_args_t *) *p_callback*, void *const *p_context*, can_callback_args_t *const *p_callback_memory* ) |
|---|
| Updates the user callback with the option to provide memory for the callback argument structure. Implements can_api_t::callbackSet. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

## 5.2.6.3 CAN FD (r_canfd)

Modules » Connectivity

### Functions

| | |
|---|---|
| fsp_err_t | R_CANFD_Open (can_ctrl_t *const p_api_ctrl, can_cfg_t const *const p_cfg) |
| fsp_err_t | R_CANFD_Close (can_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_CANFD_Write (can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame) |
| fsp_err_t | R_CANFD_Read (can_ctrl_t *const p_api_ctrl, uint32_t buffer, can_frame_t *const p_frame) |
| fsp_err_t | R_CANFD_ModeTransition (can_ctrl_t *const p_api_ctrl, can_operation_mode_t operation_mode, can_test_mode_t test_mode) |
| fsp_err_t | R_CANFD_InfoGet (can_ctrl_t *const p_api_ctrl, can_info_t *const p_info) |
| fsp_err_t | R_CANFD_CallbackSet (can_ctrl_t *const p_api_ctrl, void(*p_callback)(can_callback_args_t *), void *const p_context, can_callback_args_t *const p_callback_memory) |

### Detailed Description

Driver for the CANFD peripheral on RA MCUs. This module implements the CAN Interface.

# Overview

The CANFD module can be used to communicate over CAN networks, optionally using Flexible Data (CAN-FD) to accelerate the data phase. A variety of message filtering and buffer options are available. This document covers both the CANFD (r_canfd) and CANFD Lite (r_canfdlite) modules as they are based on the same hardware.

### Features

### Common Features

- Compatibility
  - Send and receive CAN 2.0 and CAN-FD frames on the same channel
  - Bitrate up to 1 Mbps with FD data phase speeds up to 5-8 Mbps
  - ISO 11898-1 Support
- Buffers
  - 32 global receive Message Buffers (RX MBs)
  - 2-8 global receive FIFOs (RX FIFOs)
  - 4-16 transmit Message Buffers (TX MBs) per channel
- Filtering
  - Each filter rule can be individually configured to accept messages based on:
    - ID
    - Standard or Extended ID (IDE bit)
    - Data or Remote Frame (RTR bit)
    - ID/IDE/RTR mask
    - Minimum DLC (data length) value
- Interrupts
  - Configurable Global RX FIFO Interrupt
    - Configurable per FIFO
    - Interrupt at a certain depth or on every received message
  - Configurable Common FIFO RX Interrupt
    - Configurable per FIFO
    - Interrupt at a certain depth or on every received message
  - Channel TX Interrupt
    - Interrupt on every transmitted message or when a Common FIFO is empty
  - Global Error
    - DLC Check
    - Message Lost
    - FD Payload Overflow
  - Channel Error
    - Bus Error
    - Error Warning
    - Error Passive
    - Bus-Off Entry
    - Bus-Off Recovery
    - Overload
    - Bus Lock
    - Arbitration Loss
    - Transmission Aborted

### Per-MCU Specifications

| | | | |
|---|---|---|---|

| | RA6M5 | RA6T2 | RA8M1 |
|---|---|---|---|
| Channels | 2 | 1 | 2 |
| Max nominal bitrate | 1 Mbps | 1 Mbps | 1 Mbps |
| Max data bitrate | 5 Mbps | 5 Mbps | 8 Mbps |
| Filter rules | 128 | 32 | 16/ch |
| TX message buffers | 16/ch | 4 | 4/ch |
| RX message buffers | 32 | 32 | 16/ch |
| RX FIFOs | 8 | 2 | 2/ch |
| RX Buffer RAM | 4864 bytes | 1216 bytes | 1216 bytes |
| Common FIFOs | 3/ch | 1 | 1/ch |

*Note*

*Each message buffer comprises 12 header bytes plus data length (8-64 bytes). The above buffer RAM values therefore correspond to the following capacities:*

| | *RA6M5* | *RA6T2* | *RA8M1* |
|---|---|---|---|
| *Max 64-byte storage* | *64 messages* | *16 messages* | *16 messages* |
| *Max 8-byte storage* | *243 messages* | *60 messages* | *60 messages* |

*Each Common FIFO buffer can support the following message capacities:*

| | *RA6M5* | *RA6T2* | *RA8M1* |
|---|---|---|---|
| *Maximum payload size* | *64 bytes* | *64 bytes* | *64 bytes* |
| *Maximum FIFO depth* | *128 messages* | *48 messages* | *48 messages* |

# Configuration

### Build Time Configurations for r_canfd

The following build time configurations are defined in fsp_cfg/r_canfd_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Global Error Interrupt | | | |
| Callback Channel | MCU Specific Options | | Specify which channel callback should be called to handle global errors. When starting the driver this channel must be opened first. |
| Priority | MCU Specific Options | | This interrupt is fired for each of the error sources selected below. |

| | | | |
|---|---|---|---|
| Sources | • DLC Check<br>• Message Lost<br>• FD Payload Overflow | 0U | Select which errors should trigger an interrupt. |
| Reception | | | |
| Reception > FIFOs | | | |
| Reception > FIFOs > FIFO 0 | | | |
| Enable | • Enabled<br>• Disabled | Enabled | Enable or disable RX FIFO 0. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 0. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 0. |
| Reception > FIFOs > FIFO 1 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 1. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 1. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 1. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |

| | | | |
|---|---|---|---|
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 1. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 1. |
| Reception > FIFOs > FIFO 2 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 2. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 2. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 2. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 2. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 2. |
| Reception > FIFOs > FIFO 3 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 3. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 3. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 3. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message |

| | | | |
|---|---|---|---|
| | | | payload size for RX FIFO 3. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 3. |
| Reception > FIFOs > FIFO 4 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 4. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 4. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 4. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 4. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 4. |
| Reception > FIFOs > FIFO 5 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 5. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 5. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 5. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX |

| | | | |
|---|---|---|---|
| | | | FIFO 5. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 5. |
| Reception > FIFOs > FIFO 6 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 6. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 6. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 6. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 6. |
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 6. |
| Reception > FIFOs > FIFO 7 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable RX FIFO 7. |
| Interrupt Mode | MCU Specific Options | | Set the interrupt mode for RX FIFO 7. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for RX FIFO 7. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for RX FIFO 7. |

| | | | |
|---|---|---|---|
| Depth | MCU Specific Options | | Select the number of stages for RX FIFO 7. |
| Interrupt Priority | MCU Specific Options | | This priority level will apply to all FIFO interrupts globally. |
| Reception > Message Buffers | | | |
| Number of Buffers | RX Message Buffer number must be an integer between 0 and 32. | 0 | Number of message buffers available for reception.<br><br>As there is no interrupt for message buffer reception it is recommended to use RX FIFOs instead. Set this value to 0 to disable RX Message Buffers. |
| Payload Size | • 8 bytes<br>• 12 bytes<br>• 16 bytes<br>• 20 bytes<br>• 24 bytes<br>• 32 bytes<br>• 48 bytes<br>• 64 bytes | 8 bytes | Payload size for all RX Message Buffers. |
| Reception > Acceptance Filtering | | | |
| Channel 0 Rule Count | The number of AFL rules must be a positive integer. | 32 | Number of acceptance filter list rules dedicated to Channel 0. |
| Channel 1 Rule Count | The number of AFL rules must be a positive integer. | 0 | Number of acceptance filter list rules dedicated to Channel 1. |
| Flexible Data (FD) | | | |
| Protocol Exceptions | • Enabled (ISO 11898-1)<br>• Disabled | Enabled (ISO 11898-1) | Select whether to enter the protocol exception handling state when a RES bit is sampled recessive as defined in ISO 11898-1. |
| Payload Overflow | • Reject<br>• Truncate | Reject | Configure whether received messages larger than the destination buffer should be truncated or rejected. |

Common FIFOs

Common FIFOs > FIFO 0

| | | | |
|---|---|---|---|
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable Common FIFO 0. |
| Mode | • Receive<br>• Transmit | Receive | Select the operation mode for Common FIFO 0. |
| RX Interrupt Enable | • Enabled<br>• Disabled | Disabled | Enable to allow interrupts on message receiption for Common FIFO 0. |
| TX Interrupt Enable | • Enabled<br>• Disabled | Disabled | Enable to allow interrupts on message transmission for Common FIFO 0. |
| Interrupt Mode | • Threshold<br>• Every frame | Threshold | Set the interrupt mode for Common FIFO 0. Threshold mode will only fire an interrupt each time an incoming message crosses the threshold value set below or when all messages have been transmitted. |
| Interrupt Threshold | MCU Specific Options | | Set the interrupt threshold value for Common FIFO 0. This setting is only applicable when the Interrupt Mode is set to 'At Threshold Value'. |
| Payload Size | MCU Specific Options | | Select the message payload size for Common FIFO 0. |
| Depth | MCU Specific Options | | Select the number of stages for Common FIFO 0. |
| TX Message Buffer | MCU Specific Options | | Select the TX message buffer that participates in TX scans related to Common FIFO 0. |
| Interval TX Delay | TX delay must be an integer between 0 and 255. | 0 | Selects the delay between successive transmission for Common FIFO 0 in units of the Interval Timer Clock. |

| | | | |
|---|---|---|---|
| Interval Timer | • Reference clock<br>• Bit time clock | Reference clock | Select the source of the interval timer clock for Common FIFO 0. The reference clock can be scaled by x10 below. |
| Interval Timer Reference Clock Resolution | • x1<br>• x10 | x1 | Selects the timer resolution if the reference clock is selected as the timer source for Common FIFO 0. |
| Common FIFOs > FIFO 1 | | | |
| Enable | • Enabled<br>• Disabled | Disabled | Enable or disable Common FIFO 1. |

| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Transmission Priority | • Message ID<br>• Buffer Number | Buffer Number | Select how messages should be prioritized for transmission. In either case, lower numbers indicate higher priority. |
| DLC Check | • Disabled<br>• Enabled<br>• Enabled w/truncate | config.driver.canfd.dlc_check.disabled | When enabled received messages will be rejected if their DLC field is less than the value configured in the associated AFL rule. If 'Enabled w/truncate' is selected and a message passes the DLC check the DLC field is set to the value in the associated AFL rule and any excess data is discarded. |
| Interval Timer Prescaler | Timer prescaler must be an integer between 0 and 65535. | 0 | FIFO interval timer prescaler, required for Interval TX Delay. |

**Configurations for Connectivity > CAN FD (r_canfd)**

This module can be added to the Stacks tab via New Stack > Connectivity > CAN FD (r_canfd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_canfd0 | Module name. |

| | | | |
|---|---|---|---|
| Channel | Channel should be 0 or 1 | 0 | Specify the CAN channel to use. |
| Bitrate | | | |
| Bitrate > Automatic | | | |
| Nominal Rate (bps) | Must be a valid integer with a maximum of 1MHz. | 500000 | Specify nominal bitrate in bits per second. |
| FD Data Rate (bps) | Must be a valid integer | 2000000 | Specify data bitrate in bits per second. This value is not used when sending messages without the FD and BRS bits enabled and should be left at the default setting if only Classical CAN will be used. |
| Sample Point (%) | Must be a valid integer between 60 and 99. | 75 | Specify desired sample point. |
| Bitrate > Manual | | | |
| Bitrate > Manual > Nominal | | | |
| Prescaler (divisor) | Value must be a non-negative integer between 1 and 1024. | 1 | Specify clock divisor for nominal bitrate. |
| Time Segment 1 (Tq) | Value must be a non-negative integer between 2 and 256. | 29 | Select the Time Segment 1 value. Check module usage notes for how to calculate this value. |
| Time Segment 2 (Tq) | Value must be a non-negative integer between 2 and 128. | 10 | Select the Time Segment 2 value. Check module usage notes for how to calculate this value. |
| Sync Jump Width (Tq) | Value must be a non-negative integer between 1 and 128. | 4 | Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value. |
| Bitrate > Manual > Data | | | |
| Prescaler (divisor) | Value must be a non-negative integer between 1 and 256. | 1 | Specify clock divisor for data bitrate. |
| Time Segment 1 (Tq) | Value must be a non-negative integer | 5 | Select the Time Segment 1 value. |

| | | | |
|---|---|---|---|
| | between 2 and 32. | | Check module usage notes for how to calculate this value. |
| Time Segment 2 (Tq) | Value must be a non-negative integer between 2 and 16. | 2 | Select the Time Segment 2 value. Check module usage notes for how to calculate this value. |
| Sync Jump Width (Tq) | Value must be a non-negative integer between 1 and 16. | 1 | Select the Synchronization Jump Width value. Check module usage notes for how to calculate this value. |
| Use manual settings | • Yes<br>• No | No | Select whether or not to override automatic baudrate generation and instead use the values specified here. |
| Delay Compensation | • Enable<br>• Disable | Enable | When enabled the CANFD module will automatically compensate for any transceiver or bus delay between transmitted and received bits. When manually supplying bit timing values with delay compensation enabled be sure the data prescaler is 2 or smaller for correct operation. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | canfd0_callback | A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time any interrupt occurs. |
| Channel Interrupt Priority Level | MCU Specific Options | | Channel Error/Transmit interrupt priority. |
| Transmit Interrupts | MCU Specific Options | | Select which TX Message Buffers should trigger an interrupt when transmission is complete. |

| | | | |
|---|---|---|---|
| Channel Error Interrupts | • Error Warning<br>• Error Passive<br>• Bus-Off Entry<br>• Bus-Off Recovery<br>• Overload | 0U | Select which channel error interrupt sources to enable. |
| Filter List Array | Name must be a valid C symbol | p_canfd0_afl | Acceptance Filter List (AFL) rule array symbol name. |

### Clock Configuration

The CANFD peripheral uses PLL or PLL2 as its clock source. The RA Configuration editor will attempt to get as close as possible to the supplied bitrate with the configured clock source. To achieve an exact bitrate the CANFD source clock or divisor may need to be adjusted to meet the criteria in the formula below:

```
bitrate = canfd_clock_hz / ((time_segment_1 + time_segment_2 + 1) * prescalar)
```

For CANFD, the possible values for each element are as follows:

| Element | Min | Max (Nominal) | Max (Data) |
|---|---|---|---|
| Bitrate | - | 1 Mbps | 5-8 Mbps* |
| Time Segment 1 | 2 Tq | 256 Tq | 32 Tq |
| Time Segment 2 | 2 Tq | 128 Tq | 16 Tq |
| Sync Jump Width | 1 Tq | Time Segment 2 | Time Segment 2 |
| Prescalar | 1 | 1024 | 256 |

- RA6 devices support up to 5 Mbps; RA8 devices support up to 8 Mbps.

Use the **Clocks** tab of the RA Configuration editor to configure the CANFD clock source/divisor as well as to set the frequency of PLL or PLL2. To change the clock frequency at run-time, use the CGC Interface. Refer to the CGC module guide for more information on configuring clocks.

### Pin Configuration

CANFD channels each control two pins: CRX (receive) and CTX (transmit).

# Usage Notes

### Buffers

The CANFD driver provides four types of buffers: Transmit Message Buffers (TX MBs), Receive Message Buffers (RX MBs), Receive FIFOs (RX FIFOs), and Common FIFOs (RX/TX Common FIFOs).

### TX Message Buffers

TX MBs are used for transmission only. Refer to the hardware manual for your device for information on which TX MBs are available.

*Note*

*The CANFD peripheral continually scans TX MBs for new data. Depending on the provided clock it may be possible to write to multiple TX MBs before transmission begins. In this case, messages will be sent in the priority specified by the Transmission Priority option in the RA Configuration editor.*

### RX Message Buffers

RX MBs are for reception only and may only hold one message at a time. The number of available RX MBs varies per device.

On RA6M5, RX MBs are shared between channels and no interrupts are provided. Use R_CANFD_InfoGet and R_CANFD_Read to poll and read them, respectively.

### RX FIFOs

RX FIFOs provide interrupt-driven queue functionality for receiving messages. All FIFOs have the following capabilities:

- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages for all other MCUs.
- Interrupt events:
  - On every received frame OR when filled to a specified fraction of its capacity
  - When a message is overwritten (message received on full FIFO)

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling R_CANFD_InfoGet and R_CANFD_Read, respectively.

*Note*

*On the RA6M5, FIFOs are shared across all channels.*

### RX Buffer Pool

The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. The RA Configuration editor will provide a warning when the limit is exceeded.

The number of bytes used by RX MBs and individual FIFOs can be calculated as follows:

```
Total RX MB bytes used = (number of RX MBs enabled) * (RX MB payload size + 12 header bytes)
RX FIFO bytes used = (number of FIFO stages) * (FIFO payload size + 12 header bytes)
```

### Common FIFOs

Common FIFOs provide interrupt-driven queue functionality for receiving or transmitting messages. Unlike RX FIFOs, Common FIFOs are individual to each channel. Refer to the hardware manual for your device for information on how many Common FIFOs are available. Common FIFOs support the following capabilities:

- Either TX or RX behavior can be configured.
  - Each Common FIFO can only be configured as one or the other. It cannot operate in both TX and RX modes at the same time.
- Up to 64 byte payloads
- Up to 128 messages (RA6M5) or 48 messages on all other MCUs
- Interrupt events:
  - On every message received or when filled to a specified fraction of its capacity
  - On every message transmitted or when all messages have been transmitted and the FIFO is empty

Once an interrupt is fired it will continue to fire until the FIFO is emptied and all messages have been passed to user code via the callback. When using the threshold interrupt mode a FIFO can be checked for data and read between interrupts by calling R_CANFD_InfoGet and R_CANFD_Read, respectively.

Users should be aware of the total memory allocated in the internal CAN-FD RAM area for Common FIFOs. Allocating too many FIFOs or entries can lead to unexpected behavior.

**Message Filtering (Acceptance Filter List)**

To filter messages to the desired message buffer or FIFO the CANFD peripheral uses an Acceptance Filter List (AFL). Each entry in the AFL provides a rule to check a message against along with destination and other filtering information. When a message is received the CANFD peripheral internally checks against every configured AFL rule for the channel. If a match is found the message is transferred to the destination(s) specified in the rule. The default template with one entry is shown below:

```
static const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH0_RULE_NUM] =
{
    {
       .id =
      {
 /* Specify the ID, ID type and frame type to accept. */
            .id         = 0x00000000,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode    = CAN_ID_MODE_EXTENDED,
       },
       .mask =
      {
 /* These values mask which ID/mode bits to compare when filtering messages. */
            .mask_id         = 0x1FFFFFFF,
            .mask_frame_type = 1,
            .mask_id_mode    = 1,
       },
```

```
      .destination =
     {
 /* If DLC checking is enabled any messages shorter than the below setting will be
rejected. */
           .minimum_dlc = CANFD_MINIMUM_DLC_0,
 /* Optionally specify a Receive Message Buffer (RX MB) to store accepted frames. RX
MBs do not have an
  * interrupt or overwrite protection and must be checked with R_CANFD_InfoGet and
R_CANFD_Read. */
           .rx_buffer   = CANFD_RX_MB_NONE,
 /* Specify which FIFO(s) to send filtered messages to. Multiple FIFOs can be OR'd
together. */
           .fifo_select_flags = CANFD_RX_FIFO_0,
      }
   }
};
```

AFL templates can be easily added to a project using the Developer Assistance feature in e² studio. Once the CANFD module is added to a project, drag and drop the elements circled below to build a filter list:

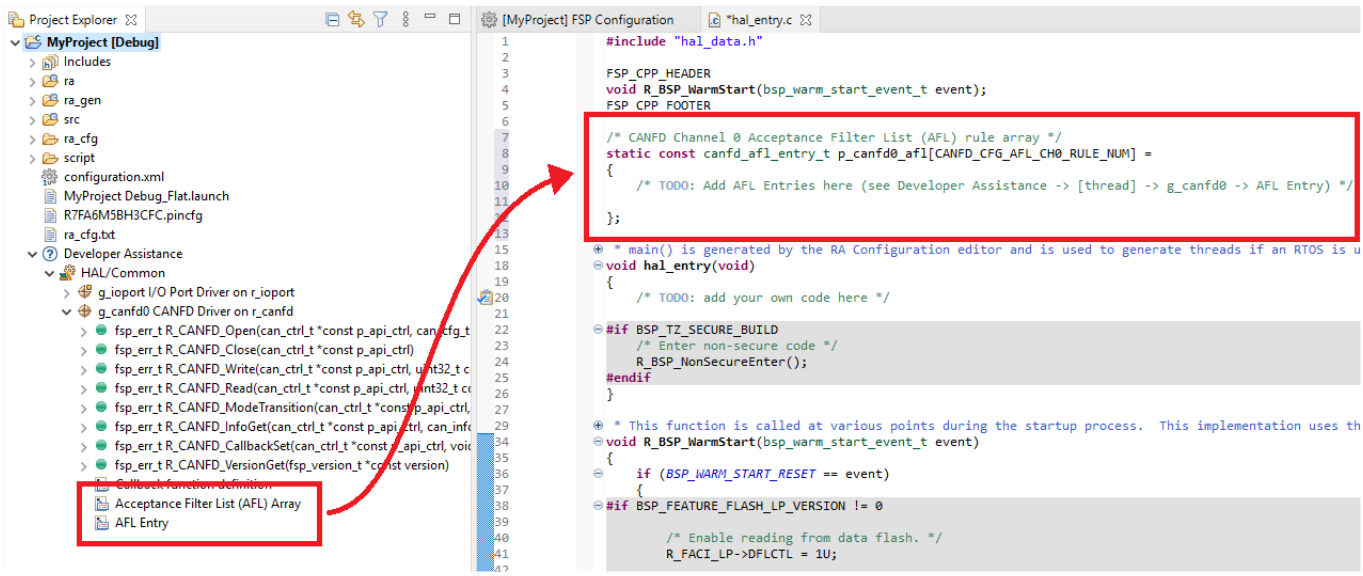

Figure 220: CANFD Developer Assistance AFL Templates

For an example configuration refer to the AFL Example below.

### Flexible Data (FD)

Flexible Data is an extension of the CAN protocol allowing for messages up to 64 bytes and higher data bitrates, among other features. The CANFD driver supports the following:

- Sending and receiving FD messages
- Bitrate switching for data phase
- Manual and automatic setting of the error state (ESI) bit

To specify one or more of these options when transmitting set can_frame_t::options with combined values from canfd_frame_options_t. Received messages will automatically have this field filled, if applicable.

```
/* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
   g_can_tx_frame.id               = CAN_EXAMPLE_ID;
   g_can_tx_frame.id_mode          = CAN_ID_MODE_STANDARD;
   g_can_tx_frame.type             = CAN_FRAME_TYPE_DATA;
   g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
   g_can_tx_frame.options          = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
```

*Note*

*When using bitrate switching be sure to configure the Data Bitrate as desired in the RA Configuration editor.*

### Bit Rate Calculation

For convenience, the baudrate of the CANFD peripheral is automatically set through the RA Configuration editor using a best effort approach.

Enabling Delay Compensation instructs the CANFD peripheral to measure TX to RX tranceiver delay and automatically adjust for it, improving the reliability of high-speed FD messages. This option may severely limit available bitrate settings depending on the source clock; it is highly recommended to check the generated values when enabled.

If the auto-generated baud settings cause deviation that is not tolerable by the application the user can override the auto-generated settings and put in manually calculated values through the RA Configuration editor. For more details on how the bitrate is calculated refer to the Clock Configuration section above.

### Sync Jump Width

The Sync Jump Width option specifies the maximum number of time quanta that the sample point may be delayed by to account for differences in oscillators on the bus. It should be set to a value between 1 and the configured Time Segment 2 value depending on the maximum permissible clock error.

### Error Handling

The CANFD peripheral provides two types of error interrupts: Channel and Global. As the names imply, each channel has its own Channel Error interrupt but there is only one Global Error interrupt.

Only the configured channel will receive callbacks for Global Errors.

Error interrupt callbacks will pass either CAN_EVENT_ERR_CHANNEL or CAN_EVENT_ERR_GLOBAL in the can_callback_args_t::event field. A second field, can_callback_args_t::error, provides the actual error code as canfd_error_t. Cast to this enum to retrieve the error condition. See the callback in the Basic Example below for a demonstration.

### DLC Checking

When DLC Checking is enabled messages are checked against the destination.minimum_dlc value of each AFL rule. If the data length of a message is less than this value the message will be rejected. When DLC checking is set to "Enabled w/truncate" in the RA Configuration editor any data in excess of the minimum DLC setting will be truncated and the DLC value for the frame will be set to match.

### FD Payload Overflow

When an FD message is received with a DLC larger than the destination buffer an FD Payload Overflow interrupt is thrown (if configured). When Payload Overflow is set to "Truncate" the message will still be accepted but only data up to the buffer capacity will be preserved. The DLC value is unchanged in this case; any data beyond this value in the can_frame_t::data array should not be used.

### Test Modes

The CANFD peripheral provides three basic test modes: Listen Only, Internal Loopback and External Loopback. Use R_CANFD_ModeTransition to switch to a test mode.

On some MCUs an additional "Internal Bus" test mode is available that allows connecting both CANFD channels together on an internal bus, effectively creating an internal CAN network. See the Internal Bus example below for details.

### Limitations

Developers should be aware of the following limitations when using CANFD:

- On RA6M5, RX Message Buffers do not have an associated interrupt. To use them in an application one of the following is recommended:
  - Use R_CANFD_InfoGet to determine if any RX MBs have received data, then use R_CANFD_Read to obtain it
  - Select an RX FIFO as an additional destination for the relevant filter rules and configure the FIFO interrupt/callback as desired
- The CANFD peripheral has a limited amount of buffer pool RAM available for allocating RX MBs and FIFO stages. See the RX Buffer Pool section above for more information.
- When switching modes with R_CANFD_ModeTransition a delay of up to several CAN frames may be incurred. Consult Section "Timing of Channel Mode Change" in the CANFD section of the relevant hardware manual for details.
- Only one channel will receive callbacks for Global Errors. If a different channel is opened first these error interrupts will be suppressed until the specified handler channel is opened.
- The CANFD driver does not currently support updating AFL entries in Operation mode (communication active). Please refer to the "Updating AFL entry during communication" section in your device's manual on how to use this feature (if available).

# Examples

### AFL Example

The below is an example Acceptance Filter List (AFL) declaration with two rules.

```
const canfd_afl_entry_t p_canfd0_afl[CANFD_CFG_AFL_CH1_RULE_NUM] =
{
 /* Store all data frames with at least 4 bytes from Standard IDs 0x40-0x4F in RX
FIFO 0 and RX FIFO 1 */
    {
       .id =
      {
            .id         = 0x40,
            .frame_type = CAN_FRAME_TYPE_DATA,
            .id_mode    = CAN_ID_MODE_STANDARD
       },
       .mask =
      {
            .mask_id         = 0x7F0,
            .mask_frame_type = 1,
            .mask_id_mode    = 1
       },
       .destination =
      {
            .minimum_dlc       = CANFD_MINIMUM_DLC_4,
            .rx_buffer         = CANFD_RX_MB_NONE,
            .fifo_select_flags = (canfd_rx_fifo_t) (CANFD_RX_FIFO_0 |
CANFD_RX_FIFO_1)
       }
    },
 /* Store all frames from Extended ID 0x1100 in RX FIFO 2 and RX MB 0 */
    {
       .id =
      {
            .id         = 0x1100,
            .frame_type = CAN_FRAME_TYPE_DATA, // This setting is ignored by the mask
            .id_mode    = CAN_ID_MODE_EXTENDED
```

```
      },
      .mask =
     {
           .mask_id         = 0x1FFFFFFF,
           .mask_frame_type = 0,
           .mask_id_mode    = 1
      },
      .destination =
     {
           .minimum_dlc       = CANFD_MINIMUM_DLC_0,
           .rx_buffer         = CANFD_RX_MB_0,
           .fifo_select_flags = CANFD_RX_FIFO_2
      }
   }
};
```

### Basic Example

This is a basic example of minimal use of the CANFD module in an application.

*Note*

*On RA6M5 it is recommended to use RX FIFOs for reception as there are no interrupts for RX message buffers.*

```
#define CAN_EXAMPLE_ID (0x20)
can_frame_t g_can_tx_frame;
can_frame_t g_can_rx_frame;
volatile canfd_error_t g_err_status = (canfd_error_t) 0;
void canfd_callback (can_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CAN_EVENT_RX_COMPLETE:    /* Receive complete event. */
     {
 /* Read received frame */
           memcpy(&g_can_rx_frame, &p_args->frame, sizeof(can_frame_t));
 /* Handle event */
```

```
 break;
       }
 case CAN_EVENT_TX_COMPLETE:    /* Transmit complete event. */
      {
 /* Handle event */
 break;
       }
 case CAN_EVENT_ERR_GLOBAL:                        /* Global error. */
 case CAN_EVENT_ERR_CHANNEL:                      /* Channel error. */
      {
 /* Get error status */
            g_err_status = (canfd_error_t) p_args->error; /* Check error code with
canfd_error_t. */
 /* Handle event */
 break;
       }
 default:
      {
 break;
       }
    }
}
void canfd_basic_example (void)
{
 fsp_err_t err;
 /* Initialize the CAN module */
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Setup frame to write to CAN ID 0x20 */
    g_can_tx_frame.id              = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode         = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type            = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = 8;
```

```
    g_can_tx_frame.options          = 0;
 /* Write some data to the transmit frame */
 for (uint32_t i = 0; i < 8; i++)
    {
       g_can_tx_frame.data[i] = (uint8_t) i;
    }
 /* Send data on the bus */
    err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
    assert(FSP_SUCCESS == err);
 /* Wait for a transmit callback event */
}
```

### Flexible Data

This example demonstrates sending an FD message with bitrate switching over external loopback. The CTX and CRX pins must be connected when using external loopback, though if a CAN tranciever is onboard a 120 Ohm resistor should be connected across CANH and CANL instead.

```
#define CAN_EXAMPLE_64_BYTES 64
void canfd_fd_loopback_example (void)
{
 fsp_err_t err;
    err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Switch to external loopback mode */
    err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
    assert(FSP_SUCCESS == err);
 /* Configure a frame to write 64 bytes with bitrate switching (BRS) enabled */
    g_can_tx_frame.id               = CAN_EXAMPLE_ID;
    g_can_tx_frame.id_mode          = CAN_ID_MODE_STANDARD;
    g_can_tx_frame.type             = CAN_FRAME_TYPE_DATA;
    g_can_tx_frame.data_length_code = CAN_EXAMPLE_64_BYTES;
    g_can_tx_frame.options          = CANFD_FRAME_OPTION_FD | CANFD_FRAME_OPTION_BRS;
 /* Write some data to the transmit frame */
```

```
for (uint32_t i = 0; i < CAN_DATA_BUFFER_LENGTH; i++)
   {
      g_can_tx_frame.data[i] = (uint8_t) i;
   }
/* Send data on the bus */
   err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
   assert(FSP_SUCCESS == err);
/* Wait for a transmit and/or receive callback event */
}
```

### Internal Bus

In this example two CANFD channels are connected to the Internal Bus test mode. API error checking has been omitted for clarity.

*Note*

*Internal Bus mode is only available on MCUs with more than one CANFD channel. In addition, use of Global Modes for any other purpose is not recommended without consulting the device User's Manual.*

| CANFD Receive FIFO (RX FIFO) |

### ◆ canfd_minimum_dlc_t

| enum canfd_minimum_dlc_t |
| --- |
| CANFD AFL Minimum DLC settings |

### ◆ canfd_frame_options_t

| enum canfd_frame_options_t | |
| --- | --- |
| CANFD Frame Options | |
| Enumerator | |
| CANFD_FRAME_OPTION_ERROR | Error state set (ESI). |
| CANFD_FRAME_OPTION_BRS | Bit Rate Switching (BRS) enabled. |
| CANFD_FRAME_OPTION_FD | Flexible Data frame (FDF). |

## Function Documentation

### ◆ R_CANFD_Open()

fsp_err_t R_CANFD_Open ( can_ctrl_t *const *p_api_ctrl*, can_cfg_t const *const *p_cfg* )

Open and configure the CANFD channel for operation.

Example:

```
/* Initialize the CAN module */
   err = R_CANFD_Open(&g_canfd0_ctrl, &g_canfd0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_IN_USE | Channel is already in use. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel does not exist on this MCU. |
| FSP_ERR_ASSERTION | A required pointer was NULL. |
| FSP_ERR_CAN_INIT_FAILED | The provided nominal or data bitrate is invalid. |
| FSP_ERR_CLOCK_INACTIVE | CANFD source clock is disabled (PLL or PLL2). |

### ◆ R_CANFD_Close()

fsp_err_t R_CANFD_Close ( can_ctrl_t *const *p_api_ctrl*)

Close the CANFD channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel closed successfully. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented. |

### ◆ R_CANFD_Write()

fsp_err_t R_CANFD_Write ( can_ctrl_t *const *p_api_ctrl*, uint32_t *buffer*, can_frame_t *const *p_frame* )

Write data to the CANFD channel.

Example:

```
/* Send data on the bus */
   err = R_CANFD_Write(&g_canfd0_ctrl, CANFD_TX_MB_0, &g_can_tx_frame);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_CAN_TRANSMIT_NOT_READY | Transmit in progress, cannot write data at this time. |
| FSP_ERR_INVALID_ARGUMENT | Data length or buffer number invalid. |
| FSP_ERR_INVALID_MODE | An FD option was set on a non-FD frame. |
| FSP_ERR_ASSERTION | One or more pointer arguments is NULL. |
| FSP_ERR_UNSUPPORTED | FD is not supported on this MCU. |

### ◆ R_CANFD_Read()

fsp_err_t R_CANFD_Read ( can_ctrl_t *const *p_api_ctrl*, uint32_t *buffer*, can_frame_t *const *p_frame* )

Read data from a CANFD Message Buffer or FIFO.

Example: snippet r_canfd_example.c R_CANFD_Read

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_INVALID_ARGUMENT | Buffer number invalid. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_frame is NULL. |
| FSP_ERR_BUFFER_EMPTY | Buffer or FIFO is empty. |

### ◆ R_CANFD_ModeTransition()

fsp_err_t R_CANFD_ModeTransition ( can_ctrl_t *const *p_api_ctrl*, can_operation_mode_t *operation_mode*, can_test_mode_t *test_mode* )

Switch to a different channel, global or test mode.

Example:

```
/* Switch to external loopback mode */
   err = R_CANFD_ModeTransition(&g_canfd0_ctrl, CAN_OPERATION_MODE_NORMAL,
CAN_TEST_MODE_LOOPBACK_EXTERNAL);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |
| FSP_ERR_INVALID_MODE | Cannot change to the requested mode from the current global mode. |

### ◆ R_CANFD_InfoGet()

fsp_err_t R_CANFD_InfoGet ( can_ctrl_t *const *p_api_ctrl*, can_info_t *const *p_info* )

Get CANFD state and status information for the channel.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | Null pointer presented |

### ◆ R_CANFD_CallbackSet()

| fsp_err_t R_CANFD_CallbackSet ( can_ctrl_t *const *p_api_ctrl*, void(*)(can_callback_args_t *) *p_callback*, void *const *p_context*, can_callback_args_t *const *p_callback_memory* ) |
|---|
| Updates the user callback with the option to provide memory for the callback argument structure. Implements can_api_t::callbackSet. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

## 5.2.6.4 CEC (r_cec)

Modules » Connectivity

### Functions

| | |
|---|---|
| fsp_err_t | R_CEC_Open (cec_ctrl_t *const p_ctrl, cec_cfg_t const *const p_cfg) |

### Detailed Description

Driver for the CEC peripheral on RA MCUs. This module implements the CEC Interface.

# Overview

The HDMI CEC HAL module provides a high-level API for CEC applications and supports the CEC peripheral available on RA microcontroller hardware. A user-callback function must be defined that the driver will invoke when data received, transmission complete, or error interrupts are received. The callback is passed a parameter which indicates the event as well as received data (if available).

### Features

- Conforms to High Definition Multimedia Interface (HDMI) Consumer Electronics Control (CEC) standard Ver. 1.4b.
- Full range of local address settings (TV, Recording Device, Playback Device, etc.)
- Data filtering based on matching destination address and local address.
- Supports a user-callback function (required), invoked when transmit, receive, or error interrupts are received.

# Configuration

### Build Time Configurations for r_cec

The following build time configurations are defined in fsp_cfg/r_cec_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| CEC Message Max Data Size | CEC message max data size must be a positive integer | 14 | Maximum Data Size for CEC Message Transmission/Reception. |

### Configurations for Connectivity > CEC (r_cec)

This module can be added to the Stacks tab via New Stack > Connectivity > CEC (r_cec). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_cec0 | Module name |
| Control Configuration | | | |
| Clock Select | • PCLKB / 32<br>• PCLKB / 64<br>• PCLKB / 128<br>• PCLKB / 256<br>• PCLKB / 512<br>• PCLKB / 1024<br>• CECCLK<br>• CECCLK / 256 | PCLKB / 1024 | CEC Clock Select Configuration |
| Ack Bit Timing Error | • Disabled | Enabled | CEC Ack Bit Timing |

| | | | |
|---|---|---|---|
| Enable | • Enabled | | Error Enable |
| Signal-Free Time Bit Width | • 3-data bit width<br>• 5-data bit width<br>• 7-data bit width<br>• Does not detect signal-free time. | 7-data bit width | Signal-Free Time Data Bit Width Select |
| Start Bit Error Detection Enable | • Disabled<br>• Enabled | Enabled | Enable to detect timing errors during start bit reception. |
| Bus Lock Detection Enable | • Disabled<br>• Enabled | Enabled | Enable to detect sticking of receive data to high or low. |
| Digital Filter Enable | • Disabled<br>• Enabled | Enabled | Enable to use a digital filter. |
| Long Bit Width Error Pulse Output Enable | • Disabled<br>• Enabled | Disabled | Enable to output an error handling pulse when a long bit width error is detected. |
| Start Detection Reception Restart Enable | • Disabled<br>• Enabled | Enabled | Enable to restart reception after a start bit error is detected. |

Bit Width Timing

Bit Width Timing > Transmit

| | | | |
|---|---|---|---|
| Start Bit Low Time | CEC transmission start bit low width setting must be a positive integer. | 180 | CEC transmission start bit low width setting (CEC Clock Cycles). |
| Start Bit Width Time | CEC transmission start bit high width setting must be a positive integer. | 220 | CEC transmission start bit high width setting (CEC Clock Cycles). |
| Logical Zero Low Time | CEC transmission logical zero low width setting must be a positive integer. | 73 | CEC transmission logical zero low width setting (CEC Clock Cycles). |
| Logical One Low Time | CEC transmission logical one low width setting must be a positive integer. | 29 | CEC transmission logical one low width setting (CEC Clock Cycles). |
| Overall Bit Width Time | CEC transmission overall data bit width time setting must be a positive integer. | 117 | CEC transmission overall data bit width time setting (CEC Clock Cycles). |

Bit Width Timing > Receive

| | | | |
|---|---|---|---|
| Data Sample Time | CEC reception data sampling time must be a positive integer. | 49 | CEC reception data sampling time setting (CEC Clock Cycles). |
| Data Bit Reference Width | CEC reception data bit reference width must be a positive integer. | 117 | CEC data bit reference width setting (CEC Clock Cycles). |
| Start Bit Low Min Time | CEC reception start bit minimum low width setting must be a positive integer. | 171 | CEC reception start bit minimum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Low Max Time | CEC reception start bit maximum low width setting must be a positive integer. | 190 | CEC reception start bit maximum low width setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Min Time | CEC start bit minimum time setting must be a positive integer. | 210 | CEC start bit minimum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Start Bit Max Time | CEC reception start bit maximum time setting must be a positive integer. | 229 | CEC start bit maximum time setting (CEC Clock Cycles). Not used when Start Bit Error Detection and restart Rx on Error are not enabled. |
| Logical Zero Low Min Time | CEC reception logical zero minimum low width setting must be a positive integer. | 64 | CEC reception logical zero minimum low width setting (CEC Clock Cycles). |
| Logical Zero Low Max Time | CEC reception locical zero maximum low width setting must be a positive integer. | 83 | CEC reception logical zero maximum low width setting (CEC Clock Cycles). |
| Logical One Low Min Time | CEC reception logical one minimum low width setting must be a positive integer. | 20 | CEC reception logical one minimum low width setting (CEC Clock Cycles). |
| Logical One Low Max | CEC reception logical | 39 | CEC reception logical |

| | | | |
|---|---|---|---|
| Time | one maximum low width setting must be a positive integer. | | one maximum low width (CEC Clock Cycles). |
| Overall Bit Width Min Time | CEC reception overall minimum bit width setting must be a positive integer. | 100 | CEC reception overall minimum bit width setting (CEC Clock Cycles). |
| Overall Bit Width Max Time | CEC reception overall maximum bit width setting must be a positive integer. | 134 | CEC reception overall maximum bit width setting (CEC Clock Cycles). |
| Interrupts | | | |
| Interrupt Priority Level | MCU Specific Options | | Error/Data/Message interrupt priority level. |
| Callback Function | Callback Function must be a valid C symbol | g_rm_cec0_callback | Callback function |
| Communication Complete Interrupt Timing | • After Last Frame and Signal Free Time<br>• After Last Frame<br>• After Signal Free Time | After Last Frame and Signal Free Time | Communication Complete Interrupt (INTCE) Generation Timing Select |
| Address Mismatch Interrupt Enable | • Disabled<br>• Enabled | Disabled | Enable to generate an interrupt when the addresses do not match. |
| Data Interrupt Timing Selection | • EOM timing (9th bit of data)<br>• ACK Timing (10th bit of data) | EOM timing (9th bit of data) | INTDA reception interrupt timing selection (EOM or ACK). |

### Clock Configuration

The CEC peripheral uses the CECCLK or PCLKB as its clock source. To set the PCLKB frequency, use the Clocks tab of the RA Configuration editor.

*Note*

*The selected clock and configured divider must be configured in the range of 23.4375 to 78.125 kHz.*

### Pin Configuration

A CEC channel uses one data pin - CECIO for data transmission and reception.

The output type for each pin should be set to **n-ch open drain** for most hardware designs. This can be configured in **Pins** tab of the RA Configuration editor by selecting the pin under Pin Selection->Ports.

# Usage Notes

### CEC Device Addresses

The CEC standard provides 13 device addresses that may be requested based on a device's primary function. Use R_CEC_MediaInit to request a specific address before starting communication with other devices.

*Note*

*Address 0 is always the primary display (TV). Do not attempt to allocate this address unless your device is intended to function as a display.*

### Limitations

Developers should be aware of the following limitations when using the CEC module:

- R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after R_CEC_Open while the hardware initializes.
- The CECIO pin must be set to n-ch open drain mode.

# Examples

### Basic Example

This is a basic example of minimal use of the CEC in an application.

```
/***********************************************************************************************************************
 * Application defined callback
 * - May be assigned at compile-time via the e2 studio configuration tool or set at run-time via R_CEC_CallbackSet()
 **********************************************************************************************************************/
void cec_callback (cec_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case CEC_EVENT_READY:
     {
 /* Application processing for address allocation success. */
 break;
      }
 case CEC_EVENT_TX_COMPLETE:
```

```
     {
 /* Any required processing after transmission has completed. */
 break;
      }
 case CEC_EVENT_ERR:
     {
 /* Error processing. See cec_error_t for possible errors. */
 break;
      }
 case CEC_EVENT_RX_DATA:
     {
 /* Application to store and process received data bytes. */
 break;
      }
 case CEC_EVENT_RX_COMPLETE:
     {
 /* Application processing for message reception complete. */
      }
   }
}
/***********************************************************************************
*********************************
 * Basic example
 ***********************************************************************************
*********************************/
#define CEC_TIMEOUT_MS (50)
#define CEC_MSG_STANDBY (0X36)  /* See CEC Specification for message definitions */
void basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the CEC module */
    err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
    assert(FSP_SUCCESS == err);
 /* Initialize the CEC module and allocate an address */
```

```
    uint32_t timeout_ms = CEC_TIMEOUT_MS;
 do
    {
 /* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
       err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
    } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
    assert(timeout_ms);
    assert(FSP_SUCCESS == err);
 /* Wait for local address allocation and CEC bus to be free */
    cec_status_t status;
    err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
 while ((FSP_SUCCESS == err) && (CEC_STATE_READY != status.state))
    {
      err = R_CEC_StatusGet(&g_cec0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 cec_message_t cec_msg;
    uint8_t       total_transmit_size;
    cec_msg.destination = CEC_ADDR_BROADCAST;       /* For this example, send message
to all devices on the bus */
    cec_msg.opcode      = CEC_MSG_STANDBY;          /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */
    total_transmit_size = 2U;                      /* Total message size, including
header, opcode, and data */
 /* Send asynchronous message.
  * - Application will then be free for other processing while message is being sent.
  * - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
}
```

## Function Documentation

### ◆ R_CEC_Open()

fsp_err_t R_CEC_Open ( cec_ctrl_t *const *p_ctrl*, cec_cfg_t const *const *p_cfg* )

Open and configure the CEC module for operation.

Example:

```
/* Open the CEC module */
   err = R_CEC_Open(&g_cec0_ctrl, &g_cec0_cfg);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CEC Module opened successfully. |
| FSP_ERR_ALREADY_OPEN | Driver already open. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_IRQ_BSP_DISABLED | Interrupts are not enabled. |

### ◆ R_CEC_MediaInit()

fsp_err_t R_CEC_MediaInit ( cec_ctrl_t *const *p_ctrl*, cec_addr_t *local_address* )

Allocate provided CEC Local Address and Initialize the CEC module for operation.

***Note***

*After calling R_CEC_Open this function may return FSP_ERR_IN_USE for up to 45 milliseconds.*

Example:

```
/* Initialize the CEC module and allocate an address */
   uint32_t timeout_ms = CEC_TIMEOUT_MS;
do
   {
/* R_CEC_MediaInit may return FSP_ERR_IN_USE for up to 45 milliseconds after calling
R_CEC_Open */
      err = R_CEC_MediaInit(&g_cec0_ctrl, CEC_ADDR_TV);
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
   } while ((FSP_ERR_IN_USE == err) && --timeout_ms);
   assert(timeout_ms);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CEC Module Initialized successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid or callback has not been set. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_IN_USE | HDMI CEC Bus is currently in use. Try again later. |

### ◆ R_CEC_Close()

fsp_err_t R_CEC_Close ( cec_ctrl_t *const *p_ctrl*)

Close the CEC module.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | CEC Module closed successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid. |

### ◆ R_CEC_Write()

fsp_err_t R_CEC_Write ( cec_ctrl_t *const *p_ctrl*, cec_message_t const *const *p_message*, uint32_t *message_size* )

Write data to the CEC bus. Data transmission is asynchronous. Provided message buffer should not be modified until transmission is complete.

Data Transmission follows the pattern defined be the HDMI CEC Specification:

| Data | Description | Size |
|---|---|---|
| Start Bit | Managed by Hardware, per config | N/A |
| Header Block | Source/Destination Identifier | 1 Byte |
| Data Block 1 | Opcode Value (Optional) | 1 Byte |
| Data Block 2 | Operands (Optional) | Variable (0-14 Bytes Typical) |

Example:

```
cec_message_t cec_msg;
    uint8_t       total_transmit_size;
    cec_msg.destination = CEC_ADDR_BROADCAST;       /* For this example, send message
to all devices on the bus */
    cec_msg.opcode      = CEC_MSG_STANDBY;          /* Send Standby Request */
    memset(cec_msg.data, 0U, sizeof(cec_msg.data)); /* See CEC Specification for
other message data structures */
    total_transmit_size = 2U;                      /* Total message size, including
header, opcode, and data */
 /* Send asynchronous message.
  * - Application will then be free for other processing while message is being sent.
  * - Do not modify the message buffer until transmission has completed. */
    err = R_CEC_Write(&g_cec0_ctrl, &cec_msg, total_transmit_size);
    assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been successfully initialized. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_INVALID_SIZE | Invalid message size. |
| FSP_ERR_IN_USE | HDMI CEC Bus is currently in use. Try again |

| | |
|---|---|
| | later. |

### ◆ R_CEC_StatusGet()

fsp_err_t R_CEC_StatusGet ( cec_ctrl_t *const *p_ctrl*, cec_status_t *const *p_status* )

Provides the state and status information according to the provided CEC control instance.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation succeeded. |
| FSP_ERR_NOT_OPEN | Control block not open. |
| FSP_ERR_ASSERTION | An input argument is invalid. |

### ◆ R_CEC_CallbackSet()

fsp_err_t R_CEC_CallbackSet ( cec_ctrl_t *const *p_ctrl*, void(*)(cec_callback_args_t *) *p_callback*, void *const *p_context*, cec_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements cec_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | An input argument is invalid. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### Detailed Description

Middleware to implement the I2C communications interface. This module implements the Communications Middleware Interface.

# Overview

### Features

The implementation of the I2C communications interface has the following key features:

- Reading data from, writing data to I2C bus
- Writes to I2C bus, then reads with restart
- A single I2C bus used by multiple I2C devices

# Configuration

### Build Time Configurations for rm_comms_i2c

The following build time configurations are defined in fsp_cfg/rm_comms_i2c_cfg.h:

| | | | |
|---|---|---|---|

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Connectivity > I2C Shared Bus (rm_comms_i2c)**

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Shared Bus (rm_comms_i2c).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comms_i2c_bus0 | Module name. |
| Bus Timeout | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for locking bus in using RTOS. |
| Semaphore for Blocking (RTOS only) | • Unuse<br>• Use | Use | Set Semaphore for blocking in using RTOS. |
| Recursive Mutex for Bus (RTOS only) | • Unuse<br>• Use | Use | Set Mutex for locking bus in using RTOS. |
| Channel | Manual Entry | 0 | IIC channel |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Transfer rate for lower level driver. |

**Configurations for Connectivity > I2C Communication Device (rm_comms_i2c)**

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Communication Device (rm_comms_i2c).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_comms_i2c_device0 | Module name. |
| Semaphore Timeout (RTOS only) | Value must be a non-negative integer less than or equal to 0xFFFFFFFF | 0xFFFFFFFF | Set timeout for blocking in using RTOS. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the I2C address mode. |
| Callback | Name must be a valid C symbol | comms_i2c_callback | A user callback function can be provided. |

**Pin Configuration**

This module uses SDA and SCL pins of I2C Master, SCI I2C, IICA Master and SAU I2C.

# Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.
  If an RTOS is used and blocking and bus lock is enabled, RM_COMMS_I2C_Write(), RM_COMMS_I2C_Read() and RM_COMMS_I2C_WriteRead() cannot be called in callback.

### Bus Initialization

The I2C communications interface expects a bus instance to be opened before opening any specific I2C comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

# Examples

### Basic Example

This is a basic example of minimal use of I2C communications implementation in an application.

```
void rm_comms_i2c_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend          =
(rm_comms_i2c_bus_extended_cfg_t *) g_comms_i2c_cfg.p_extend;
 i2c_master_instance_t          * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
```

```
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 while (true)
    {
       g_flag = 0;
 /* Send data to an I2C device. */
 RM_COMMS_I2C_Write(&g_comms_i2c_ctrl, &write_data, 1);
 while (0 == g_flag)
      {
 /* Wait callback */
      }
```

```
      g_flag = 0;
 /* Receive data from an I2C device. */
 RM_COMMS_I2C_Read(&g_comms_i2c_ctrl, &read_data, 1);
 while (0 == g_flag)
     {
 /* Wait callback */
     }
   }
}
```

### Function Documentation

#### ◆ RM_COMMS_I2C_Open()

fsp_err_t RM_COMMS_I2C_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the Communications Middle module. Implements rm_comms_api_t::open.

Example:

```
    err = RM_COMMS_I2C_Open(&g_comms_i2c_ctrl, &g_comms_i2c_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Communications Middle module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_COMMS_BUS_NOT_OPEN | I2C driver is not open. |

### ◆ RM_COMMS_I2C_Close()

fsp_err_t RM_COMMS_I2C_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified Communications Middle module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_I2C_Read()

fsp_err_t RM_COMMS_I2C_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the I2C device. Implements rm_comms_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_I2C_Write()

fsp_err_t RM_COMMS_I2C_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write from the I2C device. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_I2C_WriteRead()

fsp_err_t RM_COMMS_I2C_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs a write to, then a read from the I2C device. Implements rm_comms_api_t::writeRead.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### Detailed Description

I2C Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The I2C master on IIC/I3C HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

# Configuration

### Build Time Configurations for r_iic_b_master

The following build time configurations are defined in fsp_cfg/r_iic_b_master_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

### Configurations for Connectivity > I2C Master (r_iic_b_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_b_master). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i2c_master0 | Module name. |
| Channel | Manual Entry | 0 | Specify the IIC channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_b_master_extended_cfg_t structure. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000 |
| Rise Time (ns) | Value must be a non-negative integer | 120 | Set the rise time (tr) in nanoseconds. |
| Fall Time (ns) | Value must be a non-negative integer | 120 | Set the fall time (tf) in nanoseconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 50 | Set the SCL duty cycle. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |
| Timeout Mode | • Short Mode<br>• Long Mode | Short Mode | Select the timeout mode to detect bus hang. |
| Timeout during SCL | • Enabled | Enabled | Select if the timeout |

| | | | |
|---|---|---|---|
| Low | • Disabled | | can occur when SCL is held low for a duration longer than what is set in the timeout mode. |
| Callback | Name must be a valid C symbol | g_iic_b_master0_callback | A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status. |
| Interrupt Priority Level | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts. |

### Clock Configuration

The I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

### Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
  - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested

rate) at the current IICCLK/PCLKD (based on the MCU) settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

### Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

### Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

### Limitations

- DTC should be disabled for data transmission on RA2E2 if MCU version is 1. Please refer to "MCUVER : MCU Version Register" description in the Flash Memory section of the relevant hardware manual for how to find MCU version.

## Examples

### Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_FAST,
    .slave         = I2C_SLAVE_EEPROM,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
```

```
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_b_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {

       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

*Note*

*The callback function from the first example applies to this example as well.*

```
iic_b_master_instance_ctrl_t g_i2c_device_ctrl_2;
```

```
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_b_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_B_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_B_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
```

```
    }
 /* Send data to I2C slave on the same channel */
    err = R_IIC_B_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = 0xAA;       // NOLINT
    g_i2c_tx_buffer[1]   = 0xBB;       // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_B_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

|---|---|
| Enumerator | |
| IIC_B_MASTER_TIMEOUT_SCL_LOW_DISABLED | Timeout detection during SCL low disabled. |
| IIC_B_MASTER_TIMEOUT_SCL_LOW_ENABLED | Timeout detection during SCL low enabled. |

## Function Documentation

### ◆ R_IIC_B_MASTER_Open()

fsp_err_t R_IIC_B_MASTER_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the I2C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Set the rate to fast mode plus on a channel which does not support it.<br>5. Invalid IRQ number assigned |

### ◆ R_IIC_B_MASTER_Read()

fsp_err_t R_IIC_B_MASTER_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_dest or bytes is NULL, or DTC is used for data transmission on RA2E2 Ver 1. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

### ◆ R_IIC_B_MASTER_Write()

fsp_err_t R_IIC_B_MASTER_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

### ◆ R_IIC_B_MASTER_Abort()

fsp_err_t R_IIC_B_MASTER_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel was reset successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

### ◆ R_IIC_B_MASTER_SlaveAddressSet()

fsp_err_t R_IIC_B_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL. |
| FSP_ERR_IN_USE | Another transfer was in-progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

### ◆ R_IIC_B_MASTER_CallbackSet()

fsp_err_t R_IIC_B_MASTER_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_IIC_B_MASTER_StatusGet()

fsp_err_t R_IIC_B_MASTER_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_IIC_B_MASTER_Close()

| fsp_err_t R_IIC_B_MASTER_Close ( i2c_master_ctrl_t *const *p_api_ctrl*) |
|---|

Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_B_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

| fsp_err_t | R_IIC_MASTER_Close (i2c_master_ctrl_t *const p_api_ctrl) |

### Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The I2C master on IIC HAL module supports transactions with an I2C Slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

# Configuration

### Build Time Configurations for r_iic_master

The following build time configurations are defined in fsp_cfg/r_iic_master_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

### Configurations for Connectivity > I2C Master (r_iic_master)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_iic_master). Non-secure callable guard functions can be generated for this module by right clicking

the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i2c_master0 | Module name. |
| Channel | Manual Entry | 0 | Specify the IIC channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and duty cycle are printed in a comment in the generated iic_master_extended_cfg_t structure. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000 |
| Rise Time (ns) | Value must be a non-negative integer | 120 | Set the rise time (tr) in nanoseconds. |
| Fall Time (ns) | Value must be a non-negative integer | 120 | Set the fall time (tf) in nanoseconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 50 | Set the SCL duty cycle. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |

| | | | |
|---|---|---|---|
| Timeout Mode | • Short Mode<br>• Long Mode | Short Mode | Select the timeout mode to detect bus hang. |
| Timeout during SCL Low | • Enabled<br>• Disabled | Enabled | Select if the timeout can occur when SCL is held low for a duration longer than what is set in the timeout mode. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) upon IIC transaction completion reporting the transaction status. |
| Interrupt Priority Level | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, TEI and ERI interrupts. |

### Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

### Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### IIC Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps

    - Fast-mode (Fm) : up to 400 kbps
    - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the IIC

- DTC transfer support is configurable and is disabled from the build by default. IIC driver provides two DTC instances for transmission and reception respectively. The DTC instances can be enabled individually during configuration.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

### Multiple Devices on the Bus

- A single IIC instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

### Restart

- IIC master can hold the the bus after an I2C transaction by issuing a repeated start condition.

# Examples

### Basic Example

This is a basic example of minimal use of the r_iic_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_1;

i2c_master_cfg_t g_i2c_device_cfg_1 =

{

    .channel       = I2C_CHANNEL,

    .rate          = I2C_MASTER_RATE_FAST,

    .slave         = I2C_SLAVE_EEPROM,

    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,

    .p_callback    = i2c_callback,    // Callback

    .p_context    = &g_i2c_device_ctrl_1,
```

```
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void i2c_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IIC_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IIC_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
    {
        __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IIC_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IIC driver can be used to communicate with different slave devices which are on the same channel.

*Note*

*The callback function from the first example applies to this example as well.*

```
iic_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
```

```
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_callback,    // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;

## Function Documentation

### ◆ R_IIC_MASTER_Open()

fsp_err_t R_IIC_MASTER_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the I2C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Set the rate to fast mode plus on a channel which does not support it.<br>5. Invalid IRQ number assigned |

### ◆ R_IIC_MASTER_Read()

fsp_err_t R_IIC_MASTER_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_dest or bytes is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

### ◆ R_IIC_MASTER_Write()

fsp_err_t R_IIC_MASTER_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_IN_USE | Bus busy condition. Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

### ◆ R_IIC_MASTER_Abort()

fsp_err_t R_IIC_MASTER_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IIC peripheral into ready state.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel was reset successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

### ◆ R_IIC_MASTER_SlaveAddressSet()

fsp_err_t R_IIC_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL. |
| FSP_ERR_IN_USE | Another transfer was in-progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

### ◆ R_IIC_MASTER_CallbackSet()

fsp_err_t R_IIC_MASTER_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_IIC_MASTER_StatusGet()

fsp_err_t R_IIC_MASTER_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_IIC_MASTER_Close()

| fsp_err_t R_IIC_MASTER_Close ( i2c_master_ctrl_t *const *p_api_ctrl*) |
|---|
| Closes the I2C device. May power down IIC peripheral. This function will safely terminate any in-progress I2C transfers. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IIC_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

### Detailed Description

Driver for the IICA peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The IICA master on IICA HAL module supports transactions with an IICA slave device. Callbacks must be provided which are invoked when a transmit or receive operation has completed. The callback argument will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- IICA Master Read from a slave device.
- IICA Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.

# Configuration

### Build Time Configurations for r_iica_master

The following build time configurations are defined in fsp_cfg/r_iica_master_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |
| Enable Single Channel | MCU Specific Options | | Enable single channel to reduce code size if only one channel is to be configured for IICA. |

### Configurations for Connectivity > IICA Master (r_iica_master)

This module can be added to the Stacks tab via New Stack > Connectivity > IICA Master (r_iica_master).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid | g_iica_master0 | Module name. |

| | | | |
|---|---|---|---|
| | C symbol | | |
| Channel | Value must be a non-negative integer | 0 | Specify the IICA channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate is printed in a comment in the generated iica_master_extended_cfg_t structure. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000 |
| Signal Rising Time (us) | Must be a valid value | 0 | Set the SDA and SCL signal rising time in micro-seconds. |
| Signal Falling Time (us) | Must be a valid value | 0 | Set the SDA and SCL signal falling time in micro-seconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 53 | Set SCL high duty cycle. |
| Digital Filter | • Enabled<br>• Disabled | Disabled | Configure digital filter. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |
| Slave Address | Value must be a non-negative integer | 0x00 | Specify the slave address. |
| Callback | Name must be a valid | iica_master_callback | A user callback |

| | | |
|---|---|---|
| | C symbol | function must be provided. This will be called from the interrupt service routine (ISR) upon IICA transaction completion reporting the transaction status. |
| Interrupt Priority Level | MCU Specific Options | Select end of IICA communication interrupt priority. |

### Clock Configuration

The IICA peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

### Pin Configuration

The IICA peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An IICA channel would consist of two pins - SDAA and SCLA for data/address and clock respectively.

## Usage Notes

### IICA Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
  - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Multiple Devices on the Bus

- A single IICA instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Multi-Master Support

- If multiple masters are connected on the same bus, the I2C Master is capable of detecting bus busy state before initiating the communication.

### Restart

- IICA master can hold the bus after an I2C transaction by issuing a repeated start

condition.This will mimic a stop followed by start condition.

### Limitations

- DTC not supported.
- Interrupt request is always generated on the falling edge of the 9th clock cycle.
- Master operation in multi-master system is not supported
- Communication reservation function is not supported.

# Examples

### Basic Example

This is a basic example of minimal use of the r_iica_master in an application. This example shows how this driver can be used for basic read and write operations.

```
iica_master_instance_ctrl_t g_i2c_device_ctrl_1;
i2c_master_cfg_t g_i2c_device_cfg_1 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_FAST,
    .slave         = I2C_SLAVE_EEPROM,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_device_ctrl_1,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void iica_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_callback_event = p_args->event;
}
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the IIC module */
    err = R_IICA_MASTER_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
```

```
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IICA_MASTER_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
    {
        __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single IICA driver can be used to communicate with different slave devices which are on the same channel.

*Note*

*The callback function from the first example applies to this example as well.*

```
iica_master_instance_ctrl_t g_i2c_device_ctrl_2;
i2c_master_cfg_t g_i2c_device_cfg_2 =
{
    .channel       = I2C_CHANNEL,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_SLAVE_TEMP_SENSOR,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_device_ctrl_2,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend
};
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_IICA_MASTER_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_IICA_MASTER_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = 0xAA;       // NOLINT
    g_i2c_tx_buffer[1]   = 0xBB;       // NOLINT
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_IICA_MASTER_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
```

```
    }
}
```

## Function Documentation

### ◆ R_IICA_MASTER_Open()

fsp_err_t R_IICA_MASTER_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the IICA device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Invalid IRQ number assigned |

### ◆ R_IICA_MASTER_Read()

fsp_err_t R_IICA_MASTER_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the IICA device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_dest or bytes is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block. |

### ◆ R_IICA_MASTER_Write()

fsp_err_t R_IICA_MASTER_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the IICA device. The caller will be notifieEd when the operation has completed (successfully) by an I2C_MASTER_EVENT_TX_COMPLET in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block. |

### ◆ R_IICA_MASTER_Abort()

fsp_err_t R_IICA_MASTER_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Safely aborts any in-progress transfer and forces the IICA peripheral into ready state.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel was reset successfully. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

### ◆ R_IICA_MASTER_SlaveAddressSet()

fsp_err_t R_IICA_MASTER_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address and addressing mode of the slave device. This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | Pointer to control structure is NULL. |
| FSP_ERR_IN_USE | Another transfer was in-progress. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block. |

### ◆ R_IICA_MASTER_CallbackSet()

fsp_err_t R_IICA_MASTER_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_IICA_MASTER_StatusGet()

fsp_err_t R_IICA_MASTER_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_IICA_MASTER_Close()

fsp_err_t R_IICA_MASTER_Close ( i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the IICA device. May power down IICA peripheral. This function will safely terminate any in-progress IICA transfers.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Handle is not initialized. Call R_IICA_MASTER_Open to initialize the control block. |

***Note***

*A callback will not be invoked in case an in-progress transfer gets aborted by calling this API.*

fsp_err_t R_SAU_I2C_Stop (sau_i2c_instance_ctrl_t *const p_ctrl)

### Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The Simple I2C master on SAU HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.

# Configuration

### Build Time Configurations for r_sau_i2c

The following build time configurations are defined in fsp_cfg/r_sau_i2c_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Critical Section | • Enabled<br>• Disabled | Disabled | Critical section needs to be enabled if multiple channels on the same SAU unit are configured for I2C |
| Manual Start-Stop | • Enabled<br>• Disabled | Disabled | If enabled, users need to manually call the R_SAU_I2C_Start/R_SAU_I2C_Stop functions to generate the I2C start and stop conditions. |
| Enable Single Channel | MCU Specific Options | | Enable single channel to reduce code size if |

| | | | |
|---|---|---|---|
| | | | only one channel is to be configured for SAU I2C. |
| I2C Restart | • Enable<br>• Disable | Enable | Select whether to include code for the I2C restart (repeated start) condition in the build. Set to 'Disable' to reduce code size when all I2C slaves used by all SAU instances do not use I2C restart. |
| DTC Support | • Enable<br>• Disable | Disable | Enable DTC support for the SAU I2C module. |

**Configurations for Connectivity > I2C Master (r_sau_i2c)**

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sau_i2c).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | MCU Specific Options | | Select the SAU channel. |
| Operation clock | • CKm0<br>• CKm1 | CKm0 | Select the I2C operation clock. Use the Clocks tab to set the operation clock divider. |
| Slave Address | Value must be a non-negative integer | 0x00 | Specify the slave address. |
| Rate | • Standard<br>• Fast mode<br>• Fast mode plus | Standard | Select the I2C data rate.<br><br>If the requested rate cannot be achieved, adjust the operation clock frequency until the rate is achievable. The calculated rate is printed in a comment in the generated sau_i2c_extended_cfg_t structure. |
| Delay time (Microseconds) | Value must be a non-negative integer | 5 | Hold SDA (or SCK) for delay time to meet the I2C start (or stop) condition. Needs to be |

| | | | |
|---|---|---|---|
| | | | specified according to slave devices. |
| Callback | Name must be a valid C symbol | sau_i2c_master_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Transfer end interrupt priority | MCU Specific Options | | Select transfer end interrupt priority. This is set for TEI interrupt. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000; Fast-mode plus: up to 1000000 |

**Clock Configuration**

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

**Pin Configuration**

The SAU I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

**Enabling Single Channel By User With The SAU I2C**

- The Common > Single Channel property is used for reducing code size when only 1 SAU channel is to be configured for SAU I2C.
- Single Channel is configurable and disabled by default in the driver code.
- Note: Not all SAU channels are available on all pin layouts. Check the Hardware User Manual for your device to confirm available function assignment for each SAU channel.

### Enabling Start/Stop Condition By User With The SAU I2C

- Manual triggering of I2C start/stop conditions is configurable and disabled by default.
- The delay time between the rising edge of SCL and the rising edge of SDA (stop condition) or the falling edge of SDA and the falling edge of SCL (start condition) is blocking. If blocking in the ISR for the length of the delay time is not suitable for the application, users can decide the appropriate calling time for start/stop conditions by enabling manual triggering and calling R_SAU_I2C_Start/R_SAU_I2C_Stop from the application context.
- When manual triggering is disabled, the driver will generate the stop condition after data transmission from the ISR context.

### Interrupt Configuration

- Transmit end interrupt (TEI) for the selected channel used must be enabled in the properties of the selected device.

### SAU I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and operating clock.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
  - Fast-mode Plus (Fm+) : up to 1 Mbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ] where:

- SDRmn.STCLK is an integer in the range [1, 127] for SAU I2C
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]

percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested bitrate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

### Enabling DTC with the SAU I2C

- DTC transfer support is configurable and is disabled from the build by default. The SAU I2C driver uses a single DTC instance for transmission and reception.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- If DTC is not used by any SAU instance, set Common > DTC Support to disabled to reduce code size.
- For further details on DTC please refer Transfer (r_dtc)

### Multiple Channels Being Used In Same Unit

- When multiple channels on the same SAU unit are used for any serial function (I2C, UART, and/or SPI), then the Common > Enable Critical Section property needs to be set to enabled for all SAU serial drivers.
    - This is because some SAU registers are shared for SAU channels on the same unit. Therefore any read-modify-write operations to those registers must be protected by a critical section.

### I2C Restart Support

- I2C Restart (repeated start) is required by some, but not all slave devices.
- If no slave devices used by any SAU I2C instance require repeated start, then the Common > I2C Restart property can be set to disabled to reduce code size.
- When I2C Restart is disabled, even if restart=true is passed to the read or write APIs, the restart condition is not issued.

### Multiple Devices On The Bus

- A single SAU I2C instance can be used to communicate with multiple slave devices on the same channel by using the R_SAU_I2C_SlaveAddressSet API.

### Limitations

- Overrun error detection is not supported
- SAU I2C does not support clock stretching, I2C slave mode, or arbitration loss detection

## Examples

### Basic Example

This is a basic example of minimal use of the r_sau_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
```

```
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

### Enabling Start/Stop Condition By User

This example demonstrates how to write code for SAU I2C communication when the call start/stop condtion by user is enabled.

```
void manual_trigger_condition_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
```

```
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    err = R_SAU_I2C_Start(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
    err = R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
    err = R_SAU_I2C_Start(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
    err = R_SAU_I2C_Stop(&g_i2c_device_ctrl_1);
    assert(FSP_SUCCESS == err);
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
    {
        __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
        __BKPT(0);
    }
}
```

### Multiple Slave Devices On The Same Channel (Bus)

This example demonstrates how a single SAU I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SAU_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
```

```
    {
        __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_SAU_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1]   = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SAU_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
        timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
        __BKPT(0);
    }
}
```

## Data Structures

| | |
|---|---|
| struct | sau_i2c_clock_settings_t |
| struct | sau_i2c_instance_ctrl_t |
| struct | sau_i2c_extended_cfg_t |

## Enumerations

| | |
|---|---|
| enum | sau_i2c_operation_clock_t |

## Data Structure Documentation

### ◆ sau_i2c_clock_settings_t

| struct sau_i2c_clock_settings_t | | |
|---|---|---|
| I2C clock settings | | |
| Data Fields | | |
| uint8_t | stclk | Bit rate register settings. |
| sau_i2c_operation_clock_t | operation_clock | I2C operating clock select. |

### ◆ sau_i2c_instance_ctrl_t

| struct sau_i2c_instance_ctrl_t | |
|---|---|
| I2C control structure. DO NOT INITIALIZE. | |
| **Data Fields** | |
| i2c_master_cfg_t const * | p_cfg |
| | Pointer to the configuration structure. |
| | |
| uint32_t | open |
| | Flag to determine if the device is open. |
| | |
| R_SAU0_Type * | p_reg |
| | Base register for this channel. |
| | |
| uint8_t * | p_buff |
| | Holds the data associated with the transfer. |
| | |
| uint32_t | total |
| | Holds the total number of data bytes to transfer. |
| | |
| uint32_t | loaded |
| | Tracks the number of data bytes written to the register. |
| | |
| volatile bool | read |
| | Holds the direction of the data byte transfer. |

| | |
|---|---|
| | |
| volatile bool | restart |
| | Holds whether or not the restart should be issued when done. |
| | |
| volatile bool | restarted |
| | Tracks whether or not a restart was issued during the previous transfer. |
| | |
| volatile bool | do_dummy_read |
| | Tracks whether a dummy read is issued on the first RX. |
| | |
| uint8_t | slave |
| | The address of the slave device. |
| | |

### ◆ sau_i2c_extended_cfg_t

| struct sau_i2c_extended_cfg_t | | |
|---|---|---|
| SAU I2C extended configuration | | |
| Data Fields | | |
| sau_i2c_clock_settings_t | clock_settings | I2C clock settings. |
| uint8_t | delay_time | The delay time of the slave device. |
| uint8_t | i2c_unit | The SAU unit corresponding to the selected channel. |

## Enumeration Type Documentation

### ◆ sau_i2c_operation_clock_t

| enum sau_i2c_operation_clock_t | |
|---|---|
| Operation clock | |
| Enumerator | |
| SAU_I2C_MASTER_OPERATION_CLOCK_CK0 | Operating clock select CK0. |
| SAU_I2C_MASTER_OPERATION_CLOCK_CK1 | Operating clock select CK1. |

## Function Documentation

### ◆ R_SAU_I2C_Open()

fsp_err_t R_SAU_I2C_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the SAU device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Clock rate requested is greater than 400KHz<br>5. Invalid IRQ number assigned |

### ◆ R_SAU_I2C_Read()

fsp_err_t R_SAU_I2C_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SAU_I2C_Write()

fsp_err_t R_SAU_I2C_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. The write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SAU_I2C_Abort()

fsp_err_t R_SAU_I2C_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SAU_I2C_SlaveAddressSet()

fsp_err_t R_SAU_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address of the slave device.

This function is used to set the device address of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

### ◆ R_SAU_I2C_CallbackSet()

fsp_err_t R_SAU_I2C_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback.

***Note***

*p_callback_memory is not used in this implementation and can be set to NULL.*

Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_SAU_I2C_StatusGet()

fsp_err_t R_SAU_I2C_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_SAU_I2C_Close()

fsp_err_t R_SAU_I2C_Close ( i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Instance control block is not open. |

### ◆ R_SAU_I2C_Start()

fsp_err_t R_SAU_I2C_Start ( sau_i2c_instance_ctrl_t *const *p_ctrl*)

This function starts/restarts the IIC condition.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Instance control structure. |

### ◆ R_SAU_I2C_Stop()

fsp_err_t R_SAU_I2C_Stop ( sau_i2c_instance_ctrl_t *const *p_ctrl*)

This function stops the IIC condition.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Instance control structure. |

| fsp_err_t | R_SCI_B_I2C_StatusGet (i2c_master_ctrl_t *const p_api_ctrl, i2c_master_status_t *p_status) |
| fsp_err_t | R_SCI_B_I2C_Close (i2c_master_ctrl_t *const p_api_ctrl) |

### Detailed Description

Driver for the SCI_B peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The Simple I2C master on SCI_B HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

# Configuration

### Build Time Configurations for r_sci_b_i2c

The following build time configurations are defined in fsp_cfg/r_sci_b_i2c_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

### Configurations for Connectivity > I2C Master (r_sci_b_i2c)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_b_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | Manual Entry | 0 | Select the SCI channel. |
| Slave Address | Value must be a hex value | 0x00 | Specify the slave address. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the address mode. |
| Rate | • Standard<br>• Fast-mode | Standard | Select the I2C data rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_b_i2c_extended_cfg_t structure. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use |

| | | | |
|---|---|---|---|
| | | | the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000 |
| SDA Output Delay (nano seconds) | Must be a valid non-negative integer with maximum configurable value of 300 | 300 | Specify the SDA output delay in nanoseconds. |
| Noise Filter Clock Select | • The on-chip baud rate generator source clock divided by 1<br>• The on-chip baud rate generator source clock divided by 2<br>• The on-chip baud rate generator source clock divided by 4<br>• The on-chip baud rate generator source clock divided by 8 | The on-chip baud rate generator source clock divided by 1 | Select the on-chip baud rate generator source clock division setting for the digital noise filter |
| Clock Source | MCU Specific Options | | Select the clock source for the SCI I2C module. |
| Bit Rate Modulation | • Enable<br>• Disable | Enable | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |
| Callback | Name must be a valid C symbol | sci_b_i2c_master_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |

| | | |
|---|---|---|
| Interrupt Priority Level | MCU Specific Options | Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts. |
| RX Interrupt Priority Level [Only used when DTC is enabled] | MCU Specific Options | Select the interrupt priority level. This is set for RXI only when DTC is enabled. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA6T2 | PCLKA |
| RA8D1 | PCLKA |
| RA8D2 | PCLKA |
| RA8E1 | PCLKA |
| RA8E2 | PCLKA |
| RA8M1 | PCLKA |
| RA8M2 | PCLKA |
| RA8P1 | PCLKA |
| RA8T1 | PCLKA |
| RA8T2 | PCLKA |

The actual I2C transfer rate can be derived from either SCISPICLK or the peripheral clock (PCLK)[1], and will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the selected clock is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

*Note*

*1. See Figure 26.2 in the RA6T2 manual for more information.*

### Pin Configuration

The SCI_B I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to

different priority levels could result in improper operation.

### SCI_B I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the SCI_B I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI_B I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

### Multiple Devices on the Bus

- A single SCI_B I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Restart

- SCI_B_I2C can hold the the bus after an I2C transaction by issuing a repeated start condition.

# Examples

### Basic Example

This is a basic example of minimal use of the r_sci_b_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
```

```
   err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Write some data to the transmit buffer */
for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
   {
      g_i2c_tx_buffer[i] = (uint8_t) i;
   }
/* Send data to I2C slave */
   g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
   err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
   assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
   {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;
   }
if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
   {
      __BKPT(0);
   }
/* Read data back from the I2C slave */
   g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
   timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
   err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
   assert(FSP_SUCCESS == err);
/* Since there is nothing else to do, block until Callback triggers*/
while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
   {
R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
      timeout_ms--;
```

```
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI_B I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_B_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
```

```
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_SCI_B_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2,
I2C_SLAVE_DISPLAY_ADAPTER, I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1]   = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_B_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

## Function Documentation

### ◆ R_SCI_B_I2C_Open()

fsp_err_t R_SCI_B_I2C_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the I2C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Clock rate requested is greater than 400KHz<br>5. Invalid IRQ number assigned |

### ◆ R_SCI_B_I2C_Read()

fsp_err_t R_SCI_B_I2C_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_B_I2C_Write()

fsp_err_t R_SCI_B_I2C_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_B_I2C_Abort()

fsp_err_t R_SCI_B_I2C_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_B_I2C_SlaveAddressSet()

fsp_err_t R_SCI_B_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

### ◆ R_SCI_B_I2C_CallbackSet()

fsp_err_t R_SCI_B_I2C_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_B_I2C_StatusGet()

fsp_err_t R_SCI_B_I2C_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_SCI_B_I2C_Close()

fsp_err_t R_SCI_B_I2C_Close ( i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the I2C Master Interface.

# Overview

The Simple I2C master on SCI HAL module supports transactions with an I2C Slave device. Callbacks must be provided which would be invoked when a transmission or receive has been completed. The callback arguments will contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100 kHz transaction rate.
  - Fast Mode Support with up to 400 kHz transaction rate.
- SDA Delay in nanoseconds can be specified as a part of the configuration.
- I2C Master Read from a slave device.
- I2C Master Write to a slave device.
- Abort any in-progress transactions.
- Set the address of the slave device.
- Non-blocking behavior is achieved by the use of callbacks.
- Additional build-time features
  - Optional (build time) DTC support for read and write respectively.
  - Optional (build time) support for 10-bit slave addressing.

# Configuration

### Build Time Configurations for r_sci_i2c

The following build time configurations are defined in fsp_cfg/r_sci_i2c_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for |

| | | | |
|---|---|---|---|
| | | | both transmission and reception. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode along with the default 7-bit slave addressing mode. |

**Configurations for Connectivity > I2C Master (r_sci_i2c)**

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Master (r_sci_i2c). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i2c0 | Module name. |
| Channel | Manual Entry | 0 | Select the SCI channel. |
| Slave Address | Value must be a hex value | 0x00 | Specify the slave address. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the address mode. |
| Rate | • Standard<br>• Fast-mode | Standard | Select the I2C data rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate and SDA delay are printed in a comment in the generated sci_i2c_extended_cfg_t structure. |
| Custom Rate (bps) | Value must be a non-negative integer | 0 | Set a custom bitrate (bps). Set to 0 to use the maximum bitrate for the selected mode.<br><br>Standard-mode: up to 100000; Fast-mode: up to 400000 |
| SDA Output Delay | Must be a valid non- | 300 | Specify the SDA output |

| | | | |
|---|---|---|---|
| (nano seconds) | negative integer with maximum configurable value of 300 | | delay in nanoseconds. |
| Noise filter setting | • Use clock signal divided by 1 with noise filter<br>• Use clock signal divided by 2 with noise filter<br>• Use clock signal divided by 4 with noise filter<br>• Use clock signal divided by 8 with noise filter | Use clock signal divided by 1 with noise filter | Select the sampling clock for the digital noise filter |
| Bit Rate Modulation | • Enable<br>• Disable | Enable | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |
| Callback | Name must be a valid C symbol | sci_i2c_master_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Interrupt Priority Level | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI (if used), TEI interrupts. |
| RX Interrupt Priority Level [Only used when DTC is enabled] | MCU Specific Options | | Select the interrupt priority level. This is set for RXI only when DTC is enabled. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA2A1 | PCLKB |

| | |
|---|---|
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA2L2 | PCLKB |
| RA2T1 | PCLKB |
| RA4C1 | PCLKA |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4L1 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate and the SDA delay. If the PCLK is configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

### Pin Configuration

The SCI I2C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel used must be enabled in the properties of the selected device.
- Set equal priority levels for all the interrupts mentioned above. Setting the interrupts to different priority levels could result in improper operation.

### SCI I2C Master Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate and SDA Delay.

  When the Custom Rate setting is set to 0 the bitrate is fixed to the maximum values shown below. Otherwise, the supplied value is used to generate bitrate settings.

  - Standard-mode (Sm) : up to 100 kbps
  - Fast-mode (Fm) : up to 400 kbps
- The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLK settings is calculated and used.
- If a valid clock rate could not be calculated, an error is returned by the tool.

### Enabling DTC with the SCI I2C

- DTC transfer support is configurable and is disabled from the build by default. SCI I2C driver provides two DTC instances for transmission and reception respectively.
- DTC is helpful for minimizing interrupts during large transactions. Many I2C applications have shorter transactions. These applications will likely not see any improvement with DTC. I2C often runs at a much slower speed than the CPU core clock. Some applications with longer transactions may prefer servicing the interrupts at the I2C bitrate to the overhead of bringing in the DTC driver.
- For further details on DTC please refer Transfer (r_dtc)

### Multiple Devices on the Bus

- A single SCI I2C instance can be used to communicate with multiple slave devices on the same channel by using the SlaveAddressSet API.

### Restart

- SCI I2C master can hold the the bus after an I2C transaction by issuing Restart. This will mimic a stop followed by start condition.

## Examples

### Basic Example

This is a basic example of minimal use of the r_sci_i2c in an application. This example shows how this driver can be used for basic read and write operations.

```
void basic_example (void)
{
 fsp_err_t err;
    uint32_t i;
```

```
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
 /* Initialize the I2C module */
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_1, &g_i2c_device_cfg_1);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write some data to the transmit buffer */
 for (i = 0; i < I2C_BUFFER_SIZE_BYTES; i++)
    {
       g_i2c_tx_buffer[i] = (uint8_t) i;
    }
 /* Send data to I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Write(&g_i2c_device_ctrl_1, &g_i2c_tx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Read data back from the I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms          = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_1, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Verify the read data */
 if (0U != memcmp(g_i2c_tx_buffer, g_i2c_rx_buffer, I2C_BUFFER_SIZE_BYTES))
    {
       __BKPT(0);
    }
}
```

### Multiple Slave devices on the same channel (bus)

This example demonstrates how a single SCI I2C driver can be used to communicate with different slave devices which are on the same channel.

```
void single_channel_multi_slave (void)
{
 fsp_err_t err;
    uint32_t timeout_ms = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Open(&g_i2c_device_ctrl_2, &g_i2c_device_cfg_2);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Clear the receive buffer */
    memset(g_i2c_rx_buffer, '0', I2C_BUFFER_SIZE_BYTES);
 /* Read data from I2C slave */
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    err = R_SCI_I2C_Read(&g_i2c_device_ctrl_2, &g_i2c_rx_buffer[0],
I2C_BUFFER_SIZE_BYTES, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_RX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
```

```
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
 /* Send data to I2C slave on the same channel */
    err = R_SCI_I2C_SlaveAddressSet(&g_i2c_device_ctrl_2, I2C_SLAVE_DISPLAY_ADAPTER,
I2C_MASTER_ADDR_MODE_7BIT);
    assert(FSP_SUCCESS == err);
    g_i2c_tx_buffer[0]   = (uint8_t) I2C_EXAMPLE_DATA_1;
    g_i2c_tx_buffer[1]   = (uint8_t) I2C_EXAMPLE_DATA_2;
    g_i2c_callback_event = I2C_MASTER_EVENT_ABORTED;
    timeout_ms           = I2C_TRANSACTION_BUSY_DELAY;
    err = R_SCI_I2C_Write(&g_i2c_device_ctrl_2, &g_i2c_tx_buffer[0], 2U, false);
    assert(FSP_SUCCESS == err);
 while ((I2C_MASTER_EVENT_TX_COMPLETE != g_i2c_callback_event) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
 if (I2C_MASTER_EVENT_ABORTED == g_i2c_callback_event)
    {
       __BKPT(0);
    }
}
```

## Function Documentation

### ◆ R_SCI_I2C_Open()

fsp_err_t R_SCI_I2C_Open ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_cfg_t const *const *p_cfg* )

Opens the I2C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Requested clock rate was set exactly. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Clock rate requested is greater than 400KHz<br>5. Invalid IRQ number assigned |

### ◆ R_SCI_I2C_Read()

fsp_err_t R_SCI_I2C_Read ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart* )

Performs a read from the I2C device. The caller will be notified when the operation has completed (successfully) by an I2C_MASTER_EVENT_RX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl, p_dest is NULL, bytes is 0. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_I2C_Write()

fsp_err_t R_SCI_I2C_Write ( i2c_master_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart* )

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_ctrl, p_src is NULL. |
| FSP_ERR_INVALID_SIZE | Provided number of bytes more than uint16_t size (65535) while DTC is used for data transfer. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_I2C_Abort()

fsp_err_t R_SCI_I2C_Abort ( i2c_master_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transaction was aborted without issue. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

### ◆ R_SCI_I2C_SlaveAddressSet()

fsp_err_t R_SCI_I2C_SlaveAddressSet ( i2c_master_ctrl_t *const *p_api_ctrl*, uint32_t const *slave*, i2c_master_addr_mode_t const *addr_mode* )

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Address of the slave is set correctly. |
| FSP_ERR_ASSERTION | p_ctrl or address is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |
| FSP_ERR_IN_USE | An I2C Transaction is in progress. |

### ◆ R_SCI_I2C_CallbackSet()

fsp_err_t R_SCI_I2C_CallbackSet ( i2c_master_ctrl_t *const *p_api_ctrl*, void(*)(i2c_master_callback_args_t *) *p_callback*, void *const *p_context*, i2c_master_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_master_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_I2C_StatusGet()

fsp_err_t R_SCI_I2C_StatusGet ( i2c_master_ctrl_t *const *p_api_ctrl*, i2c_master_status_t * *p_status* )

Provides driver status.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ R_SCI_I2C_Close()

fsp_err_t R_SCI_I2C_Close ( i2c_master_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed without issue. |
| FSP_ERR_ASSERTION | The parameter p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Device was not even opened. |

## 5.2.6.12 I2C Slave (r_iic_b_slave)

fsp_err_t R_IIC_B_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl)

### Detailed Description

Driver for the IIC/I3C peripheral on RA MCUs. This module implements the I2C Slave Interface.

# Overview

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
  - Optional (build time) DTC support for read and write respectively.

# Configuration

### Build Time Configurations for r_iic_b_slave

The following build time configurations are defined in fsp_cfg/r_iic_b_slave_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |

### Configurations for Connectivity > I2C Slave (r_iic_b_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_b_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Interrupt Priority Level | | | |
| Transmit, Receive, and Transmit End | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts. |
| Error | MCU Specific Options | | Select the interrupt priority level. This is set for ERI interrupt. |
| Name | Name must be a valid C symbol | g_i2c_slave0 | Module name. |
| Channel | Manual Entry | 0 | Specify the IIC channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the delay for the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_b_slave_extended_cfg_t structure. |
| Internal Reference Clock | • I2C Clock / 1<br>• I2C Clock / 2<br>• I2C Clock / 4<br>• I2C Clock / 8<br>• I2C Clock / 16<br>• I2C Clock / 32<br>• I2C Clock / 64<br>• I2C Clock / 128 | I2C Clock / 1 | Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. I2C Clock can be either IICCLK or PCLKD based on the MCU. |
| Digital Noise Filter Stage Select | Refer to the RA Configuration tool for available options. | 3-stage filter | Select the number of digital filter stages for IIC Slave. |
| Slave Address | Value must be non-negative | 0x08 | Specify the slave address. |
| General Call | • Enabled<br>• Disabled | Disabled | Allows the slave to respond to general call address: 0x00. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. |

| | | | |
|---|---|---|---|
| Clock Stretching | • Enabled<br>• Disabled | Disabled | Configure Clock Stretching. |
| Callback | Name must be a valid C symbol | g_iic_b_slave0_callback | A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status. |

### Clock Configuration

The IIC/I3C peripheral module uses the IICCLK or PCLKD (based on the MCU) as its clock source for the bus clock. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the clocks are configured in such a manner that the selected internal rate cannot be achieved, an error will be returned.

### Pin Configuration

The IIC/I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.
  *Note*
  *: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.*
  *: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.*

### Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception: I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed: I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data: I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address: I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes

transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

| IIC Slave Callback Event | IIC Slave API expected to be called |
|---|---|
| I2C_SLAVE_EVENT_ABORTED | Handle event based on application |
| I2C_SLAVE_EVENT_RX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_TX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_RX_REQUEST | R_IIC_B_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_REQUEST | R_IIC_B_SLAVE_Write API |
| I2C_SLAVE_EVENT_RX_MORE_REQUEST | R_IIC_B_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_MORE_REQUEST | R_IIC_B_SLAVE_Write API |
| I2C_SLAVE_EVENT_GENERAL_CALL | R_IIC_B_SLAVE_Read |

- If parameter checking is enabled and R_IIC_B_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_B_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
    - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
    - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

### IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current I2C Clock (IICCLK or PCLKD based on the MCU) settings is calculated and used.

### Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

# Examples

### Basic Example

This is a basic example of minimal use of the R_IIC_B_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_b_master_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel       = I2C_MASTER_CHANNEL_2,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,
    .p_callback    = i2c_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
iic_b_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback = i2c_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};
void i2c_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_master_callback_event = p_args->event;
}
void i2c_slave_callback (i2c_slave_callback_args_t * p_args)
{
    g_i2c_slave_callback_event = p_args->event;
```

```

### Data Structures

| | |
|---|---|
| struct | iic_b_slave_clock_settings_t |
| struct | iic_b_slave_extended_cfg_t |

## Data Structure Documentation

### ◆ iic_b_slave_clock_settings_t

| struct iic_b_slave_clock_settings_t | | |
|---|---|---|
| I2C clock settings | | |
| Data Fields | | |
| uint8_t | cks_value | Internal Reference Clock Select. |
| uint8_t | brl_value | Low-level period of SCL clock. |
| uint8_t | digital_filter_stages | Number of digital filter stages based on brl_value. |

### ◆ iic_b_slave_extended_cfg_t

| struct iic_b_slave_extended_cfg_t | | |
|---|---|---|
| R_IIC_SLAVE extended configuration | | |
| Data Fields | | |
| iic_b_slave_clock_settings_t | clock_settings | I2C Clock settings. |

## Function Documentation

### ◆ R_IIC_B_SLAVE_Open()

fsp_err_t R_IIC_B_SLAVE_Open ( i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg* )

Opens the I2C slave device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | I2C slave device opened successfully. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Set the rate to fast mode plus on a channel which does not support it.<br>5. Invalid IRQ number assigned<br>6. transfer instance in p_cfg is NULL when DTC support enabled |

### ◆ R_IIC_B_SLAVE_Read()

fsp_err_t R_IIC_B_SLAVE_Read ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue |
| FSP_ERR_ASSERTION | p_api_ctrl, bytes or p_dest is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when reading data via DTC. |

### ◆ R_IIC_B_SLAVE_Write()

fsp_err_t R_IIC_B_SLAVE_Write ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when writing data via DTC. |

### ◆ R_IIC_B_SLAVE_CallbackSet()

fsp_err_t R_IIC_B_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_IIC_B_SLAVE_Close()

| fsp_err_t R_IIC_B_SLAVE_Close ( i2c_slave_ctrl_t *const *p_api_ctrl*) |
|---|
| Closes the I2C device.<br><br>**Return values**<br>FSP_SUCCESS — Device closed successfully.<br>FSP_ERR_NOT_OPEN — Device not opened.<br>FSP_ERR_ASSERTION — p_api_ctrl is NULL. |

### Detailed Description

Driver for the IIC peripheral on RA MCUs. This module implements the I2C Slave Interface.

# Overview

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.

- Write data which is read by master device.
- Can accept 0x00 as slave address.
- Can be assigned a 10-bit address.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- I2C Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.
- Additional build-time features:
    - Optional (build time) DTC support for read and write respectively.

# Configuration

### Build Time Configurations for r_iic_slave

The following build time configurations are defined in fsp_cfg/r_iic_slave_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC on Transmission and Reception | • Enabled<br>• Disabled | Disabled | If enabled, DTC instances will be included in the build for both transmission and reception. |

### Configurations for Connectivity > I2C Slave (r_iic_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > I2C Slave (r_iic_slave). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupt Priority Level | | | |
| Transmit, Receive, and Transmit End | MCU Specific Options | | Select the interrupt priority level. This is set for TXI, RXI, and TEI interrupts. |
| Error | MCU Specific Options | | Select the interrupt priority level. This is set for ERI interrupt. |
| Name | Name must be a valid C symbol | g_i2c_slave0 | Module name. |
| Channel | Manual Entry | 0 | Specify the IIC channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the delay for the |

| | | | |
|---|---|---|---|
| | | | requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated delay is printed in a comment in the generated iic_slave_extended_cfg_t structure. |
| Internal Reference Clock | • PCLKB / 1<br>• PCLKB / 2<br>• PCLKB / 4<br>• PCLKB / 8<br>• PCLKB / 16<br>• PCLKB / 32<br>• PCLKB / 64<br>• PCLKB / 128 | PCLKB / 1 | Select the internal reference clock for IIC slave. The internal reference clock is used only to determine the clock frequency of the noise filter samples. |
| Digital Noise Filter Stage Select | • Disabled<br>• Single-stage filter<br>• 2-stage filter<br>• 3-stage filter<br>• 4-stage filter | 3-stage filter | Select the number of digital filter stages for IIC Slave. |
| Slave Address | Value must be non-negative | 0x08 | Specify the slave address. |
| General Call | • Enabled<br>• Disabled | Disabled | Allows the slave to respond to general call address: 0x00. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. |
| Clock Stretching | • Enabled<br>• Disabled | Disabled | Configure Clock Stretching. |
| Callback | Name must be a valid C symbol | NULL | A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report I2C Slave transaction events and status. |

### Clock Configuration

The IIC peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

### Pin Configuration

The IIC peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I2C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- The IIC error (EEI), receive buffer full (RXI), transmit buffer empty (TXI) and transmit end (TEI) interrupts for the selected channel must be enabled in the properties of the selected device.
- The interrupt priority of ERI can be set higher than or equal to the interrupt priorities of RXI, TXI and TEI.
  *Note*
  *: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received, a higher priority ERI will ensure that the ongoing transaction is completed (by accepting the Stop/Restart condition from the master) before the next transaction is initiated.*
  *: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.*

### Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception:
    I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed:
    I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data:
    I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
  - An I2C Master initiates a general call by passing 0x00 as slave address:
    I2C_SLAVE_EVENT_GENERAL_CALL
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IIC slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

| IIC Slave Callback Event | IIC Slave API expected to be called |
|---|---|
| I2C_SLAVE_EVENT_ABORTED | Handle event based on application |
| I2C_SLAVE_EVENT_RX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_TX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_RX_REQUEST | R_IIC_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_REQUEST | R_IIC_SLAVE_Write API |

| | |
|---|---|
| I2C_SLAVE_EVENT_RX_MORE_REQUEST | R_IIC_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_MORE_REQUEST | R_IIC_SLAVE_Write API |
| I2C_SLAVE_EVENT_GENERAL_CALL | R_IIC_SLAVE_Read |

- If parameter checking is enabled and R_IIC_SLAVE_Read API is not called for I2C_SLAVE_EVENT_RX_REQUEST and/or I2C_SLAVE_EVENT_RX_MORE_REQUEST, the slave will send a NACK to the master and would eventually timeout.
- R_IIC_SLAVE_Write API is not called for I2C_SLAVE_EVENT_TX_REQUEST and/or I2C_SLAVE_EVENT_TX_MORE_REQUEST:
  - Slave timeout is less than Master timeout: The slave will timeout and release the bus causing the master to read 0xFF for every remaining byte.
  - Slave timeout is more than Master timeout: The master will timeout first followed by the slave.

### IIC Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

### Limitations

- When 'Clock Stretching' configuration is enabled, the receive operation will not utilize the double buffer arrangement in hardware for a continuous read. This means that the read operation would happen in single byte units such that the active master would send the next byte only when the slave has read the current byte of data.
- When DTC is enabled, the clock frequency supply for DTC must be configured greater than the "Internal Reference Clock" of the slave.

## Examples

### Basic Example

This is a basic example of minimal use of the R_IIC_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
iic_master_instance_ctrl_t g_i2c_master_ctrl;

i2c_master_cfg_t g_i2c_master_cfg =

{

    .channel       = I2C_MASTER_CHANNEL_2,

    .rate          = I2C_MASTER_RATE_STANDARD,

    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,

    .addr_mode    = I2C_MASTER_ADDR_MODE_7BIT,

    .p_callback    = i2c_master_callback, // Callback

    .p_context    = &g_i2c_master_ctrl,
```

```
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
iic_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .addr_mode = I2C_SLAVE_ADDR_MODE_7BIT,
    .p_callback = i2c_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};
void i2c_master_callback (i2c_master_callback_args_t * p_args)
{
    g_i2c_master_callback_event = p_args->event;
}
void i2c_slave_callback (i2c_slave_callback_args_t * p_args)
{
    g_i2c_slave_callback_event = p_args->event;
 if ((p_args->event == I2C_SLAVE_EVENT_RX_COMPLETE) || (p_args->event ==
I2C_SLAVE_EVENT_TX_COMPLETE))
    {
 /* Transaction Successful */
    }
 else if ((p_args->event == I2C_SLAVE_EVENT_RX_REQUEST) || (p_args->event ==

| iic_slave_clock_settings_t | clock_settings | I2C Clock settings. |

### Function Documentation

#### ◆ R_IIC_SLAVE_Open()

fsp_err_t R_IIC_SLAVE_Open ( i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg* )

Opens the I2C slave device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | I2C slave device opened successfully. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_INVALID_ARGUMENT | Error interrupt priority is lower than Transmit, Receive and Transmit End interrupt priority |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Set the rate to fast mode plus on a channel which does not support it.<br>5. Invalid IRQ number assigned<br>6. transfer instance in p_cfg is NULL when DTC support enabled |

### ◆ R_IIC_SLAVE_Read()

fsp_err_t R_IIC_SLAVE_Read ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue |
| FSP_ERR_ASSERTION | p_api_ctrl, bytes or p_dest is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when reading data via DTC. |

### ◆ R_IIC_SLAVE_Write()

fsp_err_t R_IIC_SLAVE_Write ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |
| FSP_ERR_INVALID_SIZE | Invalid size when writing data via DTC. |

### ◆ R_IIC_SLAVE_CallbackSet()

fsp_err_t R_IIC_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_IIC_SLAVE_Close()

fsp_err_t R_IIC_SLAVE_Close ( i2c_slave_ctrl_t *const *p_api_ctrl*)

Closes the I2C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_NOT_OPEN | Device not opened. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |

| fsp_err_t | R_IICA_SLAVE_Close (i2c_slave_ctrl_t *const p_api_ctrl) |

### Detailed Description

Driver for the IICA peripheral on RA MCUs. This module implements the I2C Slave Interface.

# Overview

### Features

- Supports multiple transmission rates
  - Standard Mode Support with up to 100-kHz transaction rate.
  - Fast Mode Support with up to 400-kHz transaction rate.
  - Fast Mode Plus Support with up to 1-MHz transaction rate.
- Reads data written by master device.
- Write data which is read by master device.
- Clock stretching is supported and can be implemented via callbacks.
- Provides Transmission/Reception transaction size in the callback.
- IICA Slave can notify the following events via callbacks: Transmission/Reception Request, Transmission/Reception Request for more data, Transmission/Reception Completion, Error Condition.

# Configuration

### Build Time Configurations for r_iica_slave

The following build time configurations are defined in fsp_cfg/r_iica_slave_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| 10-bit slave addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support 10-bit slave addressing mode. |
| General call addressing | • Enabled<br>• Disabled | Disabled | If enabled, the driver will support general call slave addressing mode along with the non-general call slave addressing mode. |
| Enable Single Channel | MCU Specific Options | | Enable single channel to reduce code size if only one channel is to be configured for IICA. |

### Configurations for Connectivity > IICA Slave (r_iica_slave)

This module can be added to the Stacks tab via New Stack > Connectivity > IICA Slave (r_iica_slave).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_iica_slave0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the IICA channel. |
| Rate | • Standard<br>• Fast-mode<br>• Fast-mode plus | Standard | Select the transfer rate.<br><br>If the requested transfer rate cannot be achieved, the settings with the largest possible transfer rate that is less than or equal to the requested transfer rate are used. The theoretical calculated transfer rate is printed in a comment in the generated iica_slave_extended_cfg_t structure. |
| Internal Reference Clock | • PCLKB / 1<br>• PCLKB / 2 | PCLKB / 1 | Select the internal reference clock for IICA slave. |
| Signal Rising Time (us) | Must be a valid value | 0 | Set the SDA and SCL signal rising time in micro-seconds. |
| Signal Falling Time (us) | Must be a valid value | 0 | Set the SDA and SCL signal falling time in micro-seconds. |
| Duty Cycle (%) | Value must be an integer between 0 and 100 | 53 | Set SCL high duty cycle. |
| Digital Filter | • Enabled<br>• Disabled | Disabled | Configure digital filter. |
| Address Mode | • 7-Bit<br>• 10-Bit | 7-Bit | Select the slave address mode. Ensure 10-bit slave addressing is enabled in the configuration to use 10-Bit setting here. |
| Slave Address | Value must be non-negative | 0x08 | Specify the slave address. |

| | | | |
|---|---|---|---|
| Callback | Name must be a valid C symbol | iica_slave_callback | A user callback function must be provided. This will be called from the interrupt service routine (ISR) to report IICA Slave transaction events and status. |
| Interrupt Priority Level | MCU Specific Options | | Select end of IICA communication interrupt priority. |

### Clock Configuration

The IICA peripheral module uses the PCLKB as its clock source. The actual I2C transfer rate will be calculated and set by the tooling depending on the selected transfer rate. If the PCLKB is configured in such a manner that the selected transfer rate cannot be achieved, an error will be returned.

### Pin Configuration

The IICA peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An IICA channel would consist of two pins - SDAA and SCLA for data/address and clock respectively.

# Usage Notes

### Interrupt Configuration

- IICA0 communication interrupt must be enabled in the properties of the selected device.
  *Note*
  *: During master-write slave-read type of operations if the slave device requires to perform clock stretching after the last data byte is received.*
  *: To support clock stretching (Holding SCL low after the falling edge of the 9th clock cycle), 'Clock Stretching' configuration must be enabled.*

### Callback

- A callback function must be provided which will be invoked for the cases below:
  - An I2C Master initiates a transmission or reception: I2C_SLAVE_EVENT_TX_REQUEST; I2C_SLAVE_EVENT_RX_REQUEST
  - A Transmission or reception has been completed: I2C_SLAVE_EVENT_TX_COMPLETE; I2C_SLAVE_EVENT_RX_COMPLETE
  - An I2C Master is requesting to read or write more data: I2C_SLAVE_EVENT_TX_MORE_REQUEST; I2C_SLAVE_EVENT_RX_MORE_REQUEST
  - Error conditions: I2C_SLAVE_EVENT_ABORTED
- The callback arguments will contain information about the transaction status/events, bytes transferred and a pointer to the user defined context.
- Clock stretching is enabled by the use of callbacks. This means that the IICA slave can hold the clock line SCL LOW to force the I2C Master into a wait state.
- The table below shows I2C Slave event handling expected in user code:

| | |
|---|---|

| IICA Slave Callback Event | IICA Slave API expected to be called |
|---|---|
| I2C_SLAVE_EVENT_ABORTED | Handle event based on application |
| I2C_SLAVE_EVENT_RX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_TX_COMPLETE | Handle event based on application |
| I2C_SLAVE_EVENT_RX_REQUEST | R_IICA_SLAVE_Read API. If the slave is a Write Only device call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_REQUEST | R_IICA_SLAVE_Write API |
| I2C_SLAVE_EVENT_RX_MORE_REQUEST | R_IICA_SLAVE_Read API. If the slave cannot read any more data call this API with 0 bytes to send a NACK to the master. |
| I2C_SLAVE_EVENT_TX_MORE_REQUEST | R_IICA_SLAVE_Write API |

### IICA Slave Rate Calculation

- The RA Configuration editor calculates the internal baud-rate setting based on the configured transfer rate. The closest possible baud-rate that can be achieved (less than or equal to the requested rate) at the current PCLKB settings is calculated and used.

### Limitations

- DTC doesn't support IICA
- Extension code is not supported

## Examples

### Basic Example

This is a basic example of minimal use of the R_IICA_SLAVE in an application. This example shows how this driver can be used for basic read and write operations.

```
sau_i2c_instance_ctrl_t g_i2c_master_ctrl;
i2c_master_cfg_t g_i2c_master_cfg =
{
    .channel       = I2C_MASTER_CHANNEL_20,
    .rate          = I2C_MASTER_RATE_STANDARD,
    .slave         = I2C_7BIT_ADDR_IIC_SLAVE,
    .p_callback    = iica_master_callback, // Callback
    .p_context    = &g_i2c_master_ctrl,
    .p_transfer_tx = NULL,
    .p_transfer_rx = NULL,
    .p_extend      = &g_iic_master_cfg_extend_standard_mode
};
```

```
iica_slave_instance_ctrl_t g_i2c_slave_ctrl;
i2c_slave_cfg_t g_i2c_slave_cfg =
{
    .channel    = I2C_SLAVE_CHANNEL_0,
    .rate       = I2C_SLAVE_RATE_STANDARD,
    .slave      = I2C_7BIT_ADDR_IIC_SLAVE,
    .p_callback = iica_slave_callback, // Callback
    .p_context = &g_i2c_slave_ctrl,
    .p_extend   = &g_iic_slave_cfg_extend_standard_mode
};

## Function Documentation

### ◆ R_IICA_SLAVE_Open()

fsp_err_t R_IICA_SLAVE_Open ( i2c_slave_ctrl_t *const *p_api_ctrl*, i2c_slave_cfg_t const *const *p_cfg* )

Opens the IICA slave device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | IICA slave device opened successfully. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel is not available on this MCU. |
| FSP_ERR_ASSERTION | Parameter check failure due to one or more reasons below:<br>1. p_api_ctrl or p_cfg is NULL.<br>2. extended parameter is NULL.<br>3. Callback parameter is NULL.<br>4. Invalid IRQ number assigned |

### ◆ R_IICA_SLAVE_Read()

fsp_err_t R_IICA_SLAVE_Read ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the IICA Master device.

This function will fail if there is already an in-progress IICA transfer on the associated channel. Otherwise, the IICA slave read operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_RX_COMPLETE in the callback. In case the master continues to write more data, an I2C_SLAVE_EVENT_RX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue |
| FSP_ERR_ASSERTION | p_api_ctrl, bytes or p_dest is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |

### ◆ R_IICA_SLAVE_Write()

fsp_err_t R_IICA_SLAVE_Write ( i2c_slave_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the IICA Master device.

This function will fail if there is already an in-progress IICA transfer on the associated channel. Otherwise, the IICA slave write operation will begin. The caller will be notified when the operation has finished by an I2C_SLAVE_EVENT_TX_COMPLETE in the callback. In case the master continues to read more data, an I2C_SLAVE_EVENT_TX_MORE_REQUEST will be issued via callback. In case of errors, an I2C_SLAVE_EVENT_ABORTED will be issued via callback.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function executed without issue. |
| FSP_ERR_ASSERTION | p_api_ctrl or p_src is NULL. |
| FSP_ERR_IN_USE | Another transfer was in progress. |
| FSP_ERR_NOT_OPEN | Device is not open. |

### ◆ R_IICA_SLAVE_CallbackSet()

fsp_err_t R_IICA_SLAVE_CallbackSet ( i2c_slave_ctrl_t *const *p_api_ctrl*, void(*)(i2c_slave_callback_args_t *) *p_callback*, void *const *p_context*, i2c_slave_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements i2c_slave_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_IICA_SLAVE_Close()

fsp_err_t R_IICA_SLAVE_Close ( i2c_slave_ctrl_t *const *p_api_ctrl*)

Closes the IICA device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_NOT_OPEN | Device not opened. |
| FSP_ERR_ASSERTION | p_api_ctrl is NULL. |

### Detailed Description

Driver for the SSIE peripheral on RA MCUs. This module implements the I2S Interface.

# Overview

### Features

The SSI module supports the following features:

- Transmission and reception of uncompressed audio data using the standard I2S protocol in master and slave modes
- Full-duplex I2S communication (channel 0 only)
- Integration with the DTC transfer module
- Internal connection to GPT timer output to generate the audio clock
- Callback function notification when all data is loaded into the SSI FIFO

# Configuration

### Build Time Configurations for r_ssi

The following build time configurations are defined in fsp_cfg/r_ssi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | • Enabled<br>• Disabled | Enabled | If code for DTC transfer support is included in the build. |

### Configurations for Connectivity > I2S (r_ssi)

This module can be added to the Stacks tab via New Stack > Connectivity > I2S (r_ssi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i2s0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Specify the I2S channel. |
| Operating Mode (Master/Slave) | • Master Mode<br>• Slave Mode | Master Mode | Select if the MCU is I2S master or slave. |
| Bit Depth | • 8 Bits<br>• 16 Bits<br>• 18 Bits<br>• 20 Bits<br>• 22 Bits<br>• 24 Bits<br>• 32 Bits | 16 Bits | Select the bit depth of one sample of audio data. |

| | | | |
|---|---|---|---|
| Word Length | • 8 Bits<br>• 16 Bits<br>• 24 Bits<br>• 32 Bits<br>• 48 Bits<br>• 64 Bits<br>• 128 Bits<br>• 256 Bits | 16 Bits | Select the word length of audio data. Must be at least as large as Data bits. |
| WS Continue Mode | • Enabled<br>• Disabled | Disabled | Enable WS continue mode to output the word select (WS) pin even when transmission is idle. |
| Bit Clock Source(available only in Master mode) | MCU Specific Options | | Select External AUDIO_CLK for external signal to AUDIO_CLK input pin or Internal AUDIO_CLK for internal connection to MCU specific GPT channel. Please refer to the hardware manual for which GPT channel is connected to the internal signal |
| Bit Clock Divider(available only in Master mode) | Refer to the RA Configuration tool for available options. | Audio Clock / 1 | Select divider used to generate bit clock from audio clock. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called from all three interrupt service routines (ISR). |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Idle/Error Interrupt Priority | MCU Specific Options | | Select the Idle/Error interrupt priority. |

### Clock Configuration

The SSI peripheral runs on PCLKB. The PCLKB frequency can be configured on the **Clocks** tab of the RA Configuration editor. The SSI audio clock can optionally be supplied from an external source through the AUDIO_CLK pin in master mode.

### Pin Configuration

The SSI uses the following pins:

- AUDIO_CLK (optional, master mode only): The AUDIO_CLK pin is used to supply the audio clock from an external source.
- SSIBCKn: Bit clock pin for channel n
- SSILRCKn/SSIFSn: Channel selection pin for channel n
- SSIRXD0: Reception pin for channel 0
- SSITXD0: Transmission pin for channel 0
- SSIDATA1: Transmission or reception pin for channel 1

# Usage Notes

### SSI Frames

An SSI frame is 2 samples worth of data. The frame boundary (end of previous frame, start of next frame) is on the falling edge of the SSILRCKn signal.

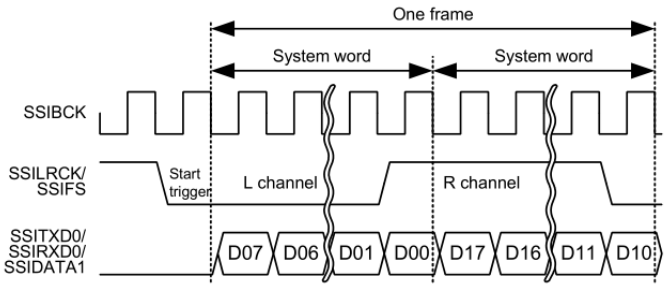

Figure 221: SSI Frame Diagram (8-bit word, 8-bit samples)

*Note*

*If the word length is longer than the sample bit depth, padding bits (0) will be added after the sample.*

### Audio Data

Only uncompressed PCM data is supported.

Data arrays have the following size, alignment, and length based on the "Bit Depth" setting:

| Bit Depth | Array Data Type | Required Alignment | Required Length (bytes) |
|---|---|---|---|
| 8 Bits | 8-bit integer | 1 byte alignment | Multiple of 2 |
| 16 Bits | 16-bit integer | 2 byte alignment | Multiple of 4 |
| 18 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 20 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 22 Bits | 32-bit integer, right justified | 4 byte alignment | Multiple of 8 |
| 24 Bits | 32-bit integer, right | 4 byte alignment | Multiple of 8 |

| | | | |
|---|---|---|---|
| | justified | | |
| 32 Bits | 32-bit integer | 4 byte alignment | Multiple of 8 |

*Note*

*The length of the array must be a multiple of 2 when the data type is the recommended data type. The 2 represents the frame size (left and right channel) of I2S communication. The SSIE peripheral does not support odd read/write lengths in I2S mode.*

### Audio Clock

The audio clock is only required for master mode.

### Audio Clock Frequency

The bit clock frequency is the product of the sampling frequency and channels and bits per system word:

bit_clock (Hz) = sampling_frequency (Hz) * channels * system_word_bits

I2S data always has 2 channels.

For example, the bit clock for transmitting 2 channels of 16-bit data (using a 16-bit system word) at 44100 Hz would be:

44100 * 2 * 16 = 1,411,200 Hz

The audio clock frequency is used to generate the bit clock frequency. It must be a multiple of the bit clock frequency. Refer to the Bit Clock Divider configuration for divider options. The input audio clock frequency must be:

audio_clock (Hz) = desired_bit_clock (Hz) * bit_clock_divider

To get a bit clock of 1.4 MHz from an audio clock of 2.8 MHz, select the divider Audio Clock / 2.

### Audio Clock Source

The audio clock source can come from:

- An external source input to the AUDIO_CLK pin
- An internal connection to the GPT timer output

*Note*

*When using the internal GPT timer output, Pin Output Support must be Enabled, and GTIOCA Output Enabled must be True.*
*See the SSIE section in the MCU hardware manual for information about which GPT channel may be used.*

### Limitations

Developers should be aware of the following limitations when using the SSI:

- When using channel 1, full duplex communication is not possible. Only tranmission or reception is possible.
- SSI must go idle before changing the communication mode (between read only, write only, and full duplex)

# Examples

### Basic Example

This is a basic example of minimal use of the SSI in an application.

```
#define SSI_EXAMPLE_SAMPLES_TO_TRANSFER (1024)
#define SSI_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t g_src[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
int16_t g_dest[SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
void ssi_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Create a stereo sine wave. Using formula sample = sin(2 * pi * tone_frequency * t
/ sampling_frequency) */
    uint32_t freq = SSI_EXAMPLE_TONE_FREQUENCY_HZ;
 for (uint32_t t = 0; t < SSI_EXAMPLE_SAMPLES_TO_TRANSFER / 2; t += 1)
    {
 float input = (((float) (freq * t)) * (float) (M_TWOPI)) /
SSI_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ;
       g_src[2 * t]    = (int16_t) ((INT16_MAX * sinf(input)));
       g_src[2 * t + 1] = (int16_t) ((INT16_MAX * sinf(input)));
    }
 /* Initialize the module. */
    err = R_SSI_Open(&g_i2s_ctrl, &g_i2s_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Transfer data. */
    (void) R_SSI_WriteRead(&g_i2s_ctrl,
                           (uint8_t *) &g_src[0],
                           (uint8_t *) &g_dest[0],
                           SSI_EXAMPLE_SAMPLES_TO_TRANSFER * sizeof(int16_t));
}
```

### Streaming Example

This is an example of using SSI to stream audio data. This application uses a double buffer to store

PCM sine wave data. It starts transmitting in the main loop, then loads the next buffer if it is ready in the callback. If the next buffer is not ready, a flag is set in the callback so the application knows to restart transmission in the main loop.

This example also checks the return code of R_SSI_Write() because R_SSI_Write() can return an error if a transmit overflow occurs before the FIFO is reloaded. If a transmit overflow occurs before the FIFO is reloaded, the SSI will be stopped in the error interrupt, and it cannot be restarted until the I2S_EVENT_IDLE callback is received.

```
#define SSI_STREAMING_EXAMPLE_AUDIO_SAMPLING_FREQUENCY_HZ (22050)
#define SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK (1024)
#define SSI_STREAMING_EXAMPLE_TONE_FREQUENCY_HZ (800)
int16_t       g_stream_src[2][SSI_EXAMPLE_SAMPLES_TO_TRANSFER];
uint32_t      g_buffer_index          = 0;
volatile bool g_send_data_in_main_loop = true;
volatile bool g_data_ready = false;
/* Example callback called when SSI is ready for more data. */
void ssi_example_callback (i2s_callback_args_t * p_args)
{
 /* Reload the FIFO if we hit the transmit watermark or restart transmission if the
SSI is idle because it was
  * stopped after a transmit FIFO overflow. */
 if ((I2S_EVENT_TX_EMPTY == p_args->event) || (I2S_EVENT_IDLE == p_args->event))
    {
 if (g_data_ready)
      {
 /* Reload FIFO and handle errors. */
            ssi_example_write();
      }
 else
      {
 /* Data was not ready yet, send it in the main loop. */
            g_send_data_in_main_loop = true;
      }
    }
}
/* Load the transmit FIFO and check for error conditions. */
void ssi_example_write (void)
```

```
{
 /* Transfer data. This call is non-blocking. */
 fsp_err_t err = R_SSI_Write(&g_i2s_ctrl,
                             (uint8_t *) &g_stream_src[g_buffer_index][0],
                             SSI_STREAMING_EXAMPLE_SAMPLES_PER_CHUNK * sizeof
(int16_t));
 if (FSP_SUCCESS == err)
    {
 /* Switch the buffer after data is sent. */
       g_buffer_index = !g_buffer_index;
 /* Allow loop to calculate next buffer only if transmission was successful. */
       g_data_ready = false;
    }
 else
    {
 /* Getting here most likely means a transmit overflow occurred before the FIFO could
be reloaded. The
  * application must wait until the SSI is idle, then restart transmission. In this
example, the idle
  * callback transmits data or resets the flag g_send_data_in_main_loop. */
    }
}
/* Calculate samples. This example is just a sine wave. For this type of data, it
would be better to calculate
 * one period and loop it. This example should be updated for the audio data used by
the application. */
void ssi_example_calculate_samples (uint32_t buffer_index)
{

## Function Documentation

### ◆ R_SSI_Open()

fsp_err_t R_SSI_Open ( i2s_ctrl_t *const *p_ctrl*, i2s_cfg_t const *const *p_cfg* )

Opens the SSI. Implements i2s_api_t::open.

This function sets this clock divisor and the configurations specified in i2s_cfg_t. It also opens the timer and transfer instances if they are provided.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Ready for I2S communication. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl or p_cfg is null. |
| FSP_ERR_ALREADY_OPEN | The control block has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | Channel number is not available on this MCU. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

### ◆ R_SSI_Write()

fsp_err_t R_SSI_Write ( i2s_ctrl_t *const *p_ctrl*, void const *const *p_src*, uint32_t const *bytes* )

Writes data buffer to SSI. Implements i2s_api_t::write.

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

Write() cannot be called if another write(), read() or writeRead() operation is in progress. Write can be called when the SSI is idle, or after the I2S_EVENT_TX_EMPTY event.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write initiated successfully. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl or p_src was null, or bytes requested was 0. |
| FSP_ERR_IN_USE | Another transfer is in progress, data was not written. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_UNDERFLOW | A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

### ◆ R_SSI_Read()

fsp_err_t R_SSI_Read ( i2s_ctrl_t *const *p_ctrl*, void *const *p_dest*, uint32_t const *bytes* )

Reads data into provided buffer. Implements i2s_api_t::read.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read initiated successfully. |
| FSP_ERR_IN_USE | Peripheral is in the wrong mode or not idle. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl or p_dest was null, or bytes requested was 0. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_OVERFLOW | A receive overflow error is pending. Wait for the SSI to go idle before resuming communication. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

### ◆ R_SSI_WriteRead()

fsp_err_t R_SSI_WriteRead ( i2s_ctrl_t *const *p_ctrl*, void const *const *p_src*, void *const *p_dest*, uint32_t const *bytes* )

Writes from source buffer and reads data into destination buffer. Implements i2s_api_t::writeRead.

This function calls R_SSI_Write and R_SSI_Read.

writeRead() cannot be called if another write(), read() or writeRead() operation is in progress. writeRead() can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write and read initiated successfully. |
| FSP_ERR_IN_USE | Peripheral is in the wrong mode or not idle. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |
| FSP_ERR_UNDERFLOW | A transmit underflow error is pending. Wait for the SSI to go idle before resuming communication. |
| FSP_ERR_OVERFLOW | A receive overflow error is pending. Wait for the SSI to go idle before resuming communication. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- transfer_api_t::reset

### ◆ R_SSI_Stop()

fsp_err_t R_SSI_Stop ( i2s_ctrl_t *const *p_ctrl*)

Stops SSI. Implements i2s_api_t::stop.

This function disables both transmission and reception, and disables any transfer instances used.

The SSI will stop on the next frame boundary. Do not restart SSI until it is idle.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | I2S communication stop request issued. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

**Returns**

See Common Error Codes or lower level drivers for other possible return codes.

### ◆ R_SSI_Mute()

fsp_err_t R_SSI_Mute ( i2s_ctrl_t *const *p_ctrl*, i2s_mute_t const *mute_enable* )

Mutes SSI on the next frame boundary. Implements i2s_api_t::mute.

Data is still written while mute is enabled, but the transmit line outputs zeros.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transmission is muted. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

### ◆ R_SSI_StatusGet()

fsp_err_t R_SSI_StatusGet ( i2s_ctrl_t *const *p_ctrl*, i2s_status_t *const *p_status* )

Gets SSI status and stores it in provided pointer p_status. Implements i2s_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored successfully. |
| FSP_ERR_ASSERTION | The p_instance_ctrl or p_status parameter was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

### ◆ R_SSI_Close()

fsp_err_t R_SSI_Close ( i2s_ctrl_t *const *p_ctrl*)

Closes SSI. Implements i2s_api_t::close.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Device closed successfully. |
| FSP_ERR_ASSERTION | The pointer to p_ctrl was null. |
| FSP_ERR_NOT_OPEN | The channel is not opened. |

### ◆ R_SSI_CallbackSet()

| fsp_err_t R_SSI_CallbackSet ( i2s_ctrl_t *const *p_api_ctrl*, void(*)(i2s_callback_args_t *) *p_callback*, void *const *p_context*, i2s_callback_args_t *const *p_callback_memory* ) |
|---|
| Updates the user callback and has option of providing memory for callback structure. Implements i2s_api_t::callbackSet |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### Detailed Description

Driver for the I3C peripheral on RA MCUs. This module implements the I3C Interface.

# Overview

I3C is a communication protocol defined by MIPI that aims to improve on I2C by increasing the maximum transfer rate, as well as providing other features like "In-band Interrupts", "Dynamic Address Assignment", and a set of standard "Common Command Codes".

### Features

- I3C Master Mode
- I3C Slave Mode
- Dynamic Address Assignment (ENTDAA/SETDASA)
- SDR Read/Write transfers
- HDR-DDR Read/Write Commands
- I2C Legacy Read/Write transfers
- In-Band Interrupts (Interrupt Requests, Hot-Join Requests)
- Common Command Codes
- Clock Stalling
- Timeout Detection

# Master Mode

On an I3C bus, only one device may operate in master mode at a time. The current master is responsible for initiating I2C Legacy transfers, SDR transfers, Common Command Codes, and handling IBIs (Interrupt Requests, Hot-Join Requests). In order to perform these operations, the driver has an internal device table that is used for storing configuration information for each device on the bus (See i3c_device_table_cfg_t). Each entry in the device table contains the static or dynamic address of the device, and IBI permissions for accepting or rejecting IBI requests from the device. The device table has a limited number of entries as well as one extended device entry that only contains the static or dynamic address of a device (See below).

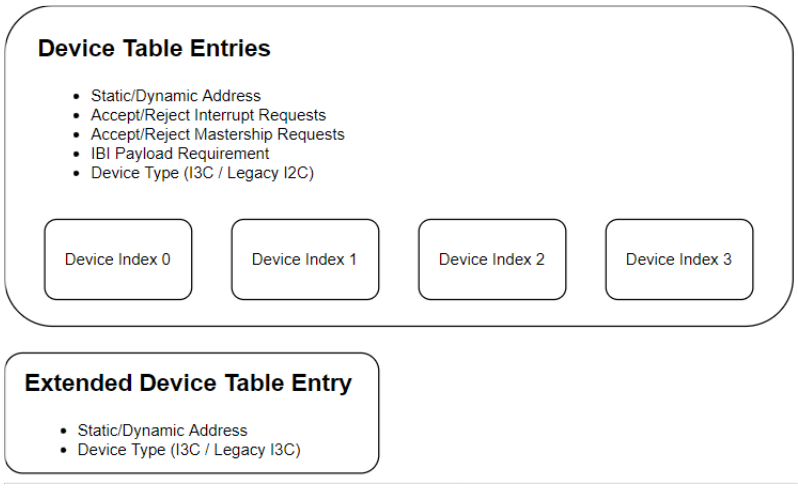

Figure 222: Master Device Table

In order to initiate I2C Legacy transfers, SDR transfers, or Common Command Codes, the master must select a device entry from the device table using i3c_api_t::deviceSelect. Once a device has been selected, all subsequent operations will be directed to the selected device until a new device is selected using i3c_api_t::deviceSelect.

The master may also receive IBI requests that are initiated by slave devices on the bus. If there is a payload, then the driver will write the data into a buffer that is provided by the application by calling i3c_api_t::ibiRead. If the application has not provided an IBI buffer prior to receiving an IBI, then the it will get a callback requesting an IBI buffer. Once the IBI is completed, the application will be notified by a callback.

*Note*

*1. Even though there are only a limited number of device table entries and one extended device table entry, the application can operate on more devices by maintaining its own list of devices and updating the extended device entry as needed. Note however that devices defined in the extended device table entry will not be able to initiate IBI requests.*

### Main Master

The main master is responsible for configuring the dynamic address of all devices on the bus. The driver initiates this procedure by calling i3c_api_t::dynamicAddressAssignmentStart. Before starting address assignment, the application must configure the device table using i3c_api_t::masterDeviceTableSet.

### Enter Dynamic Address Assignment (ENTDAA):

The application initiates the ENTDAA operation by calling i3c_api_t::dynamicAddressAssignmentStart with a starting index into the master device table and a count specifying the number of devices to configure. The master starts by sending the ENTDAA command. Every I3C device on the bus that has not already been initialized will acknowledge the command and attempt to write its Provisional ID, DCR, and BCR registers. The device with the smallest value in these registers will win arbitration and be assigned with the first dynamic address defined in the master device table. The master will then increment the index and repeat the process by assigning the dynamic address to the next device. The process continues until the specified number of devices have been initialized or until there are no more devices to configure.

*Note*

*1. The IBI payload setting will automatically be updated in the master device table based on the BCR setting that was read during ENTDAA.*
*2. After each device successfully writes its Provisional ID, DCR, and BCR registers, the application will get a callback that will provide the value of the registers.*
*3. If the starting index is set to the extended device entry, then the device count must be set to 1.*
*4. The main master assigns its own dynamic address with i3c_api_t::deviceCfgSet.*

**Set Dynamic Address from Static Address (SETDASA):**

The application initiates the SETDASA operation by calling i3c_api_t::dynamicAddressAssignmentStart with an index into the master device table. The master sends the SETDASA command to the static address defined in the given device table entry, and then assigns the associated dynamic address.

*Note*

*1. Set the count to 0 when using SETDASA.*

# Slave Mode

In slave mode, the device configures its static address, Provisional ID, BCR, and DCR registers using i3c_api_t::deviceCfgSet, and then waits for the master to initiate communication. Prior to being assigned a dynamic address, the slave will operate as an I2C device using its static address. The application will receive a callback when the master assigns it a dynamic address, after which point, the slave will operate as an I3C device until it receives the RSTDAA command.

Depending on the capabilities defined in its BCR register, the slave may also initiate IBI Interrupt Requests, and Hot-Join Requests using i3c_api_t::ibiWrite

# Configuration

**Build Time Configurations for r_i3c**

The following build time configurations are defined in fsp_cfg/r_i3c_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Unaligned Buffer Support | • Enabled<br>• Disabled | Enabled | Unaligned buffer support may be optionally disabled for improved performance. |
| Master Support | • Enabled<br>• Disabled | Enabled | If only slave mode is required, disable master support to decrease code size. |
| Slave Support | • Enabled<br>• Disabled | Enabled | If only master mode is required, disable slave |

| | | | |
|---|---|---|---|
| | | | support to decrease code size. |
| Error Recovery Procedure | MCU Specific Options | | There are two different chip versions of the RA2E2 MCU (Version 1 and Version 2). Each version requires a different procedure for recovering from errors. |

### Configurations for Connectivity > I3C (r_i3c)

This module can be added to the Stacks tab via New Stack > Connectivity > I3C (r_i3c).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Bitrate Settings | | | |
| Bitrate Settings > Standard Mode | | | |
| Bitrate Settings > Standard Mode > Open-Drain | | | |
| Logic High Period (ns) | Must be an integer greater than 0. | 167 | The Logic High period of SCL during Standard Mode Open Drain transfers. |
| Frequency | Must be an integer greater than 0. | 1000000 | The Frequency of SCL during Standard Mode Open Drain transfers. |
| Bitrate Settings > Standard Mode > Push-Pull | | | |
| Logic High Period (ns) | The Logic High Period must be greater than or equal to 24 Nanoseconds. | 167 | The Logic High period of SCL during Standard Mode Push Pull transfers. |
| Frequency | Push-Pull frequency must be greater than or equal to 10000 Hz. | 3400000 | The Frequency of SCL during Standard Mode Push-Pull transfers. |
| Bitrate Settings > Extended Mode | | | |
| Bitrate Settings > Extended Mode > Open-Drain | | | |
| Logic High Period (ns) | Must be an integer greater than 0. | 167 | The Logic High period of SCL during Extended Mode Open Drain transfers. |
| Frequency | Must be an integer greater than 0. | 1000000 | The Frequency of SCL during Extended Mode Open Drain transfers. |
| Bitrate Settings > Extended Mode > Push-Pull | | | |
| Logic High Period (ns) | The Logic High Period must be greater than | 167 | The Logic High period of SCL during Extended |

| | | | |
|---|---|---|---|
| | or equal to 24 Nanoseconds. | | Mode Push Pull transfers. |
| Frequency | Push-Pull frequency must be greater than or equal to 10000 Hz. | 3400000 | The Frequency of SCL during Extended Mode Push-Pull transfers. |
| Bitrate Settings > Bus Timing | | | |
| Open Drain Rising Time (ns) | Rising time must be greater than or equal to 0 nanoseconds. | 0 | The Open Drain rising time in nanoseconds. |
| Open Drain Falling Time (ns) | Falling time must be greater than or equal to 0 nanoseconds. | 0 | The Open Drain falling time in nanoseconds. |
| Push-Pull Rising Time (ns) | Rising time must be greater than or equal to 0 nanoseconds. | 0 | The Push-Pull rising time in nanoseconds. |
| Push-Pull Falling Time (ns) | Falling time must be greater than or equal to 0 nanoseconds. | 0 | The Push-Pull rising time in nanoseconds. |
| Bitrate Settings > Clock Stalling | | | |
| Address Assignment Phase | • Enabled<br>• Disabled | Disabled | Enable clock stalling during the Address Assignment Phase of ENTDAA. |
| Transition Phase | MCU Specific Options | | Enable clock stalling during the Transition Bit of a read transfer. |
| Parity Phase | • Enabled<br>• Disabled | Disabled | Enable clock stalling during the Parity Bit of a write transfer. |
| Ack Phase | • Enabled<br>• Disabled | Disabled | Enable clock stalling during the ACK phase of a transfer. |
| Time (us) | Must be greater than or equal to 0. | 0 | The amount of time to stall the clock during the Address Assignment Phase, Transition Phase, Parity Phase, and ACK Phase. |
| Master Mode | | | |
| ACK Hot-Join Requests | • Enabled<br>• Disabled | Disabled | If enabled, the I3C instance will ACK Hot-Join Requests and notify the application. |
| Notify Rejected Hot-Join Requests. | • Enabled<br>• Disabled | Disabled | If enabled, the application will get a |

| | | | |
|---|---|---|---|
| | | | callback when an IBI Hot-Join Request is rejected. |
| Notify Rejected Mastership Requests. | • Enabled<br>• Disabled | Disabled | If enabled, the application will get a callback when an IBI Mastership Request is rejected. |
| Notify Rejected Interrupt Requests. | • Enabled<br>• Disabled | Disabled | If enabled, the application will get a callback when an IBI Interrupt Request is rejected. |
| Slave Mode | | | |
| Slave Mode > Command Response Info | | | |
| Slave Mode > Command Response Info > ENEC/DISEC | | | |
| In-Band Interrupts | • Enabled<br>• Disabled | Disabled | Configure whether the slave can issue IBI requests. |
| Hot-Join Requests | • Enabled<br>• Disabled | Disabled | Configure whether the slave can issue Hot-Join requests. |
| Slave Mode > Command Response Info > ENTASn | | | |
| Activity State | • Activity State 0<br>• Activity State 1<br>• Activity State 2<br>• Activity State 3 | Activity State 0 | Configure the starting activity state of the slave. |
| Slave Mode > Command Response Info > SETMWL/GETMWL | | | |
| Max Write Length | Write length must be in the range of [8, 65535]. | 65535 | Set the max write length. |
| Slave Mode > Command Response Info > SETMRL/GETMRL | | | |
| Max Read Length | Read length must be in the range of [16, 65535]. | 65535 | Set the max read length. |
| Max IBI Payload Length | Read length must be in the range of [0, 255]. | 0 | Set the max IBI payload length, or set it to 0 for unlimited. |
| Slave Mode > Command Response Info > GETMXDS | | | |
| Write Data Rate | • FSCL_MAX<br>• 8Mhz<br>• 6Mhz<br>• 4Mhz<br>• 2Mhz | 2Mhz | Set the max write data rate. |

| | | | |
|---|---|---|---|
| Read Data Rate | • FSCL_MAX<br>• 8Mhz<br>• 6Mhz<br>• 4Mhz<br>• 2Mhz | 2Mhz | Set the max read data rate. |
| Clock to Data Turnaround Time | • 8 Nanoseconds<br>• 9 Nanoseconds<br>• 10 Nanoseconds<br>• 11 Nanoseconds<br>• 12 Nanoseconds<br>• Greater than 12 Nanoseconds | 8 Nanoseconds | Set the clock to data turnaround time. |
| Include Max Read Turnaround Time | • Enabled<br>• Disabled | Disabled | Configure whether the Max Read Turnaround time will be transmitted. |
| Max Read Turnaround Time | Value must be in the range [0, 255]. | 0 | Set max read turnaround time. |
| Slave Mode > Command Response Info > GETXTIME | | | |
| Frequency Byte | Value must be in the range [0, 255]. | 0 | Set the internal oscillator frequency in increments of 0.5 Mhz. |
| Inaccuracy Byte | Value must be in the range [0, 255]. | 0 | Set the oscillator inaccuracy byte in increments of 0.5% |
| Slave Mode > Command Response Info > GETCAP/GETHDRCAP | | | |
| HDR-DDR (Mode 0) | MCU Specific Options | | Slave supports HDR-DDR (Mode 0) |
| HDR-TSP (Mode 1) | MCU Specific Options | | Slave supports HDR-TSP (Mode 1) |
| HDR-TSL (Mode 2) | MCU Specific Options | | Slave supports HDR-TSL (Mode 2) |
| Interrupts | | | |
| Interrupt Priority | MCU Specific Options | | The interrupt priority of the RX, TX, RESPONSE, RCV_STATUS, and IBI ISRs. |
| Error and Event Interrupt Priority | MCU Specific Options | | The interrupt priority of the EEI ISR which is used to notify the application when an Internal Error, HDR Exit Pattern, or Timeout is detected. |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_i3c0 | Module name. |
| Callback | Name must be a valid C symbol | g_i3c0_callback | A user callback function must be provided. This will be called in order to notify the application of I3C events and provide status information. |
| Device Type | • Main Master<br>• Slave | Slave | The role that the I3C instance will take on the I3C bus. |
| Bus Free Condition Detection Time (ns) | Must be greater than or equal to 38.4 nanoseconds. | 38.4 | The minimum period occurring after a STOP and before a START. |
| Bus Available Condition Detection Time (us) | Must be greater than or equal to 1 microsecond. | 1 | The minimum period occurring after the Bus Free Condition when Slaves can initiate IBI requests. |
| Bus Idle Condition Detection Time (us) | Must be greater than or equal to 1000 microseconds. | 1000 | The minimum period occurring after the Bus Available Condition when Slaves can initiate Hot-Join requests. |
| Timeout Detection | • Enabled<br>• Disabled | Disabled | If enabled, the application will get a callback if SCL is stuck at a logic high or logic low level for more than 65535 cycles of the I3C source clock. |

### Clock Configuration

The following settings are used to configure the timing of SCL.

- Frequency of TCLK
- Standard Mode
  - Open Drain High Period ($T_{HIGH}$)
  - Open Drain Frequency
  - Push-Pull High Period ($T_{HIGH}$)
  - Push-Pull Frequency
- Extended Mode
  - Open Drain High Period ($T_{HIGH}$)
  - Open Drain Frequency
  - Push-Pull High Period ($T_{HIGH}$)
  - Push-Pull Frequency
- i3c_bitrate_mode_t (Set during i3c_api_t::deviceSelect)

The Standard and Extended Mode settings define two separate SCL configurations that can be selected at run-time using i3c_api_t::deviceSelect.

In addition to selecting between the Standard and Extended Mode settings, the base SCL period can also be multiplied using the following options:

- I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2: Multiple the base Standard Open Drain and Push-Pull period by 2.
- I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2: Multiple the base Extended Open Drain and Push-Pull period by 2.
- I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4: Multiple the base Extended Open Drain and Push-Pull period by 4.

In order to get accurate frequency calculations, the Rising and Falling edges must be input into the calculation. These values will depend on the topology the I3C bus that will be different for every application.

*Note*

*1. The Standard and Extended Open Drain period settings define the period to use during legacy I2C transfers (Only use the following i3c_bitrate_mode_t settings with I2C transfers: I3C_BITRATE_MODE_I2C_STDBR, I3C_BITRATE_MODE_I2C_EXTBR).*
*2. $T_{HIGH}$ is defined in Figure 31 in the MIPI I3C Specification v1.0 and describes the Logic High period.*
*3. Depending on the MCU, TCLK is either derived from PCLKD or from a dedicated I3C Clock (I3CCLK).*

### Pin Configuration

The I3C peripheral module uses pins on the MCU to communicate to external devices. I/O pins must be selected and configured as required by the external device. An I3C channel would consist of two pins - SDA and SCL for data/address and clock respectively.

## Usage Notes

### Read and Write in Slave Mode

In slave mode, calling read or write does not start a transfer. Instead, calling read or write will configure the driver to perform the next read or write transfer using the user provided buffer.

Provided that a transfer is not already in progress, i3c_api_t::read and i3c_api_t::write can be called to update the internal buffers even if the transfer has not been completed yet. Both the read and write buffers can be configured at the same time in order to prepare the driver for when the master initiates a read or a write transfer.

If there is no space remaining in a user configured read buffer, the application will get a I3C_EVENT_READ_BUFFER_FULL callback requesting for a new read buffer to be provided.

### Event Status

When a write, read, ibiWrite, ibiRead or commandSend, operation is completed, the i3c_callback_args_t::event_status should be checked. The event_status will provide information about the success or failure of the operation.

The following are possible statuses:

- I3C_EVENT_STATUS_SUCCESS

- I3C_EVENT_STATUS_PARITY
- I3C_EVENT_STATUS_FRAME
- I3C_EVENT_STATUS_ADDRESS_HEADER
- I3C_EVENT_STATUS_NACK
- I3C_EVENT_STATUS_OVERFLOW
- I3C_EVENT_STATUS_ABORTED_TO_MASTER
- I3C_EVENT_STATUS_ABORTED

*Note*

*In master mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be I3C_EVENT_STATUS_ABORTED.*
*In slave mode, if the master issues a stop condition before the slave ends the transfer via the 'T' bit, the status will be I3C_EVENT_STATUS_ABORTED_TO_MASTER.*

### Direct Get Common Command Codes in Slave Mode

When an I3C slave receives a Command Code of type Direct Get, the response is automatically sent from the device Special Function Registers (SFR). The SFR contains information for each command code and can be configured during open (See i3c_extended_cfg_t::slave_command_response_info). This allows the slave to respond to Direct Get Command Codes much faster, and removes the burden of responding to these commands from the application.

The response to the GETSTATUS command can be configured at run-time using i3c_api_t::slaveStatusSet.

### Disabling Unaligned Buffer Support

Support for performing read and write operations on unaligned buffers can be disabled in order to improve performance. When unaligned buffer support is disabled, all buffers passed to read, ibiRead, write, ibiWrite, and commandSend must be aligned to 4 bytes and the size of the buffers must be a multiple of 4 bytes.

In master mode, the value of the length passed to i3c_api_t::read and i3c_api_t::write sets the total length of the operation in bytes. During the read or write operation, the driver may read or write to the last word of memory during the operation. This means that the allocated memory for the buffer passed to read and write needs to be a multiple of 4 bytes even though the transfer length is not a multiple of 4 bytes.

In slave mode, the length passed to i3c_api_t::read must be a multiple of 4 bytes. The length passed to i3c_api_t::write sets the number of bytes that the slave will write. The size of the buffer passed to write still needs to be a multiple of 4 bytes.

### Max Data Speed Limitation on RA2E2/RA2L2 MCUs

In Slave Mode, it is highly recommended that BCR[0] be set to '1' in order to indicate to the master that the device doesn't support the max data speed. The master is then required to use the GETMXDS command to get the device specific data speed limitations.

This will allow the slave to specify its maximum supported data rate for read/write, and the maximum read turnaround time (See GETMXDS in the MIPI I3C Specification v1.0).

### Mixed Fast Bus

The MIPI I3C Specification v1.0 defines a Mixed Fast Bus as a bus that has legacy I2C devices that all have a 50ns Spike Filter.

On Mixed Fast Buses, SCL has the following constraints during I3C SDR transfers:

- SCL High Period: $t_{DIG_H_MIXED(MIN)}$ to $t_{DIG_H_MIXED(MAX)}$
- SCL Low Period: Up to $t_{DIG_L(MAX)}$

In this case, configure the Extended Bitrate settings for I3C SDR transfers, and use the Standard Bitrate settings for I2C transfers.

*Note*

*1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.*

### Mixed Slow Bus

The MIPI I3C Specification v1.0 defines a Mixed Slow Bus as a bus that has legacy I2C devices that do not have a 50ns Spike Filter.

In this case, the SCL frequency is limited to I2C Fast Mode or I2C Fast Mode Plus.

*Note*

*1. See section 5.1.2.4 in the MIPI I3C Specification v1.0.*

### RA2E2 MCU Version

There are two versions of the RA2E2. The version number can be identified by the part number or by reading the MCU Version Register.

| Part Number | Chip Version |
|---|---|
| R7FA2E2A72DNK::HA0 | Version 1 |
| R7FA2E2A72DNK::HA1 | Version 2 |
| R7FA2E2A72DNK::AA0 | Version 1 |
| R7FA2E2A72DNK::AA1 | Version 2 |

The I3C peripheral on the RA2E2 Version 1 has a hardware limitation related to using dynamic address assignment in slave mode. When the ENTDAA command is received, the peripheral will continue driving its PID, DCR, and BCR registers during arbitration even after its dynamic address has already been configured. This will prevent any other devices on the bus from being configured after the RA2E2 Version 1 device has been configured. One workaround for this limitation is to configure the Provisional ID to all '1's in order to ensure that the RA2E2 Version 1 device is configured last. If more than one RA2E2 Version 1 device is present on the same bus, consider initializing them using another method (Eg. SETDASA). **Note that this issue has been corrected on the RA2E2 Version 2 (Part numbers ending in #AA1 or #HA1).**

In addition to fixing this hardware limitation, the revised I3C peripheral on the RA2E2 version 2 also greatly simplifies the error recovery procedures. By default, the driver will automatically include the error recovery procedures for both versions, however, it can be configured to only support version 1 or version 2 procedures in order to reduce code size.

### Limitations

Developers should be aware of the following limitations when using the I3C:

- The MIPI Reserved area and Vendor Extension area of Command Codes are not supported.

- Mixed Fast Bus topology has the following limitation on RA2E2/RA2L2 MCUs. The minimum SCL high period ($T_{DIG_H}$) is 156 nanoseconds when PCLKD is 48 Mhz, and 120 nanoseconds when PCLKD is 64 Mhz. On a Mixed Fast Bus, the high period $T_{DIG_HIGH_MIXED}$ must be less than 45 nanoseconds in order to ensure that Legacy I2C devices do not interpret I3C signaling as valid I2C signaling (See Table 111 Push-Pull-Timing Parameters in the MIPI I3C Specification v1.1). This required high period cannot be achievable with RA2E2/RA2L2 MCUs.
- Secondary Master device role is not currently supported.

# Examples

### I3C Master Basic Example

This is a basic example of minimal use of the I3C Master in an application.

```
void i3c_master_basic_example (void)
{
 /* Initializes the module. */
 fsp_err_t status = R_I3C_Open(&g_i3c_ctrl, &g_i3c_cfg);
    assert(FSP_SUCCESS == status);
 static i3c_device_cfg_t master_device_cfg =
    {
 /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
       .static_address = EXAMPLE_MASTER_STATIC_ADDRESS,
 /* If the device is a main master, it must configure its own dynamic address. */
       .dynamic_address = EXAMPLE_MASTER_DYNAMIC_ADDRESS,
    };
    status = R_I3C_DeviceCfgSet(&g_i3c_ctrl, &master_device_cfg);
    assert(FSP_SUCCESS == status);
 static i3c_device_table_cfg_t device_table_cfg =
    {
 /* This is the Static I3C / I2C Legacy address defined by the device manufacturer.
*/
       .static_address       = EXAMPLE_STATIC_ADDRESS,
 /* Dynamic address is not used in I2C. */
       .dynamic_address       = EXAMPLE_DYNAMIC_ADDRESS,
 /* This is the type of device. It may be either an I2C device or an I3C device. */
       .device_protocol       = I3C_DEVICE_PROTOCOL_I3C,
```

```
      .ibi_accept            = false,
 /* Depending on the device the IBI requests may have a data payload.
  * Note that this field will be automatically updated if the device is configured
using ENTDAA.
  */
      .ibi_payload          = false,
 /* Master requests cannot be accepted because Secondary Master is not supported. */
      .master_request_accept = false,
   };
 /* Set the device configuration in the master device table. */
   status = R_I3C_MasterDeviceTableSet(&g_i3c_ctrl, 0, &device_table_cfg);
   assert(FSP_SUCCESS == status);
 /* Enable the I3C device. */
   status = R_I3C_Enable(&g_i3c_ctrl);
   assert(FSP_SUCCESS == status);
 /* Start assigning dynamic addresses to devices on the bus using the ENTDAA command.
*/
   status = R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl,
I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA, 0, 1);
   assert(FSP_SUCCESS == status);
 /* Wait for dynamic address assignment to complete. */
   i3c_app_event_wait(I3C_EVENT_ADDRESS_ASSIGNMENT_COMPLETE);
 /* Select the configured device and bitrate mode for the following operations. */
   status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0, I3C_BITRATE_MODE_I3C_SDR0_STDBR);
   assert(FSP_SUCCESS == status);
 /* Start a write transfer. */
 static uint8_t p_write_buffer[] = {1, 2, 3, 4, 5};
   status = R_I3C_Write(&g_i3c_ctrl, p_write_buffer, sizeof(p_write_buffer), false);
   assert(FSP_SUCCESS == status);
 /* Wait for the write transfer to complete. */
   i3c_app_event_wait(I3C_EVENT_WRITE_COMPLETE);
 /* Start a read transfer. */
 static uint8_t p_read_buffer[16];
   status = R_I3C_Read(&g_i3c_ctrl, p_read_buffer, sizeof(p_read_buffer), false);
```

```
    assert(FSP_SUCCESS == status);
 /* Wait for the read transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_READ_COMPLETE);
}
/* This function is called by the I3C driver from ISRs in order to notify the
application of I3C events. */
void i3c_master_basic_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_ENTDAA_ADDRESS_PHASE:
      {
 /* The device PID, DCR, and BCR registers will be available in

### I3C Master In-band Interrupts Example

This is a basic example of reading In-band Interrupts in I3C Master mode.

```
void i3c_master_ibi_basic_example (void)
{
 static uint8_t p_ibi_read_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Set the buffer for storing IBI data that is read from the slave. */
 fsp_err_t status = R_I3C_IbiRead(&g_i3c_ctrl, p_ibi_read_buffer, sizeof
(p_ibi_read_buffer));
    assert(FSP_SUCCESS == status);
 /* Wait for the ibiRead transfer to complete.
  * Note that the master does not need to wait for the IBI, and can start other
operations. */
    i3c_app_event_wait(I3C_EVENT_IBI_READ_COMPLETE);
}
void i3c_master_ibi_basic_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_IBI_READ_BUFFER_FULL:
      {
 /* If there is no user provided ibiRead buffer, or if the user provided ibiRead
```

```
buffer has been filled,
  * the driver will notify the application that the buffer is full. The application
may provide
  * a new read buffer by calling i3c_api_t::ibiRead. If no read buffer is provided,
then any remaining bytes
  * in the transfer will be dropped. */
            uint8_t * p_read_buffer = i3c_app_next_read_buffer_get();
 R_I3C_IbiRead(&g_i3c_ctrl, p_read_buffer, EXAMPLE_READ_BUFFER_SIZE);
 break;
       }
 case I3C_EVENT_IBI_READ_COMPLETE:
      {
 /* When an IBI is completed, the transfer_size, ibi_type, and ibi_address will be
available in p_args. */
 switch (p_args->ibi_type)
      {
 case I3C_IBI_TYPE_INTERRUPT:
      {
 /* Notify the application that an IBI was read. */
                   i3c_app_event_notify(I3C_EVENT_IBI_READ_COMPLETE);
 break;
         }
 case I3C_IBI_TYPE_HOT_JOIN:
      {
 /* If a Hot-Join event is received, then the master can initiate the dynamic address
assignment procedure. */
 R_I3C_DynamicAddressAssignmentStart(&g_i3c_ctrl, I3C_ADDRESS_ASSIGNMENT_MODE_ENTDAA,
0, 1);
 break;
         }

      {
 break;
         }
```

```
        }
      }
 default:
     {
 break;
      }
   }
}
```

### I3C Slave In-band Interrupts Example

This is a basic example of writing In-band Interrupts in I3C Slave mode.

```
void i3c_slave_ibi_write_basic_example (void)
{
    uint8_t ibi_write_buffer[EXAMPLE_WRITE_BUFFER_SIZE] = {0};
 /* Initiate an In-band interrupt in slave mode.
  * Note: If the slave does not have an IBI payload or if it is a Hot-Join request,
the write buffer should be set
  * to NULL and the write length should be set to 0. */
 fsp_err_t status = R_I3C_IbiWrite(&g_i3c_ctrl, I3C_IBI_TYPE_INTERRUPT,
ibi_write_buffer, sizeof(ibi_write_buffer));
    assert(FSP_SUCCESS == status);
 /* Wait for the ibiWrite transfer to complete. */
    i3c_app_event_wait(I3C_EVENT_IBI_WRITE_COMPLETE);
}
void i3c_slave_ibi_write_basic_example_callback (i3c_callback_args_t const * const
p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_IBI_WRITE_COMPLETE:
     {
 /* Notify the application that the IBI write is complete. */
           i3c_app_event_notify(I3C_EVENT_IBI_WRITE_COMPLETE);
```

```
 break;
       }
 default:
      {
 break;
       }
    }
}
```

### I3C Master Common Command Codes Example

This is a basic example of sending Common Command Codes in I3C Master mode.

```
void i3c_master_ccc_example (void)
{
 static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Setup the command descriptor. */
 static i3c_command_descriptor_t command_descriptor =
    {
       .command_code = I3C_CCC_DIRECT_GETSTATUS,
 /* Set a buffer for storing the data read by the command. */
       .p_buffer    = command_buffer,
 /* The length for a GETSTATUS command is 2 bytes. */
       .length       = 2,
 /* Terminate the transfer with a STOP condition. */
       .restart      = false,
 /* The GETSTATUS command is a Direct Get Command so rnw should be true. */
       .rnw          = true,
    };
 /* Send the command. */
 fsp_err_t status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);
    assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
 /* The command_buffer will have the status info that was read from the slave device.
```

```
*/
}
void i3c_master_ccc_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
    {
 case I3C_EVENT_COMMAND_COMPLETE:
      {
 /* Notify the application that the command is complete. */
            i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

### I3C Slave Common Command Codes Example

This is a basic example of receiving Common Command Codes in I3C Slave mode.

```
void i3c_slave_ccc_example (void)
{
 static uint8_t read_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Broadcast and Direct Set commands will be read into the read_buffer the same way
that
  * a normal SDR Master Write / Slave Read transfer is read. */
 fsp_err_t status = R_I3C_Read(&g_i3c_ctrl, read_buffer, sizeof(read_buffer), false);
    assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
    i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}
void i3c_slave_ccc_example_callback (i3c_callback_args_t const * const p_args)
```

```
{
 switch (p_args->event)
    {
 case I3C_EVENT_COMMAND_COMPLETE:
      {
 /* The command code and transfer size will be available in p_args.
  * If the command code is a Broadcast or Direct Set, then data will
  * be stored in the read buffer provided by i3c_api_t::read.
  * If the command code is a Direct Get, then the data will be automatically
  * sent from device SFR. */
            i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
       }
 default:
      {
 break;
       }
    }
}
```

### I3C HDR Command Example

This is a basic example of sending an HDR command

```
#define I3C_HDR_COMMAND_CODE (0x55)
#define I3C_HDR_COMMAND_LENGTH (16)
void i3c_hdr_command_example (void)
{
 static uint8_t command_buffer[EXAMPLE_READ_BUFFER_SIZE];
 /* Setup the command descriptor. */
 static i3c_command_descriptor_t command_descriptor =
    {
 /* Specify the command code for the HDR transfer. */
       .command_code = I3C_HDR_COMMAND_CODE,
 /* Set a buffer for writing command data. */
```

```
      .p_buffer    = command_buffer,
 /* The length for command (HDR commands must be a multiple of 2 bytes). */
      .length       = I3C_HDR_COMMAND_LENGTH,
 /* Terminate the transfer with a HDR-EXIT. */
      .restart      = false,
 /* Specify if this is a read/write command. */
      .rnw          = false,
   };
 /* Select the HDR mode for subsequent transfers. */
 fsp_err_t status = R_I3C_DeviceSelect(&g_i3c_ctrl, 0,
I3C_BITRATE_MODE_I3C_HDR_DDR_STDBR);
   assert(FSP_SUCCESS == status);
 /* Send the command. */
   status = R_I3C_CommandSend(&g_i3c_ctrl, &command_descriptor);
   assert(FSP_SUCCESS == status);
 /* Wait for the command to complete. */
   i3c_app_event_wait(I3C_EVENT_COMMAND_COMPLETE);
}
void i3c_hdr_command_example_callback (i3c_callback_args_t const * const p_args)
{
 switch (p_args->event)
   {
 case I3C_EVENT_COMMAND_COMPLETE:
     {
 /* Notify the application that the command is complete. */
           i3c_app_event_notify(I3C_EVENT_COMMAND_COMPLETE);
 break;
      }
 default:
     {
 break;
      }
   }
}
```

## Data Structure Documentation

### ◆ i3c_clock_stalling_t

| struct i3c_clock_stalling_t | | |
|---|---|---|
| Clock stalling settings. | | |
| Data Fields | | |
| uint32_t | assigned_address_phase_enable: 1 | Enable Clock Stalling during the address phase of the ENTDAA command. |
| uint32_t | transition_phase_enable: 1 | Enable Clock Stalling during the transition bit in read transfers. |

| | | |
|---|---|---|
| uint32_t | parity_phase_enable: 1 | Enable Clock Stalling during the parity bit period in write transfers. |
| uint32_t | ack_phase_enable: 1 | Enable Clock Stalling during the ACK/NACK phase. |
| uint16_t | clock_stalling_time | The amount of time to stall the clock in I3C source clock ticks. |

### ◆ i3c_bitrate_settings_t

| struct i3c_bitrate_settings_t | | |
|---|---|---|
| Bitrate settings for configuring the SCL clock frequency. | | |
| Data Fields | | |
| uint32_t | stdbr | The standard bitrate settings. |
| uint32_t | extbr | The extended bitrate settings. |
| i3c_clock_stalling_t | clock_stalling | Clock Stalling settings (See Master Clock Stalling in the MIPI I3C Specification v1.0). |

### ◆ i3c_ibi_control_t

| struct i3c_ibi_control_t | | |
|---|---|---|
| Settings for controlling the drivers behavior in response to IBIs. | | |
| Data Fields | | |
| uint32_t | hot_join_acknowledge: 1 | If false, NACK all Hot Join requests. |
| uint32_t | notify_rejected_hot_join_requests: 1 | Notify the application when an IBI Hot-Join request has been NACK'd. |
| uint32_t | notify_rejected_mastership_requests: 1 | Notify the application when an IBI Mastership request has been NACK'd. |
| uint32_t | notify_rejected_interrupt_requests: 1 | Notify the application when an IBI Interrupt request has been NACK'd. |

### ◆ i3c_slave_command_response_info_t

| struct i3c_slave_command_response_info_t | | |
|---|---|---|
| Default configuration settings for the slave response to Direct Get Common Command Codes. | | |
| Data Fields | | |
| bool | inband_interrupt_enable | Enable IBI interrupts.<br><br>Slave Event Settings (See ENEC and DISEC in the MIPI I3C |

| | | |
|---|---|---|
| | | Specification v1.0). |
| bool | mastership_request_enable | Enable Mastership requests. |
| bool | hotjoin_request_enable | Enable Hot-Join requests. |
| i3c_activity_state_t | activity_state | Starting Activity State (See ENTASn in the MIPI I3C Specification v1.0). |
| uint16_t | write_length | Max Write Length (See SETMWL and GETMWL in the MIPI I3C Specification v1.0). |
| uint16_t | read_length | Max Read Length (See SETMRL and GETMRL in the MIPI I3C Specification v1.0). |
| uint8_t | ibi_payload_length | Number of bytes that will be written by an IBI (See SETMRL and GETMRL in the MIPI I3C Specification v1.0). |
| i3c_data_rate_setting_t | write_data_rate | Max Write Data Rate.<br><br>Max Data Rate Settings (See GETMXDS in the MIPI I3C Specification v1.0). |
| i3c_data_rate_setting_t | read_data_rate | Max Read Data Rate. |
| i3c_clock_data_turnaround_t | clock_data_turnaround | Max Data Speed Turnaround. |
| bool | read_turnaround_time_enable | Enable transmission of the of the Max Read Max Read Turnaround Time. |
| uint32_t | read_turnaround_time | Max Read Turnaround Time. |
| uint8_t | oscillator_frequency | This byte represents the Slave's internal oscillator frequency in increments of 0.5 MHz (500kHz), up to 127.5 MHz. (See GETXTIME in the MIPI I3C Specification v1.1). |
| uint8_t | oscillator_inaccuracy | Oscillator inaccuracy in 0.5% increments of 0% up to 25.5% (See GETXTIME in the MIPI I3C Specification v1.1). |
| bool | hdr_ddr_support | HDR-DDR mode is supported. |
| bool | hdr_tsp_support | HDR-TSP mode is supported. |
| bool | hdr_tsl_support | HDR-TSL mode is supported. |

### ◆ i3c_instance_ctrl_t

| struct i3c_instance_ctrl_t |
|---|
| |

Channel control block. DO NOT INITIALIZE. Initialization occurs when i3c_api_t::open is called.

| **Public Member Functions** | |
|---|---|
| i3c_slave_info_t current_slave_info | BSP_ALIGN_VARIABLE (4) |
| | The last i3c_slave_info_t read during ENTDAA. |
| | |
| **Data Fields** | |
| uint32_t | open |
| | Indicates whether the open() API has been successfully called. |
| | |
| R_I3C0_Type * | p_reg |
| | Base register for this channel. |
| | |
| volatile uint32_t | internal_state |
| | Used to track the current state of the driver. |
| | |
| uint8_t | current_command_code |
| | The current Common Command Code that is being transferred. |
| | |
| uint32_t | device_index |
| | The device index selected using i3c_api_t::deviceSelect. |
| | |
| i3c_bitrate_mode_t | device_bitrate_mode |
| | Runtime bitrate settings to use for the next transfer. |
| | |
| uint32_t | next_word |
| | The next word that will be written to the FIFO. |
| | |
| uint32_t | ibi_next_word |

| | |
|---|---|
| | The next word that will be written to the IBI FIFO. |
| | |
| i3c_write_buffer_descriptor_t | write_buffer_descriptor |
| | Buffer descriptor for keeping track of a write transfer. |
| | |
| i3c_read_buffer_descriptor_t | read_buffer_descriptor |
| | Buffer descriptor for keeping track of a read transfer. |
| | |
| i3c_read_buffer_descriptor_t | ibi_buffer_descriptor |
| | Buffer descriptor for keeping track of an IBI read/write transfer. |
| | |
| volatile uint32_t | read_transfer_count_final |
| | The total number of bytes read during a read transfer. |
| | |
| volatile uint32_t | ibi_transfer_count_final |
| | The total number of bytes read during an IBI transfer. |
| | |
| i3c_cfg_t const * | p_cfg |
| | A pointer to the configuration structure provided during open. |
| | |

### ◆ i3c_extended_cfg_t

| struct i3c_extended_cfg_t | | |
|---|---|---|
| Extended configuration for r_i3c. | | |
| Data Fields | | |
| i3c_bitrate_settings_t | bitrate_settings | Bitrate settings configuring the frequency and duty cycle for SCL. |
| i3c_ibi_control_t | ibi_control | Configure the driver's behavior in response to IBIs. |
| uint32_t | bus_free_detection_time | The time in I3C reference clock |

| | | |
|---|---|---|
| | | ticks needed in order to detect the bus free condition (See "Bus Free Condition" in the MIPI I3C Specification v1.0). |
| uint32_t | bus_available_detection_time | The time in I3C reference clock ticks needed in order to detect the bus available condition (See "Bus Available Condition" in the MIPI I3C Specification v1.0). |
| uint32_t | bus_idle_detection_time | The time in I3C reference clock ticks needed in order to detect the bus idle condition (See "Bus Idle Condition" in the MIPI I3C Specification v1.0). |
| bool | timeout_detection_enable | Notify the application if SCL is stuck high or low. |
| i3c_slave_command_response_info_t | slave_command_response_info | Initial settings for configuring the slave's responses to received commands. |
| IRQn_Type | resp_irq | Response Queue Full IRQ number. |
| IRQn_Type | rx_irq | Receive FIFO Full IRQ number. |
| IRQn_Type | tx_irq | Transmit FIFO Empty IRQ number. |
| IRQn_Type | rcv_irq | Receive Status Queue Full IRQ number. |
| IRQn_Type | ibi_irq | IBI IRQ number. |
| IRQn_Type | eei_irq | EEI IRQ number. |
| uint8_t | ipl | Interrupt Priority for Resp, Rx, Tx, and RCV IRQs. |
| uint8_t | eei_ipl | Error and Event Interrupt Priority. |

### Macro Definition Documentation

#### ◆ I3C_ERROR_RECOVERY_VERSION_1

```
#define I3C_ERROR_RECOVERY_VERSION_1
```

Support error recovery procedure for chip version 1.

There are two different versions of the RA2E2 MCU and the error recovery procedure is different for each version.

### ◆ I3C_DEVICE_INDEX_EXTENDED_DEVICE

| #define I3C_DEVICE_INDEX_EXTENDED_DEVICE |
|---|
| Index for selecting the device defined in the extended address table. |

### ◆ I3C_EVENT_STATUS_SUCCESS

| #define I3C_EVENT_STATUS_SUCCESS |
|---|
| The transfer was completed as expected.<br>Event Status Provided by the callback. |

## Enumeration Type Documentation

### ◆ i3c_bitrate_mode_t

| enum i3c_bitrate_mode_t | |
|---|---|
| Bitrate settings that can be selected at run-time using i3c_api_t::deviceSelect. | |
| Enumerator | |
| I3C_BITRATE_MODE_I2C_STDBR | Use standard period setting for subsequent I2C transfers. |
| I3C_BITRATE_MODE_I2C_EXTBR | Use extended period setting for subsequent I2C transfers. |
| I3C_BITRATE_MODE_I3C_SDR0_STDBR | Use standard period setting for subsequent I3C SDR transfers. |
| I3C_BITRATE_MODE_I3C_SDR1_EXTBR | Use extended period setting for subsequent I3C SDR transfers. |
| I3C_BITRATE_MODE_I3C_SDR2_STDBR_X2 | Use standard period setting x 2 for subsequent I3C SDR transfers. |
| I3C_BITRATE_MODE_I3C_SDR3_EXTBR_X2 | Use extended period setting x 2 for subsequent I3C SDR transfers. |
| I3C_BITRATE_MODE_I3C_SDR4_EXTBR_X4 | Use extended period setting x 4 for subsequent I3C SDR transfers. |
| I3C_BITRATE_MODE_I3C_HDR_DDR_STDBR | Use standard period setting for subsequent I3C HDR-DDR transfers. |

### ◆ i3c_activity_state_t

| enum i3c_activity_state_t | |
|---|---|
| Supported activity states for ENTASn Command (See ENTASn in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_ACTIVITY_STATE_ENTAS0 | Activity Interval (1 microsecond). |
| I3C_ACTIVITY_STATE_ENTAS1 | Activity Interval (100 microseconds). |
| I3C_ACTIVITY_STATE_ENTAS2 | Activity Interval (2 milliseconds). |
| I3C_ACTIVITY_STATE_ENTAS3 | Activity Interval (50 milliseconds). |

### ◆ i3c_data_rate_setting_t

| enum i3c_data_rate_setting_t | |
|---|---|
| Maximum Sustained Data Rate for non-CCC messages sent by Master Device to Slave Device (See GETMXDS in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_DATA_RATE_SETTING_FSCL_MAX | There is no data rate limit. |
| I3C_DATA_RATE_SETTING_8MHZ | The max sustained data rate is 8 Mhz. |
| I3C_DATA_RATE_SETTING_6MHZ | The max sustained data rate is 6 Mhz. |
| I3C_DATA_RATE_SETTING_4MHZ | The max sustained data rate is 4 Mhz. |
| I3C_DATA_RATE_SETTING_2MHZ | The max sustained data rate is 2 Mhz. |

### ◆ i3c_clock_data_turnaround_t

| enum i3c_clock_data_turnaround_t | |
|---|---|
| Clock to Data Turnaround Time (See GETMXDS in the MIPI I3C Specification v1.0). | |
| Enumerator | |
| I3C_CLOCK_DATA_TURNAROUND_8NS | Clock to turnaround time is 8 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_9NS | Clock to turnaround time is 9 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_10NS | Clock to turnaround time is 10 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_11NS | Clock to turnaround time is 11 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_12NS | Clock to turnaround time is 12 nanoseconds or less. |
| I3C_CLOCK_DATA_TURNAROUND_EXTENDED | Clock to turnaround time is greater than 12 nanoseconds. |

## Function Documentation

### ◆ R_I3C_Open()

fsp_err_t R_I3C_Open ( i3c_ctrl_t *const *p_api_ctrl*, i3c_cfg_t const *const *p_cfg* )

Configure an I3C instance. Implements i3c_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was invalid. |
| FSP_ERR_ALREADY_OPEN | Open has already been called for this instance. |
| FSP_ERR_UNSUPPORTED | A selected feature is not supported with the current configuration. |

### ◆ R_I3C_Enable()

fsp_err_t R_I3C_Enable ( i3c_ctrl_t *const *p_api_ctrl*)

Enable the I3C device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This instance is already enabled. |

### ◆ R_I3C_DeviceCfgSet()

fsp_err_t R_I3C_DeviceCfgSet ( i3c_ctrl_t *const *p_api_ctrl*, i3c_device_cfg_t const *const *p_device_cfg* )

Set the configuration for this device.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_UNSUPPORTED | The device cannot be a secondary master if master support is disabled. |

### ◆ R_I3C_MasterDeviceTableSet()

fsp_err_t R_I3C_MasterDeviceTableSet ( i3c_ctrl_t *const *p_api_ctrl*, uint32_t *device_index*, i3c_device_table_cfg_t const *const *p_device_table_cfg* )

Configure an entry in the master device table. This function is called in master mode in order to configure the devices on the I3C bus. It may also be called in slave mode when the slave receives the DEFSVLS command.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_UNSUPPORTED | Mastership requests must be rejected is slave support is disabled. |

### ◆ R_I3C_SlaveStatusSet()

fsp_err_t R_I3C_SlaveStatusSet ( i3c_ctrl_t *const *p_api_ctrl*, i3c_device_status_t *status* )

Set the status returned to the master in response to a GETSTATUS command.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | The instance is not in slave mode. |
| FSP_ERR_UNSUPPORTED | Slave support is disabled. |

### ◆ R_I3C_DeviceSelect()

fsp_err_t R_I3C_DeviceSelect ( i3c_ctrl_t *const *p_api_ctrl*, uint32_t *device_index*, uint32_t *bitrate_mode* )

In master mode, select the device for the next transfer. This function is not used in slave mode.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This operation is prohibited in slave mode. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

### ◆ R_I3C_DynamicAddressAssignmentStart()

fsp_err_t R_I3C_DynamicAddressAssignmentStart ( i3c_ctrl_t *const *p_api_ctrl*, i3c_address_assignment_mode_t *address_assignment_mode*, uint32_t *starting_device_index*, uint32_t *device_count* )

Start the Dynamic Address Assignment Process. Implements i3c_api_t::dynamicAddressAssignmentStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This operation is prohibited in slave mode. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

### ◆ R_I3C_CommandSend()

fsp_err_t R_I3C_CommandSend ( i3c_ctrl_t *const *p_api_ctrl*, i3c_command_descriptor_t const *const *p_command_descriptor* )

Send a broadcast or direct command to slave devices on the bus. Implements i3c_api_t::commandSend.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is not in master mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. If it is a read operation, the length also be a multiple of 4 bytes. |
| FSP_ERR_UNSUPPORTED | Master support must be enabled to call this function. Slave support must be enabled when sending the GETACCMST command. |

### ◆ R_I3C_Write()

fsp_err_t R_I3C_Write ( i3c_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_data*, uint32_t *length*, bool *restart* )

Set the write buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements i3c_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is disabled, or an invalid bitrate mode is selected. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. |

### ◆ R_I3C_Read()

fsp_err_t R_I3C_Read ( i3c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t *length*, bool *restart* )

Set the read buffer for the transfer. In master mode, start the transfer. When the transfer is completed send a stop condition or a repeated-start. Implements i3c_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This driver is disabled, or an invalid bitrate mode is selected. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes. |

### ◆ R_I3C_IbiWrite()

fsp_err_t R_I3C_IbiWrite ( i3c_ctrl_t *const *p_api_ctrl*, i3c_ibi_type_t *ibi_type*, uint8_t const *const *p_data*, uint32_t *length* )

Initiate an IBI write operation (This function is only used in slave mode).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_IN_USE | The operation could not be completed because the driver is busy. |
| FSP_ERR_INVALID_MODE | This function is only called in slave mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes. |
| FSP_ERR_UNSUPPORTED | Slave supoprt is disabled. |

### ◆ R_I3C_IbiRead()

fsp_err_t R_I3C_IbiRead ( i3c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t *length* )

Set the read buffer for storing received IBI data (This function is only used in master mode).

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |
| FSP_ERR_INVALID_MODE | This function is only called in master mode. |
| FSP_ERR_INVALID_ALIGNMENT | The buffer must be aligned to 4 bytes and the length must be a multiple of 4 bytes. |
| FSP_ERR_UNSUPPORTED | Master support is disabled. |

### ◆ R_I3C_Close()

fsp_err_t R_I3C_Close ( i3c_ctrl_t *const *p_api_ctrl*)

Close the I3C instance. Implements i3c_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Open successful. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_NOT_OPEN | This instance has not been opened yet. |

## 5.2.6.17 LIN (r_sau_lin)

Modules » Connectivity

### Functions

| | |
|---|---|
| fsp_err_t | R_SAU_LIN_Open (lin_ctrl_t *const p_api_ctrl, lin_cfg_t const *const p_cfg) |
| fsp_err_t | R_SAU_LIN_Write (lin_ctrl_t *const p_api_ctrl, const lin_transfer_params_t *const p_transfer_params) |
| fsp_err_t | R_SAU_LIN_Read (lin_ctrl_t *const p_api_ctrl, lin_transfer_params_t *const p_transfer_params) |

| fsp_err_t | R_SAU_LIN_InformationFrameWrite (lin_ctrl_t *const p_api_ctrl, const lin_transfer_params_t *const p_transfer_params) |

### Detailed Description

LIN driver for the SAU peripheral on RA MCUs. This module implements the LIN Interface.

# Overview

SAU LIN supports Local Interface Network (LIN) transactions in master or slave mode. A callback must be provided, and is invoked when a transmission, reception, or other event has completed or occurred. The callback arguments contain information about the transaction status, bytes transferred and a pointer to the user-defined context.

The SAU LIN driver uses the SAU UART, TAU, and ICU peripherals to implement LIN communication.

### Features

- Half-duplex master or slave mode LIN communication
- Interrupt-driven data transmission and reception
- Optional LIN wake-up signal transmission and detection
- Generation of the sync (0x55) and Protected Identifier fields when in master mode
- Validation of the Protected Identifier field when in slave mode
- Optional checksum generation/validation using classic or enhanced LIN checksum
- Auto synchronization during sync byte reception is supported in slave mode
- Invoking the user-callback function with an event code (RX/TX complete, error, etc)
- Abort in-progress read/write operations
- Error notifications of parity error in protected identifier, framing error and overrun error
- Optional integration with the DTC transfer module

# Configuration

### Build Time Configurations for r_sau_lin

The following build time configurations are defined in fsp_cfg/r_sau_lin_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Checksum Support | • Enabled<br>• Disabled | Enabled | When set to 'Disabled', code for checksum generation and validation is excluded from the build. Disable only when checksum generation and validation is not required for any LIN instance. |
| Master Support | • Enabled<br>• Disabled | Disabled | Select whether code for master support is included in the build. |
| Slave Support | • Enabled<br>• Disabled | Enabled | Select whether code for slave support is included in the build. |
| Wake-up Support | • Enabled<br>• Disabled | Disabled | Select whether code for LIN bus sleep and wake-up signal detection is included in the build. Enable when at least one LIN instance requires sleep/wake-up support. |
| Auto Synchronization Support | • Enabled<br>• Disabled | Enabled | When set to 'Disabled', code for auto synchronization is excluded from the build. Enable when at least one LIN slave instance is using auto synchronization. |

### Configurations for Connectivity > LIN (r_sau_lin)

This module can be added to the Stacks tab via New Stack > Connectivity > LIN (r_sau_lin).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid | g_lin0 | Module name. |

| | | | |
|---|---|---|---|
| | C symbol | | |
| Mode | • Master<br>• Slave | Slave | Select the LIN mode. |
| Callback | Name must be a valid C symbol | sau_lin0_callback | A user callback function must be provided. It will be called from the interrupt service routine (ISR) in order to notify the application of LIN transmission/reception events and errors. |
| UART Channel | MCU Specific Options | | Select the LIN UART Channel. |
| TAU Channel | MCU Specific Options | | Select the LIN TAU Channel. |
| ICU Channel | MCU Specific Options | | Select the LIN ICU Channel. |
| Baud Rate | Value must be an integer greater than 0 | 19200 | Select the LIN Baudrate. |
| Auto Synchronization | • Disable<br>• Enable | Enable | Enable LIN synchronization to the master's clock by measuring pulse intervals between the falling edges of the input signal from the RXDn pin during reception of the LIN sync byte. |

**Clock Configuration**

In both master and slave modes, the SAU UART operation clock can be selected from the available operation clocks for the SAU unit.

In slave mode, the TAU operation clock can be selected from the available operation clocks for the TAU channel.

For more information about module clock settings, please refer to the clock setting of UART (r_sau_uart) and Independent Channel, 16-bit and 8-bit timer (r_tau).

**Pin Configuration**

This module uses TXD and RXD to communicate to external devices. Connect TXD and RXD to an on-board or external LIN transceiver for LIN bus communication.

An external pull up resistor is required on TXD in both master and slave modes.

**Dependent Module Configuration**

### SAU UART Module Configuration

- Disable 'Common > Enable Fixed Baudrate'
- Configure 'Interrupts > Transmit End Interrupt Priority' and 'Interrupts > Receive End Interrupt Priority'
- 'Interrupts > Error Interrupt Priority' is optional, but framing and overflow errors cannot be detected unless it is enabled.

### TAU Module Configuration

TAU is not used in master mode. In slave mode:

- Enable 'Common > Pin Input Support'
- Enable 'Common > Extra Input Mode Support'
- Configure 'Interrupts > Interrupt Priority'

### ICU Module Configuration

ICU is only required if using bus wake-up functionality (R_SAU_LIN_WakeupSend, R_SAU_LIN_SleepEnter, R_SAU_LIN_SleepExit).

- Configure ICU 'Pin Interrupt' priority when the ICU module is used.

## Usage Notes

### LIN Transmission and Reception

SAU LIN data reception is disabled until a LIN header is received (slave mode) or a call to R_SAU_LIN_Read() is made (master mode).

### Slave Mode Transmission and Reception

The header is detected in slave mode only. Header reception is interrupt driven, and is enabled after a successful call to R_SAU_LIN_Open() in slave mode.

When the LIN break field is detected by the slave node, header reception begins without action from the application. When header reception completes, the user callback is called.

If the slave node needs to receive a data frame, it must call R_SAU_LIN_Read() before the first data is received in order to receive the data. The user callback is called when reception is complete. It is permitted to call R_SAU_LIN_Read() from the callback context.

If the master node needs to publish a response to its own header, the master node must call R_SAU_LIN_Write() and provide a pointer to the response data. The response will be published following the header. The user callback is called when the full frame transmission is complete.

If the slave node neither needs to receive the data frame, nor publish a response for a received header, no action is required to ignore the frame.

### Master Mode Transmission and Reception

The header is not detected in master mode. Data frame reception is enabled only after a call to R_SAU_LIN_Read().

A header-only frame can be transmitted by calling R_SAU_LIN_Write() with a NULL data pointer. The user callback is called when transmission is complete.

If the master node needs to receive the data response, call R_SAU_LIN_Read() after header transmission has completed and before the first data is received. It is permitted to call R_SAU_LIN_Read() from the callback context.

If the master node needs to publish a response to its own header, the master node must call R_SAU_LIN_Write() with a non-NULL data pointer. The response will be published following the header. The user callback is called when the full frame transmission is complete.

### Sleep/Wake-up

### Sleep Mode Entry

R_SAU_LIN_SleepEnter can be called to place the bus into bus sleep mode. When in bus sleep mode, an external interrupt is enabled on the RXD pin which can be used to notify the application when bus activity on RXDn is detected.

R_SAU_LIN_SleepEnter does not place the MCU in a low power mode. To use it to wake from a low power mode, call R_SAU_LIN_SleepEnter, then use the Low Power Modes (r_lpm) driver to enter a low power mode.

### Sleep Mode Exit

Bus sleep mode can be exited in the following ways:

1. The LIN wake up signal is detected
2. The LIN break field is detected
3. The application calls R_SAU_LIN_SleepExit

*Note*

*If sleep mode is exited by break field detection, the incoming frame cannot be processed by the driver. Subsequent frames can be processed normally.*

### Wake-up Signal

Both the master and slave can send the LIN wake-up signal by calling R_SAU_LIN_WakeupSend.

Wake-up retry schedules, if required, must be implemented by the application.

If a LIN master receives the wake-up signal from a slave, the master should wait until the entire LIN cluster is ready before sending new header frames to ensure the frames can be processed by the slaves. The amount of time until the cluster is ready is application specific.

### Timeouts/Errors

The application is responsible for managing timeouts in case R_SAU_LIN_Read() is called, but the data is not received in the expected time period. If a timeout occurs, R_SAU_LIN_CommunicationAbort() may be called to cancel a pending read.

When an error occurs, reception is stopped and the user callback is called with the relevant error code.

### Checksum Generation and Validation

- The checksum calculation is performed in software for both checksum generation and validation.
- Checksum generation and validation are both optional.
- The LIN checksum may be generated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when writing data.
- The LIN checksum may be validated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when reading data.
- To skip driver checksum generation/validation, pass lin_transfer_params_t::LIN_CHECKSUM_TYPE_NONE to the read/write functions. Instead the checksum can be included as part of the data buffer, or omitted entirely depending on the application's needs.
- If not using driver checksum generation/validation for any LIN instance, it is recommended to set 'Checksum Support > Disabled' to reduce code size.
- The maximum number of data bytes that can be transmitted per frame is 255, including the checksum byte. Thus, when checksum generation/validation is requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 254. When checksum generation/validation is not requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 255.

**Auto Synchronization**

Auto synchronization is optional. When it is disabled, the baud rate set in R_SAU_LIN_Open is never updated.

This feature works in slave mode only.

- Auto synchronization is not the same as automatic baud rate detection. Auto synchronization is used for correcting small clock drift/difference in baud rate between nodes.
- Auto synchronization performs small automatic baud rate adjustments to synchronize with the master's clock by measuring pulse intervals between the falling edges of the input signal from the RXDn pin during reception of the LIN sync byte.
- The sync byte is measured and the baud rate is re-adjusted for every LIN sync byte received.
- When auto synchronization is enabled, it may change the operation clock frequency of the SAU unit during the baud rate adjustment. Since the operation clocks are shared between SAU channels on each SAU unit, altering the shared operation clock of one instance will result in an incorrect bitrate being generated on the other instance(s). Therefore, if your application cannot accommodate changes to the operation clock, it is advisable to disable auto synchronization or use a different operation clock for each instance.

**Limitations**

- Automatic (arbitrary) baud rate detection is not supported.
- The SAU provides an interface to the LIN Physical layer and does not implement the LIN Transport Layer or LIN Application Layer. The application is responsible for handling the frame scheduling table and monitoring for Transport Layer timeouts.
- A new LIN break field cannot be detected during slave sync byte measurement.

# Examples

### Basic LIN Slave Example

The following demonstrates a basic example of header reception and data response for a LIN slave.

```
void r_sau_lin_basic_slave_example (void)
{
 /* Initialize transmit buffer to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the header that this slave publishes the response to. */
 for ( ; ; )
    {
 if (g_header_rx_complete)
      {
 if (g_received_pid == FRAME_ID)
      {
 /* Frame ID of interest received */
 break;
      }
 /* Ignore this header. No action required by slave. */
           g_header_rx_complete = false;
      }
    }
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = g_received_pid,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_tx_buf
    };
 /* Send the LIN data response */
```

```
    err = R_SAU_LIN_Write(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for the response transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SAU_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
void slave_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
    {
 case LIN_EVENT_RX_HEADER_COMPLETE:
     {
           g_header_rx_complete = 1;
           g_received_pid       = p_args->pid;
 break;
     }
 case LIN_EVENT_RX_DATA_COMPLETE:
     {
           g_data_rx_complete = 1;
 break;
     }
 case LIN_EVENT_TX_DATA_COMPLETE:
     {
           g_data_tx_complete = 1;
 break;
     }
 case LIN_EVENT_TX_WAKEUP_COMPLETE:
     {
           g_wakeup_tx_complete = 1;
```

```
 break;
      }
 case LIN_EVENT_RX_WAKEUP_COMPLETE:
      {
            g_wakeup_rx_complete = 1;
 break;
      }
 default:
      {
 /* Handle error */
      }
   }
}
```

### Basic LIN Master Read Example

The following demonstrates a basic example of frame reception for a LIN master.

```
void r_sau_lin_basic_master_read_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 /* Send the header only */
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = 0,
       .p_data        = NULL          /* Set to NULL to send header only */
    };
    err = R_SAU_LIN_Write(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for header transmission to complete before starting a read of the response
*/
```

```
while (!g_header_tx_complete)
   {
   }
lin_transfer_params_t read_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = FRAME_ID,
      .num_bytes     = TRANSFER_LENGTH,
      .p_data        = g_rx_buf
   };
/* Begin reception of the frame data */
   err = R_SAU_LIN_Read(&g_master_ctrl, &read_params);
   assert(FSP_SUCCESS == err);
/* Wait for data reception to complete. The application is responsible for
 * timing out if data is not received within the expected time interval*/
while (!g_data_rx_complete)
   {
   }
/* Close the driver */
   err = R_SAU_LIN_Close(&g_slave_ctrl);
   assert(FSP_SUCCESS == err);
}
void master_callback (lin_callback_args_t * p_args)
{
/* Handle the LIN event */
switch (p_args->event)
   {
case LIN_EVENT_RX_DATA_COMPLETE:
     {
           g_data_rx_complete = 1;
break;
     }
case LIN_EVENT_TX_HEADER_COMPLETE:
     {
```

```
            g_header_tx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_DATA_COMPLETE:
      {
            g_data_tx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_WAKEUP_COMPLETE:
      {
            g_wakeup_tx_complete = 1;
 break;
      }
 case LIN_EVENT_RX_WAKEUP_COMPLETE:
      {
            g_wakeup_rx_complete = 1;
 break;
      }
 case LIN_EVENT_ERR_INVALID_CHECKSUM:
 case LIN_EVENT_ERR_BUS_COLLISION_DETECTED:
 case LIN_EVENT_ERR_FRAMING:
 case LIN_EVENT_ERR_COUNTER_OVERFLOW:
 case LIN_EVENT_ERR_OVERRUN:
 case LIN_EVENT_ERR_PARITY:
 default:
      {
 /* Handle error */
      }
    }
}
```

### Basic LIN Master Write Example

The following demonstrates a basic example of frame transmission for a LIN master.

```
void r_sau_lin_basic_master_write_example (void)
{
 /* Initialize transmit buffer to known data. */
 for (uint8_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_tx_buf
    };
 /* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
    err = R_SAU_LIN_Write(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for data transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SAU_LIN_Close(&g_master_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Basic LIN Send Wake Up Example

The following demonstrates a basic example of sending wake up signal for a LIN master. The usage of slave mode is the same.

```
void r_sau_lin_send_wakeup_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 /* Send the LIN wake up signal */
    err = R_SAU_LIN_WakeupSend(&g_master_ctrl);
    assert(FSP_SUCCESS == err);
 while (!g_wakeup_tx_complete)
    {
    }
 /* Application specific delay for slaves to re-initialize */
 R_BSP_SoftwareDelay(SLAVE_INITIALIZATION_DELAY_MS, BSP_DELAY_UNITS_MILLISECONDS);
 /* Send additional frames as needed */
 /* Close the driver */
    err = R_SAU_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Basic LIN Sleep Enter Example

The following demonstrates a basic example of entering sleep mode for a LIN slave. The usage in master mode is the same.

```
void r_sau_lin_sleep_enter_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* Open IRQ to prepare getting LIN_EVENT_RX_WAKEUP_COMPLETE */
    err = R_SAU_LIN_SleepEnter(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
 /* If a low power mode is required, call R_LPM_LowPowerModeEnter */
 while (!g_wakeup_rx_complete)
    {
```

```
    }
 /* Close the driver */
    err = R_SAU_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Basic LIN Sleep Exit Example

The following demonstrates a basic example of exiting the LIN slave sleep mode. The usage in master mode is the same.

```
void r_sau_lin_sleep_exit_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SAU_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* Enter bus sleep mode */
    err = R_SAU_LIN_SleepEnter(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
 /* Exit the bus sleep mode for LIN device.*/
    err = R_SAU_LIN_SleepExit(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
 /* Close the driver */
    err = R_SAU_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

| | |
|---|---|
| struct | sau_lin_extended_cfg_t |
| struct | sau_lin_instance_ctrl_t |

## Enumerations

| | |
|---|---|
| enum | sau_lin_state_t |
| enum | sau_lin_synchronization_t |

## Data Structure Documentation

### ◆ sau_lin_extended_cfg_t

| struct sau_lin_extended_cfg_t | | |
|---|---|---|
| SAU UART LIN extended configuration | | |
| Data Fields | | |
| const uart_instance_t * | p_uart | The UART instance used in SAU LIN. |
| const external_irq_instance_t * | p_icu | The IRQ instance used in SAU LIN. |

### ◆ sau_lin_instance_ctrl_t

| struct sau_lin_instance_ctrl_t |
|---|
| LIN Instance Control Block. DO NOT INITIALIZE. |

## Enumeration Type Documentation

### ◆ sau_lin_state_t

| enum sau_lin_state_t | |
|---|---|
| SAU LIN Event codes | |
| Enumerator | |
| SAU_LIN_STATE_NONE | Master mode: No event present Slave mode: Waiting for break field signal. |
| SAU_LIN_STATE_SENDING_WAKEUP | Transmitting wakeup signal. |
| SAU_LIN_STATE_SENDING_BREAK_FIELD | Transmitting break field signal. |
| SAU_LIN_STATE_SENDING_SYNC | Transmitting sync word. |
| SAU_LIN_STATE_AWAITING_SYNC_SIGNAL | Waiting to receive sync word. |
| SAU_LIN_STATE_SENDING_PID | Transmitting protected identifier. |
| SAU_LIN_STATE_AWAITING_PID_SIGNAL | Waiting to receive protected identifier. |
| SAU_LIN_STATE_HEADER_RECEIVED | LIN header received. |
| SAU_LIN_STATE_SENDING_DATA | Transmitting LIN data. |
| SAU_LIN_STATE_AWAITING_DATA | Receiving LIN data. |
| SAU_LIN_STATE_AWAITING_CHECKSUM | Receiving LIN checksum. |
| SAU_LIN_STATE_BUS_SLEEP | Bus sleep state. |

### ◆ sau_lin_synchronization_t

| enum sau_lin_synchronization_t | |
|---|---|
| Auto synchronization setting. | |
| Enumerator | |
| SAU_LIN_AUTO_SYNCHRONIZATION_DISABLE | Disable auto synchronization during sync byte reception. |
| SAU_LIN_AUTO_SYNCHRONIZATION_ENABLE | Enable auto synchronization during sync byte reception. |

## Function Documentation

### ◆ R_SAU_LIN_Open()

fsp_err_t R_SAU_LIN_Open ( lin_ctrl_t *const *p_api_ctrl*, lin_cfg_t const *const *p_cfg* )

Configures the LIN driver channel based on the input configuration.

Implements lin_api_t::open.

Example:

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SAU_LIN_Open(&g_master_ctrl, &g_master_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, configuration structure, or required dependency is NULL |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_MODE | Setting not supported for selected mode |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_Write()

fsp_err_t R_SAU_LIN_Write ( lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking transmission of a LIN frame.

In master mode, the LIN header (break, sync and protected identifier) is sent before the LIN data.

- To transmit the LIN header only, set p_transfer_params->p_data to NULL.
- To transmit both header and data, set p_transfer_params->p_data to the TX buffer to transmit.

The LIN header is not transmitted in slave mode. Set p_transfer_params->p_data to the TX buffer to transmit.

On successful header-only transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_HEADER_COMPLETE. On successful data transmission or header+data transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_DATA_COMPLETE.

Implements lin_api_t::write.

Example:

```
lin_transfer_params_t write_params =
   {
```

```
        .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
        .id            = FRAME_ID,
        .num_bytes     = TRANSFER_LENGTH,
        .p_data        = g_tx_buf
    };
 /* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
    err = R_SAU_LIN_Write(&g_master_ctrl, &write_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SAU_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_Read()

fsp_err_t R_SAU_LIN_Read ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking data reception to receive user specified number of bytes into destination buffer pointer.

The checksum type specifies the checksum type used for validation. If a non-standard algorithm is used, or the application prefers to validate the checksum outside the driver, or the application prefers to skip checksum validation, specify lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE. If checksum validation is skipped, the lin_checksum_type_t::LIN_EVENT_ERR_INVALID_CHECKSUM event is not possible. When lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE is used, the number of bytes specified in the receive buffer length will be received (the driver will not expect to receive an additional 1 checksum byte), so if a non-standard checksum is used, sufficient space must be allocated in the write buffer and accounted for in the provided length.

On successful data reception, the callback is called with event lin_event_t::LIN_EVENT_RX_DATA_COMPLETE.

Implements lin_api_t::read.

Example:

```
/* Begin reception of the frame data */
   err = R_SAU_LIN_Read(&g_master_ctrl, &read_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided, no header matching pid was received(only for slave mode). |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SAU_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |
| FSP_ERR_INVALID_CALL | Data reception is not possible because a header frame has not been received yet (slave mode only). |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_CommunicationAbort()

fsp_err_t R_SAU_LIN_CommunicationAbort ( lin_ctrl_t *const *p_api_ctrl*)

Cancels in progress data read or write, or header read or write. Break field reception cannot be cancelled. For slave nodes, reception of a new header reception is still enabled after a call to this function.

Implements lin_api_t::communicationAbort.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transfer aborted successfully or no transfer was in progress. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_INVALID_STATE | Driver is in bus sleep state. Call R_SAU_LIN_SleepExit to return to active state or wait for wakeup signal. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_CallbackSet()

fsp_err_t R_SAU_LIN_CallbackSet ( lin_ctrl_t *const *p_api_ctrl*, void(*)(lin_callback_args_t *) *p_callback*, void *const *p_context*, lin_callback_args_t *const *p_callback_memory* )

Updates the user callback and callback context.

***Note***

*Providing callback memory is not supported, pass NULL to this function for p_callback_memory.*

Implements lin_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, callback function is NULL, or p_callback_memory is not NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_STATE | Driver is in bus sleep state. Call R_SAU_LIN_SleepExit to return to active state or wait for wakeup signal. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_WakeupSend()

fsp_err_t R_SAU_LIN_WakeupSend ( lin_ctrl_t *const *p_api_ctrl*)

Begins non-blocking transmission of the LIN wakeup signal.

On successful wakeup signal transmission, the callback is called with event lin_event_t::LIN_EVENT_TX_WAKEUP_COMPLETE.

Implements lin_api_t::wakeupSend.

Example:

```
/* Send the LIN wake up signal */
   err = R_SAU_LIN_WakeupSend(&g_master_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Wakeup signal transmission successfully started. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | Unsupported when Wake-up Support build option is disabled. |
| FSP_ERR_INVALID_STATE | Driver is in bus sleep state. Call R_SAU_LIN_SleepExit to return to active state or wait for wakeup signal. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_SleepEnter()

fsp_err_t R_SAU_LIN_SleepEnter ( lin_ctrl_t *const *p_api_ctrl*)

Places the LIN node in bus sleep mode. Enables the external IRQ that can be used to detect the LIN wakeup signal.

On wakeup signal reception, the callback is called with event lin_event_t::LIN_EVENT_RX_WAKEUP_COMPLETE and bus sleep mode is automatically exited.

***Note***

*This function does not put the MCU into a low power mode. Call this function prior to entering a low power mode to enable LIN wakeup signal detection support.*

Implements lin_api_t::sleepEnter.

Example:

```
/* Open IRQ to prepare getting LIN_EVENT_RX_WAKEUP_COMPLETE */
   err = R_SAU_LIN_SleepEnter(&g_slave_ctrl);
   assert(FSP_SUCCESS == err);
/* If a low power mode is required, call R_LPM_LowPowerModeEnter */
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Bus successfully transitioned to sleep state. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | Unsupported when Wake-up Support build option is disabled. |
| FSP_ERR_INVALID_STATE | Driver is in bus sleep state. Call R_SAU_LIN_SleepExit to return to active state or wait for wakeup signal. |
| FSP_ERR_NOT_ENABLED | ICU module is not enabled. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_SleepExit()

fsp_err_t R_SAU_LIN_SleepExit ( lin_ctrl_t *const *p_api_ctrl*)

Exits the bus sleep mode for LIN device. Disables wakeup signal detection.

Implements lin_api_t::sleepExit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Bus successfully transitioned to active state |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_UNSUPPORTED | Unsupported when Wake-up Support build option is disabled. |
| FSP_ERR_NOT_ENABLED | ICU module is not enabled. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_Close()

fsp_err_t R_SAU_LIN_Close ( lin_ctrl_t *const *p_api_ctrl*)

Closes the LIN driver.

Implements lin_api_t::close.

Example:

```
/* Close the driver */
   err = R_SAU_LIN_Close(&g_master_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_InformationFrameRead()

fsp_err_t R_SAU_LIN_InformationFrameRead ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* )

DEPRECATED. Use R_SAU_LIN_Read.

**Returns**
See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_StartFrameWrite()

fsp_err_t R_SAU_LIN_StartFrameWrite ( lin_ctrl_t *const *p_api_ctrl*, uint8_t const *id* )

[DEPRECATED] Use R_SAU_LIN_Write

**Returns**
See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SAU_LIN_InformationFrameWrite()

fsp_err_t R_SAU_LIN_InformationFrameWrite ( lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params* )

[DEPRECATED] Use R_SAU_LIN_Write

**Returns**
See Common Error Codes or functions called by this function for other possible return codes.

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the LIN Interface.

# Overview

The Simple LIN on SCI_B HAL module supports Local Interface Network (LIN) transactions in master or slave mode. A callback must be provided, and is invoked when a transmission, reception, or other event has completed or occurred. The callback arguments contain information about the transaction status, bytes transferred and a pointer to the user defined context.

### Features

- Half-duplex master or slave mode LIN communication
- Interrupt-driven data transmission and reception
- Generation of the sync (0x55) and Protected Identifier fields when in master mode
- Validation of the Protected Identifier field when in slave mode
- ID filtering support in slave mode
- Optional checksum generation/validation using classic or enhanced LIN checksum

- Invoking the user-callback function with an event code (RX/TX complete, error, etc)
- Auto synchronization is supported in slave mode
- Adjustable break field length
- Adjustable break field delimiter/stop bits length
- Noise cancellation
- Abort in-progress read/write operations
- Error notifications of parity error in protected identifier, framing error, overrun error, bus collision, and counter overflow error (counter overflow error applies in slave mode only)
- Operation clock selection (PCLK or SCISPI/SCICLK)
- Configuration of all available SCI_B channels with Simple LIN mode support

# Configuration

### Build Time Configurations for r_sci_b_lin

The following build time configurations are defined in fsp_cfg/r_sci_b_lin_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Checksum Support | • Enabled<br>• Disabled | Enabled | When set to 'Disabled', code for checksum generation and validation is excluded from the build. This setting is applied globally to the project. Disable only when checksum generation and validation is not required for any LIN instance. |
| Auto Synchronization Support | • Enabled<br>• Disabled | Disabled | When set to 'Disabled', code for auto synchronization is excluded from the build. This setting is applied globally to the project. Enable when at least one LIN slave instance is using auto synchronization. |

### Configurations for Connectivity > LIN (r_sci_b_lin)

This module can be added to the Stacks tab via New Stack > Connectivity > LIN (r_sci_b_lin). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_lin0 | Module name. |
| Channel | MCU Specific Options | | Select the LIN channel. |
| Mode | • Master<br>• Slave | Master | Select the LIN operating mode (master or slave). |
| Extra | | | |
| Clock Source | MCU Specific Options | | Select whether the peripheral clock (PCLK) or SCICLK/SCISPICLK is used as the baud rate generator. |
| Noise Filter | • Enable<br>• Disable | Disable | Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits. |
| Noise Filter Clock Select | • The base clock signal divided by 1<br>• The on-chip baud rate generator source clock divided by 1<br>• The on-chip baud rate generator source clock divided by 2<br>• The on-chip baud rate generator source clock divided by 4<br>• The on-chip baud rate generator source clock divided by 8 | The base clock signal divided by 1 | Select the clock division setting for the digital noise filter |
| Bus Conflict Detection | • Enable<br>• Disable | Disable | Enable the bus conflict detection function. When enabled, the TXDn pin output and the RXDn pin input are sampled by the bus conflict detection clock set by Extra\|Bus Conflict Clock Divider. |

| | | | |
|---|---|---|---|
| | | | This function only works during transmission. |
| Bus Conflict Clock Divider | • 1<br>• 2<br>• 4 | 2 | Select the base clock divider for the sampling clock of the bus conflict detection circuit. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 19200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_lin_extended_cfg_t structure. |
| Auto Synchronization | • Disable<br>• Enable | Disable | Enable LIN synchronization to the master's clock by measuring the effective edges of the input signal from the RXDn pin during reception of the sync byte. |
| Base Clock Cycles Per Bit Period | • Auto-Select<br>• 8<br>• 16 | Auto-Select | Select number of SCI base clock cycles per single bit period at the configured baud rate. When 16 base clock cycles is selected, the period of the SCI base clock is 1/16 of a single bit period. When 8 base clock cycles is selected, the period of the SCI base clock is 1/8 of a single bit period. 'Auto-Select' will calculate the base clock period automatically. 'Auto-Select' is not recommended when bus conflict detection is |

| | | | |
|---|---|---|---|
| | | | used, see usage notes. |
| Framing | | | |
| Framing > ID Filter (Slave Mode) | | | |
| Compare Data Mask | Value must be an integer between 0 and 255. | 0 | Select the bit mask to be applied before comparing the received PID to the selected compare data. This setting specifies which bits of the selected compare data must match. Set to 0 to disable the filter (allow all frame identifiers). |
| Priority Compare Data | Value must be an integer between 0 and 255. | 0 | Select the priority compare filter data. |
| Secondary Compare Data | Value must be an integer between 0 and 255. | 0 | Select the secondary compare filter data. |
| Compare Data Select | • Priority<br>• Secondary<br>• Both | Priority | Select the compare data to use. If 'both' is selected, the priority compare data is checked before the secondary compare data. |
| Priority Interrupt Bit Enable | • Enabled<br>• Disabled | Disabled | Select whether to enable the Priority Interrupt Bit filter. When enabled, regardless of the Filter Data Select setting value, the bit specified by the Priority Interrupt Bit setting is compared with the corresponding bit in the Priority Compare Data Filter and if it matches, the identifier is allowed through the filter. |
| Priority Interrupt Bit | Value must be an integer between bit 0 (LSb) and bit 7 (MSb). | 0 | Select the priority interrupt bit (0-7) of the received PID to compare with the corresponding bit in the Priority Compare Data Filter. |

| | | | |
|---|---|---|---|
| Break Field Bits/Break Detection Threshold (bits) | Value must be an integer. | 13 | For master break field transmission, this configures the dominant period of the break field (in bits). For slave break field reception, this configures the break detection threshold in bits. Must be 13 bits or greater for master mode and 11 bits or greater for slave mode. |
| LIN Timer Divider | • 4<br>• 16<br>• 64 | 4 | Set the LIN timer divider. The LIN timer is used for break field transmission and detection. Higher dividers make possible transmission/detection of more break field bits, but are less precise. |
| Break Field Delimiter/Stop Bits | • 1bit<br>• 2bits | 1bit | Select the recessive period (in bits) of the break field. This setting also selects the number of stop bits. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | sci_b_lin0_callback | A user callback function must be provided. It will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |
| Break Field Detection Interrupt Priority | MCU Specific Options | | Select the break field detection interrupt priority (slave mode only). |
| Active Edge Detection Interrupt Priority | MCU Specific Options | | Select the active edge detection interrupt |

priority.

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA6T2 | SCISPICLK |
| RA8D1 | SCICLK |
| RA8D2 | SCICLK |
| RA8E1 | SCICLK |
| RA8E2 | SCICLK |
| RA8M1 | SCICLK |
| RA8M2 | SCICLK |
| RA8P1 | SCICLK |
| RA8T1 | SCICLK |
| RA8T2 | SCICLK |

The clock source for the baud-rate clock generator can be selected from either SCISCPI/SCICLK or the peripheral clock (PCLK).

*Note*

*1. See Figure 26.2 "Clock source selector block diagram" in the RA6T2 manual for more information.*

### Pin Configuration

This module uses TXD and RXD to communicate to external devices. Connect TXD and RXD to an on-board or external LIN transceiver for LIN bus communication.

An external pull up resistor is required on TXD in both master and slave mode.

### Interrupt Configuration

- Receive buffer full (RXI), transmit buffer empty (TXI), transmit end (TEI), and error (ERI) interrupts for the selected channel used must be enabled in the properties of the selected device for both master and slave mode operation.
- Break field detect (BFD) must be enabled in the properties of the selected device for slave mode only.

### Break Field Length/Detection Threshold Configuration

- When in master mode, this setting configures the low (dominant) time of the LIN break pattern.
- When in slave mode, this setting configures the break field detection threshold (number of bits that must be received to detect a break field).
- When configuring this setting in slave mode, take care to set the detection threshold less than the master break field length.

- The standard settings are 13 bits for master nodes and 11 bits for slave nodes, but alternate settings are supported.

**Bus Conflict Detection Configuration**

When Bus Conflict Detection is enabled, the TXDn pin output and the RXDn pin input are sampled by the selected bus conflict detection clock. When a mismatch occurs three times in a row, an SCIn_ERI interrupt is generated and transmission is stopped. This function only works during transmission.

Consideration of the specific application's LIN bus characteristics should be taken into account when enabling this function. If the bus collision sampling clock is too fast, the expected propagation delay through the transceiver may be erroneously detected as a bus collision (false positive). If the bus collision sampling clock is too slow, collisions may be missed (false negative).

When CCR2.ABCS = 1, setting the bus conflict clock divider to 4 is is prohibited by the SCI_B hardware.

A LIN transceiver is required to detect bus collisions. The propagation delay through the transceiver varies depending on individual transceiver design.

When Bus Conflict Detection is enabled, set the Bus Conflict Clock Divider to divide down the clock at least slow enough to avoid false positive collision detections caused by the worst case transceiver propagation delay. The Baud|Base Clock Cycles Per Bit Period setting can be used to adjust the SCI_B Base Clock frequency if needed.

***Example:***

The SCI_B base clock frequency can be calculated by the following formula:

sci_base_clock_frequency = 1 / [ (1/baud_rate)/cycles_per_bit_period ]

The following relationship must be satisfied to avoid false positives:

2 * [ 1e6 / (sci_base_clock_frequency/bus_conflict_clock_divider) ] > max_propagation_delay_us

Suppose:

- Transceiver TXD->LIN BUS max delay = 6us
- Transceiver LIN BUS->RXD max delay = 6us
- Transceiver max_propagation_delay_us: 6us + 6us = 12us
- baud_rate = 19200
- cycles_per_bit_period = 16

Then:

- 1 bit time @ 19200bps = 1e6/19200 = 52us
- sci_base_clock_frequency = 1/[ (1/19200)/16 ] = 307200 Hz

Bus Conflict Divider Selection Process:

- Divider of 1:
  - 2 * [ 1e6 / (307200/1) ] = 6.51 us (not > 12us, may cause false positives)
- Divider of 2:
  - 2 * [ 1e6 / (307200/2) ] = 13.02 us (is > 12us, can be used)
- Divider of 4:
  - 2 * [ 1e6 / (307200/4) ] = 26.04 us (is > 12us, can be used, but will be less accurate at detecting real collisions than divider of 2 due to slower bus collision clock)

If no possible divider is found with 16 cycles, Baud|Base Clock Cycles Per Bit Period can be reduced to 8, which will reduce the SCI_B Base Clock by half compared to 16.

If Baud|Base Clock Cycles Per Bit Period is set to 'Auto Select' the cycles per bit period will be selected automatically. In slave mode, if auto synchronization is enabled, the base cycles per bit period may change during bit rate synchronization, but the bus conflict clock divider and noise filter clock divider will not be changed at runtime. To prevent changing the base cycles per bit period during bit rate synchronization, fix the base clock cycles to 16 or 8 cycles by the procedure described above.

### ID Filter Configuration

The SCI performs optional hardware PID filtering in slave mode. When enabled, only headers with PIDs that pass through the filter are received and passed to the user callback. Other headers are ignored.

An initial configuration of the filter settings can be applied in the properties view by selecting Framing -> ID Filter and choosing the desired settings. See sci_b_lin_id_filter_setting_t for the available filter settings, as well as the examples in this document. By default, filtering is disabled and all PIDs can be received.

The filter can be updated at runtime by using using R_SCI_B_LIN_IdFilterSet. The current filter settings can be viewed with R_SCI_B_LIN_IdFilterGet.

## Usage Notes

### LIN Transmission and Reception

SCI data reception is disabled until a break field is detected (slave mode) or a call to R_SCI_B_LIN_Read() is made (master and slave mode).

### Slave Mode Transmission and Reception

The header is detected in slave mode only. Header reception is interrupt driven, and is enabled after a successful call to R_SCI_B_LIN_Open() in slave mode.

When the LIN break field is detected by the slave node, header reception begins without action from the application. When header reception completes, the user callback is called.

If the slave node needs to receive the data frame, the slave node must call R_SCI_B_LIN_Read() before the first data is received in order to receive the data. The user callback is called when reception is complete. It is permitted to call R_SCI_B_LIN_Read() from the callback context.

If the slave node needs to publish a response to the header, the slave node must call R_SCI_B_LIN_Write() and provide the response data and the PID of the received header in the lin_transfer_params_t. The user callback is called when transmission is complete.

If the slave node neither needs to receive a data frame, nor publish a response for a received header, no action is required to ignore the frame. Data reception is disabled until a new break field is detected.

**Master Mode Transmission and Reception**

The header is not detected in master mode. Data frame reception is enabled only after a call to R_SCI_B_LIN_Read().

The header is transmitted by calling R_SCI_B_LIN_Write(). The user callback is called when transmission is complete.

If the master node needs to receive the data response, call R_SCI_B_LIN_Read() after header transmission has completed and before the first data is received. It is permitted to call R_SCI_B_LIN_Read() from the callback context.

If the master node needs to publish a response to its own header, the master node must call R_SAU_LIN_Write() and provide a pointer to the response data. The response will be published following the header. The user callback is called when the full frame transmission is complete.

**Timeouts/Errors**

The application is responsible for managing timeouts in case R_SCI_B_LIN_Read() is called, but the data is not received in the expected time period. If a timeout occurs, R_SCI_B_LIN_CommunicationAbort() may be called to cancel a pending read.

When an error occurs, reception is stopped and the user callback is called with the relevant error code.

**Checksum Generation and Validation**

- The checksum calculation is performed in software for both checksum generation and validation.
- Checksum generation and validation are both optional.
- The LIN checksum may be generated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when writing data.
- The LIN checksum may be validated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when reading data.
- To skip driver checksum generation/validation, pass lin_transfer_params_t::LIN_CHECKSUM_TYPE_NONE to the read/write functions. Instead the checksum can be included as part of the data buffer, or omitted entirely depending on the application's needs.
- The maximum number of data bytes that can be transmitted per frame is 255, including the checksum byte. Thus, when checksum generation/validation is requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 254. When checksum generation/validation is not requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 255.

### Auto Synchronization

Auto synchronization is optional. When it is disabled, the baud rate and break field detection threshold set in open are never updated.

This feature works in slave mode only.

- Auto synchronization is not the same as automatic baud rate detection. Auto synchronization is used for correcting small clock drift/difference in baud rate between nodes.
- Auto synchronization performs small automatic baud rate adjustments to synchronize with the master's clock by measuring the effective edges of the input signal from the RXDn pin during reception of the LIN sync byte.
- The sync byte is measured and the baud setting and break field detection threshold are re-adjusted for every LIN sync byte received.
- If reception of the sync byte fails, or the required register settings detected would not be possible in the hardware, the baud/timer settings are not updated, and auto synchronization will be re-attempted on the next received header.
- If two or more headers are received consecutively and ignored by software (no call to R_SCI_B_LIN_Read), *and* there is no data transmission by any node on the bus between the headers, auto synchronization is performed only on the first header. Following the transmission of the next data frame (by any node), auto synchronization will be re-attempted on the next received header.

### Limitations

- DTC/DMAC is not supported
- Automatic baud rate detection is not supported
- The SCI_B provides an interface to the LIN Physical layer and does not implement the LIN Transport Layer or LIN Application Layer. The application is responsible for handling the frame scheduling table and monitoring for Transport Layer timeouts.
- LIN wake-up via external IRQ is not supported by the SCI_B (R_SCI_B_LIN_SleepEnter, R_SCI_B_LIN_SleepExit and R_SCI_B_LIN_WakeupSend are not supported)

## Examples

### Basic LIN Master Read Example

The following demonstrates a basic example of frame reception for a LIN master.

```
void r_sci_b_lin_basic_master_read_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 /* Send the header only */
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
```

```
      .id            = FRAME_ID,
      .num_bytes     = 0,
      .p_data        = NULL          /* Set to NULL to send header only */
   };
   err = R_SCI_B_LIN_Write(&g_master_ctrl, &write_params);
   assert(FSP_SUCCESS == err);
 /* Wait for header transmission to complete before starting a read of the response
*/
 while (!g_header_tx_complete)
   {
   }
 lin_transfer_params_t read_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = FRAME_ID,
      .num_bytes     = TRANSFER_LENGTH,
      .p_data        = g_rx_buf
   };
 /* Begin reception of the data */
   err = R_SCI_B_LIN_Read(&g_master_ctrl, &read_params);
   assert(FSP_SUCCESS == err);
 /* Wait for data reception to complete. The application is responsible for
  * timing out if data is not received within the expected time interval*/
 while (!g_data_rx_complete)
   {
   }
 /* Close the driver */
   err = R_SCI_B_LIN_Close(&g_slave_ctrl);
   assert(FSP_SUCCESS == err);
}
void master_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
```

```
    {
 case LIN_EVENT_RX_DATA_COMPLETE:
      {
            g_data_rx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_HEADER_COMPLETE:
      {
            g_header_tx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_DATA_COMPLETE:
      {
            g_data_tx_complete = 1;
 break;
      }
 case LIN_EVENT_ERR_INVALID_CHECKSUM:
 case LIN_EVENT_ERR_BUS_COLLISION_DETECTED:
 case LIN_EVENT_ERR_FRAMING:
 case LIN_EVENT_ERR_COUNTER_OVERFLOW:
 case LIN_EVENT_ERR_OVERRUN:
 case LIN_EVENT_ERR_PARITY:
 default:
      {
 /* Handle error */
      }
    }
}
```

### Basic LIN Master Write Example

The following demonstrates a basic example of frame transmission for a LIN master.

```
void r_sci_b_lin_basic_master_write_example (void)
{
```

```
 /* Initialize transmit buffer to known data. */
 for (uint8_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_tx_buf
    };
 /* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
    err = R_SCI_B_LIN_Write(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_master_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Basic LIN Slave Example

The following demonstrates a basic example of header reception and data response for a LIN slave.

```
void r_sci_b_lin_basic_slave_example (void)
{
 /* Initialize transmit buffer to known data */
```

```
for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
   {
      g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
   }
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
   assert(FSP_SUCCESS == err);
/* Wait for the header that this slave publishes the response to. */
for ( ; ; )
   {
if (g_header_rx_complete)
     {
if (g_received_pid == FRAME_ID)
     {
/* Frame ID of interest received */
break;
     }
/* Ignore this header. No action required by slave. */
           g_header_rx_complete = false;
     }
   }
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = g_received_pid,
      .num_bytes    = TRANSFER_LENGTH,
      .p_data       = g_tx_buf
   };
/* Send the LIN data response */
   err = R_SCI_B_LIN_Write(&g_slave_ctrl, &write_params);
   assert(FSP_SUCCESS == err);
/* Wait for the response transmission to complete */
while (!g_data_tx_complete)
   {
```

```
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
void slave_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
    {
 case LIN_EVENT_RX_HEADER_COMPLETE:
      {
            g_header_rx_complete = 1;
            g_received_pid       = p_args->pid;
 break;
      }
 case LIN_EVENT_RX_DATA_COMPLETE:
      {
            g_data_rx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_DATA_COMPLETE:
      {
            g_data_tx_complete = 1;
 break;
      }
 default:
      {
 /* Handle error */
      }
    }
}
```

### Basic LIN Slave ID Filtering Example

The following example demonstrates a basic example of frame ID filtering.

```
#define BASIC_FILTER_MASK (0x30)
#define BASIC_PRIORITY_FILTER_DATA (0x20)
#define BASIC_SECONDARY_FILTER_DATA (0x00) // Don't-care value in this example
#define BASIC_PRIORITY_INTERRUPT_BIT (0) // Don't-care value in this example
void r_sci_b_lin_basic_id_filtering_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
  * any required initial communications to get the identifiers for this slave */
 /* Configure filter to accept only frame IDs in the range 0x20-0x2F.
  *
  * The header is received only when the PID bits match the bits
  * specified by the filter.
  *
  * Example: If ID 0x24 is received (PID 0x64), the filter mask (0x30) is applied
  * first (0x64 & 0x30 = 0x20) and then the result is compared to the priority
  * compare data filter (0x20). Since the result matches the filter, the header
  * is received and the user callback is called. Otherwise, the SCI awaits
  * the next break field, and the callback is not called.
  *
  * Note: The most significant 2 bits of the PID are the parity bits, and are
  * masked off by the filter mask in this example.
  */
 sci_b_lin_id_filter_setting_t filter =
    {
       .compare_data_mask             = BASIC_FILTER_MASK,
       .priority_compare_data         = BASIC_PRIORITY_FILTER_DATA,
       .secondary_compare_data       = BASIC_SECONDARY_FILTER_DATA,
       .priority_interrupt_bit_select = BASIC_PRIORITY_INTERRUPT_BIT,
       .priority_interrupt_enable    = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE,
       .compare_data_select          = SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY,
```

```
    };
 /* Configure the ID filter */
    err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
    assert(FSP_SUCCESS == err);
 /* Wait for a header which matches the filter */
 while (!g_header_rx_complete)
    {
    }
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = g_received_pid,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_tx_buf
    };
 /* Send the LIN data response */
    err = R_SCI_B_LIN_Write(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for the response transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_B_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Advanced LIN Slave ID Filtering Example

The following example demonstrates an advanced example of frame ID filtering.

```
#define ADVANCED_FILTER_MASK (0x3E)
#define ADVANCED_PRIORITY_FILTER_DATA (0x20)
#define ADVANCED_SECONDARY_FILTER_DATA (0x08)
#define ADVANCED_PRIORITY_INTERRUPT_BIT (5)
```

```
void r_sci_b_lin_advanced_id_filtering_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_B_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
  * any required initial communications to get the identifiers for this slave */
 /* Configure filter to accept the following frame IDs:
  *
  * - Any ID in which bit 5 is set to 1 (0x20-0x3F).
  * - IDs 0x08 and 0x09
  *
  * The priority compare data filter is set to 0x20 (bit 5 set).
  * The priority interrupt bit select function is enabled for bit 5.
  *
  * The secondary compare data filter is set to 0x08. This will allow
  * both 0x08 and 0x09 through the filter, even though bit 5 is not set for
  * those values (0x08 & 0x3E = 0x08 and 0x09 & 0x3E = 0x08). All other
  * identifiers are filtered out.
  */
 sci_b_lin_id_filter_setting_t filter =
    {
       .compare_data_mask             = ADVANCED_FILTER_MASK,
       .priority_compare_data         = ADVANCED_PRIORITY_FILTER_DATA,
       .secondary_compare_data       = ADVANCED_SECONDARY_FILTER_DATA,
       .priority_interrupt_bit_select = ADVANCED_PRIORITY_INTERRUPT_BIT,
       .priority_interrupt_enable    = SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE,
       .compare_data_select          = SCI_B_LIN_COMPARE_DATA_SELECT_BOTH,
    };
 /* Configure the ID filter */
    err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
    assert(FSP_SUCCESS == err);
 /* Wait for a header which matches the filter */
 while (!g_header_rx_complete)
```

```
    {
    }
lin_transfer_params_t write_params =
    {
        .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
        .id            = g_received_pid,
        .num_bytes     = TRANSFER_LENGTH,
        .p_data        = g_tx_buf
    };
/* Send the LIN data response */
    err = R_SCI_B_LIN_Write(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
/* Wait for the response transmission to complete */
while (!g_data_tx_complete)
    {
    }
/* Close the driver */
    err = R_SCI_B_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

## Data Structure Documentation

### ◆ sci_b_lin_timer_setting_t

| struct sci_b_lin_timer_setting_t | | |
|---|---|---|
| Register settings for configuring the LIN break field timer | | |
| Data Fields | | |
| uint8_t | __pad0__: 6 | |
| uint8_t | tcss: 2 | LIN timer count clock source selection. |
| uint16_t | bflw | Break field length setting (break field length is (bflw + 1) * clock of the timer) |

### ◆ sci_b_lin_baud_setting_t

| struct sci_b_lin_baud_setting_t | | |
|---|---|---|
| Register settings for achieving a desired baud rate. | | |
| Data Fields | | |
| union sci_b_lin_baud_setting_t | __unnamed__ | |
| sci_b_lin_timer_setting_t | timer_setting | Break field timer settings associated with this baud rate. |

### ◆ sci_b_lin_id_filter_setting_t

| struct sci_b_lin_id_filter_setting_t | | |
|---|---|---|
| Parameters for configuring the ID filter settings | | |
| Data Fields | | |
| uint8_t | compare_data_mask | Bit mask applied before comparing the received PID to |

| | | |
|---|---|---|
| | | the compare data. Selects which bits of the selected compare data must match. |
| uint8_t | priority_compare_data | Priority/primary compare data |
| uint8_t | secondary_compare_data | Secondary compare data |
| uint8_t | priority_interrupt_bit_select: 3 | Specify ONE of bits 0 to 7 of Control Field 1 as the priority interrupt bit. 0 is bit 0 of the PID, 1 is bit 1 of the PID, and so on. |
| uint8_t | priority_interrupt_enable: 1 | Set to 1 to enable the priority interrupt bit filter specified by priority_interrupt_bit_select, 0 to disable. When this bit is 1, regardless of the compare_data_select setting value, the bit specified by priority_interrupt_bit_select is compared with the priority/primary comparison data for Control Field 1 (priority_compare_data). |
| uint8_t | compare_data_select: 2 | Select the compare data for Control Field 1 (priority, secondary, or both). See sci_b_lin_compare_data_select_t |
| uint8_t | __pad0__: 2 | |

### ◆ sci_b_lin_baud_params_t

| struct sci_b_lin_baud_params_t | | |
|---|---|---|
| Parameters for baud and timer setting calculation | | |
| Data Fields | | |
| uint32_t | baudrate | Desired baudrate. |
| sci_b_lin_clock_source_t | clock_source | Peripheral clock source. |
| sci_b_lin_bus_conflict_clock_t | bus_conflict_clock | DEPRECATED, not used to set baudrate. |
| uint16_t | break_bits | Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits. |

### ◆ sci_b_lin_extended_cfg_t

| struct sci_b_lin_extended_cfg_t |
|---|
| SCI B LIN extended configuration |

| Data Fields | | |
|---|---|---|
| union sci_b_lin_extended_cfg_t | __unnamed__ | |
| sci_b_lin_baud_setting_t | baud_setting | Register settings for a desired baud rate. |
| sci_b_lin_id_filter_setting_t | filter_setting | ID filter setting. |
| IRQn_Type | bfd_irq | Break field detect IRQ number. |
| IRQn_Type | aed_irq | Active edge detect IRQ number. |
| IRQn_Type | rxi_irq | Receive interrupt IRQ number. |
| IRQn_Type | txi_irq | Transmit interrupt IRQ number. |
| IRQn_Type | tei_irq | Transmit end interrupt IRQ number. |
| IRQn_Type | eri_irq | Error interrupt IRQ number. |
| uint8_t | bfd_ipl | Break field detect interrupt priority. |
| uint8_t | aed_ipl | Active edge detect interrupt priority. |
| uint8_t | rxi_ipl | Receive interrupt priority. |
| uint8_t | txi_ipl | Transmit interrupt priority. |
| uint8_t | tei_ipl | Transmit end interrupt priority. |
| uint8_t | eri_ipl | Error interrupt priority. |
| uint16_t | break_bits | Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits. |

## Enumeration Type Documentation

### ◆ sci_b_lin_priority_interrupt_bit_t

| enum sci_b_lin_priority_interrupt_bit_t | |
|---|---|
| Priority interrupt bit options for ID filtering. | |
| Enumerator | |
| SCI_B_LIN_PRIORITY_INTERRUPT_BIT_DISABLE | Disable the priority interrupt bit. |
| SCI_B_LIN_PRIORITY_INTERRUPT_BIT_ENABLE | Enable the priority interrupt bit. |

### ◆ sci_b_lin_compare_data_select_t

| enum sci_b_lin_compare_data_select_t | |
|---|---|
| Compare Data Select options for ID filtering. | |
| Enumerator | |
| SCI_B_LIN_COMPARE_DATA_SELECT_PRIORITY | Select the priority/primary compare data filter as the compare data. |
| SCI_B_LIN_COMPARE_DATA_SELECT_SECONDARY | Select the secondary compare data filter as the compare data. |
| SCI_B_LIN_COMPARE_DATA_SELECT_BOTH | Select both the priority/primary compare data filter and the secondary compare data filter as the compare data. The priority filter will be checked first. |

### ◆ sci_b_lin_clock_source_t

| enum sci_b_lin_clock_source_t | |
|---|---|
| Source clock selection options for SCI. | |
| Enumerator | |
| SCI_B_LIN_CLOCK_SOURCE_SCISPICLK | SCISPI clock source. |
| SCI_B_LIN_CLOCK_SOURCE_SCICLK | SCI clock source. |
| SCI_B_LIN_CLOCK_SOURCE_PCLK | PCLK source. |

### ◆ sci_b_lin_break_delimiter_bits_t

| enum sci_b_lin_break_delimiter_bits_t | |
|---|---|
| Break field delimiter configuration. | |
| Enumerator | |
| SCI_B_LIN_BREAK_DELIMITER_BITS_1 | 1-bit recessive break field delimiter |
| SCI_B_LIN_BREAK_DELIMITER_BITS_2 | 2-bit recessive break field delimiter |

### ◆ sci_b_lin_timer_divider_t

| enum sci_b_lin_timer_divider_t | |
|---|---|
| LIN timer configuration, used for break field generation and detection. | |
| Enumerator | |
| SCI_B_LIN_TIMER_DIV_4 | LIN timer frequency is TCLK/4. |
| SCI_B_LIN_TIMER_DIV_16 | LIN timer frequency is TCLK/16. |
| SCI_B_LIN_TIMER_DIV_64 | LIN timer frequency is TCLK/64. |

### ◆ sci_b_lin_synchronization_t

| enum sci_b_lin_synchronization_t | |
|---|---|
| Auto synchronization setting. | |
| Enumerator | |
| SCI_B_LIN_AUTO_SYNCHRONIZATION_DISABLE | Disable auto synchronization during sync byte reception. |
| SCI_B_LIN_AUTO_SYNCHRONIZATION_ENABLE | Enable auto synchronization during sync byte reception. |

### ◆ sci_b_lin_noise_cancellation_t

| enum sci_b_lin_noise_cancellation_t | |
|---|---|
| Noise cancellation configuration. | |
| Enumerator | |
| SCI_B_LIN_NOISE_CANCELLATION_DISABLE | Disable noise cancellation. |
| SCI_B_LIN_NOISE_CANCELLATION_ENABLE | Enable noise cancellation. |

### ◆ sci_b_lin_noise_cancellation_clock_t

| enum sci_b_lin_noise_cancellation_clock_t | |
|---|---|
| Noise cancellation clock configuration. | |
| Enumerator | |
| SCI_B_LIN_NOISE_CANCELLATION_CLOCK_BASE_CLOCK_DIV_1 | Noise filter clock is the base clock/1. |
| SCI_B_LIN_NOISE_CANCELLATION_CLOCK_BAUDRATE_GENERATOR_CLOCK_DIV_1 | Noise filter clock is on-chip baudrate generator source clock/1. |
| SCI_B_LIN_NOISE_CANCELLATION_CLOCK_BAUDRATE_GENERATOR_CLOCK_DIV_2 | Noise filter clock is on-chip baudrate generator source clock/2. |
| SCI_B_LIN_NOISE_CANCELLATION_CLOCK_BAUDRATE_GENERATOR_CLOCK_DIV_4 | Noise filter clock is on-chip baudrate generator source clock/3. |
| SCI_B_LIN_NOISE_CANCELLATION_CLOCK_BAUDRATE_GENERATOR_CLOCK_DIV_8 | Noise filter clock is on-chip baudrate generator source clock/4. |

### ◆ e_sci_b_lin_bus_conflict_detection_t

| enum e_sci_b_lin_bus_conflict_detection_t | |
|---|---|
| Bus conflict detection enable. | |
| Enumerator | |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_DISABLE | Disable bus conflict detection. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_ENABLE | Enable bus conflict detection. |

### ◆ sci_b_lin_bus_conflict_clock_t

| enum sci_b_lin_bus_conflict_clock_t | |
|---|---|
| Bus conflict detection clock selection. Base clock: 1/16 period of 1 bit period when CCR2.ABCS = 0, 1/8 period of 1 bit period when CCR2.ABCS = 1 | |
| Enumerator | |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_1 | Bus conflict detection clock is base clock. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_2 | Bus conflict detection clock is base clock/2. |
| SCI_B_LIN_BUS_CONFLICT_DETECTION_BASE_CLOCK_DIV_4 | Bus conflict detection clock is base clock/4. Setting prohibited when CCR2.ABCS = 1. |

### ◆ sci_b_lin_base_clock_t

| enum sci_b_lin_base_clock_t | |
|---|---|
| Asynchronous Mode Base Clock Selection | |
| Enumerator | |
| SCI_B_LIN_BASE_CLOCK_16_CYCLES_PER_BIT | Select 16 base clock cycles for 1-bit period. |
| SCI_B_LIN_BASE_CLOCK_8_CYCLES_PER_BIT | Select 8 base clock cycles for 1-bit period. |
| SCI_B_LIN_BASE_CLOCK_AUTO_CYCLES_PER_BIT | Automatic software selection of the base clock cycles (16 or 8) for 1-bit period. |

## Function Documentation

### ◆ R_SCI_B_LIN_Open()

fsp_err_t R_SCI_B_LIN_Open ( lin_ctrl_t *const *p_api_ctrl*, lin_cfg_t const *const *p_cfg* )

Configures the LIN driver channel based on the input configuration.

Implements lin_api_t::open.

Example:

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_B_LIN_Open(&g_master_ctrl, &g_master_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or configuration structure is NULL. |
| FSP_ERR_INVALID_CHANNEL | The requested channel does not exist on this MCU or the channel does not support Simple LIN mode. |
| FSP_ERR_INVALID_ARGUMENT | Break field length setting or timer divisor is invalid. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_MODE | Setting not supported for selected mode |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_Write()

fsp_err_t R_SCI_B_LIN_Write ( lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking transmission of a LIN frame.

In master mode, the LIN header (break, sync and protected identifier) is sent before the LIN data.

- To transmit the LIN header only, set p_transfer_params->p_data to NULL.
- To transmit both header and data, set p_transfer_params->p_data to the TX buffer to transmit.

The LIN header is not transmitted in slave mode. Set p_transfer_params->p_data to the TX buffer to transmit.

On successful header-only transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_HEADER_COMPLETE. On successful data transmission or header+data transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_DATA_COMPLETE.

Implements lin_api_t::write.

Example:

```
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = FRAME_ID,
      .num_bytes     = TRANSFER_LENGTH,
      .p_data        = g_tx_buf
   };
/* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
   err = R_SCI_B_LIN_Write(&g_master_ctrl, &write_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transmission started successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | ID out of range (unprotected ID must be less than 64). Only applies in master mode. In slave mode, p_transfer_params->id is ignored. |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SCI_B_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_Read()

fsp_err_t R_SCI_B_LIN_Read ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking data reception to receive user specified number of bytes into destination buffer pointer.

The checksum type specifies the checksum type used for validation. If a non-standard algorithm is used, or the application prefers to validate the checksum outside the driver, or the application prefers to skip checksum validation, specify lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE. If checksum validation is skipped, the lin_checksum_type_t::LIN_EVENT_ERR_INVALID_CHECKSUM event is not possible. When lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE is used, the number of bytes specified in the receive buffer length will be received (the driver will not expect to receive an additional 1 checksum byte), so if a non-standard checksum is used, sufficient space must be allocated in the write buffer and accounted for in the provided length.

On successful data reception completion, the callback is called with event lin_event_t::LIN_EVENT_RX_DATA_COMPLETE.

Implements lin_api_t::read.

Example:

```
/* Begin reception of the data */
   err = R_SCI_B_LIN_Read(&g_master_ctrl, &read_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SCI_B_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |
| FSP_ERR_INVALID_CALL | Data reception is not possible because a header frame has not been received yet (slave mode only). |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_CommunicationAbort()

fsp_err_t R_SCI_B_LIN_CommunicationAbort ( lin_ctrl_t *const *p_api_ctrl*)

Cancels in progress data read or write, or header read or write. Break field reception cannot be cancelled. For slave nodes, reception of a new header is still enabled after a call to this function.

Implements lin_api_t::communicationAbort.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transfer aborted successfully or no transfer was in progress. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_CallbackSet()

fsp_err_t R_SCI_B_LIN_CallbackSet ( lin_ctrl_t *const *p_api_ctrl*, void(*)(lin_callback_args_t *) *p_callback*, void *const *p_context*, lin_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure.

Implements lin_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or callback is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_BaudCalculate()

fsp_err_t R_SCI_B_LIN_BaudCalculate ( sci_b_lin_baud_params_t const *const *p_baud_params*, sci_b_lin_baud_setting_t *const *p_baud_setting* )

Calculates baud rate and LIN timer (BFLW and TCSS) register settings. This function evaluates and determines the most accurate settings for the baud rate and timer related registers.

The LIN timer setting is used for break field transmission/detection. Because the timer setting is specified in terms of bits, and the duration of a bit varies depending on baud rate, the baud rate register settings and timer register settings are related. The smallest possible LIN timer divider which can achieve the desired break field bits setting at the configured baud rate is selected to provide the highest measurement accuracy.

The baud rate cannot be updated at runtime with this function. This function is provided to ease configuration of the initial baud settings.

***Note***

*The parameter p_baud_setting->bus_conflict_clock is deprecated and is not used to determine the baud rate settings. See Usage Notes for a description of how to select the bus conflict clock divider.*

**Parameters**

| | | |
|---|---|---|
| [in] | p_baud_params | Parameters required to calculate the baud rate |
| [out] | p_baud_setting | If calculation succeeds, contains computed values to achieve requested baud rate. If calculation fails, the input structure is not modified. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Register settings updated in provided p_baud_setting |
| FSP_ERR_ASSERTION | p_baud_setting was NULL |
| FSP_ERR_INVALID_ARGUMENT | Cannot achieve combination of break field bits and baudrate with provided settings or p_baud_params->baudrate was 0 or p_baud_params->break_bits was 0 |

### ◆ R_SCI_B_LIN_IdFilterSet()

fsp_err_t R_SCI_B_LIN_IdFilterSet ( lin_ctrl_t *const *p_api_ctrl*, sci_b_lin_id_filter_setting_t const *const *p_config* )

Set the the ID filter settings for filtering control field 1 (PID byte).

NOTE: Setting the ID filter will abort any in-progress LIN header reception, as the ID filter settings cannot be changed during reception of the header. The next header will be received with the new settings.

```
/* Configure the ID filter */
   err = R_SCI_B_LIN_IdFilterSet(&g_slave_ctrl, &filter);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [in] | p_config | The ID filter settings to apply |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_IdFilterGet()

fsp_err_t R_SCI_B_LIN_IdFilterGet ( lin_ctrl_t *const *p_api_ctrl*, sci_b_lin_id_filter_setting_t *const *p_config* )

Returns the currently configured ID filter settings.

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [out] | p_config | The current ID filter settings |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_WakeupSend()

fsp_err_t R_SCI_B_LIN_WakeupSend ( lin_ctrl_t *const *p_api_ctrl*)

Send wakeup is not supported on the SCI_B LIN driver.

Implements lin_api_t::wakeupSend.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_B_LIN_SleepEnter()

fsp_err_t R_SCI_B_LIN_SleepEnter ( lin_ctrl_t *const *p_api_ctrl*)

Sleep is not supported on the SCI_B LIN driver.

Implements lin_api_t::sleepEnter.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_B_LIN_SleepExit()

fsp_err_t R_SCI_B_LIN_SleepExit ( lin_ctrl_t *const *p_api_ctrl*)

Sleep is not supported on the SCI_B LIN driver.

Implements lin_api_t::sleepExit.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_B_LIN_Close()

fsp_err_t R_SCI_B_LIN_Close ( lin_ctrl_t *const *p_api_ctrl*)

Closes the LIN driver.

Implements lin_api_t::close.

Example:

```
/* Close the driver */
   err = R_SCI_B_LIN_Close(&g_master_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_B_LIN_InformationFrameRead()

| fsp_err_t R_SCI_B_LIN_InformationFrameRead ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* ) |
|---|
| [DEPRECATED] Use R_SCI_B_LIN_Read.<br><br>**Returns**<br>See Common Error Codes or functions called by this function for other possible return codes. |

### ◆ R_SCI_B_LIN_StartFrameWrite()

| fsp_err_t R_SCI_B_LIN_StartFrameWrite ( lin_ctrl_t *const *p_api_ctrl*, uint8_t const *id* ) |
|---|
| [DEPRECATED] Use R_SCI_B_LIN_Write<br><br>**Returns**<br>See Common Error Codes or functions called by this function for other possible return codes. |

### ◆ R_SCI_B_LIN_InformationFrameWrite()

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the LIN Interface.

# Overview

The Simple LIN on SCI HAL module supports Local Interface Network (LIN) transactions in master or slave mode. A callback must be provided, and is invoked when a transmission, reception, or other event has completed or occurred. The callback arguments contain information about the transaction status, bytes transferred and a pointer to the user defined context.

*Note*

*Some MCUs call this feature **Extended Serial Mode**. **Extended Serial Mode** and **Simple Lin** are equivalent terms.*

### Features

- Half-duplex master or slave mode LIN communication
- Interrupt-driven data transmission and reception
- Generation of the sync (0x55) and Protected Identifier fields when in master mode

- Validation of the Protected Identifier field when in slave mode
- ID filtering support in slave mode
- Optional checksum generation/validation using classic or enhanced LIN checksum
- Invoking the user-callback function with an event code (RX/TX complete, error, etc)
- Adjustable break field length
- Adjustable break field delimiter bits length
- Digital filter
- Abort in-progress read/write operations
- Error notifications of parity error in protected identifier, framing error, overrun error, bus collision
- Configuration of all available SCI channels with Simple LIN mode support
- Auto synchronization is supported in slave mode

# Configuration

### Build Time Configurations for r_sci_lin

The following build time configurations are defined in fsp_cfg/r_sci_lin_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Checksum Support | • Enabled<br>• Disabled | Enabled | When set to 'Disabled', code for checksum generation and validation is excluded from the build. This setting is applied globally to the project. Disable only when checksum generation and validation is not required for any LIN instance. |
| Auto Synchronization Support | • Enabled<br>• Disabled | Disabled | When set to 'Disabled', code for auto synchronization is excluded from the build. This setting is applied globally to the project. Enable when at least one LIN slave instance is using auto synchronization. |
| Bus Conflict Detection Support | • Enabled<br>• Disabled | Disabled | When set to 'Disabled', code for bus conflict detection is excluded from the build. This setting is applied globally to the project. Enable when at least |

| | | | |
|---|---|---|---|
| | | | one LIN instance is using bus conflict detection. |

### Configurations for Connectivity > LIN (r_sci_lin)

This module can be added to the Stacks tab via New Stack > Connectivity > LIN (r_sci_lin). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_lin0 | Module name. |
| SCI Channel | MCU Specific Options | | Select the Serial Communications Interface channel. |
| Mode | • Master<br>• Slave | Master | Select the LIN operating mode (master or slave). |
| Extra | | | |
| Digital Filter Clock Select | • Disabled<br>• SCI Base Clock<br>• PCLK/8<br>• PCLK/16<br>• PCLK/32<br>• PCLK/64<br>• PCLK/128 | Disabled | Enable the digital filter on RXDXn pin. The digital filter block in SCI consists of three-stage flipflop circuits. |
| Bus Conflict Clock Divider | • 1<br>• 2<br>• 4 | 2 | Select the base clock divider for the sampling clock of the bus conflict detection circuit. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 19200 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_lin_extended_cfg_t structure. |

| | | | |
|---|---|---|---|
| Base Clock Cycles Per Bit Period | • 8<br>• 16 | 16 | Select number of SCI base clock cycles per single bit period at the configured baud rate. When 16 base clock cycles is selected, the period of the SCI base clock is 1/16 of a single bit period. When 8 base clock cycles is selected, the period of the SCI base clock is 1/8 of a single bit period. |
| Framing | | | |
| Framing > ID Filter (Slave Mode) | | | |
| Compare Data Mask | Value must be an integer between 0 and 255. | 0 | Select the bit mask to be applied before comparing the received PID to the selected compare data. This setting specifies which bits of the selected compare data must match. Set to 0 to disable the filter (allow all frame identifiers). |
| Primary Compare Data | Value must be an integer between 0 and 255. | 0 | Select the primary compare filter data. |
| Secondary Compare Data | Value must be an integer between 0 and 255. | 0 | Select the secondary compare filter data. |
| Compare Data Select | • Primary<br>• Secondary<br>• Both | Primary | Select the compare data to use. If 'both' is selected, the primary compare data is checked before the secondary compare data. |
| Priority Interrupt Bit Enable | • Enabled<br>• Disabled | Disabled | Select whether to enable the Priority Interrupt Bit filter. When enabled, regardless of the Filter Data Select setting value, the bit specified by the Priority Interrupt Bit setting is compared with the corresponding bit in the Primary |

| | | | |
|---|---|---|---|
| | | | Compare Data Filter and if it matches, the identifier is allowed through the filter. |
| Priority Interrupt Bit | Value must be an integer between bit 0 (LSb) and bit 7 (MSb). | 0 | Select the priority interrupt bit (0-7) of the received PID to compare with the corresponding bit in the Primary Compare Data Filter. |
| Break Field Bits/Break Detection Threshold (bits) | Value must be an integer. | 13 | For master break field transmission, this configures the dominant period of the break field (in bits). For slave break field reception, this configures the break detection threshold in bits. Must be 13 bits or greater for master mode and 11 bits or greater for slave mode. |
| Break Delimiter Bits | Value must be an integer between 1 and 255. | 1 | This configures the period of the break delimiter (in bits).The break delimiter shall be at least one nominal bit time long. |
| LIN Timer Divider | • 1<br>• 2<br>• 4<br>• 8<br>• 16<br>• 32<br>• 64<br>• 128 | 1 | Set the LIN timer divider. The LIN timer is used for break field transmission and detection. Higher dividers make possible transmission/detection of more break field bits, but are less precise. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | sci_lin0_callback | A user callback function must be provided. It will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Data Empty | MCU Specific Options | | Select the transmit |

| | | |
|---|---|---|
| Interrupt Priority | | interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | Select the transmit end interrupt priority. |
| Receive Error Interrupt Priority | MCU Specific Options | Select the receive error interrupt priority. |
| Break Field Low Width Interrupt Priority (SCIX0) | MCU Specific Options | Select the break field low width interrupt priority. |
| Control Field 0/1 Match Interrupt Priority (SCIX1) | MCU Specific Options | Select the Control field 0,1 and Priority bit detection interrupt priority. |
| Bus Collision Detection Interrupt Priority (SCIX2) | MCU Specific Options | Select the bus collision detection interrupt priority, or set to 'Disabled' to disable bus collision detection. |
| Valid Edge Detection Interrupt Priority (SCIX3) | MCU Specific Options | Select the valid edge detection interrupt priority to enable slave auto synchronization during the LIN sync byte, or set to 'Disabled' to disable auto synchronization. |

### Clock Configuration

Peripheral clock for SCI LIN is PCLKA.

### Pin Configuration

This module uses TXD and RXD to communicate to external devices. Connect TXD and RXD to an on-board or external LIN transceiver for LIN bus communication.

An external pull up resistor is required on TXD in both master and slave mode.

### Interrupt Configuration

- Receive data full (RXI), Transmit data empty (TXI), Transmit end (TEI), Error event (ERI), Break Field low width (SCIX0) interrupts for the selected channel used must be enabled in the properties of the selected device for both master and slave mode operation.
- Control field 0/1 match, priority interrupt bit detection (SCIX1) interrupt is only used in slave mode.
- Configuring the bus collision detection (SCIX2) interrupt is required to enable Bus Conflict Detection.
- Configuring the valid edge detection (SCIX3) interrupt is required to enable Auto Synchronization (slave mode only).

### Break Field Length/Detection Threshold Configuration

- When in master mode, this setting configures the low (dominant) time of the LIN break pattern.
- When in slave mode, this setting configures the break field detection threshold (number of bits that must be received to detect a break field).
- When configuring this setting in slave mode, take care to set the detection threshold less than the master break field length.
- The standard settings are 13 bits for master nodes and 11 bits for slave nodes, but alternate settings are supported.

**Bus Conflict Detection Configuration**

When the Bus Collision Detection Interrupt (SCIX2) is enabled, the TXDn pin output and the RXDn pin input are sampled by the selected bus conflict detection clock. When a mismatch occurs three times in a row, an SCIX2 interrupt is generated and transmission is stopped. This function only works during transmission.

Consideration of the specific application's LIN bus characteristics should be taken into account when enabling this function. If the bus collision sampling clock is too fast, the expected propagation delay through the transceiver may be erroneously detected as a bus collision (false positive). If the bus collision sampling clock is too slow, collisions may be missed (false negative).

A LIN transceiver is required to detect bus collisions. The propagation delay through the transceiver varies depending on individual transceiver design.

When Bus Conflict Detection is enabled, set the Bus Conflict Clock Divider to divide down the clock at least slow enough to avoid false positive collision detections caused by the worst case transceiver propagation delay. The Baud|Base Clock Cycles Per Bit Period setting can be used to adjust the SCI Base Clock frequency if needed.

***Example:***

The SCI base clock frequency can be calculated by the following formula:

sci_base_clock_frequency = 1 / [ (1/baud_rate)/cycles_per_bit_period ]

The following relationship must be satisfied to avoid false positives:

2 *[ 1e6 / (sci_base_clock_frequency/bus_conflict_clock_divider) ] > max_propagation_delay_us

Suppose:

- Transceiver TXD->LIN BUS max delay = 6us
- Transceiver LIN BUS->RXD max delay = 6us
- Transceiver max_propagation_delay_us: 6 + 6 = 12us
- baud_rate = 19200
- cycles_per_bit_period = 16

Then:

- 1 bit time @ 19200bps = 1e6/19200 = 52us
- sci_base_clock_frequency = 1/[ (1/19200)/16 ] = 307200 Hz

Bus Conflict Divider Selection Process:

- Divider of 1:
  - 2 * [ 1e6 / (307200/1) ] = 6.51 us (not > 12us, may cause false positives)
- Divider of 2:
  - 2 * [ 1e6 / (307200/2) ] = 13.02 us (is > 12us, can be used)
- Divider of 4:
  - 2 * [ 1e6 / (307200/4) ] = 26.04 us (is > 12us, can be used, but will be less accurate at detecting real collisions than divider of 2 due to slower bus collision clock)

If no possible divider is found with 16 cycles, Baud|Base Clock Cycles Per Bit Period can be reduced to 8, which will reduce the SCI Base Clock by half compared to 16.

### ID Filter Configuration

The SCI performs optional hardware PID filtering in slave mode. When enabled, only headers with PIDs that pass through the filter are received and passed to the user callback. Other headers are ignored.

An initial configuration of the filter settings can be applied in the properties view by selecting Framing -> ID Filter and choosing the desired settings. See sci_lin_id_filter_setting_t for the available filter settings, as well as the examples in this document. By default, filtering is disabled and all PIDs can be received.

The filter can be updated at runtime by using using R_SCI_LIN_IdFilterSet. The current filter settings can be viewed with R_SCI_LIN_IdFilterGet.

# Usage Notes

### Bit Rate Calculation

For more details on how the baudrate is set refer to Table "Relationship between N setting in BRR and bit rate B" in the SCI section of the relevant hardware manual.

### LIN Transmission and Reception

SCI data reception is disabled until a break field is detected (slave mode) or a call to R_SCI_LIN_Read() is made (master and slave mode).

### Slave Mode Transmission and Reception

The header is detected in slave mode only. Header reception is interrupt driven, and is enabled after a successful call to R_SCI_LIN_Open() in slave mode.

When the LIN break field is detected by the slave node, header reception begins without action from the application. When header reception completes, the user callback is called.

If the slave node needs to receive the data frame, the slave node must call R_SCI_LIN_Read() before the first data is received in order to receive the data. The user callback is called when reception is completed. It is permitted to call R_SCI_LIN_Read() from the callback context.

If the slave node needs to publish a response to the header, the slave node must call R_SCI_LIN_Write() and provide the response data and the PID of the received header in the lin_transfer_params_t. The user callback is called when transmission is complete.

**Master Mode Transmission and Reception**

The header is not detected in master mode. Data frame reception is enabled only after a call to R_SCI_LIN_Read().

The header is transmitted by calling R_SCI_LIN_Write(). The user callback is called when transmission is complete.

If the master node needs to receive the data response, call R_SCI_LIN_Read() after header transmission has completed and before the first data is received. It is permitted to call R_SCI_LIN_Read() from the callback context.

If the master node needs to publish a response to its own header, the master node must call R_SAU_LIN_Write() and provide a pointer to the response data. The response will be published following the header. The user callback is called when the full frame transmission is complete.

**Timeouts/Errors**

The application is responsible for managing timeouts in case R_SCI_LIN_Read() is called, but the data is not received in the expected time period. If a timeout occurs, R_SCI_LIN_CommunicationAbort() may be called to cancel a pending read.

When an error occurs, reception is stopped and the user callback is called with the relevant error code.

**Checksum Generation and Validation**

- The checksum calculation is performed in software for both checksum generation and validation.
- Checksum generation and validation are both optional.
- The LIN checksum may be generated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when writing data.
- The LIN checksum may be validated by passing lin_transfer_params_t::LIN_CHECKSUM_TYPE_CLASSIC or lin_transfer_params_t::LIN_CHECKSUM_TYPE_ENHANCED when reading data.
- To skip driver checksum generation/validation, pass lin_transfer_params_t::LIN_CHECKSUM_TYPE_NONE to the read/write functions. Instead the checksum can be included as part of the data buffer, or omitted entirely depending on the application's needs.
- The maximum number of data bytes that can be transmitted per frame is 255, including the checksum byte. Thus, when checksum generation/validation is requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 254. When checksum generation/validation is not requested in the transfer parameters, the maximum number of bytes that can be specified in transfer_params.num_bytes is 255.

**Auto Synchronization**

Auto synchronization is optional. When it is disabled, the baud rate and break field detection threshold set in open are never updated.

This feature works in slave mode only.

- Auto synchronization is not the same as automatic baud rate detection. Auto synchronization is used for correcting small clock drift/difference in baud rate between nodes.
- Auto synchronization performs small automatic baud rate adjustments to synchronize with the master's clock by measuring the effective edges of the input signal from the RXDn pin during reception of the LIN sync byte.
- The sync byte is measured and the baud setting and break field detection threshold are re-adjusted for every LIN sync byte received.
- If reception of the sync byte fails, or the required register settings detected would not be possible in the hardware, the baud/timer settings are not updated, and auto synchronization will be re-attempted on the next received start frame.

### Limitations

- The SCI provides an interface to the LIN Physical layer and does not implement the LIN Transport Layer or LIN Application Layer. The application is responsible for handling the frame scheduling table and monitoring for Transport Layer timeouts.
- Selectable timing for the sampling data is not supported.
- A new header cannot be detected during active reception of control field 0, control field 1, or frame data.
- Two or more headers that are not followed by data (from any node) cannot be received consecutively unless R_SCI_LIN_CommunicationAbort is called after receiving LIN_EVENT_HEADER_RX_COMPLETE to ignore the frame. If all headers are followed by data, no action is required to ignore a received header.

## Examples

### Basic LIN Master Read Example

The following demonstrates a basic example of frame reception for a LIN master.

```
void r_sci_lin_basic_master_read_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 /* Send the header only */
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = 0,
       .p_data        = NULL          /* Set to NULL to send header only */
    };
```

```
    err = R_SCI_LIN_Write(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for header transmission to complete before starting a read of the response
*/
 while (!g_header_tx_complete)
    {
    }
 lin_transfer_params_t read_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_rx_buf
    };
 /* Begin reception of the data */
    err = R_SCI_LIN_Read(&g_master_ctrl, &read_params);
    assert(FSP_SUCCESS == err);
 /* Wait for data reception to complete. The application is responsible for
  * timing out if data is not received within the expected time interval*/
 while (!g_data_rx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
void master_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
    {
 case LIN_EVENT_RX_DATA_COMPLETE:
      {
            g_data_rx_complete = 1;
```

```
break;
     }
case LIN_EVENT_TX_HEADER_COMPLETE:
     {
           g_header_tx_complete = 1;
break;
     }
case LIN_EVENT_TX_DATA_COMPLETE:
     {
           g_data_tx_complete = 1;
break;
     }
case LIN_EVENT_ERR_INVALID_CHECKSUM:
case LIN_EVENT_ERR_BUS_COLLISION_DETECTED:
case LIN_EVENT_ERR_FRAMING:
case LIN_EVENT_ERR_COUNTER_OVERFLOW:
case LIN_EVENT_ERR_OVERRUN:
case LIN_EVENT_ERR_PARITY:
default:
     {
/* Handle error */
     }
   }
}
```

### Basic LIN Master Write Example

The following demonstrates a basic example of frame transmission for a LIN master.

```
void r_sci_lin_basic_master_write_example (void)
{
/* Initialize transmit buffer to known data. */
for (uint8_t i = 0; i < TRANSFER_LENGTH; i++)
   {
      g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
```

```
    }
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_LIN_Open(&g_master_ctrl, &g_master_cfg);
    assert(FSP_SUCCESS == err);
 lin_transfer_params_t write_params =
    {
       .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
       .id            = FRAME_ID,
       .num_bytes     = TRANSFER_LENGTH,
       .p_data        = g_tx_buf
    };
 /* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
    err = R_SCI_LIN_Write(&g_master_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_LIN_Close(&g_master_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Basic LIN Slave Example

The following demonstrates a basic example of header reception and data response for a LIN slave.

```
void r_sci_lin_basic_slave_example (void)
{
 /* Initialize transmit buffer to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_tx_buf[i] = (uint8_t) ('A' + (i % 26));
    }
```

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
   assert(FSP_SUCCESS == err);
/* Wait for the header that this slave publishes the response to. */
for ( ; ; )
   {
if (g_header_rx_complete)
     {
if (g_received_pid == FRAME_ID)
     {
/* Frame ID of interest received */
break;
     }
/* Ignore this header. No action required by slave. */
           g_header_rx_complete = false;
/* Note: Only in case header will not followed any data,
 * R_SCI_LIN_CommunicationAbort should be called to ignore the header. */
           err = R_SCI_LIN_CommunicationAbort(&g_slave_ctrl);
     assert(FSP_SUCCESS == err);
     }
   }
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = g_received_pid,
      .num_bytes     = TRANSFER_LENGTH,
      .p_data        = g_tx_buf
   };
/* Send the LIN data response */
   err = R_SCI_LIN_Write(&g_slave_ctrl, &write_params);
   assert(FSP_SUCCESS == err);
/* Wait for the response transmission to complete */
while (!g_data_tx_complete)
   {
```

```
    }
 /* Close the driver */
    err = R_SCI_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
void slave_callback (lin_callback_args_t * p_args)
{
 /* Handle the LIN event */
 switch (p_args->event)
    {
 case LIN_EVENT_RX_HEADER_COMPLETE:
      {
            g_header_rx_complete = 1;
            g_received_pid       = p_args->pid;
 break;
      }
 case LIN_EVENT_RX_DATA_COMPLETE:
      {
            g_data_rx_complete = 1;
 break;
      }
 case LIN_EVENT_TX_DATA_COMPLETE:
      {
            g_data_tx_complete = 1;
 break;
      }
 default:
      {
 /* Handle error */
      }
    }
}
```

### Basic LIN Slave ID Filtering Example

The following example demonstrates a basic example of frame ID filtering.

```
#define BASIC_FILTER_MASK (0x30)
#define BASIC_PRIORITY_FILTER_DATA (0x20)
#define BASIC_SECONDARY_FILTER_DATA (0x00) // Don't-care value in this example
#define BASIC_PRIORITY_INTERRUPT_BIT (0) // Don't-care value in this example
void r_sci_lin_basic_id_filtering_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
  * any required initial communications to get the identifiers for this slave */
 /* Configure filter to accept only frame IDs in the range 0x20-0x2F.
  *
  * The header is received only when the PID bits match the bits
  * specified by the filter.
  *
  * Example: If ID 0x24 is received (PID 0x64), the filter mask (0x30) is applied
  * first (0x64 & 0x30 = 0x20) and then the result is compared to the priority
  * compare data filter (0x20). Since the result matches the filter, the header
  * is received and the user callback is called. Otherwise, the SCI awaits
  * the next break field, and the callback is not called.
  *
  * Note: The most significant 2 bits of the PID are the parity bits, and are
  * masked off by the filter mask in this example.
  */
 sci_lin_id_filter_setting_t filter =
    {
       .compare_data_mask             = BASIC_FILTER_MASK,

       .p_data        = g_tx_buf
    };
 /* Send the LIN data response */
    err = R_SCI_LIN_Write(&g_slave_ctrl, &write_params);
    assert(FSP_SUCCESS == err);
 /* Wait for the response transmission to complete */
 while (!g_data_tx_complete)
    {
    }
 /* Close the driver */
    err = R_SCI_LIN_Close(&g_slave_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### Advanced LIN Slave ID Filtering Example

The following example demonstrates an advanced example of frame ID filtering.

```
#define ADVANCED_FILTER_MASK (0x3E)
#define ADVANCED_PRIORITY_FILTER_DATA (0x20)
#define ADVANCED_SECONDARY_FILTER_DATA (0x08)
#define ADVANCED_PRIORITY_INTERRUPT_BIT (5)
```

```
void r_sci_lin_advanced_id_filtering_example (void)
{
 /* Open the LIN instance with initial configuration. */
 fsp_err_t err = R_SCI_LIN_Open(&g_slave_ctrl, &g_slave_cfg);
    assert(FSP_SUCCESS == err);
 /* If the application is using dynamically assigned identifiers, perform
  * any required initial communications to get the identifiers for this slave */
 /* Configure filter to accept the following frame IDs:
  *
  * - Any ID in which bit 5 is set to 1 (0x20-0x3F).
  * - IDs 0x08 and 0x09
  *
  * The priority compare data filter is set to 0x20 (bit 5 set).
  * The priority interrupt bit select function is enabled for bit 5.
  *
  * The secondary compare data filter is set to 0x08. This will allow
  * both 0x08 and 0x09 through the filter, even though bit 5 is not set for
  * those values (0x08 & 0x3E = 0x08 and 0x09 & 0x3E = 0x08). All other
  * identifiers are filtered out.
  */
 sci_lin_id_filter_setting_t filter =
    {
       .compare_data_mask             = ADVANCED_FILTER_MASK,
       .primary_compare_data          = ADVANCED_PRIORITY_FILTER_DATA,
       .secondary_compare_data       = ADVANCED_SECONDARY_FILTER_DATA,
       .priority_interrupt_bit_select = ADVANCED_PRIORITY_INTERRUPT_BIT,

## Data Structure Documentation

### ◆ sci_lin_timer_setting_t

| struct sci_lin_timer_setting_t | | |
|---|---|---|
| Register settings for configuring the LIN timer | | |
| Data Fields | | |
| uint8_t | tcss | LIN timer count clock source selection. |
| uint8_t | break_field_tpre | Break field prescaler. |
| uint8_t | break_field_tcnt | Break field count value. |
| uint8_t | delimiter_tpre | Break delimiter prescaler. |
| uint8_t | delimiter_tcnt | Break delimiter count value. |

### ◆ sci_lin_baud_setting_t

| struct sci_lin_baud_setting_t | | |
|---|---|---|
| Register settings for achieving a desired baud rate. | | |
| Data Fields | | |
| sci_lin_timer_setting_t | timer_setting | Break field timer settings associated with this baud rate. |
| union sci_lin_baud_setting_t | __unnamed__ | |
| uint8_t | brr | Bit Rate Register setting. |
| uint8_t | cks: 2 | CKS value to get divisor. |

### ◆ sci_lin_id_filter_setting_t

| struct sci_lin_id_filter_setting_t | | |
|---|---|---|
| Parameters for configuring the ID filter settings | | |
| Data Fields | | |
| uint8_t | compare_data_mask | Bit mask applied before comparing the received PID to the compare data. Selects which bits of the selected compare data must match. |
| | | |

| | | |
|---|---|---|
| uint8_t | primary_compare_data | Primary compare data |
| uint8_t | secondary_compare_data | Secondary compare data |
| uint8_t | priority_interrupt_bit_select: 3 | Specify ONE of bits 0 to 7 of Control Field 1 as the priority interrupt bit. 0 is bit 0 of the PID, 1 is bit 1 of the PID, and so on. |
| uint8_t | priority_interrupt_enable: 1 | Set to 1 to enable the priority interrupt bit filter specified by priority_interrupt_bit_select, 0 to disable. When this bit is 1, regardless of the compare_data_select setting value, the bit specified by priority_interrupt_bit_select is compared with the Primary comparison data for Control Field 1 (primary_compare_data). |
| uint8_t | compare_data_select: 2 | Select the compare data for Control Field 1 (priority, secondary, or both). See sci_lin_compare_data_select_t |
| uint8_t | __pad0__: 2 | |

### ◆ sci_lin_baud_params_t

| struct sci_lin_baud_params_t | | |
|---|---|---|
| Parameters for baud and timer setting calculation | | |
| Data Fields | | |
| uint32_t | baudrate | Desired baudrate. |
| uint16_t | break_bits | Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits. |
| uint8_t | delimiter_bits | Break delimeter length setting (at least 1 nominal bit time long). |
| sci_lin_base_clock_t | base_clock_cycles_per_bit | Number of base clock cycles for 1-bit period. |

### ◆ sci_lin_extended_cfg_t

| struct sci_lin_extended_cfg_t | | |
|---|---|---|
| SCI LIN extended configuration | | |
| Data Fields | | |
| sci_lin_digital_filter_clock_t | digital_filter_clock | Digital filter setting. See |

| | | |
|---|---|---|
| | | sci_lin_digital_filter_clock_t. |
| sci_lin_bus_conflict_clock_t | bus_conflict_clock | Bus conflict detection clock setting. See sci_lin_bus_conflict_clock_t. |
| uint16_t | break_bits | Master mode: Number of break field bits to transmit. Slave mode: Number of break field threshold bits. |
| uint8_t | delimiter_bits | Break delimeter length setting (at least 1 nominal bit time long). |
| sci_lin_baud_setting_t * | p_baud_setting | Register settings for a desired baud rate. |
| sci_lin_id_filter_setting_t | filter_setting | ID filter setting. |
| IRQn_Type | scix0_irq | Break field low width IRQ number. |
| IRQn_Type | scix1_irq | Control field 0-1 match / Priority interrupt bit detect IRQ number. |
| IRQn_Type | scix2_irq | Bus collision detect IRQ number. |
| IRQn_Type | scix3_irq | Valid edge detect IRQ number. |
| IRQn_Type | rxi_irq | Receive interrupt IRQ number. |
| IRQn_Type | txi_irq | Transmit interrupt IRQ number. |
| IRQn_Type | tei_irq | Transmit end interrupt IRQ number. |
| IRQn_Type | eri_irq | Error interrupt IRQ number. |
| uint8_t | scix0_ipl | Break field low width interrupt priority. |
| uint8_t | scix1_ipl | Control field 0-1 match / Priority interrupt bit detect interrupt priority. |
| uint8_t | scix2_ipl | Bus collision detect interrupt priority. |
| uint8_t | scix3_ipl | Valid edge detect interrupt priority. |
| uint8_t | rxi_ipl | Receive interrupt priority. |
| uint8_t | txi_ipl | Transmit interrupt priority. |
| uint8_t | tei_ipl | Transmit end interrupt priority. |
| uint8_t | eri_ipl | Error interrupt priority. |

### ◆ sci_lin_instance_ctrl_t

| struct sci_lin_instance_ctrl_t |
| --- |
| LIN Instance Control Block. DO NOT INITIALIZE. |

## Enumeration Type Documentation

### ◆ sci_lin_priority_interrupt_bit_t

| enum sci_lin_priority_interrupt_bit_t | |
| --- | --- |
| Priority interrupt bit options for ID filtering. | |
| Enumerator | |
| SCI_LIN_PRIORITY_INTERRUPT_BIT_DISABLE | Disable the priority interrupt bit. |
| SCI_LIN_PRIORITY_INTERRUPT_BIT_ENABLE | Enable the priority interrupt bit. |

### ◆ sci_lin_compare_data_select_t

| enum sci_lin_compare_data_select_t | |
| --- | --- |
| Compare Data Select options for ID filtering. | |
| Enumerator | |
| SCI_LIN_COMPARE_DATA_SELECT_PRIORITY | Deprecated. |
| SCI_LIN_COMPARE_DATA_SELECT_PRIMARY | Select the primary compare data filter as the compare data. |
| SCI_LIN_COMPARE_DATA_SELECT_SECONDARY | Select the secondary compare data filter as the compare data. |
| SCI_LIN_COMPARE_DATA_SELECT_BOTH | Select both the priority/primary compare data filter and the secondary compare data filter as the compare data. The priority filter will be checked first. |

### ◆ sci_lin_timer_divider_t

| enum sci_lin_timer_divider_t | |
|---|---|
| LIN timer divider selection. | |
| Enumerator | |
| SCI_LIN_TIMER_DIV_1 | LIN timer frequency is PCLK/1. |
| SCI_LIN_TIMER_DIV_2 | LIN timer frequency is PCLK/2. |
| SCI_LIN_TIMER_DIV_4 | LIN timer frequency is PCLK/4. |
| SCI_LIN_TIMER_DIV_8 | LIN timer frequency is PCLK/8. |
| SCI_LIN_TIMER_DIV_16 | LIN timer frequency is PCLK/16. |
| SCI_LIN_TIMER_DIV_32 | LIN timer frequency is PCLK/32. |
| SCI_LIN_TIMER_DIV_64 | LIN timer frequency is PCLK/64. |
| SCI_LIN_TIMER_DIV_128 | LIN timer frequency is PCLK/128. |

### ◆ sci_lin_digital_filter_clock_t

| enum sci_lin_digital_filter_clock_t | |
|---|---|
| Digital filter configuration. | |
| Enumerator | |
| SCI_LIN_DIGITAL_FILTER_CLOCK_DISABLED | Filter is disabled. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_SCI_BASE_CLK | Filter clock is SCI base clock. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_PCLK_DIV_8 | Filter clock is PCLK/8. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_PCLK_DIV_16 | Filter clock is PCLK/16. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_PCLK_DIV_32 | Filter clock is PCLK/32. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_PCLK_DIV_64 | Filter clock is PCLK/64. |
| SCI_LIN_DIGITAL_FILTER_CLOCK_PCLK_DIV_128 | Filter clock is PCLK/128. |

### ◆ sci_lin_bus_conflict_clock_t

| enum sci_lin_bus_conflict_clock_t | |
|---|---|
| Bus conflict detection clock selection. The period of the SCI base clock is 1/16 of a single bit period when the SCIn.SEMR.ABCS is 0, and 1/8 of a single bit period when the SCIn.SEMR.ABCS is 1. | |
| Enumerator | |
| SCI_LIN_BUS_CONFLICT_CLOCK_DIV_1 | Bus conflict detection clock is base clock. |
| SCI_LIN_BUS_CONFLICT_CLOCK_DIV_2 | Bus conflict detection clock is base clock/2. |
| SCI_LIN_BUS_CONFLICT_CLOCK_DIV_4 | Bus conflict detection clock is base clock/4. |

### ◆ sci_lin_base_clock_t

| enum sci_lin_base_clock_t | |
|---|---|
| Asynchronous Mode Base Clock Select. The period of the SCI base clock is 1/16 of a single bit period when the SCIn.SEMR.ABCS is 0, and 1/8 of a single bit period when the SCIn.SEMR.ABCS is 1. | |
| Enumerator | |
| SCI_LIN_BASE_CLOCK_16 | Select 16 base clock cycles for 1-bit period. |
| SCI_LIN_BASE_CLOCK_8 | Select 8 base clock cycles for 1-bit period. |

## Function Documentation

### ◆ R_SCI_LIN_Open()

fsp_err_t R_SCI_LIN_Open ( lin_ctrl_t *const *p_api_ctrl*, lin_cfg_t const *const *p_cfg* )

Configures the LIN driver channel based on the input configuration.

Implements lin_api_t::open.

Example:

```
/* Open the LIN instance with initial configuration. */
fsp_err_t err = R_SCI_LIN_Open(&g_master_ctrl, &g_master_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or configuration structure is NULL. |
| FSP_ERR_INVALID_CHANNEL | The requested channel does not exist on this MCU or the channel does not support LIN mode. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_MODE | Setting not supported for selected mode |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_Write()

fsp_err_t R_SCI_LIN_Write ( lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking transmission of a LIN frame.

In master mode, the LIN header (break, sync and protected identifier) is sent before the LIN data.

- To transmit the LIN header only, set p_transfer_params->p_data to NULL.
- To transmit both header and data, set p_transfer_params->p_data to the TX buffer to transmit.

The LIN header is not transmitted in slave mode. Set p_transfer_params->p_data to the TX buffer to transmit.

On successful header-only transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_HEADER_COMPLETE. On successful data transmission or header+data transmission completion, the callback is called with event lin_event_t::LIN_EVENT_TX_DATA_COMPLETE.

Implements lin_api_t::write.

Example:

```
lin_transfer_params_t write_params =
   {
      .checksum_type = LIN_CHECKSUM_TYPE_ENHANCED,
      .id            = FRAME_ID,
      .num_bytes     = TRANSFER_LENGTH,
      .p_data        = g_tx_buf
   };
/* Send the LIN data. In master mode, the header (break, sync, and protected
identifier) will be sent before the data. */
   err = R_SCI_LIN_Write(&g_master_ctrl, &write_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SCI_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_Read()

fsp_err_t R_SCI_LIN_Read ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* )

Begins non-blocking data reception to receive user specified number of bytes into destination buffer pointer.

The checksum type specifies the checksum type used for validation. If a non-standard algorithm is used, or the application prefers to validate the checksum outside the driver, or the application prefers to skip checksum validation, specify lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE. If checksum validation is skipped, the lin_checksum_type_t::LIN_EVENT_ERR_INVALID_CHECKSUM event is not possible. When lin_checksum_type_t::LIN_CHECKSUM_TYPE_NONE is used, the number of bytes specified in the receive buffer length will be received (the driver will not expect to receive an additional 1 checksum byte), so if a non-standard checksum is used, sufficient space must be allocated in the write buffer and accounted for in the provided length.

On successful data reception completion, the callback is called with event lin_event_t::LIN_EVENT_RX_DATA_COMPLETE.

Implements lin_api_t::read.

Example:

```
/* Begin reception of the data */
   err = R_SCI_LIN_Read(&g_master_ctrl, &read_params);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception started successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block, transfer parameters, or tx/rx buffer is NULL, or 0 bytes length provided |
| FSP_ERR_IN_USE | A transmission or reception is currently in progress. Call R_SCI_LIN_CommunicationAbort to cancel it if desired, or wait for the current transfer operation to complete before starting a new one. |
| FSP_ERR_INVALID_CALL | Data reception is not possible because a header frame has not been received yet (slave mode only). |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_CommunicationAbort()

fsp_err_t R_SCI_LIN_CommunicationAbort ( lin_ctrl_t *const *p_api_ctrl*)

Cancels in progress frame data read or write, or header read or write. Break field reception cannot be cancelled. For slave nodes, reception of a new header is still enabled after a call to this function.

Implements lin_api_t::communicationAbort.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transfer aborted successfully or no transfer was in progress. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_CallbackSet()

fsp_err_t R_SCI_LIN_CallbackSet ( lin_ctrl_t *const *p_api_ctrl*, void(*)(lin_callback_args_t *) *p_callback*, void *const *p_context*, lin_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure.

Implements lin_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or callback is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_BaudCalculate()

fsp_err_t R_SCI_LIN_BaudCalculate ( sci_lin_baud_params_t const *const *p_baud_params*, sci_lin_baud_setting_t *const *p_baud_setting* )

Calculates baud rate and LIN timer (TCNT, TPRE and TCSS) register settings. This function evaluates and determines the most accurate settings for the baud rate and timer related registers.

The LIN timer setting is used for break field transmission/detection. Because the timer setting is specified in terms of bits, and the duration of a bit varies depending on baud rate, the baud rate register settings and timer register settings are related. The smallest possible LIN timer divider which can achieve the desired break field bits setting at the configured baud rate is selected to provide the highest measurement accuracy.

The baud rate cannot be updated at runtime with this function. This function is provided to ease configuration of the initial baud settings.

**Parameters**

| | | |
|---|---|---|
| [in] | p_baud_params | Parameters required to calculate the baud rate |
| [out] | p_baud_setting | If calculation succeeds, contains computed values to achieve requested baud rate. If calculation fails, the input structure is not modified. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Register settings updated in provided p_baud_setting |
| FSP_ERR_ASSERTION | p_baud_setting was NULL |
| FSP_ERR_INVALID_ARGUMENT | Cannot achieve combination of break field bits and baudrate with provided settings or p_baud_params->baudrate was 0 or p_baud_params->break_bits was 0 |

### ◆ R_SCI_LIN_IdFilterSet()

fsp_err_t R_SCI_LIN_IdFilterSet ( lin_ctrl_t *const *p_api_ctrl*, sci_lin_id_filter_setting_t const *const *p_config* )

Set the the ID filter settings for filtering control field 1 (PID byte).

NOTE: Setting the ID filter will abort any in-progress LIN header reception, as the ID filter settings cannot be changed during reception of the header. The next header will be received with the new settings.

```
/* Configure the ID filter */
   err = R_SCI_LIN_IdFilterSet(&g_slave_ctrl, &filter);
```

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [in] | p_config | The ID filter settings to apply |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_IdFilterGet()

fsp_err_t R_SCI_LIN_IdFilterGet ( lin_ctrl_t *const *p_api_ctrl*, sci_lin_id_filter_setting_t *const *p_config* )

Returns the currently configured ID filter settings.

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to the LIN control block. |
| [out] | p_config | The current ID filter settings |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID filter updated successfully. |
| FSP_ERR_ASSERTION | Pointer to LIN control block or p_config is NULL. |
| FSP_ERR_INVALID_MODE | Function called by master node (not supported for master nodes) |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_Close()

fsp_err_t R_SCI_LIN_Close ( lin_ctrl_t *const *p_api_ctrl*)

Closes the LIN driver.

Implements lin_api_t::close.

Example:

```
/* Close the driver */
   err = R_SCI_LIN_Close(&g_master_ctrl);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to LIN control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_WakeupSend()

fsp_err_t R_SCI_LIN_WakeupSend ( lin_ctrl_t *const *p_api_ctrl*)

Send wakeup is not supported on the SCI LIN driver.

Implements lin_api_t::wakeupSend.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_LIN_SleepEnter()

fsp_err_t R_SCI_LIN_SleepEnter ( lin_ctrl_t *const *p_api_ctrl*)

Sleep is not supported on the SCI LIN driver.

Implements lin_api_t::sleepEnter.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_LIN_SleepExit()

fsp_err_t R_SCI_LIN_SleepExit ( lin_ctrl_t *const *p_api_ctrl*)

Sleep is not supported on the SCI LIN driver.

Implements lin_api_t::sleepExit.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function not supported in this implementation. |

### ◆ R_SCI_LIN_InformationFrameRead()

fsp_err_t R_SCI_LIN_InformationFrameRead ( lin_ctrl_t *const *p_api_ctrl*, lin_transfer_params_t *const *p_transfer_params* )

[DEPRECATED] Use R_SCI_LIN_Read.

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_LIN_StartFrameWrite()

| fsp_err_t R_SCI_LIN_StartFrameWrite ( lin_ctrl_t *const *p_api_ctrl*, uint8_t const *id* ) |
|---|
| [DEPRECATED] Use R_SCI_LIN_Write<br><br>**Returns**<br>See Common Error Codes or functions called by this function for other possible return codes. |

### ◆ R_SCI_LIN_InformationFrameWrite()

| fsp_err_t R_SCI_LIN_InformationFrameWrite ( lin_ctrl_t *const *p_api_ctrl*, const lin_transfer_params_t *const *p_transfer_params* ) |
|---|
| [DEPRECATED] Use R_SCI_LIN_Write<br><br>**Returns**<br>See Common Error Codes or functions called by this function for other possible return codes. |

### Detailed Description

Middleware to implement the SMBUS communications interface. This module implements the Communications Middleware Interface.

# Overview

The RM_COMMS_SMBUS module implements COMMS API for SMBUS interface.

RM_COMMS_SMBUS supports SMBus protocol on following modules:

- R_IIC_MASTER
- R_IIC_B_MASTER

### Features

Supported SMBUS command:

- Send byte
- Receive byte
- Write byte
- Write word

- Read byte
- Read word
- Read block

Packet error check is supported by software CRC-8 (x^8 + x^2 + x + 1).

Supported RTOS (FreeRTOS and AzureOS).

# Configuration

### Build Time Configurations for rm_comms_smbus

The following build time configurations are defined in fsp_cfg/rm_comms_smbus_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Connectivity > SMBus Communication Device (rm_comms_smbus)

This module can be added to the Stacks tab via New Stack > Connectivity > SMBus Communication Device (rm_comms_smbus).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Manual Entry | g_comms_smbus0 | Module name. |
| Callback | Name must be a valid C symbol | comms_smbus_callback | A user callback function can be provided. |
| Semaphore Timeout (RTOS only) | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for semaphore operation in using RTOS. |
| Slave Address | Value must be non-negative | 0x00 | Specify the slave address. |
| CRC support | • Enable<br>• Disable | Enable | Use CRC-8 algorithm to generate PEC byte for SMBus communication. |

### Pin Configuration

This module uses SDA and SCL pins of I2C Master

# Usage Notes

If an RTOS is used, blocking and bus lock is available.

- If blocking of an SMBus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

If an RTOS is used and blocking and bus lock is enabled, RM_COMMS_SMBUS_Write(), RM_COMMS_SMBUS_Read() and RM_COMMS_SMBUS_WriteRead() cannot be called in callback.

Dependency module General PWM Timer (GPT) and Event Link Controller (ELC) need to be openned before opening SMBus comms device.

Protocol support by SMBUS API:

- RM_COMMS_SMBUS_Write(): Send byte, Write byte, Write word.
- RM_COMMS_SMBUS_Read(): Receive byte protocol.
- RM_COMMS_SMBUS_WriteRead(): Read byte, read word, block read.

Warning

The recommended frequency of PCLKB (when using r_iic_master) or I3CCLK (when using r_iic_b_master) is in range of 1 MHz - 86 MHz. If the frequency too high, the middleware will not able to meet the 300 ns of data hold time of SMBUS standard. On the contrary, the low frequency may cause the count of BRL smaller than SDA delay count which will lead to communication between devices might malfunction or falsely indicate a start or stop condition, depending on the bus state.

### Bus Initialization

The SMBUS communications interface expects a bus instance to be opened before opening any specific SMBUS comms device. The communications interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate SMBUS Communication Device (rm_comms_smbus) open call.

## Examples

### Basic Example

This is a basic example of minimal use of SMBus communications implementation in an application.

```
void rm_comms_smbus_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the relevant drivers if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_comms_i2c_extend =
       ((rm_comms_smbus_extended_cfg_t *)
(g_comms_smbus_cfg.p_extend))->p_comms_i2c_extend_cfg;
 i2c_master_instance_t * p_driver_iic   = (i2c_master_instance_t *)
p_comms_i2c_extend->p_driver_instance;
 elc_instance_t       * p_driver_elc   = (elc_instance_t *)
p_comms_i2c_extend->p_elc;
 timer_instance_t      * p_driver_timer = (timer_instance_t *)
p_comms_i2c_extend->p_timer;
```

```
    p_driver_iic->p_api->open(p_driver_iic->p_ctrl, p_driver_iic->p_cfg);
    p_driver_elc->p_api->open(p_driver_elc->p_ctrl, p_driver_elc->p_cfg);
    p_driver_timer->p_api->open(p_driver_timer->p_ctrl, p_driver_timer->p_cfg);
#if (BSP_CFG_RTOS != 0)
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_comms_i2c_extend->p_blocking_semaphore)
    {
 #if (BSP_CFG_RTOS == 1) // AzureOS

tx_semaphore_create(p_comms_i2c_extend->p_blocking_semaphore->p_semaphore_handle,

p_comms_i2c_extend->p_blocking_semaphore->p_semaphore_name,
                            (ULONG) 0);
 #elif (BSP_CFG_RTOS == 2) // FreeRTOS
       *(p_comms_i2c_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_comms_i2c_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_comms_i2c_extend->p_bus_recursive_mutex)
    {
 #if (BSP_CFG_RTOS == 1) // AzureOS
       tx_mutex_create(p_comms_i2c_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_comms_i2c_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif (BSP_CFG_RTOS == 2) // FreeRTOS
       *(p_comms_i2c_extend->p_bus_recursive_mutex->p_mutex_handle) =
            xSemaphoreCreateRecursiveMutexStatic(p_comms_i2c_extend->p_bus_recursive_
mutex->p_mutex_memory);
 #endif
    }
```

## Function Documentation

### ◆ RM_COMMS_SMBUS_Open()

fsp_err_t RM_COMMS_SMBUS_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the SMBUS Comms module. Implements rm_comms_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Communications Middle module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SMBUS_Close()

fsp_err_t RM_COMMS_SMBUS_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SMBUS Comms module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_SMBUS_CallbackSet()

fsp_err_t RM_COMMS_SMBUS_CallbackSet ( rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context* )

Updates the SMBUS Comms callback. Implements rm_comms_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_SMBUS_Read()

fsp_err_t RM_COMMS_SMBUS_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the SMBUS device. Implements rm_comms_api_t::read.

***Note***

*When Packet Error Check (PEC) is used, size of destination buffer and the number of reading bytes must have 1-byte in addition for PEC byte.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | Read data size is invalid. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SMBUS_Write()

fsp_err_t RM_COMMS_SMBUS_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write from the SMBUS device. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | Transfer data size is invalid. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SMBUS_WriteRead()

fsp_err_t RM_COMMS_SMBUS_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs a write to, then a read from the SMBUS device. Implements rm_comms_api_t::writeRead.

***Note***

*When Packet Error Check (PEC) is used, size of destination buffer and the number of reading bytes must have 1-byte in addition for PEC byte.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | Transfer data size is invalid. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SMCI Interface.

# Overview

### Features

The SCI SMCI module supports the following features:

- Abort in-progress read/write operations
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, RX char, error, etc)
- Transfer mode (normal and block) and data convention type change at run time.
- All channels with SMCI support shall be configurable by the driver
- Baud-rate (and ETU) calculation and change based on ISO7816 asynchronous parameters at run-time. ETU is 1/baud.
- Error notifications of parity error, error signal reception (guard time) and overrun.
- Clock output control

# Configuration

### Build Time Configurations for r_sci_smci

The following build time configurations are defined in fsp_cfg/r_sci_smci_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Connectivity > SMCI (r_sci_smci)

This module can be added to the Stacks tab via New Stack > Connectivity > SMCI (r_sci_smci). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |

| | | | |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_smci0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Baud | | | |
| Baud Rate | Value must be an integer greater than 0 | 9600 | Enter the desired baud rate.<br><br>If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure. |
| Clock conversion integer | Refer to the RA Configuration tool for available options. | F=372 fmax=5MHz D=1 | Clock rate conversion integer is one of transmission parameters defined by ISO7816-3 as F and also decodes to f-max of the output clock. |
| Max Error (%) | Must be a valid non negative integer with a maximum configurable value of 100 | 5 | Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings.<br><br>NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated baud_setting_t structure. |
| Interrupts | | | |
| Callback | Name must be a valid C symbol | user_smci_callback | A user callback function can be |

| | | |
|---|---|---|
| | | provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| Receive Interrupt Priority | MCU Specific Options | Select the receive interrupt priority. |
| Transmit Data Empty Interrupt Priority | MCU Specific Options | Select the transmit interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | Select the error interrupt priority. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA2L2 | PCLKB |
| RA2T1 | PCLKB |
| RA4C1 | PCLKA |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4L1 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |

| | |
|---|---|
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

The clock source for the baud-rate clock generator is the PCLK. It is scaled by the SMR_SMCI.CKS bits to achieve the requested baud rate. This is done in R_SCI_SMCI_BaudSet routine.

**Pin Configuration**

This module uses TXDx and RXDx to communicate to external devices. TXDx and RXDx need to be tied together and pulled up to VCC externally via a pullup resistor and connected to the DATA line of a connected card.

The SmartCard clock signal is generated by the SMCI module on the SCKx pin. The clock frequency produced by the module is (baudrate * F) / D. The ISO specification defines the valid maximum frequency range as 4Mhz to 20MHz; only certain combinations of Fi, Di and f(max) are allowed.

When writing the application for the driver, the application developer must also allocate a software controlled Reset line via a GPIO. This will allow the reliable receipt of the ATR message. Optionally, VCC and VPP can also be controlled by a GPIO output, so that cold starts can be forced.

# Usage Notes

The SMCI module is compliant to ISO7816-3. SMCI is a half duplex interface. Direct convention in T0 mode is the default. The driver supports both direct and indirect (inverted) modes of transmission. It also supports GSM mode in which the output clock can be enabled and disabled while the interface is still active. If it is known that the device connected is a device in inverse convention, the convention can be changed with smci_api_t::transferModeSet() after calling open.

The MCU creates the clock for the attached SMCI device based on the initial baudrate setting. Upon reset the SmartCard device advertises the Di and Fi parameters as well as the max clock speed it can handle. The Di and Fi parameters dictate at what rate the SmartCard device can sample the data line as a function of the supplied clock generated by the RA MCU. Only certain combinations of D and F are supported by the SMCI on SCI module. Only combinations where the the ratio of S=F/D corresponds to a value of S of 32, 64, 93, 128, 186, 256, 372, or 512 (for example see Table "Base clock settings in smart card interface mode" in the SCI section of the relevant hardware manual).

The baud rate (1/ETU) can be changed while the device is open to allow for speed negotiation based on the attached device's capabilities.

The SMCI module does not contain a FIFO, and as such the receipt of multi-byte data has to be handled by interrupt initiated callback. The application developer must develop their callback so that the receipt of data is handled sufficiently without receiver overrun. If the read routine is called with a length=0, every receive interrupt will initiate a call to the user's callback. If the read is called with a non-zero length... the interrupt will fill the user's read buffer and initiate the callback after the last byte is complete. In many cases, the user can send an event from their callback so that the reading routine can wait for the event with a timeout. If a timeout occurs, the user can return the read state machine to an idle state by calling the read routine with a length of 0.

### Limitations

# Examples

### SCI SMCI Example

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sci_smci_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the smci instance with initial configuration. */
 fsp_err_t err = R_SCI_SMCI_Open(&g_smci0_ctrl, &g_smci0_cfg);
    assert(FSP_SUCCESS == err);
 /* Need to have clock on inorder to receive or transmit*/
 R_SCI_SMCI_ClockControl(&g_smci0_ctrl, true);
    err = R_SCI_SMCI_Read(&g_smci0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_SMCI_Write(&g_smci0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void user_smci_callback (smci_callback_args_t * p_args)
```

```
{
 /* Handle the SMCI event */
 switch (p_args->event)
    {
 /* Received a character */
 case SMCI_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
                g_out_of_band_received[g_out_of_band_index++] = p_args->data;
      }
 break;
      }
 /* Receive complete */
 case SMCI_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case SMCI_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

### SCI SMCI Baud Set Example

```
#define SCI_SMCI_BAUDRATE_28800 (28800)
#define SCI_SMCI_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_smci_baud_example (void)
{
 smci_speed_params_t speed_settings;
 smci_baud_setting_t baud_setting;
    speed_settings.baudrate = SCI_SMCI_BAUDRATE_28800;
    speed_settings.fi       = SMCI_CLOCK_CONVERSION_INTEGER_512_5;
    speed_settings.di       = SMCI_BAUDRATE_ADJUSTMENT_INTEGER_4;
 fsp_err_t err = R_SCI_SMCI_BaudCalculate(&speed_settings,
SCI_SMCI_BAUDRATE_ERROR_PERCENT_5, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_SMCI_BaudSet(&g_smci0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

## Function Documentation

### ◆ R_SCI_SMCI_Open()

fsp_err_t R_SCI_SMCI_Open ( smci_ctrl_t *const *p_api_ctrl*, smci_cfg_t const *const *p_cfg* )

Configures the Smart Card Interface driver based on the input configurations. The interface stays in the clock-off state without enabling reception at the end of this function. ISO7816-3 default communication parameters are used to initial ize SMCI port speed and parameters, as the ATR message is always sent in that format. Only if Inverse convention is expected should the transfer mode be changed after reset. Implements smci_api_t::open

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in] | p_cfg | Pointer to the config structure that shall be used to set parameters of the SMCI baud calculations needed to be have done and set into p_cfg->p_extend->p_smci_baud_setting |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or configuration structure is NULL. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The requested channel does not exist on this MCU. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_SMCI_Write()

fsp_err_t R_SCI_SMCI_Write ( smci_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes* )

Transmits user specified number of bytes from the source buffer pointer. Implements smci_api_t::write

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in] | p_src | Pointer to buffer that will be written out |
| [in] | bytes | Number of bytes to be transferred |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data transmission started successfully. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A SMCI transmission is in progress |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_SMCI_Read()

fsp_err_t R_SCI_SMCI_Read ( smci_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Receives user specified number of bytes into destination buffer pointer. Receiving is done at the isr level as there is no FIFO. If 0 is passed in as the length, reception will always invoke the user callback. Implements smci_api_t::read

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be opened |
| [in,out] | p_dest | Pointer to the buffer top be read into |
| [in] | bytes | Number of bytes to copy from the SMCI receive register |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data reception successfully ends. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or read buffer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_IN_USE | A previous read operation is still in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_SMCI_TransferModeSet()

fsp_err_t R_SCI_SMCI_TransferModeSet ( smci_ctrl_t *const *p_api_ctrl*, smci_transfer_mode_t const *const *p_transfer_mode_params* )

Updates the settings of block transfer mode and data transfer convention. The SCMR and SMR_SMCI registers will be set according to the input arguments of protocol type, data convention type, and mode. Implements smci_api_t::transferModeSet

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be modified |
| [in] | p_transfer_mode_params | Pointer to SMCI settings like protocol, convention, and gsm_mode |

**Warning**

This terminates any in-progress transmission and reception.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transfer mode and data transfer direction was successfully changed. |
| FSP_ERR_IN_USE | Unable to change transfer mode as device has clock off or is actively RX or TX |
| FSP_ERR_ASSERTION | Null pointer was passed as a parameter |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ R_SCI_SMCI_BaudSet()

fsp_err_t R_SCI_SMCI_BaudSet ( smci_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting* )

Updates the baud rate and clock output. p_baud_setting is a pointer to a smci_baud_setting_t structure that needs to have already been filled by R_SCI_SMCI_BaudCalculate Implements smci_api_t::baudSet

**Warning**

This terminates any in-progress transmission.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block that is to be modified |
| [in] | p_baud_setting | Pointer to baud setting information to be written to the SMCI hardware registers |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block or p_baud_setting is NUL |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_ARGUMENT | The p_baud_setting does not seem to be set correctly |

### ◆ R_SCI_SMCI_StatusGet()

fsp_err_t R_SCI_SMCI_StatusGet ( smci_ctrl_t *const *p_api_ctrl*, smci_status_t *const *p_status* )

Provides the state of the driver and the # of bytes received since read was called Implements smci_api_t::statusGet

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to SMCI control block of this SMCI instance |
| [out] | p_status | Pointer structure that will be filled in with status info |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in provided p_info. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block, or info structure is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_SMCI_ClockControl()

fsp_err_t R_SCI_SMCI_ClockControl ( smci_ctrl_t *const *p_api_ctrl*, bool *clock_enable* )

Enable or disable the clock signal that is provided by interface the baud rate. When the clock is enabled, reception is enabled at the end of this function. Clock output control as defined in "Clock Output Control" of "Operation in Smart Card Interface Mode" in the SCI section of the relevant hardware manual. Implements smci_api_t::clockControl

**Warning**

This terminates any in-progress transmission and reception.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_api_ctrl | Pointer to SMCI control block |
| [in] | clock_enable | true=Enable or false=disable the Smart Card Interface clock |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Clock output setting was successfully changed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_MODE | Clock cannot be disabled if GSM mode isnt active |

### ◆ R_SCI_SMCI_CallbackSet()

fsp_err_t R_SCI_SMCI_CallbackSet ( smci_ctrl_t *const *p_api_ctrl*, void(*)(smci_callback_args_t *) *p_callback*, void *const *p_context*, smci_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements smci_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_SMCI_Close()

fsp_err_t R_SCI_SMCI_Close ( smci_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Implements smci_api_t::close

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | Pointer to SMCI control block that is reqested to close |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to SMCI control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_SCI_SMCI_BaudCalculate()

fsp_err_t R_SCI_SMCI_BaudCalculate ( smci_speed_params_t const *const *p_speed_params*, uint32_t *baud_rate_error_x_1000*, void *const *p_baud_setting* )

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers. And then updates the SCI registers.

**Parameters**

| | | |
|---|---|---|
| [in] | p_speed_params | structure including speed defining paramets, baud, F, D, and max frequency |
| [in] | baud_rate_error_x_1000 | <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 20000 (20%) according to the ISO spec. |
| [out] | p_baud_setting | Baud setting information stored here if successful |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate setting calculation successful |
| FSP_ERR_ASSERTION | p_speed params or p_baud is a null pointer |
| FSP_ERR_INVALID_ARGUMENT | Baud rate is '0', freq is '0', or error in calculated baud rate is larger than 20%. |

### 5.2.6.22 SPI (r_sau_spi)

Modules » Connectivity

#### Functions

|---|---|
| fsp_err_t | R_SAU_SPI_Open (spi_ctrl_t *p_api_ctrl, spi_cfg_t const *const p_cfg) |
| fsp_err_t | R_SAU_SPI_Read (spi_ctrl_t *const p_api_ctrl, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width) |
| fsp_err_t | R_SAU_SPI_Write (spi_ctrl_t *const p_api_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width) |
| fsp_err_t | R_SAU_SPI_WriteRead (spi_ctrl_t *const p_api_ctrl, void const *p_src, void *p_dest, uint32_t const length, spi_bit_width_t const bit_width) |
| fsp_err_t | R_SAU_SPI_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void *const p_context, spi_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_SAU_SPI_Close (spi_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_SAU_SPI_CalculateBitrate (uint32_t bitrate, sau_spi_div_setting_t *sclk_div, uint8_t sau_unit, uint8_t channel) |

#### Detailed Description

Driver for the SAU peripheral on RA MCUs. This module implements the SPI Interface.

# Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - Single Transfer Mode or Continuous Transfer Mode
  - Data Phase (DAPmn)
    - DAPmn=0 Data output starts from the start of the operation of the serial clock
    - DAPmn=1 Data output starts half a clock cycle before the start of the serial clock operation
  - Clock Phase (CKPmn)
    - CKPmn=0 Non-reverse
    - CKPmn=1 Reverse
  - MSB/LSB first
- DTC Support
- Callback Events
  - Transfer Complete

# Configuration

- RX Overflow Error (The SAU shift register is copied to the data register before previous data was read)

**Build Time Configurations for r_sau_spi**

The following build time configurations are defined in fsp_cfg/r_sau_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Critical Section Guarding | • Enabled<br>• Disabled | Disabled | Enable critical section guarding around peripheral configuration updates. This should be enabled if the R_SAU_I2C or R_SAU_UART module is being used simultaneously with this module. |
| Enable Single Channel | MCU Specific Options | | Enable single channel to reduce code size if only one channel is to be configured for SAU SPI. |
| Transfer Operating Mode | • Reception<br>• Transmission<br>• Transmission/ Reception | Transmission/Reception | Select transfer operation mode. |
| DTC Support | • Enabled<br>• Disabled | Disabled | Enable DTC support for the SAU SPI module. |
| Multiple Slave Compatibility Mode | • Enabled<br>• Disabled | Disabled | Enable multiple slave compatibility mode when SAU SPI is configured to slave mode for multiple-slave applications. |
| Continuous Transfer Mode | • Enabled<br>• Disabled | Enabled | Set to 'Enabled' if transfer in continuous mode is needed. |

### Configurations for Connectivity > SPI (r_sau_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sau_spi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | MCU Specific Options | | Select the SAU channel. |
| Operating Mode | • Master<br>• Slave | Master | Select the SPI operating mode. |
| Operation Clock | • CKm0<br>• CKm1 | CKm0 | Select the operation clock. Use the Clocks tab to set the operation clock divider. |
| Transfer Mode | • Single transfer mode<br>• Continuous transfer mode | Single transfer mode | Select transfer mode in transfer end interrupt. But buffer empty interrupt (in continuous transfer mode) cannot be selected in Slave Reception. |
| Bit Order | • MSB First<br>• LSB First | MSB First | Select of data transfer sequence. |
| Data Phase | • Data sampling on odd edge, data variation on even edge<br>• Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select when data output shall start compared with the serial clock operation. |
| Clock Phase | • High when idle<br>• Low when idle | High when idle | Select clock phase. |
| Bitrate | Value must be an integer greater than 0 | 500000 | Enter the desired bitrate.<br><br>If the requested bitrate cannot be achieved, adjust the operation clock frequency until the |

| | | | |
|---|---|---|---|
| | | | bitrate is achievable. The calculated bitrate is printed in a comment in the generated sau_spi_extended_cfg_t structure. |
| Callback | Name must be a valid C symbol | sau_spi_callback | A user callback function that is called from the sau spi interrupts when a transfer is completed or an error has occurred. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |

**Clock Configuration**

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

**Clock Phase/Polarity Configuration**

The following table illustrates the settings of the Clock Phase/Polarity corresponding SCRmn register DCP[1:0] bits in the SAU SPI.

| Clock Phase | Clock Polarity | DCP[1:0] Value |
|---|---|---|
| Data sampling on odd edge, data variation on even edge | High when idle | 0b00 |
| Data sampling on odd edge, data variation on even edge | Low when idle | 0b01 |
| Data sampling on even edge, data variation on odd edge | High when idle | 0b10 |
| Data sampling on even edge, data variation on odd edge | Low when idle | 0b11 |

**Pin Configuration**

This module uses SCKmn, SOmn, and SImn pins to communicate with on board devices.

*Note*

*It is recommended to configure the pins with high drive strength (or high-speed high if available) to maintain signal integrity, particularly at high bitrates. The drive strength can be set by opening the e2 studio pin configuration editor, selecting the pin, and configuring 'Drive Capacity'.*

### Enabling DTC with the SAU SPI

- DTC transfer is disabled by default. When DTC is enabled, error event will not be handled until transfer is completed.
- For further details on DTC please refer Transfer (r_dtc)

# Usage Notes

### Enabling Single Channel By User With The SAU SPI

- The Common > Single Channel property is used for reducing code size when only 1 SAU channel is to be configured for SAU SPI.
- Single Channel is configurable and disabled by default in the driver code.
- Note: Not all SAU channels are available on all pin layouts. Check the Hardware User Manual for your device to confirm available function assignment for each SAU channel.

### Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

### Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors.

To improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

### Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

### Single Channel Use Case

If only SAU channel 00 is to be used for I2C or SPI or UART, enable single channel can reduce the code size.

### Continuous Transfer Mode

- In SAU SPI slave mode, the maximum bit rate of continuous transmission is up to 2.5 MHz.
- If only single transfer mode is to be used for SAU SPI, disabling 'Common > Continuous Transfer Mode' can reduce the code size.

### Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ] where:

- SDRmn.STCLK is an integer in the range [0, 127] for SAU SPI
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]

percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested bitrate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

### Runtime bitrate calculation

The function R_SAU_SPI_CalculateBitrate can be used at runtime to calculate alternate bitrate settings.

This function computes settings with both operation clocks CK0 and CK1. If valid settings are possible with both clocks, it selects the settings and clock that would produce the lowest error.

Set the divisors for CK0 and CK01 in the clocks tab such that all required bitrate settings for the application are possible. A large range of bitrates can be achieved by having one "slow" operation clock for low speed modes and one "fast" operation clock for high speed modes.

### Limitations

- When multiple channels on the same SAU unit need to be used, and one is configured as I2C, then critical section property needs to be enabled.

## Examples

### Basic Example

This is a basic example of minimal use of the SAU_SPI in an application.

```
static volatile bool g_transfer_complete = false;

static void r_sau_spi_callback (spi_callback_args_t * p_args)

{

 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
```

```
    {
       g_transfer_complete = true;
    }
}
void sau_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SAU_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;

## Function Documentation

### ◆ R_SAU_SPI_Open()

fsp_err_t R_SAU_SPI_Open ( spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg* )

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SAU channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

### ◆ R_SAU_SPI_Read()

fsp_err_t R_SAU_SPI_Read ( spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Bit width is not 8 bits<br>• Length is equal to 0<br>• Pointer to destination is NULL |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SAU_SPI_Write()

fsp_err_t R_SAU_SPI_Write ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SAU_SPI_WriteRead()

fsp_err_t R_SAU_SPI_WriteRead ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Data frame length (Set to SPI_BIT_WIDTH_7_BITS or SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Pointer to destination is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SAU_SPI_CallbackSet()

fsp_err_t R_SAU_SPI_CallbackSet ( spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void *const *p_context*, spi_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_SAU_SPI_Close()

fsp_err_t R_SAU_SPI_Close ( spi_ctrl_t *const *p_api_ctrl*)

Disable the SAU channel and set the instance as not open. Implements spi_api_t::close.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to an opened instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

### ◆ R_SAU_SPI_CalculateBitrate()

fsp_err_t R_SAU_SPI_CalculateBitrate ( uint32_t *bitrate*, sau_spi_div_setting_t * *sclk_div*, uint8_t *sau_unit*, uint8_t *channel* )

Calculate the register settings required to achieve the desired bitrate.

***Note***

*This function calculates the bitrate settings with both operation clocks CK0 and CK1, then selects the operation clock and register setting combination that would produce the lowest error.*

**Parameters**

| | | |
|---|---|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 16,000,000 (max), etc. |
| [out] | sclk_div | Pointer to sau_spi_div_setting_t used to configure baudrate settings. |
| | sau_unit | SAU unit. |
| | channel | SAU channel. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Bitrate is calculated successfully. |
| FSP_ERR_ASSERTION | Bitrate is not achievable or not valid for the selected unit/channel. |

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.

# Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support (with or without FIFO mode)
- DMAC Support (with or without FIFO mode)
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

# Configuration

### Build Time Configurations for r_sci_b_spi

The following build time configurations are defined in fsp_cfg/r_sci_b_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Support for using a Transfer API | • Enabled<br>• Disabled | Enabled | Select whether to include support for DMAC or DTC transfers |

| | | | |
|---|---|---|---|
| | | | in the build. |
| FIFO Support | • Enabled<br>• Disabled | Disabled | Enable FIFO support for the SCI_B_SPI module. |

**Configurations for Connectivity > SPI (r_sci_b_spi)**

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_b_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_sci_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Operating Mode | • Master<br>• Slave | Master | Select the SPI operating mode. |
| Clock Phase | • Data sampling on odd edge, data variation on even edge<br>• Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | • Low when idle<br>• High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | • Enable<br>• Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | • MSB First<br>• LSB First | MSB First | Select the data bit order. |
| Clock Source | • PCLK<br>• SCISPICLK | PCLK | Select whether the peripheral clock (PCLK) or SCISPICLK is used for generating the SCK frequency. |
| Callback | Name must be a valid C symbol | sci_b_spi_callback | A user callback function that is called from the sci_b_spi interrupts when a transfer is completed or an error has occurred. |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |

| | | | |
|---|---|---|---|
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |
| Bitrate | Value must be an integer greater than 0 | 8000000 | Enter the desired bitrate.<br><br>If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The actual bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure. |
| Transmit FIFO Trigger Level | Refer to the RA Configuration tool for available options. | Disabled | Set to 1 to trigger DMAC/DTC TX FIFO reload immediately when each byte is transmitted. Set to 15 to trigger the reload when the FIFO is full or after 15 bit times with no data. |
| Receive Sampling Timing Adjustment (Master Only) | • Default (No Delay)<br>• 1 TCLK Cycle<br>• 2 TCLK Cycles<br>• 3 TCLK Cycles<br>• 4 TCLK Cycles | Default (No Delay) | Select the sampling timing delay of the RXDn pin (master mode only). Configuring this property may be required at high bitrates for the master to sample the received data accurately. This setting has no effect in slave mode. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA6T2 | PCLKA |
| RA8D1 | PCLKA |
| RA8D2 | PCLKA |

| | |
|---|---|
| RA8E1 | PCLKA |
| RA8E2 | PCLKA |
| RA8M1 | PCLKA |
| RA8M2 | PCLKA |
| RA8P1 | PCLKA |
| RA8T1 | PCLKA |
| RA8T2 | PCLKA |

The SCI peripheral uses the SCISPICLK/SCICLK or PCLKA for communication and PCLKA for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

### Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

*Note*

*It is recommended to configure the pins with high drive strength (or high-speed high if available) to maintain signal integrity, particularly at high bitrates. The drive strength can be set by opening the e2 studio pin configuration editor, selecting the pin, and configuring 'Drive Capacity'.*

# Usage Notes

### Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

### Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. This may also result in SPI_EVENT_ERR_READ_OVERFLOW errors.

In order to improve performance at high bit rates, consider the following recommendations:

- Enable DTC or DMAC. Note that DMAC will provide the best performance.
- Enable the Transmit Fifo Trigger in the module properties.
- Configure the Receive Sampling Timing Adjustment in the module properties (master mode only). For more information about Receive Sampling Timing Adjustment, refer to the diagram "Reception Sampling Timing Adjustment Operation in Clock Synchronous Mode (Master)" in the HW User's Manual for the selected MCU.
- When using DMAC, set the RX DMAC channel to a higher priority (lower channel number) than the TX channel.
- When using DMAC, consider pausing operation of higher-priority DMAC instances in the project during SPI transfers or reassigning priorities to ensure high-speed SPI channels have top priority to avoid bus contention.

### Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC or DMAC is not being used.

### Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

## Examples

### Basic Example

This is a basic example of minimal use of the SCI_B_SPI module in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_b_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
void sci_b_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SCI_B_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
```

```
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
 /* Assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_B_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

## Data Structures

| | |
|---|---|
| struct | sci_b_spi_div_setting_t |

## Data Structure Documentation

### ◆ sci_b_spi_div_setting_t

| struct sci_b_spi_div_setting_t |
| --- |
| Settings for adjusting the SPI CLK. |

### Function Documentation

#### ◆ R_SCI_B_SPI_Open()

fsp_err_t R_SCI_B_SPI_Open ( spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg* )

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

**Parameters**

| | |
| --- | --- |
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |
| FSP_ERR_UNSUPPORTED | Fifo mode is requested but a transfer interface is not used |

#### ◆ R_SCI_B_SPI_Read()

fsp_err_t R_SCI_B_SPI_Read ( spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.

- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Bit width is not 8 bits<br>• Length is equal to 0<br>• Pointer to destination is NULL<br>• Transfer length is larger than supported by the transfer instances. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_B_SPI_Write()

fsp_err_t R_SCI_B_SPI_Write ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits<br>• Transfer length is larger than supported by the transfer instances. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_B_SPI_WriteRead()

fsp_err_t R_SCI_B_SPI_WriteRead ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_B_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Pointer to destination is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits<br>• Transfer length is larger than supported by the transfer instances. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |

| | |
|---|---|
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_B_SPI_CallbackSet()

fsp_err_t R_SCI_B_SPI_CallbackSet ( spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void *const *p_context*, spi_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_B_SPI_Close()

fsp_err_t R_SCI_B_SPI_Close ( spi_ctrl_t *const *p_api_ctrl*)

Disable the SCI channel and set the instance as not open. Implements spi_api_t::close.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to an opened instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

### ◆ R_SCI_B_SPI_CalculateBitrate()

fsp_err_t R_SCI_B_SPI_CalculateBitrate ( uint32_t *bitrate*, sci_b_spi_clock_source_t *clock_source*, sci_b_spi_div_setting_t * *sclk_div* )

Calculate the register settings required to achieve the desired bitrate.

**Parameters**

| | | |
|---|---|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc. |
| | clock_source | clock source (PCLKA or SCISPICLK) used for bit rate calculation. |
| | sclk_div | Pointer to sci_b_spi_div_setting_t used to configure baudrate settings. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is set successfully. |
| FSP_ERR_ASSERTION | Baud rate is not achievable. |

***Note***

*The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.*

### Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the SPI Interface.

# Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Select data sampling on leading edge, data change on trailing edge
    - CPHA=1 Select data change on leading edge, data sampling on trailing edge
  - MSB/LSB first
- Configurable bit rate
- DTC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SCI shift register is copied to the data register before previous data was read)

# Configuration

### Build Time Configurations for r_sci_spi

The following build time configurations are defined in fsp_cfg/r_sci_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DTC Support | • Enabled<br>• Disabled | Enabled | If support for transferring data using the DTC will be compiled in. |

### Configurations for Connectivity > SPI (r_sci_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_sci_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SCI channel. |
| Operating Mode | • Master<br>• Slave | Master | Select the SPI operating mode. |
| Clock Phase | • Data sampling on odd edge, data variation on even edge<br>• Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | • Low when idle<br>• High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | • Enable<br>• Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | • MSB First<br>• LSB First | MSB First | Select the data bit order. |
| Callback | Name must be a valid C symbol | sci_spi_callback | A user callback function that is called from the sci spi interrupts when a transfer is completed or an error has occurred. |
| Receive Interrupt Priority | MCU Specific Options | | Select the receive interrupt priority. |
| Transmit Interrupt Priority | MCU Specific Options | | Select the transmit interrupt priority. |
| Transmit End Interrupt Priority | MCU Specific Options | | Select the transmit end interrupt priority. |
| Error Interrupt Priority | MCU Specific Options | | Select the error interrupt priority. |
| Bitrate | Value must be an integer greater than 0 | 8000000 | Enter the desired bitrate.<br><br>If the requested bitrate cannot be achieved, the settings with the |

| | | | |
|---|---|---|---|
| | | | largest possible value that is less than or equal to the requested bitrate is used. The actual bitrate is printed in a comment in the generated sci_spi_extended_cfg_t structure. |
| Bitrate Modulation | • Disabled<br>• Enabled | Disabled | Enabling bitrate modulation reduces the percent error of the actual bitrate with respect to the requested baud rate. It does this by modulating the number of cycles per clock output pulse, so the clock is no longer a square wave. |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA2L2 | PCLKB |
| RA2T1 | PCLKB |
| RA4C1 | PCLKA |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |
| RA4L1 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |

| | |
|---|---|
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

### Pin Configuration

This module uses SCIn_MOSI, SCIn_MISO, SCIn_SPCK, and SCIn_SS pins to communicate with on board devices.

*Note*

*It is recommended to configure the pins with high drive strength (or high-speed high if available) to maintain signal integrity, particularly at high bitrates. The drive strength can be set by opening the e2 studio pin configuration editor, selecting the pin, and configuring 'Drive Capacity'.*

# Usage Notes

### Transfer Complete Event

The transfer complete event is triggered when all of the data has been transferred. In slave mode if the SS pin is de-asserted then no transfer complete event is generated until the SS pin is asserted and the remaining data is transferred.

### Performance

At high bit rates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in RX Overflow errors. In order to improve performance at high bit rates, it is recommended that the instance be configured to service transfers using the DTC.

Also note when using DTC for data transfer, SCI SPI can experience overrun error if the application makes heavy use of DMAC and/or another DTC instance. This is because DMAC has a higher priority over DTC in arbitration for the mastership of the DMA bus, and the arbitration between different triggers/transfers in DTC is done based on interrupt/trigger priority. Overrun error can be averted with one of the following options:

1. If SCI SPI uses DTC for data transfer, avoid the use of DMAC or another DTC instance in an application.
2. If DMAC/DTC is a must for other data transfers, avoid the use of DTC with SCI SPI.
3. Use the RSPI instead of SCI SPI. The RSPI hardware can handle overrun conditions.

### Transmit From RXI Interrupt

After every byte, the SCI SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. Whenever possible, the SCI_SPI module handles both interrupts in the receive buffer full interrupt. This improves performance when the DTC is not being used.

### Slave Select Pin

- In master mode the slave select pin must be driven in software.
- In slave mode the hardware handles the slave select pin and will only transfer data when the SS pin is low.

### Bit Rate Modulation

Depending on the peripheral clock frequency, the desired bit rate may not be achievable. With bit rate modulation, the device can remove a configurable number of input clock pulses to the internal bit rate counter in order to create the desired bit rate. This has the effect of changing the period of individual bits in order to achieve the desired average bit rate. For more information see section 34.9 Bit Rate Modulation Function in the RA6M3 manual.

## Examples

### Basic Example

This is a basic example of minimal use of the SCI_SPI in an application.

```
static volatile bool g_transfer_complete = false;
static void r_sci_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
void sci_spi_basic_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
 /* Initialize the SPI module. */
    err = R_SCI_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
 /* Assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
 /* Start a write/read transfer */
    g_transfer_complete = false;
    err = R_SCI_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
 /* De-assert Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
}
```

## Data Structures

| | |
|---|---|
| struct | sci_spi_div_setting_t |

## Data Structure Documentation

### ◆ sci_spi_div_setting_t

| struct sci_spi_div_setting_t | | |
|---|---|---|
| Settings for adjusting the SPI CLK. | | |
| Data Fields | | |
| uint8_t | brr | |
| uint8_t | cks: 2 | |
| uint8_t | mddr | Set to 0 to disable MDDR. |

## Function Documentation

### ◆ R_SCI_SPI_Open()

fsp_err_t R_SCI_SPI_Open ( spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg* )

Initialize a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enables the clock for the SCI channel.
- Initializes the associated registers with default value and the user-configurable options.
- Provides the channel handle for use with other API functions.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to the control structure. |
| p_cfg | Pointer to a configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

### ◆ R_SCI_SPI_Read()

fsp_err_t R_SCI_SPI_Read ( spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Receive data from an SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission by writing data to the TXD register.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Bit width is not 8 bits<br>• Length is equal to 0<br>• Pointer to destination is NULL |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_SPI_Write()

fsp_err_t R_SCI_SPI_Write ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Transmit data to a SPI device. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Complete data transmission via transmit buffer empty interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_SPI_WriteRead()

fsp_err_t R_SCI_SPI_WriteRead ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt (or by writing to the TDR register).
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt and copy data to the destination buffer.
- Complete data transmission and reception via transmit end interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | Pointer to the control structure. |
| | p_src | Pointer to the source buffer. |
| | p_dest | Pointer to the destination buffer. |
| [in] | length | The number of bytes to transfer. |
| [in] | bit_width | Invalid for SCI_SPI (Set to SPI_BIT_WIDTH_8_BITS). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | One of the following invalid parameters passed:<br>• Pointer p_api_ctrl is NULL<br>• Pointer to source is NULL<br>• Pointer to destination is NULL<br>• Length is equal to 0<br>• Bit width is not equal to 8 bits |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_UNSUPPORTED | The given bit_width is not supported. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reconfigure

### ◆ R_SCI_SPI_CallbackSet()

fsp_err_t R_SCI_SPI_CallbackSet ( spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void *const *p_context*, spi_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SCI_SPI_Close()

fsp_err_t R_SCI_SPI_Close ( spi_ctrl_t *const *p_api_ctrl*)

Disable the SCI channel and set the instance as not open. Implements spi_api_t::close.

**Parameters**

| | |
|---|---|
| p_api_ctrl | Pointer to an opened instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | The parameter p_api_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

### ◆ R_SCI_SPI_CalculateBitrate()

fsp_err_t R_SCI_SPI_CalculateBitrate ( uint32_t *bitrate*, sci_spi_div_setting_t * *sclk_div*, bool *use_mddr* )

Calculate the register settings required to achieve the desired bitrate.

**Parameters**

| | | |
|---|---|---|
| [in] | bitrate | bitrate [bps]. For example, 250,000; 500,00; 2,500,000 (max), etc. |
| | sclk_div | Pointer to sci_spi_div_setting_t used to configure baudrate settings. |
| [in] | use_mddr | Calculate the divider settings for use with MDDR. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Baud rate is set successfully. |
| FSP_ERR_ASSERTION | Baud rate is not achievable. |

***Note***

*The application must pause for 1 bit time after the BRR register is loaded before transmitting/receiving to allow time for the clock to settle.*

### Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.

# Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data is sampled at an odd edge and changes at an even edge.
    - CPHA=1 Data changes at an odd edge and is sampled at an even edge.
  - MSB/LSB first
  - 8-16 bit, 20-bit, 24-bit, and 32-bit data frames
    - Hardware endian swap in 16-bit and 32-bit modes
  - SSL level keep (burst transfer) supported if available
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- DMAC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

# Configuration

### Build Time Configurations for r_spi

The following build time configurations are defined in fsp_cfg/r_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Support for using a transfer API | • Enabled<br>• Disabled | Enabled | If enabled, transfer instances will be included in the build for |

| | | | |
|---|---|---|---|
| | | | both transmission and reception. |
| Enable Transmitting from RXI Interrupt | • Enabled<br>• Disabled | Disabled | If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a performance boost when neither DTC nor DMAC is used. In addition, Transmit Only mode is not supported when this configuration is enabled. |

**Configurations for Connectivity > SPI (r_spi)**

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SPI channel. |
| Receive Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transmit Buffer Empty Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transfer Complete Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Error Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Operating Mode | • Master<br>• Slave | Master | Select the SPI operating mode. |
| Clock Phase | • Data sampling on odd edge, data variation on even edge<br>• Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |

| | | | |
|---|---|---|---|
| Clock Polarity | • Low when idle<br>• High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | • Enable<br>• Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | • MSB First<br>• LSB First | MSB First | Select the data bit order. |
| Callback | Name must be a valid C symbol | spi_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| SPI Mode | • SPI Operation<br>• Clock Synchronous Operation | Clock Synchronous Operation | Select the clock sync mode. |
| Full or Transmit Only Mode | • Full Duplex<br>• Transmit Only | Full Duplex | Select Full Duplex or Transmit Only Mode. |
| Slave Select Polarity | • Active Low<br>• Active High | Active Low | Select the slave select active level. |
| Select SSL(Slave Select) | MCU Specific Options | | Select which slave to use. |
| MOSI Idle State | • MOSI Idle Value Fixing Disable<br>• MOSI Idle Value Fixing Low<br>• MOSI Idle Value Fixing High | MOSI Idle Value Fixing Disable | Select the MOSI idle level if MOSI idle is enabled. |
| Parity Mode | • Disabled<br>• Odd<br>• Even | Disabled | Select the parity mode if parity is enabled. |
| Byte Swapping | • Disable<br>• Enable | Disable | Select the byte swap mode for 16/32-Bit Data Frames. |
| Bitrate | Value must be an integer greater than 0 | 16000000 | Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The actual bitrate is printed |

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA2A1 | PCLKB |
| RA2A2 | PCLKB |
| RA2E1 | PCLKB |
| RA2E2 | PCLKB |
| RA2E3 | PCLKB |
| RA2L1 | PCLKB |
| RA2L2 | PCLKB |
| RA2T1 | PCLKB |
| RA4C1 | PCLKA |
| RA4E1 | PCLKA |
| RA4E2 | PCLKA |

| | |
|---|---|
| RA4L1 | PCLKA |
| RA4M1 | PCLKA |
| RA4M2 | PCLKA |
| RA4M3 | PCLKA |
| RA4T1 | PCLKA |
| RA4W1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M1 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T1 | PCLKA |
| RA6T3 | PCLKA |

### Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

*Note*

*It is recommended to configure the pins with high drive strength (or high-speed high if available) to maintain signal integrity, particularly at high bitrates. The drive strength can be set by opening the e2 studio pin configuration editor, selecting the pin, and configuring 'Drive Capacity'.*

# Usage Notes

### Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC or DMAC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when possible. A typical use-case where this is possible is when reading/writing to a block device.

### Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full isr. This only improves performance when neither the DTC nor DMAC is being used.

*Note*

*Configuring the module to use an RX DTC/DMAC instance without also providing a TX DTC/DMAC instance results in an invalid configuration when RXI transmit is enabled.*
*Transmit Only mode is not supported when Transmit from RXI is enabled.*

### Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

### Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

### Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- In order to use CPHA=0 setting in slave mode, the master must toggle the SSL pin after every data frame (Even if the device supports SSL Level Keeping). Because of this hardware limitation, the module will return FSP_ERR_UNSUPPORTED when it is configured to use CPHA=0 setting in slave mode.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.

# Examples

### Basic Example

This is a basic example of minimal use of the SPI in an application.

```
static volatile bool g_transfer_complete = false;

void spi_basic_example (void)

{

    uint8_t tx_buffer[TRANSFER_SIZE];

    uint8_t rx_buffer[TRANSFER_SIZE];

 fsp_err_t err = FSP_SUCCESS;
```

```
 /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start a write/read transfer */
    err = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer, TRANSFER_SIZE,
SPI_BIT_WIDTH_8_BITS);
    assert(FSP_SUCCESS == err);
 /* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
 while (false == g_transfer_complete)
    {
       ;
    }
}
static void r_spi_callback (spi_callback_args_t * p_args)
{
 if (SPI_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_transfer_complete = true;
    }
}
```

### Driving Software Slave Select Line

This is an example of communicating with multiple slave devices by asserting SSL in software.

```
void spi_software_ssl_example (void)
{
    uint8_t tx_buffer[TRANSFER_SIZE];
    uint8_t rx_buffer[TRANSFER_SIZE];
 /* Configure Slave Select Line 1 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
 /* Configure Slave Select Line 2 */
 R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
 fsp_err_t err = FSP_SUCCESS;
```

```
/* Initialize the SPI module. */
   err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 1 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_1, BSP_IO_LEVEL_HIGH);
/* Wait for minimum time required between transfers. */
R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
/* Assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_LOW);
/* Start a write/read transfer */
   g_transfer_complete = false;
   err                 = R_SPI_WriteRead(&g_spi_ctrl, tx_buffer, rx_buffer,
TRANSFER_SIZE, SPI_BIT_WIDTH_8_BITS);
   assert(FSP_SUCCESS == err);
/* Wait for SPI_EVENT_TRANSFER_COMPLETE callback event. */
while (false == g_transfer_complete)
   {
      ;
   }
/* De-assert Slave Select Line 2 */
R_BSP_PinWrite(SLAVE_SELECT_LINE_2, BSP_IO_LEVEL_HIGH);
```

```
}
```

### Configuring the SPI Clock Divider Registers

This example demonstrates how to set the SPI clock divisors at runtime.

```
void spi_bitrate_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_spi_cfg.p_extend = &g_spi_extended_cfg;
 /* Configure SPI Clock divider to achieve largest bitrate less than or equal to the
desired bitrate. */
    err = R_SPI_CalculateBitrate(BITRATE, &(g_spi_extended_cfg.spck_div));
    assert(FSP_SUCCESS == err);
 /* Initialize the SPI module. */
    err = R_SPI_Open(&g_spi_ctrl, &g_spi_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
}
```

### Data Structures

| | |
|---|---|
| struct | rspck_div_setting_t |

| | |
|---|---|
| enum | spi_delay_count_t |

## Data Structure Documentation

### ◆ rspck_div_setting_t

| struct rspck_div_setting_t | | |
|---|---|---|
| SPI Clock Divider settings. | | |
| Data Fields | | |
| uint8_t | spbr | SPBR register setting. |
| uint8_t | brdv: 2 | BRDV setting in SPCMD0. |

### ◆ spi_extended_cfg_t

| struct spi_extended_cfg_t | | |
|---|---|---|
| Extended SPI interface configuration | | |
| Data Fields | | |
| spi_ssl_mode_t | spi_clksyn | Select spi or clock syn mode operation. |
| spi_communication_t | spi_comm | Select full-duplex or transmit-only communication. |
| spi_ssl_polarity_t | ssl_polarity | Select SSLn signal polarity. |
| spi_ssl_select_t | ssl_select | Select which slave to use: 0-SSL0, 1-SSL1, 2-SSL2, 3-SSL3. |
| spi_mosi_idle_value_fixing_t | mosi_idle | Select MOSI idle fixed value and selection. |
| spi_parity_t | parity | Select parity and enable/disable parity. |
| spi_byte_swap_t | byte_swap | Select byte swap mode. |
| rspck_div_setting_t | spck_div | Register values for configuring the SPI Clock Divider. |
| spi_delay_count_t | spck_delay | SPI Clock Delay Register Setting. |
| spi_delay_count_t | ssl_negation_delay | SPI Slave Select Negation Delay Register Setting. |
| spi_delay_count_t | next_access_delay | SPI Next-Access Delay Register Setting. |

### ◆ spi_instance_ctrl_t

| struct spi_instance_ctrl_t |
|---|
| Channel control block. DO NOT INITIALIZE. Initialization occurs when spi_api_t::open is called. |

| Data Fields | |
|---|---|
| uint32_t | open |
| | Indicates whether the open() API has been successfully called. |
| | |
| spi_cfg_t const * | p_cfg |
| | Pointer to instance configuration. |
| | |
| R_SPI0_Type * | p_regs |
| | Base register for this channel. |
| | |
| void const * | p_tx_data |
| | Buffer to transmit. |
| | |
| void * | p_rx_data |
| | Buffer to receive. |
| | |
| uint32_t | tx_count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| | |
| uint32_t | rx_count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| | |
| uint32_t | count |
| | Number of Data Frames to transfer (8-bit, 16-bit, 32-bit) |
| | |
| spi_bit_width_t | bit_width |
| | Bits per Data frame (8-bit, 16-bit, 32-bit) |
| | |

## Enumeration Type Documentation

### ◆ spi_ssl_mode_t

| enum spi_ssl_mode_t | |
|---|---|
| 3-Wire or 4-Wire mode. | |
| Enumerator | |
| SPI_SSL_MODE_SPI | SPI operation (4-wire method) |
| SPI_SSL_MODE_CLK_SYN | Clock Synchronous operation (3-wire method) |

### ◆ spi_communication_t

| enum spi_communication_t | |
|---|---|
| Transmit Only (Half Duplex), or Full Duplex. | |
| Enumerator | |
| SPI_COMMUNICATION_FULL_DUPLEX | Full-Duplex synchronous serial communication. |
| SPI_COMMUNICATION_TRANSMIT_ONLY | Transit only serial communication. |

### ◆ spi_ssl_polarity_t

| enum spi_ssl_polarity_t | |
|---|---|
| Slave Select Polarity. | |
| Enumerator | |
| SPI_SSLP_LOW | SSLP signal polarity active low. |
| SPI_SSLP_HIGH | SSLP signal polarity active high. |

### ◆ spi_ssl_select_t

| enum spi_ssl_select_t | |
|---|---|
| The Slave Select Line | |
| Enumerator | |
| SPI_SSL_SELECT_SSL0 | Select SSL0. |
| SPI_SSL_SELECT_SSL1 | Select SSL1. |
| SPI_SSL_SELECT_SSL2 | Select SSL2. |
| SPI_SSL_SELECT_SSL3 | Select SSL3. |

### ◆ spi_mosi_idle_value_fixing_t

| enum spi_mosi_idle_value_fixing_t | |
|---|---|
| MOSI Idle Behavior. | |
| Enumerator | |
| SPI_MOSI_IDLE_VALUE_FIXING_DISABLE | MOSI output value=value set in MOIFV bit. |
| SPI_MOSI_IDLE_VALUE_FIXING_LOW | MOSIn level low during MOSI idling. |
| SPI_MOSI_IDLE_VALUE_FIXING_HIGH | MOSIn level high during MOSI idling. |

### ◆ spi_parity_t

| enum spi_parity_t | |
|---|---|
| Parity Mode | |
| Enumerator | |
| SPI_PARITY_MODE_DISABLE | Disable parity. |
| SPI_PARITY_MODE_ODD | Select even parity. |
| SPI_PARITY_MODE_EVEN | Select odd parity. |

### ◆ spi_byte_swap_t

| enum spi_byte_swap_t | |
|---|---|
| Byte Swapping Enable/Disable. | |
| Enumerator | |
| SPI_BYTE_SWAP_DISABLE | Disable Byte swapping for 16/32-Bit transfers. |
| SPI_BYTE_SWAP_ENABLE | Enable Byte swapping for 16/32-Bit transfers. |

### ◆ spi_delay_count_t

| enum spi_delay_count_t | |
|---|---|
| Delay count for SPI delay settings. | |
| Enumerator | |
| SPI_DELAY_COUNT_1 | Set RSPCK delay count to 1 RSPCK. |
| SPI_DELAY_COUNT_2 | Set RSPCK delay count to 2 RSPCK. |
| SPI_DELAY_COUNT_3 | Set RSPCK delay count to 3 RSPCK. |
| SPI_DELAY_COUNT_4 | Set RSPCK delay count to 4 RSPCK. |
| SPI_DELAY_COUNT_5 | Set RSPCK delay count to 5 RSPCK. |
| SPI_DELAY_COUNT_6 | Set RSPCK delay count to 6 RSPCK. |
| SPI_DELAY_COUNT_7 | Set RSPCK delay count to 7 RSPCK. |
| SPI_DELAY_COUNT_8 | Set RSPCK delay count to 8 RSPCK. |

## Function Documentation

### ◆ R_SPI_Open()

fsp_err_t R_SPI_Open ( spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg* )

This functions initializes a channel for SPI communication mode. Implements spi_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the pperipheral registers according to the configuration.
- Initialize the control structure for use in other SPI Interface functions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel initialized successfully. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |
| FSP_ERR_UNSUPPORTED | A requested setting is not possible on this device with the current build configuration. |
| FSP_ERR_IP_CHANNEL_NOT_PRESENT | The channel number is invalid. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::open

***Note***

*This function is reentrant.*

### ◆ R_SPI_Read()

fsp_err_t R_SPI_Read ( spi_ctrl_t *const *p_api_ctrl*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function receives data from a SPI device. Implements spi_api_t::read.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI read operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Read operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_Write()

fsp_err_t R_SPI_Write ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function transmits data to a SPI device using the TX Only Communications Operation Mode. Implements spi_api_t::write.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI write operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control or source parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_WriteRead()

fsp_err_t R_SPI_WriteRead ( spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width* )

This function simultaneously transmits and receive data. Implements spi_api_t::writeRead.

The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Sets up the instance to complete a SPI writeRead operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write operation successfully completed. |
| FSP_ERR_ASSERTION | NULL pointer to control, source or destination parameters or transfer length is zero. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |
| FSP_ERR_IN_USE | A transfer is already in progress. |

### ◆ R_SPI_CallbackSet()

fsp_err_t R_SPI_CallbackSet ( spi_ctrl_t *const *p_api_ctrl*, void(*)(spi_callback_args_t *) *p_callback*, void *const *p_context*, spi_callback_args_t *const *p_callback_memory* )

Updates the user callback and has option of providing memory for callback structure. Implements spi_api_t::callbackSet

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_SPI_Close()

fsp_err_t R_SPI_Close ( spi_ctrl_t *const *p_api_ctrl*)

This function manages the closing of a channel by the following task. Implements spi_api_t::close.

Disables SPI operations by disabling the SPI bus.

- Disables the SPI peripheral.
- Disables all the associated interrupts.
- Update control structure so it will not work with SPI Interface functions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | A required pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The channel has not been opened. Open the channel first. |

### ◆ R_SPI_CalculateBitrate()

fsp_err_t R_SPI_CalculateBitrate ( uint32_t *bitrate*, rspck_div_setting_t * *spck_div* )

Calculates the SPBR register value and the BRDV bits for a desired bitrate. If the desired bitrate is faster than the maximum bitrate, than the bitrate is set to the maximum bitrate. If the desired bitrate is slower than the minimum bitrate, than an error is returned.

**Parameters**

| | | |
|---|---|---|
| [in] | bitrate | Desired bitrate |
| [out] | spck_div | Memory location to store bitrate register settings. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Valid spbr and brdv values were calculated |
| FSP_ERR_UNSUPPORTED | Bitrate is not achievable |

| fsp_err_t | R_SPI_B_CallbackSet (spi_ctrl_t *const p_api_ctrl, void(*p_callback)(spi_callback_args_t *), void *const p_context, spi_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_SPI_B_Close (spi_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_SPI_B_CalculateBitrate (uint32_t bitrate, spi_b_clock_source_t clock_source, rspck_div_setting_t *spck_div) |

### Detailed Description

Driver for the SPI peripheral on RA MCUs. This module implements the SPI Interface.

# Overview

### Features

- Standard SPI Modes
  - Master or Slave Mode
  - 3-Wire (clock synchronous) or 4-Wire (SPI) Mode
  - Clock Polarity (CPOL)
    - CPOL=0 SCLK is low when idle
    - CPOL=1 SCLK is high when idle
  - Clock Phase (CPHA)
    - CPHA=0 Data is sampled at an odd edge and changes at an even edge.
    - CPHA=1 Data changes at an odd edge and is sampled at an even edge.
  - MSB/LSB first
  - 8- to 32-Bit data frames
    - Hardware endian swap in 16-Bit and 32-Bit mode
  - SSL level keep (burst transfer) supported
- Configurable bitrate
- Supports Full Duplex or Transmit Only Mode
- DTC Support
- DMAC Support
- Callback Events
  - Transfer Complete
  - RX Overflow Error (The SPI shift register is copied to the data register before previous data was read)
  - TX Underrun Error (No data to load into shift register for transmitting)
  - Parity Error (When parity is enabled and a parity error is detected)

# Configuration

### Build Time Configurations for r_spi_b

The following build time configurations are defined in fsp_cfg/r_spi_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable Support for using a transfer API | • Enabled<br>• Disabled | Enabled | If enabled, transfer instances will be included in the build for both transmission and reception. |
| Enable Transmitting from RXI Interrupt | • Enabled<br>• Disabled | Disabled | If enabled, all operations will be handled from the RX (receive) interrupt. This setting only provides a |

| | | | |
|---|---|---|---|
| | | | performance boost when DTC is not used. In addition, Transmit Only mode is not supported when this configuration is enabled. |

**Configurations for Connectivity > SPI (r_spi_b)**

This module can be added to the Stacks tab via New Stack > Connectivity > SPI (r_spi_b). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_spi0 | Module name. |
| Channel | Value must be a non-negative integer | 0 | Select the SPI channel. |
| Receive Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transmit Buffer Empty Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Transfer Complete Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Error Interrupt Priority | MCU Specific Options | | Select the interrupt priority for all SPI interrupts. |
| Operating Mode | • Master<br>• Slave | Master | Select the SPI operating mode. |
| Clock Phase | • Data sampling on odd edge, data variation on even edge<br>• Data sampling on even edge, data variation on odd edge | Data sampling on odd edge, data variation on even edge | Select the clock edge to sample data. |
| Clock Polarity | • Low when idle<br>• High when idle | Low when idle | Select clock level when idle. |
| Mode Fault Error | • Enable<br>• Disable | Disable | Detect master/slave mode conflicts. |
| Bit Order | • MSB First<br>• LSB First | MSB First | Select the data bit order. |

| | | | |
|---|---|---|---|
| Callback | Name must be a valid C symbol | spi_callback | A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR). |
| SPI Mode | • SPI Operation<br>• Clock Synchronous Operation | Clock Synchronous Operation | Select the clock sync mode. |
| Communication Mode Select | • Full Duplex<br>• Transmit Only | Full Duplex | Select Full Duplex or Transmit Only Mode. |
| Slave Select Polarity | • Active Low<br>• Active High | Active Low | Select the slave select active level. |
| Select SSL(Slave Select) | • SSL0<br>• SSL1<br>• SSL2<br>• SSL3 | SSL0 | Select which slave to use. |
| MOSI Idle State | • MOSI Idle Value Fixing Disable<br>• MOSI Idle Value Fixing Low<br>• MOSI Idle Value Fixing High | MOSI Idle Value Fixing Disable | Select the MOSI idle level if MOSI idle is enabled. |
| Parity Mode | • Disabled<br>• Odd<br>• Even | Disabled | Select the parity mode if parity is enabled. |
| Byte Swapping | • Disable<br>• Enable | Disable | Select the byte swap mode for 16/32-Bit Data Frames. |
| Clock Source | MCU Specific Options | | Select the clock source for communication. |
| Bitrate | Value must be an integer greater than 0 | 16000000 | Enter the desired bitrate, change the bitrate to a value supported by MCU. If the requested bitrate cannot be achieved, the settings with the largest possible value that is less than or equal to the requested bitrate is used. The actual bitrate is printed in a comment in the generated spi_extended_cfg_t |

### Clock Configuration

The SPI peripheral uses the SCISPICLK for communication and PCLKB for internal operations. Both can be configured via the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

### Pin Configuration

This module uses MOSI, MISO, RSPCK, and SSL pins to communicate with on board devices.

*Note*

*It is recommended to configure the pins with high drive strength (or high-speed high if available) to maintain signal integrity, particularly at high bitrates. The drive strength can be set by opening the e2 studio pin configuration editor, selecting the pin, and configuring 'Drive Capacity'.*

# Usage Notes

### Performance

At high bitrates, interrupts may not be able to service transfers fast enough. In master mode this means there will be a delay between each data frame. In slave mode this could result in TX Underrun and RX Overflow errors.

In order to improve performance at high bitrates, it is recommended that the instance be configured to service transfers using the DTC or DMAC.

Another way to improve performance is to transfer the data in 16/32 bit wide data frames when

possible. A typical use-case where this is possible is when reading/writing to a block device.

### Transmit From RXI Interrupt

After every data frame the SPI peripheral generates a transmit buffer empty interrupt and a receive buffer full interrupt. It is possible to configure the driver to handle transmit buffer empty interrupts in the receive buffer full ISR. This only improves performance when the DTC nor DMAC is not being used.

*Note*

*Configuring the module to use RX DTC/DMAC instance without also providing a TX DTC/DMAC instance results in an invalid configuration when RXI transmit is enabled.*
*Transmit Only mode is not supported when Transmit from RXI is enabled.*

### Clock Auto-Stopping

In master mode, if the Receive Buffer Full Interrupts are not handled fast enough, instead of generating a RX Overflow error, the last clock cycle will be stretched until the receive buffer is read.

### Parity Mode

When parity mode is configured, the LSB of each data frame is used as a parity bit. When odd parity is selected, the LSB is set such that there are an odd number of ones in the data frame. When even parity is selected, the LSB is set such that there are an even number of ones in the data frame.

### Limitations

Developers should be aware of the following limitations when using the SPI:

- In master mode, the driver will only configure 4-Wire mode if the device supports SSL Level Keeping (SSLKP bit in SPCMD0) and will return FSP_ERR_UNSUPPORTED if configured for 4-Wire mode on devices without SSL Level Keeping. Without SSL Level Keeping, the SSL pin is toggled after every data frame. In most cases this is not desirable behavior so it is recommended that the SSL pin be driven in software if SSL Level Keeping is not present on the device.
- The module does not support communicating with multiple slaves using different SSL pins. In order to achieve this, the module must either be closed and re-opened to change the SSL pin or drive SSL in software. It is recommended that SSL be driven in software when controlling multiple slave devices.
- The SPI peripheral has a minimum 3 SPI CLK delay between each data frame.
- The behavior for Byte Swap operation is not guaranteed for data frames other than 8-bit, 16-bit and 32bit.
