## Function Documentation

### ◆ rm_at_transport_da16xxx_uart_callback()

void rm_at_transport_da16xxx_uart_callback ( uart_callback_args_t * *p_args*)

UART Callback routine.

**Parameters**

| | | |
|---|---|---|
| [in] | p_args | Pointer to uart callback structure. |

### ◆ rm_at_transport_da16xxx_uartOpen()

fsp_err_t rm_at_transport_da16xxx_uartOpen ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_cfg_t const *const *p_cfg* )

Opens and configures the WIFI_DA16XXX Middleware module.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_cfg | Pointer to pin configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WIFI_DA16XXX successfully configured. |
| FSP_ERR_ASSERTION | The parameter p_cfg or p_instance_ctrl is NULL. |
| FSP_ERR_OUT_OF_MEMORY | There is no more heap memory available. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_WIFI_INIT_FAILED | WiFi module initialization failed. |

### ◆ rm_at_transport_da16xxx_uart_atCommandSendThreadSafe()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSendThreadSafe ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd* )

Send an AT command with testing for return response.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_at_cmd | Pointer to AT command data structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |

### ◆ rm_at_transport_da16xxx_uart_atCommandSend()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSend ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd* )

Send and receive an AT command with testing for return. Thread-Safe

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_at_cmd | Pointer to Transport layer instance data structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Assertion error occurred. |

### ◆ rm_at_transport_da16xxx_uart_giveMutex()

fsp_err_t rm_at_transport_da16xxx_uart_giveMutex ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag* )

Give the mutex for the send basic call.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | mutex_flag | Flags for the mutex. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred giving the mutex. |

### ◆ rm_at_transport_da16xxx_uart_takeMutex()

fsp_err_t rm_at_transport_da16xxx_uart_takeMutex ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag* )

Take the mutex for the send basic call.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | mutex_flag | Flags for the mutex. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred taking the mutex. |

### ◆ rm_at_transport_da16xxx_uart_bufferRecv()

size_t rm_at_transport_da16xxx_uart_bufferRecv ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, const char * *p_data*, uint32_t *length*, uint32_t *rx_timeout* )

Receive data from stream buffer.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |
| [in] | p_data | Pointer to data. |
| [in] | length | Data length. |
| [in] | rx_timeout | Timeout for receiving data on the buffer. |

**Return values**

| | |
|---|---|
| Number | of bytes pulled from Streambuffer |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_INVALID_DATA | Accuracy of data is not guaranteed |

### ◆ rm_at_transport_da16xxx_statusGet()

fsp_err_t rm_at_transport_da16xxx_statusGet ( at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_status_t * *p_status* )

Gets the status of the configured DA16xxx transport.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |

### ◆ rm_at_transport_da16xxx_uartClose()

fsp_err_t rm_at_transport_da16xxx_uartClose ( at_transport_da16xxx_ctrl_t *const *p_ctrl*)

Closes the AT Transport DA16XXX Middleware module.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to Transport layer instance control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WIFI_DA16XXX successfully configured. |
| FSP_ERR_ASSERTION | The parameter p_cfg or p_instance_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The Transport layer instance is not open. |

## 5.2.12.14 EtherCAT SSC Port (rm_ethercat_ssc_port)

Modules » Networking

### Functions

fsp_err_t RM_ETHERCAT_SSC_PORT_Open (ethercat_ssc_port_ctrl_t *const p_ctrl, ethercat_ssc_port_cfg_t const *const p_cfg)

EtherCAT Slave Controller is initialized with this function. This function includes PHY initialization and ESC EEPROM loading. Afterwards, EtherCAT communication begins. Also EtherCAT interrupts are permitted if the interrupts are used. In order to receive the EtherCAT, EtherCAT Sync0, EtherCAT Sync1 interrupt event, it's necessary to register a callback function. Implements ethercat_ssc_port_api_t::open. More...

| | |
|---|---|
| fsp_err_t | RM_ETHERCAT_SSC_PORT_Close (ethercat_ssc_port_ctrl_t *const p_ctrl) |

### Detailed Description

Middleware for EtherCAT Slave Stack Code (SSC) on RA microprocessors. This module implements the EtherCAT SSC Interface.

# Overview

This module provides the hardware port layer for EtherCAT Slave Stack Code. The control target is the EtherCAT Slave Controller (ESC). This module uses the EtherCAT slave stack code generated by the SSC tools provided by Beckhoff Automation GmbH. Users must register as a member of the EtherCAT Technology Group (ETG) to obtain SSC
tools.:
https://www.ethercat.org/en/downloads/downloads_01DCC32A10294F2EA866F7E46FB0285F.htm
After initializing this module, refer to the SSC API reference to use the EtherCAT slave stack. The hardware access layer API referenced from the stack are also implemented. Please include renesashw.h in the stack source file which has hardware access.

### Features

The EtherCAT SSC port module supports the following features:

- Number of EtherCAT ports: 2
- Interrupts: EtherCAT interrupt, Sync0 interrupt, Sync1 interrupt
- Hardware access layer specified by SSC (including timer)
- Initialize ESC and PHY to enable EtherCAT communication

# Configuration

### Build Time Configurations for rm_ethercat_ssc_port

The following build time configurations are defined in fsp_cfg/rm_ethercat_ssc_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Phy Link Polarity0 | • Active High<br>• Active Low | Active Low | Set the signal porality of CAT0_LINKSTA pin. |
| Phy Link Polarity1 | • Active High<br>• Active Low | Active High | Set the signal porality of CAT1_LINKSTA pin. |

### Configurations for Networking > EtherCAT SSC Port (rm_ethercat_ssc_port)

This module can be added to the Stacks tab via New Stack > Networking > EtherCAT SSC Port (rm_ethercat_ssc_port).

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| PHY | | | |
| Reset Signal Hold Time (ms) | Specify a value between 0x1 and 0xFFFFFFFF. | 1 | Time to keep the PHY reset signal low. |
| Reset Wait Time (us) | Specify a value between 0x1 and 0xFFFFFFFF. | 15000 | Wait time to access the PHY register after the PHY reset signal is released. |
| Offset Address | Specify a value between 0x0 and 0xFF. | 0 | The offset address of PHY in case of using the EtherCAT. |
| Delay Time of TX Signal | | | |
| Port 0 | • 0 ns<br>• 10 ns<br>• 20 ns<br>• 30 ns | 0 ns | Set the amount of delay time for TX signal of the Port 0 |
| Port 1 | • 0 ns<br>• 10 ns<br>• 20 ns<br>• 30 ns | 0 ns | Set the amount of delay time for TX signal of the Port 1 |
| Interrupts | | | |
| EtherCAT Interrupt Priority | MCU Specific Options | | Select the EtherCAT interrupt priority. |
| EtherCAT SYNC0 Interrupt Priority | MCU Specific Options | | Select the EtherCAT SYNC0 interrupt priority. |
| EtherCAT SYNC1 Interrupt Priority | MCU Specific Options | | Select the EtherCAT SYNC1 interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |
| Name | Name must be a valid C symbol | g_ethercat_ssc_port0 | Module name. |
| EEPROM Size | • Under 32Kbits<br>• Over 32Kbits | Under 32Kbits | Specify whether to use Normal or Inverted. |

### Clock Configuration

The ESC uses the ESCCLK which is generated by the clock generation circuit and the ESCCLK divided by 4 as CLK100 and CLK25 of the ESC IP Core, respectively.

Set the registers in the clock generation circuit so that the frequency of the ESCCLK becomes 100 MHz. Also, set the registers that the frequency of the ETHPHYCLK signal which is used as the operating clock of a PHY-LSI becomes 25 MHz.

### Pin Configuration

The RM_ETHERCAT_SSC_PORT module is used for configuring pins.

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the RM_ETHERCAT_SSC_PORT:

- Port configuration is EtherCAT port only.

### ETHERCAT SSC Port Basic Example

This is a basic example of minimal use of the ETHERCAT SSC Port in an application.

```
void ethercat_ssc_port_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module before using the EtherCAT Slave Stack. */
 /* The instance of EtherCAT SSC Port instance can be accessed as
gp_ether_cat_ssc_port */
    err = RM_ETHERCAT_SSC_PORT_Open(gp_ethercat_ssc_port->p_ctrl,
gp_ethercat_ssc_port->p_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 /* Close the module after using the EtherCAT Slave Stack. */
 RM_ETHERCAT_SSC_PORT_Close(gp_ethercat_ssc_port->p_ctrl);
}
/* Example callback called when EtherCAT interrupt. */
void ethercat_ssc_port_callback (ethercat_ssc_port_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case ETHERCAT_SSC_PORT_EVENT_ESC_CAT_INTERRUPT:
      {
/* ESC CAT Interrupt application */
 break;
       }
 case ETHERCAT_SSC_PORT_EVENT_ESC_SYNC0_INTERRUPT:
      {
```

```
/* ESC SYNC0 Interrupt application */
 break;
       }
 case ETHERCAT_SSC_PORT_EVENT_ESC_SYNC1_INTERRUPT:
      {
/* ESC SYNC1 Interrupt application */
 break;
       }
 default:
      {
 /* Do Nothing! */
       }
    }
}
```

### Data Structures

| | |
|---|---|
| struct | ethercat_ssc_port_instance_ctrl_t |
| struct | ethercat_ssc_port_extend_cfg_t |

### Enumerations

| | |
|---|---|
| enum | ethercat_ssc_port_eeprom_size_t |
| enum | ethercat_ssc_port_tx_signal_delay_t |

## Data Structure Documentation

### ◆ ethercat_ssc_port_instance_ctrl_t

| struct ethercat_ssc_port_instance_ctrl_t | | |
|---|---|---|
| EtherCAT SSC port control block. DO NOT INITIALIZE. Initialization occurs when ethercat_ssc_port_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | Flag to indicate if EtherCAT SSC port instance has been initialized. |
| uint16_t | sys_time | System time of EtherCAT Slave Controller. |
| ethercat_ssc_port_cfg_t const * | p_cfg | Pointer to initial configurations. |
| R_ESC_INI_Type * | p_reg_esc_ini | Pointer to EtherCAT Initial |

| | | |
|---|---|---|

| R_ESC_Type * | p_reg_esc | Pointer to EtherCAT Slave Controller registers. |

### ◆ ethercat_ssc_port_extend_cfg_t

| struct ethercat_ssc_port_extend_cfg_t | | |
|---|---|---|
| Extended configuration | | |
| Data Fields | | |
| ethercat_ssc_port_eeprom_size_t | eeprom_size | EEPROM memory size. |
| ethercat_ssc_port_tx_signal_delay_t | tx_signal_delay_port0 | Port 0 TX signal delay time. |
| ethercat_ssc_port_tx_signal_delay_t | tx_signal_delay_port1 | Port 1 TX signal delay time. |
| ether_phy_instance_t const * | p_ether_phy_instance[BSP_FEATURE_ESC_NUM_PORTS] | Pointer to ETHER_PHY instance. |

## Enumeration Type Documentation

### ◆ ethercat_ssc_port_eeprom_size_t

| enum ethercat_ssc_port_eeprom_size_t | |
|---|---|
| EEPROM memory size of the EtherCAT | |
| Enumerator | |
| ETHERCAT_SSC_PORT_EEPROM_SIZE_UNDER_32KBIT | Up to 16KBit. |
| ETHERCAT_SSC_PORT_EEPROM_SIZE_OVER_32KBIT | 32KBit to 4MBit |

### ◆ ethercat_ssc_port_tx_signal_delay_t

| enum ethercat_ssc_port_tx_signal_delay_t | |
|---|---|
| Delay time of TX signal | |
| Enumerator | |
| ETHERCAT_SSC_PORT_TX_SIGNAL_DELAY_00NS | 0 ns |
| ETHERCAT_SSC_PORT_TX_SIGNAL_DELAY_10NS | 10 ns |
| ETHERCAT_SSC_PORT_TX_SIGNAL_DELAY_20NS | 20 ns |
| ETHERCAT_SSC_PORT_TX_SIGNAL_DELAY_30NS | 30 ns |

### Function Documentation

#### ◆ RM_ETHERCAT_SSC_PORT_Open()

fsp_err_t RM_ETHERCAT_SSC_PORT_Open ( ethercat_ssc_port_ctrl_t *const *p_ctrl*, ethercat_ssc_port_cfg_t const *const *p_cfg* )

EtherCAT Slave Controller is initialized with this function. This function includes PHY initialization and ESC EEPROM loading. Afterwards, EtherCAT communication begins. Also EtherCAT interrupts are permitted if the interrupts are used. In order to receive the EtherCAT, EtherCAT Sync0, EtherCAT Sync1 interrupt event, it's necessary to register a callback function. Implements ethercat_ssc_port_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Opened successfully |
| FSP_ERR_ASSERTION | A required input pointer is NULL |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened |
| FSP_ERR_INVALID_ARGUMENT | Irq number lower then 0. |
| FSP_ERR_INVALID_HW_CONDITION | ESC EEPROM loading error |
| FSP_ERR_TIMEOUT | ESC EEPROM loading timeout error |

#### ◆ RM_ETHERCAT_SSC_PORT_Close()

fsp_err_t RM_ETHERCAT_SSC_PORT_Close ( ethercat_ssc_port_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ethercat_ssc_port_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to the control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

## Detailed Description

The Ethercat PHY module (r_ethercat_phy) provides an API for standard Ethercat PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY

Interface.

# Overview

The Ethercat PHY module is used to setup and manage an external Ethercat PHY device for use with the on-chip Ethercat Slave Controller (ESC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

### Features

The Ethercat PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

# Configuration

### Build Time Configurations for r_ethercat_phy

The following build time configurations are defined in fsp_cfg/r_ethercat_phy_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ICS1894 Target | • Disabled<br>• Enabled | Disabled | Select whether to use ICS1894 Phy LSI or not. |
| User Own Target | • Disabled<br>• Enabled | Disabled | Select whether to use User own Phy LSI or not. |

### Configurations for Networking > Ethernet (r_ethercat_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ethercat_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_ethercat_phy0 | Module name. |
| Channel | • 0<br>• 1 | 0 | Select the Ethernet controller channel number. |
| PHY-LSI Address | Specify a value between 0 and 31. | 0 | Specify the address of the PHY-LSI used. |
| PHY-LSI Reset Completion Timeout | Specify a value between 0x1 and | 0x00020000 | Specify the number of times to read the PHY- |

| | | | |
|---|---|---|---|
| | 0xFFFFFFFF. | | LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used. |
| Select MII type | MII | module.driver.ether_phy.mii_type.rmii | Specify to use MII. |
| PHY-LSI Type | • Kit Component<br>• DEFAULT<br>• ICS1894<br>• User own PHY | Kit Component | Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board. |
| Target Init Function | Name must be a valid C symbol | NULL | Set the initial function of the PHY-LSI, When using your own PHY-LSI. |
| Target Link Partner Ability Get Function | Name must be a valid C symbol | NULL | Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI. |
| MII Register Access Wait-time | Specify a value between 0x1 and 0x7FFFFFFF. | 8 | Specify the bit timing for MII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used. |
| Flow Control | • Disable<br>• Enable | Disable | Select whether to enable or disable flow control. |

# Usage Notes

*Note*

*See the example below for details on how to initialize the Ethercat PHY module.*

### Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

### MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

| Access type | MII and RMII management frame | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |
| | Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 |
| Read | | 1...1 | 01 | 10 | 00001 | RRRRR | Z0 | DDDDDDDDDDDDDDDD | Z |
| Write | | 1...1 | 01 | 01 | 00001 | RRRRR | 10 | DDDDDDDDDDDDDDDD | Z |

*Note*

*- PRE (preamble): Send 32 consecutive 1s.*
*- ST (start of frame): Send 01b.*
*- OP (operation code): Send 10b for read or 01b for write.*
*- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.*
*- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.*
*- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.*
*Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).*
*(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)*
*- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.*
*- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write*
*operation (Z is output). No control is required, because a bus was already released during a read operation.*

### Limitations

- The r_ethercat_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - ICS1894

# Examples

### ETHERCAT PHY Basic Example

This is a basic example of minimal use of the ETHERCAT PHY in an application.

```
void ethercat_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ethercat_phy0_ctrl.open   = 0U;
    g_ethercat_phy0_cfg.channel = 0;
```

```
/* Initializes the module. */
   err = R_ETHERCAT_PHY_Open(&g_ethercat_phy0_ctrl, &g_ethercat_phy0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Start auto negotiation. */
   err = R_ETHERCAT_PHY_StartAutoNegotiate(&g_ethercat_phy0_ctrl);
   assert(FSP_SUCCESS == err);
/* Polling until link is established. */
while (FSP_SUCCESS != R_ETHERCAT_PHY_LinkStatusGet(&g_ethercat_phy0_ctrl))
   {
/* Do nothing */
   }
/* Get link partner ability from phy interface. */
   err = R_ETHERCAT_PHY_LinkPartnerAbilityGet(&g_ethercat_phy0_ctrl,
                                              &g_ethercat_phy0_line_speed_duplex,
                                              &g_ethercat_phy0_local_pause,
                                              &g_ethercat_phy0_partner_pause);
   assert(FSP_SUCCESS == err);
/* Check current link status. */
   err = R_ETHERCAT_PHY_LinkStatusGet(&g_ethercat_phy0_ctrl);
   assert(FSP_SUCCESS == err);
}
```

| Data Fields | | |
|---|---|---|
| uint32_t | open | Used to determine if the channel is configured. |
| ether_phy_cfg_t const * | p_ether_phy_cfg | Pointer to initial configurations. |
| uint32_t | local_advertise | Capabilities bitmap for local advertising. |
| ethercat_phy_interface_status_t | interface_status | Initialized status of ETHER PHY interface. |

### ◆ ethercat_phy_extended_cfg_t

| struct ethercat_phy_extended_cfg_t | |
|---|---|
| ETHERCAT PHY extended configuration. | |
| **Data Fields** | |
| void(* | p_target_init )(ethercat_phy_instance_ctrl_t *p_instance_ctrl) |
| | Pointer to callback that is called to initialize the target. |
| | |
| bool(* | p_target_link_partner_ability_get )(ethercat_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex) |
| | Pointer to callback that is called to get the link partner ability. |
| | |

## Enumeration Type Documentation

### ◆ ethercat_phy_interface_status_t

| enum ethercat_phy_interface_status_t | |
|---|---|
| Initialization state for read/write | |
| Enumerator | |
| ETHERCAT_PHY_INTERFACE_STATUS_UNINITIALIZED | ETHER PHY interface is uninitialized. |
| ETHERCAT_PHY_INTERFACE_STATUS_INITIALIZED | ETHER PHY interface is initialized. |

## Function Documentation

### ◆ R_ETHERCAT_PHY_Open()

fsp_err_t R_ETHERCAT_PHY_Open ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Resets Ethercat PHY device. Implements ether_phy_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |

### ◆ R_ETHERCAT_PHY_Close()

fsp_err_t R_ETHERCAT_PHY_Close ( ether_phy_ctrl_t *const *p_ctrl*)

Close Ethercat PHY device. Implements ether_phy_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_ETHERCAT_PHY_StartAutoNegotiate()

fsp_err_t R_ETHERCAT_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHERCAT_PHY successfully starts auto-negotiate. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_ARGUMENT | Register address is incorrect |
| FSP_ERR_INVALID_MODE | Command is invalid. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHERCAT_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHERCAT_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause* )

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHERCAT_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | The auto-negotiation isn't completed |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_INVALID_MODE | Command is invalid. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHERCAT_PHY_LinkStatusGet()

fsp_err_t R_ETHERCAT_PHY_LinkStatusGet ( ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHERCAT_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_INVALID_MODE | Command is invalid. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHERCAT_PHY_ChipInit()

fsp_err_t R_ETHERCAT_PHY_ChipInit ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Initialize Ethercat PHY device. Implements ether_phy_api_t::chipInit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PHY device initialized successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block or configuration structure is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |

### ◆ R_ETHERCAT_PHY_Read()

fsp_err_t R_ETHERCAT_PHY_Read ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data* )

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHERCAT_PHY successfully read data. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address is not a valid size |
| FSP_ERR_INVALID_MODE | Command is invalid. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHERCAT_PHY_Write()

fsp_err_t R_ETHERCAT_PHY_Write ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data* )

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHERCAT_PHY successfully write data. |
| FSP_ERR_ASSERTION | Pointer to ETHERCAT_PHY control block is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size |
| FSP_ERR_INVALID_MODE | Command is invalid. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

## 5.2.12.16 Ethernet (r_ether)

Modules » Networking

### Functions

### Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

# Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

### Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

# Configuration

### Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| ET0_LINKSTA Pin Status Flag | • Fall -> Rise<br>• Rise -> Fall | Fall -> Rise | Specify the polarity of the link signal output by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond |

| | | | |
|---|---|---|---|
| | | | respectively to the rise and fall of the LINKSTA signal. |
| Link Signal Change Flag | • Unused<br>• Used | Unused | Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal) |

**Configurations for Networking > Ethernet (r_ether)**

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ether0 | Module name. |
| Channel | 0 | 0 | Select the ether channel number. |
| MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of this channel. |
| Zero-copy Mode | • Disable<br>• Enable | Disable | Enable or disable zero-copy mode. |
| Flow control functionality | • Disable<br>• Enable | Disable | Enable or disable flow control. |
| Filters | | | |
| Multicast Mode | • Disable<br>• Enable | Enable | Enable or disable multicast frame reception. |
| Promiscuous Mode | • Disable<br>• Enable | Disable | Enable this option to receive packets addressed to other NICs. |
| Broadcast filter | Must be a valid non-negative integer with maximum configurable value of 65535. | 0 | Limit of the number of broadcast frames received continuously |
| Buffers | | | |
| Number of TX buffer | Must be an integer from 1 to 8 | 1 | Number of transmit buffers |
| Number of RX buffer | Must be an integer from 1 to 8 | 1 | Number of receive buffers |

| | | | |
|---|---|---|---|
| Allocate RX buffer | • Disable<br>• Enable | Enable | Allocates the RX buffer when generating the configuration structure |
| Buffer size | Must be at least 1514 which is the maximum Ethernet frame size. | 1514 | Size of Ethernet buffer |
| Padding size | • Disable<br>• 1 Byte<br>• 2 Bytes<br>• 3 Bytes | Disable | The padding size that is automatically inserted into the received packets |
| Padding offset | Must be less than 64 bytes. | 0 | The offset into a receive buffer to insert padding bytes. |
| Interrupts | | | |
| EESR event | Refer to the RA Configuration tool for available options. | • RFOF<br>• RDE<br>• FR<br>• TFUF<br>• TDE<br>• TC | Select event list for each bit of EESR. |
| ECSR event | • ICD<br>• MPD<br>• LCHNG<br>• PSRTO<br>• BFR | | Select event list for each bit of ECSR. |
| Interrupt priority | MCU Specific Options | | Select the EDMAC interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |

### Interrupt Configuration

The first R_ETHER_Open function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

### Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

### Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

| MCU Group | Peripheral Clock |
|---|---|
| RA4E2 | PCLKA |
| RA4T1 | PCLKA |
| RA6E1 | PCLKA |
| RA6E2 | PCLKA |
| RA6M2 | PCLKA |
| RA6M3 | PCLKA |
| RA6M4 | PCLKA |
| RA6M5 | PCLKA |
| RA6T3 | PCLKA |

*Note*

1. *When using ETHERC, the PCLKA frequency is in the range 12.5 MHz <= PCLKA <= 120 MHz.*
2. *When using ETHERC, PCLKA = ICLK.*

### Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_ETHER_Open function.

# Usage Notes

### Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

### Frame Format for Data Transmission and Reception

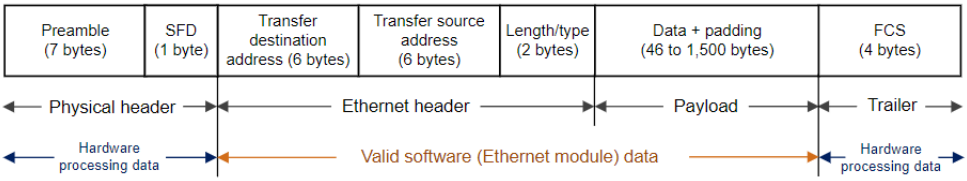

Figure 315: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

### PAUSE Frame Format

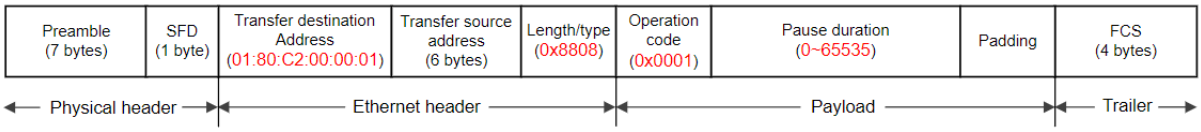

Figure 316: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

### Magic Packet Frame Format

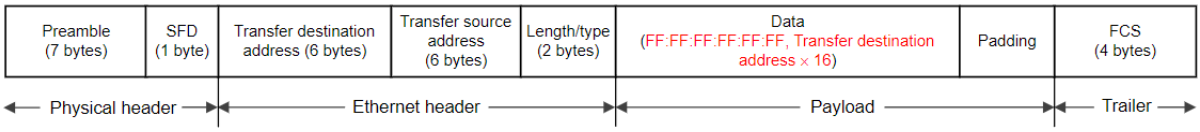

Figure 317: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

### Limitations

### Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for R_ETHER_RxBufferUpdate when zero copy mode is enabled

### Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

| MCU | Has Security Extension | Support Flat project | Support TrustZone project | |
|---|---|---|---|---|
| | | | Secure | Non-Secure |
| RA6M2 | - | x | - | - |
| RA6M3 | - | x | - | - |
| RA6M4 | - *1 | x | - | x |
| RA6M5 | - *1 | x | - | x |
| RA8M1 | x | x | x | x |

*Note*

*1. ETHERC/EDMAC is always Non-secure peripheral in this MCU.*

# Examples

## ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

*Note*

*In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.*

```
#define ETHER_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)
#define ETHER_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)

## Data Structure Documentation

### ◆ ether_instance_descriptor_t

| struct ether_instance_descriptor_t |
|---|
| EDMAC descriptor as defined in the hardware manual. Structure must be packed at 1 byte. |

### ◆ ether_extended_cfg_t

| struct ether_extended_cfg_t | | |
|---|---|---|
| ETHER extension configures the buffer descriptor for ETHER. | | |
| Data Fields | | |
| ether_instance_descriptor_t * | p_rx_descriptors | Receive descriptor buffer pool. |
| ether_instance_descriptor_t * | p_tx_descriptors | Transmit descriptor buffer pool. |

| | | |
|---|---|---|
| uint32_t | eesr_event_filter | Filter for EESR related event. |
| uint8_t | ecsr_event_filter | Filter for ECSR related event. |

### ◆ ether_instance_ctrl_t

| struct ether_instance_ctrl_t | |
|---|---|
| ETHER control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | open |
| | Used to determine if the channel is configured. |
| | |
| ether_cfg_t const * | p_ether_cfg |
| | Pointer to initial configurations. |
| | |
| ether_instance_descriptor_t * | p_rx_descriptor |
| | Pointer to the currently referenced transmit descriptor. |
| | |
| ether_instance_descriptor_t * | p_tx_descriptor |
| | Pointer to the currently referenced receive descriptor. |
| | |
| void * | p_reg_etherc |
| | Base register of ethernet controller for this channel. |
| | |
| void * | p_reg_edmac |
| | Base register of EDMA controller for this channel. |
| | |
| ether_previous_link_status_t | previous_link_status |
| | Previous link status. |
| | |

| | |
|---|---|
| ether_link_change_t | link_change |
| | status of link change |
| | |
| ether_magic_packet_t | magic_packet |
| | status of magic packet detection |
| | |
| ether_link_establish_status_t | link_establish_status |
| | Current Link status. |
| | |

### Enumeration Type Documentation

#### ◆ ether_previous_link_status_t

enum ether_previous_link_status_t

| Enumerator | |
|---|---|
| ETHER_PREVIOUS_LINK_STATUS_DOWN | Previous link status is down. |
| ETHER_PREVIOUS_LINK_STATUS_UP | Previous link status is up. |
| ETHER_PREVIOUS_LINK_STATUS_DOWN | Previous link status is down. |
| ETHER_PREVIOUS_LINK_STATUS_UP | Previous link status is up. |

### ◆ ether_link_change_t

| enum ether_link_change_t | |
|---|---|
| Enumerator | |
| ETHER_LINK_CHANGE_NO_CHANGE | Link status is no change. |
| ETHER_LINK_CHANGE_LINK_DOWN | Link status changes to down. |
| ETHER_LINK_CHANGE_LINK_UP | Link status changes to up. |
| ETHER_LINK_CHANGE_NO_CHANGE | Link status is no change. |
| ETHER_LINK_CHANGE_LINK_DOWN | Link status changes to down. |
| ETHER_LINK_CHANGE_LINK_UP | Link status changes to up. |

### ◆ ether_magic_packet_t

| enum ether_magic_packet_t | |
|---|---|
| Enumerator | |
| ETHER_MAGIC_PACKET_NOT_DETECTED | Magic packet is not detected. |
| ETHER_MAGIC_PACKET_DETECTED | Magic packet is detected. |

### ◆ ether_link_establish_status_t

| enum ether_link_establish_status_t | |
|---|---|
| Enumerator | |
| ETHER_LINK_ESTABLISH_STATUS_DOWN | Link establish status is down. |
| ETHER_LINK_ESTABLISH_STATUS_UP | Link establish status is up. |
| ETHER_LINK_ESTABLISH_STATUS_DOWN | Link establish status is down. |
| ETHER_LINK_ESTABLISH_STATUS_UP | Link establish status is up. |

### ◆ ether_eesr_event_mask_t

| enum ether_eesr_event_mask_t |
|---|
| Event mask for EESR register |

| Enumerator | |
|---|---|
| ETHER_EESR_EVENT_MASK_CERF | CERF event. |
| ETHER_EESR_EVENT_MASK_PRE | PRE event. |
| ETHER_EESR_EVENT_MASK_RTSF | RTSF event. |
| ETHER_EESR_EVENT_MASK_RTLF | RTLF event. |
| ETHER_EESR_EVENT_MASK_RRF | PRF event. |
| ETHER_EESR_EVENT_MASK_RMAF | RMAF event. |
| ETHER_EESR_EVENT_MASK_TRO | TRO event. |
| ETHER_EESR_EVENT_MASK_CD | CD event. |
| ETHER_EESR_EVENT_MASK_DLC | DLC event. |
| ETHER_EESR_EVENT_MASK_CND | CND event. |
| ETHER_EESR_EVENT_MASK_RFOF | RFOF event. |
| ETHER_EESR_EVENT_MASK_RDE | RDE event. |
| ETHER_EESR_EVENT_MASK_FR | FR event. |
| ETHER_EESR_EVENT_MASK_TFUF | TFUF event. |
| ETHER_EESR_EVENT_MASK_TDE | TDE event. |
| ETHER_EESR_EVENT_MASK_TC | TC event. |
| ETHER_EESR_EVENT_MASK_ECI | ECI event. |
| ETHER_EESR_EVENT_MASK_ADE | ADE event. |
| ETHER_EESR_EVENT_MASK_RFCOF | RFCOF event. |
| ETHER_EESR_EVENT_MASK_RABT | RABT event. |
| ETHER_EESR_EVENT_MASK_TABT | TABT event. |
| ETHER_EESR_EVENT_MASK_TWB | TWB event. |

### ◆ ether_ecsr_event_mask_t

| enum ether_ecsr_event_mask_t | |
|---|---|
| Event mask for ECSR register | |
| Enumerator | |
| ETHER_ECSR_EVENT_MASK_ICD | ICD event. |
| ETHER_ECSR_EVENT_MASK_MPD | MPD event. |
| ETHER_ECSR_EVENT_MASK_LCHNG | LCHNG event. |
| ETHER_ECSR_EVENT_MASK_PSRTO | PSRTO event. |
| ETHER_ECSR_EVENT_MASK_BFR | BFR event. |

## Function Documentation

### ◆ R_ETHER_Open()

fsp_err_t R_ETHER_Open ( ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg* )

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | Initialization of PHY-LSI failed. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to extend config structure or MAC address is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Interrupt is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

### ◆ R_ETHER_Close()

fsp_err_t R_ETHER_Close ( ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_ETHER_BufferRelease()

fsp_err_t R_ETHER_BufferRelease ( ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |

### ◆ R_ETHER_RxBufferUpdate()

fsp_err_t R_ETHER_RxBufferUpdate ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer* )

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | The pointer of buffer is NULL or not aligned on a 32-bit boundary. |
| FSP_ERR_INVALID_MODE | Driver is configured to non zero copy mode. |
| FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE | All descriptor is active. |

### ◆ R_ETHER_LinkProcess()

fsp_err_t R_ETHER_LinkProcess ( ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Link is up. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Link is down. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | When reopening the PHY interface initialization of the PHY-LSI failed. |
| FSP_ERR_ALREADY_OPEN | When reopening the PHY interface it was already opened. |
| FSP_ERR_INVALID_CHANNEL | When reopening the PHY interface an invalid channel was passed. |
| FSP_ERR_INVALID_POINTER | When reopening the PHY interface the MAC address pointer was NULL. |
| FSP_ERR_INVALID_ARGUMENT | When reopening the PHY interface the interrupt was not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of the PHY-LSI failed. |

### ◆ R_ETHER_WakeOnLANEnable()

fsp_err_t R_ETHER_WakeOnLANEnable ( ether_ctrl_t *const *p_ctrl*)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

### ◆ R_ETHER_Read()

fsp_err_t R_ETHER_Read ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes* )

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_NO_DATA | There is no data in receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_FILTERING | Multicast Frame filter is enable, and Multicast Address Frame is received. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |

### ◆ R_ETHER_Write()

fsp_err_t R_ETHER_Write ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length* )

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE | As a Magic Packet is being detected, transmission and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Value of the send frame size is out of range. |

### ◆ R_ETHER_TxStatusGet()

fsp_err_t R_ETHER_TxStatusGet ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address* )

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transmit buffer address is stored in provided p_buffer_address. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | p_status is NULL. |
| FSP_ERR_NOT_FOUND | Transmit buffer address has been overwritten in transmit descriptor. |

### ◆ R_ETHER_CallbackSet()

fsp_err_t R_ETHER_CallbackSet ( ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### Detailed Description

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.

# Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

### Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

# Configuration

### Build Time Configurations for r_ether_phy

The following build time configurations are defined in fsp_cfg/r_ether_phy_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| KSZ8091RNB Target | • Disabled<br>• Enabled | Disabled | Select whether to use KSZ8091RNB PHY-LSI or not. |
| KSZ8041 Target | • Disabled<br>• Enabled | Disabled | Select whether to use KSZ8041 PHY-LSI or not. |
| DP83620 Target | • Disabled<br>• Enabled | Disabled | Select whether to use DP83620 PHY-LSI or not. |
| ICS1894 Target | • Disabled<br>• Enabled | Disabled | Select whether to use ICS1894 PHY-LSI or not. |
| User Own Target | • Disabled<br>• Enabled | Disabled | Select whether to use User own PHY-LSI or not. |
| Reference Clock | • Default<br>• Enabled<br>• Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |
| Reference Clock | • Default<br>• Enabled<br>• Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |
| Automatic PHY-LSI Initialization | • Enabled<br>• Disabled | Enabled | Select whether to initialize the Ethernet PHY-LSI in the open function. |

**Configurations for Networking > Ethernet (r_ether_phy)**

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_ether_phy0 | Module name. |

| | | | |
|---|---|---|---|
| Channel | • 0<br>• 1 | 0 | Select the Ethernet controller channel number. |
| PHY-LSI Address | Specify a value between 0 and 31. | 0 | Specify the address of the PHY-LSI used. |
| Default PHY-LSI port | 0 | 0 | Specify the default port for PHY-LSI configuration. |
| PHY-LSI Reset Completion Timeout | Specify a value between 0x1 and 0xFFFFFFFF. | 0x00020000 | Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used. |
| Select MII type | • MII<br>• RMII | RMII | Specify whether to use MII or RMII. |
| PHY-LSI type | • Kit Component<br>• DEFAULT<br>• KSZ8091RNB<br>• KSZ8041<br>• DP83620<br>• ICS1894<br>• User own PHY | Kit Component | Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board. |
| Port Custom Init Function | Name must be a valid C symbol | NULL | Set the initial function of the PHY-LSI, When using your own PHY-LSI. |
| Port Custom Link Partner Ability Get Function | Name must be a valid C symbol | NULL | Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI. |
| MII/RMII Register Access Wait-time | Specify a value between 0x1 and 0x7FFFFFFF. | 8 | Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used. |
| Flow Control | • Disable<br>• Enable | Disable | Select whether to enable or disable flow control. |

# Usage Notes

*Note*

*See the example below for details on how to initialize the Ethernet PHY module.*

### Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

### MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

| Access type | MII and RMII management frame | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |
| | Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 |
| Read | | 1...1 | 01 | 10 | 00001 | RRRRR | Z0 | DDDDDDDDDDDDDDDD | Z |
| Write | | 1...1 | 01 | 01 | 00001 | RRRRR | 10 | DDDDDDDDDDDDDDDD | Z |

*Note*

*- PRE (preamble): Send 32 consecutive 1s.*
*- ST (start of frame): Send 01b.*
*- OP (operation code): Send 10b for read or 01b for write.*
*- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.*
*- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.*
*- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.*
*Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).*
*(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)*
*- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.*
*- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write*
*operation (Z is output). No control is required, because a bus was already released during a read operation.*

### Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
    - KSZ8091RNB
    - KSZ8041
    - DP83620
    - ICS1894

# Examples

### ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ether_phy0_ctrl.open   = 0U;
    g_ether_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                            &g_ether_phy0_line_speed_duplex,
                                            &g_ether_phy0_local_pause,
                                            &g_ether_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

#### Data Structures

| | |
|---|---|
| struct | ether_phy_instance_ctrl_t |

| | |
|---|---|
| struct | ether_phy_extended_cfg_t |

### Enumerations

| | |
|---|---|
| enum | ether_phy_interface_status_t |

## Data Structure Documentation

### ◆ ether_phy_instance_ctrl_t

| struct ether_phy_instance_ctrl_t | | |
|---|---|---|
| ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| ether_phy_cfg_t const * | p_ether_phy_cfg | Pointer to initial configurations. |
| volatile uint32_t * | p_reg_pir | Pointer to ETHERC peripheral registers. |
| uint32_t | local_advertise | Capabilities bitmap for local advertising. |
| ether_phy_interface_status_t | interface_status | Initialized status of ETHER PHY interface. |

### ◆ ether_phy_extended_cfg_t

| struct ether_phy_extended_cfg_t | |
|---|---|
| ETHER PHY extended configuration. | |
| **Data Fields** | |
| void(* | p_target_init )(ether_phy_instance_ctrl_t *p_instance_ctrl) |
| | Pointer to callback that is called to initialize the target. |
| | |
| bool(* | p_target_link_partner_ability_get )(ether_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex) |
| | Pointer to callback that is called to get the link partner ability. |
| | |
| ether_phy_lsi_cfg_t const * | p_phy_lsi_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS] |
| | Pointer list of PHY LSI configurations. |
| | |
| uint8_t | default_phy_lsi_cfg_index |

| | |
|---|---|
| | Index of the default PHY LSI condiguration. |
| | |

## Enumeration Type Documentation

### ◆ ether_phy_interface_status_t

| enum ether_phy_interface_status_t | |
|---|---|
| Initialization state for read/write | |
| Enumerator | |
| ETHER_PHY_INTERFACE_STATUS_UNINITIALIZED | ETHER PHY interface is uninitialized. |
| ETHER_PHY_INTERFACE_STATUS_INITIALIZED | ETHER PHY interface is initialized. |

## Function Documentation

### ◆ R_ETHER_PHY_Open()

fsp_err_t R_ETHER_PHY_Open ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |
| FSP_ERR_INVALID_ARGUMENT | Register address is incorrect |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized. |

### ◆ R_ETHER_PHY_Close()

fsp_err_t R_ETHER_PHY_Close ( ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_ETHER_PHY_StartAutoNegotiate()

fsp_err_t R_ETHER_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHER_PHY successfully starts auto-negotiate. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_ARGUMENT | Register address is incorrect |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHER_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause* )

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | The auto-negotiation isn't completed |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHER_PHY_LinkStatusGet()

fsp_err_t R_ETHER_PHY_LinkStatusGet ( ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHER_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_INVALID_ARGUMENT | Status register address is incorrect |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHER_PHY_ChipInit()

fsp_err_t R_ETHER_PHY_ChipInit ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PHY device initialized successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block or configuration structure is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |

### ◆ R_ETHER_PHY_Read()

fsp_err_t R_ETHER_PHY_Read ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data* )

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHER_PHY successfully read data. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### ◆ R_ETHER_PHY_Write()

| fsp_err_t R_ETHER_PHY_Write ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data* ) |
|---|
| Write data to register of PHY-LSI . Implements ether_phy_api_t::write. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ETHER_PHY successfully write data. |
| FSP_ERR_ASSERTION | Pointer to ETHER_PHY control block is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |

### Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

# Overview

This module transmits and receives Ethernet (IEEE 802.3) frames. This module provides single MAC layer interface.

The following figure shows which IPs are used by the r_rmac module.

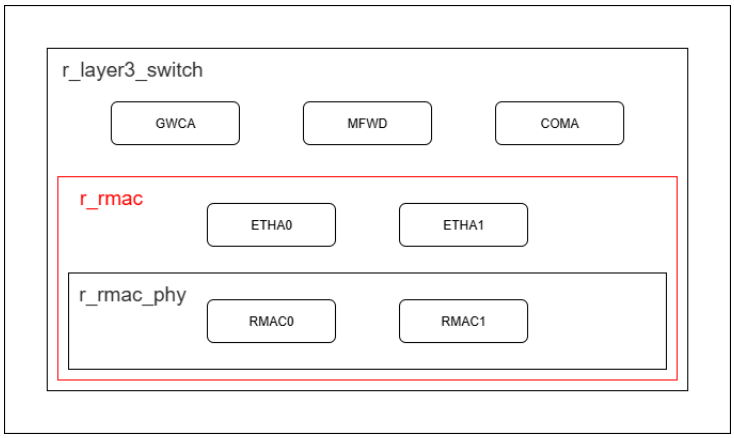

Figure 318: ESWM block diagram

### Features

The RMAC module supports the following features:

- Transmit/Receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support
- Get the frame transmission and reception times

# Configuration

### Build Time Configurations for r_rmac

The following build time configurations are defined in fsp_cfg/r_rmac_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Networking > Ethernet MAC (r_rmac)**

This module can be added to the Stacks tab via New Stack > Networking > Ethernet MAC (r_rmac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ether0 | Module name. |
| Channel | Must be an integer greater than or equal to 0. | 0 | Write the ether channel number. |
| Zero-copy Mode | • Disable<br>• Enable | Disable | Enable or disable zero-copy mode. |
| Flow control functionality | • Disable<br>• Enable | Disable | Enable or disable flow control. |
| MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of this channel. |
| Filters | | | |
| Multicast Mode | • Disable<br>• Enable | Enable | Enable or disable multicast frame reception. |
| Promiscuous Mode | • Disable<br>• Enable | Disable | Enable this option to receive packets addressed to other NICs. |
| Broadcast filter | Must be a valid non-negative integer with maximum configurable value of 65535. | 0 | Limit of the number of broadcast frames received continuously |
| Buffers | | | |
| Padding size | Disable | Disable | The padding size that is automatically inserted into the received packets |
| Padding offset | Must be less than 64 bytes. | 0 | The offset into a receive buffer to insert padding bytes. |
| TX queue length | Value must be an integer | 3 | Number of buffers per TX queue. |

| | | | |
|---|---|---|---|
| RX queue length | Value must be an integer | 3 | Number of buffers per RX queue. |
| TX queue num | Value must be an integer | 2 | TX queue num |
| RX queue num | Value must be an integer | 2 | RX queue num |
| Number of TX buffer | Value must be an integer | 12 | Number of transmit buffers |
| Number of RX buffer | Value must be an integer | 12 | Number of receive buffers |
| Buffer size | Must be at least 1514 which is the maximum Ethernet frame size. | 1514 | Size of Ethernet buffer |
| Allocate RX buffer | • Disable<br>• Enable | Enable | Allocates the RX buffer when generating the configuration structure |
| Number of node num | Value must be an integer | 24 | Number of receive buffers |
| Interrupts | | | |
| Magic packet interrupt priority | MCU Specific Options | | Select the magic packet detection interrupt priority. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |
| Timestamp | | | |
| TS queue length | Value must be an integer | 8 | Timestamp queue length. |

### Interrupt Configuration

The first R_RMAC_Open function call sets GWDI interrupts. The user could provide callback function which would be invoked when GWDI interrupt handler has been completed. The callback arguments will contain information about a channel number, the event code and a pointer to the user defined context.

### Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

### Clock Configuration

The ESWM peripheral uses ICLK, PCLKA, ESWCLK and ESWPHYCLK as clocks. These clocks must be set to frequencies within the ranges shown in the following table.

| PHY speed [Mbps] | ICLK [MHz] | PCLKA [MHz] | ESWCLK [MHz] | ESWPHYCLK [MHz] |
|---|---|---|---|---|
| 10/100 | 50 to 250 | up to 125 | 50 to 250 | Not required |
| 1000 | 150 to 250 | up to 125 | 150 to 250 | 500 |

*Note*

1. *Clock restrictions are as follow: ICLK × 1.5 => ESWCLK, ESWCLK > PCLKA and ICLK > PCLKA.*
2. *When using a products in the HLQFP176 package, set ESWCLK to 125 MHz or less.*

### Pin Configuration

To use the RMAC module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_RMAC_Open function.

# Usage Notes

### Ethernet Frame Format

The RMAC module supports the Ethernet II/IEEE 802.3 frame format.

### Frame Format for Data Transmission and Reception

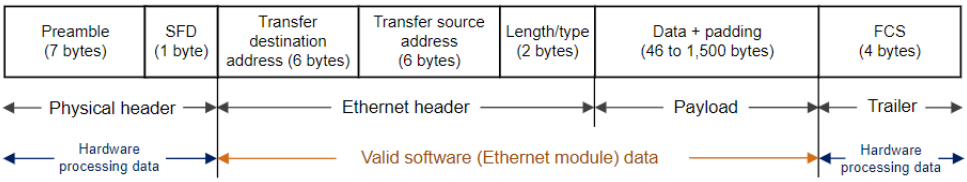

Figure 319: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

### PAUSE Frame Format

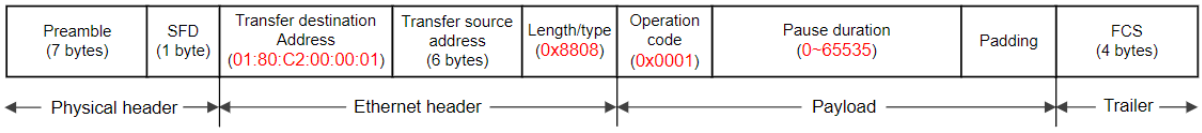

Figure 320: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and

the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

### Magic Packet Frame Format

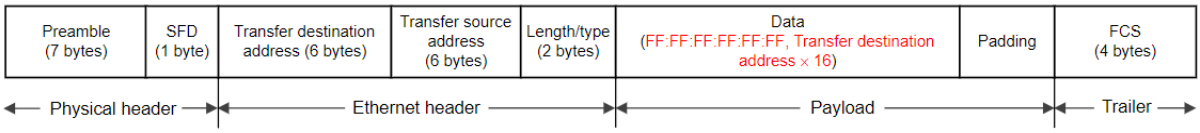

Figure 321: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

# Examples

### ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

*Note*

*In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.*

```
#define RMAC_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)

    assert(FSP_SUCCESS == err);
 /* Disable transmission and receive function and close the rmac instance. */
 R_RMAC_Close(&g_ether0_ctrl);
}
```

### Timestamp Example

This is a example of getting transmission and reception timestamps.

```
void rmac_timestamp_example (void)
{
```

```
fsp_err_t err            = FSP_SUCCESS;
   uint32_t read_data_size = 0;
rmac_timestamp_t rx_timestamp;
rmac_timestamp_t tx_timestamp;
rmac_write_cfg_t write_cfg = {.tx_timestamp_enable = 1};
/* Open the rmac instance with initial configuration. */
   err = R_RMAC_Open(&g_ether0_ctrl, &g_ether0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
do
   {
/* When the Ethernet link status read from the PHY-LSI Basic Status register is link-
up,
 * Initializes the module and make auto negotiation. */
      err = R_RMAC_LinkProcess(&g_ether0_ctrl);
   } while (FSP_SUCCESS != err);
/* Set write configuration. */
   err = R_RMAC_SetWriteConfig(&g_ether0_ctrl, &write_cfg);
   assert(FSP_SUCCESS == err);
/* Transmission is non-blocking. */
/* User data copy to internal buffer and is transferred by DMA in the background. */
   err = R_RMAC_Write(&g_ether0_ctrl, (void *) gp_send_data, sizeof(gp_send_data));
   assert(FSP_SUCCESS == err);
/* Get TX timestamp value. */
   err = R_RMAC_GetTxTimestamp(&g_ether0_ctrl, &tx_timestamp);
   assert(FSP_SUCCESS == err);
/* Get RX timestamp value. */
   err = R_RMAC_GetRxTimestamp(&g_ether0_ctrl, &rx_timestamp);
   assert(FSP_SUCCESS == err);
/* Received data copy to user buffer from internal buffer. */
   err = R_RMAC_Read(&g_ether0_ctrl, (void *) gp_read_buffer, &read_data_size);
   assert(FSP_SUCCESS == err);
/* Disable transmission and receive function and close the rmac instance. */
R_RMAC_Close(&g_ether0_ctrl);
```

```
}
```

### Function Documentation

#### ◆ R_RMAC_Open()

fsp_err_t R_RMAC_Open ( ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg* )

After RMAC, Switch and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

Initializes the ether module and applies configurations. Implements ether_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | Initialization of PHY-LSI failed. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to extend config structure or MAC address is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Interrupt is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

#### ◆ R_RMAC_Close()

fsp_err_t R_RMAC_Close ( ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_RMAC_BufferRelease()

fsp_err_t R_RMAC_BufferRelease ( ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the receive buffer list. Implements ether_api_t::bufferRelease.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block or internal buffers is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_BUFFER_EMPTY | There is no available internal RX buffer. |

### ◆ R_RMAC_RxBufferUpdate()

fsp_err_t R_RMAC_RxBufferUpdate ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer* )

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | The pointer of buffer is NULL or not aligned on a 32-bit boundary. |
| FSP_ERR_INVALID_MODE | Driver is configured to non zero copy mode. |
| FSP_ERR_BUFFER_EMPTY | There is no available internal RX buffer. |

### ◆ R_RMAC_LinkProcess()

fsp_err_t R_RMAC_LinkProcess ( ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Link is up. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Link is down. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | When reopening the PHY interface initialization of the PHY-LSI failed. |
| FSP_ERR_ALREADY_OPEN | When reopening the PHY interface it was already opened. |
| FSP_ERR_INVALID_CHANNEL | When reopening the PHY interface an invalid channel was passed. |
| FSP_ERR_INVALID_POINTER | When reopening the PHY interface the MAC address pointer was NULL. |
| FSP_ERR_INVALID_ARGUMENT | When reopening the PHY interface the interrupt was not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of the PHY-LSI failed. |

### ◆ R_RMAC_WakeOnLANEnable()

fsp_err_t R_RMAC_WakeOnLANEnable ( ether_ctrl_t *const *p_ctrl*)

The setting of RMAC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_PHY_ERROR_LINK | Initialization of PHY-LSI failed. |

### ◆ R_RMAC_Read()

fsp_err_t R_RMAC_Read ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes* )

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_NO_DATA | There is no data in receive buffer. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_FILTERING | Multicast Frame filter is enable, and Multicast Address Frame is received. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |
| FSP_ERR_BUFFER_EMPTY | There is no available internal RX buffer. |

### ◆ R_RMAC_Write()

fsp_err_t R_RMAC_Write ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length* )

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_ETHER_ERROR_LINK | Auto-negotiation is not completed, and reception is not enabled. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | Transmit buffer is not empty. |
| FSP_ERR_INVALID_POINTER | Value of the pointer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Value of the send frame size is out of range. |
| FSP_ERR_BUFFER_EMPTY | There is no available internal TX buffer. |

### ◆ R_RMAC_TxStatusGet()

fsp_err_t R_RMAC_TxStatusGet ( ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address* )

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transmit buffer address is stored in provided p_buffer_address. |
| FSP_ERR_ASSERTION | Pointer to ETHER control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | p_status is NULL. |
| FSP_ERR_NOT_FOUND | Transmit buffer address has been overwritten in transmit descriptor. |

### ◆ R_RMAC_CallbackSet()

fsp_err_t R_RMAC_CallbackSet ( ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_RMAC_SetWriteConfig()

fsp_err_t R_RMAC_SetWriteConfig ( ether_ctrl_t *const *p_ctrl*, rmac_write_cfg_t *const *p_write_cfg* )

Set configuration for tx frame. This API must call before ether_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_RMAC_GetTxTimestamp()

fsp_err_t R_RMAC_GetTxTimestamp ( ether_ctrl_t *const *p_ctrl*, rmac_timestamp_t *const *p_timestamp* )

Get timestamp of transmitted frame. This API must call after ether_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### ◆ R_RMAC_GetRxTimestamp()

fsp_err_t R_RMAC_GetRxTimestamp ( ether_ctrl_t *const *p_ctrl*, rmac_timestamp_t *const *p_timestamp* )

Get timestamp of received frame. This API must call before ether_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Processing completed successfully. |
| FSP_ERR_ASSERTION | A pointer argument is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |

### Detailed Description

The RMAC PHY module (r_rmac_phy) provides an API for standard Ethernet PHY communications applications that use the RMAC peripheral. It implements the Ethernet PHY Interface.

# Overview

The RMAC PHY module is used to setup and manage an external Ethernet PHY device. r_rmac_phy use the on-chip MAC layer peripheral(RMAC), which is part of Ethernet Switch Module(ESWM). It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

The following figure shows which IPs are used by the r_rmac_phy module.

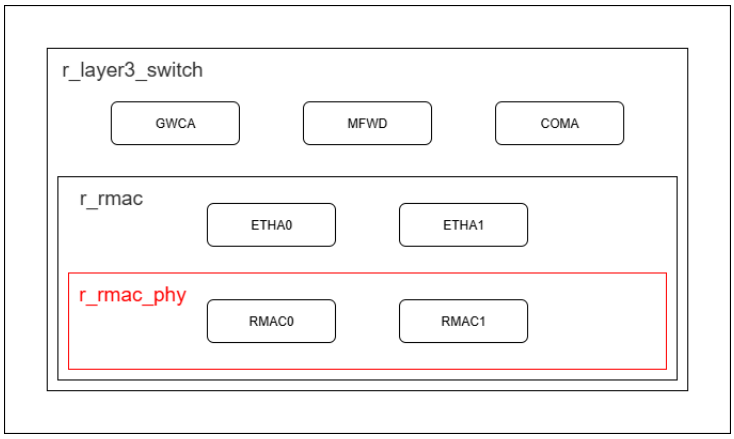

Figure 322: ESWM block diagram

### Features

The RMAC PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support
- Gigabit Ethernet support

Following features are not supported:

- Extensions to management frame format defined in IEEE802.3 clause 45

# Configuration

### Build Time Configurations for r_rmac_phy

The following build time configurations are defined in fsp_cfg/r_rmac_phy_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| KSZ8091RNB Target | • Disabled<br>• Enabled | Disabled | Select whether to use KSZ8091RNB PHY-LSI or not. |
| KSZ8041 Target | • Disabled<br>• Enabled | Disabled | Select whether to use KSZ8041 PHY-LSI or not. |
| DP83620 Target | • Disabled<br>• Enabled | Disabled | Select whether to use DP83620 PHY-LSI or not. |
| ICS1894 Target | • Disabled<br>• Enabled | Disabled | Select whether to use ICS1894 PHY-LSI or not. |

| | | | |
|---|---|---|---|
| GPY111 Target | • Disabled<br>• Enabled | Disabled | Select whether to use GPY111 PHY-LSI or not. |
| User Own Target | • Disabled<br>• Enabled | Disabled | Select whether to use User own PHY-LSI or not. |
| Reference Clock | • Default<br>• Enabled<br>• Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |
| Reference Clock | • Default<br>• Enabled<br>• Disabled | Default | Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board. |

**Configurations for Networking > Ethernet (r_rmac_phy)**

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_rmac_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rmac_phy0 | Module name. |
| Channel | • 0<br>• 1 | 0 | Select the Ethernet controller channel number. |
| Default PHY-LSI port | • 0<br>• 1 | 0 | Specify the default port for PHY-LSI configuration. |
| PHY-LSI Reset Completion Timeout | Specify a value between 0x1 and 0xFFFFFFFF. | 0x00020000 | Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used. |
| Select MII type | • MII<br>• RMII<br>• GMII<br>• RGMII | RMII | Specify whether to use MII or RMII. |

| | | | |
|---|---|---|---|
| Port Custom Init Function | Name must be a valid C symbol | NULL | Set the initial function of the PHY-LSI, When using your own PHY-LSI. |
| Port Custom Link Partner Ability Get Function | Name must be a valid C symbol | NULL | Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI. |
| Flow Control | • Disable<br>• Enable | Disable | Select whether to enable or disable flow control. |
| Management frame format | Clause 22 frame format | Clause 22 frame format | Select the management frame format used to access the PHY-LSI. |
| MDC clock rate (Hz) | Value must be a non-negative number | 2500000 | Specify the MDC clock frequency |
| MDIO hold timing adjustment | Value must be a non-negative integer less than 8 | 0 | Specify the clock cycle for hold timing. |
| MDIO capture timing adjustment | Value must be a non-negative integer less than 8 | 0 | Specify the clock cycle for capture timing. |

# Usage Notes

### Accessing the Registers in PHY-LSI

Use the RMAC peripheral to access the registers in the PHY-LSI. Management frame is transmitted and received through the ETn_MDC and ETn_MDIO pins controlled by hardware.

This HW supports two management frame format.

- Normal management frame format defined in Clause 22 of IEEE802.3 (Describe "MDIO" in this document)
- Extension management frame format defined in Clause 45 of IEEE802.3 (Describe "eMDIO" in this document)

### Management frame format of MDIO (Clause 22)

The below table lists the management frame formats of MDIO.

| Access type | MII and RMII management frame | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Item | PRE | ST | OP | PHYAD | REGAD | TA | DATA | IDLE |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Read | 1...1 | 01 | 10 | 00001 | RRRRR | Z0 | DDDDD DDDDD DDDDD D | Z |
| Write | 1...1 | 01 | 01 | 00001 | RRRRR | 10 | DDDDD DDDDD DDDDD D | Z |

*Note*

*- PRE (preamble): Send 32 consecutive 1s.*
*- ST (start of frame): Send 01b.*
*- OP (operation code): Send 10b for read or 01b for write.*
*- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.*
*- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.*
*- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.*
*Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).*
*(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)*
*- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.*
*- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write*
*operation (Z is output). No control is required, because a bus was already released during a read operation.*

### Management frame format of eMDIO (Clause 45)

The below table lists the management frame formats of eMDIO(Clause 45).

| Access type | MII and RMII management frame | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Item | PRE | ST | OP | PRTAD | DEVAD | TA | DATA | IDLE |
| Number of bits | 32 | 2 | 2 | 5 | 5 | 2 | 16 | 1 |
| Address | 1...1 | 00 | 00 | PPPPP | EEEEE | 10 | AAAAAA AAAAAA AAAA | Z |
| Write | 1...1 | 00 | 01 | PPPPP | EEEEE | 10 | DDDDD DDDDD DDDDD D | Z |
| Read | 1...1 | 00 | 11 | PPPPP | EEEEE | Z0 | DDDDD DDDDD DDDDD D | Z |
| Read Increment | 1...1 | 00 | 10 | PPPPP | EEEEE | Z0 | DDDDD DDDDD DDDDD D | Z |

*Note*

*- PRE (preamble): Send 32 consecutive 1s.*
*- ST (start of frame): Send 00b.*
*- OP (operation code): Send 00b for register address, 10b for read operation, 11b for write operation, or 10b for post-read-increment-address operation.*
*- PRTAD (port address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits port address. When the port address is 1, send 00001b.*
*- DEVAD (device address): Up to 32 MDIO Manageable Devices(MMD) are contained in a PHY-LSI. MMD are selected with these 5 bits device address.*
*- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.*
*Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).*
*(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)*
*- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.*
*- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write*
*operation (Z is output). No control is required, because a bus was already released during a read operation.*

### Limitations

- The r_rmac_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - KSZ8091RNB
  - KSZ8041
  - DP83620
  - ICS1894
  - GPY111

# Examples

### RMAC PHY Basic Example

This is a basic example of minimal use of the RMAC PHY in an application.

```
void rmac_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_rmac_phy0_ctrl.open   = 0U;
    g_rmac_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_RMAC_PHY_Open(&g_rmac_phy0_ctrl, &g_rmac_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_RMAC_PHY_StartAutoNegotiate(&g_rmac_phy0_ctrl);
    assert(FSP_SUCCESS == err);
```

```
/* Polling until link is established. */
while (FSP_SUCCESS != R_RMAC_PHY_LinkStatusGet(&g_rmac_phy0_ctrl))
   {
/* Do nothing */
   }
/* Get link partner ability from phy interface. */
   err = R_RMAC_PHY_LinkPartnerAbilityGet(&g_rmac_phy0_ctrl,
                                          &g_rmac_phy0_line_speed_duplex,
                                          &g_rmac_phy0_local_pause,
                                          &g_rmac_phy0_partner_pause);
   assert(FSP_SUCCESS == err);
/* Check current link status. */
   err = R_RMAC_PHY_LinkStatusGet(&g_rmac_phy0_ctrl);
   assert(FSP_SUCCESS == err);
}
```

## Data Structures

| | |
|---|---|
| struct | rmac_phy_instance_ctrl_t |
| struct | rmac_phy_extended_cfg_t |

## Enumerations

| | |
|---|---|
| enum | rmac_phy_interface_status_t |
| enum | rmac_phy_frame_format_t |

## Data Structure Documentation

### ◆ rmac_phy_instance_ctrl_t

| struct rmac_phy_instance_ctrl_t | | |
|---|---|---|
| RMAC PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called. | | |
| Data Fields | | |
| uint32_t | open | Used to determine if the channel is configured. |
| ether_phy_cfg_t const * | p_ether_phy_cfg | Pointer to initial configurations. |
| R_RMAC0_Type * | p_reg_rmac | Pointer to RMAC peripheral registers. |
| | | |

| | | |
|---|---|---|
| uint32_t | local_advertise | Capabilities bitmap for local advertising. |
| rmac_phy_interface_status_t | interface_status | Initialized status of ETHER PHY interface. |
| uint8_t | phy_lsi_cfg_index | Index of the PHY LSI that is currently the target of operation. |

### ◆ rmac_phy_extended_cfg_t

| struct rmac_phy_extended_cfg_t | |
|---|---|
| RMAC PHY extended configuration. | |
| **Data Fields** | |
| void(* | p_target_init )(rmac_phy_instance_ctrl_t *p_instance_ctrl) |
| | Pointer to callback that is called to initialize the target. |
| | |
| bool(* | p_target_link_partner_ability_get )(rmac_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex) |
| | Pointer to callback that is called to get the link partner ability. |
| | |
| rmac_phy_frame_format_t | frame_format |
| | Whether the management frame format is MDIO or eMDIO. |
| | |
| uint32_t | mdc_clock_rate |
| | MDC frequency division. |
| | |
| uint8_t | mdio_hold_time |
| | MDIO hold time adjustment. |
| | |
| uint8_t | mdio_capture_time |
| | MDIO capture time adjustment. |
| | |
| ether_phy_lsi_cfg_t const * | p_phy_lsi_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS] |
| | Pointer list of PHY LSI configurations. |

| | |
|---|---|
| uint8_t | default_phy_lsi_cfg_index |
| | Index of the default PHY LSI condiguration. |

## Enumeration Type Documentation

### ◆ rmac_phy_interface_status_t

| enum rmac_phy_interface_status_t | |
|---|---|
| Initialization state for read/write | |
| Enumerator | |
| RMAC_PHY_INTERFACE_STATUS_UNINITIALIZED | ETHER PHY interface is uninitialized. |
| RMAC_PHY_INTERFACE_STATUS_INITIALIZED | ETHER PHY interface is initialized. |

### ◆ rmac_phy_frame_format_t

| enum rmac_phy_frame_format_t | |
|---|---|
| Enumerator | |
| RMAC_PHY_FRAME_FORMAT_MDIO | Normal management frame format defined in clause 22. |
| RMAC_PHY_FRAME_FORMAT_EMDIO | Extension management frame format defined in clause 45. |

## Function Documentation

### ◆ R_RMAC_PHY_Open()

fsp_err_t R_RMAC_PHY_Open ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_CHANNEL | Invalid channel number is given. |
| FSP_ERR_INVALID_POINTER | Pointer to p_cfg is NULL. |
| FSP_ERR_INVALID_MODE | Function is called when not in CONFIG mode. |

### ◆ R_RMAC_PHY_Close()

fsp_err_t R_RMAC_PHY_Close ( ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_INVALID_MODE | Function is called when not in DISABLE mode. |

### ◆ R_RMAC_PHY_StartAutoNegotiate()

fsp_err_t R_RMAC_PHY_StartAutoNegotiate ( ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RMAC_PHY successfully starts auto-negotiate. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_LinkPartnerAbilityGet()

fsp_err_t R_RMAC_PHY_LinkPartnerAbilityGet ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause* )

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RMAC_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_ETHER_PHY_NOT_READY | The auto-negotiation isn't completed |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_LinkStatusGet()

fsp_err_t R_RMAC_PHY_LinkStatusGet ( ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RMAC_PHY successfully get link partner ability. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |
| FSP_ERR_ETHER_PHY_ERROR_LINK | PHY-LSI is not link up. |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_ChipInit()

fsp_err_t R_RMAC_PHY_ChipInit ( ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg* )

Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PHY device initialized successfully. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_TIMEOUT | PHY-LSI Reset wait timeout. |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_Read()

fsp_err_t R_RMAC_PHY_Read ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data* )

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RMAC_PHY successfully read data. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_INVALID_POINTER | Pointer to read buffer is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_Write()

fsp_err_t R_RMAC_PHY_Write ( ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data* )

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RMAC_PHY successfully write data. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Address or data is not a valid size |
| FSP_ERR_NOT_INITIALIZED | The control block has not been initialized |
| FSP_ERR_INVALID_MODE | Function is called when not in OPERATION mode. |

### ◆ R_RMAC_PHY_ChipSelect()

| fsp_err_t R_RMAC_PHY_ChipSelect ( ether_phy_ctrl_t *const *p_ctrl*, uint8_t *port* ) |
|---|

Update the target PHY LSI of this driver.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | PHY device initialized successfully. |
| FSP_ERR_ASSERTION | Pointer to RMAC_PHY control block or configuration structure is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Invalid PHY LSI is selected. |

## 5.2.12.20 Ethernet Generic PTP Timer (r_gptp)

gptp_callback_args_t *const p_callback_memory)

### Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the GPTP Interface.

# Overview

Ethernet Generic PTP timer (GPTP) enables accurate synchronization of the clock in the control system.

This module supports two GPTP timer.

### Features

The GPTP module has the following features:

- Supports start and stop gPTP timer.
- Supports set timer offset.
- Supports set timer rate.
- Supports set pulse generator.

# Configuration

### Build Time Configurations for r_gptp

The following build time configurations are defined in fsp_cfg/r_gptp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Networking > Ethernet Generic PTP Timer (r_gptp)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet Generic PTP Timer (r_gptp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_gptp0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |

### Clock Configuration

The GPTP clock is based on the ESWCLK frequency. You can set the PTPTIVCt (t = 0 or 1) register to

timer increment value according to ESWCLK frequency.

# Usage Notes

# Examples

This is a basic example of minimal use of the GPTP in an application.

```
void gptp_basic_example (void)
{
 fsp_err_t       err       = FSP_SUCCESS;
    uint8_t          timer    = GPTP_EXAMPLE_TIMER_NUMBER;
 gptp_timer_cfg_t timer_cfg = {.clock_period = GPTP_EXAMPLE_CLOCK_PERIOD};
    int64_t          offset    = GPTP_EXAMPLE_OFFSET;
    uint32_t         rate      = GPTP_EXAMPLE_RATE;
 gptp_timer_value_t timer_value =
    {
       .time_sec_upper = 0,
       .time_sec_lower = 0,
       .time_nsec      = 0,
    };
 gptp_pulsed_output_cfg_t pulsed_output_cfg0 =
    {
       .pulse_num       = 0,
       .start_sec_upper = 0,
       .start_sec_lower = 0,
       .start_ns         = 0,
       .wide             = 0,
       .period_sec_upper = 0,
       .period_sec_lower = 0,
       .period_ns       = 0,
    };
 gptp_pulsed_output_cfg_t pulsed_output_cfg1 =
    {
       .pulse_num       = 1,
       .start_sec_upper = 0,
```

```
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
gptp_pulsed_output_cfg_t pulsed_output_cfg2 =
   {
      .pulse_num       = 2,
      .start_sec_upper = 0,
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
gptp_pulsed_output_cfg_t pulsed_output_cfg3 =
   {
      .pulse_num       = 3,
      .start_sec_upper = 0,
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
gptp_pulse_generator_t pulse_generator =
   {
      .p_pulsed_output_cfg_list =
     {&pulsed_output_cfg0, &pulsed_output_cfg1, &pulsed_output_cfg2,
&pulsed_output_cfg3},
```

```
    };
/* Open the gptp instance with initial configuration. */
    err = R_GPTP_Open(&g_gptp0_ctrl, &g_gptp0_cfg);
/* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
/* Set configuration of gptp timer. */
    err = R_GPTP_TimerCfg(&g_gptp0_ctrl, timer, &timer_cfg);
    assert(FSP_SUCCESS == err);
/* Start gptp timer. */
    err = R_GPTP_Start(&g_gptp0_ctrl, timer);
    assert(FSP_SUCCESS == err);
/* Get value of gptp timer. */
    err = R_GPTP_TimerValueGet(&g_gptp0_ctrl, timer, &timer_value);
    assert(FSP_SUCCESS == err);
/* Set offset of gptp timer. */
    err = R_GPTP_TimerOffsetSet(&g_gptp0_ctrl, timer, offset);
    assert(FSP_SUCCESS == err);
/* Set rate of gptp timer. */
    err = R_GPTP_TimerRateSet(&g_gptp0_ctrl, timer, rate);
    assert(FSP_SUCCESS == err);
/* Set pulse generator of gptp timer. */
    err = R_GPTP_PulseGeneratorSet(&g_gptp0_ctrl, timer, &pulse_generator);

| struct | gptp_pulsed_output_cfg_t |
| struct | gptp_pulse_generator_t |

| | |
|---|---|
| struct | gptp_instance_ctrl_t |

## Data Structure Documentation

### ◆ gptp_pulsed_output_cfg_t

| struct gptp_pulsed_output_cfg_t | | |
|---|---|---|
| Pulsed output configuration. | | |
| Data Fields | | |
| uint8_t | pulse_num | Pulse generator number. |
| uint16_t | start_sec_upper | Pulse start second(upper 16 bit). |
| uint32_t | start_sec_lower | Pulse start second(lower 32 bit). |
| uint32_t | start_ns | Pulse start nanosecond. |
| uint16_t | wide | Pulse width. |
| uint16_t | period_sec_upper | Pulse period second(upper 16 bit). |
| uint32_t | period_sec_lower | Pulse period second(lower 32 bit). |
| uint32_t | period_ns | Pulse period nanosecond. |

### ◆ gptp_pulse_generator_t

| struct gptp_pulse_generator_t | | |
|---|---|---|
| Pulse generator. | | |
| Data Fields | | |
| gptp_pulsed_output_cfg_t * | p_pulsed_output_cfg_list[BSP_FEATURE_ESWM_GPTP_PULSE_GENERATOR_NUM] | List of pointer to pulsed output configuration. |

### ◆ gptp_instance_ctrl_t

| struct gptp_instance_ctrl_t | |
|---|---|
| GPTP control block. DO NOT INITIALIZE. Initialization occurs when gptp_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | open |
| | Indicates whether the open() API has been successfully called. |
| | |
| gptp_cfg_t const * | p_cfg |
| | Pointer to initial configurations. |

| | |
|---|---|
| | |
| R_GPTP_Type * | p_reg_gptp |
| | Pointer to GPTP timer register. |
| | |
| void(* | p_callback )(gptp_callback_args_t *) |
| | Pointer to callback that is called. |
| | |
| gptp_callback_args_t * | p_callback_memory |
| | Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory. |
| | |
| void const * | p_context |
| | Pointer to context to be passed into callback function. |
| | |

### Function Documentation

#### ◆ R_GPTP_Open()

fsp_err_t R_GPTP_Open ( gptp_ctrl_t *const *p_ctrl*, gptp_cfg_t const *const *p_cfg* )

Initializes the gptp module and applies configurations.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module opened successfully. |
| FSP_ERR_ASSERTION | Pointer to GPTP control block or configuration structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |

### ◆ R_GPTP_Close()

fsp_err_t R_GPTP_Close ( gptp_ctrl_t *const *p_ctrl*)

Close the gptp module.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Pointer to GPTP control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened |

### ◆ R_GPTP_TimerCfg()

fsp_err_t R_GPTP_TimerCfg ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_timer_cfg_t const *const *p_timer_cfg* )

Configures the gptp timer parameters.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Command successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Invalid timer id. |
| FSP_ERR_INVALID_POINTER | Invalid poiter to the timer cfg. |

### ◆ R_GPTP_Start()

fsp_err_t R_GPTP_Start ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer* )

Starts gptp timer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Timer started.. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Invalid timer id. |

### ◆ R_GPTP_Stop()

fsp_err_t R_GPTP_Stop ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer* )

Stops gptp timer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Timer stopped. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Invalid timer id. |

### ◆ R_GPTP_TimerValueGet()

fsp_err_t R_GPTP_TimerValueGet ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_timer_value_t *const *p_timer_value* )

Gets the current time value to the timer with the specified gptp timer number.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Sec upper, sec lower, and nano sec srored in p_timestamp. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

### ◆ R_GPTP_TimerOffsetSet()

fsp_err_t R_GPTP_TimerOffsetSet ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, int64_t *offset* )

Sets the offset correction for the specified gptp timer number.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Time offset set successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

### ◆ R_GPTP_TimerRateSet()

fsp_err_t R_GPTP_TimerRateSet ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, uint32_t *rate* )

Sets clock rate correction for the specified timer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Time rate set successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

### ◆ R_GPTP_PulseGeneratorSet()

fsp_err_t R_GPTP_PulseGeneratorSet ( gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_pulse_generator_t * *p_pulse* )

Sets pulse generator.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Pulse generator set successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to arguments are NULL. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameter. |

◆ **R_GPTP_CallbackSet()**

| fsp_err_t R_GPTP_CallbackSet ( gptp_ctrl_t *const *p_ctrl*, void(*)(gptp_callback_args_t *) *p_callback*, void *const *p_context*, gptp_callback_args_t *const *p_callback_memory* ) |
|---|
| Updates the user callback with the option to provide memory for the callback argument structure. Implements gptp_api_t::callbackSet. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### 5.2.12.21 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

Modules » Networking

Middleware for using TCP on RA MCUs.

# Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the Ethernet (r_ether) driver or the Ethernet (r_rmac) driver.

Please refer to the FreeRTOS Plus TCP documentation for further details.

# Configuration

### Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Print debug messages | • Disable<br>• Enable | Disable | If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging |

| | | | |
|---|---|---|---|
| | | | messages. |
| Backward Compatible Mode | • No<br>• Yes | Yes | Run the code in backward compatible mode |
| Enable IPV6 | • Disable<br>• Enable | Disable | Stack supports handling IPv6 packets (including handling IPv6 header, ND, RA, and so on) when enabled |
| Print info messages | • Disable<br>• Enable | Disable | Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages. |
| Byte order of the target MCU | pdFREERTOS_LITTLE_ENDIAN | pdFREERTOS_LITTLE_ENDIAN | Define the byte order of the target MCU |
| IP/TCP/UDP checksums | • Disable<br>• Enable | Enable | If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations. |
| Receive Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket, using setsockopt(). |
| Send Block Time | Value must be a non-negative integer | 10000 | Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt(). |
| DNS caching | • Disable<br>• Enable | Enable | DNS caching |
| DNS Request Attempts | Value must be an | 2 | When a cache is |

| | | | |
|---|---|---|---|
| | integer | | present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small timeouts. |
| IP stack task priority | Only symbols, numbers and arithmetic operators are valid. | configMAX_PRIORITIES - 2 | Set the priority of the task that executes the IP stack. |
| Stack size in words (not bytes) | Only symbols, numbers and arithmetic operators are valid. | configMINIMAL_STACK_SIZE * 5 | The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack. |
| Network Events call vApplicationIPNetworkEventHook | • Disable<br>• Enable | Enable | vApplicationIPNetworkEventHook is called when the network connects or disconnects. |
| Max UDP send block time | Only symbols, numbers and arithmetic operators are valid. | 15000 / portTICK_PERIOD_MS | Max UDP send block time |
| Use DHCP | • Disable<br>• Enable | Enable | If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server. |
| DHCP Register Hostname | • Disable<br>• Enable | Enable | Register hostname when using DHCP |
| DHCP Uses Unicast | • Disable<br>• Enable | Enable | DHCP uses unicast. |
| DHCP callback function | • Disable<br>• Enable | Disable | Provide an implementation of the DHCP callback function (xApplicationDHCPHook) |
| Interval between transmissions | Only symbols, numbers and arithmetic operators are valid. | 120000 / portTICK_PERIOD_MS | When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISC |

| | | | |
|---|---|---|---|
| | | | OVER_TX_PERIOD. |
| ARP Cache Entries | Value must be an integer | 6 | The maximum number of entries that can exist in the ARP table at any one time |
| ARP Request Retransmissions | Value must be an integer | 5 | ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted. |
| Maximum time before ARP table entry becomes stale | Value must be an integer | 150 | The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale |
| Use string for IP Address | • Disable<br>• Enable | Enable | Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters |
| Total number of available network buffers | Value must be an integer | 10 | Define the total number of network buffer that are available to the IP stack |
| Set the maximum number of events | Only symbols, numbers and arithmetic operators are valid. | ipconfigNUM_NETWORK_BUFFER_DESCRIPTORS + 5 | Set the maximum number of events that can be queued for processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers |
| Enable FreeRTOS_sendto() without calling Bind | • Enable<br>• Disable | Disable | Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding |

| | | | |
|---|---|---|---|
| | | | the socket to a port number from the range socketAUTO_PORT_ALLOCATION_START_NUMBER to 0xffff. If ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted. |
| TTL values for UDP packets | Value must be an integer | 128 | Define the Time To Live (TTL) values used in outgoing UDP packets |
| TTL values for TCP packets | Value must be an integer | 128 | Defines the Time To Live (TTL) values used in outgoing TCP packets |
| Use TCP and all its features | • Disable<br>• Enable | Enable | Use TCP and all its features |
| Let TCP use windowing mechanism | • Disable<br>• Enable | Disable | Let TCP use windowing mechanism |
| Maximum number of bytes the payload of a network frame can contain | Value must be an integer | 1500 | Maximum number of bytes the payload of a network frame can contain |

|---|---|---|---|
| The socket semaphore to unblock the MQTT task (USE_CALLBACKS) | • Disable<br>• Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (TX_DRIVER) | • Disable<br>• Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| The socket semaphore to unblock the MQTT task (RX_DRIVER) | • Disable<br>• Enable | Disable | The socket semaphore is used to unblock the MQTT task |
| Possible optimisation for expert users | • Disable<br>• Enable | Disable | Possible optimisation for expert users - requires network driver support. It is is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time. |

**Configurations for Networking > FreeRTOS+TCP Wrapper to ethernet driver (rm_freertos_plus_tcp)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_freertos_plus_tcp0 | Module name. |
| RX Handler Task Stack Size | Only symbols, numbers and arithmetic operators are valid. | configMINIMAL_STACK_SIZE | Stack size of RX handler task. |
| RX Handler Task Priority | Only symbols, numbers and arithmetic operators are valid. | configMAX_PRIORITIES - 1 | Priority of RX handler task. A higher priority ensures timely processing of network traffic or callbacks. |
| Check Link Status Task Stack Size | Only symbols, numbers and arithmetic operators are valid. | configMINIMAL_STACK_SIZE | Stack size of Check link status task. |
| Check Link Status Task Priority | Only symbols, numbers and arithmetic operators are valid. | configMAX_PRIORITIES - 1 | Priority of Check link status task. A low priority is recommended as this is an periodic task. |

| | | | |
|---|---|---|---|
| Link check interval | Only symbols, numbers and arithmetic operators are valid. | 1000 | Interval for checking link status of the ethernet instance of the network interface. Low period will consume more processing time |

# Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

### 1/ In case of Common|Backward Compatible Mode =="NO" (FreeRTOS+TCP 4.0.0 onward)

*Note*

*This mode use IP_Init_Multi to initialize the TCP/IP stack.*
*Before calling this function, at least 1 interface and 1 end-point must have been added to the TCP/IP stack.*

### 2/ In case of Common|Backward Compatible Mode =="YES" (FreeRTOS+TCP 4.0.0 backward)

*Note*

*This mode use IP_Init to initialize stack.*
*Only support 1 interface.*
*Only one instance of the middle port layer should be generated.*

- Some of the stack initialisation APIs have been deprecated as of FreeRTOS V4.0.0 onwards. Please refer to FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack for the new APIs supporting IPv6, Multiple Endpoints and Multiple interfaces. To use the deprecated APIs please set it to "Yes" for the stack property "Common|Backward Compatible Mode".

*Note*

*The MAC address passed to FreeRTOS_FillEndPoint must match the MAC address configured in the r_ether instance.*
*g_ether_instance must have vEtherISRCallback configured as the callback.*
*The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets.*
*The weak implementations provided of xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber rely on rand() as implemented by the respective compiler's math library and may require heap allocation to support re-entrant usage. If these implementations are to be used, srand() must be seeded with a truly random value in the application in order to ensure randomness. This should be done using psa_generate_random() from the mbedtls stack. The weak implementations can also be instead overridden with a user-implementation that uses psa_generate_random().*
*To connect to a server using an IP address the macro ipconfigINCLUDE_FULL_INET_ADDR must be set to 1.*

### Limitations

- Zero-copy is not currently supported by the NetworkInterface.

## 5.2.12.22 GTL BLE Abstraction (rm_ble_abs_gtl)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

# Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics DA14531 and DA14535 Bluetooth® Low Energy 5 Modules. The rm_ble_abs_gtl driver interfaces with the DA14531/DA14535 module over UART.

### Features

The Bluetooth® Low Energy Abstraction module with GTL supports the following features:

- Common functionality
  - Boot from host or DA14531/DA14535 flash.
  - Use 1-wire (default) or 2-wire UART for booting.
  - Open/Close the BLE protocol stack.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Central: The device that initiates a connection with a peripheral.
  - All roles: The device may act as a central and peripheral the same time.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
  - Scan
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notifications and Indications.
  - Read/Write of GATT Profile from host.
  - Optionally the application and not the device may handle the attributes (Read Indication).
- Gatt Client functionality
  - Discover Peripheral Services/Characteristics.
  - Read/Write Peripheral Characteristics.
  - Receive Notifications and Indications.
- Security functionality (DA14531/DA14535)
  - Supporting Legacy Pairing.
  - Initiate security request procedure from Peripheral as well.
  - Support Secure connections.
  - Support security for both roles (Central - Peripheral).
  - Store bonding data to flash using vee_flash generic module.
  - Enable security from configurator.

    - Store bonding data to flash using vee_flash generic module.
    - Enable security from configurator.
    - Delete all bonding data.
    - Delete bonding data with specific BD address.
    - Read and Write BD address to storage.
    - Add crypto libs to encode bonding data in flash.
    - Add crypto libs to encode bonding data in flash.
- DA1453x Sleep support
    - Three sleep modes are supported with UART HW flow control.

# Configuration

### Pin Configuration

Pins used by the BLE driver to control the DA14531/DA14535 module:

- Reset Pin : Active low reset line for DA14531/DA14535 module.
- UART Interface : RX/TX/RTS Pins. The PMOD DA1453x modules require manually setting CTS GPIO as input. PMOD2_SS should be Input and PMOD2_CLK Output Low.

# Usage Notes

### Getting Started Guide

The below guide walks users through building a fully working solution that allows booting from the host via 1-wire UART in order to run a BLE application from the RA MCU using the GTL interface.

https://lpccs-docs.renesas.com/DA1453x-FSP_BLE_Framework/UM-B-172/index.html

### Addresses

- A public BD address the address pre-programmed into the DA14531/DA14535 and will be used as default.
- A random BD address can be set by calling the R_BLE_VS_SetBdAddr function before the R_BLE_GAP_Init function is called.
- A public BD address can be set by calling the R_BLE_GTL_VS_SetPublicBdAddress() after R_BLE_GAP_Init function is called.

### Heap Requirements

Ensure the BSP heap size is set to at least 2K bytes.

When using FreeRTOS ensure the heap 4 size is set to a minimum of 2K bytes.

### Module Firmware Compatibility

This middleware module is compatible with GTL binary version 6.0.23.1451 and later. You must ensure that the DA14531/DA14535 Module (or PMOD) you are using contains this version (or later) firmware or that you use the boot from host feature and have the host MCU load the binary into the DA14531/DA14535. Note that DA14531 and DA14535 are not firmware compatible even though the GTL API is the same.

Instructions detailing how to upgrade the firmware in a DA14531 Module can be found here:

https://lpccs-docs.renesas.com/US159-DA14531EVZ_Firmware_Upgrade/index.html

The GTL binary file can be downloaded using the tool described in the above instructions, or by using the following link:

https://www.renesas.com/us/en/document/swo/fsp-gtl-binary-us159-da14531evz-pmod-programming?r=1564826

**Limitations**

Developers should be aware of the following limitations when using the BLE_ABS:

Following a power on reset, the R_BLE_VS_GetRand function always returns the same number. Subsequent calls to this function produce random numbers.

Up to 3 concurrent connections are supported.

For DA1453x Sleep mode CTSRTS0 (EK-RA6M4) should be set to P413. Flow Control CTS/RTS Selection should be set to Hardware CTS. If RA is required to wake-up from DA453x P413 and P414 should be shorted and P414 should be set to interrupt mode. R_BLE_GTL_VS_SetSleepMode() is not unsupported, R_BLE_GTL_VS_SetSleepModeExt should be called directly instead.

For bonded devices Client Characteristic Configuration (CCC) values are not saved to flash memory. They are kept to RAM as long as reset does not take place. If the user wishes to save the CCC values to non-volatile memory, he should handle it from the application layer by marking them as Read Indicated (RI, please find the description bellow).

The CCC values are not kept per connection, the value of a CCC is the value of the last modification by a GATT Client. If the user wishes to keep CCC values per connection, he should handle it from the application layer by marking them as Read Indicated (RI, please find the description bellow).

Maximum bonded devices are limited to seven (7). Application must delete an entry before bonding with a new device. Saving bond data is supported with devices that use HP_Flash and boards RA6M4_EK, RA6M5_EK, RA4M3_EK, RA4M2_EK.

Role switching between Central and Peripheral is not supported after the devices have been bonded.

Out Of Band (OOB) paring is not supported.

GAP operations cannot overlap, e.g. you cannot initiate two connections concurrently

The boot from host feature currently supports 1-wire and 2-wire UART operation. If using a 1-wire boot from host the UART RX and TX pins on the host RA MCU must be tied together using a 1K ohm resistor in order to boot the DA14531/DA14535 - this resistor can remain in place after the boot operation has been completed. Boot from host using 2-wire UART is not supported when using a DA14531MOD module because not all the required pins are exposed. Boot from host using 2-wire UART is supported when a DA14535PMOD with SmartBoot (UM-B-171) is already flashed in DA14535. In this case the same pins used for GTL communication are also used for 2-wire boot.

The RI feature of attributes (values are not stored in DA1453x database) is controlled from the flag Enable Characteristic Value Read Callback of QE Tool. In case of a write request the local data base is automatically updated. The app will be notified by an BLE_GATTS_OP_PEER_XXX_WRITE_REQ. In case of a read request and Value Read Callback is enabled (read indication) the local data base is not automatically accessed to get the value. The user is responsible to provide the reply value from gatts_cb by using R_BLE_GTL_GATTS_ReadCfm after a BLE_GATTS_EVENT_DB_ACCESS_IND with

BLE_GATTS_OP_PEER_XXX_READ_REQ. The Client Characteristic Configuration (CCC) values are always treated as RI values. If the attribute is CCC and it is not marked as read_notify, then r_ble_gtl automatically handles it by using a cached value.

Service and characteristic write callback functions, are not generated by the QE Tool. Thus, R_BLE_GTL_GATTC_WRITE_REQ_IND always confirms with R_BLE_GTL_GAP_ERR_NO_ERROR. No value check is provided for incorrect value/range etc

R_BLE_GTL_GAP_StartScan supports only :

- Passive Scan (R_BLE_GTL_GAPM_OP_SCAN_PASSIVE)
- General Discovery Mode (R_BLE_GTL_GAP_GEN_DISCOVERY)
- No White Listing (R_BLE_GTL_SCAN_ALLOW_ADV_ALL)
- Static own address (R_BLE_GTL_GAPM_STATIC_ADDR)
- Slow Scan input
- 1M Phy
- Timeout of 7.7 Seconds restricted by DA145xx ROM.

R_BLE_GTL_GAP_CreateConn supports only :

- Static own address (R_BLE_GTL_GAPM_STATIC_ADDR)
- Automatic connection operation (R_BLE_GTL_GAPM_OP_CONNECTION_AUTO)

Currently supported rm_ble_abs_gtl interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising
- RM_BLE_ABS_CreateConnection
- RM_BLE_ABS_StartScanning

Currently supported r_ble_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_Execute
- R_BLE_IsTaskFree
- R_BLE_GetVersion
- R_BLE_GAP_Init
- R_BLE_GAP_Terminate
- R_BLE_GAP_UpdConn
- R_BLE_GAP_SetDataLen
- R_BLE_GAP_Disconnect
- R_BLE_GAP_ConfWhiteList
- R_BLE_GAP_GetVerInfo
- R_BLE_GAP_ReadRssi
- R_BLE_GAP_ReadChMap
- R_BLE_GAP_SetAdvParam
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_StopAdv
- R_BLE_GAP_GetRemainAdvBufSize
- R_BLE_GAP_GetRemDevInfo
- R_BLE_GAP_CreateConn
- R_BLE_GAP_CancelCreateConn

- R_BLE_GAP_StartScan
- R_BLE_GAP_StopScan
- R_BLE_GATTS_SetDbInst
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTS_DeregisterCb
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTC_DiscAllPrimServ
- R_BLE_GATTC_DiscPrimServ
- R_BLE_GATTC_DiscCharByUuid
- R_BLE_GATTC_DiscIncServ
- R_BLE_GATTC_DiscAllChar
- R_BLE_GATTC_DiscAllCharDesc
- R_BLE_GATTC_RegisterCb
- R_BLE_GATTC_DeregisterCb
- R_BLE_GATTC_ReqExMtu
- R_BLE_GATTC_ReadChar
- R_BLE_GATTC_ReadCharUsingUuid
- R_BLE_GATTC_ReadLongChar
- R_BLE_GATTC_ReadMultiChar
- R_BLE_GATTC_WriteCharWithoutRsp
- R_BLE_GATTC_WriteChar
- R_BLE_GATTC_WriteLongChar
- R_BLE_GATTC_ReliableWrites
- R_BLE_GATTC_ExecWrite
- R_BLE_VS_Init
- R_BLE_VS_GetBdAddr
- R_BLE_VS_SetBdAddr
- R_BLE_VS_GetRand
- R_BLE_VS_SetTxPower
- R_BLE_VS_GetTxPower
- R_BLE_GAP_SetPairingParams
- R_BLE_GAP_ReplyPairing
- R_BLE_GAP_ReplyLtkReq
- R_BLE_GAP_ReplyExKeyInfoReq
- R_BLE_GAP_StartPairing
- R_BLE_GAP_ReplyNumComp
- R_BLE_GAP_ReplyPasskeyEntry
- R_BLE_GAP_StartEnc
- R_BLE_GAP_GetDevSecInfo

Currently supported callback events:

- BLE_GAP_EVENT_STACK_ON
- BLE_GAP_EVENT_STACK_OFF
- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_DATA_LEN_CHG
- BLE_GAP_EVENT_CONN_PARAM_UPD_COMP
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GAP_EVENT_ADV_REPT_IND

- BLE_GAP_EVENT_SET_DATA_LEN_COMP
- BLE_GAP_EVENT_LOC_VER_INFO
- BLE_GAP_EVENT_RSSI_RD_COMP
- BLE_GAP_EVENT_CH_MAP_RD_COMP
- BLE_GAP_EVENT_GET_REM_DEV_INFO
- BLE_GAP_EVENT_CONN_CANCEL_COMP
- BLE_GAP_EVENT_CONN_PARAM_UPD_REQ
- BLE_GATTS_EVENT_WRITE_RSP_COMP
- BLE_GATTS_EVENT_HDL_VAL_CNF
- BLE_GATTS_EVENT_DB_ACCESS_IND
- BLE_GATTC_EVENT_EX_MTU_RSP
- BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND
- BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND
- BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP
- BLE_GATTC_EVENT_CHAR_READ_BY_UUID_RSP
- BLE_GATTC_EVENT_CHAR_READ_RSP
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTC_EVENT_CHAR_WRITE_RSP
- BLE_GATTC_EVENT_CHAR_WRITE_WITHOUT_RSP
- BLE_GATTC_EVENT_CHAR_DISC_COMP
- BLE_GATTC_EVENT_CHAR_128_DISC_IND
- BLE_GATTC_EVENT_HDL_VAL_IND
- BLE_GATTC_EVENT_HDL_VAL_NTF
- BLE_GATTC_EVENT_EXECUTE_WRITE_COMP
- BLE_GATTC_EVENT_ATT_INFO_REQ_IND
- BLE_GATTC_EVENT_HDL_VAL_SVC_CHNG
- BLE_GAP_EVENT_EX_KEY_REQ
- BLE_GAP_EVENT_PASSKEY_ENTRY_REQ
- BLE_GAP_EVENT_PEER_KEY_INFO
- BLE_GAP_EVENT_PAIRING_COMP
- BLE_GAP_EVENT_LTK_REQ
- BLE_GAP_EVENT_ENC_CHG
- BLE_GAP_EVENT_LTK_RSP_COMP

# Examples

### BLE_ABS_GTL Basic Example

This is a basic example of minimal use of the BLE_ABS_GTL in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
```

```
     {
           g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_ON:
     {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
           g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
           g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_OFF:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
      }
 case BLE_GAP_EVENT_CONN_IND:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
      }
     {
 /* Do nothing. */
 break;
        }
 default:
 break;
   }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
```

```

### Detailed Description

The LAYER3 SWITCH module (r_layer3_switch) provides an API for standard Ethernet communications applications that use the ESWM peripheral. It implements the Ethernet Switch Interface.

# Overview

This module performs Ethernet frame transmission and reception using Ethernet Switch Module.

The following figure shows which IPs are used by the r_layer3_switch module.

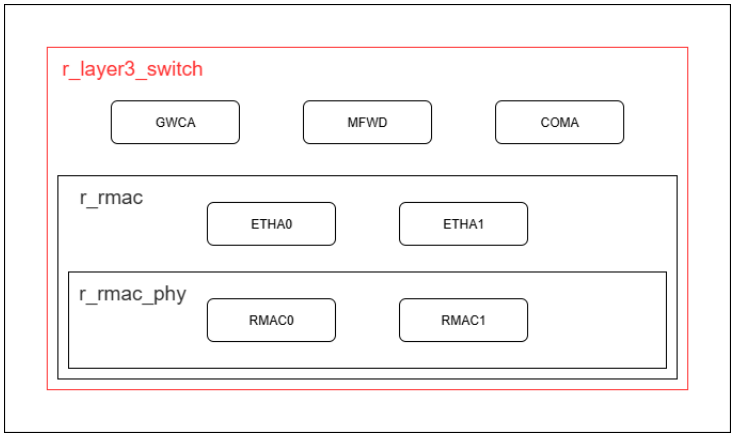

Figure 323: ESWM block diagram

### Features

The layer3 switch module supports the following features:

- Transmit/receive data using a descriptor.
- Timestamp feature
- Optional callback function when transmit/receive complete or an error occurs
- Frame Replication and Elimination for Reliability (FRER) feature.

# Configuration

### Build Time Configurations for r_layer3_switch

The following build time configurations are defined in fsp_cfg/r_layer3_switch_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Available queue num | Value must be an integer between 1 and 64 | 4 | available queue num. |
| gPTP enable | • Enabled<br>• Disabled | Enabled | Select whether or not to use gPTP function. |
| Time Aware Shaper | • Enabled<br>• Disabled | Disabled | Select whether or not to use the Time Aware Shaper function. |

### Configurations for Networking > Switch (r_layer3_switch)

This module can be added to the Stacks tab via New Stack > Networking > Switch (r_layer3_switch).

Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Interrupts | | | |
| Interrupt priority | MCU Specific Options | | Select the layer3_switch interrupt priority. |
| ETHA0 error interrupt priority | MCU Specific Options | | Select the layer3_switch etha0 interrupt priority. |
| ETHA1 error interrupt priority | MCU Specific Options | | Select the layer3_switch etha1 interrupt priority. |
| Ports | | | |
| Ports > Port 0 | | | |
| Ports > Port 0 > IPV queue depth | | | |
| Queue 0 | Value must be an integer more than 1 | 64 | queue0 dept of port 0. |
| Queue 1 | Value must be an integer more than 1 | 64 | queue1 dept of port 0. |
| Queue 2 | Value must be an integer more than 1 | 64 | queue2 dept of port 0. |
| Queue 3 | Value must be an integer more than 1 | 64 | queue3 dept of port 0. |
| Queue 4 | Value must be an integer more than 1 | 64 | queue4 dept of port 0. |
| Queue 5 | Value must be an integer more than 1 | 64 | queue5 dept of port 0. |
| Queue 6 | Value must be an integer more than 1 | 64 | queue6 dept of port 0. |
| Queue 7 | Value must be an integer more than 1 | 64 | queue7 dept of port 0. |
| Fowarding | MCU Specific Options | | Destination ports for port 0 fowarding |
| MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of port 0. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs for port0. |
| Context | Name must be a valid C symbol | NULL | Placeholder for user data. Passed to the user callback in |

| | | | |
|---|---|---|---|
| | | | ether_switch_callback_args_t for port0. |
| GPTP timer number | • Timer 0<br>• Timer 1 | Timer 0 | GPTP timer number of port 0. |
| Ports > Port 1 | | | |
| Ports > Port 1 > IPV queue depth | | | |
| Queue 0 | Value must be an integer more than 1 | 64 | queue0 dept of port 1. |
| Queue 1 | Value must be an integer more than 1 | 64 | queue1 dept of port 1. |
| Queue 2 | Value must be an integer more than 1 | 64 | queue2 dept of port 1. |
| Queue 3 | Value must be an integer more than 1 | 64 | queue3 dept of port 1. |
| Queue 4 | Value must be an integer more than 1 | 64 | queue4 dept of port 1. |
| Queue 5 | Value must be an integer more than 1 | 64 | queue5 dept of port 1. |
| Queue 6 | Value must be an integer more than 1 | 64 | queue6 dept of port 1. |
| Queue 7 | Value must be an integer more than 1 | 64 | queue7 dept of port 1. |
| Fowarding | MCU Specific Options | | Destination ports for port 1 fowarding |
| MAC address | Must be a valid MAC address | 00:11:22:33:44:55 | MAC address of port 1. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs for port1. |
| Context | Name must be a valid C symbol | NULL | Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t for port1. |
| GPTP timer number | • Timer 0<br>• Timer 1 | Timer 1 | GPTP timer number of port 1. |
| CBS | | | |
| CBS > Port 0 Band width ( % ) | | | |
| Queue 0 | Value must be an integer between 0 and 100 | 0 | queue0 Band width of port 0. |
| Queue 1 | Value must be an | 0 | queue1 Band width of |

| | | | |
|---|---|---|---|
| | integer between 0 and 100 | | port 0. |
| Queue 2 | Value must be an integer between 0 and 100 | 0 | queue2 Band width of port 0. |
| Queue 3 | Value must be an integer between 0 and 100 | 0 | queue3 Band width of port 0. |
| Queue 4 | Value must be an integer between 0 and 100 | 0 | queue4 Band width of port 0. |
| Queue 5 | Value must be an integer between 0 and 100 | 0 | queue5 Band width of port 0. |
| Queue 6 | Value must be an integer between 0 and 100 | 0 | queue6 Band width of port 0. |
| Queue 7 | Value must be an integer between 0 and 100 | 0 | queue7 Band width of port 0. |
| CBS > Port 1 Band width ( % ) | | | |
| Queue 0 | Value must be an integer between 0 and 100 | 0 | queue0 Band width of port 1. |
| Queue 1 | Value must be an integer between 0 and 100 | 0 | queue1 Band width of port 1. |
| Queue 2 | Value must be an integer between 0 and 100 | 0 | queue2 Band width of port 1. |
| Queue 3 | Value must be an integer between 0 and 100 | 0 | queue3 Band width of port 1. |
| Queue 4 | Value must be an integer between 0 and 100 | 0 | queue4 Band width of port 1. |
| Queue 5 | Value must be an integer between 0 and 100 | 0 | queue5 Band width of port 1. |
| Queue 6 | Value must be an integer between 0 and 100 | 0 | queue6 Band width of port 1. |
| Queue 7 | Value must be an integer between 0 and 100 | 0 | queue7 Band width of port 1. |

CBS > Port 0 Maximum burst frame number

| | | | |
|---|---|---|---|
| Queue 0 | Value must be an integer between 0 and 255 | 0 | queue0 maximum burst frame number of port 0. |
| Queue 1 | Value must be an integer between 0 and 255 | 0 | queue1 maximum burst frame number of port 0. |
| Queue 2 | Value must be an integer between 0 and 255 | 0 | queue2 maximum burst frame number of port 0. |
| Queue 3 | Value must be an integer between 0 and 255 | 0 | queue3 maximum burst frame number of port 0. |
| Queue 4 | Value must be an integer between 0 and 255 | 0 | queue4 maximum burst frame number of port 0. |
| Queue 5 | Value must be an integer between 0 and 255 | 0 | queue5 maximum burst frame number of port 0. |
| Queue 6 | Value must be an integer between 0 and 255 | 0 | queue6 maximum burst frame number of port 0. |
| Queue 7 | Value must be an integer between 0 and 255 | 0 | queue7 maximum burst frame number of port 0. |

CBS > Port 1 Maximum burst frame number

| | | | |
|---|---|---|---|
| Queue 0 | Value must be an integer between 0 and 255 | 0 | queue0 maximum burst frame number of port 0. |
| Queue 1 | Value must be an integer between 0 and 255 | 0 | queue1 maximum burst frame number of port 0. |
| Queue 2 | Value must be an integer between 0 and 255 | 0 | queue2 maximum burst frame number of port 0. |
| Queue 3 | Value must be an integer between 0 and 255 | 0 | queue3 maximum burst frame number of port 0. |
| Queue 4 | Value must be an integer between 0 and 255 | 0 | queue4 maximum burst frame number of port 0. |
| Queue 5 | Value must be an integer between 0 and 255 | 0 | queue5 maximum burst frame number of port 0. |
| Queue 6 | Value must be an | 0 | queue6 maximum |

| | | | |
|---|---|---|---|
| | integer between 0 and 255 | | burst frame number of port 0. |
| Queue 7 | Value must be an integer between 0 and 255 | 0 | queue7 maximum burst frame number of port 0. |
| Name | Name must be a valid C symbol | g_layer3_switch0 | Module name. |
| Channel | 0 | 0 | Select the layer3 switch controller channel number. |
| Context | Name must be a valid C symbol | NULL | Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t. |
| Callback | Name must be a valid C symbol | NULL | Callback provided when an ISR occurs |
| Number of Layer 3 routing entries | Value must be an integer between 1 and 256 | 10 | Maximum number of Layer 3 routing entries. |

# Usage Notes

### Time-Sensitive Network (TSN)

### Credit Based Shaper [802.1Qav]

Credit Based Shaper (CBS) is a standard defined in IEEE 802.1Qav that limits the throughput of Ethernet traffic. The figure below illustrates the operation of CBS when the bandwidth is set to 40Mbps. When the transmission throughput exceeds the bandwidth configured by CBS, frame transmission is restricted. The restricted frames are buffered in the queue and transmitted with delay.

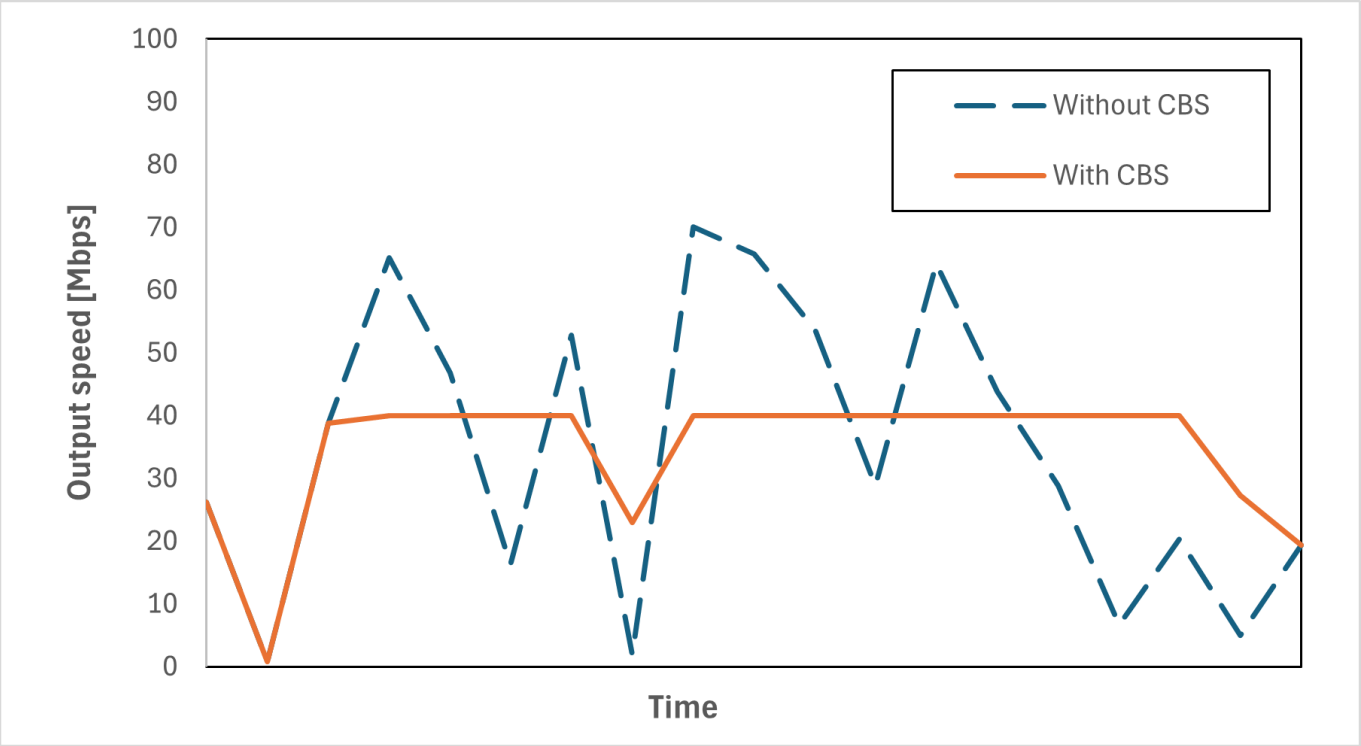

Figure 324: CBS operation image

In the r_layer3_switch module, CBS bandwidth can be configured for each Internal Priority Value (IPV) queue per transmission port. There are 8 IPV queues available for each port. On transmission ports where CBS is enabled, the throughput is limited to the configured bandwidth. CBS can be configured through stack properties or the ConfigurePort() API.

*Note*

*The maximum number of frames that can be buffered by CBS is limited to the depth of each IPV queue. If many frames are buffered in high-priority queues, the common memory pool may be depleted, potentially limiting transmission from other queues.*

### Time-Aware Shaper [802.1Qbv]

Time-Aware Shaper (TAS) is a standard defined in IEEE 802.1Qbv that limits Ethernet traffic by controlling the time window when frames are transmitted. TAS controls transmission by changing gate states. Frames are transmitted while the gate is opened and when the gate is closed, frames cannot be transmitted and are delayed until the next open state. By opening each gate at different timings, it is possible to prevent frames of specific priorities from monopolizing the bandwidth. The figure below illustrates the operation of TAS. In this image, the gate cycle time is set to 10ms, Gate 0 is opened for 2.5 ms and closed for 7.5 ms, Gate 1 is closed for 1.0 + 5.0 ms and open for 4.0 ms.

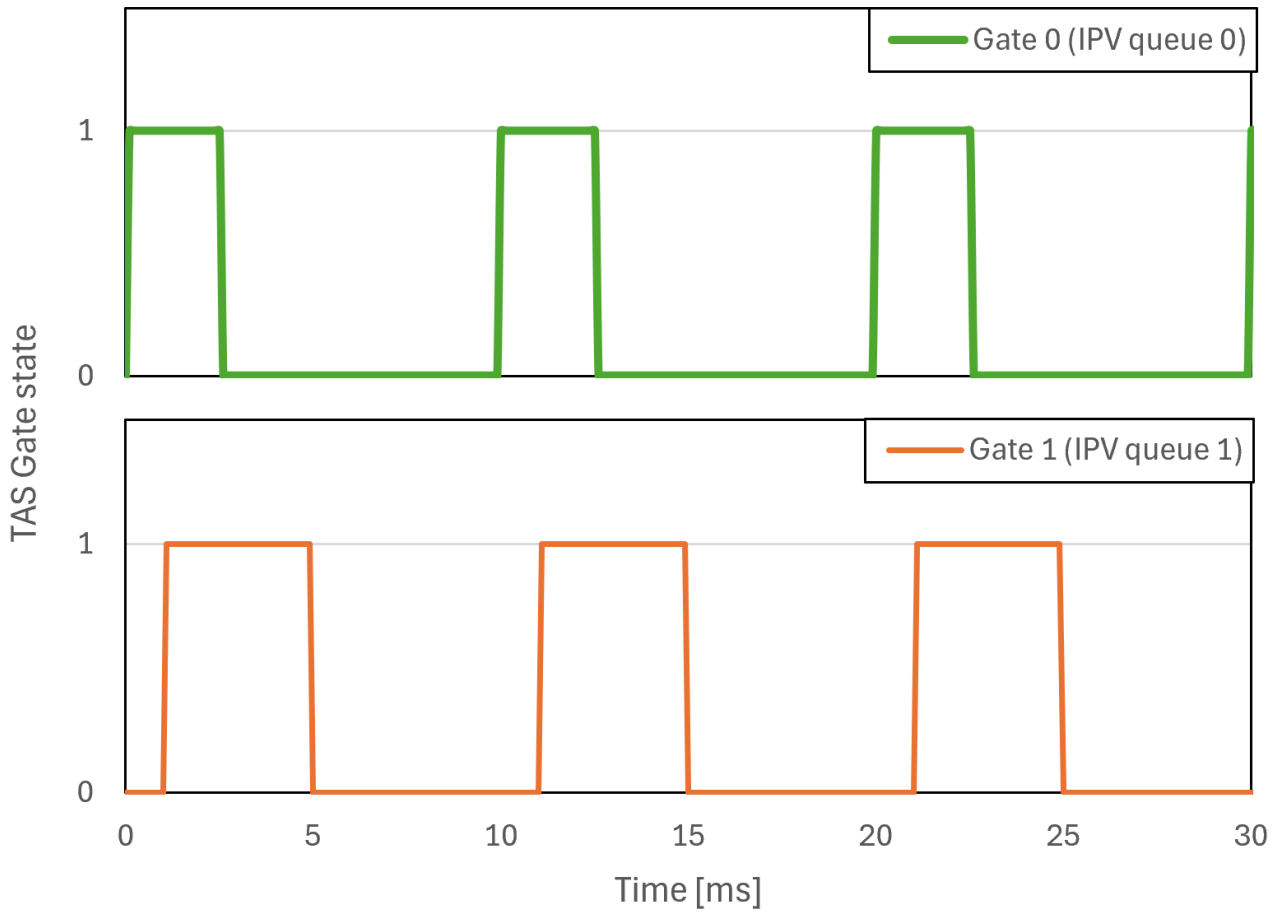

Figure 325: TAS operation image

In the r_layer3_switch module, TAS gates can be configured for each IPV queue of the transmission ports. Each gate learns entries that represent windows. An entry contains the window time and state. TAS feature is configured using the ConfigureTAS() API, and enabled using the EnableTAS() API.

*Note*

*This TAS feature uses the gPTP timer.*

### Limitations

Developers should be aware of the following limitations when using the r_layer3_switch:

- CBS feature supports only 100 Mbps and 1 Gbps link speeds.

# Examples

### Basic Example

This is a basic example of transmission use of the LAYER3 SWITCH.

```
#define LAYER3_SWITCH_EXAMPLE_DESCRIPTOR_POOL_SIZE (8)
```

```
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE (1514)
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE_UPPER ((uint8_t)
((LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE & \
  0xFF00) >> 8))
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE_LOWER ((uint8_t)
LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE & \
  0x00FF)
#define LAYER3_SWITCH_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)
#define LAYER3_SWITCH_EXAMPLE_SOURCE_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79, 0x01
#define LAYER3_SWITCH_EXAMPLE_DESTINATION_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79,
0x02
#define LAYER3_SWITCH_EXAMPLE_FRAME_TYPE 0x00, 0x2E
#define LAYER3_SWITCH_EXAMPLE_PAYLOAD 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
0x00, \
  0x00, \
  0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, \
  0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, \
  0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00

## Data Structure Documentation

### ◆ layer3_switch_basic_descriptor_t

| struct layer3_switch_basic_descriptor_t |
|---|
| GWCA descriptor. |

### ◆ layer3_switch_descriptor_t

| struct layer3_switch_descriptor_t |
|---|
| GWCA extended descriptor. |

### ◆ layer3_switch_ts_reception_process_descriptor_t

| struct layer3_switch_ts_reception_process_descriptor_t |
|---|
| GWCA TS reception process descriptor. |

### ◆ layer3_switch_frer_cfg_t

| struct layer3_switch_frer_cfg_t | | |
|---|---|---|
| Configuration of FRER feature. | | |
| Data Fields | | |
| uint32_t | sys_clock | Timeout check time. |
| uint32_t | timeout_enable | Timeout check valid. |
| uint32_t | check_period | Microsecond prescaler used to creates an internal clock for aging at 1 MHz to derive the timeout 1 kHz clock. |

### ◆ layer3_switch_frer_entry_t

| struct layer3_switch_frer_entry_t | | |
|---|---|---|
| FRER table entry. | | |
| Data Fields | | |
| uint32_t | take_no_sequence | Reject frames without R-TAG. |
| uint32_t | sequence_history_len | Sequence history length. |
| uint32_t | set_recovery_remaining_tick | Time in tick before timeout. |

### ◆ layer3_switch_frer_entry_cfg_t

| struct layer3_switch_frer_entry_cfg_t | | |
|---|---|---|
| Configuration of FRER entry (individual and sequence recovery). | | |
| Data Fields | | |
| layer3_switch_frer_entry_t | individual_recovery | FRER table entry for individual recovery. |
| layer3_switch_frer_entry_t * | p_sequence_recovery | Pointer to FRER entry(sequence recovery) information referenced by FRERN in this FRER entry(individual recovery). |
| uint32_t | sequence_recovery_id | |

### ◆ layer3_switch_frer_sequence_recovery_status_t

| struct layer3_switch_frer_sequence_recovery_status_t | | |
|---|---|---|
| Status of FRER sequence recovery table. | | |
| Data Fields | | |
| bool | learned | Flags whether the FRER entry(sequence recovery) related to this entry has been |

| | | |
|---|---|---|
| | | learned. |
| uint32_t | frer_entry_index | Real FRER table index of the FRER entry(sequence recovery) related to this entry. |

### ◆ layer3_switch_descriptor_queue_cfg_t

| struct layer3_switch_descriptor_queue_cfg_t | | |
|---|---|---|
| Configuration of a descriptor queue. | | |
| Data Fields | | |
| layer3_switch_descriptor_format_t | descriptor_format | Enable or disable extended descriptors. |
| layer3_switch_queue_type_t | type | Reception queue or transmission queue. |
| layer3_switch_write_back_mode_t | write_back_mode | Configure write-back to descriptor fields. |
| layer3_switch_descriptor_t * | p_descriptor_array | Descriptor array that use to create queue. |
| layer3_switch_ts_reception_process_descriptor_t * | p_ts_descriptor_array | TS descriptor array that use to create queue. |
| layer3_switch_rx_timestamp_storage_t | rx_timestamp_storage | Configure RX timestamp storage. |
| uint32_t | array_length | Length of descriptor array. This length includes terminate descriptor at the end. |
| uint32_t | ports | Bitmap of ports that use this queue. |

### ◆ layer3_switch_cbs_cfg_t

| struct layer3_switch_cbs_cfg_t | | |
|---|---|---|
| Configuration of Credit Based Shaper. | | |
| Data Fields | | |
| uint8_t | band_width_list[8] | CBS band width [%] of each queue. |
| uint8_t | max_burst_num_list[8] | Maximum burst frame number of each queue. |

### ◆ layer3_switch_port_cfg_t

| struct layer3_switch_port_cfg_t | |
|---|---|
| Configuration of each Ethernet port. | |
| **Data Fields** | |
| uint8_t * | p_mac_address |

| | |
|---|---|
| | Pointer to MAC address. |
| | |
| bool | forwarding_to_cpu_enable |
| | Enable or disable reception on CPU. |
| | |
| layer3_switch_cbs_cfg_t * | p_cbs_cfg |
| | Pointer to CBS configuration. |
| | |
| void(* | p_callback )(ether_switch_callback_args_t *p_args) |
| | Callback provided when an ISR occurs. |
| | |
| ether_switch_callback_args_t * | p_callback_memory |
| | Pointer to optional callback argument memory. |
| | |
| void * | p_context |
| | Pointer to context to be passed into callback function. |
| | |

### ◆ layer3_switch_descriptor_queue_status_t

struct layer3_switch_descriptor_queue_status_t

Status of a descriptor queue.

Data Fields

| | | |
|---|---|---|
| uint32_t | head | Index at the head of the queue. This used for GetDescriptor API. |
| uint32_t | tail | Index at the tail of the queue. This used for SetDescriptor API. |
| bool | created | This queue is already created. |
| layer3_switch_descriptor_queue_cfg_t const * | p_queue_cfg | Configuration of this queue. |
| bool | rx_available | Indicates whether the queue is available for reception. |

### ◆ layer3_switch_ipv6_filter_address_offset_t

| struct layer3_switch_ipv6_filter_address_offset_t | | |
|---|---|---|
| IP address offset for creating IPv6 filter of Layer3 forwarding. | | |
| Data Fields | | |
| uint8_t | offset | Offset of IPv6 address. |
| layer3_switch_ip_address_direction_t | direction | Select source or destination. |

### ◆ layer3_switch_l3_stream_filter_cfg_t

| struct layer3_switch_l3_stream_filter_cfg_t | | |
|---|---|---|
| Configuration of stream filter in Layer3 forwarding. | | |
| Data Fields | | |
| uint16_t | filter_field_bitmask | Bitmask of which feilds is enabled in stream filter. Use layer3_switch_l3_filter_bitmask_t. |
| layer3_switch_ipv6_filter_address_offset_t | ipv6_address0 | Offset of IPv6 address 0. |
| layer3_switch_ipv6_filter_address_offset_t | ipv6_address1 | Offset of IPv6 address 1. |

### ◆ layer3_switch_frame_vlan_tag_t

| struct layer3_switch_frame_vlan_tag_t | | |
|---|---|---|
| VLAN tag structure. | | |
| Data Fields | | |
| uint16_t | pcp: 3 | Priority Code Point (3 bit). |
| uint16_t | dei: 1 | Drop Eligible Indicator (1 bit). |
| uint16_t | id: 12 | VLAN ID (12 bit). |

### ◆ layer3_switch_frame_filter_t

| struct layer3_switch_frame_filter_t | | |
|---|---|---|
| Frame filter of a MAC/VLAN/Layer3 forwarding entry. Set values for members required for filtering. | | |
| Data Fields | | |
| layer3_switch_table_entry_type_t | entry_type | Type of this entry. Select MAC, VLAN or Layer3. |
| uint8_t * | p_destination_mac_address | Destination MAC address. |
| uint8_t * | p_source_mac_address | Source MAC address. |
| layer3_switch_frame_vlan_tag_t | vlan_c_tag | VLAN C-TAG. |
| layer3_switch_frame_vlan_tag_t | vlan_s_tag | VLAN S-TAG. |

| | | |
|---|---|---|
| layer3_switch_ip_version_t | ip_version | IP version. Select IPv4, IPv6, or not IP packet. |
| uint8_t | protocol | IP protocol. |
| uint8_t * | p_source_ip_address | Source IP address. |
| uint8_t * | p_destination_ip_address | Destination IP address. |
| uint16_t | layer4_source_port | TCP/UDP source port. |
| uint16_t | layer4_destination_port | TCP/UDP destination port. |

### ◆ layer3_switch_l3_filter_t

| struct layer3_switch_l3_filter_t | | |
|---|---|---|
| Store filter information of Layer3 forwarding entry. | | |
| Data Fields | | |
| layer3_switch_frame_filter_t | frame | Target frame format that used to Layer3 forwarding. |

### ◆ layer3_switch_l3_update_config_t

| struct layer3_switch_l3_update_config_t | | |
|---|---|---|
| Configuration of a L2/L3 update feature for output frames. | | |
| Data Fields | | |
| uint32_t | enable_destination_ports | Destination ports that this update config is enabled. |
| uint32_t | update_field_bitmask | Bit mask of which fields will be updated. Use layer3_switch_l3_update_bitmask_t. |
| uint8_t * | p_mac_destination_address | MAC Destination Address. |
| layer3_switch_frame_vlan_tag_t | vlan_c_tag | VLAN C-tag. |
| layer3_switch_frame_vlan_tag_t | vlan_s_tag | VLAN S-tag. |
| layer3_switch_forwarding_r_tag_t | r_tag_update_mode | R-TAG update setting. |
| bool | sequence_number_generation_enable | Flags whether sequence number generation (FRER) is enabled for this entry. |

### ◆ layer3_switch_table_entry_cfg_t

| struct layer3_switch_table_entry_cfg_t | | |
|---|---|---|
| Table entry configuration of MAC/VLAN/Layer3 forwarding. | | |
| Data Fields | | |
| bool | entry_enable | Enable or disable entry. If this field is false, entry will be |

| | | |
|---|---|---|
| | | removed. |
| bool | security_enable | Entry is secure or not. |
| layer3_switch_frer_entry_cfg_t * | p_frer_entry_cfg | Configuration of the FRER entry(individual recovery) for this L3 entry (set to NULL : FRER is not valid in this L3 entry). |
| uint32_t | destination_ports | Destination ports of forwarding. |
| uint32_t | source_ports | Source ports that enable forwarding of incoming frame. |
| uint32_t | destination_queue_index | Destination queue. This fields is only used when a destination port is CPU. |
| uint32_t | internal_priority_update_enable | Enable to update internal priority. |
| uint32_t | internal_priority_update_value | Internal priority when updating is enabled. |
| union layer3_switch_table_entry_cfg_t | __unnamed__ | |

### ◆ layer3_switch_table_entry_t

| struct layer3_switch_table_entry_t | | |
|---|---|---|
| Table entry of MAC/VLAN/Layer3 forwarding. | | |
| Data Fields | | |
| layer3_switch_frame_filter_t | target_frame | Target frame of forwarding by this entry. |
| layer3_switch_table_entry_cfg_t | entry_cfg | Configuration of this entry. |

### ◆ layer3_switch_forwarding_port_cfg_t

| struct layer3_switch_forwarding_port_cfg_t | | |
|---|---|---|
| Configuration of forwarding feature for each port. | | |
| Data Fields | | |
| bool | mac_table_enable | Enable MAC table and forwarding feature. |
| bool | mac_reject_unknown | Reject frame with unknown MAC address. |
| bool | mac_hardware_learning_enable | Enable hardware learning and migration. |
| bool | vlan_table_enable | Enable VLAN table and forwarding feature. |
| bool | vlan_reject_unknown | Reject frame with unknown VLAN ID. |

| | | |
|---|---|---|
| layer3_switch_vlan_ingress_mode_t | vlan_ingress_mode | Select Tag-based VLAN or Port-based VLAN for incoming frame. |
| layer3_switch_vlan_egress_mode_t | vlan_egress_mode | Tagging/untagging mode for outgoing frame. |
| layer3_switch_frame_vlan_tag_t | vlan_s_tag | S-TAG of this port. When egress mode is hardware SC-TAG, add this to outgoing frame. |
| layer3_switch_frame_vlan_tag_t | vlan_c_tag | C-TAG of this port. When egress mode is hardware C-TAG, add this to outgoing frame. |
| bool | layer3_table_enable | Enable Layer3 table and forwarding feature. |
| bool | layer3_reject_unknown | Reject frame that not found in Layer3 table. |
| bool | layer3_ipv4_filter_enable | Enable IPv4 stream filter. |
| bool | layer3_ipv6_filter_enable | Enable IPv6 stream filter. |
| bool | layer3_l2_filter_enable | Enable L2 stream filter. |

### ◆ layer3_switch_table_t

| struct layer3_switch_table_t | | |
|---|---|---|
| Forwarding table containing MAC/VLAN/Layer3 forwarding entries. | | |
| Data Fields | | |
| layer3_switch_table_entry_t * | p_mac_entry_list | List of MAC entries. |
| uint32_t | mac_list_length | Length of the MAC entry list. |
| layer3_switch_table_entry_t * | p_vlan_entry_list | List of VLAN entries. |
| uint32_t | vlan_list_length | Length of the VLAN entry list. |
| layer3_switch_table_entry_t * | p_l3_entry_list | List of Layer3 entries. |
| uint32_t | l3_list_length | Length of the Layer3 entry list. |

### ◆ layer3_switch_table_cfg_t

| struct layer3_switch_table_cfg_t | | |
|---|---|---|
| Configuration of the forwarding table. | | |
| Data Fields | | |
| layer3_switch_table_t * | p_table | Pointer to forwarding table. |
| layer3_switch_forwarding_port_cfg_t | port_cfg_list[BSP_FEATURE_ETHER_NUM_CHANNELS+1] | Forwarding configuration of each port. |
| uint32_t | unsecure_entry_maximum_num | Maximum number of unsecure entries. |
| | | |

| | | |
|---|---|---|
| bool | mac_entry_aging_enable | Enable aging feature of MAC table. |
| uint32_t | mac_entry_aging_time_sec | Time[s] to delete an entry by aging. |
| layer3_switch_vlan_mode_t | vlan_mode | VLAN mode options: NO VLAN, C-TAG, or SC-TAG. |
| layer3_switch_l3_stream_filter_cfg_t | l3_stream_filter_cfg | Configuration of stream filter in Layer3 forwarding. |
| layer3_switch_frer_cfg_t | frer_cfg | Configuration of FRER feature. |

### ◆ layer3_switch_extended_cfg_t

| struct layer3_switch_extended_cfg_t | | |
|---|---|---|
| ESWM extension configures each Ethernet port and forwarding feature. | | |
| Data Fields | | |
| ether_phy_instance_t const * | p_ether_phy_instances[BSP_FEATURE_ETHER_NUM_CHANNELS] | List of pointers to ETHER_PHY instance. |
| gptp_instance_t const * | p_gptp_instance | Pointer to a gPTP instance. |
| uint32_t | fowarding_target_port_masks[BSP_FEATURE_ETHER_NUM_CHANNELS] | List of ports to which incoming frames are forwarded. |
| uint8_t * | p_mac_addresses[BSP_FEATURE_ETHER_NUM_CHANNELS] | |
| uint32_t | ipv_queue_depth_list[BSP_FEATURE_ETHER_NUM_CHANNELS][8] | List of IPV queue depth for each port. |
| layer3_switch_l3_filter_t * | l3_filter_list | Filter list of layer3 routing. |
| uint32_t | l3_filter_list_length | Length of Layer3 filter list. |
| layer3_switch_port_cfg_t * | p_port_cfg_list[BSP_FEATURE_ETHER_NUM_CHANNELS] | Configuration for each port. |
| IRQn_Type | etha_error_irq_port_0 | ETHA error interrupt number for port 0. |
| IRQn_Type | etha_error_irq_port_1 | ETHA error interrupt number for port 1. |
| uint8_t | etha_error_ipl_port_0 | ETHA error interrupt priority for port 0. |
| uint8_t | etha_error_ipl_port_1 | ETHA error interrupt priority for port 1. |
| uint8_t | gptp_timer_numbers[BSP_FEATURE_ESWM_GPTP_TIMER_NUM] | List of timer numbers for transmission/reception timestamp. |

### ◆ layer3_switch_instance_ctrl_t

| struct layer3_switch_instance_ctrl_t | |
|---|---|
| LAYER3_SWITCH control block. DO NOT INITIALIZE. Initialization occurs when ether_switch_api_t::open is called. | |
| **Data Fields** | |
| uint32_t | open |
| | Used to determine if the channel is configured. |
| | |
| ether_switch_cfg_t const * | p_cfg |
| | Pointer to initial configurations. |
| | |
| R_GWCA0_Type * | p_gwca_reg |
| | Pointer to GWCA register. |
| | |
| uint32_t | allocated_descriptor_queue_index |
| | Index of the descriptor pool. |
| | |
| layer3_switch_basic_descriptor_t | p_descriptor_queue_list [LAYER3_SWITCH_CFG_AVAILABLE_QUEUE_NUM] |
| | Descriptor queue lists used by hardware. |
| | |
| layer3_switch_descriptor_queue_status_t | p_queues_status [LAYER3_SWITCH_CFG_AVAILABLE_QUEUE_NUM] |
| | Status of each descriptor queues. |
| | |
| layer3_switch_port_cfg_t | p_port_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS] |
| | Configuration for each port. |
| | |
| layer3_switch_table_status_t | table_status |
| | Forwarding table is initialized or not. |
| | |

| | |
|---|---|
| uint32_t | l3_entry_count |
| | Counts of valid LAYER3 entry. |
| | |
| uint8_t | l3_routing_number |
| | Routing number for L2/L3 update feature. |
| | |
| uint8_t | l3_remapping_number |
| | Remapping number for L2/L3 update feature. |
| | |
| layer3_switch_ts_descriptor_queue_status_t | ts_descriptor_queue_status_list [BSP_FEATURE_ESWM_TS_DESCRIPTOR_QUEUE_MAX_NUM] |
| | Status of TS reception descriptor queues. |
| | |
| uint32_t | valid_frer_entry_num |
| | Number of valid FRER entry. |
| | |
| layer3_switch_frer_sequence_recovery_status_t | frer_sequence_recovery_status [BSP_FEATURE_ESWM_FRER_TABLE_SIZE] |
| | Status of table for each FRER sequence recovery entry. |
| | |
| uint32_t | used_frer_sequence_generator_num |
| | Number of the sequence number generator. |
| | |
| void(* | p_callback )(ether_switch_callback_args_t *p_args) |
| | Callback provided when an ISR occurs. |
| | |
| ether_switch_callback_args_t * | p_callback_memory |
| | Pointer to optional callback argument memory. |

| | |
|---|---|
| void * | p_context |
| | Pointer to context to be passed into callback function. |

### ◆ layer3_switch_tas_entry_t

| struct layer3_switch_tas_entry_t | | |
|---|---|---|
| Configuration of the gate operation. | | |
| Data Fields | | |
| layer3_switch_tas_gate_state_t | state | Gate state. |
| uint32_t | time | Time associated with the entry gate state [nsec]. |

### ◆ layer3_switch_tas_gate_cfg_t

| struct layer3_switch_tas_gate_cfg_t | | |
|---|---|---|
| Configuration of the gate. | | |
| Data Fields | | |
| layer3_switch_tas_gate_state_t | initial_gate_state | Initial gate state when the cycle starts. |
| uint8_t | tas_entry_num | Number of TAS entries included in this gate. |
| layer3_switch_tas_entry_t * | p_tas_entry_list | List of TAS entries included in this gate. |

### ◆ layer3_switch_tas_cfg_t

| struct layer3_switch_tas_cfg_t | | |
|---|---|---|
| Configuration of the TAS. | | |
| Data Fields | | |
| uint8_t | gptp_timer_number | gPTP timer number. |
| uint32_t | cycle_time_start_high | Upper 32 bits of TAS cycle start time [nsec]. |
| uint32_t | cycle_time_start_low | Lower 32 bits of TAS cycle start time [nsec]. |
| uint32_t | cycle_time | TAS cycle time [nsec]. |
| layer3_switch_tas_gate_cfg_t | gate_cfg_list[8] | List of TAS gate configurations. |

## Enumeration Type Documentation

### ◆ layer3_switch_descriptor_type_t

| enum layer3_switch_descriptor_type_t | |
|---|---|
| GWCA descriptor type. | |
| Enumerator | |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_LINKFIX | Linkfix. Control element pointing to next descriptor in chain. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_IS | Frame Empty Incremental Start. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_IC | Frame Empty Incremental Continue. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_ND | Frame Empty No Data Storage. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY | Frame Empty. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_START | Frame Empty Start. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_MID | Frame Empty Mid. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_END | Frame Empty End. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FSINGLE | Frame Single. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FSTART | Frame Start. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FMID | Frame Mid. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_FEND | Frame End. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_LEMPTY | Link Empty. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_EEMPTY | EOS Empty. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_LINK | Link. |
| LAYER3_SWITCH_DESCRIPTOR_TYPE_EOS | End of Set. |

### ◆ layer3_switch_port_bitmask_t

| enum layer3_switch_port_bitmask_t | |
|---|---|
| Bitmasks for each port. | |
| Enumerator | |
| LAYER3_SWITCH_PORT_BITMASK_PORT0 | Port 0. |
| LAYER3_SWITCH_PORT_BITMASK_PORT1 | Port 1. |
| LAYER3_SWITCH_PORT_BITMASK_PORT2 | Port 2. |

### ◆ layer3_switch_queue_type_t

| enum layer3_switch_queue_type_t | |
|---|---|
| Descriptor queue type. | |
| Enumerator | |
| LAYER3_SWITCH_QUEUE_TYPE_RX | Reception queue. |
| LAYER3_SWITCH_QUEUE_TYPE_TX | Transmission queue. |

### ◆ layer3_switch_descriptor_format_t

| enum layer3_switch_descriptor_format_t | |
|---|---|
| Descriptor format type. | |
| Enumerator | |
| LAYER3_SWITCH_DISCRIPTOR_FORMTAT_BASIC | Using basic descriptor. |
| LAYER3_SWITCH_DISCRIPTOR_FORMTAT_EXTENDED | Using extended descriptor with additional fields. |
| LAYER3_SWITCH_DISCRIPTOR_FORMTAT_TX_TIMESTAMP | Using TX timestamp descriptor. |

### ◆ layer3_switch_write_back_mode_t

| enum layer3_switch_write_back_mode_t | |
|---|---|
| Write back mode. | |
| Enumerator | |
| LAYER3_SWITCH_WRITE_BACK_MODE_FULL | All fields are updated by hardware. |
| LAYER3_SWITCH_WRITE_BACK_MODE_DISABLE | No fields are updated by hardware. |
| LAYER3_SWITCH_WRITE_BACK_MODE_KEEP_DT | Fields exclude DT are updated by hardware. |

### ◆ layer3_switch_ip_version_t

| enum layer3_switch_ip_version_t | |
|---|---|
| IP version options. | |
| Enumerator | |
| LAYER3_SWITCH_IP_VERSION_NONE | Not IP packet. |
| LAYER3_SWITCH_IP_VERSION_IPV4 | IPv4 packet. |
| LAYER3_SWITCH_IP_VERSION_IPV6 | IPv6 packet. |

### ◆ layer3_switch_ip_address_direction_t

| enum layer3_switch_ip_address_direction_t | |
|---|---|
| Direction of IP address. | |
| Enumerator | |
| LAYER3_SWITCH_IP_ADDRESS_DIRECTION_SOURCE | Use IP source address in stream ID. |
| LAYER3_SWITCH_IP_ADDRESS_DIRECTION_DESTINATION | Use IP destination address in stream ID. |

### ◆ layer3_switch_magic_packet_detection_t

| enum layer3_switch_magic_packet_detection_t | |
|---|---|
| Magic packet detection options. | |
| Enumerator | |
| LAYER3_SWITCH_MAGIC_PACKET_DETECTION_ENABLE | Enable magic packet detection. |
| LAYER3_SWITCH_MAGIC_PACKET_DETECTION_DISABLE | Disable magic packet detection. |

### ◆ layer3_switch_vlan_mode_t

| enum layer3_switch_vlan_mode_t | |
|---|---|
| VLAN detection mode. | |
| Enumerator | |
| LAYER3_SWITCH_VLAN_MODE_NO_VLAN | Not use VLAN feature. |
| LAYER3_SWITCH_VLAN_MODE_C_TAG | Detect and use VLAN C-TAG. |
| LAYER3_SWITCH_VLAN_MODE_SC_TAG | Detect and use VLAN SC-TAG. |

### ◆ layer3_switch_vlan_ingress_mode_t

| enum layer3_switch_vlan_ingress_mode_t | |
|---|---|
| VLAN ingress mode determines whether the switch operates with tagged VLAN or port-based VLAN. | |
| Enumerator | |
| LAYER3_SWITCH_VLAN_INGRESS_MODE_TAG_BASED | Use VLAN ID of the incoming frame. |
| LAYER3_SWITCH_VLAN_INGRESS_MODE_PORT_BASED | Use VLAN ID of the incoming port. |

### ◆ layer3_switch_vlan_egress_mode_t

| enum layer3_switch_vlan_egress_mode_t | |
|---|---|
| VLAN egress mode determines the VLAN tag that is added to output frames. | |
| Enumerator | |
| LAYER3_SWITCH_VLAN_EGRESS_MODE_NO_VLAN | Frame always outgoing without VLAN TAG. |
| LAYER3_SWITCH_VLAN_EGRESS_MODE_C_TAG | Frame outgoing with C-TAG of incoming frame. |
| LAYER3_SWITCH_VLAN_EGRESS_MODE_HW_C_TAG | Frame always outgoing with C-TAG of output port. |
| LAYER3_SWITCH_VLAN_EGRESS_MODE_SC_TAG | Frame always outgoing with SC-TAG of incoming frame. |
| LAYER3_SWITCH_VLAN_EGRESS_MODE_HW_SC_TAG | Frame always outgoing with SC-TAG of output port. |

### ◆ layer3_switch_ip_protocol_t

| enum layer3_switch_ip_protocol_t | |
|---|---|
| IP protocols type. | |
| Enumerator | |
| LAYER3_SWITCH_IP_PROTOCOL_TCP | IP protocol is TCP. |
| LAYER3_SWITCH_IP_PROTOCOL_UDP | IP protocol is UDP. |

### ◆ layer3_switch_forwarding_r_tag_t

| enum layer3_switch_forwarding_r_tag_t | |
|---|---|
| R-TAG filed update options. | |
| Enumerator | |
| LAYER3_SWITCH_FORWARDING_R_TAG_UPDATE | Incoming frame with R-TAG will be updated with new R-TAG. |
| LAYER3_SWITCH_FORWARDING_R_TAG_ALWAYS_ADD | ALl incoming frame will be added new R-TAG. |
| LAYER3_SWITCH_FORWARDING_R_TAG_ALWAYS_ELIMINATE | ALl incoming frame will be removed R-TAG. |

### ◆ layer3_switch_l3_filter_bitmask_t

| enum layer3_switch_l3_filter_bitmask_t | |
|---|---|
| Frame filters options for layer3 forwarding. | |
| Enumerator | |
| LAYER3_SWITCH_L3_FILTER_BITMASK_MAC_DESTINATION | Enable MAC destination address. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_MAC_SOURCE | Enable MAC source address. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_ID | Enable VLAN ID of S-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_PCP | Enable PCP of S-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_DEI | Enable DEI of S-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_ID | Enable VLAN ID of C-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_PCP | Enable PCP of C-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_DEI | Enable DEI of C-TAG. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_IP_SOURCE_ADDRESS | Enable IP source address. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_IP_DESTINATION_ADDRESS | Enable IP destination address. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_PROTOCOL | Enable IP protocol. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_IP_SOURCE_PORT | Enable layer4 source port. |
| LAYER3_SWITCH_L3_FILTER_BITMASK_IP_DESTINATION_PORT | Enable layer4 destination port. |

### ◆ layer3_switch_l3_update_bitmask_t

| enum layer3_switch_l3_update_bitmask_t | |
|---|---|
| Enable L2/L3 update feature. | |
| Enumerator | |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_TTL | Update TTL. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_MAC_DESTINATION | Update MAC destination address. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_MAC_SOURCE | Update MAC source address. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_ID | Update VLAN ID of C-TAG. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_PCP | Update PCP of C-TAG. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_DEI | Update DEI of C-TAG. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_ID | Update VLAN ID of C-TAG. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_PCP | Update PCP of C-TAG. |
| LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_DEI | Update DEI of C-TAG. |

### ◆ layer3_switch_table_entry_type_t

| enum layer3_switch_table_entry_type_t | |
|---|---|
| Table entry type for forwarding feature. | |
| Enumerator | |
| LAYER3_SWITCH_TABLE_ENTRY_TYPE_EMPTY | Entry is not initialized yet. |
| LAYER3_SWITCH_TABLE_ENTRY_TYPE_MAC | Entry of MAC table. |
| LAYER3_SWITCH_TABLE_ENTRY_TYPE_VLAN | Entry of VLAN table. |
| LAYER3_SWITCH_TABLE_ENTRY_TYPE_LAYER3 | Entry of Layer3 table. |

### ◆ layer3_switch_table_status_t

| enum layer3_switch_table_status_t | |
|---|---|
| Table status for forwarding feature. | |
| Enumerator | |
| LAYER3_SWITCH_TABLE_STATUS_UNINITIALIZED | Forwarding table is uninitialized. |
| LAYER3_SWITCH_TABLE_STATUS_INITIALIZED | Forwarding table is initialized. |

### ◆ layer3_switch_tas_gate_state_t

| enum layer3_switch_tas_gate_state_t | |
|---|---|
| TAS gate state. | |
| Enumerator | |
| LAYER3_SWITCH_TAS_GATE_STATE_CLOSE | Gate is closed. |
| LAYER3_SWITCH_TAS_GATE_STATE_OPEN | Gate is opened. |

### ◆ layer3_switch_rx_timestamp_storage_t

| enum layer3_switch_rx_timestamp_storage_t | |
|---|---|
| Enable or disable rx timestamp storage. | |
| Enumerator | |
| LAYER3_SWITCH_RX_TIMESTAMP_STORAGE_DISABLE | Timestamp is not added in the descriptor. |
| LAYER3_SWITCH_RX_TIMESTAMP_STORAGE_ENABLE | Timestamp is added in the descriptor. |

### ◆ layer3_switch_ts_descriptor_queue_status_t

| enum layer3_switch_ts_descriptor_queue_status_t | |
|---|---|
| Used or not timestamp descriptor queue. | |
| Enumerator | |
| LAYER3_SWITCH_TS_DESCRIPTOR_QUEUE_STATUS_UNUSED | TS descriptor queue is unused. |
| LAYER3_SWITCH_TS_DESCRIPTOR_QUEUE_STATUS_USED | TS descriptor queue is used. |

## Function Documentation

### ◆ R_LAYER3_SWITCH_Open()

fsp_err_t R_LAYER3_SWITCH_Open ( ether_switch_ctrl_t *const *p_ctrl*, ether_switch_cfg_t const *const *p_cfg* )

Initializes the switch module and applies configurations. Implements ether_switch_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel opened successfully. |
| FSP_ERR_ASSERTION | Pointer to control block, config structure or extended config structure is NULL. |
| FSP_ERR_ALREADY_OPEN | Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure. |
| FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION | Initialization of PHY-LSI failed. |
| FSP_ERR_INVALID_ARGUMENT | Invalid configuration value. |

### ◆ R_LAYER3_SWITCH_Close()

fsp_err_t R_LAYER3_SWITCH_Close ( ether_switch_ctrl_t *const *p_ctrl*)

Disables interrupts and stop module. Implements ether_switch_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Channel successfully closed. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | Control block is not open. |

### ◆ R_LAYER3_SWITCH_CreateDescriptorQueue()

fsp_err_t R_LAYER3_SWITCH_CreateDescriptorQueue ( ether_switch_ctrl_t *const *p_ctrl*, uint32_t *const *p_queue_index*, const layer3_switch_descriptor_queue_cfg_t *const *p_queue_cfg* )

Create a new descriptor queue and set it to LINKFIX table. This function must be called before calling R_LAYER3_SWITCH_SetDescriptor and R_LAYER3_SWITCH_GetDescriptor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Descriptor created successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | Control block is not open. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_OUT_OF_MEMORY | Descriptor queue list is depleted. |
| FSP_ERR_OVERFLOW | TS descriptor queue is used. |

### ◆ R_LAYER3_SWITCH_SetDescriptor()

fsp_err_t R_LAYER3_SWITCH_SetDescriptor ( ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index*, layer3_switch_descriptor_t const *const *p_descriptor* )

Set descriptor data to a target descriptor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Descriptor set successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | Control block is not open. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Queue index is invalid. |
| FSP_ERR_NOT_INITIALIZED | This descriptor queue is not created. |
| FSP_ERR_IN_USE | Target descriptor is now running. |
| FSP_ERR_OVERFLOW | Descriptor queue is full. |

### ◆ R_LAYER3_SWITCH_GetDescriptor()

fsp_err_t R_LAYER3_SWITCH_GetDescriptor ( ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index*, layer3_switch_descriptor_t *const *p_descriptor* )

Get descriptor data from a target descriptor.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Descriptor got successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | Control block is not open. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Queue index is invalid. |
| FSP_ERR_NOT_INITIALIZED | This descriptor queue is not created or target descriptor is not set. |
| FSP_ERR_IN_USE | Target descriptor is now running. |

### ◆ R_LAYER3_SWITCH_StartDescriptorQueue()

fsp_err_t R_LAYER3_SWITCH_StartDescriptorQueue ( ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index* )

Reload and enable a descriptor queue. In a TX descriptor queue, the queue start transmission. In a RX descriptor queue, the queue start reception.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Descriptor queue started successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | Control block is not open. |
| FSP_ERR_INVALID_ARGUMENT | Queue index is invalid. |
| FSP_ERR_NOT_INITIALIZED | Target descriptor queue is not created. |
| FSP_ERR_IN_USE | Target descriptor queue is already running. |
| FSP_ERR_INVALID_DATA | Target TX queue have no data. |

### ◆ R_LAYER3_SWITCH_CallbackSet()

fsp_err_t R_LAYER3_SWITCH_CallbackSet ( ether_switch_ctrl_t *const *p_ctrl*, void(*)(ether_switch_callback_args_t *) *p_callback*, void *const *p_context*, ether_switch_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_LAYER3_SWITCH_ConfigurePort()

fsp_err_t R_LAYER3_SWITCH_ConfigurePort ( ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port*, layer3_switch_port_cfg_t * *p_port_cfg* )

Configure Ethernet port features, including callback function for each port.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Port configured successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Port number is invalid. |

### ◆ R_LAYER3_SWITCH_AddTableEntry()

fsp_err_t R_LAYER3_SWITCH_AddTableEntry ( ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_frame_filter_t const *const *p_target_frame*, layer3_switch_table_entry_cfg_t const *const *p_entry_cfg* )

Add or update an entry of the forwarding table.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully add/updated an entry into the table. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_OVERFLOW | The number of unsecure entries exceeded the configured value. |
| FSP_ERR_WRITE_FAILED | A hardware error occurred while learning the entry. |
| FSP_ERR_INVALID_ARGUMENT | Target frame or entry type is invalid. |
| FSP_ERR_INVALID_MODE | VLAN feature is disabled and a VLAN entry is passed. |

### ◆ R_LAYER3_SWITCH_SearchTableEntry()

fsp_err_t R_LAYER3_SWITCH_SearchTableEntry ( ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_frame_filter_t const *const *p_target_frame*, layer3_switch_table_entry_cfg_t *const *p_entry_cfg* )

Search an entry from the forwarding table.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The entry is found successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_NOT_FOUND | The entry is not found in the table. |
| FSP_ERR_INVALID_ARGUMENT | Target frame or entry type is invalid. |
| FSP_ERR_INVALID_MODE | VLAN feature is disabled and a VLAN entry is passed. |

### ◆ R_LAYER3_SWITCH_ConfigureTable()

fsp_err_t R_LAYER3_SWITCH_ConfigureTable ( ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_table_cfg_t const *const *p_table_cfg* )

Configure and initialize an forwarding table.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Table configured successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_WRITE_FAILED | Failed to add entries. |

### ◆ R_LAYER3_SWITCH_GetTable()

fsp_err_t R_LAYER3_SWITCH_GetTable ( ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_table_t *const *p_table* )

Get a pointer to the forwarding table.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Table got successfully. |
| FSP_ERR_ASSERTION | Pointer to control block is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_INVALID_MODE | VLAN feature is disabled and a VLAN entry list is passed. |

### ◆ R_LAYER3_SWITCH_ConfigureTAS()

fsp_err_t R_LAYER3_SWITCH_ConfigureTAS ( ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port*, layer3_switch_tas_cfg_t * *p_tas_cfg* )

Configure Time Aware Shaper feature.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | TAS configure successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_POINTER | Pointer to a argument is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Port number is invalid. |
| FSP_ERR_UNSUPPORTED | TAS feature is not enabled in the configuration. |

### ◆ R_LAYER3_SWITCH_EnableTAS()

fsp_err_t R_LAYER3_SWITCH_EnableTAS ( ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port* )

Enable Time Aware Shaper feature.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | TAS enabled successfully. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Port number is invalid. |
| FSP_ERR_UNSUPPORTED | TAS feature is not enabled in the configuration. |

### Detailed Description

NFC Reader driver implementation using the PTX NFC module on RA MCUs.

# Overview

This middleware module supplies an implementation for the NFC IoT Reader on the PTX module. The NFC functionalities are provided via a modular NFC Soft Controller (NCS) architecture, and this FSP module will include the NSC (aka NFC SDK). Functionality is provided in a split-stack architecture, where time-critical operations are running on the on-chip MCU, and the rest of the NFC logic is in the host controller to carry out applications such as IoT reader. The driver may also be adapted to further support next-generation PTX devices in future (which have not yet been released).

The NFC Reader module supports the following modules:

- PTX105R (https://www.renesas.com/en/products/wireless-connectivity/nfc/ptx105r-mid-power-multi-protocol-nfc-forum-compliant-reader)

**Features**

The NFC Reader PTX driver supplies these features:

- Initializes the IOTRD (IoT Reader) API and NSC stack
- Initializes the PTX chip
- Discovers cards according to NFC Forum
- Selects a specific card in case multiple cards/protocols were discovered
- Retrieves card details like technical/activation parameters
- Exchanges RF data and bitstreams
- Stops RF communication
- NDEF add-on API for exchanging data using the NDEF (NFC Data Exchange Format) standard
- Discovery support for "Low-Power-Card-Detection"
- Optionally puts the PTX chip into and wake up from stand-by mode

Future support is considered for the following features:

- Optionally updates RF and System configuration parameters at runtime
- Controls various GPIO pins of the PTX chip
- Plus several add-on features for additional operations and testing

# Configuration

**Build Time Configurations for rm_nfc_reader_ptx**

The following build time configurations are defined in fsp_cfg/rm_nfc_reader_ptx_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Add-on | | | |
| NDEF Support | • Disabled<br>• Enabled | Disabled | Includes the APIs provided by the NDEF Add-on. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| NFC NDEF Work Buffer Size | Must be an integer greater than 0 | 64 | Size in bytes of the NFC NDEF work buffer used for internally exchanging data with a tag. Must be an integer greater than 0. |

**Configurations for Networking > NFC IoT Reader on PTX (rm_nfc_reader_ptx)**

This module can be added to the Stacks tab via New Stack > Networking > NFC IoT Reader on PTX (rm_nfc_reader_ptx).

| | | | |
|---|---|---|---|

| Configuration | Options | Default | Description |
|---|---|---|---|
| NFC Poll Type | | | |
| Type-A | • Disabled<br>• Enabled | Enabled | Select to discover NFC Type-A tags |
| Type-B | • Disabled<br>• Enabled | Enabled | Select to discover NFC Type-B tags |
| Type-V | • Disabled<br>• Enabled | Enabled | Select to discover NFC Type-V tags |
| Type-F | • Disabled<br>• Enabled | Enabled | Select to discover NFC Type-F tags |
| Temperature Sensor | | | |
| Calibrate Sensor | • Disabled<br>• Enabled | Enabled | Enable/Disable on-board temperature sensor calibration. Must be executed once per chip (lifetime), it is not needed after. |
| Shutdown Temperature (°C) | Must be an integer greater than 0 and less than 223 | 100 | Set the expected thermal shutdown threshold value (Celsius). |
| Ambient Temperature (°C) | Must be an integer greater than 0 and less than 85 | 25 | Set the ambient temperature value at which calibration takes place (Celsius). |
| Name | Name must be a valid C symbol | g_nfc_reader_ptx0 | Module name. |
| Set Polling Mode | Must be an integer greater than or equal to 0 and less than 256 | 0 | Set polling mode, where 0 is Regular Polling, 1 is Low-power Card Detection (LPCD), and 2-255 is LPCD with every n-th cycle as Regular Polling |
| NFC Interrupt Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the interrupt port/pin used by the NFC chip to signal for SPI communications. |
| NFC Interrupt Pin | Refer to the RA Configuration tool for available options. | module.driver.nfc_reader_ptx.pin_control_pin.PIN_DISABLE | Specify the interrupt port/pin used by the NFC chip to signal for SPI communications. |
| Device Limit | Must be an integer greater than 0 and less than 50 | 5 | Select the max number of tags to discover. |

| | | | |
|---|---|---|---|
| Idle Time | Must be an integer greater than 0 and less than 65535 | 100 | Select idle time between polling cycles (ms). |

Note: This module provides the basic configurations in the FSP Configurator required to discover, activate, and exchange data with an NFC tag. The user can then copy these configurations to a new structure if they want to connect to a new tag type/make changes to the configurations dynamically.

**Interrupt Configuration**

Refer to SPI (r_sci_spi). R_SCI_SPI_Open() is called by this module

**Clock Configuration**

Refer to SPI (r_sci_spi).

**Pin Configuration**

Refer to SPI (r_sci_spi). R_SCI_SPI_Open() is called by this module

# Usage Notes

- For all information on the PTX NFC IoT Reader, including data types, APIs, the SDK, etc., refer to the PTX105R documentation on the webpage above.
- This module includes the NFC SDK which must be stored and compiled on the host RA MCU. The NFC IoT Reader claims that code size is roughly 39K B Code Flash (53 KB with the reference application) and 3-4 KB of Stack memory for the reference application. Consider this when looking at the device and the user application.
- This module also requires a minimal amount of heap allocation (256 bytes). Be sure to allocate some heap size in the FSP Configurator BSP tab.
- The NFC SDK provided with this module contains platform-specific and device-specific code related to using the FSP on RA devices. For other devices, the Platform API (ptxPLAT) must be implemented/ported.
- When selecting the NFC tag protocol (Type-A, Type-B, Type-V, and Type-F), ensure that at least one type is selected.
- For data exchange, the user must provide transmission/receive buffers with the exact data packet for the intended tag type. For information on commands, responses, and parameters, definitions can be found in the NFC Specification.
- The NFC SDK contains a default RF waveform configuration file (ptxNSC_RfConfigVal.c) which is compatible with the PTX105RQC Pmod board. For custom boards, this configuration file will need to be generated with the GUI tool available on the module webpage.
- The NFC chip provides an external interrupt pin which links to the ptxPLAT_GPIO_IsrCallback callback function. The same pin is also used during SPI communications for the NFC chip to signal it is ready and must be implemented in the FSP Configurator. The port/pin chosen for the interrupt pin should be the same for the NFC module properties and the External IRQ properties.

**Limitations**

- The module will only support SPI for the first release, with other protocols (I2C, UART) planned for future releases.
- The PTX105RQC Pmod board only supports SPI, so consider the evaluation kit (PTX105REK) for other interfaces.
- The NFC chip reset pin (labeled as SEN pin) isn't supported in the FSP currently, and it does

not have a pinout on the PTX105RQC Pmod board.

# Examples

### Basic Example

This is a basic example of minimal use of the NFC IoT Reader module in an application.

```
void nfc_basic_example (void)
{
 fsp_err_t                err       = FSP_SUCCESS;
    ptxIotRdInt_Demo_State_t demo_state = IoTRd_DemoState_WaitForActivation;
    err = RM_NFC_READER_PTX_Open(&g_rm_nfc_reader_ptx_instance,
&g_nfc_reader_ptx_cfg);
    assert(FSP_SUCCESS == err);
    err = RM_NFC_READER_PTX_DiscoveryStart(&g_rm_nfc_reader_ptx_instance);
    assert(FSP_SUCCESS == err);
    ptxIoTRd_CardRegistry_t * card_registry = NULL;
    err = RM_NFC_READER_PTX_CardRegistryGet(&g_rm_nfc_reader_ptx_instance,
&card_registry);
    assert(FSP_SUCCESS == err);
 /* T2T Protocol Example => READ BLOCK 0 */
 const uint8_t PROT_T2T_EXAMPLE[] = {0x30, 0x00};
    nfc_send_buf.tx_length = sizeof(PROT_T2T_EXAMPLE);

## Data Structures

| | |
|---|---|
| struct | nfc_reader_ptx_data_info_t |
| struct | nfc_reader_ptx_cfg_t |
| struct | nfc_reader_ptx_instance_ctrl_t |

## Enumerations

| | |
|---|---|
| enum | nfc_reader_ptx_ndef_read_write_t |
| enum | nfc_reader_ptx_power_mode_t |
| enum | nfc_reader_ptx_state_t |
| enum | nfc_reader_ptx_return_state_t |

## Data Structure Documentation

### ◆ nfc_reader_ptx_data_info_t

| struct nfc_reader_ptx_data_info_t | | |
|---|---|---|
| NFC data exchange packet parameters | | |
| Data Fields | | |
| uint8_t * | p_tx_buf | Pointer to buffer holding data to send. |
| uint32_t | tx_length | Length of data to send. |
| uint8_t * | p_rx_buf | Pointer to buffer for data to receive. |
| uint32_t | rx_length | Length of data to receive. |

### ◆ nfc_reader_ptx_cfg_t

| struct nfc_reader_ptx_cfg_t | | |
|---|---|---|
| NFC Configuration | | |
| Data Fields | | |
| bool | poll_type_a | Flag to indicate enabling discovery for Type-A tags. |
| bool | poll_type_b | Flag to indicate enabling discovery for Type-B tags. |

| | | |
|---|---|---|
| bool | poll_type_f | Flag to indicate enabling discovery for Type-F tags. |
| bool | poll_type_v | Flag to indicate enabling discovery for Type-V tags. |
| uint8_t | device_limit | Defines the maximum number of devices that can be connected at once. |
| uint8_t | discover_mode | Set polling mode, where 0 = Regular Polling, 1 = Low-Power Card Detection (LPCD), 2-255 = LPCD with every n-th Cycle Regular Polling. |
| uint32_t | idle_time_ms | RF-Discovery Loop. Idle time between polling cycles in milliseconds. |
| uint8_t | temp_sensor_calibrate | Flag to enable/disable temperature sensor calibration. |
| uint8_t | temp_sensor_shutdown | Expected thermal shutdown threshold value. |
| uint8_t | temp_sensor_ambient | Ambient temperature at which temperature sensor calibration takes place. |
| const bsp_io_port_pin_t | interrupt_pin | Interrupt pin for NFC chip to signal for communication. |
| ptxIoTRd_t * | iot_reader_context | Instance of the NFC SDK IoT Reader main structure. |
| rm_comms_instance_t * | p_comms_instance_ctrl | Pointer to the NFC module's Comms instance. |
| ioport_instance_t * | p_gpio_context | Pointer to the NFC module's GPIO instance. |
| external_irq_instance_t * | p_irq_context | Pointer to the NFC module's SPI external interrupt instance. |
| timer_instance_t * | p_timer_context | Pointer to the NFC module's sleep timer instance. |
| timer_instance_t * | p_app_timer | Pointer to the NFC module's Transparent Data Channel (TDC) timer instance. |
| ptxNDEF_t * | p_ndef_context | Pointer to the optional NDEF API context. |

### ◆ nfc_reader_ptx_instance_ctrl_t

| struct nfc_reader_ptx_instance_ctrl_t |
|---|
| NFC_READER_PTX private control block. DO NOT MODIFY. |

| Data Fields | | |
|---|---|---|
| uint8_t | ndef_work_buf[NFC_READER_PTX_NDEF_WORK_BUF_SIZE] | Buffer for NDEF internal data exchange. |
| uint32_t | open | Flag to indicate if NFC has been opened. |
| uint32_t | ndef_open | Flag to indicate if NFC NDEF has been initialized. |
| nfc_reader_ptx_state_t | state_flag | Flag to track Idle/discovered/activated. |
| nfc_reader_ptx_cfg_t const * | p_cfg | Pointer to p_cfg for NFC. |

## Enumeration Type Documentation

### ◆ nfc_reader_ptx_ndef_read_write_t

| enum nfc_reader_ptx_ndef_read_write_t | |
|---|---|
| NFC NDEF data exchange flags | |
| Enumerator | |
| NFC_READER_PTX_NDEF_WRITE | Write flag for NDEF data exchange. |
| NFC_READER_PTX_NDEF_READ | Read flag for NDEF data exchange. |

### ◆ nfc_reader_ptx_power_mode_t

| enum nfc_reader_ptx_power_mode_t | |
|---|---|
| NFC power mode flags | |
| Enumerator | |
| NFC_READER_PTX_ACTIVE_MODE | Active mode (default), all features enabled. |
| NFC_READER_PTX_STANDBY_MODE | Stand-by mode, most features disabled for low power. |

### ◆ nfc_reader_ptx_state_t

| enum nfc_reader_ptx_state_t | |
|---|---|
| NFC state machine status | |
| Enumerator | |
| NFC_READER_PTX_IDLE | Idle state before starting discovery. |
| NFC_READER_PTX_POLLING | Polling state for discovering tags. |
| NFC_READER_PTX_DISCOVERED | Discovered state for tags that were found. |
| NFC_READER_PTX_ACTIVATED | Activated state for activating a discovered tag. |

### ◆ nfc_reader_ptx_return_state_t

| enum nfc_reader_ptx_return_state_t | |
|---|---|
| NFC de-activation return state | |
| Enumerator | |
| NFC_READER_PTX_RETURN_IDLE | Rf-Deactivation Type 0 - Turn off RF-field. |
| NFC_READER_PTX_RETURN_DISCOVER | Rf-Deactivation Type 1 - Restart RF-Discovery. |
| NFC_READER_PTX_RETURN_SLEEP | Rf-Deactivation Type 2 - Put remote device to sleep. |
| NFC_READER_PTX_RETURN_SLEEP_NON_BLOCKING | Rf-Deactivation Type 3 - Put remote device to sleep (non-blocking) |
| NFC_READER_PTX_RETURN_NO_RF_RESET | Rf-Deactivation Type 4 - Common RF Deactivate but no Field Reset. |
| NFC_READER_PTX_RETURN_IDLE_PROTOCOL | Rf-Deactivation Type 5 - Use protocol-specific Deactivation, IDLE afterwards. |
| NFC_READER_PTX_RETURN_DISCOVER_PROTOCOL | Rf-Deactivation Type 6 - Use protocol-specific Deactivation, RF-Discovery started afterwards. |

## Function Documentation

### ◆ RM_NFC_READER_PTX_Open()

fsp_err_t RM_NFC_READER_PTX_Open ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_cfg_t const *const *p_cfg* )

Initializes the NFC IoT Reader.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | p_cfg | Pointer to NFC IoT Reader configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_ALREADY_OPEN | Module is already opened. |
| FSP_ERR_INVALID_DATA | NFC SDK initialization data was incomplete. |

### ◆ RM_NFC_READER_PTX_DiscoveryStart()

fsp_err_t RM_NFC_READER_PTX_DiscoveryStart ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Initiates discovery of NFC tags.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the idle state. |
| FSP_ERR_INVALID_DATA | NFC Discovery parameters were invalid or discovery was not started. |

### ◆ RM_NFC_READER_PTX_StatusGet()

fsp_err_t RM_NFC_READER_PTX_StatusGet ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_StatusType_t *status_type*, uint8_t *const *p_status* )

Gets the status information on the provided status identifier (system, discovery, etc.). Used during polling to confirm a card was discovered.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | status_type | Status identifier for target info. |
| [in] | p_status | Pointer to location to store NFC chip status flag. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the polling state. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameters to NFC Status function. |

### ◆ RM_NFC_READER_PTX_CardRegistryGet()

fsp_err_t RM_NFC_READER_PTX_CardRegistryGet ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_CardRegistry_t ** *pp_card_registry* )

Gets the internal card registry.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | pp_card_registry | Pointer to card registry for discovered cards. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameters to NFC registry function. |

### ◆ RM_NFC_READER_PTX_CardActivate()

fsp_err_t RM_NFC_READER_PTX_CardActivate ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_CardParams_t *const *p_card_params*, ptxIoTRd_CardProtocol_t *protocol* )

Gets the details of the discovered card and connects to it. Not required if only a single tag was discovered.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | p_card_params | Parameters of the card to be activated. |
| [in] | protocol | The NFC protocol of the card to be activated. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the discovered/selection state. |

### ◆ RM_NFC_READER_PTX_DataExchange()

fsp_err_t RM_NFC_READER_PTX_DataExchange ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_data_info_t *const *p_data_info* )

Sends and receives data to/from the activated card.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | p_data_info | Pointer to the NFC TX/RX data. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the activated state. |
| FSP_ERR_INVALID_ARGUMENT | Issue with input parameters (buffers) leading to failed transmission. |

### ◆ RM_NFC_READER_PTX_ReaderDeactivation()

fsp_err_t RM_NFC_READER_PTX_ReaderDeactivation ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_return_state_t *return_state* )

Deactivates the activated card to return to the desired state (idle, discovery, etc.).

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | return_state | Expectation for end state of NFC state machine. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the activated state. |
| FSP_ERR_INVALID_ARGUMENT | Issue with input parameters or transmission. |

### ◆ RM_NFC_READER_PTX_PowerModeSet()

fsp_err_t RM_NFC_READER_PTX_PowerModeSet ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_power_mode_t *power_mode* )

Puts the device into either Active (all features) or Stand-by mode (most features off), to cut down energy consumption. RF communication is not possible from Stand-by mode, and Wake-up is possible only via communication interface. This function is only available exclusively before starting discovery.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | power_mode | Flag to indicate if setting to Active or Stand-by mode. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the idle/polling state. |
| FSP_ERR_INVALID_ARGUMENT | Invalid input parameters to NFC Status function. |

### ◆ RM_NFC_READER_PTX_NDEF_Init()

fsp_err_t RM_NFC_READER_PTX_NDEF_Init ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_data_info_t *const *p_data_info* )

Initializes the optional NDEF API add-on. Must be done after NFC stack is initialized.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | p_data_info | Pointer to the NFC TX/RX data. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_ALREADY_OPEN | NDEF API add-on was already initialized. |
| FSP_ERR_UNSUPPORTED | NDEF API add-on was not included in project configuration. |

### ◆ RM_NFC_READER_PTX_NDEF_DataExchange()

fsp_err_t RM_NFC_READER_PTX_NDEF_DataExchange ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, uint8_t * *p_ndef_message*, uint32_t *message_length*, nfc_reader_ptx_ndef_read_write_t *ndef_read_write_flag* )

Exchanges NDEF data with an NFC tag by reading from or writing to it.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |
| [in] | p_ndef_message | Pointer to the buffer to transmit or receive a message. |
| [in] | message_length | Length of the NDEF message buffer. |
| [in] | ndef_read_write_flag | Flag to control if the data exchange is a read or a write. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_NOT_INITIALIZED | NDEF add-on is not initialized yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the activated state. |
| FSP_ERR_INVALID_DATA | Problem with input parameters or data transmission. |
| FSP_ERR_UNSUPPORTED | NDEF API add-on was not included in project configuration. |

### ◆ RM_NFC_READER_PTX_NDEF_Lock()

fsp_err_t RM_NFC_READER_PTX_NDEF_Lock ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Locks an NFC tag to prevent writing to it, making it read-only.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened yet. |
| FSP_ERR_NOT_INITIALIZED | NDEF add-on is not initialized yet. |
| FSP_ERR_INVALID_STATE | NFC module is not in the activated state. |
| FSP_ERR_INVALID_DATA | Problem with input parameters or data transmission. |
| FSP_ERR_UNSUPPORTED | NDEF API add-on was not included in project configuration. |

### ◆ RM_NFC_READER_PTX_Close()

fsp_err_t RM_NFC_READER_PTX_Close ( nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Closes the FSP NFC module and resets all variables.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to NFC IoT Reader control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Assertion error occurred. |
| FSP_ERR_NOT_OPEN | Close being called before the module is Open. |

## 5.2.12.25 NetX Duo Ethernet Driver (rm_netxduo_ether)

Modules » Networking

# Overview

This module provides a NetX Duo driver that is implemented using the Ethernet Interface.

Please refer to the NetXDuo documentation for further details.

### Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- Link status callback
- Configurable IP MTU

# Configuration

### Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_netxduo_ether_0 | Module name. |
| IP MTU | Value must be in the range [576, 1500] bytes. | 1500 | IP MTU |

# Usage Notes

### Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured ether_cfg_t::ether_buffer_size. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

ether_cfg_t::ether_buffer_size is calculated from the IP MTU using the following formula:

ceil(( rm_netxduo_ether_cfg_t::mtu + Ethernet Header (14) + Padding Bytes (2)) / 32 ) * 32

### Zero Copy Support

Zero copy support should only be disabled when a lower level ethernet driver doesn't support it. Disabling zero copy will negatively impact performance. When zero copy is disabled larger buffers will need to be allocated or link speed will need to be limited to counteract poor performance.

# Examples

### Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_MSW (0)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_LSW (0)
static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
 /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
    UINT status;
    nx_system_initialize();
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool_memory[0],
```

```
                                    NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool,
                          rm_netxduo_ether0,
                          &g_ip_stack_memory[0],
 sizeof(g_ip_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
(g_ip_arp_cache_memory));
    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

### Changing MAC address Example

This is an example of changing the MAC address after an IP instance has already been created.

```
void rm_netxduo_ether_change_mac_address_example ()
{
    ULONG driver_status;
    UINT status;
 /* Disable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_DISABLE, 0,
&driver_status);
```

```
    assert(NX_SUCCESS == status);
 /* Update the MAC address. */
    status = nx_ip_interface_physical_address_set(&g_ip,
                                                  0,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_MSW,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_LSW,
                                                  NX_TRUE);
    assert(NX_SUCCESS == status);
 /* Re-enable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_ENABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
}
```

#### 5.2.12.26 NetX Duo WiFi Driver (rm_netxduo_wifi)

Modules » Networking

# Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the NetXDuo documentation for further details.

**Features**

- Packet Types Supported
  - TCP/IPv4
  - UDP
- Configurable IP MTU

# Configuration

**Build Time Configurations for rm_netxduo_wifi**

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| IP MTU (bytes) | Value must be in the | 1500 | IP MTU |

range [576, 1500] bytes.

# Usage Notes

### Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- rm_wifi_onchip_silex_open() should be called to initialize the WiFi module driver.
- rm_wifi_onchip_silex_scan() should be used to scan for access points.
- rm_wifi_onchip_silex_connect() should be used before opening a NetX IP instance in order to connect it to a network.
- rm_wifi_onchip_silex_network_info_get() should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

### Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the rm_wifi_onchip_silex driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the rm_wifi_onchip_silex driver, thus the software DHCP stack is unsupported.
- The source port will not be used when binding a TCP or UDP socket. Applications should set the source port to NX_ANY_PORT.
- Use of the NetX Duo FTP addon is not recommended as certain FTP functions will return a NX_NO_PACKET due to how SX-ULPGN firmware handles bundling packet data.

### On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling rm_wifi_onchip_silex_dns_query().
- ICMP: The user can perform a ping by calling rm_wifi_onchip_silex_ping().
- SNTP: The WiFi module has multiple public APIs for time related functions:
  - RM_WIFI_ONCHIP_SILEX_EpochTimeGet()
  - RM_WIFI_ONCHIP_SILEX_LocalTimeGet()
  - RM_WIFI_ONCHIP_SILEX_SntpEnableSet()
  - RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()
  - RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

# Examples

### Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
```

```
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_SSID "ssidName"
#define NETXDUO_EXAMPLE_PASSWORD "password"
static NX_IP g_ip0;
static NX_PACKET_POOL g_packet_pool0;
static uint8_t g_ip0_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool0_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;
void rm_netxduo_wifi_example ()
{
    UINT      status;
 fsp_err_t err;
    nx_system_initialize();
 /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
 /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUO_EXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUO_EXAMPLE_PASSWORD);
    assert(FSP_SUCCESS == err);
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool0_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
```

```
 /* Create an IP instance using the rm_netxduo_wifi driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip0,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool0,
                          rm_netxduo_wifi,
                          &g_ip0_stack_memory[0],
 sizeof(g_ip0_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_tcp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
    status = nx_udp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
}
```

### TLS Example

This is a basic example of connecting a TLS socket.

```
#define NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE (18000U)
#define NETXDUO_EXAMPLE_TLS_PACKET_REASSEMBLY_BUFFER_SIZE (4000U)
#define NETXDUO_EXAMPLE_PORT (3005U)
#define NETXDUO_EXAMPLE_SERVER_PORT (9050U)
#define NETXDUO_EXAMPLE_IP IP_ADDRESS(1, 2, 3, 5)
NX_SECURE_TLS_CRYPTO       g_nx_crypto_tls_test_ciphers;
static UCHAR g_tls_crypto_metadata[NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE];
static UCHAR g_tls_packet_buffer[NETXDUO_EXAMPLE_TLS_PACKET_REASSEMBLY_BUFFER_SIZE];
static NX_SECURE_X509_CERT g_certificate;
extern const UCHAR g_trusted_ca_data; // User trusted certificates
extern USHORT g_trusted_ca_length;
void rm_netxduo_wifi_tls_example ()
```

```
{
    UINT                  status;
 fsp_err_t             err;
    NX_TCP_SOCKET       * p_socket;
    NX_SECURE_TLS_SESSION tls_session;
    nx_system_initialize();
 /* Initialize NetX Crypto */
    status = nx_crypto_initialize();
    assert(NX_SUCCESS == status);
 /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
 /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUO_EXAMPLE_SSID, eWiFiSecurityWPA2,

/* Create a TLS session for our socket. This sets up the TLS session object for
 * later use */
   status =
      nx_secure_tls_session_create(&tls_session,
                                   &g_nx_crypto_tls_test_ciphers,
                                   g_tls_crypto_metadata,
                                   NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE);
   assert(NX_SUCCESS == status);
/* Set the packet reassembly buffer for this TLS session. */
   status = nx_secure_tls_session_packet_buffer_set(&tls_session,
                                                    g_tls_packet_buffer,

NETXDUO_EXAMPLE_TLS_PACKET_REASSEMBLY_BUFFER_SIZE);
   assert(NX_SUCCESS == status);
/* Initialize an X.509 certificate with the CA root certificate data. */
   status = nx_secure_x509_certificate_initialize(&g_certificate,
                                                  (UCHAR *) g_trusted_ca_data,
```

```
                                           g_trusted_ca_length,
                                NX_NULL,
                                           0,
                                NX_NULL,
                                           0,
                                           NX_SECURE_X509_KEY_TYPE_NONE);
    assert(NX_SUCCESS == status);
 /* Add the initialized certificate as a trusted root certificate. */
    status = nx_secure_tls_trusted_certificate_add(&tls_session, &g_certificate);
    assert(NX_SUCCESS == status);
 /* Bind the socket to a port. */
    status = nx_tcp_client_socket_bind(p_socket, NETXDUO_EXAMPLE_PORT,
NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
 /* Connect TCP socket */
    status = nx_tcp_client_socket_connect(p_socket, NETXDUO_EXAMPLE_IP,
NETXDUO_EXAMPLE_SERVER_PORT, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
 /* Start the TLS Session using the connected TCP socket. This function will
  * ascertain from the TCP socket state that this is a TLS Client session. */
    status = nx_secure_tls_session_start(&tls_session, p_socket, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
}
```

### UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUO_TESTS_SOCKET_TIMEOUT (3000)
#define NETXDUO_TESTS_UDP_TX_PORT (5000)
#define NETXDUO_TESTS_SERVER_IP (0xC0A80064)
void rm_netxduo_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
 /* IP Address of the remote socket. */
```

```
    NXD_ADDRESS g_ip_address = NETXDUO_TESTS_SERVER_IP;
 /* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
NX_FRAGMENT_OKAY, 0, 5);
 /* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUO_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);
    NX_PACKET * p_nx_packet = NX_NULL;
 /* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUO_TESTS_SOCKET_TIMEOUT)
 /* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);
 /* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUO_TESTS_UDP_TX_PORT);
    NX_PACKET * p_nx_packet_recv;
 /* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_recv,
NETXDUO_TESTS_SOCKET_TIMEOUT);
 /* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}
```

### Detailed Description

HTTP client implementation using the DA16XXX WiFi module on RA MCUs.

# Overview

This Middleware module supplies an implementation for the HTTP Client on the DA16XXX module, as well as the ability to start an HTTP server on the module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX HTTP module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Features

The HTTP Onchip da16xxx Middleware driver supplies these features:

- Supports sending a request header (GET, PUT, and POST) to an HTTP server and receiving a response header
- Supports unsecure and secure connection via TLS encryption
- Supports parsing of the response header and returning to the user
- Supports other optional configurations such as Server Name Indication (SNI) and ALPNs
- Supports starting a secure or unsecure HTTP server on the DA16XXX module

# Configuration

### Build Time Configurations for rm_http_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_http_onchip_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Networking > HTTP Client/Server on DA16XXX (rm_http_onchip_da16xxx)

This module can be added to the Stacks tab via New Stack > Networking > HTTP Client/Server on DA16XXX (rm_http_onchip_da16xxx).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Certificates | | | |
| HTTP Certificates Header File | Must be a valid C symbol | | Name of header file that will contain certificates (macros). User must create header file if this field is populated. |
| Root CA | Must be a valid C symbol | ROOT_CA | Links to user-defined macro of the same name for Root CA which user must define in application header. |
| Client Certificate | Must be a valid C symbol | CLIENT_CERT | Links to user-defined macro of the same name for client certificate which user must define in application header. |
| Private Key | Must be a valid C symbol | PRIVATE_KEY | Links to user-defined macro of the same name for private key which user must define in application header. |
| ALPN | | | |
| ALPN 1 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| ALPN 2 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| ALPN 3 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| Server Name Indication (SNI) | Manual Entry | | |
| TLS Authentification Level | • 0 (None)<br>• 1 (Optional)<br>• 2 (Required) | 0 (None) | Level of TLS authentication for HTTP requests. |

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Clock Configuration

Refer to UART (r_sci_uart).

### Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

## Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- When starting an HTTP server, the DA16XXX module will use the default HTTP test server included in the SDK. The user will need to customize the SDK to provide their own desired server. Refer to guides on the DA16XXX module page for importing/modifying the SDK

### Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the HTTP module
- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an HTTP server with TLS (unless buffer size settings are altered manually)

## Examples

### Basic Example

This is a basic example of minimal use of HTTP Middleware in an application.

```
void http_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       http_err;
```

```
/* Setup Access Point connection parameters */
WIFINetworkParams_t net_params =
   {
      .ucChannel                  = 0,
      .xPassword.xWPA.cPassphrase = WIFI_PWD,
      .ucSSID                     = WIFI_SSID,
      .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
      .ucSSIDLength            = sizeof(WIFI_SSID),
      .xSecurity               = eWiFiSecurityWPA2,
   };
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Initialize the HTTP Client connection */
   http_err = RM_HTTP_DA16XXX_Open(&g_rm_http_onchip_da16xxx_instance,
&g_http_onchip_da16xxx_cfg);
   assert(FSP_SUCCESS == http_err);
/* Initialize the HTTP Client connection */
   http_err = RM_HTTP_DA16XXX_Send(&g_rm_http_onchip_da16xxx_instance, &test_req,
&user_buf);
   assert(FSP_SUCCESS == http_err);
/* Close the HTTP Client module */
   http_err = RM_HTTP_DA16XXX_Close(&g_rm_http_onchip_da16xxx_instance);
   assert(FSP_SUCCESS == http_err);
}
```

## Data Structures

| | |
|---|---|
| struct | http_onchip_da16xxx_request_t |
| struct | http_onchip_da16xxx_buffer_t |
| struct | http_onchip_da16xxx_cfg_t |

| | |
|---|---|
| struct | http_onchip_da16xxx_instance_ctrl_t |

### Macros

| | |
|---|---|
| #define | HTTP_ONCHIP_DA16XXX_MAX_ALPN<br>Maximum number of ALPNs supported by DA16XXX. |
| #define | HTTP_ONCHIP_DA16XXX_MAX_SNI_LEN<br>Maximum length of SNI supported by DA16XXX. |
| #define | HTTP_ONCHIP_DA16XXX_MAX_GET_LEN<br>Maximum length of HTTP GET request. |

### Enumerations

| | |
|---|---|
| enum | http_onchip_da16xxx_method_t |
| enum | http_onchip_da16xxx_tls_auth_t |
| enum | http_onchip_da16xxx_ssl_enable_t |

## Data Structure Documentation

### ◆ http_onchip_da16xxx_request_t

| struct http_onchip_da16xxx_request_t | | |
|---|---|---|
| HTTP Request Buffer | | |
| Data Fields | | |
| const char * | p_http_endpoint | Defines the URL to send HTTP requests to. |
| const char * | p_request_body | Pointer to optional buffer for body. |
| http_onchip_da16xxx_method_t | method | Request method to be used. |
| uint32_t | length | Length of optional body buffer. |

### ◆ http_onchip_da16xxx_buffer_t

| struct http_onchip_da16xxx_buffer_t | | |
|---|---|---|
| HTTP User Buffers | | |
| Data Fields | | |
| char * | p_request_buffer | User HTTP request buffer. |
| uint32_t | req_length | Size of HTTP request buffer. |

| | | |
|---|---|---|
| char * | p_response_buffer | User HTTP request buffer. |
| uint32_t | resp_length | Size of HTTP request buffer. |

### ◆ http_onchip_da16xxx_cfg_t

| struct http_onchip_da16xxx_cfg_t | | |
|---|---|---|
| HTTP Configuration | | |
| Data Fields | | |
| at_transport_da16xxx_instance_t const * | p_transport_instance | |
| const char * | p_alpns[ HTTP_ONCHIP_DA16XXX_MAX_ALPN] | Buffer for storing ALPN names. |
| uint8_t | alpn_count | ALPN Protocols count. Max value is 3. |
| const char * | p_sni_name | Pointer to Server Name Indication. |
| http_onchip_da16xxx_tls_auth_t | tls_level | Set TLS Authentication Level (0, 1, or 2) |
| const char * | p_root_ca | String representing a trusted server root certificate. |
| uint32_t | root_ca_size | Size associated with root CA Certificate. |
| const char * | p_client_cert | String representing a Client certificate. |
| uint32_t | client_cert_size | Size associated with Client certificate. |
| const char * | p_client_private_key | String representing Client Private Key. |
| uint32_t | private_key_size | Size associated with Client Private Key. |

### ◆ http_onchip_da16xxx_instance_ctrl_t

| struct http_onchip_da16xxx_instance_ctrl_t | | |
|---|---|---|
| HTTP_ONCHIP_DA16XXX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint32_t | open | Flag to indicate if HTTP has been opened. |
| http_onchip_da16xxx_ssl_enable_t | enable | Flag to indicate if HTTP server is secure. |
| http_onchip_da16xxx_cfg_t | p_cfg | Pointer to p_cfg for HTTP. |

| | | |
|---|---|---|
| const * | | |

## Enumeration Type Documentation

### ◆ http_onchip_da16xxx_method_t

| enum http_onchip_da16xxx_method_t | |
|---|---|
| HTTP Request Method | |
| Enumerator | |
| HTTP_ONCHIP_DA16XXX_GET | Value converted to "get" string. |
| HTTP_ONCHIP_DA16XXX_POST | Value converted to "post" string. |
| HTTP_ONCHIP_DA16XXX_PUT | Value converted to "put" string. |

### ◆ http_onchip_da16xxx_tls_auth_t

| enum http_onchip_da16xxx_tls_auth_t | |
|---|---|
| HTTP TLS Authentication Level | |
| Enumerator | |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_NONE | TLS verification is not used. |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_OPTIONAL | TLS verification is optional. |
| HTTP_ONCHIP_DA16XXX_TLS_VERIFY_REQUIRED | TLS verification is required. |

### ◆ http_onchip_da16xxx_ssl_enable_t

| enum http_onchip_da16xxx_ssl_enable_t | |
|---|---|
| HTTP SSL Enable | |
| Enumerator | |
| HTTP_ONCHIP_DA16XXX_SSL_DISABLE | SSL is disabled. |
| HTTP_ONCHIP_DA16XXX_SSL_ENABLE | SSL is enabled. |

## Function Documentation

### ◆ RM_HTTP_DA16XXX_Open()

fsp_err_t RM_HTTP_DA16XXX_Open ( http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_cfg_t const *const *p_cfg* )

Initialize the DA16XXX on-chip HTTP Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
| [in] | p_cfg | Pointer to HTTP Client configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |

### ◆ RM_HTTP_DA16XXX_Send()

fsp_err_t RM_HTTP_DA16XXX_Send ( http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_request_t * *p_request*, http_onchip_da16xxx_buffer_t * *p_buffer* )

Send the HTTP request with the configured buffers.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
| [in] | p_request | Pointer to HTTP request control structure. |
| [in] | p_buffer | Pointer to HTTP user buffer struct for request and response. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large. |
| FSP_ERR_INVALID_DATA | Data was not received correctly. |

### ◆ RM_HTTP_DA16XXX_Start()

fsp_err_t RM_HTTP_DA16XXX_Start ( http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_ssl_enable_t *enable* )

Start the HTTP server.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |
| [in] | enable | Enum value to enable or disable SSL. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_INVALID_ARGUMENT | SSl enable is either null or incorrect. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ RM_HTTP_DA16XXX_Stop()

fsp_err_t RM_HTTP_DA16XXX_Stop ( http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Start the HTTP server.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |
| FSP_ERR_INVALID_ARGUMENT | SSl enable is either null or incorrect. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ RM_HTTP_DA16XXX_Close()

fsp_err_t RM_HTTP_DA16XXX_Close ( http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX HTTP Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to HTTP Client instance control structure. |

**Return values**

| | |
|---|---|
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | Parameter checking was unsuccessful. |

### Detailed Description

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

# Overview

This Middleware module supplies an implementation for the MQTT Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX MQTT module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Features

The MQTT Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to an MQTT broker via hostname, port, and user credentials
- Supports unsecure and secure connection via TLS encryption
- Supports the MQTT subscribe/publish model for multiple topics
- Supports other optional configurations such as MQTT v3.1.1, Quality-of-service (QoS) level, TLS cipher suites, and ALPNs

# Configuration

### Build Time Configurations for rm_mqtt_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_mqtt_onchip_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Size of MQTT RX buffer | Must be an integer greater than 0 | 512 | Size in bytes of the MQTT buffer used for receiving subscribed data. Must be an integer greater than 0. |
| Size of MQTT TX buffer | Must be an integer greater than 200 and less than 2064 | 512 | Size in bytes of the MQTT buffer used for sending commands and publishing data. Maximum publishing |

length is 2063 bytes

### Configurations for Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx)

This module can be added to the Stacks tab via New Stack > Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Certificates | | | |
| MQTT Certificates Header File | Must be a valid C symbol | | Name of header file that will contain certificates (macros). User must create header file if this field is populated. |
| Root CA | Must be a valid C symbol | ROOT_CA | Links to user-defined macro of the same name for Root CA which user must define in application header. |
| Client Certificate | Must be a valid C symbol | CLIENT_CERT | Links to user-defined macro of the same name for client certificate which user must define in application header. |
| Private Key | Must be a valid C symbol | PRIVATE_KEY | Links to user-defined macro of the same name for private key which user must define in application header. |
| ALPN | | | |
| ALPN 1 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| ALPN 2 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| ALPN 3 | Manual Entry | | Select Application Layer Protocol Negotiations (ALPNs) |
| Interrupts | | | |
| Callback | Must be a valid C symbol | mqtt0_callback | A user callback function. This callback function must be provided. It is called from the MQTT Receive function to process |

| | | | |
|---|---|---|---|
| | | | subscribed MQTT messages. |
| Use MQTT protocol v3.1.1 | • Disabled<br>• Enabled | Enabled | |
| MQTT Receive Maximum Timeout (ms) | Timeout must be an integer greater than 0 and less than 65535 | 10 | Timeout for the MQTT Receive function to check the buffer for incoming MQTT messages in milliseconds. |
| MQTT Transit Maximum Timeout (ms) | Timeout must be an integer greater than 0 and less than 65535 | 10 | Timeout for publishing MQTT messages in milliseconds. |
| Clean Session | • Disabled<br>• Enabled | Enabled | |
| Keep Alive (s) | Must be an integer greater than 0 and less than 65535 | 60 | MQTT ping period to check if connection is still active. |
| Client Identifier | Manual Entry | | |
| Host Name (or IP address) | Manual Entry | | |
| MQTT Port | Must be an integer greater than 0 and less than 65535 | 8883 | |
| MQTT User Name | Must be a valid C symbol | | |
| MQTT Password | Must be a valid C symbol | | |
| Last Will Topic | Manual Entry | | Topic for MQTT Last Will message. |
| Last Will Message | Manual Entry | | Payload for MQTT Last Will message. |
| Server Name Indication (SNI) | Manual Entry | | |
| Last Will QoS | • 0<br>• 1<br>• 2 | 0 | Quality-of-Service for MQTT Last Will message. |
| TLS Cipher Suites | Refer to the RA Configuration tool for available options. | 0U | Select TLS Cipher Suites |

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Note: This module provides the basic configurations in the FSP Configurator required to connect to an MQTT broker such as credential information (user, password, client key, etc.), publish/subscribe

topics, and optional configurations as required. The user can then copy these configurations to a new structure if they want to connect to a new endpoint/make changes to the configurations dynamically.

### Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Clock Configuration

Refer to UART (r_sci_uart).

### Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

## Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the MQTT module where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB.
- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- If only using username and password, these fields can be left blank (default), and a header file does not need to be created

### Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an MQTT broker with TLS (unless buffer size settings are altered manually)
- For publish/subscribe topics, a separate QoS level cannot be set per topic - only one QoS level can be set which applies to all messages
- Currently the module only supports unsecured MQTT with username/password or secure MQTT/TLS with certificates (root CA, client certificate, and private key). The module does not accept username/password with certificates.

## Examples

### Basic Example

This is a basic example of minimal use of MQTT Middleware in an application.

```
void mqtt_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       mqtt_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = WIFI_PWD,
       .ucSSID                     = WIFI_SSID,
       .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
       .ucSSIDLength            = sizeof(WIFI_SSID),
       .xSecurity               = eWiFiSecurityWPA2,
    };
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Initialize the MQTT Client connection */
    mqtt_err = RM_MQTT_DA16XXX_Open(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
    assert(FSP_SUCCESS == mqtt_err);
 /* Subscribe to MQTT topics to be received */
    mqtt_err = RM_MQTT_DA16XXX_Subscribe(&g_rm_mqtt_onchip_da16xxx_instance,
subTopics, 1);
    assert(FSP_SUCCESS == mqtt_err);
 /* Connect to the MQTT Broker */
    mqtt_err = RM_MQTT_DA16XXX_Connect(&g_rm_mqtt_onchip_da16xxx_instance,
CONNECT_TIMEOUT);
    assert(FSP_SUCCESS == mqtt_err);
 /* Publish data to the MQTT Broker */
    mqtt_err = RM_MQTT_DA16XXX_Publish(&g_rm_mqtt_onchip_da16xxx_instance,
```

```
&pubTopics[0]);
    assert(FSP_SUCCESS == mqtt_err);
 /* Loop to receive data from the MQTT Broker */
 do
    {
 RM_MQTT_DA16XXX_Receive(&g_rm_mqtt_onchip_da16xxx_instance);
 R_BSP_SoftwareDelay(CONNECT_TIMEOUT, BSP_DELAY_UNITS_MILLISECONDS);
    } while (cb_flag == 0);
 /* Disconnect from the MQTT Broker */

| enum | mqtt_onchip_da16xxx_qos_t |
| enum | mqtt_onchip_da16xxx_tls_cipher_suites_t |

## Data Structure Documentation

### ◆ mqtt_onchip_da16xxx_sub_info_t

| struct mqtt_onchip_da16xxx_sub_info_t | | |
|---|---|---|
| MQTT SUBSCRIBE packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for subscription. |
| const char * | p_topic_filter | Topic filter to subscribe to. |
| uint16_t | topic_filter_length | Length of subscription topic filter. |

### ◆ mqtt_onchip_da16xxx_pub_info_t

| struct mqtt_onchip_da16xxx_pub_info_t | | |
|---|---|---|
| MQTT PUBLISH packet parameters | | |
| Data Fields | | |
| mqtt_onchip_da16xxx_qos_t | qos | Quality of Service for |

| | | |
|---|---|---|
| | | subscription. |
| const char * | p_topic_name | Topic name on which the message is published. |
| uint16_t | topic_name_Length | Length of topic name. |
| const char * | p_payload | Message payload. |
| uint32_t | payload_length | Message payload length. |

### ◆ mqtt_onchip_da16xxx_callback_args_t

| struct mqtt_onchip_da16xxx_callback_args_t | | |
|---|---|---|
| MQTT Packet info structure to be passed to user callback | | |
| Data Fields | | |
| uint8_t * | p_data | Payload received from subscribed MQTT topic. |
| const char * | p_topic | Topic to which the message payload belongs to. |
| uint32_t | data_length | Length of the MQTT payload. |
| void * | p_context | Placeholder for user data. |

### ◆ mqtt_onchip_da16xxx_cfg_t

| struct mqtt_onchip_da16xxx_cfg_t | |
|---|---|
| MQTT Configuration | |
| **Data Fields** | |
| const uint8_t | use_mqtt_v311 |
| | Flag to use MQTT v3.1.1. |
| | |
| const uint16_t | rx_timeout |
| | MQTT Rx timeout in milliseconds. |
| | |
| const uint16_t | tx_timeout |
| | MQTT Tx timeout in milliseconds. |
| | |
| void(* | p_callback )(mqtt_onchip_da16xxx_callback_args_t *p_args) |
| | Location of user callback. |
| | |

| | |
|---|---|
| void * | p_context |
| | Placeholder for user data. Passed to the user callback in mqtt_onchip_da16xxx_callback_args_t. |
| | |
| uint8_t | clean_session |
| | Whether to establish a new, clean session or resume a previous session. |
| | |
| uint8_t | alpn_count |
| | ALPN Protocols count. Max value is 3. |
| | |
| const char * | p_alpns [MQTT_ONCHIP_DA16XXX_MAX_ALPN] |
| | ALPN Protocols. |
| | |
| uint8_t | tls_cipher_count |
| | TLS Cipher suites count. Max value is 17. |
| | |
| uint16_t | keep_alive_seconds |
| | MQTT keep alive period. |
| | |
| const char * | p_client_identifier |
| | MQTT Client identifier. Must be unique per client. |
| | |
| uint16_t | client_identifier_length |
| | Length of the client identifier. |
| | |
| const char * | p_host_name |
| | MQTT endpoint host name. |
| | |

| | |
|---|---|
| uint16_t | mqtt_port |
| | MQTT Port number. |
| | |
| const char * | p_mqtt_user_name |
| | MQTT user name. Set to NULL if not used. |
| | |
| uint16_t | user_name_length |
| | Length of MQTT user name. Set to 0 if not used. |
| | |
| const char * | p_mqtt_password |
| | MQTT password. Set to NULL if not used. |
| | |
| uint16_t | password_length |
| | Length of MQTT password. Set to 0 if not used. |
| | |
| const char * | p_root_ca |
| | String representing a trusted server root certificate. |
| | |
| uint32_t | root_ca_size |
| | Size associated with root CA Certificate. |
| | |
| const char * | p_client_cert |
| | String representing a Client certificate. |
| | |
| uint32_t | client_cert_size |
| | Size associated with Client certificate. |
| | |
| const char * | p_client_private_key |

| | |
|---|---|
| | String representing Client Private Key. |
| | |
| uint32_t | private_key_size |
| | Size associated with Client Private Key. |
| | |
| const char * | p_will_topic |
| | String representing Will Topic. |
| | |
| const char * | p_will_msg |
| | String representing Will Message. |
| | |
| const char * | p_sni_name |
| | Server Name Indication. |
| | |
| mqtt_onchip_da16xxx_qos_t | will_qos_level |
| | Will Topic QoS level. |
| | |
| mqtt_onchip_da16xxx_tls_cipher_suites_t | p_tls_cipher_suites [MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT] |
| | TLS Cipher suites supported. |
| | |

### ◆ mqtt_onchip_da16xxx_instance_ctrl_t

| struct mqtt_onchip_da16xxx_instance_ctrl_t | | |
|---|---|---|
| MQTT_ONCHIP_DA16XXX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint8_t | cmd_tx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_TX_BUF_SIZE] | Command send buffer. |
| uint8_t | cmd_rx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_RX_BUF_SIZE] | Command receive buffer. |

| | | |
|---|---|---|
| uint32_t | open | Flag to indicate if MQTT has been opened. |
| bool | is_mqtt_connected | Flag to track MQTT connection status. |
| mqtt_onchip_da16xxx_cfg_t const * | p_cfg | Pointer to p_cfg for MQTT. |

## Enumeration Type Documentation

### ◆ mqtt_onchip_da16xxx_qos_t

| enum mqtt_onchip_da16xxx_qos_t | |
|---|---|
| MQTT Quality-of-service (QoS) levels | |
| Enumerator | |
| MQTT_ONCHIP_DA16XXX_QOS_0 | Delivery at most once. |
| MQTT_ONCHIP_DA16XXX_QOS_1 | Delivery at least once. |
| MQTT_ONCHIP_DA16XXX_QOS_2 | Delivery exactly once. |

### ◆ mqtt_onchip_da16xxx_tls_cipher_suites_t

| enum mqtt_onchip_da16xxx_tls_cipher_suites_t | |
|---|---|
| MQTT TLS Cipher Suites | |
| Enumerator | |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA | TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA protocol. |
| TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 | TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 | TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 protocol. |
| TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 | TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 protocol. |
| TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 | TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA | TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA | TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 | TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 | TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 | TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 protocol. |
| TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 | TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 protocol. |

## Function Documentation

### ◆ RM_MQTT_DA16XXX_Open()

fsp_err_t RM_MQTT_DA16XXX_Open ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_cfg_t const *const *p_cfg* )

Initialize the DA16XXX on-chip MQTT Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_cfg | Pointer to MQTT Client configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_cfg instance is NULL. |
| FSP_ERR_INVALID_ARGUMENT | Data size is too large or NULL. |
| FSP_ERR_ALREADY_OPEN | The instance has already been opened. |

### ◆ RM_MQTT_DA16XXX_Disconnect()

fsp_err_t RM_MQTT_DA16XXX_Disconnect ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Disconnect from DA16XXX MQTT Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl instance is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |

### ◆ RM_MQTT_DA16XXX_Connect()

fsp_err_t RM_MQTT_DA16XXX_Connect ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, uint32_t *timeout_ms* )

Configure and connect the DA16XXX MQTT Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | timeout_ms | Timeout in milliseconds. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_IN_USE | The MQTT client is already connected. |
| FSP_ERR_INVALID_DATA | Response does not contain Connect status. |

### ◆ RM_MQTT_DA16XXX_Publish()

fsp_err_t RM_MQTT_DA16XXX_Publish ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_pub_info_t *const *p_pub_info* )

Publish a message for a given MQTT topic.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_pub_info | MQTT Publish packet parameters. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_pub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

### ◆ RM_MQTT_DA16XXX_Subscribe()

fsp_err_t RM_MQTT_DA16XXX_Subscribe ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info*, size_t *subscription_count* )

Subscribe to DA16XXX MQTT topics.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |
| [in] | subscription_count | Number of topics to subscribe to. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL or subscription_count is 0. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

### ◆ RM_MQTT_DA16XXX_UnSubscribe()

fsp_err_t RM_MQTT_DA16XXX_UnSubscribe ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info* )

Unsubscribe from DA16XXX MQTT topics.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |
| [in] | p_sub_info | List of MQTT subscription info. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_ctrl, p_sub_info is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Data size is too large. |

### ◆ RM_MQTT_DA16XXX_Receive()

fsp_err_t RM_MQTT_DA16XXX_Receive ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Receive data subscribed to on DA16XXX MQTT Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The p_ctrl, p_textstring, p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened or the client is not connected. |
| FSP_ERR_INVALID_DATA | Receive function did not receive valid publish data. |

### ◆ RM_MQTT_DA16XXX_Close()

fsp_err_t RM_MQTT_DA16XXX_Close ( mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX MQTT Client service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to MQTT Client instance control structure. |

**Return values**

| | |
|---|---|
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The p_ctrl, p_textstring, p_ip_addr is NULL. |

## 5.2.12.29 PTP (r_ptp)

Modules » Networking

**Functions**

### Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.

# Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

### Features

- Ordinary clock
  - Master mode
  - Slave mode
- Peer-to-peer
- End-to-end
- Frame fromats
  - Ethernet II frames
  - IEEE802.3 + LLC + SNAP frames
  - IPv4 + UDP
- Clock correction modes
  - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
  - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

# Configuration

### Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Networking > PTP (r_ptp)**

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Clock Properties | | | |
| Priority 1 | Value must in the range [0,255]. | 128 | Priority1 field advertised in generated announce packets. |
| Class | Value must in the range [0,255]. | 248 | Class field advertised in generated announce packets. |
| Accuracy | Value must in the range [0,255]. | 0xFE | Accuracy field advertised in generated announce packets. |
| Variance | Value must in the range [0,65535]. | 0xFFFF | Variance field advertised in generated announce packets. |
| Priority 2 | Value must in the range [0,255]. | 128 | Priority2 field advertised in generated announce packets. |
| Time Source | Value must in the range [0,255]. | 160 | Time Source field advertised in generated announce packets. |
| Ethernet | | | |
| Multicast Filter MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC. |
| Primary Destination MAC address | Must be a valid MAC address | 01:1B:19:00:00:00 | The destination MAC address for primary PTP messages. |
| PDelay Destination MAC address | Must be a valid MAC address | 01:80:C2:00:00:0E | The destination MAC address for PDelay messages. |

| | | | |
|---|---|---|---|
| IP | | | |
| Primary Destination IP address | Must be a valid IP address | 224.0.1.129 | The destination IPv4 address for primary messages. |
| PDelay Destination IP address | Must be a valid IP address | 224.0.0.107 | The destination IPv4 address for PDelay messages. |
| Event Message TOS | Value must in the range [0,255]. | 0 | The IP packet TOS for event messages. |
| General Message TOS | Value must in the range [0,255]. | 0 | The IP packet TOS for general messages. |
| Primary Message TTL | Value must in the range [0,255]. | 1 | The IP packet TTL for primary messages. |
| PDelay Message TTL | Value must in the range [0,255]. | 1 | The IP packet TTL for p_delay messages. |
| Event Port | Value must in the range [0,65535]. | 319 | The UDP port for event messages. |
| General Port | Value must in the range [0,65535]. | 320 | The UDP port for general messages. |
| Synchronization Detection | | | |
| Threshold (Nanoseconds) | Value must be greater than 0. | 1000000 | The minimum offsetFromMaster value required in order to synchronize with the master clock. |
| Count | Value must in the range [0,15]. | 5 | The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock. |
| Synchronization Lost Detection | | | |
| Threshold (Nanoseconds) | Value must be greater than 0. | 10000000 | The minimum offsetFromMaster value required in order to lose synchronization with the master clock. |
| Count | Value must in the range [0,15]. | 5 | The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master. |

| | | | |
|---|---|---|---|
| Interrupts | | | |
| Callback | Name must be a valid C symbol | ptp0_user_callback | Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs. |
| MINT Interrupt priority | MCU Specific Options | | Select the EPTPC MINT interrupt priority. |
| Pulse Timer Interrupt priority | MCU Specific Options | | Select the EPTPC IPLS priority. |
| Name | Name must be a valid C symbol | g_ptp0 | Module name. |
| Ethernet PHY Interface Type | • MII<br>• RMII | RMII | The interface type used to communicate with the Ethernet PHY. |
| Frame Filter | • Extended Promiscuous Mode<br>• Unicast and Multicast<br>• Unicast and Multicast Filtered<br>• Unicast | Unicast | Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC. |
| Frame Format | • Ethernet II<br>• Ethernet II \| IPv4 \| UDP<br>• IEEE802.3 \| LLC \| SNAP<br>• IEEE802.3 \| LLC \| SNAP \| IPv4 \| UDP | Ethernet II | The format of the frames that encapsulate the PTP messages. |
| Clock Domain | Value must in the range [0,255]. | 0 | The PTP clock will only respond to clocks in its domain. |
| Clock Domain Filter | • Enable<br>• Disable | Enable | Filter out PTP messages from other clock domains. |
| Buffer Size | Value must in the range [64,1536]. | 1536 | The maximum Ethernet packet size that can be transmitted or received by the application from the EDMAC. |
| Number of transmit buffers | Value must in the range [1,16]. | 4 | The number of transmit buffers in the packet queue. |
| Number of receive | Value must in the | 4 | The number of receive |

| | | | |
|---|---|---|---|
| buffers | range [1,16]. | | buffers in the packet queue. |
| Announce message interval. | MCU Specific Options | | The period of time between generated announce messages. |
| Sync message interval. | MCU Specific Options | | The period of time between generated sync messages. |
| Delay_req message interval. | MCU Specific Options | | The period of time between generated delay_req messages. |
| Message timeout | Value must be greater than 0. | 4000 | The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message. |
| Clock Source | • PCLKA / 1<br>• PCLKA / 2<br>• PCLKA / 3<br>• PCLKA / 4<br>• PCLKA / 5<br>• PCLKA / 6<br>• REF50CK0 | PCLKA / 6 | The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz. |
| Clock Correction Mode | • Clock Correction Mode 1<br>• Clock Correction Mode 2 | Clock Correction Mode 1 | Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock. |
| Gradient Worst10 Interval | Value must in the range [0,255]. | 32 | The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2). |

### Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

### Pin Configuration

The PTP module requires the Ethernet (r_ether) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

# Usage Notes

### PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management
- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

| State | Generated Messages | Processed Messages | Received Messages |
|---|---|---|---|
| Disabled | N/A | N/A | N/A |
| Passive | N/A | N/A | Announce, Signaling, Management |
| E2E/P2P Slave | Delay_req/(PDelay_req, PDelay_resp) | Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp) | Announce, Signaling, Management |
| E2E/P2P Master | Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp) | delay_req/(PDelay_req, PDelay_resp) | Announce, Signaling, Management |

### Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

### ELC Events

Pulse timers may be configured to generate the following ELC events:

- EPTPC_TIMERn_RISE - Generated on the rising edge of pulse timer channel n[1].
- EPTPC_TIMERn_FALL - Generated on the falling edge of pulse timer channel n[1].

*Note*

*1. n = [0,5] corresponds to the channel of the pulse timer.*

### MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

### IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

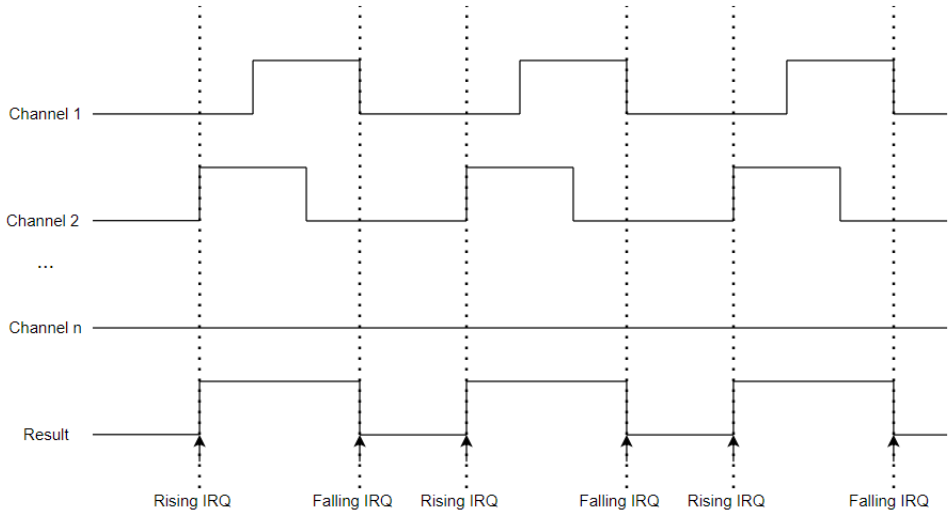

Figure 326: IPLS IRQ Generation

### Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by Ethernet (r_ether). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by Ethernet (r_ether).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by Ethernet (r_ether).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by Ethernet (r_ether). All multicast frames that match ptp_synfp_cfg_t::p_multicast_addr_filter are received by Ethernet (r_ether).
- Unicast - Only Unicast frames destined for the PTP are received by Ethernet (r_ether).

### Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize Ethernet (r_ether). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)), however this means the application must execute the Ethernet (r_ether) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. This is to guarantee that PTP register accesses are atomic.
- When IEEE802.3 | LLC | SNAP | IP | UDP or IEEE802.3 | LLC | SNAP Frame Format is selected, the PTP peripheral sets the OUI field in the SNAP frame to the first 3 bytes of the **MAC address** configured in the Ethernet (r_ether) module's configuration property. In order for the PID field of SNAP to be interpreted as EtherType, the OUI field should be set to '0'.

# Examples

### Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
 /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (!g_first_announce_message_received && --timeout)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
 /* When a master clock is found, change to the slave state to start synchronizing
```

```
 * the local clock to the master clock. */
   err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
   assert(FSP_SUCCESS == err);
/* Wait for local clock to be synchronized with the master clock. */
   timeout = EXAMPLE_TIMEOUT;
while (!g_sync_acquired && --timeout)
   {
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
   }
   assert(0U != timeout);
/* The local clock is now synchronized with the grand master clock. */
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
   {
case PTP_EVENT_SYNC_ACQUIRED:
     {
/* The offsetFromMaster value is now within the configured threshold to be
 * synchronized with the master clock.
 */
           g_sync_acquired = true;
break;
     }
case PTP_EVENT_MESSAGE_RECEIVED:
     {
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
     {
case PTP_MESSAGE_TYPE_ANNOUNCE:
     {
                int8_t comparison = 0;
if (!g_first_announce_message_received)
```

```
     {
 /* If this is the first announce packet, immediately switch to this master clock. */
                       comparison = 1;
                       g_first_announce_message_received = true;
     }
 else
     {
 /*
  * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
  * packet is better than the current master clock.
  */
 fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                                        p_args->p_message,
                                                        &comparison);
     assert(FSP_SUCCESS == err);
     }
 if (1 == comparison)
     {
 /* Save the message as the new master announce message. */
                       g_current_master_announce_message = *p_args->p_message;
 /* Set the master clock ID and sourcePortID in the PTP instance so that it
  * synchronizes with the new best master clock.
  */
 fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                                          g_current_master_annou
nce_message.header.clock_id,
                                                          g_current_master_annou
nce_message.header.source_port_id);
     assert(FSP_SUCCESS == err);
     }
 break;
     }
 default:
```

```
     {
 break;
     }
     }
 break;
     }
 default:
     {
 break;
     }
   }
}
```

### Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Get the current time from an external time source (Eg. RTC). */
 ptp_time_t current_time;
    get_current_time_example(&current_time);
 /* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
```

```
 /* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
    assert(FSP_SUCCESS == err);
 /* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
 ptp_message_flags_t flags;
    flags.value = 0;
    flags.value_b.currentUtcOffsetValid = 1;
    flags.value_b.ptpTimescale          = 1;
    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);
 /*
  * The master clock is now operational and will automatically generate announce and
sync messages
  * as well as respond to delay_req messages.
  */
}
```

### Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
```

```
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)
static uint32_t g_transmit_complete = 0U;
void send_message_example (void)
{
 static ptp_message_t message;
 static uint8_t       p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
 /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
 /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
 sizeof(ptp_message_management_t) +
 sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
 /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id         = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops          = 1;
    message.management.action                = PTP_MANAGEMENT_ACTION_GET;
 /*
  * Fill in TLV data (Note that TLV data is big endian).
  *
  * Type (Management)
  */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
 /* Length */
    p_tlv_data[2] = 0;
```

```
    p_tlv_data[3] = 2;
 /* Management ID (Clock Description) */
    p_tlv_data[4] = 0;
    p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
 /* Send the message. */
 fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
    assert(FSP_SUCCESS == err);
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (0U == g_transmit_complete && --timeout)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
    }
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
     {
           g_transmit_complete = 1U;
 break;
     }
 case PTP_EVENT_MESSAGE_RECEIVED:
     {
 switch (p_args->p_message->header.message_type)
     {
 case PTP_MESSAGE_TYPE_MANAGEMENT:
     {
 /* Handle the response message. */
 break;
     }
 default:
```

```
      {
 break;
      }
      }
      }
 default:
      {
 break;
      }
    }
}
```

### Data Structures

| | |
|---|---|
| struct | ptp_instance_ctrl_t |

## Data Structure Documentation

### ◆ ptp_instance_ctrl_t

| struct ptp_instance_ctrl_t | | |
|---|---|---|
| PTP instance control block. | | |
| Data Fields | | |
| uint32_t | open | Marks if the instance has been opened. |
| uint32_t | tx_buffer_write_index | Index into the descriptor list to write the next packet. |
| uint32_t | tx_buffer_complete_index | Index into the descriptor list of the last transmitted packet. |
| uint32_t | rx_buffer_index | Index into the descriptor of the last received packet. |
| uint32_t | tslatr | Keep track of whether tslatr was set. |
| ptp_cfg_t const * | p_cfg | Pointer to the configuration structure. |

## Function Documentation

### ◆ R_PTP_Open()

fsp_err_t R_PTP_Open ( ptp_ctrl_t *const *p_ctrl*, ptp_cfg_t const *const *p_cfg* )

This function initializes PTP. Implements ptp_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other PTP Interface functions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The instance has been successfully configured. |
| FSP_ERR_ALREADY_OPEN | Instance was already initialized. |
| FSP_ERR_NOT_OPEN | The EDMAC instance was not opened correctly. |
| FSP_ERR_ASSERTION | An invalid argument was given in the configuration structure. |

### ◆ R_PTP_MacAddrSet()

fsp_err_t R_PTP_MacAddrSet ( ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr* )

This function sets the MAC address for the PTP instance. Implements ptp_api_t::macAddrSet.

***Note***

*This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The MAC address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

### ◆ R_PTP_IpAddrSet()

fsp_err_t R_PTP_IpAddrSet ( ptp_ctrl_t *const *p_ctrl*, uint32_t *ip_addr* )

This function sets the IP address for the PTP instance. Implements ptp_api_t::ipAddrSet.

***Note***

*This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The IP address has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL. |
| FSP_ERR_INVALID_MODE | The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state. |

### ◆ R_PTP_LocalClockIdSet()

fsp_err_t R_PTP_LocalClockIdSet ( ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id* )

This function sets the local clock ID for the PTP instance. Implements ptp_api_t::localClockIdSet.

***Note***

*This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.*
*Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The local clock ID has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |
| FSP_ERR_INVALID_MODE | The instance is not in the correct state. |

### ◆ R_PTP_MasterClockIdSet()

fsp_err_t R_PTP_MasterClockIdSet ( ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*, uint16_t *port_id* )

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements ptp_api_t::masterClockIdSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

### ◆ R_PTP_MessageFlagsSet()

fsp_err_t R_PTP_MessageFlagsSet ( ptp_ctrl_t *const *p_ctrl*, ptp_message_type_t *message_type*, ptp_message_flags_t *flags* )

This function sets the flags field for the given message type. Implements ptp_api_t::messageFlagsSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The master clock ID and port ID have been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_CurrentUtcOffsetSet()

fsp_err_t R_PTP_CurrentUtcOffsetSet ( ptp_ctrl_t *const *p_ctrl*, uint16_t *offset* )

This function sets the currentUtcOffset value in announce messages. ptp_api_t::currentUtcOffsetSet .

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The currentUtcOffset has been updated. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_PortStateSet()

fsp_err_t R_PTP_PortStateSet ( ptp_ctrl_t *const *p_ctrl*, uint32_t *state* )

This function changes the current state of the PTP instance. Implements ptp_api_t::portStateSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The instance will transition to the new state. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

### ◆ R_PTP_MessageSend()

fsp_err_t R_PTP_MessageSend ( ptp_ctrl_t *const *p_ctrl*, ptp_message_t const *const *p_message*, uint8_t const *const *p_tlv_data*, uint16_t *tlv_data_size* )

This function sends a PTP message. ptp_api_t::messageSend.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The packet has been written to the transmit descriptor. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL | There is no space for the packet in the transmit queue. |

### ◆ R_PTP_LocalClockValueSet()

fsp_err_t R_PTP_LocalClockValueSet ( ptp_ctrl_t *const *p_ctrl*, ptp_time_t const *const *p_time* )

This function sets the local clock value. Implements ptp_api_t::localClockValueSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The local clock value has been set. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_LocalClockValueGet()

fsp_err_t R_PTP_LocalClockValueGet ( ptp_ctrl_t *const *p_ctrl*, ptp_time_t *const *p_time* )

This function gets the local clock value. Implements ptp_api_t::localClockValueGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The local clock value has been written in p_time. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL |

### ◆ R_PTP_PulseTimerCommonConfig()

fsp_err_t R_PTP_PulseTimerCommonConfig ( ptp_ctrl_t *const *p_ctrl*, ptp_pulse_timer_common_cfg_t *const *p_timer_cfg* )

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements ptp_api_t::pulseTimerCommonConfig.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_PulseTimerEnable()

fsp_err_t R_PTP_PulseTimerEnable ( ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*, ptp_pulse_timer_cfg_t *const *p_timer_cfg* )

This function enables a pulse timer channel. Implements ptp_api_t::pulseTimerEnable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The pulse timer has been enabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |
| FSP_ERR_INVALID_ARGUMENT | The start time must be set to a value that is later than current time. |

### ◆ R_PTP_PulseTimerDisable()

fsp_err_t R_PTP_PulseTimerDisable ( ptp_ctrl_t *const *p_ctrl*, uint32_t *channel* )

This function disables a pulse timer channel. Implements ptp_api_t::pulseTimerDisable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_Close()

fsp_err_t R_PTP_Close ( ptp_ctrl_t *const *p_ctrl*)

Disable the PTP instance. Implements ptp_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The pulse timer has been disabled. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | An argument was NULL or invalid. |

### ◆ R_PTP_BestMasterClock()

fsp_err_t R_PTP_BestMasterClock ( ptp_message_t const *const *p_announce1*, ptp_message_t const *const *p_announce2*, int8_t *const *p_comparison* )

This function compares two clocks to determine which one is the better master clock.

p_comparison:

- Set to -1 if p_announce1 defines the best master clock.
- Set to 1 if p_announce2 defines the best master clock.
- Set to 0 if p_announce1 and p_announce2 define the same clock.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The valid result has been written to p_use_announce_clock. |
| FSP_ERR_ASSERTION | An argument was NULL. |

## 5.2.12.30 SPP BLE Abstraction (rm_ble_abs_spp)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

# Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

### Features

The Bluetooth Low Energy (BLE) Abstraction module with SPP supports the following features:

- Common functionality
  - Open/Close the BLE protocol stack.
  - Setting Transmit Power Level.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
  - SPI Interface
  - UART Interface

### Target Devices

The BLE Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

# Configuration

### Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enable<br>• Disable | Default (BSP) | Specify whether to include code for API parameter checking. |
| Reset Port | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin port for the MCU. |
| Reset Pin | Refer to the RA Configuration tool for available options. | 10 | Specify the module reset pin for the MCU. |
| UART/SPI Select Port (PB5) | Refer to the RA Configuration tool for available options. | 03 | Specify the module PB5 (UART/SPI select) port for the MCU. |
| UART/SPI Select Pin (PB5) | Refer to the RA Configuration tool for available options. | 11 | Specify the module PB5 (UART/SPI select) pin for the MCU. |
| SPI Software SSL Port | Refer to the RA Configuration tool for available options. | Disabled | Specify the port to use for controlling SSL using the ioport module. |
| SPI Software SSL Pin | Refer to the RA Configuration tool for available options. | Disabled | Specify the pin to use for controlling SSL using the ioport module. |
| Transmit Power Level (in dBm) | Refer to the RA Configuration tool for available options. | 4.57 | Specify the module transmit power in dBm. |

**Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)**

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_ble_abs0 | Module name. |
| GAP callback | Name must be a valid C symbol | gap_cb | If QE is used, set to "gap_cb". |
| Vendor specific callback | Name must be a valid C symbol | vs_cb | If QE is used, set to "vs_cb". |
| GATT server callback parameter | Name must be a valid C symbol | gs_abs_gatts_cb_param | If QE is used, set to "gs _abs_gattc_cb_param". |
| GATT server callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

| | | | |
|---|---|---|---|
| GATT client callback parameter | Name must be a valid C symbol | gs_abs_gattc_cb_param | Set GATT client callback parameter. If QE is used, set to "gs_abs_gattc_cb_param". |
| GATT client callback number | Must be a valid number | 2 | The number of GATT Server callback functions. |

### Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- UART Interface : RX/TX Pins
- SPI Interface : MOSI/MISO/SCK/SSL Pins
  - Data Ready Pin : When the SPI Interface is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
  - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware[1].

*Note*

*1. The software SSL Pin is required when using the SPI (r_sci_spi) driver.*
*2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.*

# Usage Notes

### Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_SetEvent
- R_BLE_GAP_Init
- R_BLE_GAP_StopAdv
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_SetAdvParam
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_SetDbInst
- R_BLE_GATTS_Init
- R_BLE_GATTS_GetAttr

- R_BLE_GATTS_SetAttr
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTC_Init
- R_BLE_GATTC_RegisterCb
- R_BLE_VS_SetBdAddr
- R_BLE_VS_SetTxPower

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

# Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

**Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.**

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

# Examples

### BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
```

```
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
     {
           g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_ON:
     {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
           g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
           g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
      }
 case BLE_GAP_EVENT_ADV_OFF:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
      }
 case BLE_GAP_EVENT_CONN_IND:
     {
           g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
      }
     {
 /* Do nothing. */
 break;
        }
 default:
 break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)

### BLE_ABS_SPP Firmware Update Example

This is a basic example of performing a firmware update.

```
void ble_abs_firmware_update_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
    err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
    assert(FSP_SUCCESS == err);
 /* Complete the firmware update (This function blocks until the procedure has
completed). */
    ble_status_t status = R_BLE_VS_UpdateModuleFirmware(g_firmware_image,
g_firmware_image_size);
    assert(BLE_SUCCESS == status);
```

```
 /* Close the module. */
    err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
    assert(FSP_SUCCESS == err);
 /* The RYZ012 is now using the updated firmware. Call open to re-initialize the
module using the new firmware. */
}
```

### BLE_ABS_SPP Firmware Update Asynchronous Example

This is an example of performing a firmware update using the asynchronous API.

```
volatile uint32_t g_firmware_update_complete = 0;
void vs_cb (uint16_t type, ble_status_t result, st_ble_vs_evt_data_t * p_data)
{
 FSP_PARAMETER_NOT_USED(p_data);
 if (BLE_SUCCESS != result)
    {
 /* Stop the firmware update process if there was an error. */
 return;
    }
 static uint16_t index = 0;
 switch (type)
    {
 /* The response to the START_FW_UPDATE command was received (Fall through to send
the next data frame). */
 case BLE_VS_EVENT_START_FW_UPDATE_COMP:
 /* The response to the SEND_FW_DATA command was received. */
 case BLE_VS_EVENT_SEND_FW_DATA_COMP:
     {
 if (BLE_VS_EVENT_START_FW_UPDATE_COMP == index)
     {
                index = 0;
        }
           uint16_t length          = 0;
           uint8_t * p_firmware_data = NULL;
```

```
 /*
  * Get next firmware data frame.
  * Note that app_data_frame_get() is an application defined function.
  */
            app_data_frame_get(index, &p_firmware_data, &length);
 if (length > 0)
      {
 /* Send the firmware data frame. */
 R_BLE_VS_SendFirmwareData(index, length, p_firmware_data);
                index++;
         }
 else
      {
 /* The previously completed data frame was the last data frame. Send the firmware
update end command. */
 R_BLE_VS_EndFirmwareUpdate(index - 1);
         }
 break;
       }
 /* The response to the END_FW_UPDATE command was received. */
 case BLE_VS_EVENT_END_FW_UPDATE_COMP:
      {
 /* After the BLE_VS_EVENT_END_FW_UPDATE_COMP command is sent, send the restart
command. */
 R_BLE_VS_RestartModule();
 break;
       }
 /* The module has finished restarting and the MODULE_READY event has been received.
*/
 case BLE_VS_EVENT_MODULE_READY_COMP:
      {
 /* Firmware update process has completed. */
            g_firmware_update_complete = 1;
 break;
```

```
      }
 default:
     {
 break;
      }
   }
}
void ble_abs_firmware_update_async_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
   assert(FSP_SUCCESS == err);
 /* Start the firmware update process. */
   ble_status_t status = R_BLE_VS_StartFirmwareUpdate();
   assert(BLE_SUCCESS == status);
 /* main loop */
 while (0 == g_firmware_update_complete)
   {
 /* Process BLE Event */
 R_BLE_Execute();
   }
 /* Close the module. */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
   assert(FSP_SUCCESS == err);
 /* The RYZ012 is now using the updated firmware. Call open to re-initialize the
module using the new firmware. */
}
```

### Detailed Description

Middleware to implement a generic communications interface over LWIP. This module implements the Communications Middleware Interface.

# Overview

The RM_COMMS_SOCKET module implements COMMS API for LWIP interface.

### Features

The implementation of the LWIP communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS
- Socket connection detection mode

# Configuration

### Build Time Configurations for rm_comms_socket

The following build time configurations are defined in fsp_cfg/rm_comms_socket_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Networking > Socket Communication Device (rm_comms_socket)

This module can be added to the Stacks tab via New Stack > Networking > Socket Communication Device (rm_comms_socket).

| Configuration | Options | Default | Description |
|---|---|---|---|
| RTOS | | | |
| Recursive Write Mutex | • Do Not Use<br>• Use | Use | Lock device for writing in using RTOS. |
| Recursive Read Mutex | • Do Not Use<br>• Use | Use | Lock device for reading in using RTOS. |
| Mutex Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for recursive mutex operation in using RTOS. |
| Write Semaphore | • Do Not Use<br>• Use | Use | Block writing in using RTOS. |
| Read Semaphore | • Do Not Use<br>• Use | Use | Block reading in using RTOS. |
| Semaphore Timeout | Value must be a non-negative integer | 0xFFFFFFFF | Timeout for semaphore operation in using RTOS. |
| Name | Name must be a valid C symbol | g_comms_socket0 | Module name. |
| Socket type | TCP | TCP | |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. |
| Server Port | Value must be a non-negative integer | 9010 | TCP port ranges from 1 to 63556 |

# Usage Notes

### Limitations

- If DHCP is enabled, user have to find board's IP address via DHCP server, mDNS, etc.
- UDP socket is not supported.
- RM_COMMS_SOCKET_WriteRead API is not implemented.

## Examples

### Basic Example

This is a basic example of minimal use of LWIP communications implementation in an application.

```
void rm_comms_socket_example () {
 /* This step: Initialize pin setting (of MCU device) */
 /* TODO code */
    rm_comms_socket_extended_cfg_t * p_extend = (rm_comms_socket_extended_cfg_t *)
g_comms_socket_port_cfg.p_extend;
 struct netif comms_socket_netif;
 /* Following code are lwIP setup process. */
    lwip_init();
 /* Initialize netif before open rm_comms_socket. */
    netif_add(&comms_socket_netif,
              RM_COMMS_SOCKET_EXAMPLE_IP_ADDR,
              RM_COMMS_SOCKET_EXAMPLE_NETMASK,
              RM_COMMS_SOCKET_EXAMPLE_GW,
              p_extend->p_lwip_ether,
 rm_lwip_ether_init,
              netif_input);
    netif_set_default(&comms_socket_netif);
    netif_set_up(&comms_socket_netif);
    netif_set_link_up(&comms_socket_netif);
 /* Init the rm_comms_socket */
 RM_COMMS_SOCKET_Open(&g_comms_socket_port_ctrl, &g_comms_socket_port_cfg);
 /* Waiting few milliseconds for socket ready to be used */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MILLISECONDS);
 /* Set callback function */
 RM_COMMS_SOCKET_CallbackSet(&g_comms_socket_port_ctrl, tcp_callback,
g_comms_socket_port_cfg.p_context);
```

```
 /* This step: Client start to creating the socket and send connect command to Server
(MCU device) */
 /* TODO code */
 /* Waiting for connection to be established. */
    LWIP_TEST_WAIT_TIMEOUT(true == connected, LWIP_TEST_MAXIMUM_WAITING_TIME);
 /* Tries 3 times loop to receive/send data from/to client */
 for (uint16_t tries = 1; tries < 3; tries++)
    {
 /* This step: Server (MCU device) starts to receive data */

| | Pointer to callback that is called when a socket_event_t occurs. |
| | |
| void * | p_context |
| | Pointer to context passed into callback function. |
| | |

### Function Documentation

#### ◆ RM_COMMS_SOCKET_Open()

fsp_err_t RM_COMMS_SOCKET_Open ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg* )

Opens and configures the SOCKET Comms module. Implements rm_comms_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SOCKET Comms module successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ABORTED | Module is not successfully open. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_UNSUPPORTED | Socket type is not supported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SOCKET_Close()

fsp_err_t RM_COMMS_SOCKET_Close ( rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SOCKET Comms module. Implements rm_comms_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNSUPPORTED | Socket type is not supported. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SOCKET_CallbackSet()

fsp_err_t RM_COMMS_SOCKET_CallbackSet ( rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context* )

Updates the SOCKET Comms callback. Implements rm_comms_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_COMMS_SOCKET_Read()

fsp_err_t RM_COMMS_SOCKET_Read ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Performs a read from the SOCKET bus. Implements rm_comms_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_ENABLED | Operation is disabled when there is no TCP connection. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

*Do not call this API in Interrupt function when enabling mutex or semaphore*

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SOCKET_Write()

fsp_err_t RM_COMMS_SOCKET_Write ( rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes* )

Performs a write to the SOCKET bus. Implements rm_comms_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully writing data . |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_WRITE_FAILED | No bytes were transferred. |
| FSP_ERR_NOT_ENABLED | Operation is disabled when there is no active TCP connection. |
| FSP_ERR_NOT_OPEN | Module is not open. |

***Note***

*Do not call this API in Interrupt function when enabling mutex or semaphore*

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_COMMS_SOCKET_WriteRead()

fsp_err_t RM_COMMS_SOCKET_WriteRead ( rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params* )

Performs simultaneous read and write. Implements rm_comms_api_t::writeRead..

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Transfer was started successfully. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Read bytes and write bytes are not the same. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

## 5.2.12.32 WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Modules » Networking

### Functions

| | |
|---|---|
| fsp_err_t | RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t *p_server_ip_addr) |
| fsp_err_t | RM_WIFI_DA16XXX_SntpEnableSet (wifi_da16xxx_sntp_enable_t enable) |
| fsp_err_t | RM_WIFI_DA16XXX_SntpTimeZoneSet (int utc_offset_in_hours, uint32_t minutes, wifi_da16xxx_sntp_daylight_savings_enable_t daylightSavingsEnable) |
| fsp_err_t | RM_WIFI_DA16XXX_LocalTimeGet (uint8_t *p_local_time, uint32_t size_string) |

### Detailed Description

Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.

# Overview

This Middleware module currently supplies an implementation for using the DA16XXX module in two different configurations.

The first is for the FreeRTOS WiFi interface, where the network stack is located on the MCU using a socket interface, and the DA16XXX Wi-Fi module provides a connection to the internet. This configuration requires FreeRTOS to be used.

The second configuration is for use with the DA16XXX on-chip MQTT and HTTP client modules, where the network stack is located on the DA16XXX module. In this configuration, this Middleware driver supports FreeRTOS as well as Baremetal (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the DA16XXX Web Site

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

**Features**

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

# Configuration

### Build Time Configurations for rm_wifi_da16xxx

The following build time configurations are defined in fsp_cfg/rm_wifi_da16xxx_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Enable DA16600 Support | • Enabled<br>• Disabled | Disabled | Enabled if using the DA16600 module |
| Check Minimum SDK Version | • Disabled<br>• Enabled | Enabled | Enable or disable comparing the current DA16XXX module's SDK version to the minimum required |

| | | | |
|---|---|---|---|
| Number of supported socket instances (not used with on-chip APIs) | 1 | 1 | Enable number of socket instances |
| Size of RX buffer for socket (not used with on-chip APIs) | Manual Entry | 8192 | |
| Size of TX buffer for CMD Port | Manual Entry | 1500 | |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Enable SNTP Client | • Enabled<br>• Disabled | Disabled | Should the SNTP client of the module be enabled |

**Configurations for Networking > WiFi DA16XXX Framework Driver (rm_wifi_da16xxx)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Country code in ISO 3166-1 alpha-2 standard | Manual Entry | US | |
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone UTC Offset in Hours | Refer to the RA Configuration tool for available options. | 0 | Value in hours from 12 to -12 |

Note: It is suggested that when using the DA16XXX module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

### Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

### Clock Configuration

Refer to UART (r_sci_uart).

### Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

# Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the WIFI_On() API to fail. This is not required for the DA16200 Pmod module.

### Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- This driver is configured to support the following baud rates only: 115200, 230400, 460800, and 921600. These values are defined by the uart_baud_rates[] array and UART_BAUD_MAX_CNT found in the transport layer files.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as minutes = 0, daylight savings to disable when calling RM_WIFI_DA16XXX_SntpTimeZoneSet() API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The rm_wifi_da16xxx_connect() function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

# Examples

### Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = "password",
       .ucSSID                     = "access_point_ssid",
```

```
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
   assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

### SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
```

```
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
```

```
 /* Change the IP address of the server */
 RM_WIFI_DA16XXX_SntpServerIpAddressSet((uint8_t *) ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_DA16XXX_SntpTimeZoneSet(-8, 0, WIFI_DA16XXX_SNTP_DAYLIGHT_SAVINGS_DISABLE);
 /* Connect back to the access point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
 WIFI_Disconnect();
 WIFI_Off();
}
```

## Data Structures

| enum | wifi_da16xxx_sntp_daylight_savings_enable_t |

## Data Structure Documentation

### ◆ wifi_da16xxx_cfg_t

| struct wifi_da16xxx_cfg_t | | |
|---|---|---|
| User configuration structure, used in open function | | |
| Data Fields | | |
| at_transport_da16xxx_instance_t | p_transport_instance | |

| | | |
|---|---|---|
| const * | | |
| const uint32_t | num_sockets | Number of sockets to initialize. |
| const uint8_t * | country_code | Country code defined in ISO3166-1 alpha-2 standard. |
| const uint8_t * | sntp_server_ip | The SNTP server IP address string. |
| const int32_t | sntp_utc_offset_in_hours | Timezone offset in secs (-43200 - 43200) |
| void * | p_context | User defined context passed into callback function. |
| void const * | p_extend | Pointer to extended configuration by instance of interface. |

### ◆ da16xxx_socket_t

| struct da16xxx_socket_t | | |
|---|---|---|
| DA16XXX Wifi internal socket instance structure | | |
| Data Fields | | |
| uint8_t | remote_ipaddr[4] | Remote IP address. |
| int | remote_port | Remote Port. |
| int | socket_recv_data_len | Data length of incoming socket data. |
| int | socket_type | Socket type (TCP Server \| TCP Client \| UDP) |
| uint32_t | socket_status | Current socket status. |
| uint32_t | socket_recv_error_count | Socket receive error count. |
| uint32_t | socket_create_flag | Flag to determine in socket has been created. |
| uint32_t | socket_read_write_flag | flag to determine if read and/or write channels are active. |
| da16xxx_recv_state | socket_recv_state | Incoming Socket data header information. |
| StreamBufferHandle_t | socket_byteq_hdl | Socket stream buffer handle. |
| StaticStreamBuffer_t | socket_byteq_struct | Structure to hold stream buffer info. |
| uint8_t | socket_recv_buff[WIFI_DA16XXX_CFG_MAX_SOCKET_RX_SIZE] | Socket receive buffer used by byte queue. |

### ◆ wifi_da16xxx_instance_ctrl_t

| struct wifi_da16xxx_instance_ctrl_t |
|---|
| |

| WIFI_DA16XXX private control block. DO NOT MODIFY. | | |
|---|---|---|
| Data Fields | | |
| wifi_da16xxx_cfg_t const * | p_wifi_da16xxx_cfg | Pointer to initial configurations. |
| uint32_t | num_creatable_sockets | Number of simultaneous sockets supported. |
| uint32_t | curr_socket | Current Socket index for AT commands. |
| uint32_t | open | Flag to indicate if wifi instance has been initialized. |
| uint8_t | is_sntp_enabled | Flag to indicate Enable/Disable of SNTP Client. |
| uint8_t | cmd_tx_buff[WIFI_DA16XXX_CFG_CMD_TX_BUF_SIZE] | Command send buffer. |
| uint8_t | cmd_rx_buff[WIFI_DA16XXX_CFG_CMD_RX_BUF_SIZE] | Command receive buffer. |
| volatile uint32_t | curr_socket_index | Currently active socket instance. |
| uint8_t | curr_ipaddr[4] | Current IP address of module. |
| uint8_t | curr_subnetmask[4] | Current Subnet Mask of module. |
| uint8_t | curr_gateway[4] | Current GAteway of module. |
| da16xxx_socket_t | sockets[WIFI_DA16XXX_CFG_NUM_CREATEABLE_SOCKETS] | Internal socket instances. |

## Enumeration Type Documentation

### ◆ wifi_da16xxx_sntp_enable_t

| enum wifi_da16xxx_sntp_enable_t |
|---|
| DA16XXX WiFi module enable/disable for SNTP |

### ◆ da16xxx_socket_status_t

| enum da16xxx_socket_status_t |

| --- |
| DA16XXX WiFi module enable/disable for SNTP Daylight |

## Function Documentation

### ◆ RM_WIFI_DA16XXX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_DA16XXX_SntpServerIpAddressSet ( uint8_t * *p_server_ip_addr*)

Set the SNTP Client Server IP Address

**Parameters**

| | | |
| --- | --- | --- |
| [in] | p_server_ip_addr | Pointer to IP address of SNTP server in byte array format. |

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_ASSERTION | The parameter p_server_ip_addr is NULL. |

Update the SNTP Server IP Address

### ◆ RM_WIFI_DA16XXX_SntpEnableSet()

fsp_err_t RM_WIFI_DA16XXX_SntpEnableSet ( wifi_da16xxx_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

**Parameters**

| | | |
|---|---|---|
| [in] | enable | Flag to indicate enable/disable for SNTP support. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

### ◆ RM_WIFI_DA16XXX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_DA16XXX_SntpTimeZoneSet ( int *utc_offset_in_hours*, uint32_t *minutes*, wifi_da16xxx_sntp_daylight_savings_enable_t *daylightSavingsEnable* )

Set the SNTP Client Timezone

**Parameters**

| | | |
|---|---|---|
| [in] | utc_offset_in_hours | Timezone in UTC offset in hours |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

### ◆ RM_WIFI_DA16XXX_LocalTimeGet()

fsp_err_t RM_WIFI_DA16XXX_LocalTimeGet ( uint8_t * *p_local_time*, uint32_t *size_string* )

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

**Parameters**

| | | |
|---|---|---|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

### ◆ RM_WIFI_DA16XXX_GenericAtSendRcv()

fsp_err_t RM_WIFI_DA16XXX_GenericAtSendRcv ( char const *const *at_string*, char *const *response_buffer*, uint32_t *length* )

Sends any AT command compatible with the DA16XXX module. Provide optional buffer to receive the response.

**Parameters**

| | | |
|---|---|---|
| [in] | at_string | Input AT command string from the user. |
| [in] | response_buffer | Optional buffer for receiving the response. |
| [in] | length | Size of optional buffer. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Input was not a valid AT command. |

Send a generic AT command to the DA16XXX and optionally receive a response

### Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

# Overview

This Middleware module supplies an implementation for the FreeRTOS WiFi interface and AzureRTOS NetxDuo WiFi interface using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: Wifi API.

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the Silex Web Site

### Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

# Configuration

### Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Number of supported socket instances | Refer to the RA Configuration tool for available options. | 1 | Enable number of socket instances |
| Size of RX buffer for socket | Manual Entry | 4096 | |

| | | | |
|---|---|---|---|
| Size of TX buffer for CMD Port | Manual Entry | 1500 | |
| Size of RX buffer for CMD Port | Manual Entry | 3000 | |
| Semaphore maximum timeout | Manual Entry | 10000 | |
| Number of retries for AT commands | Manual Entry | 10 | |
| Module Reset Port | Refer to the RA Configuration tool for available options. | 06 | Specify the module reset pin port for the MCU. |
| Module Reset Pin | Refer to the RA Configuration tool for available options. | 03 | Specify the module reset pin for the MCU. |
| Enable SNTP Client | • Enabled<br>• Disabled | Disabled | Should the SNTP client of the module be enabled |

**Configurations for Networking > WiFi Onchip Silex Driver using UART (rm_wifi_onchip_silex)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| SNTP server IPv4 address | Must be a valid IPv4 address | 0.0.0.0 | |
| SNTP Timezone Offset from UTC Hours | Must be between 12 and -12 hours | 0 | Value in hours from 12 to -12 |
| SNTP Timezone Offset from UTC Minutes | Must be between 0 and 59 minutes | 0 | Value in minutes from 0 to 59 |
| Use Daylight Savings Time | • Enabled<br>• Disabled | Disabled | Specify if daytime savings should be used for local time calulation |

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

### Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex).

### Clock Configuration

Refer to UART (r_sci_uart).

### Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

## Usage Notes

### Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The rm_wifi_onchip_silex_connect() function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call WIFI_Scan(), WIFI_Ping(), WIFI_GetMAC(), or WIFI_GetIPInfo(). Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

## Examples

### Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
```

```
      .xPassword.xWPA.cPassphrase = "password",
      .ucSSID                     = "access_point_ssid",
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
   assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

### SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
```

```
 /* Get the local time string */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
 /* Change the IP address of the server */
 RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet((uint8_t *)
ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet(-7, 0,
WIFI_ONCHIP_SILEX_SNTP_DAYLIGHT_SAVINGS_ENABLE);
 /* Connect back to the access point */
 WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
 WIFI_Disconnect();
 WIFI_Off();
}
```

## Data Structures

| struct | wifi_onchip_silex_instance_ctrl_t |

## Enumerations

| | |
|---|---|
| enum | sx_ulpgn_socket_status_t |
| enum | sx_ulpgn_socket_rw |
| enum | wifi_onchip_silex_sntp_enable_t |
| enum | wifi_onchip_silex_sntp_daylight_savings_enable_t |

## Data Structure Documentation

### ◆ wifi_onchip_silex_cfg_t

| struct wifi_onchip_silex_cfg_t | | |
|---|---|---|
| User configuration structure, used in open function | | |
| Data Fields | | |
| const uint32_t | num_uarts | Number of UART interfaces to use. |
| const uint32_t | num_sockets | Number of sockets to initialize. |
| const bsp_io_port_pin_t | reset_pin | Reset pin used for module. |
| const uart_instance_t * | uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS] | SCI UART instances. |
| const wifi_onchip_silex_sntp_enable_t | sntp_enabled | Enable/Disable the SNTP Client. |
| const uint8_t * | sntp_server_ip | The SNTP server IP address string. |
| const int32_t | sntp_timezone_offset_from_utc_hours | Timezone offset from UTC in (+/-) hours. |
| const uint32_t | sntp_timezone_offset_from_utc_minutes | Timezone offset from UTC in minutes. |
| const wifi_onchip_silex_sntp_daylight_savings_enable_t | sntp_timezone_use_daylight_savings | Enable/Disable use of daylight saving time. |
| void * | p_context | User defined context passed into callback function. |
| void const * | p_extend | Pointer to extended configuration by instance of interface. |

### ◆ ulpgn_socket_t

| struct ulpgn_socket_t | | |
|---|---|---|
| Silex ULPGN Wifi internal socket instance structure | | |
| Data Fields | | |
| StreamBufferHandle_t | socket_byteq_hdl | Socket stream buffer handle. |
| StaticStreamBuffer_t | socket_byteq_struct | Structure to hold stream buffer info. |
| uint8_t | socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE] | Socket receive buffer used by byte queue. |
| uint32_t | socket_status | Current socket status. |

| | | |
|---|---|---|
| uint32_t | socket_recv_error_count | Socket receive error count. |
| uint32_t | socket_create_flag | Flag to determine in socket has been created. |
| uint32_t | socket_read_write_flag | flag to determine if read and/or write channels are active. |

### ◆ wifi_onchip_silex_instance_ctrl_t

| struct wifi_onchip_silex_instance_ctrl_t | | |
|---|---|---|
| WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY. | | |
| Data Fields | | |
| uint32_t | open | Flag to indicate if wifi instance has been initialized. |
| wifi_onchip_silex_cfg_t const * | p_wifi_onchip_silex_cfg | Pointer to initial configurations. |
| bsp_io_port_pin_t | reset_pin | Wifi module reset pin. |
| uint32_t | num_uarts | number of UARTS currently used for communication with module |
| uint32_t | tx_data_size | Size of the data to send. |
| uint32_t | num_creatable_sockets | Number of simultaneous sockets supported. |
| uint32_t | curr_cmd_port | Current UART instance index for AT commands. |
| uint32_t | curr_data_port | Current UART instance index for data. |
| uint8_t | cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE] | Command port receive buffer used by byte queue // FreeRTOS. |
| StreamBufferHandle_t | socket_byteq_hdl | Socket stream buffer handle. |
| StaticStreamBuffer_t | socket_byteq_struct | Structure to hold stream buffer info. |
| volatile uint32_t | curr_socket_index | Currently active socket instance. |
| uint8_t | cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE] | Command send buffer. |
| uint8_t | cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE] | Command receive buffer. |
| uint32_t | at_cmd_mode | Current command mode. |
| uint8_t | curr_ipaddr[4] | Current IP address of module. |
| uint8_t | curr_subnetmask[4] | Current Subnet Mask of module. |

| | | |
|---|---|---|
| uint8_t | curr_gateway[4] | Current GAteway of module. |
| SemaphoreHandle_t | tx_sem | Transmit binary semaphore handle. |
| SemaphoreHandle_t | rx_sem | Receive binary semaphore handle. |
| uint8_t | last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH] | Tailing buffer used for command parser. |
| uart_instance_t * | uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS] | UART instance objects. |
| SemaphoreHandle_t | uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS] | UART transmission end binary semaphore. |
| ulpgn_socket_t | sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS] | Internal socket instances. |

## Enumeration Type Documentation

### ◆ sx_ulpgn_socket_status_t

| |
|---|
| enum sx_ulpgn_socket_status_t |
| Silex ULPGN Wifi socket status types |

### ◆ sx_ulpgn_socket_rw

| |
|---|
| enum sx_ulpgn_socket_rw |
| Silex socket shutdown channels |

### ◆ wifi_onchip_silex_sntp_enable_t

| |
|---|
| enum wifi_onchip_silex_sntp_enable_t |
| Silex WiFi module enable/disable for SNTP |

### ◆ wifi_onchip_silex_sntp_daylight_savings_enable_t

| |
|---|
| enum wifi_onchip_silex_sntp_daylight_savings_enable_t |
| Silex WiFi module enable/disable for SNTP |

## Function Documentation

### ◆ rm_wifi_onchip_silex_open()

fsp_err_t rm_wifi_onchip_silex_open ( wifi_onchip_silex_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_ONCHIP_SILEX Middleware module.

**Parameters**

| | | |
|---|---|---|
| [in] | p_cfg | Pointer to pin configuration structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WIFI_ONCHIP_SILEX successfully configured. |
| FSP_ERR_ASSERTION | The parameter p_cfg or p_instance_ctrl is NULL. |
| FSP_ERR_OUT_OF_MEMORY | There is no more heap memory available. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

### ◆ rm_wifi_onchip_silex_close()

fsp_err_t rm_wifi_onchip_silex_close ( )

Disables WIFI_ONCHIP_SILEX.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WIFI_ONCHIP_SILEX closed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ rm_wifi_onchip_silex_disconnect()

fsp_err_t rm_wifi_onchip_silex_disconnect ( )

Disconnects from connected AP.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | WIFI_ONCHIP_SILEX disconnected successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ rm_wifi_onchip_silex_socket_connected()

fsp_err_t rm_wifi_onchip_silex_socket_connected ( fsp_err_t * *p_status*)

Check if a specific socket instance is connected.

**Parameters**

| | | |
|---|---|---|
| [out] | p_status | Pointer to integer holding the socket connection status. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The parameter p_status is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |

### ◆ rm_wifi_onchip_silex_network_info_get()

fsp_err_t rm_wifi_onchip_silex_network_info_get ( uint32_t * *p_ip_addr*, uint32_t * *p_subnet_mask*, uint32_t * *p_gateway* )

Return the network information for the connection to the access point.

**Parameters**

| | | |
|---|---|---|
| [out] | p_ip_addr | Pointer to integer holding the IP address. |
| [out] | p_subnet_mask | Pointer to integer holding the subnet mask. |
| [out] | p_gateway | Pointer to integer holding the gateway. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | A parameter pointer is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_WIFI_AP_NOT_CONNECTED | No connection to access point has happened. |

### ◆ rm_wifi_onchip_silex_connect()

fsp_err_t rm_wifi_onchip_silex_connect ( const char * *p_ssid*, WIFISecurity_t *security*, const char * *p_passphrase* )

Connects to the specified Wifi Access Point.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ssid | Pointer to SSID of Wifi Access Point. |
| [in] | security | Security type to use for connection. |
| [in] | p_passphrase | Pointer to the passphrase to use for connection. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The parameter p_ssid or p_passphrase is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | No commas are accepted in the SSID or Passphrase. |

### ◆ rm_wifi_onchip_silex_mac_addr_get()

fsp_err_t rm_wifi_onchip_silex_mac_addr_get ( uint8_t * *p_macaddr*)

Get MAC address.

**Parameters**

| | | |
|---|---|---|
| [out] | p_macaddr | Pointer array to hold mac address. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The parameter p_macaddr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_scan()

fsp_err_t rm_wifi_onchip_silex_scan ( WIFIScanResult_t * *p_results*, uint32_t *maxNetworks* )

Get the information about local Wifi Access Points.

**Parameters**

| | | |
|---|---|---|
| [out] | p_results | Pointer to a structure array holding scanned Access Points. |
| [in] | maxNetworks | Size of the structure array for holding APs. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The parameter p_results or p_instance_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_ping()

fsp_err_t rm_wifi_onchip_silex_ping ( uint8_t * *p_ip_addr*, uint32_t *count*, uint32_t *interval_ms* )

Ping an IP address on the network.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ip_addr | Pointer to IP address array. |
| [in] | count | Number of pings to attempt. |
| [in] | interval_ms | Interval between ping attempts. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The parameter p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_ip_addr_get()

fsp_err_t rm_wifi_onchip_silex_ip_addr_get ( uint32_t * *p_ip_addr*)

Get the assigned module IP address.

**Parameters**

| | | |
|---|---|---|
| [out] | p_ip_addr | Pointer an array to hold the IP address. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The parameter p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_avail_socket_get()

fsp_err_t rm_wifi_onchip_silex_avail_socket_get ( uint32_t * *p_socket_id*)

Get the next available socket ID.

**Parameters**

| | | |
|---|---|---|
| [out] | p_socket_id | Pointer to an integer to hold the socket ID. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The parameter p_socket_id is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_WIFI_FAILED | Error occurred in the execution of this function |

### ◆ rm_wifi_onchip_silex_socket_status_get()

fsp_err_t rm_wifi_onchip_silex_socket_status_get ( uint32_t *socket_no*, uint32_t * *p_socket_status* )

Get the socket status.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [out] | p_socket_status | Pointer to an integer to hold the socket status |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl or p_socket_status is NULL. The value of socket_no is greater than/equal num_creatable_sockets. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_tcp_shutdown()

int32_t rm_wifi_onchip_silex_tcp_shutdown ( uint32_t *socket_no*, uint32_t *shutdown_channels* )

Shutdown portion of a socket

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [in] | shutdown_channels | Specify if read or write channel is shutdown for socket |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_ASSERTION | The parameter p_instance_ctrl is NULL. The value of socket_no is greater than/equal num_creatable_sockets. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_socket_create()

fsp_err_t rm_wifi_onchip_silex_socket_create ( uint32_t *socket_no*, uint32_t *type*, uint32_t *ipversion* )

Create a new socket instance.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [in] | type | Socket type. |
| [in] | ipversion | Socket IP type. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_instance_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_tcp_connect()

fsp_err_t rm_wifi_onchip_silex_tcp_connect ( uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port* )

Connect to a specific IP and Port using socket.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [in] | ipaddr | IP address for socket connection. |
| [in] | port | Port number for socket connection. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_udp_connect()

fsp_err_t rm_wifi_onchip_silex_udp_connect ( uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*, uint32_t *type* )

Connect to a specific IP and Port using UDP socket.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [in] | ipaddr | IP address for socket connection. 0 if type is server. |
| [in] | port | Port number for socket connection. |
| [in] | type | Type of UDP connection. Can be client or server. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_send()

int32_t rm_wifi_onchip_silex_send ( uint32_t *socket_no*, const uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms* )

Send data over TCP to a server.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [in] | p_data | Pointer to data to send. |
| [in] | length | Length of data to send. |
| [in] | timeout_ms | Timeout to wait for transmit end event |

**Return values**

| | |
|---|---|
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_instance_ctrl or parameter p_data is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |

### ◆ rm_wifi_onchip_silex_recv()

int32_t rm_wifi_onchip_silex_recv ( uint32_t *socket_no*, uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms* )

Receive data over TCP from a server.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID number. |
| [out] | p_data | Pointer to data received from socket. |
| [in] | length | Length of data array used for receive. |
| [in] | timeout_ms | Timeout to wait for data to be received from socket. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_ASSERTION | The p_instance_ctrl or parameter p_data is NULL. |

### ◆ rm_wifi_onchip_silex_socket_disconnect()

fsp_err_t rm_wifi_onchip_silex_socket_disconnect ( uint32_t *socket_no*)

Disconnect a specific socket connection.

**Parameters**

| | | |
|---|---|---|
| [in] | socket_no | Socket ID to disconnect |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | Bad parameter value was passed into function. |

### ◆ rm_wifi_onchip_silex_dns_query()

fsp_err_t rm_wifi_onchip_silex_dns_query ( const char * *p_textstring*, uint8_t * *p_ip_addr* )

Initiate a DNS lookup for a given URL.

**Parameters**

| | | |
|---|---|---|
| [in] | p_textstring | Pointer to array holding URL to query from DNS. |
| [out] | p_ip_addr | Pointer to IP address returned from look up. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Function completed successfully. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_ASSERTION | The p_instance_ctrl, p_textstring, p_ip_addr is NULL. |
| FSP_ERR_NOT_OPEN | The instance has not been opened. |
| FSP_ERR_INVALID_ARGUMENT | The URL passed in is to long. |

### ◆ RM_WIFI_ONCHIP_SILEX_EpochTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet ( time_t * *p_utc_time*)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

**Parameters**

| | | |
|---|---|---|
| [out] | p_utc_time | Returns the epoch time in seconds. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully retrieved the system time from module. |
| FSP_ERR_ASSERTION | The parameter utc_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

### ◆ RM_WIFI_ONCHIP_SILEX_LocalTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet ( uint8_t * *p_local_time*, uint32_t *size_string* )

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

**Parameters**

| | | |
|---|---|---|
| [out] | p_local_time | Returns local time in string format. |
| [in] | size_string | Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully returned the local time string. |
| FSP_ERR_ASSERTION | The parameter local_time or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | String size value passed in exceeds maximum. |

Get the current local time based on current timezone in a string format

### ◆ RM_WIFI_ONCHIP_SILEX_SntpEnableSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet ( wifi_onchip_silex_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

**Parameters**

| | | |
|---|---|---|
| [in] | enable | Can be set to enable/disable for SNTP support. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Enable or Disable the SNTP Client Service

### ◆ RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet ( uint8_t * *p_ip_address*)

Set the SNTP Client Server IP Address

**Parameters**

| | | |
|---|---|---|
| [in] | p_ip_address | Pointer to IP address of SNTP server in byte array format. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_ASSERTION | The parameter p_ip_address or p_instance_ctrl is NULL. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |

Update the SNTP Server IP Address

### ◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet ( int32_t *hours*, uint32_t *minutes*, wifi_onchip_silex_sntp_daylight_savings_enable_t *daylightSavingsEnable* )

Set the SNTP Client Timezone

**Parameters**

| | | |
|---|---|---|
| [in] | hours | Number of hours (+/-) used for timezone offset from GMT. |
| [in] | minutes | Number of minutes used for timezone offset from GMT. |
| [in] | daylightSavingsEnable | Enable/Disable daylight saving in the timezone calculation. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully set the value. |
| FSP_ERR_WIFI_FAILED | Error occurred with command to Wifi module. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_ARGUMENT | Parameter passed into function was invalid. |

Update the SNTP Timezone

## 5.2.12.34 lwIP Baremetal Porting Layer (rm_lwip_sys_baremetal)

Modules » Networking

# Overview

This module provides system timer feature for baremetal.

Please refer to the lwIP documentation for further details.

### Features

This porting layer includes the following features.

- Timer
- Critical sections
- Compiler/Platform abstraction.

### 5.2.12.35 lwIP Ethernet Driver (rm_lwip_ether)

Modules » Networking

#### Functions

| | |
|---|---|
| err_t | rm_lwip_ether_init (struct netif *p_netif) |
| void | rm_lwip_ether_callback (ether_callback_args_t *p_args) |

#### Detailed Description

# Overview

This module provides a lwIP driver that is implemented using the Ethernet Interface.

Please refer to the lwIP documentation for further details.

#### Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- UDP (User Datagram Protocol) including experimental UDP-lite extensions
- TCP (Transmission Control Protocol) with congestion control, RTT estimation fast recovery/fast retransmit and sending SACKs
- raw/native API for enhanced performance
- Link status callback

# Configuration

#### Configurations for Networking > lwIP Wrapper to (rm_lwip_ether)

| Configuration | Options | Default | Description |
|---|---|---|---|
| RTOS | | | |
| RX thread stacksize | Must be a positive integer | 1024 | Stack size of RX thread. |
| RX thread priority | Must be a positive integer | 4 | Priority of RX thread. |
| Name | Name must be a valid C symbol | g_lwip_ether0 | Module name. |
| MTU | Must be an integer from 576 to 1500 | 1500 | MTU size. |
| Netif flags | • UP<br>• BROADCAST | • BROADCAST<br>• ETHARP | Flags representing the capabilities of the |

| | | | |
|---|---|---|---|
| | • LINK_UP<br>• ETHARP<br>• ETHERNET<br>• IGMP<br>• MLD6 | | Ethernet device |
| Zero-copy mode | • Disable<br>• Enable | Disable | Enable or disable zero-copy mode. |
| RX buffer pool size | Must be a positive integer | 10 | Buffer pool size for zero-copy RX. |
| Link check interval | Must be a positive integer | 100 | Interval for checking link status. |

# Usage Notes

### Limitations

# Examples

### Basic Example

This is a basic example of minimal use of the lwIP Ether Driver in an application.

```
#include "lwip/tcp.h"
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#define LWIP_EXAMPLE_PORT_NUMBER 9000
/* TCP callback functions. */
static err_t lwip_example_connected_callback(void * arg, struct tcp_pcb * tpcb, err_t
err);
err_t       lwip_example_sent_callback(void * arg, struct tcp_pcb * tpcb, u16_t len);
err_t       lwip_example_recv_callback(void * arg, struct tcp_pcb * tpcb, struct pbuf
* p, err_t err);
volatile uint8_t g_lwip_example_connected_flag;
volatile uint8_t g_lwip_example_sent_flag;
volatile uint8_t g_lwip_example_recv_flag;
void rm_lwip_ether_example () {
 struct netif    netif;
 struct tcp_pcb * pcb = NULL;
    ip_addr_t ipaddr;
```

```
    ip_addr_t netmask;
    ip_addr_t gw;
    ip_addr_t server_ip;
 const char data[] = "lwIP Hello world.";
 /* Initializing lwIP core. */
    lwip_init();
 /* Set ip address of the board. */
    IP4_ADDR(&ipaddr, 192, 168, 10, 4);
    IP4_ADDR(&netmask, 255, 255, 255, 0);
    IP4_ADDR(&gw, 192, 168, 10, 1);
 /* Initialize netif. Please pass rm_lwip_ether_init() function and the instance of
rm_lwip_ether to netif_add(). */

 /* If the callback function returns ERR_OK it must have freed the pbuf, otherwise it
must not have freed it. */
 if (p != NULL)
    {
       pbuf_free(p);
    }
 return ERR_OK;
}
```

### Function Documentation

#### ◆ rm_lwip_ether_init()

| err_t rm_lwip_ether_init ( struct netif * *p_netif*) |
|---|
| Initialize ethernet hardware and lwIP network interface. This function is passed to netif_add() |

#### ◆ rm_lwip_ether_callback()

| void rm_lwip_ether_callback ( ether_callback_args_t * *p_args*) |
|---|
| Callback of Ethernet interrupt subroutine. This function is set to ethernet driver callback by configurator. |

### 5.2.12.36 lwIP FreeRTOS Porting Layer (rm_lwip_sys_freertos)

Modules » Networking

# Overview

This module provides a lwIP porting layer for FreeRTOS.

Please refer to the lwIP documentation for further details.

#### Features

This porting layer includes the following features.

- Compiler/Platform abstraction.

All other features of FreeRTOS porting layer are provided by the lwIP library.

### 5.2.12.37 lwIP HTTP Server

Modules » Networking

This module provides the lwIP HTTP Server integration documentation.

## Overview

The LwIP HTTP Server library can be used to respond HTTP request. The documentation for the library can be found at the following link: lwIPServer.

#### Features

The LwIP HTTP Server:

- Can respond from HTTP GET and POST requests.
- Supports Server-Side Includes (SSI) and Common Gateway Interface (CGI).
- Can set up TLS connection handling (HTTPS).

## Configuration

#### Build Time Configurations for Source

The following build time configurations are defined in lwip/lwip/apps/httpd_opts.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| LwIP HTTPD CGI (old style) | • Enabled<br>• Disabled | Disabled | Enable CGI support (old style). Use this CGI type e.g. to execute specific actions and return a page that does not depend on the CGI parameters. |
| LwIP HTTPD CGI SSI (new style) | • Enabled<br>• Disabled | Disabled | Enable CGI support with SSI feature (new style). Use this CGI handler if you want CGI information passed on to SSI. |

| | | | |
|---|---|---|---|
| LwIP HTTPD SSI | • Enabled<br>• Disabled | Disabled | Enable SSI support (Server-Side-Includes). |
| LwIP HTTPD SSI Raw | • Enabled<br>• Disabled | Disabled | Enable to implement an SSI tag handler callback that gets a const char* to the tag (instead of an index into a pre-registered array of known tags). |
| LwIP HTTPD SSI By File Extension | • Overridden<br>• Enabled<br>• Disabled | Enabled | enable/disable or override the file SSI tag scan function. You need to provide an external function to perform the check: u8_t http_uri_is_ssi(struct fs_file *file, const char *uri) |
| LwIP HTTPD SSI Extension | Manual Entry | ".shtml", ".shtm", ".ssi", ".xml", ".json" | List of file extensions handled as SSI files. Only used if LWIP_HTTPD_SSI_BY_FILE_EXTENSION != 0. |
| LwIP HTTPD Support POST | • Enabled<br>• Disabled | Disabled | Set this to 1 to support HTTP POST. |
| LwIP HTTPD Maximum CGI Parameters | Must be a non zero positive interger. | 16 | The maximum number of parameters that the CGI handler can be sent. |
| LwIP HTTPD SSI Multipart | • Enabled<br>• Disabled | Disabled | SSI handler function is called with 2 more arguments to handle string too long to be inserted at once |
| LwIP HTTPD Maximum Tag Name Length | Must be a non zero positive interger. | 8 | The maximum length of the string comprising the SSI tag name. The longer tags are ignored. |
| LwIP HTTPD Maximum Tag Insert Length | Must be a non zero positive interger. | 192 | The maximum length of string that can be returned to replace any given tag. |
| LwIP HTTPD POST Manual WND | • Enabled<br>• Disabled | Disabled | Enable configurating POST window response for HTTP server |
| HTTPD Server Agent | Manual Entry | lwIP/" LWIP_VERSION_STRING | This string is passed in the HTTP header as |

| | | | |
|---|---|---|---|
| | | "<br>(<br>http://savannah.nongnu.org/projects/lwip) | 'Server: HTTPD_SERVER_AGENT'. |
| LwIP HTTPD Dynamic Headers | • Enabled<br>• Disabled | Disabled | Set this to 1 if you want to include code that creates HTTP headers at runtime. Else use static header created by the makefsdata tool. |
| HTTPD Debug | • Disabled<br>• Enabled | Disabled | Configure debug for HTTPD file send timing |
| HTTPD Use Mem Pool | • Enabled<br>• Disabled | Disabled | Set this to 1 to allocate http_state instead of using heap.If enabled, define MEMP_NUM_PARALLEL_HTTPD_CONNS (and MEMP_NUM_PARALLEL_HTTPD_SSI_CONNS for SSI) to set the size of the pool(s). |
| HTTPD Server Port | Must be an interger in range 0-65535. | 80 | The http server port for HTTPD to use |
| HTTPD Server Port HTTPS | Must be an interger in range 0-65535. | 443 | The https server port for HTTPD to use |
| HTTPD Enable HTTPS | • Enabled<br>• Disabled | Disabled | Enable https support. |
| HTTPD Maximum Retries | Must be a positive integer. | 4 | Maximum retries before the connection is aborted/closed. |
| HTTPD Poll Interval | Must be a non zero positive interger. | 4 | How long the Server will keep the connection. The poll delay is X*500ms. |
| HTTPD TCP Priority | Must be an interger in range 1-127. | 1 | Priority for tcp pcbs created by HTTPD 1 by default range from 1-127. |
| LwIP HTTPD Timing | • Enabled<br>• Disabled | Disabled | Set this to 1 to enable timing each file sent. |
| HTTPD Debug Timing | • Disabled<br>• Enabled | Disabled | Set this to 1 to enable timing each file sent. |
| LwIP HTTPD Support Extstatus | • Enabled<br>• Disabled | Disabled | Set this to one to show error pages when parsing request fail. Else simply close the connection |

| | | | |
|---|---|---|---|
| LwIP HTTPD Support V09 | • Enabled<br>• Disabled | Enabled | Set this to 0 to drop support for HTTP/0.9 clients (to save some bytes). |
| LwIP HTTPD Support 11 Keepalive | • Enabled<br>• Disabled | Disabled | Set this to 1 to enable HTTP/1.1 persistent connections. |
| LwIP HTTPD Support Requestlist | • Enabled<br>• Disabled | Enabled | Set this to 1 to support HTTP request coming in in multiple packets/pbufs. |
| LwIP HTTPD Request Queuelen | Must be a non zero positive interger. | 5 | Number of rx pbufs to enqueue to parse an incoming request. |
| LwIP HTTPD Request Bufsize | Must be a non zero positive interger. | LWIP_HTTPD_MAX_REQ_LENGTH | Number of (TCP payload-) bytes (in pbufs) to enqueue to parse and incoming request. |
| LwIP HTTPD Maximum Request Length | Must be a non zero positive interger. | LWIP_MIN(1023, (LWIP_HTTPD_REQ_QUEUELEN * PBUF_POOL_BUFSIZE)) | Defines the maximum length of a HTTP request line. |
| LwIP HTTPD Maximum Request URI Length | Must be a positive interger. | 63 | This is the size of a static buffer used when URIs end with '/'. |
| LwIP HTTPD POST Maximum Response URI Length | Must be a non zero positive interger. | 63 | Maximum length of the filename to send as response to a POST request. |
| LwIP HTTPD SSI Include Tag | • Enabled<br>• Disabled | Enabled | Set this to 0 to not send the SSI tag. |
| LwIP HTTPD Abort On Close Memory Error | • Enabled<br>• Disabled | Disabled | Set this to 1 to call tcp_abort when tcp_close fails with memory error. |
| LwIP HTTPD Kill Old On Connections Exceeded | • Enabled<br>• Disabled | Disabled | Set this to 1 to kill the oldest connection. |
| LwIP HTTPD Omit Header For Extensionless URI | • Enabled<br>• Disabled | Disabled | Set this to 1 to send URIs without extension without headers. |
| HTTPD Limit Sending To 2mss | • Enabled<br>• Disabled | Enabled | By default, the httpd is limited to send 2*pcb->mss. |
| HTTPD Maximum Write Length | The name function must be a valid C symbol | altcp_mss | Define this to a function that returns the maximum amount |

| | | | |
|---|---|---|---|
| | | | of data to enqueue. The function have this signature: u16_t fn(struct altcp_pcb* pcb);. |
| LwIP HTTPD Custom Files | • Enabled<br>• Disabled | Disabled | Set this to 1 and provide the functions: - int fs_open_custom(struct fs_file *file, const char *name) Called first for every opened file to allow opening files that are not included in fsdata(_custom).c - void fs_close_custom(struct fs_file *file) Called to free resources allocated by fs_open_custom(). |
| LwIP HTTPD Dynamic File Read | • Enabled<br>• Disabled | Disabled | Set this to 1 to support fs_read(). Else only one-block files are supported, and the contents must be ready after fs_open(). |
| LwIP HTTPD File State | • Enabled<br>• Disabled | Disabled | Set this to 1 to include an application stateargument per file that is opened. |
| LwIP HTTPD File Extension | • Enabled<br>• Disabled | Disabled | Set this to 1 to add the pextension field to the fs_file structure.New code should use LWIP_ HTTPD_FILE_STATE instead. |
| HTTPD Precalculated Checksum | • Enabled<br>• Disabled | Disabled | Support asynchronous read operations. |
| LwIP HTTPD FS Async Read | • Enabled<br>• Disabled | Disabled | Set this to 1 to add the pextension field. |
| HTTPD Fsdata File | Manual Entry | fsdata_sample.c | Provide source name file of FS custom data. This data file will be included by fs.c file |
| HTTP Is Data Volatile | • Allow Copy and More<br>• Allow Copy<br>• Undefined | Allow Copy | Determines if HTTP data should be copied into the TCP buffer before transmission. |

| | | | |
|---|---|---|---|
| | | | Allow Copy: data will be copied into memory belonging to the stack.<br>Allow Copy and More: Notify to TCP that data will be copied into memory belonging to the stack<br>and additional data will follow in subsequent TCP transmissions. |
| LwIP HTTPD Use Default Template | • Enabled FSdata Generator<br>• Disabled FSdata Generator | Enabled FSdata Generator | Set this to 1 to when intent to use the default template from the generator |

# Usage Notes

### Limitations

- In normal mode, the user must select the "HTTP Is Data Volatile" option as Allow Copy mode (TCP_WRITE_FLAG_COPY) in the FSP Configurator properties to ensure tcp_write() functions correctly.
- When using the Server-Side Includes (SSI) mode or the Common Gateway Interface (CGI) mode, make sure that the "HTTP Is Data Volatile" option is set to Allow Copy and More mode (TCP_WRITE_FLAG_COPY | TCP_WRITE_FLAG_MORE) in the FSP Configurator properties to work properly.

### How to use fsdata file

There are two ways to use fsdata file as follows:

### 1. Use the available fsdata_sample.c file

When the stack "LwIP HTTP Server" is added, by default it includes the stack "LwIP HTTP Server FS" which is the sample file provided in the LwIP HTTP Server library repository, and the fsdata_sample.c file is generated at the src/fsdata/ path.

### 2. Generate new fsdata.c file using makefsdata script

In case, creating a new fsdata.c file by makefsdata script, follow these detailed steps:

*Note*

*Reffer to this link readme.txt for an introduction by the author about the makefsdata scripts.*

- ***Setup Environment***
  1. *Make sure Perl is installed on your development environment to ensure the required script runs.*
- ***Convert Server Contents to C Source Code***
  1. *Create a new folder. (the created folder can be placed outside the project workspace).*
  2. *Copy the "makefsdata" folder from the LwIP HTTP Server library repository into the created folder.*
  3. *Inside the created folder, create a new subfolder named "fs" (the name "fs" is mandatory).*
  4. *Place the files to be converted into the "fs" folder.*
  5. *Open a terminal on Linux or Git Bash/Windows Command Prompt on Windows. (if Cygwin*

*is installed) and navigate to the created folder.*
6. *Type the command "perl makefsdata".*
7. *The new "fsdata.c" file will be generated in the created folder.*

- ***Configure the Generated File***
  1. *Remove the the stack "LwIP HTTP Server FS".*
  2. *Add an "include guard" to prevent multiple inclusions in the new file "fsdata.c".*
  3. *Include the headers "lwip/apps/fs.h" and "lwip/def.h" in the new file "fsdata.c".*
  4. *Copy only the new file "fsdata.c" into the project workspace.*
  5. *In the FSP Configurator properties, set the "HTTPD Fsdata File" option to the new file "fsdata.c".*

### TLS connection

The stack and heap sizes must be properly configured when using the TLS layer with MbedTLS. Depending on the specific configuration and use case, these values may need to be increased from their defaults. For more information on memory requirements, refer to the **Memory Usage** section in Mbed Crypto H/W Acceleration (rm_psa_crypto).

*Note*

*When using hardware acceleration for the MbedTLS implementation, verify that the target device supports all required mbedCrypto features for the TLS layer of lwIP. Refer to the **HW Overview** and **Features** sections in Mbed Crypto H/W Acceleration (rm_psa_crypto) to check hardware support. If any required feature is not supported, configure the corresponding features to use the software crypto implementation instead.*

# Examples

### Basic Example

This is a basic example of minimal use of the LwIP HTTP Server APIs in an application.

```
#if HTTPD_ENABLE_HTTPS
 #include "lwip/altcp_tls.h"
 #include "mbedtls/platform.h"
#endif
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#include "lwip/apps/httpd.h"
#if HTTPD_ENABLE_HTTPS
/* Example server key, needs to be updated. */

### 5.2.12.38 lwIP MQTT

Modules » Networking

This module provides the lwIP MQTT integration documentation.

# Overview

The lwIP MQTT library can connect to a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: lwIPMQTT.

### Features

- MQTT connections to MQTT broker
- Support set up TLS connection handling with one-way server authentication or two-way server/client authentication
- The version of MQTT protocol supported in lwIP is 3.1.1. Details of the MQTT protocol can be found at: mqtt-v3.1.1

# Usage Notes

### TLS connection

The stack and heap sizes must be properly configured when using the TLS layer with MbedTLS. Depending on the specific configuration and use case, these values may need to be increased from their defaults. For more information on memory requirements, refer to the **Memory Usage** section in Mbed Crypto H/W Acceleration (rm_psa_crypto).

*Note*

*When using hardware acceleration for the MbedTLS implementation, verify that the target device supports all required mbedCrypto features for the TLS layer of lwIP. Refer to the **HW Overview** and **Features** sections in Mbed Crypto H/W Acceleration (rm_psa_crypto) to check hardware support. If any required feature is not supported, configure the corresponding features to use the software crypto implementation instead.*

# Examples

### Basic Example

This is a basic example of minimal use of the lwIP MQTT APIs in an application.

```
#if LWIP_ALTCP && LWIP_ALTCP_TLS

### Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

# Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

### Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Deep Sleep (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

# Configuration

### Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Standby Limit | • Enabled<br>• Disabled | Disabled | If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call. |

### Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_lpm0 | Module name. |
| Low Power Mode | MCU Specific Options | | Power mode to be entered. |
| Output port state in standby and deep standby | MCU Specific Options | | Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins. |
| Supply of SOSC clock to peripheral function in standby | MCU Specific Options | | If enabled, SOSC clock is provided to peripheral functions in Software Standby and Snooze modes. |
| Startup speed of the HOCO in Standby and Snooze modes | MCU Specific Options | | If enabled, the HOCO enters high-speed startup mode, shortening standby release time, and snooze transition time. |
| Flash mode in sleep or snooze | MCU Specific Options | | Select flash mode in sleep mode or in snooze mode. |
| Deep Sleep and Standby Options | | | |
| Deep Sleep and Standby Options > Snooze Options (Not available on every MCU) | | | |
| Snooze Request Source | MCU Specific Options | | Select the event that will enter snooze. |
| Snooze End Sources | MCU Specific Options | | Enable wake from snooze from these sources. |
| DTC state in Snooze Mode | MCU Specific Options | | Enable wake from snooze from this source. |
| Snooze Cancel Source | MCU Specific Options | | Select an interrupt source to cancel snooze. |
| Wake Sources | MCU Specific Options | | Enable wake from deep sleep and standby from these Sources. |

| | | |
|---|---|---|
| Wake Sources 2 | MCU Specific Options | Enable wake from deep sleep and standby from these Sources. |
| RAM Retention Control (Not available on every MCU) | | |
| RAM retention in Standby mode | MCU Specific Options | Select the memory regions that are retained in standby mode. |
| TCM retention in Deep Sleep and Standby modes | MCU Specific Options | Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes. |
| Standby RAM retention in Standby and Deep Standby modes | MCU Specific Options | Select if Standby RAM is retained in standby and deep standby modes. |
| Oscillator LDO Control (Not available on every MCU) | | |
| PLL1 LDO State in standby mode | MCU Specific Options | Select the state PLL1 LDO state in standby mode. |
| PLL2 LDO State in standby mode | MCU Specific Options | Select the state PLL2 LDO state in standby mode. |
| HOCO LDO State in standby mode | MCU Specific Options | Select the state HOCO LDO state in standby mode. |
| Deep Standby Options (Not available on every MCU) | | |
| I/O Port Retention | MCU Specific Options | Select the state of the IO Pins after exiting deep standby mode. |
| Power-Supply Control | MCU Specific Options | Select the state of the internal power supply in deep standby mode. |
| Cancel Sources | MCU Specific Options | Enable wake from deep standby using these sources. |
| Cancel Edges | MCU Specific Options | Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge. |
| Soft Start Mode | MCU Specific Options | The soft start setting affects the inrush current, and wake-up time when waking from |

| | |
|---|---|
| | deep standby mode (See the MCU user manual for more information). |

### Clock Configuration

This module does not have any selectable clock sources.

### Pin Configuration

This module does not use I/O pins.

## Usage Notes

### Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

### Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

### Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

### Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

### Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby

Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the R_LPM_IoKeepClear API.

### Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).
- On RA8, there are delays inserted before and after switching to a lower power mode based on BSP configuration options and current CPUCLK speed. These delays do not disable interrupts for the entire delay as required by the RA8 Hardware Manual. Interrupts should be disabled by the application when possible before sleeping to meet the requirements, or the control of interrupts and the delay should be managed by the user to ensure the requirement is fully met.

## Examples

### LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
 fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
```

```
    assert(FSP_SUCCESS == err);
}
```

### LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
 fsp_err_t err;
#ifdef R_SYSTEM_RSTSR0_DPSRSTF_Msk
 /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
  * Deep Software Standby mode. */
 if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
 /* Clear the IOKEEP bit to allow I/O Port use.
  * Note that this function should be called before opening the LPM driver. */
       err = R_LPM_IoKeepClear(&g_lpm_ctrl);
      assert(FSP_SUCCESS == err);
    }
#endif
    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Add user code here. */
 /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
 /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
  * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

## Data Structures

| | |
|---|---|
| struct | lpm_instance_ctrl_t |

## Data Structure Documentation

### ◆ lpm_instance_ctrl_t

| struct lpm_instance_ctrl_t |
|---|
| LPM private control block. DO NOT MODIFY. Initialization occurs when R_LPM_Open() is called. |

## Function Documentation

### ◆ R_LPM_Open()

fsp_err_t R_LPM_Open ( lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg* )

Perform any necessary initialization

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LPM instance opened |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_ALREADY_OPEN | LPM instance is already open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following:<br>• Invalid snooze entry source<br>• Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following:<br>• Invalid low power mode<br>• Invalid DTC option for snooze mode<br>• Invalid deep standby end sources<br>• Invalid deep standby end sources edges<br>• Invalid power supply option for deep standby<br>• Invalid IO port option for deep standby<br>• Invalid output port state setting for standby or deep standby<br>• Invalid sources for wake from standby mode<br>• Invalid power supply option for standby<br>• Invalid IO port option for standby<br>• Invalid standby end sources<br>• Invalid standby end sources edges |

### ◆ R_LPM_LowPowerReconfigure()

fsp_err_t R_LPM_LowPowerReconfigure ( lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg* )

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Low power mode successfully applied |
| FSP_ERR_ASSERTION | Null Pointer |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_UNSUPPORTED | This MCU does not support Deep Software Standby |
| FSP_ERR_INVALID_ARGUMENT | One of the following:<br>• Invalid snooze entry source<br>• Invalid snooze end sources |
| FSP_ERR_INVALID_MODE | One of the following:<br>• Invalid low power mode<br>• Invalid DTC option for snooze mode<br>• Invalid deep standby end sources<br>• Invalid deep standby end sources edges<br>• Invalid power supply option for deep standby<br>• Invalid IO port option for deep standby<br>• Invalid output port state setting for standby or deep standby<br>• Invalid sources for wake from standby mode<br>• Invalid power supply option for standby<br>• Invalid IO port option for standby<br>• Invalid standby end sources<br>• Invalid standby end sources edges |

### ◆ R_LPM_LowPowerModeEnter()

fsp_err_t R_LPM_LowPowerModeEnter ( lpm_ctrl_t *const *p_api_ctrl*)

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful. |
| FSP_ERR_ASSERTION | Null pointer. |
| FSP_ERR_NOT_OPEN | LPM instance is not open |
| FSP_ERR_INVALID_MODE | One of the following:<br>• HOCO was not system clock when using snooze mode with SCI0/RXD0.<br>• HOCO was not stable when using snooze mode with SCI0/RXD0.<br>• MOCO was running when using snooze mode with SCI0/RXD0.<br>• MAIN OSCILLATOR was running when using snooze mode with SCI0/RXD0.<br>• PLL was running when using snooze mode with SCI0/RXD0.<br>• Unable to disable ocillator stop detect when using standby or deep standby. |

### ◆ R_LPM_IoKeepClear()

fsp_err_t R_LPM_IoKeepClear ( lpm_ctrl_t *const *p_api_ctrl*)

Clear the IOKEEP bit after deep software standby

**Return values**

| | |
|---|---|
| FSP_SUCCESS | DPSBYCR_b.IOKEEP bit cleared Successfully. |
| FSP_ERR_UNSUPPORTED | Deep standby mode not supported on this MCU. |

◆ **R_LPM_Close()**

| fsp_err_t R_LPM_Close ( lpm_ctrl_t *const *p_api_ctrl*) |
|---|
| Close the LPM Instance<br><br>**Return values**<br>FSP_SUCCESS — LPM driver closed<br>FSP_ERR_NOT_OPEN — LPM instance is not open<br>FSP_ERR_ASSERTION — Null Pointer |

## 5.2.14 RTOS

Modules

### Detailed Description

RTOS Modules.

### Modules

Azure RTOS ThreadX Port (rm_threadx_port)

ThreadX port for RA MCUs.

FreeRTOS Port (rm_freertos_port)

FreeRTOS port for RA MCUs.

### 5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

# Overview

*Note*

***The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at https://docs.microsoft.com/en-us/azure/rtos/threadx/ for further information.***

### Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

# Configuration

### Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Custom tx_user.h | Manual Entry | | Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Error Checking | • Enabled<br>• Disabled | Enabled | The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined. |
| Max Priorities | Value must be a multiple of 32 and in range 32 to 1024 or empty | 32 | Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32. |
| Minimum Stack | Value must be greater than 0 or empty | 200 | Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error. |
| Stack Filling | • Enabled<br>• Disabled | Enabled | Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each |

| | | | |
|---|---|---|---|
| | | | thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature. |
| Preemption Threshold | • Enabled<br>• Disabled | Disabled | Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance. |
| Notify Callbacks | • Enabled<br>• Disabled | Disabled | Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance. |
| Inline Thread Resume Suspend | • Enabled<br>• Disabled | Disabled | Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services. |
| Not Interruptable | • Enabled<br>• Disabled | Disabled | Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time. |
| IAR Library Support | • Enabled<br>• Disabled | Disabled | Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option |

| | | | |
|---|---|---|---|
| | | | --threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library. |
| BSD Support | • Enabled<br>• Disabled | Disabled | Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD. |
| FileX Pointer | • Enabled<br>• Disabled | Enabled | Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block. |
| Timer | | | |
| Timer Ticks Per Second | Value must be greater than 0 or empty | 100 | Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms. |
| Timer Thread Stack Size | Value must be greater than 0 or empty | 1024 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer Thread Priority | Value must be a positive integer or empty | 0 | Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled. |
| Timer Process In ISR | • Enabled<br>• Disabled | Enabled | Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system |

| | | | |
|---|---|---|---|
| | | | timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it. |
| Reactivate Inline | • Enabled<br>• Disabled | Disabled | Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size. |
| Timer | • Enabled<br>• Disabled | Enabled | Determine if no timer processing is required. This option will help eliminate the timer processing when not needed. |
| Trace | | | |
| Event Trace | • Enabled<br>• Disabled | Disabled | Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX. |
| Trace Buffer Name | Name must be a valid C symbol | g_tx_trace_buffer | Name of trace buffer symbol, only used if Event Trace is enabled. |
| Memory section for Trace Buffer | Manual Entry | .bss | Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled. |

| | | | |
|---|---|---|---|
| | | | To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and open it with Azure RTOS TraceX. |
| Trace Buffer Size | Value must be greater than 0 | 65536 | Trace buffer size in bytes, only used if Event Trace is enabled |
| Trace Buffer Number of Registries | Value must be greater than 0 | 30 | Number of registries available to TraceX, only used if Event Trace is enabled |
| Performance | | | |
| Block Pool Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers block pool performance information. |
| Byte Pool Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers byte pool performance information. |
| Event Flags Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers event flags performance information. |
| Mutex Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers mutex performance information. |
| Queue Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers queue performance information. |
| Semaphore Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers semaphore performance information. |
| Thread Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers thread performance information. |
| Timer Performance Info | • Enabled<br>• Disabled | Disabled | When enabled, ThreadX gathers timer performance information. |

| | | |
|---|---|---|
| RA | | |
| Hardware Thread Stack Monitoring | MCU Specific Options | Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM. |
| Interrupts | | |
| SysTick Interrupt Priority | MCU Specific Options | Select the Systick interrupt priority. |
| Maximum Interrupt Priority | MCU Specific Options | The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register. |

### Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See Low Power Modes (r_lpm) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt

priority unless the application has created an idle thread.

### Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

### Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

### TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

## Examples

### Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
```

```
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
```

```
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the thread to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

### TrustZone Example

This is an example of calling tx_thread_secure_stack_allocate before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
 /* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
  * to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
  * This function can be called when the thread is created or in the thread before an
non-secure callable function is
  * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
```

```
    rm_threadx_port_nsc_function();
}
```

### 5.2.14.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

# Overview

*Note*

***The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at https://www.freertos.org/Documentation for further information.***

#### Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

# Configuration

*Note*

***The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).***

#### Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Custom FreeRTOSConfig.h | Manual Entry | | Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Use Preemption | • Enabled<br>• Disabled | Enabled | Set to Enabled to use the preemptive RTOS scheduler, or Disabled |

| | | | |
|---|---|---|---|
| | | | to use the cooperative RTOS scheduler. |
| Use Port Optimised Task Selection | • Enabled<br>• Disabled | Disabled | Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port.<br><br>The Generic method:<br>Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented.<br>Can be used with all FreeRTOS ports.<br>Is completely written in C, making it less efficient than a port specific method.<br>Does not impose a limit on the maximum number of available priorities.<br><br>A port specific method:<br>Is not available for all ports.<br>Is used when Use Port Optimized Task Selection is Enabled.<br>Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written.<br>Is more efficient than the generic method.<br>Typically imposes a limit of 32 on the maximum number of available priorities. |
| Use Tickless Idle | • Enabled<br>• Disabled | Disabled | Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the |

| | | | |
|---|---|---|---|
| | | | tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports. |
| Cpu Clock Hz | Manual Entry | SystemCoreClock | Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals. |
| Tick Rate Hz | Value must be greater than 0 | 1000 | The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required.<br><br>More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the |

| | | | |
|---|---|---|---|
| | | | 'time slice' given to each task. |
| Max Priorities | Must be an integer and greater than 0 | 5 | The number of priorities available to the application tasks. Any number of tasks can share the same priority.<br>Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application. |
| Minimal Stack Size | Must be an integer and greater than 0 | 128 | The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes). |
| Max Task Name Len | Must be an integer and greater than 0 | 16 | The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte. |
| Use 16-bit Ticks | Disabled | Disabled | Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the |

| | | | |
|---|---|---|---|
| | | | RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type.<br><br>Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter. |
| Idle Should Yield | • Enabled<br>• Disabled | Enabled | This parameter controls the behaviour of tasks at the idle priority. It only has an effect if:<br>The preemptive scheduler is being used.<br>The application creates tasks that run at the idle priority.<br>If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be |

allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

| | | | |
|---|---|---|---|
| | | | This situation can be avoided by:<br><br>If appropriate, using an idle hook in place of separate tasks at the idle priority.<br>Creating all application tasks at a priority greater than the idle priority.<br>Setting Idle Should Yield to Disabled.<br>Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task. |
| Use Task Notifications | • Enabled<br>• Disabled | Enabled | Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build.<br>Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build.<br><br>Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build. |
| Task Notification Array Entries | Must be an integer and greater than 0 | 1 | Set the Task Notifications Array |

| | | | |
|---|---|---|---|
| | | | Entries to enter the size of array needed |
| Use Mutexes | • Enabled<br>• Disabled | Disabled | Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality. |
| Use Recursive Mutexes | • Enabled<br>• Disabled | Disabled | Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build. |
| Use Counting Semaphores | • Enabled<br>• Disabled | Enabled | Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build. |
| Queue Registry Size | Value must be positive integer greater than or equal to 0 | 10 | The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging:<br>It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI.<br>It contains the information required by a debugger to locate each registered queue and semaphore.<br>The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry |

| | | | |
|---|---|---|---|
| | | | Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for vQueueAddToRegistry( ) and vQueueUnregisterQueue() for more information. |
| Use Queue Sets | • Enabled<br>• Disabled | Disabled | Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality. |
| Use Time Slicing | • Enabled<br>• Disabled | Disabled | If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred. |
| Use Newlib Reentrant | • Enabled<br>• Disabled | Disabled | If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for |

| | | | |
|---|---|---|---|
| | | | each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks. |
| Enable Backward Compatibility | • Enabled<br>• Disabled | Disabled | The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used. |
| Num Thread Local Storage Pointers | Value must be positive integer greater than or equal to 0 | 5 | Sets the number of indexes in each task's thread local storage array. |
| Stack Depth Type | Manual Entry | uint32_t | Sets the type used to |

| | | | |
|---|---|---|---|
| | | | specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use. |
| Message Buffer Length Type | Manual Entry | size_t | FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller. |
| Library Max Syscall Interrupt Priority | MCU Specific Options | | The highest interrupt priority that can be used by any interrupt service routine that |

makes calls to interrupt safe FreeRTOS API functions. DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the

disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above configMAX_SYSCALL_INTERRUPT_PRIORITY and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above config MAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest

| | | | |
|---|---|---|---|
| | | | priority you can specify is 15 - and the highest priority you can specify is 0. |
| Assert | Manual Entry | assert(x) | The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT() defined.<br><br>The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (__FILE__ and __LINE__ are standard macros provided by most compilers). This is just for demonstration as vAssertCalled() is not a FreeRTOS function, configASSERT() can be defined to take whatever action the application writer deems appropriate.<br><br>It is normal to define configASSERT() in such a way that it will prevent the application from executing any further. This if for two reasons; stopping the application at the point |

of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining configASSERT() will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the configASSERT() definition in FreeRTOSConfig.h.

/* Define configASSERT() to call vAssertCalled() if the assertion fails. The assertion
has failed if the value of the parameter passed into configASSERT() equals zero. */
#define configASSERT( ( x ) ) if( ( x ) == 0 ) vAssertCalled( __FILE__, __LINE__ )
If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

| | | | |
|---|---|---|---|
| | | | /* Define configASSERT() to disable interrupts and sit in a loop. */ #define configASSERT( ( x ) ) if( ( x ) == 0 ) { taskDISABLE_INTERRUPTS(); for( ;; ); } |
| Include Application Defined Privileged Functions | • Enabled<br>• Disabled | Disabled | Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes.<br><br>Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can |

| | | | |
|---|---|---|---|
| | | | be encapsulated in a privileged function using the following code:<br><br>void MPU_debug_printf( const char *pcMessage )<br>{<br>/* State the privilege level of the processor when the function was called. */<br>BaseType_t xRunningPrivileged = prvRaisePrivilege();<br><br>/* Call the library function, which now has access to all RAM. */<br>debug_printf( pcMessage );<br><br>/* Reset the processor privilege level to its original value. */<br>portRESET_PRIVILEGE( xRunningPrivileged );<br>}<br>This technique should only be use during development, and not deployment, as it circumvents the memory protection. |
| Hooks | | | |
| Use Idle Hook | • Enabled<br>• Disabled | Enabled | Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook. |
| Use Malloc Failed Hook | • Enabled<br>• Disabled | Disabled | The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are |

| | | | |
|---|---|---|---|
| | | | implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed.<br><br>If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Dosab;ed then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below.<br><br>void vApplicationMalloc FailedHook( void ); |
| Use Daemon Task Startup Hook | • Enabled<br>• Disabled | Disabled | If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task |

| | | | |
|---|---|---|---|
| | | | (also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function. void void vApplicationDaemonTaskStartupHook( void ); |
| Use Tick Hook | • Enabled<br>• Disabled | Disabled | Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook. |
| Check For Stack Overflow | • Enabled<br>• Disabled | Disabled | The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable the RA hardware stack monitor instead. |
| Stats | | | |
| Use Trace Facility | • Enabled<br>• Disabled | Disabled | Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing. |
| Use Stats Formatting Functions | • Enabled<br>• Disabled | Disabled | Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStates() from the build. |
| Generate Run Time Stats | • Enabled<br>• Disabled | Disabled | The Run Time Stats page describes the use of this parameter. |
| Memory Allocation | | | |

| | | | |
|---|---|---|---|
| Clear Memory on Free | • Enabled<br>• Disabled | Disabled | If set to 1, then blocks of memory allocated using pvPortMalloc() will be cleared when freed using vPortFree() |
| Support Static Allocation | • Enabled<br>• Disabled | Enabled | If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer.<br>If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap.<br><br>If Support Static Allocation is left undefined it will default to 0.<br><br>If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplication GetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vAp plicationGetTimerTask Memory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below.<br><br>/* Support Static Allocation is Enabled, so the application must provide an implementation of vAp plicationGetIdleTaskMe mory() to provide the memory that is used by the Idle task. */ void vApplicationGetIdl eTaskMemory( StaticTask_t **ppxIdleT |

```
askTCBBuffer,<br>
StackType_t **ppxIdleT
askStackBuffer,<br>
uint32_t
*pulIdleTaskStackSize )
{
/* If the buffers to be
provided to the Idle
task are declared
inside this
function then they
must be declared static
- otherwise they will be
allocated on
the stack and so not
exists after this
function exits. */
static StaticTask_t
xIdleTaskTCB;
static StackType_t
uxIdleTaskStack[ config
MINIMAL_STACK_SIZE ];

/* Pass out a pointer to
the StaticTask_t
structure in which the
Idle task's
state will be stored. */
*ppxIdleTaskTCBBuffer
=

/* Pass out the array
that will be used as the
Idle task's stack. */
*ppxIdleTaskStackBuffe
r = uxIdleTaskStack;

/* Pass out the size of
the array pointed to by
*ppxIdleTaskStackBuffe
r.
Note that, as the array
is necessarily of type
StackType_t,
configMINIMAL_STACK_
SIZE is specified in
words, not bytes. */
*pulIdleTaskStackSize
= configMINIMAL_STAC
K_SIZE;
}
/*-----------------------------
-----------------------------*/

/* Support Static
```

Allocation and Use Timers are both Enabled, so the application must provide an implementation of vApplicationGetTimerTaskMemory()
to provide the memory that is used by the Timer service task. */
void vApplicationGetTimerTaskMemory(
StaticTask_t **ppxTimerTaskTCBBuffer,<br>
StackType_t **ppxTimerTaskStackBuffer,<br>
uint32_t *pulTimerTaskStackSize )
{
/* If the buffers to be provided to the Timer task are declared inside this
function then they must be declared static - otherwise they will be allocated on
the stack and so not exists after this function exits. */
static StaticTask_t xTimerTaskTCB;
static StackType_t uxTimerTaskStack[ configTIMER_TASK_STACK_DEPTH ];

/* Pass out a pointer to the StaticTask_t structure in which the Timer
task's state will be stored. */
*ppxTimerTaskTCBBuffer =

/* Pass out the array that will be used as the Timer task's stack. */
*ppxTimerTaskStackBuffer =
uxTimerTaskStack;

| | | | |
|---|---|---|---|
| | | | /* Pass out the size of the array pointed to by *ppxTimerTaskStackBuffer.<br>Note that, as the array is necessarily of type StackType_t, configTIMER_TASK_STACK_DEPTH is specified in words, not bytes. */<br>*pulTimerTaskStackSize = configTIMER_TASK_STACK_DEPTH;<br>}<br><br>Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.<br><br>See the Static Vs Dynamic Memory Allocation page for more information. |
| Support Dynamic Allocation | • Enabled<br>• Disabled | Disabled | If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap.<br>If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer.<br><br>See the Static Vs Dynamic Memory Allocation page for more information. |
| Total Heap Size | Value must be positive integer greater than or equal to 0 | 1024 | The total amount of RAM available in the FreeRTOS heap.<br>This value will only be used if Support Dynamic Allocation is Enabled and the |

| | | | |
|---|---|---|---|
| | | | application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details. |
| Application Allocated Heap | • Enabled<br>• Disabled | Disabled | By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory.<br>If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t array with the exact name and dimension as shown below. The array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation.<br><br>uint8_t ucHeap[ configTOTAL_HEAP_SIZE ]; |
| Timers | | | |
| Use Timers | • Enabled<br>• Disabled | Enabled | Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the |

| | | | |
|---|---|---|---|
| | | | FreeRTOS software timers page for a full description. |
| Timer Task Priority | Value must be positive integer greater than or equal to 0 | 3 | Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description. |
| Timer Queue Length | Value must be a non-negative integer | 10 | Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description. |
| Timer Task Stack Depth | Value must be a non-negative integer | 128 | Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description. |
| Optional Functions | | | |
| vTaskPrioritySet() Function | • Enabled<br>• Disabled | Enabled | Include vTaskPrioritySet() function in build |

### Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

### Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

### Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD_STACK_HIGH_ADDRESS as 1 on the command line.

### Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

### TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE_SECURE_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN_UP_TCB(pxTCB) macro.

# Examples

### Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
```

```
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
```

```
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the task to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

### TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
 /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
```

```
  * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

#### 5.2.15.1 AWS Device Provisioning

Modules » Security

AWS Device Provisioning example software.

# Overview

### Terminology

The terminology defined below will be used in the following sections.

| Term | Description |
|---|---|
| Service Provider | Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure. |
| Device Manufacturer | Entity that provides the MCU, for example, |

| | |
|---|---|
| | Renesas. |
| OEM | Entity that uses the MCU to create a product. |
| Customer | End user of OEM product. |

**Device ID**

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the X.509 format which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

**Provisioning**

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage.  Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

**Provisioning Models**

Provisioning services vary between service providers. There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality .Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an example of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal

rm_aws_pkcs11_pal_littlefs module implements these requirements on RA MCU data flash.

# AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (aws_dev_mode_key_provisioning.c) exposes:

1. vAlternateKeyProvisioning()

This function requires that the device credentials be provided in PEM format. Using this example function as is in production is not recommended.

Note **vDevModeKeyProvisioning()** is no longer supported.

Credentials can be created as follows: *Create your own CA and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example Register your CA with AWS.

- Use AWS to generate the device certificate.

# Examples

### Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

being linked into the image.
  * The same example provisioning function, vAlternateKeyProvisioning, can be used in
that case. */
    params.pucClientPrivateKey       = (uint8_t *) keyCLIENT_PRIVATE_KEY_PEM;
    params.pucClientCertificate      = (uint8_t *) keyCLIENT_CERTIFICATE_PEM;
    params.ulClientPrivateKeyLength = 1 + strlen((const char *)
params.pucClientPrivateKey);
    params.ulClientCertificateLength = 1 + strlen((const char *)
params.pucClientCertificate);
    params.pucJITPCertificate       = NULL;
    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
}
```

# Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

### 5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

Modules » Security

#### Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.

# Overview

Please refer to the NetXDuo - NetX Crypto documentation for further details.

### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |
| RSIP-E50D | RA8P1 |
| RSIP-E31A | RA4C1 |
| RSIP-E11A | RA4L1 |
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |
| AES Engine 2 | RA2A2 |
| TRNG | RA0E1, RA0E2, RA2L2, RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3, RA8E1, RA8E2 |

### Features

| | | AES Engine | AES Engine 2 | SCE5 | SCE5_B | SCE7 | SCE9 | RSIP-E11A | RSIP-E31A | RSIP-E51A | RSIP-E50D |

*Note*

*1. Only block cipher unit is HW accelerated*
*2. Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated*
*3. Signature verification only*

# Configuration

### Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Standalone Usage | • Use Standalone Crypto Only<br>• Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTO_STANDALONE_ENABLE. |
| Maximum RSA Modulus size (bits) | • 1024<br>• 2048<br>• 3072<br>• 4096 | 4096 | |

### Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Hardware Acceleration | | | |
| Hardware Acceleration > Hash | | | |
| SHA256/224 | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT. |
| SHA512/384 | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT. |
| Hardware Acceleration > Cipher | | | |
| AES | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) | | | |
| Hardware Acceleration > Public Key Cryptography (PKC) > ECC | | | |
| ECC | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_M |

| | | | |
|---|---|---|---|
| | | | ETHODS_ECC_ALT |
| ECDSA Scratch Buffer Size (Bytes) | Value must be a non-negative integer | 3016 | Sets value of NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE |
| ECDH Scratch Buffer Size (Bytes) | Value must be a non-negative integer | 2464 | Sets value of NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA | | | |
| RSA | MCU Specific Options | | Enables/Disables RSA HW support |
| RSA 1024 (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT to allow HW support |
| RSA 2048 (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support |
| RSA 3072 Verify/Encryption (HW) | MCU Specific Options | | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support |
| RSA 4096 Verify/Encryption (HW) | MCU Specific Options | | Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support |
| RSA Scratch Buffer Size (Bytes) | MCU Specific Options | | Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE |
| TRNG | • Enabled<br>• Disabled | Enabled | Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT. |
| Standalone Usage | • Use Standalone Crypto Only<br>• Use with TLS | Use Standalone Crypto Only | Defines NX_CRYPTO_STANDALONE_ENABLE. |

**Random Number Generator Configuration**

To enable hardware acceleration for the TRNG, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT must be defined in the configuration file. By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require

setting up the heap as 'rand' implementation calls 'malloc'.

### SHA Configuration

To enable hardware acceleration for the SHA256/224 or SHA384/512 calculation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT or NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT must be defined in the configuration file. By default SHA is enabled which can be disabled using the RA Configuration editor.

### AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

### ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

### RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be must be defined in the configuration file:

| Configuration Macro | Feature / Operation |
|---|---|
| NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT | Signature Generation / Signature Verification (Encryption / Decryption) |
| NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT | Signature Generation / Signature Verification (Encryption / Decryption) |
| NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT | Signature Verification (Encryption Only) |
| NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT | Signature Verification (Encryption Only) |

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

# Usage Notes

### Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

### Hardware Initialization

_nx_crypto_initialize() must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

### Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer Azure RTOS NetX Crypto API description for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

### AES Usage

#### GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the _nx_crypto_method_aes_operation must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

#### CTR mode

For CTR mode the IV pointer must be as defined in Using Advanced Encryption Standard (AES) Counter Mode With IPsec Encapsulating Security Payload (ESP) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to _nx_crypto_method_aes_operation through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the _nx_crypto_method_aes_operation during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

### ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE and NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE macros for ECDSA and ECDH respectively.

| Operation | Key Format |
|---|---|
| ECDSA Signature | Plain private key; Wrapped private key |
| ECDSA Signature-Verify | Uncompressed public key |
| Key Generation using ECDSA operation API | Wrapped private key; Uncompressed public key |
| ECDH private key import | Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key) |
| ECDH public key export | Uncompressed public key |

| | |
|---|---|
| ECDH setup | Uncompressed public key |
| ECDH shared secret calculate | Uncompressed public key |
| Key Generation using ECDH operation API | Wrapped private key; Uncompressed public key |

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under RFC5480
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral.

### RSA Usage

### Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during _nx_crypto_method_rsa_init API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_rsa_operation API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of _nx_crypto_method_pkcs1_v1_5_init are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_pkcs1_v1_5_operation API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

### Software Implementation

The plaintext data passed in to the RSA encryption API must be 4-byte aligned. If it is not aligned then when the resultant encrypted data is decrypted using the decryption API, the unaligned data will be endian-swapped. For instance, if {0x01, 0x02,0x03, 0x04, 0x05} is passed as input data for encryption, when decrypted, the result will be {0x01, 0x02, 0x03, 0x04, 0x00, 0x00, 0x00, 0x05}. Note that this alignment of input data need not be taken care while using Hardware accelerated RSA.

### Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is eanbled.

# Examples

### Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
/* Setup the platform; initialize the SCE and the TRNG */

   err = nx_crypto_initialize();
```

```
    assert(NX_CRYPTO_SUCCESS == err);
```

### Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTO_METHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};

### ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPTO_METHOD crypto_method_ecdh;
/*Private key 59137e38152350b195c9718d39673d519838055ad908dd4757152fd8255c09bf */

```

### RSA PKCS1V1.5 Example

This is an example on using the NetX Crypto API to sign and verify input message data. The plain input message is PKCS1V1.5 encoded before signature generation.

PKCS1V15 Example

### HMAC SHA256 Example

This is an example on using the HMAC with SHA256 hash using the NetX Crypto API.

#### Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

# Overview

*Note*

***The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.6.2 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface for further information.*** *FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

#### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |
| RSIP-E50D | RA8P1 |

| | |
|---|---|
| RSIP-E31A | RA4C1 |
| RSIP-E11A | RA4L1 |
| SCE9 | RA6M4, RA4M3, RA4M2, RA6M5 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |
| AES Engine | RA2A1, RA2E1, RA2E2, RA2L1 |
| AES Engine 2 | RA2A2 |
| TRNG | RA0E1, RA0E2, RA2L2, RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3, RA8E1, RA8E2 |

# Configuration

### Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Hardware Acceleration | | | |
| Hardware Acceleration > Key Format | | | |
| AES | MCU Specific Options | | Select AES key formats used |
| ECC | MCU Specific Options | | Select ECC key formats used |
| RSA | MCU Specific Options | | Select RSA key formats used |
| Hardware Acceleration > Hash | | | |
| SHA256/224 | MCU Specific Options | | Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT. |
| SHA512/384 | MCU Specific Options | | Defines MBEDTLS_SHA512_ALT and MBEDTLS_SHA512_PROCESS_ALT. |
| SHA3_224/256/384/512 | MCU Specific Options | | Defines MBEDTLS_SHA3_ALT and MBEDTLS_SHA3_PROCESS_ALT. |
| Hardware Acceleration > Cipher | | | |
| AES | MCU Specific Options | | Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT |
| Hardware Acceleration > Public Key Cryptography (PKC) | | | |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072 | | | |
| Key Generation | MCU Specific Options | | Enables RSA 3072 Key |

| | | | |
|---|---|---|---|
| | | | Generation. |
| Signing | MCU Specific Options | | Enables RSA 3072 Key Signing. |
| Verification | MCU Specific Options | | Enables RSA 3072 Verify. |
| Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096 | | | |
| Key Generation | MCU Specific Options | | Enables RSA 4096 Key Generation. |
| Signing | MCU Specific Options | | Enables RSA 4096 Key Signing. |
| Verification | MCU Specific Options | | Enables RSA 4096 Verify. |
| ECC | MCU Specific Options | | Defines MBEDTLS_ECP_ALT |
| ECDSA | MCU Specific Options | | Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT |
| ECDH | MCU Specific Options | | Defines MBEDTLS_ECDH_ALT |
| RSA 1024 | MCU Specific Options | | Defines MBEDTLS_RSA_1024_ALT. RSA 1024 Key Generation, Signing and Verification are also enabled. |
| RSA 2048 | MCU Specific Options | | Defines MBEDTLS_RSA_ALT. RSA 2048 Key Generation, Signing and Verification are also enabled. |
| TRNG | Enabled | Enabled | Defines MBEDTLS_ENTROPY_HARDWARE_ALT. |
| Crypto Engine Initialization | Enabled | Enabled | MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT |

**SHA256 Configuration**

To enable hardware acceleration for the SHA256/224 calculation, the macro MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

### AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

*Note*

***Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.***

### ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

### RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

### Post Quantum Cryptography (PQC) Configuration

### ML-KEM Configuration

To enable software only PQC ML-KEM key generation, encapsulation, and decapsulation operations, the macro MBEDTLS_MLKEM_C must be defined in the configuration file. By default, PQC ML-KEM is disabled as the PQC stack is optional. This can be done using the RA Configuration editor.

### ML-DSA Configuration

To enable software only PQC ML-DSA key generation, signing, and verification operations, the macro MBEDTLS_ML_DSA_C must be defined in the configuration file. By default, PQC ML-DSA is disabled as the PQC stack is optional. This can be done using the RA Configuration editor.

### Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the

project configuration.

*Note*

***On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.***

### Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO, MBEDTLS_PSA_CRYPTO_STORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specified as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
   {
/* Set the id to a positive integer. */
      psa_set_key_id(&attributes, (psa_key_id_t) 5);
   }
```

### Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS_CHECK_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

### Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_ENTROPY_HARDWARE_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

## Usage Notes

### Hardware Initialization

mbedtls_platform_setup() must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

### Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms:

| Algorithm | Required Heap (bytes) |
|---|---|

| | |
|---|---|
| SHA256/224 | None |
| AES | 0x200 |
| Hardware ECC | 0x400 |
| Software ECC | 0x1800 |
| RSA | 0x1500 |

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations.

**Limitations**

- Only little endian mode is supported.

**Stdio Buffering**

The MBEDTLS_PLATFORM_SETBUF_MACRO was introduced in mbedTLS 3.2.1 to prevent stdio read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in setbuf() to NULL. FSP uses a dummy_setbuf() function in rm_psa_crypto.c to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for MBEDTLS_PLATFORM_SETBUF_MACRO_value in the FSP configurator.

**Post Quantum Cryptography (PQC)**

- The PSA API Specificiation v1.3 supports ML-KEM and ML-DSA however MbedTLS currently does not provide an implementation. The implementation in the FSP release is thus likely to change and may cause backward compatibility issues when MbedTLS officially supports it.
- ASN.1 encoding not implemented. Keys are currently implemented in raw bytes.

## ML-DSA

- The FIPS204 Standard allows the user to provide an optional context string for ML-DSA signature generation and verification. The current implementation does not allow the user to provide such a string. Internally this field is set to a value of 0 with a length of 0.
- The data format for import and export of the key pair is a byte array of the 32 byte seed value.
- Only ML-DSA-44 and ML-DSA-65 supported. ML-DSA-87 not supported.
- Only PSA_ALG_HASH_ML_DSA supported. PSA_ALG_ML_DSA requires PSA to offer a SHAKE-256 implementation.
- The current implementation of ML-DSA is too big for devices with less than 64KB of RAM.
- There is a known runtime issue when IAR toolchain is used for ML-DSA.

## ML-KEM

- Only ML-KEM-512 and ML-KEM-768 supported. ML-KEM-1024 not supported.
- Key derivation not supported.
- The data format for import and export of the key pair is the concatenation of the two 32 byte seed values: d || z

### SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

*Note*

***For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.***

### Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

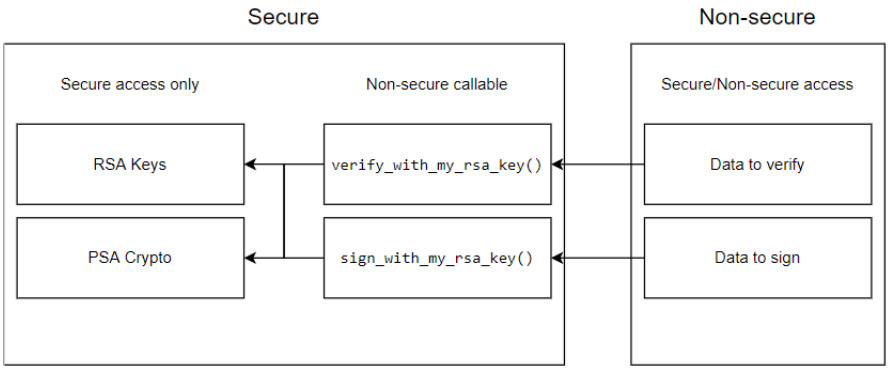

Figure 327: PSA Crypto Non-secure callable example

- Secure project
  - During secure project boot-up, psa_crypto_init() is called.
  - The RSA private key is programmed into secure flash either at the factory or by calling psa_generate_key() in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
  - psa_import_key()/psa_open_key() are called with the resultant handle held in secure RAM.
  - The Non-secure callable section contains the following **user-defined** functions
  - verify_with_my_rsa_key(input_signature, input_hash, verification_result)

    - The implementation of this function in secure region will call psa_verify_hash() and return the result via verification_result.
    - sign_with_my_rsa_key(input_hash, output_signature)
    - The implementation of this function in secure region will call psa_sign_hash() and return the signature via output_signature.

- Non-secure project

    - Calls verify_with_my_rsa_key() to verify a signature. The implementation will use the public key that is present in the secure project.
    - Calls sign_with_my_rsa_key() to generate a signature. The implementation will use the private key that is present on the secure project.

  For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

# Examples

### Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg              = PSA_ALG_SHA_256;
    psa_hash_operation_t operation        = {0};
 size_t               expected_hash_len = PSA_HASH_LENGTH(alg);
    uint8_t             actual_hash[PSA_HASH_MAX_SIZE];
```

```
 size_t              actual_hash_len;
 mbedtls_platform_context ctx = {0};
 /* Setup the platform; initialize the SCE and the TRNG */
 if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
 /* Platform initialization failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
 /* Hash setup failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
sizeof(NIST_SHA256ShortMsgLen200)))
    {
 /* Hash calculation failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
    {
 /* Reading calculated hash failed */
       debugger_break();
    }
 else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
    {
 /* Hash compare of calculated value with expected value failed */
       debugger_break();
    }
 else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
    {
```

```
 /* Hash size compare of calculated value with expected value failed */
       debugger_break();
    }
 else
    {
 /* SHA256 calculation succeeded */
       debugger_break();
    }
 /* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
 mbedtls_platform_teardown(&ctx);
}
```

### AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
 const uint8_t          * input,
 size_t                   input_size,
 size_t                   part_size,
                                    uint8_t               * output,
 size_t                   output_size,
 size_t                * output_len)
{
    psa_status_t status;
 size_t       bytes_to_write = 0;
 size_t       bytes_written = 0;
 size_t       len            = 0;
    *output_len = 0;
 while (bytes_written != input_size)
    {
       bytes_to_write = (input_size - bytes_written > part_size ?
                         part_size :
```

```
                        input_size - bytes_written);
      status = psa_cipher_update(operation,
                                 input + bytes_written,
                                 bytes_to_write,

   }
else
   {
/* All the operations succeeded for MAC generation */
   }
/* Steps to verify the generated MAC */
if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
   {
/* MAC verification setup failure */
      debugger_break();
```

```
    }
 else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
    {
 /* MAC update failure */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
    {
 /* MAC verification failed */
       debugger_break();
    }
 else
    {
 /* All the operations succeeded for MAC verification */
    }
```

### ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

*Note*

*Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."*

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
 * It then exports the generated key into ASN1 DER format to a RAM array which can
```

```
then be programmed to flash.
 * It then re-imports that key, and performs signing and verification operations. */

### Migrating to MbedTLS 3.6.0

MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS macro is disabled by default to handle shared memory in a secure manner. Note that this increases heap memory usage and code size. The macro can be enabled if all buffers passed to any PSA function reside in memory that is accessible only to the PSA function during its execution or if it possible otherwise for the user to conclude that the user buffers

passed into PSA are secure from modification. Refer to https://github.com/Mbed-TLS/mbedtls-docs/blob/main/security-advisories/mbedtls-security-advisory-2024-03.md for more details.

psa_import_key() now only accepts RSA keys in the PSA standard formats. Applications that need other formats like: PKCS#8, SubjectPublicKey, PEM can call mbedtls_pk_parse_{public,}key() followed by mbedtls_pk_import_into_psa().

### Function Documentation

#### ◆ mbedtls_platform_setup()

int mbedtls_platform_setup ( mbedtls_platform_context * *ctx*)

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};
/* Setup the platform; initialize the SCE and the TRNG */
if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

**Return values**

| | |
|---|---|
| 0 | Initialization was successful. |
| MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED | SCE Initialization error. |

### ◆ mbedtls_platform_teardown()

void mbedtls_platform_teardown ( mbedtls_platform_context * *ctx*)

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the mbedtls_platform_setup() function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
mbedtls_platform_teardown(&ctx);
```

**Return values**

| | |
|---|---|
| N/A | |

### ◆ RM_PSA_CRYPTO_TRNG_Read()

fsp_err_t RM_PSA_CRYPTO_TRNG_Read ( uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*, uint32_t * *p_num_gen_bytes* )

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Random number generation successful |
| FSP_ERR_ASSERTION | NULL input parameter(s). |
| FSP_ERR_CRYPTO_UNKNOWN | An unknown error occurred. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

### Detailed Description

Ocrypto software only crypto on RA2E1.

# Overview

Ocrypto is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP only on RA2E1.

*Note*

***The Ocrypto port module does not provide any crypto interfaces to the user. See Ocrypto Licensed Functions.***

### Hardware Overview

Limited to RA2E1 only.

### Features

For features supported by the software-only version, refer to the Ocrypto documentation.

# Configuration

### Build Time Configurations for rm_ocrypto_trng_port

The following build time configurations are defined in fsp_cfg/rm_ocrypto_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### AES Configuration

To enable hardware acceleration for the AES-EBC, CBC, and CTR operations, choose Ocrypto (H/W Accelerated) from the stack options. Be sure to initialize the hardware

# Usage Notes

### Hardware Initialization

Invoke RM_OCRYPTO_PORT_Init() to initialize the hardware before using Ocrypto if the TRNG or if H/W Acceleration is to be used.

### Random Number Generation

Use the RM_OCRYPTO_PORT_TRNG_Read() function to obtain random data from the TRNG hardware. If purely random data is sufficient for the application, then RM_OCRYPTO_PORT_TRNG_Read() can be used directly instead.

### Memory Usage

Ocrypto does not use dynamic allocation so there is no heap requirement.

A minimum stack of 0x800 is required to use Ocrypto.

### Side Channel Safety Statement

See Ocrypto Side Channel Safety Statement.

### Function Overview

### Limitations

### Usage with RA2E1

Ocrypto can only be used on RA2E1.

### Ocrypto

Ocrypto does provide any API to generate keys. It is the responsibility of the caller to provide generated keys.

### AES Reentrancy

Use the S/W only stack if AES reentrancy is required in your application.

# Examples

### Ocrypto Library Examples

For examples of how to use Ocrypto APIs, see Ocrypto test code under ra/oberon/ocrypto/tests/. These tests are not meant to be built or run in FSP and have been compiled out by the macro OCRYPTO_REFERENCE_TEST_CODE_DOES_NOT_BUILD by default.

### TRNG Example

This is an example on using Ocrypto to generate a random number

```
#define TEST_SECRET_KEY_SIZE 32U
#define TEST_PUBLIC_KEY_SIZE 64U
void ocrypto_trng_example (void)
{
 fsp_err_t status       = FSP_SUCCESS;
    uint8_t   ecdsa_msg[3] = "abc";
```

```
    uint8_t   secret_key[TEST_SECRET_KEY_SIZE];
    uint8_t   session_key[TEST_SECRET_KEY_SIZE];
    uint8_t   ecdsa_public_key[TEST_PUBLIC_KEY_SIZE];
    uint8_t   signature[TEST_PUBLIC_KEY_SIZE];
 /* Setup the platform; initialize the crypto engine. */
    status = RM_OCRYPTO_PORT_Init();
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 /* Read random data from the TRNG to use as secret key. */
    status = RM_OCRYPTO_PORT_TRNG_Read(secret_key, sizeof(secret_key));
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_public_key(ecdsa_public_key, secret_key))
    {
       assert(0);
    }
 /* Read random data from the TRNG to use as session key */
    status = RM_OCRYPTO_PORT_TRNG_Read(session_key, sizeof(session_key));
 if (FSP_SUCCESS != status)
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_sign(signature, ecdsa_msg, sizeof(ecdsa_msg),
secret_key, session_key))
    {
       assert(0);
    }
 if (0 != ocrypto_ecdsa_p256_verify(signature, ecdsa_msg, sizeof(ecdsa_msg),
ecdsa_public_key))
    {
```

```
      assert(0);
   }
/* Operation successful. */
while (1)
   {
      ;
   }
}
```

### Function Documentation

#### ◆ RM_OCRYPTO_PORT_Init()

### 5.2.15.5 Renesas Secure IP (r_rsip_e11a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E11A) on RA MPUs.

# Version

v2.0.0

The version that appears on the Components tab of the FSP Configuration editor is v2.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

# Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.0.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.0.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

# Overview

This module provides RSIP-E11A CAVP Certified functions.

### HW Overview

RSIP-E11A Protected Mode CAVP certification has been obtained using the RA4L1 as the target processor.

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E11A | RA4L1 |

### Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - CTR 128/256bit
      - GCM 128/256bit

        - CCM 128/256bit
    - Asymmetric Encryption/Decryption
        - ECC
            - ECDSA
                - secp256r1
    - Key Agreement
        - ECDH
            - secp256r1
    - Key Derivation
        - Key Derivation Function (KDF) using SHA
            - SHA-256bit
        - Key Import by derived keying material
        - IV output by derived keying material
    - Public Key Infrastructure (PKI)
        - Certificate Verification
            - ECDSA
                - secp256r1
        - Key Import from Certificate
            - ECC
                - secp256r1
    - Hash Functions
        - SHA-2
            - SHA-224/256
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224/256bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - ECC
            - secp256r1
        - HMAC-SHA224/256bit
- Random Number Generate

### Supported algorithms

The following algorithms are available on each devices.

- RSIP-E11A: RA4L1

### Symmetric Key

| Key type (rsip_key_type_t) | RSIP-E11A |
|---|---|
| RSIP_KEY_TYPE_AES_128 | Supported |
| RSIP_KEY_TYPE_AES_192 | Not Supported |
| RSIP_KEY_TYPE_AES_256 | Supported |
| RSIP_KEY_TYPE_XTS_AES_128 | Not Supported |
| RSIP_KEY_TYPE_XTS_AES_256 | Not Supported |
| RSIP_KEY_TYPE_HMAC_SHA224 | Supported |
| RSIP_KEY_TYPE_HMAC_SHA256 | Supported |

| | |
|---|---|
| RSIP_KEY_TYPE_HMAC_SHA384 | Not Supported |
| RSIP_KEY_TYPE_HMAC_SHA512 | Not Supported |

### Asymmetric Key

| Key pair type (rsip_key_pair_type_t) | Public key type (rsip_key_type_t) | Private key type (rsip_key_type_t) | RSIP-E11A |
|---|---|---|---|
| RSIP_KEY_PAIR_TYPE_ECC_SECP256R1 | RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP384R1 | RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP521R1 | RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP256K1 | RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP512R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_RSA_2048 | RSIP_KEY_TYPE_RSA_2048_PUBLIC | RSIP_KEY_TYPE_RSA_2048_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_RSA_3072 | RSIP_KEY_TYPE_RSA_3072_PUBLIC | RSIP_KEY_TYPE_RSA_3072_PRIVATE | Not Supported |
| RSIP_KEY_PAIR_TYPE_RSA_4096 | RSIP_KEY_TYPE_RSA_4096_PUBLIC | RSIP_KEY_TYPE_RSA_4096_PRIVATE | Not Supported |

### AES Block Cipher Mode of Operation

| Cipher mode (rsip_aes_cipher_mode_t) | RSIP-E11A |
|---|---|
| RSIP_AES_CIPHER_MODE_ECB_ENC | Supported |
| RSIP_AES_CIPHER_MODE_ECB_DEC | Supported |
| RSIP_AES_CIPHER_MODE_CBC_ENC | Supported |
| RSIP_AES_CIPHER_MODE_CBC_DEC | Supported |
| RSIP_AES_CIPHER_MODE_CTR | Supported |
| RSIP_AES_CIPHER_MODE_XTS_ENC | Not Supported |
| RSIP_AES_CIPHER_MODE_XTS_DEC | Not Supported |

| AEAD mode (rsip_aes_aead_mode_t) | RSIP-E11A |
|---|---|

| | |
|---|---|
| RSIP_AES_AEAD_MODE_GCM_ENC | Supported |
| RSIP_AES_AEAD_MODE_GCM_DEC | Supported |
| RSIP_AES_AEAD_MODE_CCM_ENC | Supported |
| RSIP_AES_AEAD_MODE_CCM_DEC | Supported |

| MAC mode (rsip_aes_mac_mode_t) | RSIP-E11A |
|---|---|
| RSIP_AES_MAC_MODE_CMAC | Supported |

**Hash Function**

| Hash Function | RSIP-E11A |
|---|---|
| RSIP_HASH_TYPE_SHA224 | Supported |
| RSIP_HASH_TYPE_SHA256 | Supported |
| RSIP_HASH_TYPE_SHA384 | Not Supported |
| RSIP_HASH_TYPE_SHA512 | Not Supported |
| RSIP_HASH_TYPE_SHA512_224 | Not Supported |
| RSIP_HASH_TYPE_SHA512_256 | Not Supported |

**Key Derivation Function**

| Key Derivation Function | RSIP-E11A |
|---|---|
| SHA-256 | Supported |
| SHA-384 | Not Supported |
| HMAC-SHA256 | Not Supported |
| HMAC-SHA384 | Not Supported |
| HMAC-SHA512 | Not Supported |

# Configuration

### Build Time Configurations for r_rsip_e11a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the |

| | | | |
|---|---|---|---|
| | | | functions for which it works effectively. |
| AES-192 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-128 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused |

| | | | |
|---|---|---|---|
| | | | algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | Enabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the |

| | | | |
|---|---|---|---|
| | | | function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP384R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP256R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |

| | | | |
|---|---|---|---|
| ECC BRAINPOOLP384R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC EDWARDS25519 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-3072 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| RSA-4096 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

| | | | |
|---|---|---|---|
| | | | disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the |

| | | | |
|---|---|---|---|
| | | | algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Security > RSIP-E11A Protected Mode (CAVP Certified)**

This module can be added to the Stacks tab via New Stack > Security > RSIP-E11A Protected Mode (CAVP Certified).

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_rsip | Module name. |

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E11A Protected Mode (CAVP Certified).

### State Transition

This driver has the following states.

| State Name | Details |
|---|---|
| STATE_INITIAL | Driver is not open. |
| STATE_MAIN | Ready to Compute. |
| STATE_AES | Computing AES (unauthenticated cipher) |
| STATE_AES_AEAD | Computing AES (AEAD). |
| STATE_AES_MAC | Computing AES (MAC). |
| STATE_SHA | Computing SHA. |
| STATE_HMAC | Computing HMAC. |
| STATE_KDF_SHA | Computing KDF SHA. |
| STATE_KDF_HMAC | Computing KDF HMAC. |

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part

operations.

# Examples

### AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
```

```
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```

### 5.2.15.6 Renesas Secure IP (r_rsip_e51a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E51A) on RA MPUs.

# Version

v2.1.0

The version that appears on the Components tab of the FSP Configuration editor is v2.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

# Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.1.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.1.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

# Overview

This module provides RSIP-E51A CAVP Certified functions.

### HW Overview

RSIP-E51A Protected Mode CAVP certification has been obtained using the RA8M1 as the target processor.

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |

### Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit
      - CBC 128/192/256bit
      - CTR 128/192/256bit
      - GCM 128/192/256bit
      - CCM 128/192/256bit
      - XTS 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 2048/3072/4096bit
      - RSAES-OAEP 2048/3072/4096bit
      - RSASSA-PKCS1-V1_5 2048/3072/4096bit
      - RSASSA-PSS 2048/3072/4096bit
    - ECC
      - ECDSA
        - secp256r1/secp384r1/secp521r1
        - secp256k1
        - brainpool P256r1/P384r1/P512r1
      - EdDSA
        - Ed25519
  - Key Agreement
    - ECDH
      - secp256r1/secp384r1/secp521r1
        - brainpool P256r1/P384r1
  - Key Derivation
    - Key Derivation Function (KDF) using SHA
      - SHA-256/384bit
    - Key Derivation Function (KDF) using HMAC
      - HMAC-SHA256/384/512bit
    - Key Import by derived keying material
    - IV output by derived keying material
  - Public Key Infrastructure (PKI)
    - Certificate Verification
      - ECDSA
        - secp256r1/secp384r1/secp521r1
        - brainpool P256r1/P384r1
    - Key Import from Certificate
      - ECC
        - secp256r1/secp384r1/secp521r1
        - brainpool P256r1/P384r1
  - Hash Functions
    - SHA-2
      - SHA-224, 256, 384, 512, 512/224, 512/256
  - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
  - HMAC-SHA224/256/384/512bit
  - AES-CMAC 128/192/256bit
- Key Manage
  - Key Support
    - AES 128/192/256bit
    - RSA 2048/3072/4096bit
    - ECC
      - secp256r1/secp384r1/secp521r1

        - secp256k1
        - brainpool P256r1/P384r1/P512r1
    - HMAC-SHA224/256/384/512bit
- Random Number Generate
- Secure boot for FSBL
    - Manifest verification and MAC generation (Refer to Application Note R11AN0774.)

### Supported algorithms

The following algorithms are available on each devices.

- RSIP-E51A: RA8M1, RA8D1, RA8T1

### Symmetric Key

| Key type (rsip_key_type_t) | RSIP-E51A |
|---|---|
| RSIP_KEY_TYPE_AES_128 | Supported |
| RSIP_KEY_TYPE_AES_256 | Supported |
| RSIP_KEY_TYPE_XTS_AES_128 | Supported |
| RSIP_KEY_TYPE_XTS_AES_256 | Supported |
| RSIP_KEY_TYPE_HMAC_SHA224 | Supported |
| RSIP_KEY_TYPE_HMAC_SHA256 | Supported |
| RSIP_KEY_TYPE_HMAC_SHA384 | Supported |
| RSIP_KEY_TYPE_HMAC_SHA512 | Supported |

### Asymmetric Key

| Key pair type (rsip_key_pair_type_t) | Public key type (rsip_key_type_t) | Private key type (rsip_key_type_t) | RSIP-E51A |
|---|---|---|---|
| RSIP_KEY_PAIR_TYPE_ECC_SECP256R1 | RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP384R1 | RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP521R1 | RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_SECP256K1 | RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC | RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP256R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP384R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_ECC_BRAINPOOLP512R1 | RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC | RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE | Supported |

| | | | |
|---|---|---|---|
| RSIP_KEY_PAIR_TYPE_RSA_2048 | RSIP_KEY_TYPE_RSA_2048_PUBLIC | RSIP_KEY_TYPE_RSA_2048_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_RSA_3072 | RSIP_KEY_TYPE_RSA_3072_PUBLIC | RSIP_KEY_TYPE_RSA_3072_PRIVATE | Supported |
| RSIP_KEY_PAIR_TYPE_RSA_4096 | RSIP_KEY_TYPE_RSA_4096_PUBLIC | RSIP_KEY_TYPE_RSA_4096_PRIVATE | Supported |

### AES Block Cipher Mode of Operation

| Cipher mode (rsip_aes_cipher_mode_t) | RSIP-E51A |
|---|---|
| RSIP_AES_CIPHER_MODE_ECB_ENC | Supported |
| RSIP_AES_CIPHER_MODE_ECB_DEC | Supported |
| RSIP_AES_CIPHER_MODE_CBC_ENC | Supported |
| RSIP_AES_CIPHER_MODE_CBC_DEC | Supported |
| RSIP_AES_CIPHER_MODE_CTR | Supported |
| RSIP_AES_CIPHER_MODE_XTS_ENC | Supported |
| RSIP_AES_CIPHER_MODE_XTS_DEC | Supported |

| AEAD mode (rsip_aes_aead_mode_t) | RSIP-E51A |
|---|---|
| RSIP_AES_AEAD_MODE_GCM_ENC | Supported |
| RSIP_AES_AEAD_MODE_GCM_DEC | Supported |
| RSIP_AES_AEAD_MODE_CCM_ENC | Supported |
| RSIP_AES_AEAD_MODE_CCM_DEC | Supported |

| MAC mode (rsip_aes_mac_mode_t) | RSIP-E51A |
|---|---|
| RSIP_AES_MAC_MODE_CMAC | Supported |

### Hash Function

| Hash Function (rsip_hash_type_t) | RSIP-E51A |
|---|---|
| RSIP_HASH_TYPE_SHA224 | Supported |
| RSIP_HASH_TYPE_SHA256 | Supported |
| RSIP_HASH_TYPE_SHA384 | Supported |
| RSIP_HASH_TYPE_SHA512 | Supported |

### Key Derivation Function

| Key Derivation Function | RSIP-E51A |
|---|---|
| SHA-256 | Supported |
| SHA-384 | Supported |
| HMAC-SHA256 | Supported |
| HMAC-SHA384 | Supported |

| | |
|---|---|
| HMAC-SHA512 | Supported |

# Configuration

### Build Time Configurations for r_rsip_e51a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-192 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| XTS-AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

| | | | |
|---|---|---|---|
| | | | disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the |

| | | | |
|---|---|---|---|
| | | | algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it |

| | | | |
|---|---|---|---|
| | | | works effectively. |
| ECC EDWARDS25519 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-3072 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-4096 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This |

| | | | |
|---|---|---|---|
| | | | configuration is provided only for the functions for which it works effectively. |
| SHA-224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-384 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size |

| | | | |
|---|---|---|---|
| | | | can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA384 | • Enabled | Enabled | If the application uses |

| | | | |
|---|---|---|---|
| | • Disabled | | only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Security > RSIP-E51A Protected Mode (CAVP Certified)**

This module can be added to the Stacks tab via New Stack > Security > RSIP-E51A Protected Mode (CAVP Certified).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Name must be a valid C symbol | g_rsip | Module name. |

**Clock Configuration**

This module does not require a specific clock configuration.

**Pin Configuration**

This module does not use I/O pins.

# Usage Notes

**Getting Started: Creating a RSIP Protected Mode Project**

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E51A Protected Mode (CAVP Certified).

**State Transition**

This driver has the following states.

| State Name | Details |
|---|---|
| STATE_INITIAL | Driver is not open. |
| STATE_MAIN | Ready to Compute. |
| STATE_AES | Computing AES (unauthenticated cipher) |
| STATE_AES_AEAD | Computing AES (AEAD). |
| STATE_AES_MAC | Computing AES (MAC). |
| STATE_SHA | Computing SHA. |
| STATE_HMAC | Computing HMAC. |
| STATE_KDF_SHA | Computing KDF SHA. |
| STATE_KDF_HMAC | Computing KDF HMAC. |

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

# Examples

### AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
```

```
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
```

```
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)
#define GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
#define GCM_AAD_LEN (8)
#define GCM_TAG_LEN (8)
void r_rsip_example_gcm ()
{
 fsp_err_t            err;
 static const uint8_t plain[GCM_TEXT_LEN] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
```

```
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e,
    };
 static const uint8_t aad[GCM_AAD_LEN] BSP_ALIGN_VARIABLE(4) =
    {
       0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07
    };
    uint8_t nonce[GCM_BLOCK_LEN] BSP_ALIGN_VARIABLE(4)                = {0};
    uint8_t tag[GCM_BLOCK_LEN] BSP_ALIGN_VARIABLE(4)                   = {0};
    uint8_t cipher_calculated[GCM_BLOCK_LEN * 2] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t plain_calculated[GCM_BLOCK_LEN * 2] BSP_ALIGN_VARIABLE(4) = {0};
    uint32_t input_length      = 0;
    uint32_t output_length    = 0;
    uint32_t input_length_tmp = 0;
    uint32_t output_length_tmp = 0;
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);

## Detailed Description

Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.

# Overview

This module provides RSIP functions in protected mode.

### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E11A | RA4L1 |
| RSIP-E31A | RA4C1 |
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |
| RSIP-E50D | RA8M2, RA8D2, RA8T2, RA8P1 |

### Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit
      - CBC 128/192/256bit
      - CTR 128/192/256bit
      - GCM 128/192/256bit
      - CCM 128/192/256bit
      - XTS 128/256bit
    - ChaCha
      - ChaCha20
      - ChaCha20-Poly1305
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 2048/3072/4096bit
      - RSAES-OAEP 2048/3072/4096bit
      - RSASSA-PKCS1-V1_5 2048/3072/4096bit
      - RSASSA-PSS 2048/3072/4096bit
    - ECC
      - ECDSA
        - secp256r1/secp384r1/secp521r1
        - secp256k1
        - brainpool P256r1/P384r1/P512r1
      - EdDSA
        - Ed25519
  - Key Agreement
    - ECDH
      - secp256r1/secp384r1/secp521r1
      - brainpool P256r1/P384r1
  - Key Derivation
    - Key Derivation Function (KDF) using SHA
      - SHA-256/384bit
    - Key Derivation Function (KDF) using HMAC
      - HMAC-SHA256/384/512bit

        - Key Import by derived keying material
        - IV output by derived keying material
    - Public Key Infrastructure (PKI)
        - Certificate Verification
            - ECDSA
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1
        - Key Import from Certificate
            - ECC
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1
    - Hash Functions
        - SHA-2
            - SHA-224, 256, 384, 512, 512/224, 512/256
        - SHA-3
            - SHA3-224, 256, 384, 512
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224, 256, 384, 512, 512/224, 512/256 bit
    - AES-CMAC 128/192/256bit
- Key Manage
    - Key Support
        - AES 128/192/256bit
        - RSA 2048/3072/4096bit
        - ECC
            - secp256r1/secp384r1/secp521r1
            - secp256k1
            - brainpool P256r1/P384r1/P512r1
        - HMAC-SHA224, 256, 384, 512, 512/224, 512/256 bit
- Random Number Generate
- Secure boot for FSBL
    - Manifest verification and MAC generation (Refer to Application Note R11AN0774.)

**Supported algorithms**

The following algorithms are available on each devices.

- RSIP-E11A: RA4L1
- RSIP-E31A: RA4C1
- RSIP-E51A: RA8M1, RA8D1, RA8T1
- RSIP-E50D: RA8M2, RA8D2, RA8T2, RA8P1

**Symmetric Key**

| Key type (rsip_key_type_t) | RSIP-E11A | RSIP-E31A | RSIP-E51A | RSIP-E50D |

|---|---|---|---|---|
| RSIP_AES_MAC_MODE_CMAC | Supported | Supported | Supported | Supported |

**ChaCha20-Poly1305 Operation**

This feature has a usage constraint that requires an input of at least one byte of encrypt/decrypt text data.

| ChaCha20-Poly1305 mode (rsip_chacha_poly_mode_t) | RSIP-E11A | RSIP-E31A | RSIP-E51A | RSIP-E50D |
|---|---|---|---|---|
| RSIP_CHACHA20_POLY1305_MODE_ENC | Not Supported | Not Supported | Not Supported | Supported |
| RSIP_CHACHA20_POLY1305_MODE_DEC | Not Supported | Not Supported | Not Supported | Supported |

**Hash Function**

Using hardware-accelerated SHA-3 in Protected Mode for use with a software PQC library is prohibited by the Protected Mode security policy due to the requirement for plaintext key usage with a software cryptographic library.

| Hash Function (rsip_hash_type_t) | RSIP-E11A | RSIP-E31A | RSIP-E51A | RSIP-E50D |
|---|---|---|---|---|
| RSIP_HASH_TYPE_SHA224 | Supported | Supported | Supported | Supported |

# Configuration

### Build Time Configurations for r_rsip_e11a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-192 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the |

| | | | |
|---|---|---|---|
| | | | functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-128 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused |

| | | | |
|---|---|---|---|
| | | | algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20-Poly1305 | Disabled | Disabled | If the application uses only some of the algorithm in the |

| | | | |
|---|---|---|---|
| | | | function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP384R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |

| | | | |
|---|---|---|---|
| ECC BRAINPOOLP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP384R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC EDWARDS25519 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| RSA-3072 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-4096 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

| | | | |
|---|---|---|---|
| | | | disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-224 | Disabled | Disabled | If the application uses only some of the |

| | | | |
|---|---|---|---|
| | | | algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it |

| | | | |
|---|---|---|---|
| | | | works effectively. |
| HMAC_SHA224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This |

| | | | |
|---|---|---|---|
| | | | configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Build Time Configurations for r_rsip_e31a_protected**

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-192 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size |

| | | | |
|---|---|---|---|
| | | | can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-128 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled | Enabled | If the application uses |

| | | | |
|---|---|---|---|
| | • Disabled | | only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20-Poly1305 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the |

| | | | |
|---|---|---|---|
| | | | functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused |

| | | | |
|---|---|---|---|
| | | | algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC EDWARDS25519 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-3072 | Disabled | Disabled | If the application uses only some of the algorithm in the |

| | | | |
|---|---|---|---|
| | | | function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-4096 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |

| | | | |
|---|---|---|---|
| SHA-384 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| SHA3-256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-384 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-512 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

| | | | |
|---|---|---|---|
| | | | disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA384 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the |

| | | | |
|---|---|---|---|
| | | | algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Build Time Configurations for r_rsip_e51a_protected**

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-192 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |

| | | | |
|---|---|---|---|
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20-Poly1305 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

| | | | |
|---|---|---|---|
| | | | disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the |

| | | | |
|---|---|---|---|
| | | | algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC EDWARDS25519 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-3072 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it |

| | | | |
|---|---|---|---|
| | | | works effectively. |
| RSA-4096 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-384 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This |

| | | | |
|---|---|---|---|
| | | | configuration is provided only for the functions for which it works effectively. |
| SHA-512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA-512_256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-224 | Disabled | config.driver.rsip.algorithms_enable.sha3_224.enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-256 | Disabled | config.driver.rsip.algorithms_enable.sha3_256.enabled | If the application uses only some of the algorithm in the function, the code size |

| | | | |
|---|---|---|---|
| | | | can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-384 | Disabled | config.driver.rsip.algorithms_enable.sha3_384.enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| SHA3-512 | Disabled | config.driver.rsip.algorithms_enable.sha3_512.enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA1 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA224 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA256 | • Enabled | Enabled | If the application uses |

| | | | |
|---|---|---|---|
| | • Disabled | | only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA384 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_224 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| HMAC_SHA512_256 | Disabled | Disabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the |

| | | | |
|---|---|---|---|
| | | | functions for which it works effectively. |
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Build Time Configurations for r_rsip_e50d_protected**

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Selection of algorithms to enable | | | |
| AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-192 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-ECB CBC CTR | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused |

| | | | |
|---|---|---|---|
| | | | algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-128 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES-256 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| XTS-AES | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-GCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CCM | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the |

| | | | |
|---|---|---|---|
| | | | function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| AES-CMAC | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ChaCha20-Poly1305 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |

| | | | |
|---|---|---|---|
| ECC SECP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP521R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC SECP256K1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP256R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP384R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is |

| | | | |
|---|---|---|---|
| | | | provided only for the functions for which it works effectively. |
| ECC BRAINPOOLP512R1 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| ECC EDWARDS25519 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-2048 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-3072 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively. |
| RSA-4096 | • Enabled<br>• Disabled | Enabled | If the application uses only some of the algorithm in the function, the code size can be reduced by |

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP Protected Mode (r_rsip_protected).

### State Transition

This driver has the following states.

| State Name | Details |
|---|---|
| STATE_INITIAL | Driver is not open. |
| STATE_MAIN | Ready to Compute. |
| STATE_AES | Computing AES (unauthenticated cipher) |
| STATE_AES_AEAD | Computing AES (AEAD). |
| STATE_AES_MAC | Computing AES (MAC). |
| STATE_CHACHA | Computing ChaCha20. |
| STATE_CHACHA_POLY | Computing ChaCha20-Poly1305. |
| STATE_SHA | Computing SHA. |
| STATE_HMAC | Computing HMAC. |
| STATE_KDF_SHA | Computing KDF SHA. |
| STATE_KDF_HMAC | Computing KDF HMAC. |

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

# Examples

### AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
```

```
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

### AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define GCM_BLOCK_LEN (16)

## Data Structure Documentation

### ◆ rsip_sha_handle_t

| struct rsip_sha_handle_t |
| --- |
| Working area for SHA functions. DO NOT MODIFY. |

### ◆ rsip_hmac_handle_t

| struct rsip_hmac_handle_t |
| --- |
| Working area for HMAC functions. DO NOT MODIFY. |

### ◆ rsip_kdf_sha_handle_t

| struct rsip_kdf_sha_handle_t |
| --- |
| Working area for KDF SHA functions. DO NOT MODIFY. |

### ◆ rsip_kdf_hmac_handle_t

| struct rsip_kdf_hmac_handle_t |
| --- |
| Working area for KDF HMAC functions. DO NOT MODIFY. |

### ◆ rsip_verified_cert_info_t

| struct rsip_verified_cert_info_t |
| --- |
| Verified certificate information |

### ◆ rsip_wrapped_secret_t

| struct rsip_wrapped_secret_t |
| --- |
| Wrapped ECDH secret structure for ECDH and KDF APIs. |

### ◆ rsip_instance_ctrl_t

| struct rsip_instance_ctrl_t |
| --- |
| RSIP private control block. DO NOT MODIFY. Initialization occurs when R_RSIP_Open() is called. |

## Macro Definition Documentation

### ◆ RSIP_BYTE_SIZE_PLAIN_KEY

| #define RSIP_BYTE_SIZE_PLAIN_KEY ( key_type) |
| --- |
| Returns the plain key size formatted for RSIP driver of the key type. |

### ◆ RSIP_BYTE_SIZE_ENCRYPTED_KEY

| #define RSIP_BYTE_SIZE_ENCRYPTED_KEY ( key_type) |
| --- |
| Returns the encrypted key size of the key type. |

### ◆ RSIP_BYTE_SIZE_WRAPPED_KEY

| #define RSIP_BYTE_SIZE_WRAPPED_KEY ( key_type) |
| --- |
| Returns the wrapped key size of the key type. |

## Enumeration Type Documentation

### ◆ rsip_byte_size_wrapped_key_t

| RSIP_BYTE_SIZE_ENCRYPTED_KEY_KDF_HMAC_SHA384 | KDF HMAC-SHA384. |
| RSIP_BYTE_SIZE_ENCRYPTED_KEY_KDF_HMAC_SHA512 | KDF HMAC-SHA512. |
| RSIP_BYTE_SIZE_ENCRYPTED_KEY_KUK | Key Update Key (KUK) |

### ◆ rsip_byte_size_wrapped_dkm_t

| enum rsip_byte_size_wrapped_dkm_t | |
|---|---|
| Byte size of wrapped key | |
| Enumerator | |
| RSIP_BYTE_SIZE_WRAPPED_DKM_HEADER | Header. |
| RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA256 | A block of SHA-256. |
| RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA384 | A block of SHA-384. |
| RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA512 | A block of SHA-384. |

## Function Documentation

### ◆ R_RSIP_Open()

fsp_err_t R_RSIP_Open ( rsip_ctrl_t *const *p_ctrl*, rsip_cfg_t const *const *p_cfg* )

Enables use of Renesas Secure IP functionality.

Implements rsip_api_t::open.

**State transition**

This API can only be executed in **STATE_INITIAL**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Internal key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Hardware initialization is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption or hardware fault is detected. |

***Note***

*This version does not have an optional feature to disable TRNG initialization.*

### ◆ R_RSIP_Close()

fsp_err_t R_RSIP_Close ( rsip_ctrl_t *const *p_ctrl*)

Disables use of Renesas Secure IP functionality.

Implements rsip_api_t::close.

**State transition**

This API can be executed in **except STATE_INITIAL**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_INITIAL |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_RandomNumberGenerate()

fsp_err_t R_RSIP_RandomNumberGenerate ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_random* )

Generates a 128-bit random number.

Implements rsip_api_t::randomNumberGenerate.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KeyGenerate()

fsp_err_t R_RSIP_KeyGenerate ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_key* )

Generates a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyGenerate.

**Conditions**

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256
- RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA512

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_KeyPairGenerate()

fsp_err_t R_RSIP_KeyPairGenerate ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_public_key*, rsip_wrapped_key_t *const *p_wrapped_private_key* )

Generates a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyPairGenerate.

**Conditions**

Argument p_wrapped_public_key->type must be one of the following:

- RSIP_KEY_TYPE_ECC_*_PUBLIC
- RSIP_KEY_TYPE_RSA_*_PUBLIC Argument p_wrapped_private_key->type must be one of the following:
- RSIP_KEY_TYPE_ECC_*_PRIVATE
- RSIP_KEY_TYPE_RSA_*_PRIVATE Here, p_wrapped_public_key->type and p_wrapped_private_key->type must match. For example, if p_wrapped_public_key->type is RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC, then p_wrapped_public_key->type must be RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_EncryptedKeyWrap()

fsp_err_t R_RSIP_EncryptedKeyWrap ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_key_update_key*, void const *const *p_initial_vector*, void const *const *p_encrypted_key*, rsip_wrapped_key_t *const *p_wrapped_key* )

Decrypts an encrypted user key with Key Update Key (KUK) and wrap it with the Hardware Unique Key (HUK).

Implements rsip_api_t::encryptedKeyWrap.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input KUK is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms

### ◆ R_RSIP_RFC3394_KeyWrap()

fsp_err_t R_RSIP_RFC3394_KeyWrap ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_wrapped_key_t const *const *p_wrapped_target_key*, uint8_t *const *p_rfc3394_wrapped_target_key* )

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyWrap.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Conditions**

- Key type of p_wrapped_kek must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256
- Key type of p_wrapped_target_key must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_ARGUMENT | Input key type or mode is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_RFC3394_KeyUnwrap()

fsp_err_t R_RSIP_RFC3394_KeyUnwrap ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, uint8_t const *const *p_rfc3394_wrapped_target_key*, rsip_wrapped_key_t *const *p_wrapped_target_key* )

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyUnwrap.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Conditions**

- Key type of p_wrapped_kek must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256
- The third argument key_type represents the key type of p_rfc3394_wrapped_target_key must be one of the following:
  - RSIP_KEY_TYPE_AES_128
  - RSIP_KEY_TYPE_AES_256

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_ARGUMENT | Input key type or mode is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_PublicKeyExport()

fsp_err_t R_RSIP_PublicKeyExport ( rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t *const *p_raw_public_key* )

Exports public key parameters from a wrapped key.

Implements rsip_api_t::publicKeyExport.

Relative position of each elements in p_raw_public_key is shown in below:

- ECC (RSIP_KEY_TYPE_ECC_*) : Qx placed first and Qy placed after that.

| bit length | Qx | Qy |
|---|---|---|
| 256 | 0 | 32 |
| 384 | 0 | 48 |
| 512 | 0 | 64 |
| 521 | 0 | 66 |

- RSA (RSIP_KEY_TYPE_RSA_*) : n placed first and e placed after that.

| modulus | n | e |
|---|---|---|
| 1024 | 0 | 128 |
| 2048 | 0 | 256 |
| 3072 | 0 | 384 |
| 4096 | 0 | 512 |

**State transition**

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_AES_Cipher_Init()

fsp_err_t R_RSIP_AES_Cipher_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_aes_cipher_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_initial_vector* )

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

**Conditions**

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128, RSIP_KEY_TYPE_AES_192, RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_XTS_AES_128, RSIP_KEY_TYPE_XTS_AES_256

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_AES |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_ARGUMENT | Input key type or mode is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_AES_Cipher_Update()

fsp_err_t R_RSIP_AES_Cipher_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint8_t *const *p_output*, uint32_t const *length* )

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesCipherUpdate.

**Conditions**

Argument length must be the following:

- [ECB][CBC][CTR] 0 or a multiple of 16.
- [XTS] 0 or greater than or equal to 16.

**Output length**

Output length to p_output is length.

**State transition**

This API can only be executed in **STATE_AES**, and does not cause any state transitions.

In XTS mode, if once an integer other than 0 or a multiple of 16 is input, this API can no longer be called.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | Input length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_AES_Cipher_Finish()

fsp_err_t R_RSIP_AES_Cipher_Finish ( rsip_ctrl_t *const *p_ctrl*)

Finishes AES operation.

Implements rsip_api_t::aesCipherFinish.

**State transition**

This API can only be executed in **STATE_AES**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_AES_AEAD_Init()

fsp_err_t R_RSIP_AES_AEAD_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_aes_aead_mode_t *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length* )

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

**Conditions**

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192

- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_AES_AEAD |
| Others | No change |

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | nonce_length is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_ARGUMENT | Input key type is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_AES_AEAD_LengthsSet()

fsp_err_t R_RSIP_AES_AEAD_LengthsSet ( rsip_ctrl_t *const *p_ctrl*, uint32_t const *total_aad_length*, uint32_t const *total_text_length*, uint32_t const *tag_length* )

Sets text and tag lengths for CCM mode.

Implements rsip_api_t::aesAeadLengthsSet.

**Conditions**

Argument total_aad_length must be equal to the length of AAD and must be 110 or less.

Argument total_test_length must be equal to the length of the plaintext or ciphertext.

Argument tag_length must be 4, 6, 8, 10, 12, 14, or 16.

**State transition**

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

The next callable API functions in STATE_AES_AEAD are as below.

- [CCM] R_RSIP_AES_AEAD_AADUpdate()

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | Input length is illegal. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

***Note***

*In GCM mode, this API must NOT be called. If called, FSP_ERR_INVALID_STATE will be returned. AAD length and text length are indeterminate and output tag length is fixed to 16 bytes.*

### ◆ R_RSIP_AES_AEAD_AADUpdate()

fsp_err_t R_RSIP_AES_AEAD_AADUpdate ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length* )

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::aesAeadAadUpdate.

**State transition**

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_AADUpdate() (AAD input is not completed), R_RSIP_AES_AEAD_Update() (AAD input is completed)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | aad_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |

### ◆ R_RSIP_AES_AEAD_Update()

fsp_err_t R_RSIP_AES_AEAD_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length* )

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesAeadUpdate.

**Output length**

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 16 bytes.

**State transition**

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_Update() (text input is not completed), R_RSIP_AES_AEAD_Finish() (text input is completed, encryption), R_RSIP_AES_AEAD_Verify() (text input is completed, decryption)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_SIZE | Input length is illegal. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

***Note***

*In GCM mode, if this API is skipped, GMAC will be calculated. For detailed usage, refer to example code.*

### ◆ R_RSIP_AES_AEAD_Finish()

fsp_err_t R_RSIP_AES_AEAD_Finish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag* )

Finalizes an AES AEAD encryption.

Implements rsip_api_t::aesAeadFinish.

**Output length**

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag as below.

- [GCM] 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

**State transition**

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_AES_AEAD_Verify()

fsp_err_t R_RSIP_AES_AEAD_Verify ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length* )

Finalizes an AES AEAD decryption.

If there is 16-byte fractional data indicated by the total data length of the value of p_cipher that was input by R_RSIP_AES_GCM_DecryptUpdate(), this API will output the result of decrypting that fractional data to p_cipher. Here, the portion that does not reach 16 bytes will be padded with zeros.

Implements rsip_api_t::aesAeadVerify.

**Conditions**

Argument tag_length must be as below.

- [GCM] 1 to 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

**Output length**

Output length to p_output (p_output_length) is the remaining calculated text length.

**State transition**

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | tag_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_AUTHENTICATION | Authentication is failed. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_AES_MAC_Init()

fsp_err_t R_RSIP_AES_MAC_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_aes_mac_mode_t const *mode*, rsip_wrapped_key_t const *const p_wrapped_key* )

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

**Conditions**

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_192
- RSIP_KEY_TYPE_AES_256

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_AES_MAC |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.*

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_AES_MAC_Update()

fsp_err_t R_RSIP_AES_MAC_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length* )

Inputs message.

Implements rsip_api_t::aesMacUpdate.

Inside this function, the data that is input by the user is buffered until the input value of p_message exceeds 16 bytes. If the input value, p_message, is not a multiple of 16 bytes, it will be padded within the function.

**State transition**

This API can only be executed in **STATE_AES_MAC**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_AES_MAC_SignFinish()

fsp_err_t R_RSIP_AES_MAC_SignFinish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac* )

Outputs AES MAC.

Implements rsip_api_t::aesMacSignFinish.

**Output length**

Output length to p_mac is 16 bytes.

**State transition**

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_AES_MAC_VerifyFinish()

fsp_err_t R_RSIP_AES_MAC_VerifyFinish ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length* )

Verifies AES MAC.

Implements rsip_api_t::aesMacVerifyFinish.

**Conditions**

Argument mac_length must be as below.

- [CMAC] 2 to 16 bytes.

**State transition**

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | mac_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Internal error. |
| FSP_ERR_CRYPTO_RSIP_AUTHENTICATION | Authentication is failed. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Init()

fsp_err_t R_RSIP_ChaCha20_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *counter* )

Prepares a ChaCha20 function.

Implements rsip_api_t::chacha20Init.

**Conditions**

Key type of p_wrapped_key must be RSIP_KEY_TYPE_CHACHA20.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_CHACHA |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Update()

fsp_err_t R_RSIP_ChaCha20_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length* )

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::chacha20Update.

**Output length**

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 64 bytes.

**State transition**

This API can only be executed in **RSIP_STATE_CHACHA**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_ChaCha20_Finish()

fsp_err_t R_RSIP_ChaCha20_Finish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length* )

Finalize ChaCha20 operation.

Implements rsip_api_t::chacha20Finish.

**Output length**

Output length to p_output (p_output_length) is the remaining calculated text length.

**State transition**

This API can only be executed in **RSIP_STATE_CHACHA**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Poly1305_Init()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_chacha_poly_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length* )

Prepares a ChaCha20-Poly1305 function.

Implements rsip_api_t::chacha20Poly1305Init.

**Conditions**

Key type of p_wrapped_key must be RSIP_KEY_TYPE_CHACHA20.

Argument mode accepts any member of enumeration rsip_chacha_poly_mode_t.

Argument nonce_length must be 12 bytes.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_CHACHA_POLY |
| Others | No change |

The next callable API functions in STATE_CHACHA_POLY are as below.

- R_RSIP_ChaCha20_Poly1305_AADUpdate(), R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | nonce_length is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_ARGUMENT | Input mode is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Poly1305_AADUpdate()

fsp_err_t R_RSIP_ChaCha20_Poly1305_AADUpdate ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length* )

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::chacha20Poly1305AadUpdate.

**State transition**

This API can only be executed in **STATE_CHACHA_POLY**, and does not cause any state transitions.

- R_RSIP_ChaCha20_Poly1305_AADUpdate(), R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_ChaCha20_Poly1305_Update()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length* )

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::chacha20Poly1305Update.

**Conditions**

At least one byte of data must be input with this API before calling R_RSIP_ChaCha20_Poly1305_Finish() or R_RSIP_ChaCha20_Poly1305_Verify().

**Output length**

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 64 bytes.

**State transition**

This API can only be executed in **STATE_CHACHA_POLY**, and does not cause any state transitions.

- R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Poly1305_Finish()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Finish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag* )

Finalizes a ChaCha20-Poly1305 encryption.

Implements rsip_api_t::chacha20Poly1305Finish.

**Output length**

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag is 16 bytes.

**State transition**

This API can only be executed in **STATE_CHACHA_POLY**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| FSP_ERR_INVALID_SIZE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | Input text length is illegal. (zero byte) |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ChaCha20_Poly1305_Verify()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Verify ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length* )

Finalizes a ChaCha20-Poly1305 decryption.

Implements rsip_api_t::chacha20Poly1305Verify.

**Conditions**

Argument tag_length must be 16 bytes.

**Output length**

Output length to p_output (p_output_length) is the remaining calculated text length.

**State transition**

This API can only be executed in **STATE_CHACHA_POLY**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | tag_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_AUTHENTICATION | Authentication is failed. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ECDSA_Sign()

fsp_err_t R_RSIP_ECDSA_Sign ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_hash*, uint8_t *const *p_signature* )

Generates an ECDSA signature.

Implements rsip_api_t::ecdsaSign.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE
- RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

| Data Format for secp521r1 (132 byte) | | | |
|---|---|---|---|
| zero padding (7 bit) | signature r (521 bit) | zero padding (7 bit) | signature s (521 bit) |

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | • Input parameter is illegal.<br>• Signature generation is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_ECDSA_Verify()

fsp_err_t R_RSIP_ECDSA_Verify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies an ECDSA signature.

Implements rsip_api_t::ecdsaVerify.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

| Data Format for secp521r1 (132 byte) | | | |
|---|---|---|---|
| zero padding (7 bit) | signature r (521 bit) | zero padding (7 bit) | signature s (521 bit) |

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | • Input parameter is illegal.<br>• Signature verification is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_PKI_ECDSA_CertVerify()

fsp_err_t R_RSIP_PKI_ECDSA_CertVerify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies a public key certificate with ECDSA.

Implements rsip_api_t::pkiEcdsaCertVerify.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

| Data Format for secp521r1 (132 byte) | | | |
|---|---|---|---|
| zero padding (7 bit) | signature r (521 bit) | zero padding (7 bit) | signature s (521 bit) |

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | • Input parameter is illegal.<br>• Signature verification is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_PureEdDSA_Sign()

fsp_err_t R_RSIP_PureEdDSA_Sign ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t *const *p_signature* )

Generates an EdDSA signature.

Implements rsip_api_t::eddsaSign.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PRIVATE

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_SIZE | Input length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_PureEdDSA_Verify()

fsp_err_t R_RSIP_PureEdDSA_Verify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t const *const *p_signature* )

Verifies an EdDSA signature.

Implements rsip_api_t::eddsaVerify.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_INVALID_SIZE | Input length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_ECDH_KeyAgree()

fsp_err_t R_RSIP_ECDH_KeyAgree ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret* )

Computes ECDH secret with wrapped private key and wrapped public key.

Implements rsip_api_t::ecdhKeyAgree.

**Conditions**

Key type of p_wrapped_private_key and p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_ECDH_PlainKeyAgree()

fsp_err_t R_RSIP_ECDH_PlainKeyAgree ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_plain_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret* )

Computes ECDH secret with wrapped private key and plain public key.

Implements rsip_api_t::ecdhPlainKeyAgree.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

For secp521r1 operation, the length of the argument p_plain_public_key must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

| Data Format for secp521r1 (132 byte) | | | |
|---|---|---|---|
| zero padding (7 bit) | public_key Qx (521 bit) | zero padding (7 bit) | public_key Qy (521 bit) |

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**Attention**

Unauthenticated public key of Diffie–Hellman key exchange generally carry the risk of man-in-the-middle (MITM) attack. Please use R_RSIP_ECDH_KeyAgree() or implement signature verification whenever possible.

### ◆ R_RSIP_KDF_SHA_Init()

fsp_err_t R_RSIP_KDF_SHA_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type* )

Prepares a SHA generation.

Implements rsip_api_t::kdfShaInit.

**Conditions**

Argument hash_type must be one of the following:
- RSIP_HASH_TYPE_SHA256
- RSIP_HASH_TYPE_SHA384

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_KDF_SHA |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |

### ◆ R_RSIP_KDF_SHA_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_SHA_ECDHSecretUpdate ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret* )

Inputs wrapped ECDH secret as a message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_Update() in the desired order.

Implements rsip_api_t::kdfShaEcdhSecretUpdate.

**Conditions**

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree(). This API can only be called if there is no previous message input, or if a 4-byte message has been input using R_RSIP_KDF_SHA_Update(). This API cannot be called multiple times in a process of performing SHA operation.

**State transition**

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_SHA_Update()

fsp_err_t R_RSIP_KDF_SHA_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length* )

Inputs message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_ECDHSecretUpdate() in the desired order.

Implements rsip_api_t::kdfShaUpdate.

**State transition**

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | Input message_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*For RSIP-E11A, the total message length that can be input is the block size of the SHA algorithm used.*

### ◆ R_RSIP_KDF_SHA_Finish()

fsp_err_t R_RSIP_KDF_SHA_Finish ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm* )

Finalizes a SHA operation and generate DKM (Derived Keying Material).

Implements rsip_api_t::kdfShaFinish.

**State transition**

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_SHA_Suspend()

fsp_err_t R_RSIP_KDF_SHA_Suspend ( rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t *const *p_handle* )

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfShaSuspend.

**State transition**

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_SHA_Resume()

fsp_err_t R_RSIP_KDF_SHA_Resume ( rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t const *const *p_handle* )

Resumes SHA operation suspended by R_RSIP_KDF_SHA_Suspend().

Implements rsip_api_t::kdfShaResume.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_KDF_SHA |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_KDF_HMAC_DKMKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_DKMKeyImport ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *key_length*, rsip_wrapped_key_t *const *p_wrapped_key* )

Converts wrapped MAC to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacDkmKeyImport.

**Conditions**

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_KDF_HMAC_SHA256
- RSIP_KEY_TYPE_KDF_HMAC_SHA384
- RSIP_KEY_TYPE_KDF_HMAC_SHA512

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

Argument kdf_data_length depends on key type.

- 32 to 64 ( RSIP_KEY_TYPE_KDF_HMAC_SHA256)
- 48 to 64 ( RSIP_KEY_TYPE_KDF_HMAC_SHA384)
- 64 ( RSIP_KEY_TYPE_KDF_HMAC_SHA512)

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_ECDHSecretKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretKeyImport ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*, rsip_wrapped_key_t *const *p_wrapped_key* )

Converts wrapped ECDH secret to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacEcdhSecretKeyImport.

**Conditions**

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_KDF_HMAC_SHA256
- RSIP_KEY_TYPE_KDF_HMAC_SHA384
- RSIP_KEY_TYPE_KDF_HMAC_SHA512

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_Init()

fsp_err_t R_RSIP_KDF_HMAC_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key* )

Prepares a HMAC generation.

Implements rsip_api_t::kdfHmacInit.

**Conditions**

Argument p_wrapped_key must be one of the following:
- Output data p_wrapped_key from R_RSIP_KDF_ECDHSecretKeyImport().
- Key type of p_wrapped_key is RSIP_KEY_TYPE_HMAC_*.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_KDF_HMAC |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |

### ◆ R_RSIP_KDF_HMAC_DKMUpdate()

fsp_err_t R_RSIP_KDF_HMAC_DKMUpdate ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm* )

Inputs wrapped Derived Keying Material (DKM) as a message.

Implements rsip_api_t::kdfHmacDkmUpdate.

**Conditions**

The argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish().

**State transition**

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_KDF_HMAC_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretUpdate ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret* )

Inputs wrapped ECDH secret as a message.

Implements rsip_api_t::kdfHmacEcdhSecretUpdate.

**Conditions**

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree().

**State transition**

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_Update()

fsp_err_t R_RSIP_KDF_HMAC_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length* )

Inputs message.

Implements rsip_api_t::kdfHmacUpdate.

**State transition**

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_SignFinish()

fsp_err_t R_RSIP_KDF_HMAC_SignFinish ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm* )

Finalizes a HMAC generation.

Implements rsip_api_t::kdfHmacSignFinish.

**State transition**

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_Suspend()

fsp_err_t R_RSIP_KDF_HMAC_Suspend ( rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t *const *p_handle* )

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfHmacSuspend.

**State transition**

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_HMAC_Resume()

fsp_err_t R_RSIP_KDF_HMAC_Resume ( rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t const *const *p_handle* )

Resumes HMAC operation suspended by R_RSIP_KDF_HMAC_Suspend().

Implements rsip_api_t::kdfHmacResume.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_KDF_HMAC |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_KDF_DKMConcatenate()

fsp_err_t R_RSIP_KDF_DKMConcatenate ( rsip_wrapped_dkm_t *const *p_wrapped_dkm1*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm2*, uint32_t const *wrapped_dkm1_buffer_length* )

Concatenates two wrapped derived keying materials (DKMs).

DKM1 || DKM2 is output to p_wrapped_dkm1.

Implements rsip_api_t::kdfDkmConcatenate.

**State transition**

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |

### ◆ R_RSIP_KDF_DerivedKeyImport()

fsp_err_t R_RSIP_KDF_DerivedKeyImport ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *position*, rsip_wrapped_key_t *const *p_wrapped_key* )

Outputs a wrapped key from KDF output.

Implements rsip_api_t::kdfDerivedKeyImport.

**Conditions**

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument key_type must be one of the following:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_KDF_DerivedIVWrap()

fsp_err_t R_RSIP_KDF_DerivedIVWrap ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, rsip_initial_vector_type_t const *initial_vector_type*, uint32_t const *position*, uint8_t const *const *p_tls_sequence_num*, uint8_t *const *p_wrapped_initial_vector* )

Outputs a initial vector from KDF output.

Implements rsip_api_t::kdfDerivedIvWrap

**Conditions**

Argument p_wrapped_mac must be input the result of R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_MACConcatenate(). Argument initial_vector_type must be one of the following:

- RSIP_INITIAL_VECTOR_TYPE_AES_16_BYTE

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_OTF_Init()

fsp_err_t R_RSIP_OTF_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_otf_channel_t const *channel*, rsip_wrapped_key_t *const *p_wrapped_key*, uint8_t const *const *p_seed* )

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled or selected channel is invalid. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms

**Attention**

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled.

### ◆ R_RSIP_PKI_VerifiedCertInfoExport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoExport ( rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t *const *p_verified_cert_info* )

Exports verified certificate information stored in this driver.

The certificate is last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), R_RSIP_PKI_RSASSA_PSS_CertVerify(), or R_RSIP_PKI_VerifiedCertInfoImport().

Implements rsip_api_t::pkiVerifiedCertInfoExport.

**State transition**

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |

### ◆ R_RSIP_PKI_VerifiedCertInfoImport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoImport ( rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t const *const *p_verified_cert_info* )

Imports verified certificate information.

Implements rsip_api_t::pkiVerifiedCertInfoImport.

**State transition**

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |

### ◆ R_RSIP_PKI_CertKeyImport()

fsp_err_t R_RSIP_PKI_CertKeyImport ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_cert*, uint32_t const *cert_length*, uint8_t const *const *p_key_param1*, uint32_t const *key_param1_length*, uint8_t const *const *p_key_param2*, uint32_t const *key_param2_length*, rsip_hash_type_t const *hash_function*, rsip_wrapped_key_t *const *p_wrapped_public_key* )

Wraps the public key in the verified public key certificate.

Implements rsip_api_t::pkiCertKeyImport.

**Conditions**

Argument key_type must be one of the following:

- RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC
- RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC
- RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

- *Argument p_cert must correspond to the signature of the last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), or R_RSIP_PKI_RSASSA_PSS_CertVerify().*
- *For arguments p_key_param1 and p_key_param2, specify an address inside the certificate. Addresses outside the certificate are invalid.*

**See also**

### ◆ R_RSIP_RSA_Encrypt()

fsp_err_t R_RSIP_RSA_Encrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint8_t *const *p_cipher* )

Encrypts plaintext with raw RSA.

Implements rsip_api_t::rsaEncrypt.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*This API provides RSA low-level primitives (RSAEP/RSAVP1). It should be used in conjunction with any padding scheme.*

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSA_Decrypt()

fsp_err_t R_RSIP_RSA_Decrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain* )

Decrypts ciphertext with raw RSA.

Implements rsip_api_t::rsaDecrypt.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:
- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*This API provides RSA low-level primitives (RSADP/RSASP1). It should be used in conjunction with any padding scheme.*

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSAES_PKCS1_V1_5_Encrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Encrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher* )

Encrypts plaintext with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Encrypt.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length) and k (modulus length) must meet the following condition.

- mLen <= k - 11

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSAES_PKCS1_V1_5_Decrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Decrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length* )

Decrypts with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Decrypt.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

plain_buffer_length must be greater than or equal to mLen(plaintext length).

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.2.2 Step 1.*

### ◆ R_RSIP_RSAES_OAEP_Encrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Encrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher* )

Encrypts plaintext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepEncrypt.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

mLen (plain_length), hLen (hash length of hash_function), and k (modulus length) must meet the following condition.

- mLen <= k - 2 hLen - 2

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSAES_OAEP_Decrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Decrypt ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length* )

Decrypts ciphertext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepDecrypt.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

hLen (hash length of hash_function) and k (modulus length) must meet the following condition.

- k >= 2 hLen + 2

plain_buffer_length must be greater than or equal to mLen(plaintext length).

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

***Note***

*This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.1.2 Step 1.*

### ◆ R_RSIP_RSASSA_PKCS1_V1_5_Sign()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Sign ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t *const *p_signature* )

Signs message with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Sign.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSASSA_PKCS1_V1_5_Verify()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Verify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies signature with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Verify.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Message hash p_hash should be computed in advance with hash_function.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSASSA_PSS_Sign()

fsp_err_t R_RSIP_RSASSA_PSS_Sign ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t *const

*p_signature* )

Signs message with RSASSA-PSS.

Implements rsip_api_t::rsassaPssSign.

**Conditions**

Key type of p_wrapped_private_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PRIVATE
- RSIP_KEY_TYPE_RSA_3072_PRIVATE
- RSIP_KEY_TYPE_RSA_4096_PRIVATE

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_RSASSA_PSS_Verify()

fsp_err_t R_RSIP_RSASSA_PSS_Verify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies signature with RSASSA-PSS. Implements rsip_api_t::rsassaPssVerify.

**Conditions**

Key type of p_wrapped_public_key must be one of the following:

- RSIP_KEY_TYPE_RSA_2048_PUBLIC
- RSIP_KEY_TYPE_RSA_3072_PUBLIC
- RSIP_KEY_TYPE_RSA_4096_PUBLIC

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

Argument mask_generation_function accepts any member of enumeration rsip_mgf_type_t.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| | |

| | |
|---|---|
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies a certificate with RSASSA-PKCS1-v1_5.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_ctrl | Pointer to control block. |
| [in] | p_wrapped_public_key | Pointer to wrapped key of RSA public key. |
| [in] | hash_function | Hash function in EMSA-PKCS1-v1_5. |
| [in] | p_hash | Pointer to input hash. |
| [in] | p_signature | Pointer to input signature. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_PKI_RSASSA_PSS_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PSS_CertVerify ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature* )

Verifies a certificate with RSASSA-PSS.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_ctrl | Pointer to control block. |
| [in] | p_wrapped_public_key | Pointer to wrapped key of RSA public key. |
| [in] | hash_function | Hash function in EMSA-PSS-VERIFY. |
| [in] | mask_generation_function | Mask generation function in EMSA-PSS-VERIFY. |
| [in] | salt_length | Salt length. RSIP_RSA_SALT_LENGTH_AUTO, RSIP_RSA_SALT_LENGTH_HASH, RSIP_RSA_SALT_LENGTH_MAX, 0, or positive integers can be set, where salt_length <= emLen - hLen - 2 (emLen is the same as the key length and hLen is the hash length). |
| [in] | p_hash | Pointer to input hash. |
| [in] | p_signature | Pointer to input signature. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | Input parameter is invalid. |
| FSP_ERR_INVALID_SIZE | Any length is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLI | A resource conflict occurred because a |

| | |
|---|---|
| CT | hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_SHA_Compute()

fsp_err_t R_RSIP_SHA_Compute ( rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_digest* )

Generates SHA message digest. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaCompute.

**Conditions**

See R_RSIP_SHA_Init().

**Output length**

See R_RSIP_SHA_Finish().

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_SHA_Init()

fsp_err_t R_RSIP_SHA_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type* )

Starts SHA operation.

Implements rsip_api_t::shaInit.

**Conditions**

Argument hash_function accepts any member of enumeration rsip_hash_type_t.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_SHA |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_SHA_Update()

fsp_err_t R_RSIP_SHA_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length* )

Inputs SHA message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaUpdate.

**State transition**

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_SHA_Finish()

fsp_err_t R_RSIP_SHA_Finish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_digest* )

Outputs SHA message digest.

Implements rsip_api_t::shaFinish.

**Output length**

Output length to p_digest depends on hash_function.

- 28 ( RSIP_HASH_TYPE_SHA224, RSIP_HASH_TYPE_SHA512_224, RSIP_HASH_TYPE_SHA3_224)
- 32 ( RSIP_HASH_TYPE_SHA256, RSIP_HASH_TYPE_SHA512_256, RSIP_HASH_TYPE_SHA3_256)
- 48 ( RSIP_HASH_TYPE_SHA384, RSIP_HASH_TYPE_SHA3_384)
- 64 ( RSIP_HASH_TYPE_SHA512, RSIP_HASH_TYPE_SHA3_512)

**State transition**

This API can only be executed in **STATE_SHA**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_SHA_Suspend()

fsp_err_t R_RSIP_SHA_Suspend ( rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t *const *p_handle* )

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::shaSuspend.

**State transition**

This API can only be executed in **STATE_SHA**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_SHA_Resume()

fsp_err_t R_RSIP_SHA_Resume ( rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t const *const *p_handle* )

Resumes SHA operation suspended by R_RSIP_SHA_Suspend().

Implements rsip_api_t::shaResume.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_SHA |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_HMAC_Compute()

fsp_err_t R_RSIP_HMAC_Compute ( rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_mac* )

Generates HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacCompute.

**Conditions**

See R_RSIP_HMAC_Init().

**Output length**

See R_RSIP_HMAC_SignFinish().

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_HMAC_Verify()

fsp_err_t R_RSIP_HMAC_Verify ( rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t const *const *p_mac*, uint32_t const *mac_length* )

Verifies HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacVerify.

**Conditions**

See R_RSIP_HMAC_Init() and R_RSIP_HMAC_VerifyFinish().

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | mac_length is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key value is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | MAC verification is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_HMAC_Init()

fsp_err_t R_RSIP_HMAC_Init ( rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key* )

Starts HMAC operation.

Implements rsip_api_t::hmacInit.

**Conditions**

Key type of p_wrapped_key must be one of the following:

- RSIP_KEY_TYPE_HMAC_SHA224
- RSIP_KEY_TYPE_HMAC_SHA256
- RSIP_KEY_TYPE_HMAC_SHA384
- RSIP_KEY_TYPE_HMAC_SHA512
- RSIP_KEY_TYPE_HMAC_SHA512_224
- RSIP_KEY_TYPE_HMAC_SHA512_256

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_HMAC |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_NOT_ENABLED | Input key type is disabled in this function by configuration. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |

**See also**

Section Supported Algorithms.

### ◆ R_RSIP_HMAC_Update()

fsp_err_t R_RSIP_HMAC_Update ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length* )

Inputs HMAC message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacUpdate.

**State transition**

This API can only be executed in **STATE_HMAC**, and does not cause any state transitions.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_HMAC_SignFinish()

fsp_err_t R_RSIP_HMAC_SignFinish ( rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac* )

Outputs HMAC.

Implements rsip_api_t::hmacSignFinish.

**Output length**

Output length to p_mac depends on key type of p_wrapped_key.

- 28 ( RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA512_224)
- 32 ( RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA512_256)
- 48 ( RSIP_KEY_TYPE_HMAC_SHA384)
- 64 ( RSIP_KEY_TYPE_HMAC_SHA512)

**State transition**

This API can only be executed in **STATE_HMAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_HMAC_VerifyFinish()

fsp_err_t R_RSIP_HMAC_VerifyFinish ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length* )

Verifies HMAC.

Implements rsip_api_t::hmacVerifyFinish.

**Conditions**

Argument mac_length depends on key type of p_wrapped_key. Usually the longest length is recommended.

- 4 to 28 ( RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA512_224)
- 4 to 32 ( RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA512_256)
- 4 to 48 ( RSIP_KEY_TYPE_HMAC_SHA384)
- 4 to 64 ( RSIP_KEY_TYPE_HMAC_SHA512)

**State transition**

This API can only be executed in **STATE_HMAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| FSP_ERR_ASSERTION | No change |
| FSP_ERR_NOT_OPEN | No change |
| FSP_ERR_INVALID_STATE | No change |
| FSP_ERR_INVALID_SIZE | No change |
| Others | STATE_MAIN |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_INVALID_SIZE | mac_length is illegal. |
| FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL | Input key is illegal. |
| FSP_ERR_CRYPTO_RSIP_FAIL | MAC verification is failed. |
| FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_HMAC_Suspend()

fsp_err_t R_RSIP_HMAC_Suspend ( rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t *const *p_handle* )

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::hmacSuspend.

**State transition**

This API can only be executed in **STATE_HMAC**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_MAIN |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_CRYPTO_RSIP_FATAL | Software corruption is detected. |

### ◆ R_RSIP_HMAC_Resume()

fsp_err_t R_RSIP_HMAC_Resume ( rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t const *const *p_handle* )

Resumes HMAC operation suspended by R_RSIP_HMAC_Suspend().

Implements rsip_api_t::hmacResume.

**State transition**

This API can only be executed in **STATE_MAIN**, and causes state transition.

| Return value | Next state |
|---|---|
| FSP_SUCCESS | STATE_HMAC |
| Others | No change |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |

### ◆ R_RSIP_FSBL_OEM_BL_Digest_Generate()

fsp_err_t R_RSIP_FSBL_OEM_BL_Digest_Generate ( rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key_cert*, uint32_t const *key_cert_max_length*, uint8_t const *const *p_code_cert*, uint32_t const *code_cert_max_length*, uint32_t *const *p_mac* )

Verifies a Manifest signature and outputs the MAC of image and code certificate. The hash algorithm only supports HMAC-SHA256. The signature algorithm only supports ECDSA secp256r1.

**State transition**

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

***Note***

*If this API returns FSP_ERR_SB_LOWER_IMAGE_VERSION or FSP_ERR_SB_CRYPTO_AUTH_FAIL, RSIP stops working. In this case, RSIP can be resumed by executing R_RSIP_Close() and R_RSIP_Open() in that order.*

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_ctrl | Pointer to control block. |
| [in] | p_key_cert | Pointer to key certificate. |
| [in] | key_cert_max_length | Maximum length of key certificate. |
| [in] | p_code_cert | Pointer to key code certificate. |

| | | |
|---|---|---|
| [in] | code_cert_max_length | Maximum length of code certificate. |
| [out] | p_mac | Pointer to output MAC. It is output in TLV format and consists of a 4-byte Type-Length and a 32-byte Value. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_STATE | Internal state is illegal. |
| FSP_ERR_SB_INTERNAL_FAIL | An internal failure. |
| FSP_ERR_SB_INVALID_ARG | An invalid argument was entered. |
| FSP_ERR_SB_UNSUPPORTED_FUNCTION | Unsupported function executed. |
| FSP_ERR_SB_INVALID_ALIGNMENT | Data entered with incorrect alignment. |
| FSP_ERR_SB_SAME_IMAGE_VERSION | An image of the same version as the current version is input. (verification completed successfully) |
| FSP_ERR_SB_LOWER_IMAGE_VERSION | Image version lower than the current image version is installed. |
| FSP_ERR_SB_MANI_INVALID_MAGIC | An invalid magic number is set. |
| FSP_ERR_SB_MANI_UNSUPPORTED_VERSION | Unsupported version is set. |
| FSP_ERR_SB_MANI_OUT_OF_RANGE_LEN | Out of range TLV Length is set. |
| FSP_ERR_SB_MANI_TLV_FIELD_ERR | Missing required TLV field. |
| FSP_ERR_SB_MANI_TLV_INVALID_LEN | The length exceeding the end of the manifest is specified in length of the TLV field. |
| FSP_ERR_SB_MANI_INVALID_IMAGE_LEN | An invalid image length is set. |
| FSP_ERR_SB_MANI_MISMATCH_SIGN_ALGORITHM | There is a wrong combination of signature algorithms. |
| FSP_ERR_SB_MANI_UNSUPPORTED_ALGORITHM | An algorithm was specified that the manifest does not support. |
| FSP_ERR_SB_CRYPTO_FAIL | Cryptographic processing failure. |
| FSP_ERR_SB_CRYPTO_AUTH_FAIL | Verification failed. |
| FSP_ERR_SB_CRYPTO_PARAM_ERR | Parameter error. |
| FSP_ERR_SB_CRYPTO_RESOURCE_CONFLICT | CryptoIP is in use. |
| FSP_ERR_UNSUPPORTED | This API is not supported on this device. |

### Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

# Overview

This module provides SCE functions in protected mode.

*Note*

***For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.***

### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| SCE9 (Protected mode) | RA4M2, RA4M3, RA6M4, RA6M5 |

### Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1

    - HMAC-SHA256bit
- TRNG
- TLS
    - SSL / TLS support function (TLS1.2 compliant)

# Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

### Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

### Limitations

### Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

### SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

| | |
|---|---|
| message | [in] Start address of message |
| digest | [in,out] address for storing hash calculation result (48 bytes) |
| message_length | [in] Effective byte count of message |

Return values

| | |
|---|---|
| 0 | Hash value stored successfully. |
| others | Storing of hash value failed. |

# Examples

### AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
```

```
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

### ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
```

```
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */
 R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
 /* Verify Signature and Public wrapped key */
    return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 if (FSP_SUCCESS != return_code)
    {
 while (1)
     {
 /* Verify Fail */
       }
    }
 else
```

```
    {
 while (1)
      {
 /* Verify Success */
       }
    }
}
```

### RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,
0x1d, 0x1e, 0x1f,
    0x20, 0x21, 0x22, 0x23, 0x24, 0x25, 0x26, 0x27, 0x28, 0x29, 0x2a, 0x2b, 0x2c,
0x2d, 0x2e, 0x2f,
    0x30, 0x31, 0x32, 0x33, 0x34, 0x35, 0x36, 0x37, 0x38, 0x39, 0x3a, 0x3b, 0x3c,
0x3d, 0x3e, 0x3f,
    0x40, 0x41, 0x42, 0x43, 0x44, 0x45, 0x46, 0x47, 0x48, 0x49, 0x4a, 0x4b, 0x4c,
0x4d, 0x4e, 0x4f,
    0x50, 0x51, 0x52, 0x53, 0x54, 0x55, 0x56, 0x57, 0x58, 0x59, 0x5a, 0x5b, 0x5c,
0x5d, 0x5e, 0x5f,

```

### HASH Example

This is an example of calculating the SHA256 hash.

```
uint8_t message[] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,
0x1d, 0x1e, 0x1f,
};
uint8_t hash[] =
{
    0x63, 0x0d, 0xcd, 0x29, 0x66, 0xc4, 0x33, 0x66, 0x91, 0x12, 0x54, 0x48, 0xbb,
0xb2, 0x5b, 0x4f,
    0xf4, 0x12, 0xa4, 0x9c, 0x73, 0x2d, 0xb2, 0xc8, 0xab, 0xc1, 0xb8, 0x58, 0x1b,
0xd7, 0x10, 0xdd
```

```
};
void r_sce_example_hash ()
{
 sce_sha_md5_handle_t handle;
    uint8_t             digest[HW_SCE_SHA256_HASH_LENGTH_BYTE_SIZE] = {0};
    uint32_t             digest_length = 0;
 /* SCE power on */

## Data Structures

| | |
|---|---|
| struct | sce_instance_ctrl_t |

## Data Structure Documentation

### ◆ sce_instance_ctrl_t

| struct sce_instance_ctrl_t |
| --- |
| SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called. |

## Function Documentation

### ◆ R_SCE_Open()

fsp_err_t R_SCE_Open ( sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg* )

Enables use of SCE functionality.

**Parameters**

| | | |
| --- | --- | --- |
| [in] | p_ctrl | Pointer to control structure. |
| [in] | p_cfg | Pointer to pin configuration structure. |

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_FAIL | The error-detection self-test failed to terminate normally. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_RETRY | Indicates that an entropy evaluation failure occurred. Run the function again. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

***Note***

*The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_Close()

fsp_err_t R_SCE_Close ( sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Pointer to control structure. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |

***Note***

*The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.*

### ◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset ( void )

Software reset to SCE.

Reverts the state to the SCE initial state.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |

***Note***

*The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.*

### ◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate ( sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.*

### ◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate ( sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.*

### ◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate ( sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | User key index for RSA 1024-bit public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. Key generation failed. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate ( sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | User key index for RSA 2048-bit public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. Key generation failed. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp192r1 public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp224r1 public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp256r1 public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate ( sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

**Parameters**

| | | |
|---|---|---|
| [in,out] | wrapped_pair_key | Wrapped pair key for secp384r1 public key and private key pair |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate ( uint32_t * *random*)

This API can generate 4 words random number.

**Parameters**

| | | |
|---|---|---|
| [in,out] | random | Stores 4words (16 bytes) random data. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key* )

This API wraps 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key* )

This API wraps 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap ( sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key* )

This API wraps 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | master_key | AES-128 key used for wrapping. |
| [in] | target_key_type | Selects key to be wrapped. |
| [in] | target_key | Key to be wrapped. |
| [out] | rfc3394_wrapped_key | Wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

### ◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap ( sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key* )

This API wraps 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | master_key | AES-256 key used for wrapping. |
| [in] | target_key_type | Selects key to be wrapped. |
| [in] | target_key | Key to be wrapped. |
| [out] | rfc3394_wrapped_key | Wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

### ◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key* )

This API unwraps 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | master_key | AES-128 key used for unwrapping. |
| [in] | target_key_type | Selects key to be unwrapped. |
| [in] | rfc3394_wrapped_key | Wrapped key. |
| [out] | target_key | Key to be unwrapped. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

### ◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap ( sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key* )

This API unwraps 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | master_key | AES-256 key used for unwrapping. |
| [in] | target_key_type | Selects key to be unwrapped. |
| [in] | rfc3394_wrapped_key | Wrapped key. |
| [out] | target_key | Key to be unwrapped. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | Resource conflict. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal user Key Generation Information. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

### ◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key* )

This API wraps HMAC-SHA256 key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | HMAC-SHA256 wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key* )

This API wraps 1024-bit RSA public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key* )

This API wraps 1024-bit RSA private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key* )

This API wraps 2048-bit RSA public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key* )

This API wraps 2048-bit RSA private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key* )

This API wraps 3072-bit RSA public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 3072-bit RSA public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key* )

This API wraps 4096-bit RSA public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 1024-bit RSA public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

This API wraps secp192r1 public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp192r1 public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

This API wraps secp224r1 public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp224r1 public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

This API wraps secp256r1 public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp256r1 public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

This API wraps secp384r1 public key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp384r1 public wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

This API wraps secp192r1 private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp192r1 private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

This API wraps secp224r1 private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp224r1 private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

This API wraps secp256r1 private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp256r1 private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

This API wraps secp384r1 private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | secp384r1 private wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_EncryptInit()

fsp_err_t R_SCE_AES128ECB_EncryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES128ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_EncryptUpdate() function and R_SCE_AES128ECB_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_EncryptUpdate()

fsp_err_t R_SCE_AES128ECB_EncryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES128ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in,out] | plain_length | plaintext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_EncryptFinal()

fsp_err_t R_SCE_AES128ECB_EncryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_DecryptInit()

fsp_err_t R_SCE_AES128ECB_DecryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_DecryptUpdate()

fsp_err_t R_SCE_AES128ECB_DecryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES128ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128ECB_DecryptFinal()

fsp_err_t R_SCE_AES128ECB_DecryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_EncryptInit()

fsp_err_t R_SCE_AES256ECB_EncryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES256ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256ECB_EncryptUpdate() function and R_SCE_AES256ECB_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_EncryptUpdate()

fsp_err_t R_SCE_AES256ECB_EncryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES256ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in,out] | plain_length | plaintext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_EncryptFinal()

fsp_err_t R_SCE_AES256ECB_EncryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_DecryptInit()

fsp_err_t R_SCE_AES256ECB_DecryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_DecryptUpdate()

fsp_err_t R_SCE_AES256ECB_DecryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES256ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256ECB_DecryptFinal()

fsp_err_t R_SCE_AES256ECB_DecryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_EncryptInit()

fsp_err_t R_SCE_AES128CBC_EncryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector* )

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_EncryptUpdate()

fsp_err_t R_SCE_AES128CBC_EncryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES128CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in,out] | plain_length | plaintext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_EncryptFinal()

fsp_err_t R_SCE_AES128CBC_EncryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_DecryptInit()

fsp_err_t R_SCE_AES128CBC_DecryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector* )

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_DecryptUpdate()

fsp_err_t R_SCE_AES128CBC_DecryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES128CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CBC_DecryptFinal()

fsp_err_t R_SCE_AES128CBC_DecryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_EncryptInit()

fsp_err_t R_SCE_AES256CBC_EncryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector* )

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initial vector area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_EncryptUpdate()

fsp_err_t R_SCE_AES256CBC_EncryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES256CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in,out] | plain_length | plaintext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_EncryptFinal()

fsp_err_t R_SCE_AES256CBC_EncryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | cipher | ciphertext data area (nothing ever written here) |
| [in,out] | cipher_length | ciphertext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_DecryptInit()

fsp_err_t R_SCE_AES256CBC_DecryptInit ( sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector* )

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Input illegal wrapped key. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_DecryptUpdate()

fsp_err_t R_SCE_AES256CBC_DecryptUpdate ( sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES256CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in,out] | cipher_length | ciphertext data length (must be a multiple of 16) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CBC_DecryptFinal()

fsp_err_t R_SCE_AES256CBC_DecryptFinal ( sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length* )

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES handler (work area) |
| [in,out] | plain | plaintext data area (nothing ever written here) |
| [in,out] | plain_length | plaintext data length (0 always written here) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_EncryptInit()

fsp_err_t R_SCE_AES128GCM_EncryptInit ( sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length* )

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 ore more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_EncryptUpdate()

fsp_err_t R_SCE_AES128GCM_EncryptUpdate ( sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length* )

The R_SCE_AES128GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_data_length | plaintext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | After the data from plain was input, an invalid handle was input from aad. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_EncryptFinal()

fsp_err_t R_SCE_AES128GCM_EncryptFinal ( sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag* )

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area (cipher_data_length byte) |
| [in,out] | cipher_data_length | ciphertext data length (0 always written here) |
| [in,out] | atag | authentication tag area |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_DecryptInit()

fsp_err_t R_SCE_AES128GCM_DecryptInit ( sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length* )

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 ore more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_DecryptUpdate()

fsp_err_t R_SCE_AES128GCM_DecryptUpdate ( sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length* )

The R_SCE_AES128GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in] | plain | plaintext data area |
| [in] | cipher_data_length | ciphertext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | After the data from plain was input, an invalid handle was input from aad. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128GCM_DecryptFinal()

fsp_err_t R_SCE_AES128GCM_DecryptFinal ( sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length* )

The R_SCE_AES128GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES128GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | plain | plaintext data area (cipher_data_length byte) |
| [in,out] | plain_data_length | plaintext data length (0 always written here) |
| [in,out] | atag | authentication tag area (atag_length byte) |
| [in] | atag_length | authentication tag length (4,8,12,13,14,15,16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_EncryptInit()

fsp_err_t R_SCE_AES256GCM_EncryptInit ( sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length* )

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 ore more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_EncryptUpdate()

fsp_err_t R_SCE_AES256GCM_EncryptUpdate ( sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length* )

The R_SCE_AES256GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_data_length | plaintext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | After the data from plain was input, an invalid handle was input from aad. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_EncryptFinal()

fsp_err_t R_SCE_AES256GCM_EncryptFinal ( sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag* )

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area (cipher_data_length byte) |
| [in,out] | cipher_data_length | ciphertext data length (0 always written here) |
| [in,out] | atag | authentication tag area |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_DecryptInit()

fsp_err_t R_SCE_AES256GCM_DecryptInit ( sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length* )

The R_SCE_AES256GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_DecryptUpdate() function and R_SCE_AES256GCM_DecryptFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | initial_vector | initialization vector area (initial_vector_length byte) |
| [in] | initial_vector_length | initialization vector length (1 ore more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_DecryptUpdate()

fsp_err_t R_SCE_AES256GCM_DecryptUpdate ( sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length* )

The R_SCE_AES256GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in] | plain | plaintext data area |
| [in] | cipher_data_length | ciphertext data length (0 or more bytes) |
| [in] | aad | additional authentication data (aad_length byte) |
| [in] | aad_length | additional authentication data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | After the data from plain was input, an invalid handle was input from aad. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256GCM_DecryptFinal()

fsp_err_t R_SCE_AES256GCM_DecryptFinal ( sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length* )

The R_SCE_AES256GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES256GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-GCM handler (work area) |
| [in,out] | plain | plaintext data area (cipher_data_length byte) |
| [in,out] | plain_data_length | plaintext data length (0 always written here) |
| [in,out] | atag | authentication tag area (atag_length byte) |
| [in] | atag_length | authentication tag length (4,8,12,13,14,15,16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_EncryptInit()

fsp_err_t R_SCE_AES128CCM_EncryptInit ( sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length* )

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_EncryptUpdate()

fsp_err_t R_SCE_AES128CCM_EncryptUpdate ( sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES128CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES128CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_length | plaintext data length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_EncryptFinal()

fsp_err_t R_SCE_AES128CCM_EncryptFinal ( sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length* )

If the data length of plain input in R_SCE_AES128CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes128CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in,out] | cipher_length | ciphertext data length |
| [in,out] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_DecryptInit()

fsp_err_t R_SCE_AES128CCM_DecryptInit ( sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length* )

The R_SCE_AES128CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_DecryptUpdate() and R_SCE_AES128CCM_DecryptFinal() use handle as an argument.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_DecryptUpdate()

fsp_err_t R_SCE_AES128CCM_DecryptUpdate ( sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES128CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES128CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in] | cipher_length | ciphertext data length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CCM_DecryptFinal()

fsp_err_t R_SCE_AES128CCM_DecryptFinal ( sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length* )

If the data length of cipher input in R_SCE_AES128GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes128CcmDecryptInit().

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | plain | plaintext data area |
| [in,out] | plain_length | plaintext data length |
| [in] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error, or authentication failed. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_EncryptInit()

fsp_err_t R_SCE_AES256CCM_EncryptInit ( sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length* )

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_EncryptUpdate()

fsp_err_t R_SCE_AES256CCM_EncryptUpdate ( sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length* )

The R_SCE_AES256CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES256CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | plain | plaintext data area |
| [in,out] | cipher | ciphertext data area |
| [in] | plain_length | plaintext data length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_EncryptFinal()

fsp_err_t R_SCE_AES256CCM_EncryptFinal ( sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length* )

If the data length of plain input in R_SCE_AES256CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes256CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | cipher | ciphertext data area |
| [in,out] | cipher_length | ciphertext data length |
| [in,out] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_DecryptInit()

fsp_err_t R_SCE_AES256CCM_DecryptInit ( sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length* )

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |
| [in] | nonce | Nonce |
| [in] | nonce_length | Nonce data length (7 to 13 bytes) |
| [in] | adata | additional authentication data |
| [in] | a_length | additional authentication data length (0 to 110 bytes) |
| [in] | payload_length | Payload length (any number of bytes) |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_DecryptUpdate()

fsp_err_t R_SCE_AES256CCM_DecryptUpdate ( sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length* )

The R_SCE_AES256CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES256CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in] | cipher | ciphertext data area |
| [in,out] | plain | plaintext data area |
| [in] | cipher_length | ciphertext data length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CCM_DecryptFinal()

fsp_err_t R_SCE_AES256CCM_DecryptFinal ( sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length* )

If the data length of cipher input in R_SCE_AES256GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes256CcmDecryptInit().

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CCM handler (work area) |
| [in,out] | plain | plaintext data area |
| [in,out] | plain_length | plaintext data length |
| [in] | mac | MAC area |
| [in] | mac_length | MAC length (4, 6, 8, 10, 12, 14, or 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error, or authentication failed. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_GenerateInit()

fsp_err_t R_SCE_AES128CMAC_GenerateInit ( sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES128CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_GenerateUpdate() function and R_SCE_AES128CMAC_GenerateFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES128CMAC_GenerateUpdate ( sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_AES128CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_GenerateFinal()

fsp_err_t R_SCE_AES128CMAC_GenerateFinal ( sce_cmac_handle_t * *handle*, uint8_t * *mac* )

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Not used. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_VerifyInit()

fsp_err_t R_SCE_AES128CMAC_VerifyInit ( sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES128CMAC_VerifyUpdate ( sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128CMAC_VerifyFinal()

fsp_err_t R_SCE_AES128CMAC_VerifyFinal ( sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length* )

The R_SCE_AES128CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (mac_length byte) |
| [in,out] | mac_length | MAC data length (2 to 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_GenerateInit()

fsp_err_t R_SCE_AES256CMAC_GenerateInit ( sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES256CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CMAC_GenerateUpdate() function and R_SCE_AES256CMAC_GenerateFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES256CMAC_GenerateUpdate ( sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_AES256CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_GenerateFinal()

fsp_err_t R_SCE_AES256CMAC_GenerateFinal ( sce_cmac_handle_t * *handle*, uint8_t * *mac* )

The R_SCE_AES256CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (16byte) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Not used. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_VerifyInit()

fsp_err_t R_SCE_AES256CMAC_VerifyInit ( sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_AES256CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES256CMAC_VerifyUpdate() function and R_SCE_AES256CMAC_VerifyFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES256CMAC_VerifyUpdate ( sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_AES256CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in] | message | message data area (message_length byte) |
| [in] | message_length | message data length (0 or more bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256CMAC_VerifyFinal()

fsp_err_t R_SCE_AES256CMAC_VerifyFinal ( sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length* )

The R_SCE_AES256CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | AES-CMAC handler (work area) |
| [in,out] | mac | MAC data area (mac_length byte) |
| [in,out] | mac_length | MAC data length (2 to 16 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_ASSERTION | A required parameter is NULL. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init ( sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA handler (work area) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update ( sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA handler (work area) |
| [in] | message | message data area |
| [in] | message_length | message data length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final ( sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length* )

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA handler (work area) |
| [in,out] | digest | hasha data area |
| [in,out] | digest_length | hash data length (32bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit ( sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key* )

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handler (work area) |
| [in] | wrapped_key | MAC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | An invalid MAC wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate ( sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | message | Message area |
| [in] | message_length | Message length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal ( sce_hmac_sha_handle_t * *handle*, uint8_t * *mac* )

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in,out] | mac | HMAC area (32 bytes) |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit ( sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key* )

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handler (work area) |
| [in] | wrapped_key | MAC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | An invalid MAC wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate ( sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length* )

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | message | Message area |
| [in] | message_length | Message length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal ( sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length* )

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | SHA-HMAC handle (work area) |
| [in] | mac | HMAC area |
| [in] | mac_length | HMAC length |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate ( sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value |

| | | |
|---|---|---|
| | | • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : data length |
| [in] | wrapped_key | Inputs the 1024-bit RSA private wrapped key. |
| [in] | hash_type | Only HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify ( sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to verify<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

| | | |
|---|---|---|
| | | HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate ( sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS2048_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the |

| | | |
|---|---|---|
| | | data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : data length |
| [in] | wrapped_key | Inputs the 2048-bit RSA private wrapped key. |
| [in] | hash_type | Only HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify ( sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS2048_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to verify<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

| | | |
|---|---|---|
| | | HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify ( sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS3072_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to verify<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify<br>• message_hash->pda |

| | | |
|---|---|---|
| | | ta : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 3072-bit RSA public wrapped key. |
| [in] | hash_type | Only HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify ( sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type* )

The R_SCE_RSASSA_PKCS4096_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to verify<br>• signature->pdata : Specifies pointer to array storing the signature text<br>• signature->data_length : Specifies effective data length of the array |
| [in] | message_hash | Message text or hash value to verify<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |
| [in] | hash_type | Only |

| | | |
|---|---|---|
| | | HW_SCE_RSA_HASH_SHA256 is supported |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_AUTHENTICATION | Authentication failed |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt ( sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

**Parameters**

| | | |
|---|---|---|
| [in] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA public wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS1024_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt ( sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa1024_private_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

**Parameters**

| | | |
|---|---|---|
| [in] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in,out] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA private wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |

| | |
|---|---|
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS2048_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt ( sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa2048_public_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

**Parameters**

| | | |
|---|---|---|
| [in] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 2048-bit RSA public wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS2048_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt ( sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa2048_private_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

**Parameters**

| | | |
|---|---|---|
| [in] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in,out] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size). |
| [in] | wrapped_key | Inputs the 1024-bit RSA private wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |

| | |
|---|---|
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS3072_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt ( sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa3072_public_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

**Parameters**

| | | |
|---|---|---|
| [in] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 3072-bit RSA public wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSAES_PKCS4096_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt ( sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa4096_public_wrapped_key_t * *wrapped_key* )

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

**Parameters**

| | | |
|---|---|---|
| [in] | plain | plaintext<br>• plain->pdata : Specifies pointer to array containing plaintext.<br>• plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11 |
| [in,out] | cipher | ciphertext<br>• cipher->pdata : Specifies pointer to array containing ciphertext.<br>• cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size). |
| [in] | wrapped_key | Inputs the 4096-bit RSA public wrapped key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Incorrect wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is illegal. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate ( sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) \|\| signature r (192 bits) \|\| 0 padding (64 bits) \|\| signature s (192 bits)".<br>• signature->data_length : Data length (byte units) |
| | | |

| | | |
|---|---|---|
| [in] | wrapped_key | Input wrapped key of secp192r1 private key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate ( sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash |

| | | |
|---|---|---|
| | | (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) \|\| signature r (224 bits) \|\| 0 padding (32 bits) \|\| signature s (224 bits)".<br>• signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp224r1 private key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate ( sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) \|\| signature s (256 bits)".<br>• signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp256r1 private key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate ( sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | message_hash | Message or hash value to which to attach signature<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash |

| | | |
|---|---|---|
| | | value: 1) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) \|\| signature s (384 bits)".<br>• signature->data_length : Data length (byte units) |
| [in] | wrapped_key | Input wrapped key of secp384r1 private key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify ( sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to be verified<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) \|\| signature r (192 bits) \|\| 0 padding (64 bits) \|\| signature s (192 bits)".<br>• signature->data_length : Specifies the data length (byte units) (nonuse) |
| [in,out] | message_hash | Message or hash value to be verified<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |

| | | |
|---|---|---|
| [in] | wrapped_key | Input wrapped key of secp192r1 public key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

### ◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify ( sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to be verified<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) \|\| signature r (224 bits) \|\| 0 padding (32 bits) \|\| signature s (224 bits)".<br>• signature->data_length : Specifies the data length (byte units) (nonuse) |

| | | |
|---|---|---|
| [in,out] | message_hash | Message or hash value to be verified<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of secp224r1 public key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify ( sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to be verified<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) \|\| signature s (256 bits)".<br>• signature->data_length : Specifies the data length (byte units) (nonuse) |
| [in,out] | message_hash | Message or hash value to be verified<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of |

| | | |
|---|---|---|
| | | secp256r1 public key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify ( sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

**Parameters**

| | | |
|---|---|---|
| [in] | signature | Signature text information to be verified<br>• signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) \|\| signature s (384 bits)".<br>• signature->data_length : Specifies the data length (byte units) (nonuse) |
| | | |

| | | |
|---|---|---|
| [in,out] | message_hash | Message or hash value to be verified<br>• message_hash->pdata : Specifies pointer to array storing the message or hash value<br>• message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected)<br>• message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1) |
| [in] | wrapped_key | Input wrapped key of secp384r1 public key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDH_secp256r1_Init()

fsp_err_t R_SCE_ECDH_secp256r1_Init ( sce_ecdh_handle_t * *handle*, uint32_t *key_type*, uint32_t *use_key_id* )

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | key_type | Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV)) |
| [in] | use_key_id | 0: key_id not used, 1: key_id used |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_PARAMETER | Input data is invalid. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDH_secp256r1_PublicKeySign()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign ( sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, uint8_t * *public_key*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key* )

The R_SCE_ECDH_secp256r1_PublicKeySign() function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to public_key and the private key is output to wrapped_key.

If ECDH is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the public key input as ecc_public_wrapped_key is output to public_key and nothing is output to wrapped_key.

The succeeding function R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses the first argument, handle, as an argument. R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses wrapped_key as input to calculate Z.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) When using key_id, input handle->key_id after running R_SCE_ECDH_secp256r1_Init(). |
| [in] | ecc_public_wrapped_key | For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key. |
| [in] | ecc_private_wrapped_key | secp256r1 private key for signature generation |
| [in,out] | public_key | User secp256r1 public key (512-bit) for key exchange. When using key_id, key_id (8-bit) \|\| public key (512-bit) \|\| 0 padding (24-bit) |
| [in,out] | signature | Signature text storage destination information<br>• signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) \|\| signature s (256 bits)"<br>• signature->data_leng |

| | | |
|---|---|---|
| | | th : Data length (in byte units) |
| [in,out] | wrapped_key | For ECDHE, a private wrapped key generated from a random number. Not output for ECDH. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify ( sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, uint8_t * *public_key_data*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | ecc_public_wrapped_key | Public wrapped key area for signature verification |
| [in] | public_key_data | secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) \|\| public key (512-bit) |
| [in] | signature | ECDSA secp256r1 signature of ecc_public_wrapped_key |
| [in,out] | wrapped_key | wrapped key of ecc_public_wrapped_key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred or signature verification failed. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature ( sce_ecdh_handle_t * *handle*, uint8_t * *public_key_data*, sce_ecc_public_wrapped_key_t * *wrapped_key* )

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().
R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | public_key_data | secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) \|\| public key (512-bit) |
| [in,out] | wrapped_key | wrapped key of public_key_data |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.*

### ◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate ( sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key* )

The R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, ecc_public_wrapped_key, the public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify(). When key_type of R_SCE_ECDH_secp256r1_Init() is 0, input as the third argument, ecc_private_wrapped_key, the private wrapped key generated from a random number by R_SCE_ECDH_secp256r1_PublicKeySign(), and when key_type is other than 0, input the private wrapped key that forms a pair with the second argument of R_SCE_ECDH_secp256r1_PublicKeySign(). The subsequent R_SCE_ECDH_secp256r1_KeyDerivation() function uses shared_secret_wrapped_key as key material for outputting the wrapped key.

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | ecc_public_wrapped_key | Public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify() |
| [in] | ecc_private_wrapped_key | Private wrapped key |
| [in,out] | shared_secret_wrapped_key | Wrapped key of shared secret Z calculated by ECDH key exchange |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECDH_secp256r1_KeyDerivation()

fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation ( sce_ecdh_handle_t * *handle*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*, uint32_t *key_type*, uint32_t *kdf_type*, uint8_t * *other_info*, uint32_t *other_info_length*, sce_hmac_sha_wrapped_key_t * *salt_wrapped_key*, sce_aes_wrapped_key_t * *wrapped_key* )

The R_SCE_ECDH_secp256r1_KeyDerivation() function uses the shared secret "Z (shared_secret_index)" calculated by the R_SCE_ECDH_secp256r1_SharedSecretCalculate() function as the key material to derive the wrapped key specified by the third argument, key_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, kdf_type. When SHA-256 HMAC is specified, the wrapped key output by the R_SCE_SHA256HMAC_EncryptedKeyWrap() function is specified as the seventh argument, salt_wrapped_key. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, other_info. A wrapped key corresponding to key_type is output as the eighth argument, wrapped_key. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: R_SCE_SHA256HMAC_GenerateInit() function and R_SCE_SHA256HMAC_VerifyInit() function

**Parameters**

| | | |
|---|---|---|
| [in,out] | handle | ECDH handler (work area) |
| [in] | shared_secret_wrapped_key | Z wrapped key calculated by R_SCE_ECDH_secp256r1_SharedSecretCalculate |
| [in] | key_type | Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV) |
| [in] | kdf_type | Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC) |
| [in] | other_info | Additional data used for key derivation calculation: AlgorithmID \|\| PartyUInfo \|\| PartyVInfo |
| [in] | other_info_length | Data length of other_info (up to 147 byte units) |
| [in] | salt_wrapped_key | Salt wrapped key (Input NULL when kdf_type is 0.) |
| [in,out] | wrapped_key | Wrapped key corresponding to key_type. When the value of key_type is 2, an SHA256-HMAC wrapped key is output. wrapped_key can be specified by casting the start address of the area |

| | | |
|---|---|---|
| | | reserved beforehand by the sce_hmac_sha_wrapped_key_t type with the (sce_aes_wrapped_key_t*) type. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal end |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource required by the processing is in use by other processing. |
| FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL | Invalid wrapped key was input. |
| FSP_ERR_CRYPTO_SCE_PARAMETER | An invalid handle was input. |
| FSP_ERR_CRYPTO_SCE_FAIL | Internal error occurred. |
| FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION | An invalid function was called. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall ( uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key* )

Generate TLS RSA Public key index data

**Parameters**

| | | |
|---|---|---|
| [in] | encrypted_provisioning_key | the provisioning key includes encrypted CBC/CBC-MAC key for user key |
| [in] | initial_vector | the initial_vector for user key CBC encrypt |
| [in] | encrypted_key | the user key encrypted with AES128-ECB mode |
| [out] | wrapped_key | the user Key Generation Information (141 words) of RSA2048 bit |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate ( sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key* )

Generate TLS ECC key pair

**Parameters**

| | | |
|---|---|---|
| [in] | tls_p256_ecc_wrapped_key | P256 ECC key index for TLS |
| [in] | ephemeral_ecdh_public_key | ephemeral ECDH public key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_RootCertificateVerify()

fsp_err_t R_SCE_TLS_RootCertificateVerify ( uint32_t *public_key_type*, uint8_t * *certificate*, uint32_t *certificate_length*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint8_t * *signature*, uint32_t * *encrypted_root_public_key* )

Verify root CA certificate.

**Parameters**

| | | |
|---|---|---|
| [in] | public_key_type | key type |
| [in] | certificate | certificates. |
| [in] | certificate_length | byte size of certificates. |
| [in] | public_key_n_start_position | start position of public key n. |
| [in] | public_key_n_end_position | end position of public key n. |
| [in] | public_key_e_start_position | start position of public key e. |
| [in] | public_key_e_end_position | end position of public key e. |
| [in] | signature | signature for certificates. |
| [out] | encrypted_root_public_key | public key for RSA 2048bit. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_CertificateVerify()

fsp_err_t R_SCE_TLS_CertificateVerify ( uint32_t *public_key_type*, uint32_t * *encrypted_input_public_key*, uint8_t * *certificate*, uint32_t *certificate_length*, uint8_t * *signature*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint32_t * *encrypted_output_public_key* )

Verify server certificate and intermediate certificate.

**Parameters**

| | | |
|---|---|---|
| [in] | public_key_type | key type |
| [in] | encrypted_input_public_key | public key. |
| [in] | certificate | certificates. |
| [in] | certificate_length | byte size of certificates. |
| [in] | signature | signature for certificates. |
| [in] | public_key_n_start_position | start position of public key n. |
| [in] | public_key_n_end_position | end position of public key n. |
| [in] | public_key_e_start_position | start position of public key e. |
| [in] | public_key_e_end_position | end position of public key e. |
| [out] | encrypted_output_public_key | public key for RSA 2048bit. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 ( uint32_t * *encrypted_public_key*, uint32_t * *sce_pre_master_secret*, uint8_t * *encrypted_pre_master_secret* )

Output the result encrypted pre-master secret with RSA 2048bit

**Parameters**

| | | |
|---|---|---|
| [in] | encrypted_public_key | public key data. |
| [in] | sce_pre_master_secret | pre-master secret value. |
| [out] | encrypted_pre_master_secret | the value encrypted pre-master secret. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 ( uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

**Parameters**

| | | |
|---|---|---|
| [out] | sce_pre_master_secret | pre-master secret value for SCE. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_MasterSecretGenerate()

fsp_err_t R_SCE_TLS_MasterSecretGenerate ( uint32_t *select_cipher_suite*, uint32_t * *sce_pre_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint32_t * *sce_master_secret* )

Generate encrypted master secret.

**Parameters**

| | | |
|---|---|---|
| [in] | select_cipher_suite | cipher suite type |
| [in] | sce_pre_master_secret | pre-master secret value for SCE. |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [out] | sce_master_secret | master secret value with SCE-specific conversion. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_SessionKeyGenerate()

fsp_err_t R_SCE_TLS_SessionKeyGenerate ( uint32_t *select_cipher_suite*, uint32_t * *sce_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *nonce_explicit*, sce_hmac_sha_wrapped_key_t * *client_mac_wrapped_key*, sce_hmac_sha_wrapped_key_t * *server_mac_wrapped_key*, sce_aes_wrapped_key_t * *client_crypto_wrapped_key*, sce_aes_wrapped_key_t * *server_crypto_wrapped_key*, uint8_t * *client_initial_vector*, uint8_t * *server_initial_vector* )

Output various key information.

**Parameters**

| | | |
|---|---|---|
| [in] | select_cipher_suite | Key suite information number. |
| [in] | sce_master_secret | master secret value. |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [in] | nonce_explicit | nonce value |
| [out] | client_mac_wrapped_key | the mac key during communication from client to server. |
| [out] | server_mac_wrapped_key | the mac key during communication from server to client. |
| [out] | client_crypto_wrapped_key | the crypto key during communication from client to server. |
| [out] | server_crypto_wrapped_key | the crypto key during communication from server to client. |
| [in] | client_initial_vector | not use. |
| [in] | server_initial_vector | not use. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_VerifyDataGenerate()

fsp_err_t R_SCE_TLS_VerifyDataGenerate ( uint32_t *select_verify_data*, uint32_t * *sce_master_secret*, uint8_t * *hand_shake_hash*, uint8_t * *verify_data* )

Generate verify data.

**Parameters**

| | | |
|---|---|---|
| [in] | select_verify_data | Select Client/Server data. |
| [in] | sce_master_secret | master secret data. |
| [in] | hand_shake_hash | TLS hand shake message SHA256 HASH value. |
| [out] | verify_data | verify data. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_ServerKeyExchangeVerify()

fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify ( uint32_t *public_key_type*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *server_ephemeral_ecdh_public_key*, uint8_t * *server_key_exchange_signature*, uint32_t * *encrypted_public_key*, uint32_t * *encrypted_ephemeral_ecdh_public_key* )

Retrives ECDH public key.

**Parameters**

| | | |
|---|---|---|
| [in] | public_key_type | key type |
| [in] | client_random | random value reported ClientHello. |
| [in] | server_random | random value reported ServerHello. |
| [in] | server_ephemeral_ecdh_public_key | Ephemeral ECDH public key from Server. |
| [in] | server_key_exchange_signature | Server Key Exchange sigunature. |
| [in] | encrypted_public_key | encrypted public key. |
| [out] | encrypted_ephemeral_ecdh_public_key | encrypted Ephemeral ECDH public key. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 ( uint32_t * *encrypted_public_key*, sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint32_t * *sce_pre_master_secret* )

Generate encrypted pre-master secret.

**Parameters**

| | | |
|---|---|---|
| [in] | encrypted_public_key | encrypted public key |
| [in] | tls_p256_ecc_wrapped_key | P-256 ECC key index. |
| [out] | sce_pre_master_secret | encrypted pre-master secret value for SCE. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination |
| FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT | A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine. |
| FSP_ERR_CRYPTO_SCE_FAIL | An internal error occurred. |

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### 5.2.15.9 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

# Version

v1.1.0

The version that appears on the Components tab of the FSP Configuration editor is v1.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

# Functions

The specifications of this module comply with the Secure Crypto Engine (r_sce_protected) of FSP v5.5.0.

For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v5.5.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

# Overview

This module provides SCE CAVP Certified functions.

### HW Overview

SCE9 Protected Mode CAVP certification has been obtained using the RA6M4 as the target processor.

| Crypto Peripheral version | Devices |
|---|---|
| SCE9 (Protected mode) | RA4M2, RA4M3, RA6M4, RA6M5 |

### Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS

- SSL / TLS support function (TLS1.2 compliant)

# Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

### Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

### Limitations

### Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

### SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

| | |
|---|---|
| message | [in] Start address of message |
| digest | [in,out] address for storing hash calculation result (48 bytes) |
| message_length | [in] Effective byte count of message |

Return values

| | |
|---|---|
| 0 | Hash value stored successfully. |
| others | Storing of hash value failed. |

# Examples

### AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
```

```

 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

### ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
```

```
sce_ecc_wrapped_pair_key_t wrapped_pair_key;
sce_ecdsa_byte_data_t      message_hash =
   {
      0
   };
sce_ecdsa_byte_data_t signature;
   uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
fsp_err_t             return_code;
   message_hash.data_length = sizeof(ecc256_data_msg);
   message_hash.pdata       = (uint8_t *) ecc256_data_msg;
   signature.pdata          = out_data;
/* SCE power on */
R_SCE_Open(&sce_ctrl, &sce_cfg);
/* Generate a random pair key */
R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
/* Generate a Signature */
R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
/* Verify Signature and Public wrapped key */
   return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
/* SCE power off */
R_SCE_Close(&sce_ctrl);
if (FSP_SUCCESS != return_code)
   {
while (1)
     {
/* Verify Fail */
      }
   }
else
   {
while (1)
     {
```

```
 /* Verify Success */
       }
    }
}
```

### RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{

### Detailed Description

Driver for the Secure Key Injection on RA MCUs.

# Overview

This module provides RSIP functions in PSA Crypto.

### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| RSIP-E11A | RA4L1 |
| RSIP-E31A | RA4C1 |
| RSIP-E51A | RA8M1, RA8D1, RA8T1 |
| RSIP-E50D | RA8P1 |

### Features

The RSIP Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used RSIP. Please refer to the following for details.

### Key Support

## AES Key Injection

| Crypto Peripheral version | 128 bit | 192 bit | 256 bit |
|---|---|---|---|
| RSIP-E11A | Support | No support | Support |
| RSIP-E31A | Support | No support | Support |
| RSIP-E51A | Support | Support | Support |
| RSIP-E50D | Support | Support | Support |

## AES XTS Key Injection

| Crypto Peripheral version | 128 bit XTS | 256 bit XTS |
|---|---|---|
| RSIP-E11A | No support | No support |
| RSIP-E31A | Support | Support |
| RSIP-E51A | Support | Support |
| RSIP-E50D | Support | Support |

## ChaCha20 Key Injection

| Crypto Peripheral version | ChaCha20 |
|---|---|
| RSIP-E11A | No support |
| RSIP-E31A | No support |
| RSIP-E51A | No support |
| RSIP-E50D | Support |

## RSA Key Injection

| Crypto Peripheral version | 2048 bit | 3072 bit | 4096 bit |
|---|---|---|---|
| RSIP-E11A | No support | No support | No support |
| RSIP-E31A | No support | No support | No support |
| RSIP-E51A | Support | Support | Support |
| RSIP-E50D | Support | Support | Support |

## ECC Key Injection

| Crypto Peripheral version | secp256r1 | secp384r1 | secp521r1 | secp256k1 | brainpoolP256r1 | brainpoolP384r1 | brainpoolP512r1 | Ed25519 |
|---|---|---|---|---|---|---|---|---|
| RSIP- | Support | No | No | Support | Support | No | No | No |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| E11A | | support | support | | | support | support | support |
| RSIP-E31A | Support | Support | No support | Support | Support | Support | No support | Support |
| RSIP-E51A | Support | Support | Support | Support | Support | Support | Support | Support |
| RSIP-E50D | Support | Support | Support | Support | Support | Support | Support | Support |

### HMAC Key Injection

| Crypto Peripheral version | SHA224 | SHA256 | SHA384 | SHA512 | SHA512/224 | SHA512/256 |
|---|---|---|---|---|---|---|
| RSIP-E11A | Support | Support | No support | No support | No support | No support |
| RSIP-E31A | No support | Support | Support | Support | Support | Support |
| RSIP-E51A | Support | Support | Support | Support | Support | Support |
| RSIP-E50D | Support | Support | Support | Support | Support | Support |

# Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Module activation

RSIP Key Umport for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires RSIP Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injectin for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to injection and update secure keys, refer to the Application Note R11AN0496.

### Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

### Enumerations

enum rsip_key_type_t

### Enumeration Type Documentation

### ◆ rsip_key_type_t

| enum rsip_key_type_t | |
|---|---|
| Enumerator | |
| RSIP_KEY_TYPE_INVALID | Invalid key. |
| RSIP_KEY_TYPE_AES_128 | AES-128. |
| RSIP_KEY_TYPE_AES_192 | AES-192. |
| RSIP_KEY_TYPE_AES_256 | AES-256. |
| RSIP_KEY_TYPE_XTS_AES_128 | XTS-AES-128. |
| RSIP_KEY_TYPE_XTS_AES_256 | XTS-AES-256. |
| RSIP_KEY_TYPE_CHACHA20 | ChaCha20. |
| RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC | secp256r1 public key (also known as NIST P-256, prime256v1) |

## Function Documentation

### ◆ R_RSIP_AES128_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key* )

This API generates 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_AES192_InitialKeyWrap()

fsp_err_t R_RSIP_AES192_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key* )

This API generates 192-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 192-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_AES256_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key* )

This API generates 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_AES128_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_XTS_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key* )

This API generates 128-bit AES-XTS key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 128-bit AES-XTS wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_AES256_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_XTS_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key* )

This API generates 256-bit AES-XTS key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit AES-XTS wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ChaCha20_InitialKeyWrap()

fsp_err_t R_RSIP_ChaCha20_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_chacha20_wrapped_key_t *const *p_wrapped_key* )

This API generates 256-bit ChaCha20-Poly-1305 key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit ChaCha20 wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA2048_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa2048_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 2048-bit RSA private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 2048-bit RSA wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_RSA3072_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA3072_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa3072_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 3072-bit RSA private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 3072-bit RSA wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_RSA4096_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA4096_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa4096_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 4096-bit RSA private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 4096-bit RSA wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  *p_wrapped_user_factory_programming_key*, uint8_t const *const  *p_initial_vector*, uint8_t const *const  *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*  )

This API generates 256-bit ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 384-bit ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 384-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  p_wrapped_user_factory_programming_key*, uint8_t const *const  p_initial_vector*, uint8_t const *const  p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*  )

This API generates 521-bit ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 521-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  *p_wrapped_user_factory_programming_key*, uint8_t const *const  *p_initial_vector*, uint8_t const *const  *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*  )

This API generates 256-bit ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 256-bit brainpool ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 384-bit brainpool ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key* )

This API generates 512-bit brainpool ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 512-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  *p_wrapped_user_factory_programming_key*, uint8_t const *const  *p_initial_vector*, uint8_t const *const  *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*  )

This API generates 256-bit Edwards curve ECC private key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit ECC wrapped private key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA224_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key* )

This API generates 224-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 224-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA256_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key* )

This API generates 256-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 256-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA384_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA384_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key* )

This API generates 384-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 384-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA512_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key* )

This API generates 512-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 512-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA512_224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_224_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  *p_wrapped_user_factory_programming_key*, uint8_t const *const  *p_initial_vector*, uint8_t const *const  *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*  )

This API generates 512/224-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 512/224-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### ◆ R_RSIP_HMAC_SHA512_256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_256_InitialKeyWrap ( rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const  *p_wrapped_user_factory_programming_key*, uint8_t const *const  *p_initial_vector*, uint8_t const *const  *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*  )

This API generates 512/256-bit HMAC-SHA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_injection_type | Selection key injection type when generating wrapped key |
| [in] | p_wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_initial_vector | Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified. |
| [in] | p_user_key | User key. If key injection type is not plain, it is encrypted and MAC appended |
| [out] | p_wrapped_key | 512/256-bit HMAC-SHA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

***Note***

*The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.*

### Detailed Description

Driver for the Secure Key Injection on RA MCUs.

# Overview

This module provides SCE functions in PSA Crypto.

### HW Overview

| Crypto Peripheral version | Devices |
|---|---|
| SCE9 | RA6M5, RA6M4, RA4M3, RA4M2 |
| SCE7 | RA6M3, RA6M2, RA6M1, RA6T1 |
| SCE5 | RA4W1, RA4M1 |
| SCE5B | RA6T2 |

### Features

The SCE Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used SCE. Please refer to the following for details.

- Key Support
  - AES 128/256bit

| Crypto Peripheral version | 128 bit | 192 bit | 256 bit |
|---|---|---|---|
| SCE9 | InitialKeyWrap Only | InitialKeyWrap Only | InitialKeyWrap Only |

| | | | |
|---|---|---|---|

# Configuration

### Clock Configuration

This module does not require a specific clock configuration.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Module activation

SCE Key Injection for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires SCE Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injection for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to import and update secure keys, refer to the Application Note R11AN0496.
(*1)

|---|---|

| Crypto Peripheral version | String displayed in the Stacks tab |
|---|---|
| SCE9 | SCE Compatibility Mode |
| SCE7 | SCE7 |
| SCE5 | SCE5 |
| SCE5B | SCE5B |

### Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

### Function Documentation

### ◆ R_SCE_AES128_InitialKeyWrap()

fsp_err_t R_SCE_AES128_InitialKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API generates 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES192_InitialKeyWrap()

fsp_err_t R_SCE_AES192_InitialKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API generates 192-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 192-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256_InitialKeyWrap()

fsp_err_t R_SCE_AES256_InitialKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_KeyUpdateKeyWrap()

fsp_err_t R_SCE_KeyUpdateKeyWrap ( const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_key_update_key_t *const *key_update_key* )

This API generates a key update key which is used for functions of the key updating.

**Parameters**

| | | |
|---|---|---|
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | key_update_key | Key update key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API wraps 128-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 128-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES192_EncryptedKeyWrap()

fsp_err_t R_SCE_AES192_EncryptedKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API wraps 192-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 192-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit AES key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit AES wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key* )

This API generates 2048-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA3072_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa3072_public_wrapped_key_t *const *wrapped_key* )

This API generates 3072-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 3072-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA4096_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa4096_public_wrapped_key_t *const *wrapped_key* )

This API generates 4096-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 4096-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPrivateKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key* )

This API generates 2048-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key* )

This API wraps 2048-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key* )

This API wraps 2048-bit RSA key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 2048-bit RSA wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256k1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API generates 384-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 364-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPrivateKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPrivateKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPrivateKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API generates 384-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API wraps 384-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API wraps 384-bit ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API generates 256-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |

| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API generates 384-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 364-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap ( const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API generates 384-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | key_type | Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key) |
| [in] | wrapped_user_factory_programming_key | Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | initial_vector | Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified. |
| [in] | encrypted_key | Encrypted user key and MAC appended |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key* )

This API wraps 256-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 256-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

*The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.*

### ◆ R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap ( const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key* )

This API wraps 384-bit Brainpool ECC key within the user routine.

**Parameters**

| | | |
|---|---|---|
| [in] | initial_vector | Initialization vector when generating encrypted_key |
| [in] | encrypted_key | User key encryptedand MAC appended |
| [in] | key_update_key | Key update keyring |
| [in,out] | wrapped_key | 384-bit ECC wrapped key |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Normal termination. |
| FSP_ERR_UNSUPPORTED | API not supported. |

**Returns**

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

***Note***

### Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

# Overview

*Note*

***The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst for further information.***

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

### Hardware Overview

| Crypto Peripheral version | Devices |
|---|---|
| AES Engine | RA2A1, RA2E1, RA2L1 |

### Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128, 192, 256
  - ECB, CBC, CTR, CCM, GCM and CMAC modes  -TRNG

# Configuration

### Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

# Usage Notes

### Hardware Initialization

Invoke RM_TINCYRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either

hardware acceleration or the TRNG is to be used.

### Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

**Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in rm_tinycrypt_port must be used to seed these modules.** When using CTR-PRNG or HMAC-PRNG, use the RM_TINCYRYPT_PORT_TRNG_Read() function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then RM_TINCYRYPT_PORT_TRNG_Read() can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

### Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the default_CSPRNG() function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement default_CSPRNG() if using ECC signature generation (ECDSA) or key derivation (ECDH).

### AES-128 Usage

The AES ECB mode implementation is provided in aes_encrypt.decrypt.c. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

### Usage with RA2A2

On the RA2A2, the TinyCrypt API has been expanded to support GCM mode operation. Key lengths of 128, 192 and 256 are supported. GCM mode operation is not supported on other MCUs in hardware or software in the TinyCrypt API.

### Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

### Limitations

### Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function default_CSPRNG() must be implemented in the user code.

### TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

### Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

## Examples

### AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)

### AES-GCM Example

This is an example on using AES Circuit (Hardware support) to encrypt data using an AES-128 key in GCM mode. This operation is supported only on the RA2A2 device.

```
/*
 * gcmEncryptExtIV128.rsp AES-GCM Test for encryption.

### Function Documentation

### ◆ RM_TINCYRYPT_PORT_Init()

| fsp_err_t RM_TINCYRYPT_PORT_Init ( ) |
|---|
| Initialize the SCE. |

### ◆ RM_TINCYRYPT_PORT_TRNG_Read()

| fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read ( uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes* ) |
|---|
| Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Random number generation successful |
| FSP_ERR_ASSERTION | NULL input parameter(s). |
| FSP_ERR_CRYPTO_UNKNOWN | An unknown error occurred. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ default_CSPRNG()

| int default_CSPRNG ( uint8_t * *dest*, unsigned int *size* ) |
|---|
| Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt. |

**Return values**

| | |
|---|---|
| TC_CRYPTO_SUCCESS | Random number generation successful |
| TC_CRYPTO_FAIL | Random number generation failed. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- RM_TINCYRYPT_PORT_TRNG_Read

## 5.2.16 Sensor

Modules

### Detailed Description

Sensor Modules.

### Detailed Description

Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.

# Overview

FS3000 is EOL.

### Features

The FS3000 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

### Limitations

- I2C Master (r_sau_i2c) is not supported. FS3000 needs clock stretching, but is not supported by SAU I2C.

# Configuration

### Build Time Configurations for rm_fs3000

The following build time configurations are defined in fsp_cfg/rm_fs3000_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Device Type | FS3000-1005 | FS3000-1005 | Select FS3000 device used. |

**Configurations for Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated]**

This module can be added to the Stacks tab via New Stack > Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_fs3000_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | fs3000_callback | A user callback function can be provided. |

**Pin Configuration**

This module use SDA and SCL pins of I2C Master and SCI I2C.

# Usage Notes

FS3000 datasheet is here.
If ADC data is invalid, it is needed to read ADC data from FS3000 again. The module only supports FS3000-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

**Bus Initialization**

The FS3000 interface expects a bus instance to be opened before opening any FS3000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

# Examples

**Basic Example**

This is a basic example of minimal use of FS3000 sensor implementation in an application.

```
void rm_fs3000_basic_example (void)

{
 fsp_err_t            err = FSP_SUCCESS;
```

```
 rm_fsxxxx_raw_data_t fs3000_raw_data;
 rm_fsxxxx_data_t    fs3000_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_fs3000_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_mutex_create(p_extend->p_bus_recursive_mutex->p_mutex_handle,
                       p_extend->p_bus_recursive_mutex->p_mutex_name,
                       TX_INHERIT);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
```

```
      *(p_extend->p_bus_recursive_mutex->p_mutex_handle) =
           xSemaphoreCreateRecursiveMutexStatic(p_extend->p_bus_recursive_mutex->p_m
utex_memory);
 #endif
    }
#endif
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 while (true)
    {
 do
     {
           g_flag = 0;
 /* Read ADC Data from FS3000 */

## Function Documentation

### ◆ RM_FS3000_Open()

fsp_err_t RM_FS3000_Open ( rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg* )

Opens and configures the FS3000 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | FS3000 successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

### ◆ RM_FS3000_Close()

fsp_err_t RM_FS3000_Close ( rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS3000 control block. Implements rm_fsxxxx_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_FS3000_Read()

fsp_err_t RM_FS3000_Read ( rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data* )

Reads ADC data from FS3000. Implements rm_fsxxxx_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_FS3000_DataCalculate()

| fsp_err_t RM_FS3000_DataCalculate ( rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs3000_data* ) |
|---|
| Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

More... |

## Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.

# Overview

HS300x is EOL.

### Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

# Configuration

### Build Time Configurations for rm_hs300x

The following build time configurations are defined in fsp_cfg/rm_hs300x_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Data type | • Both humidity and temperature<br>• Humidity only | Both humidity and temperature | Select Getting humidity only and both humidity and temperature. |
| Programming Mode | • ON<br>• OFF | OFF | If selected the programming mode can be entered. |

### Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_hs300x_sensor0 | Module name. |
| Callback | Name must be a valid C symbol | hs300x_callback | A user callback function can be provided. |

### Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

# Usage Notes

HS300x datasheet is here.
If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

### Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

## Examples

### Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_hs300x_raw_data_t hs300x_raw_data;
 rm_hs300x_data_t    hs300x_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
```

```
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {

### Function Documentation

#### ◆ RM_HS300X_Open()

fsp_err_t RM_HS300X_Open ( rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_cfg_t const *const *p_cfg* )

Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open.

Example:

```
    err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | HS300X successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |

### ◆ RM_HS300X_Close()

fsp_err_t RM_HS300X_Close ( rm_hs300x_ctrl_t *const *p_api_ctrl*)

Disables specified HS300X control block. Implements rm_hs300x_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_HS300X_MeasurementStart()

fsp_err_t RM_HS300X_MeasurementStart ( rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_HS300X_Read()

fsp_err_t RM_HS300X_Read ( rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data* )

Reads ADC data from HS300X. Implements rm_hs300x_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_HS300X_DataCalculate()

fsp_err_t RM_HS300X_DataCalculate ( rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*, rm_hs300x_data_t *const *p_hs300x_data* )

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

### ◆ RM_HS300X_ProgrammingModeEnter()

fsp_err_t RM_HS300X_ProgrammingModeEnter ( rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

### ◆ RM_HS300X_ResolutionChange()

fsp_err_t RM_HS300X_ResolutionChange ( rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_data_type_t const *data_type*, rm_hs300x_resolution_t const *resolution* )

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_ABORTED | Communication is aborted. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

### ◆ RM_HS300X_SensorIdGet()

fsp_err_t RM_HS300X_SensorIdGet ( rm_hs300x_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_sensor_id* )

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_ABORTED | Communication is aborted. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

### ◆ RM_HS300X_ProgrammingModeExit()

| fsp_err_t RM_HS300X_ProgrammingModeExit ( rm_hs300x_ctrl_t *const *p_api_ctrl*) |
|---|
| This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_INVALID_MODE | Module is not entering the programming mode. |
| FSP_ERR_UNSUPPORTED | Programming mode is not supported. |

### Detailed Description

Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.

# Overview

HS400x is EOL.

### Features

The HS400X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Selecting one shot or a periodic measurement
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data

### Limitations

- Alert feature is not supported. It will be supported in the future.
- I2C Master (r_sau_i2c) is not supported in Hold measurement. Hold measurement needs clock stretching, but is not supported by SAU I2C.

### Notifications

The minimum frequency for the SCL clock in Hold measurement is 200kHz. Please configure I2C_MASTER_RATE_FAST or I2C_MASTER_RATE_FASTPLUS to "Rate" in I2C Master (r_iic_master) or I2C Master (r_sci_i2c).

# Configuration

### Build Time Configurations for rm_hs400x

The following build time configurations are defined in fsp_cfg/rm_hs400x_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Measurement Type | • Hold Measurement<br>• No-Hold Measurement<br>• Periodic Measurement | No-Hold Measurement | Select measurement type. |
| Data type | • Both humidity and temperature<br>• Temperature only | Both humidity and temperature | Select getting temperature only or both humidity and temperature. |

### Configurations for Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_hs400x_sensor0 | Module name. |
| Temperature Resolution | • 8-bit<br>• 10-bit<br>• 12-bit<br>• 14-bit | 14-bit | Set resolution of temperature. |
| Humidity Resolution | • 8-bit<br>• 10-bit<br>• 12-bit<br>• 14-bit | 14-bit | Set resolution of humidity. |
| Frequency for Periodic Measurement | • 0.4Hz<br>• 1Hz<br>• 2Hz | 1Hz | Set frequency for periodic measurement. |
| Comms I2C Callback | Name must be a valid | hs400x_comms_i2c_cal | A user COMMS I2C |

| | | | |
|---|---|---|---|
| | C symbol | lback | callback function can be provided. |

### Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

# Usage Notes

HS400x datasheet is here.
This module supports three measurement type :

- Hold measurement
- No-Hold measurement
- Periodic measurement

Hold and no-hold measurements also support measuring temperature data only. However, a periodic measurement only supports measuring both humidity and temperature data.

### Hold Measurement

A hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired hold measurement command.
2. Change the direction of communication by sending a start bit, the HS400x I2C address, and a read bit. The SCL line is held low by the sensor during the measurement process, which prevents the master from initiating any communications with other slaves on the bus.
3. Once the requested measurement is completed by the HS400x series sensor, the SCL line is released and the chip waits for the SCL clock signal to send the results. The sensor will then transmit the requested measurement data on the bus for the master to capture.

### No-Hold Measurement

A no-hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired no-hold measurement command.
2. To read the result from the HS400x series sensor, the master has to send the chip its I2C address and a read bit. If the measurement is completed and the result is ready, the chip will send an ACK bit and starts to send the result over the bus. If the measurement is still in progress, the chip will send a NACK bit and the master will need to try to read the result again.

### Periodic Measurement

The HS400x sensors can also be configured to measure at regular intervals without user intervention. In this mode, the user can read the latest relative humidity / temperature data by issuing a data fetch sequence, which consists of sending the HS400x I2C address with a read bit. The sensor will then send the latest measurement result over the I2C bus.
When the periodic measurement mode is active, the only commands the chip will respond to are the data fetch command, and a command to stop the periodic measurements. The command to stop periodic measurements is issued by sending the I2C address with a write bit, followed by the command 0x30. Sequence to Stop Periodic Measurements. Once the periodic measurements have been stopped, the chip returns to sleep and is ready to accept all valid I2C commands.

### Bus Initialization

The HS400X interface expects a I2C bus instance to be opened before opening any I2C device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

### Initialization

Initialize with RM_HS400X_Open().

### From measurement start to data acquisition

After normal completion, start the each measurement.

### Hold Measurement

In hold measurement, the HS400x series sensor holds the SCL line low during the measurement and releases the SCL line when the measurement is complete.

1. Call RM_HS400X_Read(). This function will start a measurement and read the ADC data.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

### No-Hold Measurement

In no-hold measurement, the HS400x series sensor does not hold the SCL line low, and the master is free to initiate communication with other slaves while the chip is performing the measurement.

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_Read(). This function will read the ADC data.
4. If the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. User should call RM_HS400X_Read() again. If the measurement is completed, RM_HS400X_EVENT_SUCCESS is received in callback.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

### Periodic Measurement

In periodic measurement, the HS400x sensors measure at regular intervals without user intervention. If a periodic measurement is running, the resolution and the frequency cannot be changed. please stop the periodic measurement with RM_HS400X_MeasurementStop().

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement. If the function is called once, a second call is not required.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.

3. Wait for frequency for periodic measurement.
4. Call RM_HS400X_Read(). This function will read the ADC data.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

# Examples

### Basic Example

This is a basic examples of minimal use of HS400X sensor implementation in an application.

```
void rm_hs400x_basic_example (void)

### Function Documentation

### ◆ RM_HS400X_Open()

fsp_err_t RM_HS400X_Open ( rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_cfg_t const *const *p_cfg* )

Opens and configures the HS400X middleware module. Implements rm_hs400x_api_t::open.

Example:

```
err = RM_HS400X_Open(&g_hs400x_ctrl, &g_hs400x_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | HS400X successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_HS400X_Close()

fsp_err_t RM_HS400X_Close ( rm_hs400x_ctrl_t *const *p_api_ctrl*)

Disables specified HS400X control block. Implements rm_hs400x_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_HS400X_MeasurementStart()

fsp_err_t RM_HS400X_MeasurementStart ( rm_hs400x_ctrl_t *const *p_api_ctrl*)

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_UNSUPPORTED | Hold measurement is unsupported. |

### ◆ RM_HS400X_MeasurementStop()

fsp_err_t RM_HS400X_MeasurementStop ( rm_hs400x_ctrl_t *const *p_api_ctrl*)

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_UNSUPPORTED | Hold and No-Hold measurement are unsupported. |

### ◆ RM_HS400X_Read()

fsp_err_t RM_HS400X_Read ( rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data* )

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_HS400X_DataCalculate()

fsp_err_t RM_HS400X_DataCalculate ( rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*, rm_hs400x_data_t *const *p_hs400x_data* )

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully data decoded. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_SENSOR_INVALID_DATA | Data is invalid. |

### Detailed Description

Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.

# Overview

RRH46410 is EOL.

This module provides an API for configuring and controlling the RRH46410 sensor module (ZMOD4410 + MCU).

I2C communication with the RRH46410 sensor module is realized by connecting with the rm_comms_i2c module.

### Features

The RRH46410 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Input current humidity for best performance.
- Receive status for wait until the measurement is done. This will also be signaled by an interrupt
- Get the measruement results from the sensor module
- Different from ZMOD sensors, no libraries are needed.

# Configuration

### Build Time Configurations for rm_rrh46410

The following build time configurations are defined in fsp_cfg/rm_rrh46410_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Operation Mode | • IAQ 2nd Gen and Rel IAQ<br>• IAQ 2nd Gen ULP and Rel IAQ ULP<br>• Public Building AQ Standard (PBAQ) | IAQ 2nd Gen and Rel IAQ | Select operation mode. |

### Configurations for Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rrh46410_sensor0 | Module name. |
| Comms I2C Callback | Name must be a valid C symbol | rrh46410_comms_i2c_callback | A user COMMS I2C callback function can be provided. |
| IRQ Callback | Name must be a valid C symbol | rrh46410_irq_callback | A user IRQ callback function can be provided. |

#### Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

## Usage Notes

RRH46410 datasheet is here.
The RRH46410 has three modes of operation.
The RRH46410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

| Operation mode | Description | Data |
|---|---|---|
| IAQ 2nd Generation and Relative IAQ | Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs). Lightweight algorithm reacts to air quality changes and outputs a relative IAQ | IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ |
| IAQ 2nd Generation Ultra Low Power and Relative IAQ Ultra Low Power | Using AI for improved ppm TVOC, IAQ and eCO2 functionality. Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This operation mode offers a much lower power consumption. | IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ |
| Public Building AQ Standard (PBAQ) | For highly accurate and consistent sensor readings to fulfill public building standards. | TVOC[mg/m^3], EtOH[ppm] |

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

### Limitations

- I2C Master (r_sau_i2c) is not supported. RRH46410 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - Get Product ID
    - Get Tracking Number
    - Set Operation Mode -> Sensor cleaning
    - Config GPIO
    - Get GPIO
    - Set GPIO
    - Clear GPIO
    - Read Flash Shadow
    - Write Flash Shadow
    - Write Flash
    - Reset

### Notifications

- The RRH46410 sensor module needs a reset before operation; please input a reset signal to the RES_N pin (active low).
- The RRH46410 sensor module needs some time (e.g. 1s) for self initialization after power-on and reset.

### Bus Initialization

The RRH46410 interface expects a bus instance to be opened before opening any RRH46410 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

### Initialization

Initialize with RM_RRH46410_Open().

### From measurement start to data acquisition

After normal completion, start the measurement with RM_RRH46410_MeasurementStart(). An endless loop continuously checks the status of the RRH46410 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

### If IRQ is enabled

1. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
2. Call RM_RRH46410_Read(). This function will read the measurement results.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

### If IRQ is disabled

1. Call RM_RRH46410_Read(). This function will read the measurement results.
2. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user

should wait some time and then call RM_RRH46410_Read() again.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

# Examples

### Basic Example

These are basic examples of minimal use of RRH46410 sensor implementation in an application.

IAQ 2nd Gen.

```
void rm_rrh46410_iaq_2nd_gen_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;

## Function Documentation

### ◆ RM_RRH46410_Open()

fsp_err_t RM_RRH46410_Open ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg* )

Opens and configures the RRH46410 sensor module. Implements rm_zmod4xxx_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RRH46410 successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH46410_Close()

fsp_err_t RM_RRH46410_Close ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_zmod4xxx_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_RRH46410_MeasurementStart()

fsp_err_t RM_RRH46410_MeasurementStart ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH46410_MeasurementStop()

fsp_err_t RM_RRH46410_MeasurementStop ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully stopped. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH46410_Read()

fsp_err_t RM_RRH46410_Read ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data* )

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH46410_Iaq2ndGenDataCalculate()

fsp_err_t RM_RRH46410_Iaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_rrh46410_data* )

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully gas data is calculated. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_UNSUPPORTED | Unsupported operation mode. |
| FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED | Measurement is not finished. |

### ◆ RM_RRH46410_PbaqDataCalculate()

fsp_err_t RM_RRH46410_PbaqDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_rrh46410_data* )

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully gas data is calculated. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_UNSUPPORTED | Unsupported operation mode. |
| FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED | Measurement is not finished. |

### ◆ RM_RRH46410_TemperatureAndHumiditySet()

| fsp_err_t RM_RRH46410_TemperatureAndHumiditySet ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity* ) |
|---|
| This function should be called before Read. Humidity measurements are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully humidity is set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### Detailed Description

Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.

# Overview

RRH47000 is EOL.

This module provides an API for configuring and controlling the RRH47000 sensor module.

I2C communication with the RRH47000 sensor module is realized by connecting with the rm_comms_i2c module.

### Features

The RRH47000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Get the measruement results from the sensor module

# Configuration

### Build Time Configurations for rm_rrh47000

The following build time configurations are defined in fsp_cfg/rm_rrh47000_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled | Default (BSP) | If selected code for parameter checking is |

| | | |
|---|---|---|
| • Disabled | | included in the build. |

### Configurations for Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rrh47000_sensor0 | Module name. |
| Automatic Baseline Correction (ABC) | • Enable all<br>• Enable only ABC<br>• Enable only fast ABC<br>• Disable all | Enable all | Set Automatic Baseline Correction (ABC). |
| Correction cycle period [days] | Value must be 1 or more | 7 | Set correction cycle period. Min = 1 and Max = 30. |
| CO2 baseline value [ppm] | Value must be 400 or more | 400 | Set CO2 baseline value. Min = 400 and Max = 1500. |
| Comms I2C Callback | Name must be a valid C symbol | rrh47000_comms_i2c_callback | A user COMMS I2C callback function can be provided. |

#### Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

## Usage Notes

RRH47000 datasheet is here.
The RRH47000 sensor module uses nondispersive infrared (NDIR) technology to accurately measure CO2 in a compact package size while ensuring competitive pricing. An integrated relative humidity and temperature sensor enables calibration and compensation of the NDIR sensor for precise operation in different environments. Sensors for carbon dioxide (CO2, not estimated), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

#### Notifications

- This module supports I2C only (not support UART).
- The RRH47000 sensor module needs a minimum of 3 seconds to initiate communication via I²C after power-on.
- The RRH47000 sensor module supports a clock frequency ranging from 10kHz to 100kHz.

### Limitations

- I2C Master (r_sau_i2c) is not supported. RRH47000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
  - Start CO2 Correction
  - Get Serial Number

### Bus Initialization

The RRH47000 interface expects a bus instance to be opened before opening any RRH47000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

### Initialization

Initialize with RM_RRH47000_Open().

### From measurement start to data acquisition

An endless loop continuously checks the status of the RRH47000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH47000_Read() and read the measurement data.
2. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
3. Call RM_RRH47000_DataCalculate().

## Examples

### Basic Example

These are basic examples of minimal use of RRH47000 sensor implementation in an application.

```
void rm_rrh47000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;
 rm_air_sensor_raw_data_t raw_data;
 rm_air_sensor_data_t     rrh47000_data;
 bool calculated = false;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_rrh47000_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
```

```
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)

| RM_RRH47000_ABC_DISABLE_ALL | Disable all. |

## Function Documentation

### ◆ RM_RRH47000_Open()

fsp_err_t RM_RRH47000_Open ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg* )

Opens and configures the RRH47000 sensor module. Implements rm_air_sensor_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RRH47000 successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_INVALID_DATA | Checksum error occurs. |

### ◆ RM_RRH47000_Close()

fsp_err_t RM_RRH47000_Close ( rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_RRH47000_Read()

fsp_err_t RM_RRH47000_Read ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data* )

This function should be called to get measurement results after measurement finishes. Implements rm_air_sensor_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH47000_DataCalculate()

fsp_err_t RM_RRH47000_DataCalculate ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh47000_data* )

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully gas data is calculated. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_SENSOR_INVALID_DATA | Checksum error occurs. |

### ◆ RM_RRH47000_FirmwareVersionGet()

fsp_err_t RM_RRH47000_FirmwareVersionGet ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version* )

This function should be called to get firmware version. Firmware version will be set "ascii_code" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_INVALID_POINTER | Pointer is NULL. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH47000_StatusCheck()

fsp_err_t RM_RRH47000_StatusCheck ( rm_air_sensor_ctrl_t *const *p_api_ctrl*)

StatusCheck API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### ◆ RM_RRH47000_AlgorithmVersionGet()

fsp_err_t RM_RRH47000_AlgorithmVersionGet ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version* )

AlgorithmVersionGet API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Unsupported. |

### Detailed Description

Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.

# Overview

RRH62000 is EOL.

This module provides an API for configuring and controlling the RRH62000 sensor module.

I2C communication with the RRH62000 sensor module is realized by connecting with the rm_comms_i2c module.

### Features

The RRH62000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Receive status for wait until the measurement is done.
- Get the measruement results from the sensor module

# Configuration

### Build Time Configurations for rm_rrh62000

The following build time configurations are defined in fsp_cfg/rm_rrh62000_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rrh62000_sensor0 | Module name. |
| Number of moving average [times] | Value must be 1 or more | 10 | Set number of moving average. Min = 1 and Max = 60. |
| Fan speed control [%] | Value must be 60 or more | 86 | Set fan speed control. Min = 60 and Max = 100. |
| Comms I2C Callback | Name must be a valid C symbol | rrh62000_comms_i2c_callback | A user COMMS I2C callback function can |

be provided.

### Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

# Usage Notes

RRH62000 datasheet is here.
When using the sensor for the first time, allow up to 48 hours for re-hydration of the humidity sensor in ambient air and for TVOC sensor conditioning. This will allow the module to take optimal readings.
The RRH62000 is an integrated sensor module for the measurement of critical air quality parameters. Sensors for particulate matter (PM), total volatile organic compounds (TVOC), estimation of carbon dioxide (eCO2) optional nitrogen dioxide (NO2), optional ozone (O3), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

### Notifications

- After turning on the module for the first time, the sensor will automatically start in ZMOD sensor cleaning mode for 1 minute. Do not cut power to the sensor during this period.
- Interval time needs to be at least 1s after power-on or reset.
- I2C-master access interval for RRH62000 must be longer than 1s.
- This module supports I2C only (not support UART).

### Limitations

- r_iic_master on RA8 series MCU is not supported.
- I2C Master (r_sau_i2c) is not supported. RRH62000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - SLEEP
    - CLEAN
    - TINTC_H
    - TINTC_L
    - TCLEAN
    - RMOX
    - UID

### Bus Initialization

The RRH62000 interface expects a bus instance to be opened before opening any RRH62000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

### Initialization

Initialize with RM_RRH62000_Open().

### From measurement start to data acquisition

An endless loop continuously checks the status of the RRH62000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH62000_StatusCheck(). This function will execute a status check over I2C.
2. If RM_AIR_SENSOR_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time (min=1s) and then call RM_RRH62000_StatusCheck() again.
3. Wait until RM_AIR_SENSOR_EVENT_MEASUREMENT_COMPLETE is received.
4. Call RM_RRH62000_Read() and read the measurement data.
5. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
6. Call RM_RRH62000_DataCalculate().

# Examples

### Basic Example

These are basic examples of minimal use of RRH62000 sensor implementation in an application.

```

## Function Documentation

### ◆ RM_RRH62000_Open()

fsp_err_t RM_RRH62000_Open ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg* )

Opens and configures the RRH62000 sensor module. If ZMOD cleaning is not complete, this function will take at least 1 minute. Implements rm_air_sensor_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | RRH62000 successfully configured. |
| FSP_ERR_ASSERTION | Null pointer, or one or more configuration options is invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. This module can only be opened once. |
| FSP_ERR_NOT_INITIALIZED | ZMOD cleaning is not complete. |

### ◆ RM_RRH62000_Close()

fsp_err_t RM_RRH62000_Close ( rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_RRH62000_StatusCheck()

fsp_err_t RM_RRH62000_StatusCheck ( rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_air_sensor_api_t::statusCheck.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_RRH62000_Read()

fsp_err_t RM_RRH62000_Read ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data* )

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_air_sensor_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH62000_DataCalculate()

fsp_err_t RM_RRH62000_DataCalculate ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh62000_data* )

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully gas data is calculated. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_RRH62000_FirmwareVersionGet()

fsp_err_t RM_RRH62000_FirmwareVersionGet ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version* )

This function should be called to get firmware version. Firmware version does not use "patch" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### ◆ RM_RRH62000_AlgorithmVersionGet()

fsp_err_t RM_RRH62000_AlgorithmVersionGet ( rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version* )

This function should be called to get algorithm version. Implements rm_air_sensor_api_t::algorithmVersionGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |

### Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

# Overview

ZMOD4410, ZMOD4450 and ZMOD4510 are EOL.

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4450
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

### Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement

- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

# Configuration

### Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated].

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_zmod4xxx_sensor0 | Module name. |
| Comms I2C Callback | Name must be a valid C symbol | zmod4xxx_comms_i2c_callback | A user COMMS I2C callback function can be provided. |
| IRQ Callback | Name must be a valid C symbol | zmod4xxx_irq_callback | A user IRQ callback function can be provided. |

### Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

# Usage Notes

ZMOD4410 datasheet is here.
The ZMOD4410 has five modes of operation.
The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

| Method | Description |
|---|---|
| IAQ 1st Generation Continuous | Measurement of UBA levels for IAQ and eCO2, provides continuous data |

| | |
|---|---|
| IAQ 1st Generation Low Power | Measurement of UBA levels for IAQ and eCO2, fixed sampling interval of 6 seconds |
| IAQ 2nd Generation | Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs) |
| IAQ 2nd Generation Ultra Low Power | Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption |
| Relative IAQ | Lightweight algorithm reacts to air quality changes and outputs a relative IAQ |
| Relative IAQ Ultra Low Power | Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This method offers a much lower power consumption |
| Public Building AQ Standard (PBAQ) | For highly accurate and consistent sensor readings to fulfill public building standards. |
| Sulfur-based Odor Discrimination | The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell |

ZMOD4450 datasheet is here.
The ZMOD4450 has one modes of operation.
The response time for a gas stimulation is always within a few seconds, depending on the gas and its concentration. An active or direct airflow onto the sensor module is not necessary since diffusion of ambient gas does not limit the sensor module response time. The ZMOD4450 will respond to typical refrigeration gases immediate upon start-up; however, a conditioning period of 48 hours in a refrigeration environment is recommended to improve stability and get maximum performance, as the module algorithm is able to learn about the refrigeration environment over time.

| Method | Description |
|---|---|
| RAQ | Control signal based on Refrigerator Air Quality Changes |

ZMOD4510 datasheet is here.
The ZMOD4510 has two modes of operation.
For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.
For NO2 O3 operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
For Compensation for oxidizing gases ULP option operation a response to ozone will be seen after a warmup time of 30 min.
For Compensation for oxidizing gases option operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

| Method | Description |
|---|---|
| OAQ 2nd Generation | Selective Ozone featuring Ultra-Low Power |
| NO2 O3 | Selective nitrogen dioxide and ozone firmware |
| Compensation for oxidizing gases option | Measurement of compensation data for IAQ 2nd |

| | |
|---|---|
| | Gen, PBAQ |
| Compensation for oxidizing gases option ULP | Measurement of compensation data for IAQ 2nd Gen Ultra-Low Power |

A library corresponding to each of these modes is required.
The **Compensation for oxidizing gases option** mode can be used with the **IAQ 2nd Generation** mode and the **Public Building AQ Standard (PBAQ)** mode.
The **Compensation for oxidizing gases option ULP** mode can be used with the **IAQ 2nd Generation Ultra Low Power** mode.
By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

**Notifications**

The ZMOD4xxx sensor needs a reset before operation; please input a reset signal to the RES_N pin (active low).

Program flow for OAQ 2nd gen is changed in FSP v4.0.0. Please refer to the programming manual [R36US0004EU] and the application note[R01AN5899].
R01AN5899 : https://www.renesas.com/document/apn/zmod4xxx-sample-application
R36US0004EU : https://www.renesas.com/document/mat/zmod4510-programming-manual-read-me

**Limitations**

- The following modes are currently not supported for dev_assist.
  - Compensation
  - Compensation ULP

**Bus Initialization**

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

**Initialization**

Initialize with RM_ZMOD4XXX_Open(). One channel of timer is required to measure the waiting time at initialization.

**From measurement start to data acquisition**

After normal completion, start the measurement with RM_ZMOD4XXX_MeasurementStart(). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

**If IRQ is enabled**

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
3. Call RM_ZMOD4XXX_Read(). This function will read the ADC data.
4. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
5. Call the DataCalculate API according to the mode.

**If IRQ is disabled**

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
3. Call RM_ZMOD4XXX_StatusCheck(). This function will execute a status check over I2C.
4. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_ZMOD4XXX_StatusCheck() again.
5. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
6. Call RM_ZMOD4XXX_Read() and read the ADC data.
7. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
8. Call the DataCalculate API according to the mode.

**Checking device error for IAQ 2nd Gen.**

1. Call RM_ZMOD4XXX_DeviceErrorCheck(). This function will execute a device error check over I2C.
2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

# Examples

### Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
 fsp_err_t                 err = FSP_SUCCESS;

## Enumeration Type Documentation

### ◆ rm_zmod4xxx_lib_type_t

| enum rm_zmod4xxx_lib_type_t |
|---|
| ZMOD4XXX Library type |

## Function Documentation

### ◆ RM_ZMOD4XXX_Open()

fsp_err_t RM_ZMOD4XXX_Open ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg* )

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_UNSUPPORTED | Unsupport product ID. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_ZMOD4XXX_Close()

fsp_err_t RM_ZMOD4XXX_Close ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully closed. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_ZMOD4XXX_MeasurementStart()

fsp_err_t RM_ZMOD4XXX_MeasurementStart ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_ZMOD4XXX_MeasurementStop()

fsp_err_t RM_ZMOD4XXX_MeasurementStop ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_ZMOD4XXX_StatusCheck()

fsp_err_t RM_ZMOD4XXX_StatusCheck ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully started. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

### ◆ RM_ZMOD4XXX_Read()

fsp_err_t RM_ZMOD4XXX_Read ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | Communication is timeout. |
| FSP_ERR_ABORTED | Communication is aborted. |
| FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED | Measurement is not finished. |

### ◆ RM_ZMOD4XXX_Iaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_1st_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate .

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_sulfur_odor_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_2nd_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_RaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RaqDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_raq_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::raqDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_RellaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RellaqDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_rel_iaq_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::rellaqDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_PbaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_PbaqDataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_No2O3DataCalculate()

fsp_err_t RM_ZMOD4XXX_No2O3DataCalculate ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_no2_o3_data_t *const *p_zmod4xxx_data* )

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::no2O3DataCalculate.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter or library internal error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_SENSOR_IN_STABILIZATION | Module is stabilizing. |
| FSP_ERR_SENSOR_INVALID_DATA | Sensor probably damaged. Algorithm results may be incorrect. |

### ◆ RM_ZMOD4XXX_CompensationInfoSet()

fsp_err_t RM_ZMOD4XXX_CompensationInfoSet ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_compensation_info_t const *const *p_compensation_info* )

This function should be called when setting the compensation info from ZMOD4510 device for the ZMOD4410 device and when the ZMOD4510 for oxidizing gas correction option is enabled. After reading the raw data from the ZMOD4510 device, set the compensation info for the ZMOD4410 to begin calculating the compensation data.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully compensation info are set. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter or library internal error occurred. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_UNSUPPORTED | Operation mode is not supported. |

### ◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity* )

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |

### ◆ RM_ZMOD4XXX_DeviceErrorCheck()

fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck ( rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successfully results are read. |
| FSP_ERR_ASSERTION | Null pointer passed as a parameter. |
| FSP_ERR_NOT_OPEN | Module is not opened configured. |
| FSP_ERR_TIMEOUT | communication is timeout. |
| FSP_ERR_ABORTED | communication is aborted. |

## 5.2.17 Storage

Modules

### Detailed Description

Storage Modules.

### Modules

Block Media Custom Implementation (rm_block_media_user)

### 5.2.17.1 Block Media Custom Implementation (rm_block_media_user)

Modules » Storage

Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.

# Overview

### Features

This module is for using Block media with user-selected media.

# Configuration

Block Media User has no output config settings.
The user is required to create the config settings etc. in the application.
The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write    = RM_BLOCK_MEDIA_RAM_Write,
    .erase    = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close    = RM_BLOCK_MEDIA_RAM_Close,
};
extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

*Note*

*If you use block_media_user, you need to create a function that matches the media you are using.*
*In the above example, this is the function with RM_BLOCK_MEDIA_.*
*Register the created function in rm_block_media_api_t.*
*The registered rm_block_media_api_t is registered in p_api, which is a member of rm_block_media_instance_t.*

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

# Examples

### Basic Example

Please refer to USB PMSC (r_usb_pmsc) for the PMSC application given as an example.

## 5.2.17.2 Block Media RAM (rm_block_media_ram)

Modules » Storage

### Functions

| | |
|---|---|
| fsp_err_t | RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg) |
| fsp_err_t | RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest_address, uint32_t const block_address, uint32_t const num_blocks) |
| fsp_err_t | RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src_address, uint32_t const block_address, uint32_t const num_blocks) |
| fsp_err_t | RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const block_address, uint32_t const num_blocks) |

| fsp_err_t | RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info) |
| fsp_err_t | RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const p_ctrl) |

### Detailed Description

Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.

# Overview

### Features

- This module is for using RAM as a media area.
- Supports using any read/write section of the address space as the media area.

*Note*

*When using an external RAM as the media area (like SDRAM or OctaRAM), it must be initialized before calling RM_BLOCK_MEDIA_RAM_Open().*
*When using PMSC driver in combination with this module, the API of this module is called from the PMSC driver.*

# Configuration

### Build Time Configurations for rm_block_media_ram

The following build time configurations are defined in fsp_cfg/rm_block_media_ram_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| RAM Media Size | Please enter the RAM media size. | 65536 | Enter a RAM media size of 20K bytes or more. |
| Memory Storage Section | Manual Entry | .bss | This is the section of memory that will be used for the backing storage. Must be a valid Linker section. ('.bss', '.sdram', '.OSPI_DEVICE_0_RAM', etc). For AC6 preface any section with '.bss' e.g. '.bss.sdram' |
| Format during mediaInit | • Enabled<br>• Disabled | Enabled | If disabled RAM must be formatted with filex_media_format before calling filex_media_open. |

### Configurations for Storage > Block Media RAM Implementation (rm_block_media_ram)

This module can be added to the Stacks tab via New Stack > Storage > Block Media RAM Implementation (rm_block_media_ram).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_block_media0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed. |

*Note*

*Specify RAM media size of 20 Kbytes or more. This module cannot be used with an MCU that cannot allocate at least 20 Kbytes of RAM as media area.*
*When using AC6 it is recommended to start section names with ".bss" (ex. ".bss.sdram") to prevent unnecessarily large binaries. This tells AC6 to create ZI sections rather than initialized sections.*

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the RAM block media implementation in an application.

```
#define RM_BLOCK_MEDIA_RAM_BLOCK_SIZE (512U)
uint8_t g_dest[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
rm_block_media_status_t status;
void rm_block_media_ram_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_RAM_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_RAM driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_RAM_Open(&g_rm_block_media0_ctrl,
```

```
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When enabled, format RAM as FAT file system. */
    err = RM_BLOCK_MEDIA_RAM_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Get the RM_BLOCK_MEDIA_RAM driver status. */
    err = RM_BLOCK_MEDIA_RAM_StatusGet(&g_rm_block_media0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 if (true == status.initialized)
    {
 /* Write a block of data to block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
      assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
      assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Close the RM_BLOCK_MEDIA_RAM driver. */
 RM_BLOCK_MEDIA_RAM_Close(&g_rm_block_media0_ctrl);
    }
}
```

## Function Documentation

### ◆ RM_BLOCK_MEDIA_RAM_Open()

fsp_err_t RM_BLOCK_MEDIA_RAM_Open ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg* )

Opens the module.

Implements rm_block_media_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is available and is now open. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Module has already been opened with this instance of the control structure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_RAM_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_RAM_MediaInit ( rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the RAM media area.

Implements rm_block_media_api_t::mediaInit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_RAM_Read()

fsp_err_t RM_BLOCK_MEDIA_RAM_Read ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Reads data from RAM media.

Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_RAM_Write()

fsp_err_t RM_BLOCK_MEDIA_RAM_Write ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Writes data to RAM media.

Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write finished successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_RAM_Erase()

fsp_err_t RM_BLOCK_MEDIA_RAM_Erase ( rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Erases sectors of RAM media.

Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_RAM_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_StatusGet ( rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status* )

Provides driver status.

Implements rm_block_media_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLOCK_MEDIA_RAM_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_InfoGet ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info* )

Retrieves module information.

Implements rm_block_media_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLOCK_MEDIA_RAM_Close()

fsp_err_t RM_BLOCK_MEDIA_RAM_Close ( rm_block_media_ctrl_t *const *p_ctrl*)

Closes the module.

Implements rm_block_media_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.

# Overview

### Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

# Configuration

### Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by

right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_block_media0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed. |

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SDMMC driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

### Function Documentation

#### ◆ RM_BLOCK_MEDIA_SDMMC_Open()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg* )

Opens the module.

Implements rm_block_media_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is available and is now open. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Module has already been opened with this instance of the control structure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::open

### ◆ RM_BLOCK_MEDIA_SDMMC_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit ( rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements rm_block_media_api_t::mediaInit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::mediaInit

### ◆ RM_BLOCK_MEDIA_SDMMC_Read()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements rm_block_media_api_t::read().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::read

### ◆ RM_BLOCK_MEDIA_SDMMC_Write()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements rm_block_media_api_t::write().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write finished successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::write

### ◆ RM_BLOCK_MEDIA_SDMMC_Erase()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase ( rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Erases sectors of an SD card or eMMC device. Implements rm_block_media_api_t::erase().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::erase
- sdmmc_api_t::statusGet

### ◆ RM_BLOCK_MEDIA_SDMMC_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet ( rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ RM_BLOCK_MEDIA_SDMMC_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet ( rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status* )

Provides driver status. Implements rm_block_media_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLOCK_MEDIA_SDMMC_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info* )

Retrieves module information. Implements rm_block_media_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

### ◆ RM_BLOCK_MEDIA_SDMMC_Close()

| fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close ( rm_block_media_ctrl_t *const *p_ctrl*) |
|---|
| Closes an open SD/MMC device. Implements rm_block_media_api_t::close(). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

## 5.2.17.4 Block Media SPI Flash (rm_block_media_spi)

Modules » Storage

### Functions

| | |
|---|---|
| fsp_err_t | RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_block, uint32_t const num_blocks) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_StatusGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_status_t *const p_status) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void *const p_context, rm_block_media_callback_args_t *const p_callback_memory) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl) |
| fsp_err_t | RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks) |

### Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.

# Overview

### Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

*Note*

*By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.*

# Configuration

### Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected, code for parameter checking is included in the build |

### Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Module Instance Name | Name must be a valid C symbol | g_rm_block_media0 | Module name |
| Block size (bytes) | Manual Entry | 4096 | Specify the size of a block in bytes. |
| Block count | Minimum block count is 1, maximum is defined by hardware and software design. | 8192 | Number of blocks available for use by this driver instance. |
| Base Address | Manual Entry | 0 | Base address offset (bytes) for instance memory region. |
| Callback Function | Name must be a valid C symbol | NULL | A user callback function can be |

provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

### Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

## Examples

### Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

### Non-Blocking Example

This is a basic example of using the optional SPI callback to implement non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
```

```
}
/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
 * been blocked by the lower level SPI driver busy indication.
 */
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
 /* Process operation complete. */
    }
 else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
    {
 rm_block_media_status_t status;
 rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
      assert(FSP_SUCCESS == err);
 if (true == status.busy)
      {
 /* Run waiting tasks */
            vTaskSuspend(xTaskGetCurrentTaskHandle());
      }
    }
 else
    {
       assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
 /* Process Read, Write, or Erase error. */
    }
}
```

### Function Documentation

### ◆ RM_BLOCK_MEDIA_SPI_Open()

fsp_err_t RM_BLOCK_MEDIA_SPI_Open ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg* )

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements rm_block_media_api_t::open.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Block media for SPI framework is successfully opened. |
| FSP_ERR_ASSERTION | One of the input parameters or their data references may be null. |
| FSP_ERR_ALREADY_OPEN | The channel specified has already been opened. See HAL driver for other possible causes. |

**Returns**

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- spi_flash_api_t::open

### ◆ RM_BLOCK_MEDIA_SPI_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info* )

Retrieves module information.

Implements rm_block_media_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

### ◆ RM_BLOCK_MEDIA_SPI_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit ( rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the Block Media SPI Flash device.

Implements rm_block_media_api_t::mediaInit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLOCK_MEDIA_SPI_Read()

fsp_err_t RM_BLOCK_MEDIA_SPI_Read ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_block*, uint32_t const *num_blocks* )

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::read.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SPI data read successfully |
| FSP_ERR_ASSERTION | p_ctrl or p_dest is NULL, or num_blocks is zero |
| FSP_ERR_NOT_OPEN | Block Media SPI module is not yet open |
| FSP_ERR_INVALID_ADDRESS | Invalid address range for read operation |
| FSP_ERR_NOT_INITIALIZED | Block Media SPI module is not yet initialized |

### ◆ RM_BLOCK_MEDIA_SPI_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_StatusGet ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_status_t *const *p_status* )

Provides driver status.

Implements rm_block_media_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |

**Returns**

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::statusGet

### ◆ RM_BLOCK_MEDIA_SPI_Write()

fsp_err_t RM_BLOCK_MEDIA_SPI_Write ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *start_block*, uint32_t const *num_blocks* )

Writes provided data to a number of blocks of spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::write.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Flash write finished successfully. |
| FSP_ERR_ASSERTION | p_ctrl or p_src is NULL. Or num_blocks is zero. |
| FSP_ERR_NOT_OPEN | Block media SPI Framework module is not yet initialized. |
| FSP_ERR_INVALID_ADDRESS | Invalid address range |
| FSP_ERR_NOT_INITIALIZED | Block Media SPI module is not yet initialized |

**Returns**

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::write

### ◆ RM_BLOCK_MEDIA_SPI_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SPI_CallbackSet ( rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. API not supported.

Implements rm_block_media_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | API not supported by RM_BLOCK_MEDIA_SPI. |

### ◆ RM_BLOCK_MEDIA_SPI_Close()

fsp_err_t RM_BLOCK_MEDIA_SPI_Close ( rm_block_media_ctrl_t *const *p_ctrl*)

Closes the Block Media SPI device. Implements rm_block_media_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | One of the following parameters may be null: p_ctrl. |
| FSP_ERR_NOT_OPEN | Block media SPI Framework module is not yet initialized. |

**Returns**

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- spi_flash_api_t::close

### ◆ RM_BLOCK_MEDIA_SPI_Erase()

fsp_err_t RM_BLOCK_MEDIA_SPI_Erase ( rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *start_block*, uint32_t const *num_blocks* )

This function erases blocks of the SPI device. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.

Implements rm_block_media_api_t::erase.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |
| FSP_ERR_INVALID_ADDRESS | Invalid address range |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- spi_flash_api_t::erase
- spi_flash_api_t::statusGet

## 5.2.17.5 Block Media USB (rm_block_media_usb)

### Detailed Description

Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.

# Overview

### Features

The USB implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from a USB mass storage device
- Callback called when device insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

# Configuration

### Build Time Configurations for rm_block_media_usb

The following build time configurations are defined in driver/rm_block_media_usb_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Storage > Block Media USB (rm_block_media_usb)

This module can be added to the Stacks tab via New Stack > Storage > Block Media USB (rm_block_media_usb). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_block_media0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be |

| | | | |
|---|---|---|---|
| | | | provided. If this callback function is provided, it will be called when a device is attached or removed. |
| Pointer to user context | Name must be a valid C symbol | NULL | A user context can be provided. If this context is provided, it will be passed to callback function when a device is attached or removed. |

*Note*

*RM_BLOCK_MEDIA_USB_MediaInit function must be called after receiving the insert event notification.*

### Clock Configuration

This module has no required clock configurations.

### Pin Configuration

This module does not use I/O pins.

## Examples

### Basic Example

This is a basic example of minimal use of the USB mass storage block media implementation in an application.

```
#define RM_BLOCK_MEDIA_USB_BLOCK_SIZE (512)
volatile bool g_usb_inserted = false;
uint8_t       g_dest[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t       g_src[RM_BLOCK_MEDIA_USB_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_usb_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_USB_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_USB driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_USB_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!g_usb_inserted)
    {
 /* Wait for a card insertion interrupt. */
    }
 /* Initialize the mass storage device. This should not be done until the device is
plugged in and initialized. */
    err = RM_BLOCK_MEDIA_USB_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an USB mass storage device. */
    err = RM_BLOCK_MEDIA_USB_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

### Device Insertion

This is an example of using a callback to determine when a mass storage device is plugged in and enumerated.

```
/* The callback is called when a media insertion event occurs. */
void rm_block_media_usb_media_insertion_example_callback
(rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED == p_args->event)
    {
       g_usb_inserted = true;
    }
 if (RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED == p_args->event)
    {
       g_usb_inserted = false;
    }
```

```
}
```

## Function Documentation

### ◆ RM_BLOCK_MEDIA_USB_Open()

fsp_err_t RM_BLOCK_MEDIA_USB_Open ( rm_block_media_ctrl_t *const *p_ctrl*,
rm_block_media_cfg_t const *const *p_cfg* )

Opens the module.

Implements rm_block_media_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is available and is now open. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_ALREADY_OPEN | Module has already been opened with this instance of the control structure. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_USB_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_USB_MediaInit ( rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the USB device.

Implements rm_block_media_api_t::mediaInit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### ◆ RM_BLOCK_MEDIA_USB_Read()

fsp_err_t RM_BLOCK_MEDIA_USB_Read ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Reads data from an USB device. Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Data read successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |
| FSP_ERR_USB_FAILED | The message could not received completed successfully. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_USB_Write()

fsp_err_t RM_BLOCK_MEDIA_USB_Write ( rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Writes data to an USB device. Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Write finished successfully. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |
| FSP_ERR_USB_FAILED | The message could not received completed successfully. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_USB_Erase()

fsp_err_t RM_BLOCK_MEDIA_USB_Erase ( rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks* )

Erases sectors of an USB device. Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_USB_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_USB_CallbackSet ( rm_block_media_ctrl_t *const *p_api_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

***Note***

*This function is currently unsupported for Block Media over USB.*

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | CallbackSet is not currently supported for Block Media over USB. |

### ◆ RM_BLOCK_MEDIA_USB_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_USB_StatusGet ( rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status* )

Provides driver status. Implements rm_block_media_api_t::statusGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Status stored in p_status. |
| FSP_ERR_ASSERTION | NULL pointer. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_BLOCK_MEDIA_USB_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_USB_InfoGet ( rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info* )

Retrieves module information. Implements rm_block_media_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Erase operation requested. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |
| FSP_ERR_NOT_INITIALIZED | Module has not been initialized. |

### ◆ RM_BLOCK_MEDIA_USB_Close()

fsp_err_t RM_BLOCK_MEDIA_USB_Close ( rm_block_media_ctrl_t *const *p_ctrl*)

Closes an open USB device. Implements rm_block_media_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module is not open. |

### 5.2.17.6 FileX I/O (rm_filex_block_media)

Modules » Storage

**Functions**

| | |
|---|---|
| fsp_err_t | RM_FILEX_BLOCK_MEDIA_Open (rm_filex_block_media_ctrl_t *const p_ctrl, rm_filex_block_media_cfg_t const *const p_cfg) |
| fsp_err_t | RM_FILEX_BLOCK_MEDIA_Close (rm_filex_block_media_ctrl_t *const p_ctrl) |
| void | RM_FILEX_BLOCK_MEDIA_BlockDriver (FX_MEDIA *p_fx_media)<br>Access Block Media device functions open, close, read, write and control. More... |

**Detailed Description**

Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.

# Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

### Features

The FileX Block Media module supports the following features:

- Callbacks for insertion and removal for removable devices.
- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

# Configuration

### Build Time Configurations for rm_filex_block_media

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_block_media_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |

### Configurations for Storage > FileX I/O (rm_filex_block_media)

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_filex_block_media_0 | Module name. |
| Callback | Name must be a valid C symbol | g_rm_filex_block_media_0_callback | A user callback function can be provided. If this callback function is provided, it will be called when media is inserted or removed. It will also be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality. |
| Partition Number | • 0<br>• 1<br>• 2<br>• 3 | 0 | The partition to use for partitioned media. This partition will only be used if a Master Boot Record with partition table exists at block 0 of the media, otherwise the FileX FAT boot record should exist or be formatted to block 0. |

### Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Common | | | |
| Max Long Name Len | Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty | | Specifies the maximum file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256. |
| Max Last Name Len | Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty | | This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256. |

| | | | |
|---|---|---|---|
| Max Sector Cache | Value must be an integer greater than 0 and power of 2 or empty | | Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2. |
| Fat Map Size | Value must be an integer greater than 0 or empty | | Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors. |
| Max Fat Cache | Value must be an integer greater than 0 and power of 2 or empty | | Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2. |
| Threading | | | |
| Update Rate (Seconds) | Value must be an integer greater than 0 or empty | | Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 seconds. |
| No Timer | • Enabled<br>• Disabled (default) | Disabled (default) | Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations. |
| Single Thread | • Enabled<br>• Disabled (default) | Disabled (default) | Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from |

| | | | |
|---|---|---|---|
| | | | one thread. |
| Standalone | • Enabled<br>• Disabled (default) | Disabled (default) | Enables FileX to be used in standalone mode (without Azure RTOS). |
| Extra Features | | | |
| Don't Update Open Files | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX does not update already opened files. |
| Media Search Cache | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, the file search cache optimization is disabled. |
| Direct Data Read Cache Fill | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, the direct read sector update of cache is disabled. |
| Media Statistics | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, gathering of media statistics is disabled. |
| Single Open Legacy | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, legacy single open logic for the same file is enabled. |
| Rename Path Inherit | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, renaming inherits path information. |
| No Local Path | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, removes local path logic from FileX, resulting in smaller code size. |
| 64-bit LBA | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, 64-bits sector addresses are used in I/O driver. |
| Cache | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables the cache, default is enabled. |
| File Close | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables file close, default is enabled. |
| Fast Close | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables fast open, default is enabled. |
| Force Memory Operation | • Enabled (default) | Enabled (default) | Enables or disables force memory |

| | | | |
|---|---|---|---|
| | • Disabled | | operation, default is enabled. |
| Build Options | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables build options, default is enabled. |
| One Line Function | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables one line function, default is enabled. |
| FAT Entry Refresh | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables FAT entry refresh, default is enabled. |
| Consecutive Detect | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables consecutive detect, default is enabled. |
| Enable exFAT | • Enabled<br>• Disabled (default) | Disabled (default) | Enables exFAT support in FileX. |
| Fault Tolerant | | | |
| Fault Tolerant Service | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA. |
| Fault Tolerant Data | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately. |
| Fault Tolerant | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps |

| | | | |
|---|---|---|---|
| | | | limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately. |
| Fault Tolerant Boot Index | Value must be an integer greater than or equal to 116 and less than or equal to 119 | | Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification. |
| Error Checking | • Enabled (default)<br>• Disabled | Enabled (default) | |

**Configurations for Storage > Azure RTOS FileX on Block Media**

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on Block Media.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_fx_media0 | Symbol used for media_ptr parameter in FileX APIs |
| Volume Name | Name must be a maximum of 11 characters | Volume 1 | Volume name string, which is a maximum of 11 characters. |
| Number of FATs | Number of FATs must be an integer greater than 0 | 1 | Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time. |
| Directory Entries | Number of Directory Entries must be an integer greater than 0 | 256 | Number of directory entries in the root directory. |
| Hidden Sectors | Number of Hidden Sectors must be an | 0 | Number of sectors hidden before this |

| | | | |
|---|---|---|---|
| | integer | | media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition. |
| Total Sectors | Total Sectors must be an integer greater than 0 | 65536 | Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info. |
| Bytes per Sector | Bytes per Sector must be multiple of 32 | 512 | Number of bytes per sector, which is typically 512. FileX requires this to be a multiple of 32. When using a Renesas provided block media implementation, bytes per sector can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info. |
| Sectors per Cluster | Sectors per Cluster must be an integer greater than 0 | 1 | Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system. |
| Volume Serial Number (exFAT only) | Volume Serial Number must be an integer greater than 0 | 12345 | Serial number to be used for this volume. exFAT only. |
| Boundary Unit (exFAT only) | Boundary unit must be an integer greater than 0 | 128 | Physical data area alignment size, in number of sectors. exFAT only. |
| Working media memory size | Memory size must be an integer greater than or equal to the size of one sector | 512 | Memory allocated for file system. Memory size must be an integer greater than or equal |

to the size of one sector.

# Usage Notes

### Pending during Read/Write

The FileX Block Media driver provides a number of events in the user callback to handle waiting or pending while it is doing blocking operations. The events received in the callback will differ depending on the lower level block media driver in use.

If the lower level block media driver is rm_block_media_spi (SPI blocks on read/write operations):

- The user will receive RM_BLOCK_MEDIA_EVENT_POLL_STATUS in the user callback while the lower level driver is polling for the read/write operation to be complete. The user can choose to do a thread sleep or software delay upon receiving this event in the callback.
- Once the operation is complete no other callbacks will be received.

If the lower level block media driver is rm_block_media_sdmmc (SDMMC is interrupt based, the FileX Block Media driver will still block while waiting for interrupts from SDMMC):

- The user will receive RM_BLOCK_MEDIA_EVENT_WAIT in the user callback when the FileX Block Media driver begins waiting for an interrupt event from SDMMC. This is sent from a thread context. The user can choose to pend on a semaphore, sleep the thread, or do a software delay upon receiving this event in the callback. The FileX Block Media driver thread will block until an interrupt is received.
- Once an SDMMC interrupt is received the user will receive RM_BLOCK_MEDIA_EVENT_WAIT_END in the user callback. This is sent from an interrupt context. The user can choose to give a semaphore on this event or do nothing.
- If SDMMC is busy on a long erase after receiving the interrupt the FileX Block Media driver will send RM_BLOCK_MEDIA_EVENT_POLL_STATUS to the user callback and proceed to do a blocking poll on SDMMC status. The user can choose to do a thread sleep or software delay upon receiving this event in the callback. This event will not be received by the user on typical operations by FileX.

### Partitioned Media

When using fx_format to format a partition the number of hidden sectors should match the starting block number of the partition and the total number of sectors should be equal to the number of sectors in the partition.

### Unused User Callback Events

Certain events are defined in rm_block_media_event_t but not returned by the FileX Block Media user callback:

- RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE: This event is handled internally and operation success is indicated by FileX API calls returning FX_SUCCESS.
- RM_BLOCK_MEDIA_EVENT_ERROR: This event is handled internally and operation failure will be indicated by an error return code from FileX API calls.

### Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the FileX instance should be erased using the lower

level flash API prior to usage. Otherwise, FileX open operation may fail when fx_media_open( ) is called.

# Examples

### Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS (1073741824)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_block_media_instance_t g_filex_block_media0;

extern uint8_t g_file_data[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FILEX_BLOCK_MEDIA_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_filex_block_media_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize FileX */
    fx_system_initialize();
```

```
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                              &g_filex_block_media0,
                              g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
 /* Create a file */
    fx_err = fx_file_create(&g_fx_media0, RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME);
    handle_fx_error(fx_err);
 /* Open source file for writing. */
    FX_FILE sourceFile;
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_WRITE);
    handle_fx_error(fx_err);
 /* Write file data. */
    fx_err = fx_file_write(&sourceFile, g_file_data, sizeof(g_file_data));
    handle_fx_error(fx_err);
 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Open the source file in read mode. */
    fx_err = fx_file_open(&g_fx_media0, &sourceFile,
RM_FILEX_BLOCK_MEDIA_EXAMPLE_FILE_NAME, FX_OPEN_FOR_READ);
    handle_fx_error(fx_err);
 /* Read file data. */
    ULONG actual_size_read;
    fx_err = fx_file_read(&sourceFile, g_read_buffer, sizeof(g_file_data),
&actual_size_read);
    handle_fx_error(fx_err);
    assert(sizeof(g_file_data) == actual_size_read);
 /* Close the file. */
```

```
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

### Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_filex_block_media_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

### Callback Pend Example

This shows how to use the I/O driver callback with ThreadX in order to wait/pend for operations to complete.

```
TX_SEMAPHORE g_operation_wait_semaphore;
/* Callback called by FileX block media I/O driver needs to pend on operation. */
void rm_filex_block_media_test_callback_pend (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT)
    {
 /* Interrupt has not happened for operation, get semaphore to wait for it. This will
be called from the FileX I/O driver thread. */
       tx_semaphore_get(&g_operation_wait_semaphore, TX_WAIT_FOREVER);
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_WAIT_END)
    {
 /* Interrupt has occurred for operation, post semaphore so that wait will end. This
will be called from an interrupt context. */
       tx_semaphore_put(&g_operation_wait_semaphore);
```

```
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_POLL_STATUS)
    {
 /* Interrupt has been received from block media device but operation is still
ongoing. The FileX I/O driver will wait on the driver busy status.
  * This event can be used to put the thread to sleep while waiting. This will be
called from the FileX I/O driver thread. */
       tx_thread_sleep(1);
    }
}
void rm_filex_block_media_callback_pend_example (void)
{
 /* Create semaphore for driver use */
    tx_semaphore_create(&g_operation_wait_semaphore, "operation_wait_semaphore", 0);
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the media */
    UINT fx_err =
fx_media_format(&g_fx_media0,                                    // Pointer to
FileX media control block.
 RM_FILEX_BLOCK_MEDIA_BlockDriver,                  // Driver entry
                                &g_filex_block_media0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                 // Volume Name
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_BLOCK_MEDIA_EXAMPLE_HIDDEN_SECTORS,
```

```
// Hidden sectors

RM_FILEX_BLOCK_MEDIA_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_NUM_HEADS,
// Heads
                                  RM_FILEX_BLOCK_MEDIA_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

### Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
volatile uint32_t g_rm_filex_block_media_insertion_events = 0;
volatile uint32_t g_rm_filex_block_media_removal_events = 0;
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_filex_block_media_test_callback (rm_filex_block_media_callback_args_t *
p_args)
{
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_INSERTED)
    {
       g_rm_filex_block_media_insertion_events++;
    }
 if (p_args->event & RM_BLOCK_MEDIA_EVENT_MEDIA_REMOVED)
    {
       g_rm_filex_block_media_removal_events++;
    }
}
void rm_filex_block_media_media_insertion_example (void)
{
```

```
 /* Open media driver.*/
 fsp_err_t err = RM_FILEX_BLOCK_MEDIA_Open(&g_filex_block_media0_ctrl,
&g_filex_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
 while (0U == g_rm_filex_block_media_insertion_events)
    {
 /* Wait for media insertion. */
    }
 /* Open the media. If the media is removable, it must be inserted before calling
  * fx_media_open. This assumes the disk is already partitioned and formatted. */
    UINT fx_err = fx_media_open(&g_fx_media0,
 "filex_example_media",
 RM_FILEX_BLOCK_MEDIA_BlockDriver,
                             &g_filex_block_media0,
                             g_fx_media0_memory,
 sizeof(g_fx_media0_memory));
    handle_fx_error(fx_err);
}
```

### Using FileX with Custom Block Media Implementations

When using a Custom Block Media implementation with rm_filex_block_media the custom implementation must call rm_filex_block_media_memory_callback upon the completion of a read/write operation. This callback should be called with an event of RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE and p_context of rm_filex_block_media_instance_ctrl_t *. The following example shows how this should be done in the context of a demo RAM block media read function.

```
#define EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR (0x20004AFE)
#define EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES (512)
/* Example implementation of rm_block_media_api_t::read(), user should define custom
block media RAM implementation. */
fsp_err_t RM_BLOCK_MEDIA_CUSTOM_RAM_Read (rm_block_media_ctrl_t * const p_ctrl,
                                          uint8_t * const
               p_dest_address,
```

```
                                       uint32_t const
block_address,
                                       uint32_t const                num_blocks)
{
 FSP_PARAMETER_NOT_USED(p_ctrl);
    memcpy(p_dest_address,
          (void *) (EXAMPLE_BLOCK_MEDIA_RAM_START_ADDR + (block_address *
EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES)),
          (EXAMPLE_BLOCK_MEDIA_RAM_BLOCK_SIZE_BYTES * num_blocks));
 /* Notify FileX port of operation complete through calling the callback, this is
required for custom block media/FileX port integration */
 rm_block_media_callback_args_t args;
    args.event    = RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE;
    args.p_context = &g_filex_block_media0_ctrl;
    rm_filex_block_media_memory_callback(&args);
 return FSP_SUCCESS;
}
```

## Data Structures

| | |
|---|---|
| struct | rm_filex_block_media_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_filex_block_media_instance_ctrl_t

| struct rm_filex_block_media_instance_ctrl_t |
|---|
| Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_BLOCK_MEDIA_Open is called. |

## Function Documentation

### ◆ RM_FILEX_BLOCK_MEDIA_Open()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Open ( rm_filex_block_media_ctrl_t *const *p_ctrl*, rm_filex_block_media_cfg_t const *const *p_cfg* )

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. Initializes callback and configuration for FileX Block Media interface. Call this before calling any FileX functions.

Implements rm_filex_block_media_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_FILEX_BLOCK_MEDIA_Close()

fsp_err_t RM_FILEX_BLOCK_MEDIA_Close ( rm_filex_block_media_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_filex_block_media_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Media device closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes.

### ◆ RM_FILEX_BLOCK_MEDIA_BlockDriver()

void RM_FILEX_BLOCK_MEDIA_BlockDriver ( FX_MEDIA * *p_fx_media*)

Access Block Media device functions open, close, read, write and control.

The RM_FILEX_BLOCK_MEDIA_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the FSP Block Media Interface. Uses block media driver for accesses.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_fx_media | FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide. |

**Return values**

| | |
|---|---|
| None | |

**Returns**

Nothing, but updates FileX media control block.

## 5.2.17.7 FileX I/O (rm_filex_levelx_nor)

Modules » Storage

### Functions

| | |
|---|---|
| void | RM_FILEX_LEVELX_NOR_DeviceDriver (FX_MEDIA *p_fx_media)<br>Access LevelX NOR device functions open, close, read, write and control. More... |

### Detailed Description

Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.

# Overview

This module provides the hardware port layer for FileX file system. After initializing this module, refer to the FileX API reference to use the file system: https://docs.microsoft.com/en-us/azure/rtos/filex/

### Features

The FileX LevelX NOR module supports the following features:

- ThreadX is typically required for FileX. To use FileX without ThreadX FX_STANDALONE_ENABLE must be defined.
- Unless FX_SINGLE_THREAD or FX_STANDALONE_ENABLE are defined, all FileX operations are thread safe.

## Configuration

### Build Time Configurations for rm_filex_levelx_nor

The following build time configurations are defined in fsp_cfg/middleware/rm_filex_levelx_nor_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the build. |

### Configurations for Storage > FileX I/O (rm_filex_levelx_nor)

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_filex_levelx_nor0 | Module name. |
| Callback | Name must be a valid C symbol | g_rm_filex_levelx_nor_0_callback | A user callback function can be provided. If this callback function is provided, it will be called during operations by the lower level block media as a way for the user to provide their desired waiting functionality. |
| LevelX NOR Name (String) | Manual Entry | g_rm_filex_levelx_nor_0 | String name to be input into LevelX API. |

### Build Time Configurations for fx

The following build time configurations are defined in fsp_cfg/azure/fx/fx_user.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Common | | | |
| Max Long Name Len | Value must be an | | Specifies the maximum |

| | | |
|---|---|---|
| | integer greater than or equal to 13 and less than or equal to 256, or empty | file name size for FileX. If left blank the default value is 256. Legal values range between 13 and 256. |
| Max Last Name Len | Value must be an integer greater than or equal to 13 and less than or equal to 256, or empty | This value defines the maximum file name length, which includes full path name. If left blank the default value is 256. Legal values range between 13 and 256. |
| Max Sector Cache | Value must be an integer greater than 0 and power of 2 or empty | Specifies the maximum number of logical sectors that can be cached by FileX. The actual number of sectors that can be cached is lesser of this constant and how many sectors can fit in the amount of memory supplied at fx_media_open. The default value if left blank is 256. All values must be a power of 2. |
| Fat Map Size | Value must be an integer greater than 0 or empty | Specifies the number of sectors that can be represented in the FAT update map. The default value if left blank is 256. Larger values help reduce unneeded updates of secondary FAT sectors. |
| Max Fat Cache | Value must be an integer greater than 0 and power of 2 or empty | Specifies the number of entries in the internal FAT cache. The default value if left blank is 16. All values must be a power of 2. |
| Threading | | |
| Update Rate (Seconds) | Value must be an integer greater than 0 or empty | Specifies rate at which system time in FileX is adjusted. Default value if left blank is 10, specifying that the FileX system time is updated every 10 |

| | | | |
|---|---|---|---|
| | | | seconds. |
| No Timer | • Enabled<br>• Disabled (default) | Disabled (default) | Eliminates the ThreadX timer setup to update the FileX system time and date. Doing so causes default time and date to be placed on all file operations. |
| Single Thread | • Enabled<br>• Disabled (default) | Disabled (default) | Eliminates ThreadX protection logic from the FileX source. It should be used if FileX is being used only from one thread. |
| Standalone | • Enabled<br>• Disabled (default) | Disabled (default) | Enables FileX to be used in standalone mode (without Azure RTOS). |
| Extra Features | | | |
| Don't Update Open Files | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX does not update already opened files. |
| Media Search Cache | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, the file search cache optimization is disabled. |
| Direct Data Read Cache Fill | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, the direct read sector update of cache is disabled. |
| Media Statistics | • Enabled (default)<br>• Disabled | Enabled (default) | When disabled, gathering of media statistics is disabled. |
| Single Open Legacy | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, legacy single open logic for the same file is enabled. |
| Rename Path Inherit | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, renaming inherits path information. |
| No Local Path | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, removes local path logic from FileX, resulting in smaller code size. |
| 64-bit LBA | • Enabled<br>• Disabled | Disabled (default) | When enabled, 64-bits sector addresses are |

| | | | |
|---|---|---|---|
| | (default) | | used in I/O driver. |
| Cache | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables the cache, default is enabled. |
| File Close | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables file close, default is enabled. |
| Fast Close | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables fast open, default is enabled. |
| Force Memory Operation | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables force memory operation, default is enabled. |
| Build Options | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables build options, default is enabled. |
| One Line Function | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables one line function, default is enabled. |
| FAT Entry Refresh | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables FAT entry refresh, default is enabled. |
| Consecutive Detect | • Enabled (default)<br>• Disabled | Enabled (default) | Enables or disables consecutive detect, default is enabled. |
| Enable exFAT | • Enabled<br>• Disabled (default) | Disabled (default) | Enables exFAT support in FileX. |
| Fault Tolerant | | | |
| Fault Tolerant Service | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, enables the FileX Fault Tolerant Module. Enabling Fault Tolerant automatically defines the symbol FX_FAULT_TOLERANT and FX_FAULT_TOLERANT_DATA. |
| Fault Tolerant Data | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX immediately passes all file data write requests to the media's driver. This potentially decreases performance, but helps limit lost file data. Note that enabling this |

| | | | |
|---|---|---|---|
| | | | feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately. |
| Fault Tolerant | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, FileX immediately passes write requests of all system sectors (boot, FAT, and directory sectors) to the media's driver. This potentially decreases performance, but helps limit corruption to lost clusters. Note that enabling this feature does not automatically enable FileX Fault Tolerant Module, which should be enabled separately. |
| Fault Tolerant Boot Index | Value must be an integer greater than or equal to 116 and less than or equal to 119 | | Defines byte offset in the boot sector where the cluster for the fault tolerant log is. By default if left blank this value is 116. This field takes 4 bytes. Bytes 116 through 119 are chosen because they are marked as reserved by FAT 12/16/32/exFAT specification. |
| Error Checking | • Enabled (default)<br>• Disabled | Enabled (default) | |

**Configurations for Storage > Azure RTOS FileX on LevelX NOR**

This module can be added to the Stacks tab via New Stack > Storage > Azure RTOS FileX on LevelX NOR.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_fx_media0 | Symbol used for media_ptr parameter in FileX APIs |
| Volume Name | Name must be a maximum of 11 characters | Volume 1 | Volume name string, which is a maximum of 11 characters. |

| | | | |
|---|---|---|---|
| Number of FATs | Number of FATs must be an integer greater than 0 | 1 | Number of FATs in the media. The minimal value is 1 for the primary FAT. Values greater than 1 result in additional FAT copies being maintained at run-time. |
| Directory Entries | Number of Directory Entries must be an integer greater than 0 | 256 | Number of directory entries in the root directory. |
| Hidden Sectors | Number of Hidden Sectors must be an integer | 0 | Number of sectors hidden before this media's boot sector. If using media formatted with multiple partitions this number should correspond to the starting block number for the desired partition. |
| Total Sectors | Total Sectors must be an integer greater than 0 | 57337 | Total number of sectors in the media. When using a Renesas provided block media implementation, total sectors can be fetched by the infoGet from the block media API. Any removable media must be inserted and initialized first to retrieve this info. |
| Sectors per Cluster | Sectors per Cluster must be an integer greater than 0 | 1 | Number of sectors in each cluster. The cluster is the minimum allocation unit in a FAT file system. |
| Volume Serial Number (exFAT only) | Volume Serial Number must be an integer greater than 0 | 12345 | Serial number to be used for this volume. exFAT only. |
| Boundary Unit (exFAT only) | Boundary unit must be an integer greater than 0 | 128 | Physical data area alignment size, in number of sectors. exFAT only. |
| Working media memory size | Memory size must be an integer greater than or equal to the size of one sector | 512 | Memory allocated for file system. Memory size must be an integer greater than or equal to the size of one sector. |

# Usage Notes

### Pending during Write/Erase

If the underlying LevelX NOR driver performs a blocking operation that requires waiting to complete (such as a long write/erase on NOR SPI), a callback can be provided to provide a way to wait with an OS-specific thread wait. This callback will also pass up block erase events.

### Partitioned Media

Partitioned media is not supported directly by the FileX LevelX NOR port.

# Examples

### Basic Example

This is a basic example of FileX Block Media in an application.

```
#define RM_FILEX_LEVELX_NOR_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_PARTITION_NUMBER (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_BLOCK_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES (128)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS (0)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE (512)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS (1)
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK (1)
extern rm_filex_levelx_nor_instance_t g_filex_levelx_nor0;

 /* Close the file. */
    fx_err = fx_file_close(&sourceFile);
    handle_fx_error(fx_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
 /* Close the Media */
    fx_err = fx_media_close(&g_fx_media0);
    handle_fx_error(fx_err);
}
```

### Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
#define RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE (4096)
void rm_filex_levelx_nor_format_example (void)
{
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_FILEX_LEVELX_NOR_EXAMPLE_SPI_SECTOR_SIZE);
```

```
     assert(FSP_SUCCESS == err);
      status.write_in_progress = true;
 while (status.write_in_progress)
     {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
     assert(FSP_SUCCESS == err);
      }
   }
   err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
   assert(FSP_SUCCESS == err);
 /* Format the media */
   UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,         // Total sectors
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,   // Sectors per cluster
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

### Callback Wait Example

This shows how to use the I/O driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by FileX block media I/O driver needs to wait on operation. */
void rm_filex_levelx_nor_test_callback_wait (rm_filex_levelx_nor_callback_args_t *
p_args)
{
 if (p_args->event & RM_FILEX_LEVELX_NOR_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
void rm_filex_levelx_nor_callback_wait_example (void)
{
 /* Format the media */
    UINT fx_err = fx_media_format(&g_fx_media0,
// Pointer to FileX media control block.
 RM_FILEX_LEVELX_NOR_DeviceDriver,                  // Driver entry
                                &g_filex_levelx_nor0, // Pointer to Block Media
Driver
                                g_fx_media0_memory, // Media buffer pointer
 sizeof(g_fx_media0_memory),                        // Media buffer size
 "EXAMPLE_VOLUME",                                  // Volume Name
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_FATS,
// Number of FATs
                                 RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_DIRECTORY_ENTRIES,
// Directory Entries
```

```
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_HIDDEN_SECTORS,
// Hidden sectors

RM_FILEX_LEVELX_NOR_EXAMPLE_TOTAL_SECTORS,          // Total sectors
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTOR_SIZE,
// Sector size

RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_CLUSTER,    // Sectors per cluster
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_NUM_HEADS,
// Heads
                                    RM_FILEX_LEVELX_NOR_EXAMPLE_SECTORS_PER_TRACK);
// Sectors per track
    handle_fx_error(fx_err);
}
```

## Data Structures

## Enumerations

| | |
|---|---|
| enum | rm_filex_levelx_nor_event_t |

## Data Structure Documentation

### ◆ rm_filex_levelx_nor_callback_args_t

| struct rm_filex_levelx_nor_callback_args_t | | |
|---|---|---|
| Callback function parameter data | | |
| Data Fields | | |
| rm_filex_levelx_nor_event_t | event | The event can be used to identify what caused the callback. |

| | | |
|---|---|---|
| void * | p_context | Placeholder for user data. |

### ◆ rm_filex_levelx_nor_cfg_t

| struct rm_filex_levelx_nor_cfg_t | |
|---|---|
| FileX LevelX configuration | |
| **Data Fields** | |
| UINT(* | nor_driver_initialize )(LX_NOR_FLASH *) |
| | Pointer to the initialization function. |
| | |
| LX_NOR_FLASH * | p_nor_flash |
| | NOR Flash instance. |
| | |
| CHAR * | p_nor_flash_name |
| | NOR Flash instance name. |
| | |
| fsp_err_t(* | close )() |
| | Pointer to underlying driver close. |
| | |
| void(* | p_callback )(rm_filex_levelx_nor_callback_args_t *p_args) |
| | Pointer to callback function. |
| | |
| void * | p_context |
| | Placeholder for user data. |
| | |

### ◆ rm_filex_levelx_nor_instance_ctrl_t

| struct rm_filex_levelx_nor_instance_ctrl_t | | |
|---|---|---|
| FileX block media private control block. DO NOT MODIFY. Initialization occurs when RM_FILEX_LEVELX_NOR_Open is called. | | |
| Data Fields | | |
| rm_filex_levelx_nor_cfg_t const * | p_cfg | Pointer to instance configuration. |

### ◆ rm_filex_levelx_nor_instance_t

| struct rm_filex_levelx_nor_instance_t | | |
|---|---|---|
| This structure encompasses everything that is needed to use an instance of this interface. | | |
| Data Fields | | |
| rm_filex_levelx_nor_instance_ctrl_t * | p_ctrl | Pointer to the control structure for this instance. |
| rm_filex_levelx_nor_cfg_t const * | p_cfg | Pointer to the configuration structure for this instance. |

## Macro Definition Documentation

### ◆ VOID

| #define VOID |
|---|
| Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. |

## Enumeration Type Documentation

### ◆ rm_filex_levelx_nor_event_t

| enum rm_filex_levelx_nor_event_t | |
|---|---|
| Options for the callback events. | |
| Enumerator | |
| RM_FILEX_LEVELX_NOR_EVENT_BUSY | Pending operation, user can define their own wait functionality. |

## Function Documentation

### ◆ RM_FILEX_LEVELX_NOR_DeviceDriver()

void RM_FILEX_LEVELX_NOR_DeviceDriver ( FX_MEDIA * *p_fx_media*)

Access LevelX NOR device functions open, close, read, write and control.

The RM_FILEX_LEVELX_NOR_DeviceDriver function is called from the FileX file system driver and issues requests to a LevelX NOR device through the LevelX API.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_fx_media | FileX media control block. All information about each open media device are maintained in the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide. |

**Return values**

| | |
|---|---|
| None | |

**Returns**

Nothing, but updates FileX media control block.

## 5.2.17.8 Flash (r_flash_hp)

Modules » Storage

### Detailed Description

Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.

# Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and

ROM flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

### Features

The R_FLASH_HP module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank-checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for ROM Flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.
- Anti-rollback counter support (select MCUs).
- Blocking writing of user lockable data flash option setting memory area (select MCUs).

# Configuration

### Build Time Configurations for r_flash_hp

The following build time configurations are defined in fsp_cfg/r_flash_hp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Code Flash Programming Enable | • Enabled<br>• Disabled | Disabled | Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API. |
| Data Flash Programming Enable | • Enabled<br>• Disabled | Enabled | Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API. |

### Configurations for Storage > Flash (r_flash_hp)

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_hp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_flash0 | Module name. |
| Data Flash Background | • Enabled | Enabled | Enabling allows Flash |

| | | | |
|---|---|---|---|
| Operation | • Disabled | | API calls that reference data-flash to return immediately, with the operation continuing in the background. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors. |
| Flash Ready Interrupt Priority | MCU Specific Options | | Select the flash ready interrupt priority. |
| Flash Error Interrupt Priority | MCU Specific Options | | Select the flash error interrupt priority. |

**Clock Configuration**

Flash uses FCLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

**Pin Configuration**

This module does not use I/O pins.

# Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_hp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

**Data Flash Background Operation (BGO) Precautions**

When using the data flash BGO (Background Operation) mode, you can still access the user ROM, RAM and external memory. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

Data flash BGO is not supported during anti-rollback counter operations or writes to the user lockable area.

**Code Flash Precautions**

Code flash cannot be accessed while writing, erasing or blank checking code flash. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash all supporting code must reside in RAM. This is only done when code flash programming is enabled. BGO mode is not supported for code flash, so a code flash operation will not return before the operation has completed. By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to

RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must insure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

### Flash Clock (FCLK)

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

### Anti Rollback Counter

Anti-rollback counters are available on select MCUs and can be used to prevent or limit firmware downgrade. The counters can only be incremented and never decremented or reset, even with an external programming tool.

*Note*

> ***The OEM bootloader anti-rollback counter is protected by the security engine and cannot be incremented past the version number specified in the code certificate. This counter works with the First Stage Bootloader (FSBL) set to enabled. For more information, read the 'Secure Boot' section in the 'Security Features' chapter of the user manual of the target MCU and refer to Application Note R11AN0774.***

### Anti-Rollback Counter Configuration Setting

When anti-rollback counters are used for one or more non-secure applications, the Anti-Rollback Counter Configuration Setting for ARC_NSEC (ARCCS) must be configured as either a single line (1xn bits) or multi-line counter (mxn bits). Single line is suitable when there is only one non-secure application using the anti-rollback counter. Multi-line is suitable when there are multiple non-secure applications. Before the counter is configured, it can't be used.

This configuration setting is permanent and must be performed with an external programming tool such as Renesas Flash Programmer (RFP). It cannot be configured in e2 studio.

The secure application and OEM bootloader anti-rollback counters do not require any initial configuration.

### Anti-Rollback Counter Lock Setting

Select MCUs have the ability to permanently lock the anti-rollback counters using the Anti-Rollback Counter Lock Setting (ARCLS). It cannot be set with e2 studio, but if needed, it can be configured with an external programming tool such as Renesas Flash Programmer (RFP). **Once the lock protection is applied to a counter, the counter value can never be incremented again.** It is still possible to read the value of a locked counter.

### Anti-Rollback Counter Recovery from Power Loss or other Counter Increment Error

If an error is returned by R_FLASH_HP_AntiRollbackCounterIncrement or power loss occurs during increment command processing, a successful call to R_FLASH_HP_AntiRollbackCounterRefresh is required before reading or incrementing the counter again. Otherwise, the counter flash may be in an invalid state.

### User Lockable Area

The user lockable area of the data flash configuration area neither requires nor supports erase before rewriting.

Locked sections of the user lockable area cannot be rewritten.

If lockable area is available on the MCU, start address, end address, and write size can be read at runtime in the second element of the data flash block information array (p_info->data_flash.p_block_array[1]) returned by R_FLASH_HP_InfoGet.

### Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

*Note*

*The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).*

### Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e$^2$ studio. This means that during a debug session, modifications to these memory regions will not be observed by e$^2$ studio. When debugging applications using e$^2$ studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

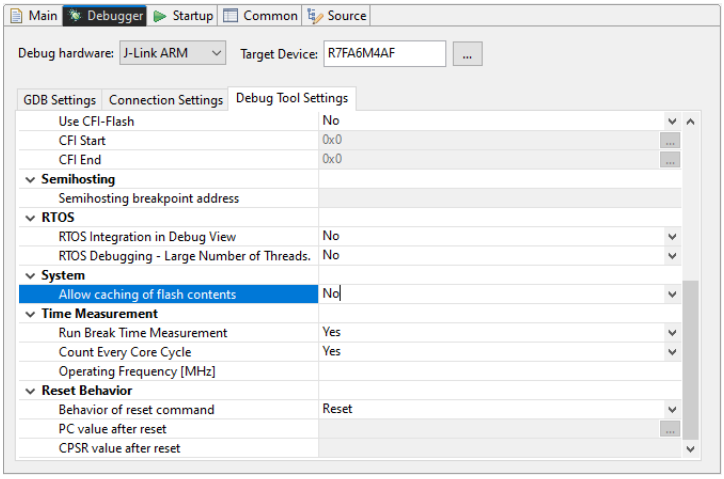

Figure 328: Debug Configuration

### Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is

still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased data flash blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.
- Runtime locking of the user lockable area is not currently supported. The area can be locked by an external programming tool. Do not write to locked areas of user lockable area.

# Examples

### High-Performance Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 64 B: 0x40100000 - 0x4010003F */
#define FLASH_CF_BLOCK_8 0x00010000  /* 32 KB: 0x00010000 - 0x00017FFF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_HP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
void r_flash_hp_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
```

```
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_8, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_8,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
```

### High-Performance Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
```

```
    .irq            = BSP_VECTOR_FLASH_HP_FRDYI_ISR,
};
void r_flash_hp_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
```

```
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE));
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

### High-Performance Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void r_flash_hp_bankswap_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x00200000. */
 /* Swap the block at address 0 with the one at 0x00200000 after the next restart.
  * The application at 0x00200000 must be written there by application code. */
    err = R_FLASH_HP_BankSwap(&g_flash_ctrl);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* Reset the MCU to swap to the other bank */
    __NVIC_SystemReset();
}
```

### High-Performance Anti-Rollback Counter Basic Example

This example demonstrates basic usage of the anti-rollback counter functions.

```
void r_flash_hp_anti_rollback_counter_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    uint32_t current_count;
 /* Read the current counter value for the secure application */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_SEC,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the OEM bootloader */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_OEMBL,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the non-secure application if counter is
configured as 1xn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for 4 non-secure applications if counter is
configured as mxn bits */
    err = R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App 0
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_1,
&current_count); // NSEC App 1
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_2,
&current_count); // NSEC App 2
    err |= R_FLASH_HP_AntiRollbackCounterRead(&g_flash_ctrl, FLASH_ARC_NSEC_3,
&current_count); // NSEC App 3
    assert(FSP_SUCCESS == err);
 /* Increment the counter value for the secure application. Caution: The increment
```

```
cannot be reversed. */
    err = R_FLASH_HP_AntiRollbackCounterIncrement(&g_flash_ctrl, FLASH_ARC_SEC);
 /* If error occurred during increment, refresh the counter flash to ensure a valid
state */
 if (FSP_SUCCESS != err)
    {
       err = R_FLASH_HP_AntiRollbackCounterRefresh(&g_flash_ctrl, FLASH_ARC_SEC);
      assert(FSP_SUCCESS == err);
    }
    assert(FSP_SUCCESS == err);
}
```

### High-Performance User Lockable Area Basic Example

This example demonstrates writing the user lockable area.

```
void r_flash_hp_user_lockable_area_example (void)
{
 /* Open the flash hp instance. */
 fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 flash_info_t flash_info;
    err = R_FLASH_HP_InfoGet(&g_flash_ctrl, &flash_info);
    assert(FSP_SUCCESS == err);
    assert(flash_info.data_flash.num_regions >= 2);
 flash_block_info_t const * const p_user_area_info =
&flash_info.data_flash.p_block_array[1];
 /* Select initial value to write to the lockable area */
    uint32_t update_complete_flag = 0;
 /* Set parameters for writing update_complete_flag to start of lockable area */
    uint32_t const flash_address    = p_user_area_info->block_section_st_addr;
    uint32_t const write_size_bytes = sizeof(update_complete_flag);
 /* Ensure write size is a multiple of the programming size */
    uint32_t const programming_size_bytes = p_user_area_info->block_size_write;
    assert(write_size_bytes % programming_size_bytes == 0);
```

```
 /* Write data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
 /* Select new value to write to the lockable area */
    update_complete_flag = 1;
 /* Write new data to the beginning of User Lockable Area 0 */
    err = R_FLASH_HP_UserLockableAreaWrite(&g_flash_ctrl,
                                           (uint32_t) &update_complete_flag,
                                           flash_address,
                                           write_size_bytes);
    assert(FSP_SUCCESS == err);
 /* Confirm the data was written */
    assert(0 == memcmp(&update_complete_flag, (uint8_t *) flash_address,
write_size_bytes));
}
```

### Data Structures

| | |
|---|---|
| struct | flash_hp_instance_ctrl_t |

### Enumerations

| | |
|---|---|
| enum | flash_bgo_operation_t |

## Data Structure Documentation

### ◆ flash_hp_instance_ctrl_t

| struct flash_hp_instance_ctrl_t | |
|---|---|
| Flash HP instance control block. DO NOT INITIALIZE. | |
| **Data Fields** | |
| uint32_t | opened |
| | To check whether api has been opened or not. |

| | |
|---|---|
| flash_bgo_operation_t | current_operation |
| | Operation in progress, for example, FLASH_OPERATION_CF_ERASE. |

### Enumeration Type Documentation

#### ◆ flash_bgo_operation_t

| enum flash_bgo_operation_t |
|---|
| Possible Flash operation states |

### Function Documentation

#### ◆ R_FLASH_HP_Open()

fsp_err_t R_FLASH_HP_Open ( flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg* )

Initializes the high performance flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

Example:

```
/* Open the flash hp instance. */
fsp_err_t err = R_FLASH_HP_Open(&g_flash_ctrl, &g_flash_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful and timer has started. |
| FSP_ERR_ALREADY_OPEN | The flash control block is already open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_cfg. |
| FSP_ERR_IRQ_BSP_DISABLED | Caller is requesting BGO but the Flash interrupts are not enabled. |
| FSP_ERR_FCLK | FCLK must be a minimum of 4 MHz for Flash operations. |

### ◆ R_FLASH_HP_Write()

fsp_err_t R_FLASH_HP_Write ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes* )

Writes to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_HP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_HP_EXAMPLE_WRITE_SIZE);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation successful. If BGO is enabled this means the operation was started successfully. |
| FSP_ERR_IN_USE | The Flash peripheral is busy with a prior on-going transaction. |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank. |
| FSP_ERR_TIMEOUT | Timed out waiting for FCU operation to complete. |
| FSP_ERR_INVALID_SIZE | Number of bytes provided was not a multiple of the programming size or exceeded the maximum range. |
| FSP_ERR_INVALID_ADDRESS | Invalid address was input or address not on programming boundary. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |

### ◆ R_FLASH_HP_Erase()

fsp_err_t R_FLASH_HP_Erase ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks* )

Erases the specified Code or Data Flash blocks. Implements flash_api_t::erase by the block_erase_address.

***Note***

*Code flash may contain blocks of different sizes. When erasing code flash it is important to take this into consideration to prevent erasing a larger address space than desired.*

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_HP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful open. |
| FSP_ERR_INVALID_BLOCKS | Invalid number of blocks specified |
| FSP_ERR_INVALID_ADDRESS | Invalid address specified. If the address is in code flash then code flash programming must be enabled. |
| FSP_ERR_IN_USE | Other flash operation in progress, or API not initialized |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_ERASE_FAILED | Status is indicating a Erase error. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |

### ◆ R_FLASH_HP_BlankCheck()

fsp_err_t R_FLASH_HP_BlankCheck ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result* )

Performs a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_HP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Blank check operation completed with result in p_blank_check_result, or blank check started and in-progess (BGO mode). |
| FSP_ERR_INVALID_ADDRESS | Invalid data flash address was input. |
| FSP_ERR_INVALID_SIZE | 'num_bytes' was either too large or not aligned for the CF/DF boundary size. |
| FSP_ERR_IN_USE | Other flash operation in progress or API not initialized. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window. |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |
| FSP_ERR_BLANK_CHECK_FAILED | Blank check operation failed. |

### ◆ R_FLASH_HP_StatusGet()

fsp_err_t R_FLASH_HP_StatusGet ( flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status* )

Query the FLASH peripheral for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_HP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | FLASH peripheral is ready to use. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |

### ◆ R_FLASH_HP_IdCodeSet()

fsp_err_t R_FLASH_HP_IdCodeSet ( flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode* )

Implements flash_api_t::idCodeSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID Code successfully configured. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Code Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_AccessWindowSet()

fsp_err_t R_FLASH_HP_AccessWindowSet ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr* )

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected.

***Note***

*If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().*

Implements flash_api_t::accessWindowSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Access window successfully configured. |
| FSP_ERR_INVALID_ADDRESS | Invalid settings for start_addr and/or end_addr. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Code Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_AccessWindowClear()

fsp_err_t R_FLASH_HP_AccessWindowClear ( flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements flash_api_t::accessWindowClear.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Access window successfully removed. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Code Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_Reset()

fsp_err_t R_FLASH_HP_Reset ( flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Flash circuit successfully reset. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_StartUpAreaSelect()

fsp_err_t R_FLASH_HP_StartUpAreaSelect ( flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary* )

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements flash_api_t::startupAreaSelect.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Code Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_BankSwap()

fsp_err_t R_FLASH_HP_BankSwap ( flash_ctrl_t *const *p_api_ctrl*)

Swaps the flash bank located at address 0x00000000 and address 0x00200000. This can only be done when in dual bank mode. Dual bank mode can be enabled in the FSP Configuration Tool under BSP Properties. After a bank swap is done the MCU will need to be reset for the changes to take place. flash_api_t::bankSwap.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Code Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_INVALID_MODE | Cannot switch banks while flash is in Linear mode. |
| FSP_ERR_WRITE_FAILED | Flash write operation failed. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command. |

### ◆ R_FLASH_HP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_HP_UpdateFlashClockFreq ( flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | Flash is busy with an on-going operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_FCLK | FCLK is not within the acceptable range. |

### ◆ R_FLASH_HP_InfoGet()

fsp_err_t R_FLASH_HP_InfoGet ( flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info* )

Returns the information about the flash regions. Implements flash_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful retrieved the request information. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_info. |

### ◆ R_FLASH_HP_Close()

fsp_err_t R_FLASH_HP_Close ( flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent Flash operations. Implements flash_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_cfg. |

### ◆ R_FLASH_HP_CallbackSet()

fsp_err_t R_FLASH_HP_CallbackSet ( flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements flash_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_FLASH_HP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_HP_AntiRollbackCounterIncrement ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Increments the selected anti-rollback counter.

**Warning**

If this function returns an error code other than FSP_SUCCESS, or power loss occurs during a call to this function, call R_FLASH_HP_AntiRollbackCounterRefresh to ensure the counter flash is in a valid state following the error.

***Note***

*The counter is read internally before increment.*

Implements flash_api_t::antiRollbackCounterIncrement

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Counter incremented successfully |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_api_ctrl |
| FSP_ERR_NOT_ENABLED | The specified counter has not been configured (configuration is only required for ARC_NSEC) |
| FSP_ERR_OVERFLOW | The counter cannot be incremented because it is already at its max value |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Data Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command |
| FSP_ERR_UNSUPPORTED | Data flash programming is not enabled or selected anti-rollback counter is not supported on this MCU |

### ◆ R_FLASH_HP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRefresh ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Refreshes the selected anti-rollback counter flash area to ensure the flash is in a valid state even if an error occurred during counter increment processing.

This function must be called if errors or power failure occurred during counter increment.

Power failure can be detected by the application code by management of user-defined non-voltile flags during counter increment.

Until a refresh completes successfully, the value of the anti-rollback counter cannot be guaranteed and should not be read.

Implements flash_api_t::antiRollbackCounterRefresh

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Counter refreshed successfully |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_ENABLED | The specified counter has not been configured (configuration is only required for ARC_NSEC) |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Data Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command |
| FSP_ERR_UNSUPPORTED | Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU |

### ◆ R_FLASH_HP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_HP_AntiRollbackCounterRead ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count* )

Reads the selected anti-rollback counter and returns the number of counter bits set.

Implements flash_api_t::antiRollbackCounterRead

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Counter read successfully into p_count |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_api_ctrl or p_count |
| FSP_ERR_NOT_ENABLED | The specified counter has not been configured (configuration is only required for ARC_NSEC) |
| FSP_ERR_PE_FAILURE | Failed to enter or exit Data Flash P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of having received an illegal command |
| FSP_ERR_UNSUPPORTED | Data flash programming is not enabled or Anti-Rollback counter is not supported on this MCU |

### ◆ R_FLASH_HP_UserLockableAreaWrite()

fsp_err_t R_FLASH_HP_UserLockableAreaWrite ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes* )

Write to the user lockable area in flash

Implements flash_api_t::userLockableAreaWrite

***Note***

*BGO is not supported for user lockable area flash operations.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation successful. |
| FSP_ERR_IN_USE | The Flash peripheral is busy with a prior on-going transaction. |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_CMD_LOCKED | FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_TIMEOUT | Timed out waiting for FCU operation to complete. |
| FSP_ERR_INVALID_SIZE | Number of bytes provided was not a multiple of the programming size or exceeded the maximum range. |
| FSP_ERR_INVALID_ADDRESS | Invalid address was input or address not on programming boundary. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |

## 5.2.17.9 Flash (r_flash_lp)

| fsp_err_t | R_FLASH_LP_BankSwap (flash_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_FLASH_LP_InfoGet (flash_ctrl_t *const p_api_ctrl, flash_info_t *const p_info) |
| fsp_err_t | R_FLASH_LP_Close (flash_ctrl_t *const p_api_ctrl) |
| fsp_err_t | R_FLASH_LP_CallbackSet (flash_ctrl_t *const p_api_ctrl, void(*p_callback)(flash_callback_args_t *), void *const p_context, flash_callback_args_t *const p_callback_memory) |
| fsp_err_t | R_FLASH_LP_AntiRollbackCounterIncrement (flash_ctrl_t *const p_api_ctrl, flash_arc_t counter) |
| fsp_err_t | R_FLASH_LP_AntiRollbackCounterRefresh (flash_ctrl_t *const p_api_ctrl, flash_arc_t counter) |
| fsp_err_t | R_FLASH_LP_AntiRollbackCounterRead (flash_ctrl_t *const p_api_ctrl, flash_arc_t counter, uint32_t *const p_count) |
| fsp_err_t | R_FLASH_LP_UserLockableAreaWrite (flash_ctrl_t *const p_api_ctrl, uint32_t const src_address, uint32_t flash_address, uint32_t const num_bytes) |

## Detailed Description

Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.

# Overview

The Flash HAL module APIs allow an application to write, erase and blank check both the data and code flash areas that reside within the MCU. The amount of flash memory available varies across MCU parts.

### Features

The Low-Power Flash HAL module has the following key features:

- Blocking and non-blocking erasing, writing and blank-checking of data flash.
- Blocking erasing, writing and blank checking of code flash.
- Callback functions for completion of non-blocking data flash operations.
- Access window (write protection) for code flash, allowing only specified areas of code flash to be erased or written.
- Boot block-swapping.
- ID code programming support.

# Configuration

### Build Time Configurations for r_flash_lp

The following build time configurations are defined in fsp_cfg/r_flash_lp_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| Code Flash Programming | • Enabled<br>• Disabled | Disabled | Controls whether or not code-flash programming is enabled. Disabling reduces the amount of ROM and RAM used by the API. |
| Code Flash Background Operation Support With Bank Programming | MCU Specific Options | | Enables execution from the startup code flash bank while programming the other code flash bank. |
| Data Flash Programming | • Enabled<br>• Disabled | Enabled | Controls whether or not data-flash programming is enabled. Disabling reduces the amount of ROM used by the API. |
| Data Flash Background Operation Support | • Enabled<br>• Disabled | Enabled | Controls whether or not Data Flash Background |

| | | | |
|---|---|---|---|
| | | | Operation support is included in the build. Disabling reduces the amount of ROM used by the API. |
| Instant Bank Swap (No Reset Required) | MCU Specific Options | | Calls to R_FLASH_LP_BankSwap will immediately swap banks without requiring a reset. |

**Configurations for Storage > Flash (r_flash_lp)**

This module can be added to the Stacks tab via New Stack > Storage > Flash (r_flash_lp).

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_flash0 | Module name. |
| Data Flash Background Operation | • Enabled<br>• Disabled | Enabled | Enabling allows Flash API calls that reference data-flash to return immediately, with the operation continuing in the background. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be specified. Callback function called when a Data Flash Background Operation completes or errors. |
| Flash Ready Interrupt Priority | MCU Specific Options | | Select the flash ready interrupt priority. |

**Clock Configuration**

Flash either uses FCLK or ICLK as the clock source depending on the MCU. When writing and erasing the clock source must be at least 4 MHz.

**Pin Configuration**

This module does not use I/O pins.

# Usage Notes

Warning

It is highly recommended that the developer reviews sections 5 and 6 of the Flash Memory section of the target MCUs Hardware User's Manual prior to using the r_flash_lp module. In particular, understanding ID Code and Access Window functionality can help avoid unrecoverable flash scenarios.

### Data Flash Background Operation (BGO) Precautions

When using the data flash BGO, the code flash, RAM and external memory can still be accessed. You must ensure that the data flash is not accessed during a data flash operation. This includes interrupts that may access the data flash.

### Code Flash Precautions

Modifying code flash has limitations requiring some of the flash code to reside in RAM. The use of Bank Programming can limit these requirements but some still exist.

Code flash cannot be accessed while writing, erasing or blank checking code flash unless Bank Programming is supported. Code flash cannot be accessed while modifying the access window, selecting the startup area or setting the ID code. In order to support modifying code flash or flash settings all supporting code must reside in RAM. This is only done when code flash programming is enabled.

When Bank Programming is disabled or not supported a code flash write, erase or blank check operation will not return before the operation has completed.

By default, the vector table resides in the code flash. If an interrupt occurs during the code flash operation other thank a Bank Programming operation, then code flash will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code flash operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must ensure that if in a multi-threaded environment, threads running from code flash cannot become active while a code flash operation is in progress.

### Bank Programming Precautions

Bank programming is supported on select MCUs. When enabled Bank1 can be programmed while executing out of Bank0, decreasing the RAM used by the flash driver. When this mode is enabled only Bank1 can be modified.

### Flash Clock Source

The flash clock source is the clock used by the Flash peripheral in performing all Flash operations. As part of the flash_api_t::open function the Flash clock source is checked will return FSP_ERR_FCLK if it is invalid. Once the Flash API has been opened, if the flash clock source frequency is changed, the flash_api_t::updateFlashClockFreq API function must be called to inform the API of the change. Failure to do so could result in flash operation failures and possibly damage the part.

### Interrupts

Enable the flash ready interrupt only if you plan to use the data flash BGO. In this mode, the application can initiate a data flash operation and then be asynchronously notified of its completion, or an error, using a user supplied-callback function. The callback function is passed a structure containing event information that indicates the source of the callback event (for example, flash_api_t::FLASH_EVENT_ERASE_COMPLETE) When the FLASH FRDYI interrupt is enabled, the corresponding ISR will be defined in the flash driver. The ISR will call a user-callback function if one was registered with the flash_api_t::open API.

*Note*

*The Flash HP supports an additional flash-error interrupt and if the BGO mode is enabled for the FLASH HP then both the Flash Ready Interrupt and Flash Error Interrupts must be enabled (assigned a priority).*

### Viewing flash contents in e2 studio

By default, the contents of data flash and code flash are cached by e$^2$ studio. This means that during a debug session, modifications to these memory regions will not be observed by e$^2$ studio. When debugging applications using e$^2$ studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified flash contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

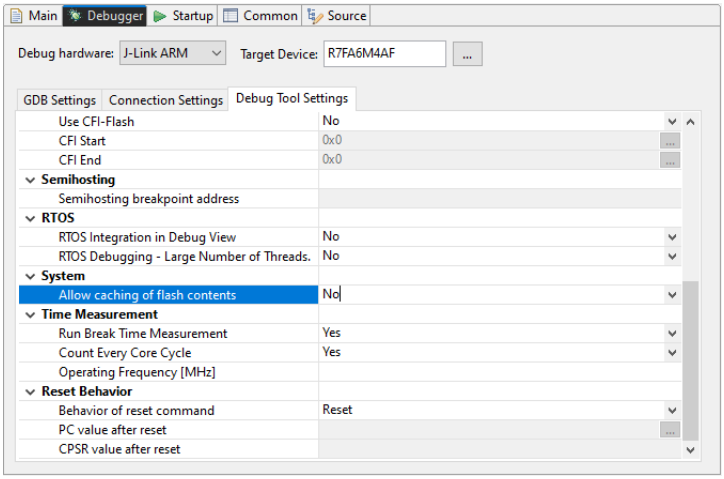

Figure 329: Debug Configuration

### Limitations

- Write operations must be aligned on page boundaries and must be a multiple of the page boundary size.
- Erase operations will erase the entire block the provided address resides in.
- Data flash is better suited for storing data as it can be erased and written to while code is still executing from code flash. Data flash is also guaranteed for a larger number of reprogramming/erasure cycles than code flash.
- Read values of erased blocks are not guaranteed to be 0xFF. Blank check should be used to determine if memory has been erased but not yet programmed.

## Examples

### Low-Power Flash Basic Example

This is a basic example of erasing and writing to data flash and code flash.

```
#define FLASH_DF_BLOCK_0 0x40100000U /* 1 KB: 0x40100000 - 0x401003FF */
#define FLASH_CF_BLOCK_10 0x00005000  /* 2 KB: 0x00005000 - 0x000057FF */
#define FLASH_DATA_BLOCK_SIZE (1024)
#define FLASH_LP_EXAMPLE_WRITE_SIZE 32
uint8_t       g_dest[TRANSFER_LENGTH];
uint8_t       g_src[TRANSFER_LENGTH];
flash_result_t blank_check_result;
```

```
void R_FLASH_LP_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
    assert(FSP_SUCCESS == err);
 /* Erase 1 block of data flash starting at block 0. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 /* Check if block 0 is erased. */
    err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
    assert(FSP_SUCCESS == err);
 /* Verify the previously erased area is blank */
    assert(FLASH_RESULT_BLANK == blank_check_result);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* Disable interrupts to prevent vector table access while code flash is in P/E
mode. */
    __disable_irq();
 /* Erase 1 block of code flash starting at block 10. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_CF_BLOCK_10, 1);
    assert(FSP_SUCCESS == err);
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

```
    assert(FSP_SUCCESS == err);
 /* Enable interrupts after code flash operations are complete. */
    __enable_irq();
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_CF_BLOCK_10,
FLASH_LP_EXAMPLE_WRITE_SIZE));
}
```

### Low-Power Flash Advanced Example

This example demonstrates using BGO to do non-blocking operations on the data flash.

```
bool interrupt_called;
flash_event_t flash_event;
static flash_cfg_t g_flash_bgo_example_cfg =
{
    .p_callback    = flash_callback,
    .p_context      = 0,
    .p_extend       = NULL,
    .data_flash_bgo = true,
    .ipl            = 5,
    .irq            = BSP_VECTOR_FLASH_LP_FRDYI_ISR,
};
void R_FLASH_LP_bgo_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_bgo_example_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    interrupt_called = false;
 /* Erase 1 block of data flash starting at block 0. */
```

```
    err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
       ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
    interrupt_called = false;
 /* Write 32 bytes to the first block of data flash. */
    err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
    assert(FSP_SUCCESS == err);
 flash_status_t status;
 /* Wait until the current flash operation completes. */
 do
    {
       err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
    } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
 /* If the interrupt wasn't called process the error. */
    assert(interrupt_called);
 /* If the event wasn't a write complete process the error. */
    assert(FLASH_EVENT_WRITE_COMPLETE == flash_event);
 /* Verify the data was written correctly. */
    assert(0 == memcmp(g_src, (uint8_t *) FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE));
 /* When Bank Programming is enabled the code flash P/E operations are also non
blocking. */
    interrupt_called = false;
 /* Erase the first block of the flash bank not configured as the startup bank. */
    err = R_FLASH_LP_Erase(&g_flash_ctrl, (BSP_FEATURE_FLASH_CODE_FLASH_START +
BSP_ROM_SIZE_BYTES) / 2, 1);
    assert(FSP_SUCCESS == err);
 while (!interrupt_called)
    {
```

```
        ;
    }
    assert(FLASH_EVENT_ERASE_COMPLETE == flash_event);
}
void flash_callback (flash_callback_args_t * p_args)
{
    interrupt_called = true;
    flash_event      = p_args->event;
}
```

### Low-Power Flash Bank Swap Example

This example demonstrates swapping which flash bank is located at address 0. This feature is only on select MCUs.

```
void R_FLASH_LP_bankswap_example (void)
{
 /* Open the flash lp instance. */
 fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Write the new application starting at 0x0004_0000. */
 /* Swap the bank at address 0 with the one at 0x0004_0000 after the next restart.
  * The application at 0x0004_0000 must be written there by application code. */
    err = R_FLASH_LP_BankSwap(&g_flash_ctrl);
 /* When using Instant Bank Swap the MCU will now have the banks swapped. */
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
 /* Handle any pre-reset operations here */
 /* When using Bank Swap with Reset the MCU must be reset to swap to the other bank
*/
    __NVIC_SystemReset();
}
```

## Data Structures

| | |
|---|---|
| struct | flash_lp_instance_ctrl_t |

## Data Structure Documentation

### ◆ flash_lp_instance_ctrl_t

| struct flash_lp_instance_ctrl_t |
| --- |
| Flash instance control block. DO NOT INITIALIZE. Initialization occurs when R_FLASH_LP_Open() is called. |

## Function Documentation

### ◆ R_FLASH_LP_Open()

fsp_err_t R_FLASH_LP_Open ( flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg* )

Initialize the Low Power flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations.

Example:

```
/* Open the flash lp instance. */
fsp_err_t err = R_FLASH_LP_Open(&g_flash_ctrl, &g_flash_cfg);
```

***Note***

*Providing a callback function in the supplied p_cfg->callback field automatically configures the Flash for Data Flash to operate in non-blocking background operation (BGO) mode.*

**Return values**

| | |
| --- | --- |
| FSP_SUCCESS | Initialization was successful and timer has started. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl, p_cfg or p_callback if BGO is enabled. |
| FSP_ERR_IRQ_BSP_DISABLED | Caller is requesting BGO but the Flash interrupts are not enabled. |
| FSP_ERR_FCLK | FCLK must be a minimum of 4 MHz for Flash operations. |
| FSP_ERR_ALREADY_OPEN | Flash Open() has already been called. |
| FSP_ERR_TIMEOUT | Failed to exit P/E mode after configuring flash. |
| FSP_ERR_INVALID_STATE | The system is not running from the required clock or the required clock is not running and stable. |

### ◆ R_FLASH_LP_Write()

fsp_err_t R_FLASH_LP_Write ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes* )

Write to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Example:

```
/* Write 32 bytes to the first block of data flash. */
   err = R_FLASH_LP_Write(&g_flash_ctrl, (uint32_t) g_src, FLASH_DF_BLOCK_0,
FLASH_LP_EXAMPLE_WRITE_SIZE);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation successful. If BGO is enabled this means the operation was started successfully. |
| FSP_ERR_IN_USE | The Flash peripheral is busy with a prior on-going transaction. |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank. |
| FSP_ERR_TIMEOUT | Timed out waiting for FCU operation to complete. |
| FSP_ERR_INVALID_SIZE | Number of bytes provided was not a multiple of the programming size or exceeded the maximum range. |
| FSP_ERR_INVALID_ADDRESS | Invalid address was input or address not on programming boundary. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |

### ◆ R_FLASH_LP_Erase()

fsp_err_t R_FLASH_LP_Erase ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks* )

Erase the specified Code or Data Flash blocks. Implements flash_api_t::erase.

Example:

```
/* Erase 1 block of data flash starting at block 0. */
   err = R_FLASH_LP_Erase(&g_flash_ctrl, FLASH_DF_BLOCK_0, 1);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful open. |
| FSP_ERR_INVALID_BLOCKS | Invalid number of blocks specified |
| FSP_ERR_INVALID_ADDRESS | Invalid address specified |
| FSP_ERR_IN_USE | Other flash operation in progress, or API not initialized |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | The Flash API is not Open. |
| FSP_ERR_TIMEOUT | Timed out waiting for FCU to be ready. |
| FSP_ERR_ERASE_FAILED | Status is indicating a Erase error. |

### ◆ R_FLASH_LP_BlankCheck()

fsp_err_t R_FLASH_LP_BlankCheck ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result* )

Perform a blank check on the specified address area. Implements flash_api_t::blankCheck.

Example:

```
/* Check if block 0 is erased. */
   err = R_FLASH_LP_BlankCheck(&g_flash_ctrl, FLASH_DF_BLOCK_0,
FLASH_DATA_BLOCK_SIZE, &blank_check_result);
   assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode). |
| FSP_ERR_INVALID_ADDRESS | Invalid data flash address was input |
| FSP_ERR_INVALID_SIZE | 'num_bytes' was either too large or not aligned for the CF/DF boundary size. |
| FSP_ERR_IN_USE | Flash is busy with an on-going operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_BLANK_CHECK_FAILED | An error occurred during blank checking. |

### ◆ R_FLASH_LP_StatusGet()

fsp_err_t R_FLASH_LP_StatusGet ( flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status* )

Query the FLASH for its status. Implements flash_api_t::statusGet.

Example:

```
flash_status_t status;
/* Wait until the current flash operation completes. */
do
   {
      err = R_FLASH_LP_StatusGet(&g_flash_ctrl, &status);
   } while ((FSP_SUCCESS == err) && (FLASH_STATUS_BUSY == status));
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Flash is ready and available to accept commands. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |

### ◆ R_FLASH_LP_AccessWindowSet()

fsp_err_t R_FLASH_LP_AccessWindowSet ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr* )

Configure an access window for the Code Flash memory. Implements flash_api_t::accessWindowSet .

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block (inclusive) –> last block (exclusive). Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

***Note***

*If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear().*

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

**Parameters**

| | | |
|---|---|---|
| | p_api_ctrl | The p api control |
| [in] | start_addr | The start address |
| [in] | end_addr | The end address |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Access window successfully configured. |
| FSP_ERR_INVALID_ADDRESS | Invalid settings for start_addr and/or end_addr. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |

### ◆ R_FLASH_LP_AccessWindowClear()

fsp_err_t R_FLASH_LP_AccessWindowClear ( flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is configured in the Code Flash. Implements flash_api_t::accessWindowClear. On successful return from this call all Code Flash is writable.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Access window successfully removed. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |

### ◆ R_FLASH_LP_IdCodeSet()

fsp_err_t R_FLASH_LP_IdCodeSet ( flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode* )

Write the ID code provided to the id code registers. Implements flash_api_t::idCodeSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | ID code successfully configured. |
| FSP_ERR_IN_USE | FLASH peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_TIMEOUT | Timed out waiting for completion of extra command. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |

### ◆ R_FLASH_LP_Reset()

fsp_err_t R_FLASH_LP_Reset ( flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to check if the flash is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Flash circuit successfully reset. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |

### ◆ R_FLASH_LP_StartUpAreaSelect()

fsp_err_t R_FLASH_LP_StartUpAreaSelect ( flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary* )

Select which block is used as the startup area block. Implements flash_api_t::startupAreaSelect.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | Flash is busy with an on-going operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |
| FSP_ERR_UNSUPPORTED | Code Flash Programming is not enabled. Cannot set FLASH_STARTUP_AREA_BTFLG when the temporary flag is false. |

### ◆ R_FLASH_LP_BankSwap()

fsp_err_t R_FLASH_LP_BankSwap ( flash_ctrl_t *const *p_api_ctrl*)

Swap the Code Flash bank to update new program. Implement flash_api_t::bankSwap.

Swap the flash bank located at address 0x00000000 and address 0x00040000. After a bank swap is done the MCU will need to be reset for the changes to take place unless instant swap is enabled.

To use this API, Code Flash Programming in the FSP Configuration Tool under Stack Properties must be enabled.

***Note***

*This function only available on MCUs which support bank swap feature.*
*When active bank is bank 1, startup program protection function is invalid.*

**Parameters**

| | | |
|---|---|---|
| [in] | p_api_ctrl | The api control instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Banks were swapped. |
| FSP_ERR_UNSUPPORTED | Module does not support Bank Swap. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_IN_USE | Extra area is being used by other command. |

### ◆ R_FLASH_LP_UpdateFlashClockFreq()

fsp_err_t R_FLASH_LP_UpdateFlashClockFreq ( flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements flash_api_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | Flash is busy with an on-going operation. |
| FSP_ERR_FCLK | Invalid flash clock source frequency. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_TIMEOUT | Timed out waiting for the FCU to become ready. |

### ◆ R_FLASH_LP_InfoGet()

fsp_err_t R_FLASH_LP_InfoGet ( flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info* )

Returns the information about the flash regions. Implements flash_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful retrieved the request information. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_info. |
| FSP_ERR_NOT_OPEN | The flash is not open. |

### ◆ R_FLASH_LP_Close()

fsp_err_t R_FLASH_LP_Close ( flash_ctrl_t *const *p_api_ctrl*)

Release any resources that were allocated by the Flash API. Implements flash_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_cfg. |
| FSP_ERR_NOT_OPEN | Flash API has not yet been opened. |
| FSP_ERR_IN_USE | The flash is currently in P/E mode. |

### ◆ R_FLASH_LP_CallbackSet()

fsp_err_t R_FLASH_LP_CallbackSet ( flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory* )

Stub function Implements flash_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function has not been implemented. |

### ◆ R_FLASH_LP_AntiRollbackCounterIncrement()

fsp_err_t R_FLASH_LP_AntiRollbackCounterIncrement ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Stub function Implements flash_api_t::antiRollbackCounterIncrement.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function has not been implemented. |

### ◆ R_FLASH_LP_AntiRollbackCounterRefresh()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRefresh ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Stub function Implements flash_api_t::antiRollbackCounterRefresh.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function has not been implemented. |

### ◆ R_FLASH_LP_AntiRollbackCounterRead()

fsp_err_t R_FLASH_LP_AntiRollbackCounterRead ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count* )

Stub function Implements flash_api_t::antiRollbackCounterRead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function has not been implemented. |

### ◆ R_FLASH_LP_UserLockableAreaWrite()

fsp_err_t R_FLASH_LP_UserLockableAreaWrite ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes* )

Stub function Implements flash_api_t::userLockableAreaWrite.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Function has not been implemented. |

### 5.2.17.10 FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)

Modules » Storage

#### Functions

| | |

| fsp_err_t | RM_FREERTOS_PLUS_FAT_Close (rm_freertos_plus_fat_ctrl_t *const p_ctrl) |

#### Detailed Description

Middleware for the FAT File System control on RA MCUs.

# Overview

This module provides the hardware port layer for FreeRTOS+FAT file system. After initializing this module, refer to the FreeRTOS+FAT API reference to use the file system: https://www.freertos.org/FreeRTOS-Plus/FreeRTOS_Plus_FAT/index.html

### Features

The FreeRTOS+FAT port module supports the following features:

- Callbacks for insertion and removal for removable devices.
- Helper function to initialize FF_Disk_t
- Blocking read and write port functions that use FreeRTOS task notification to pend if FreeRTOS is used
- FreeRTOS is optional

# Configuration

### Build Time Configurations for rm_freertos_plus_fat

The following build time configurations are defined in fsp_cfg/middleware/rm_freertos_plus_fat_cfg.h:

| | | | |
|---|---|---|---|

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Storage > FreeRTOS+FAT Port for RA (rm_freertos_plus_fat)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_freertos_plus_fat0 | Module name. |
| Total Number of Sectors | Must be a non-negative integer | 31293440 | Enter the total number of sectors on the device. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit(). |
| Sector Size (bytes) | Must be a power of 2 multiple of 512 | 512 | Select the sector size. Must match the underlying media sector size and at least 512. If this is not known, update rm_freertos_plus_fat_disk_cfg_t::num_blocks after calling RM_FREERTOS_PLUS_FAT_MediaInit(). |
| Cache Size (bytes) | Must be a power of 2 multiple of 512 | 1024 | Select the cache size. Must be a multiple of the sector size and at least 2 times the sector size. |
| Partition Number | Must be a non-negative integer | 0 | Select the partition number for this disk. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed. |

# Usage Notes

### Pending during Read/Write

If the underlying driver supports non-blocking operations, the FreeRTOS+FAT port pends the active

FreeRTOS task during read and write operations so other tasks can run in the background.

If FreeRTOS is not used, the FreeRTOS+FAT port spins in a while loop waiting for read and write operations to complete.

### FreeRTOS+FAT without FreeRTOS

To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.

Also, update the Malloc function to malloc and the Free function to free in the Common configurations.

# Examples

### Basic Example

This is a basic example of FreeRTOS+FAT in an application.

```
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME "TEST_FILE.txt"
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES (10240)
#define RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER (0)
extern rm_freertos_plus_fat_instance_ctrl_t g_freertos_plus_fat0_ctrl;
extern const rm_freertos_plus_fat_cfg_t g_freertos_plus_fat0_cfg;
extern rm_freertos_plus_fat_disk_cfg_t g_rm_freertos_plus_fat_disk_cfg;
extern uint8_t g_file_data[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
extern uint8_t g_read_buffer[RM_FREERTOS_PLUS_FAT_EXAMPLE_BUFFER_SIZE_BYTES];
void rm_freertos_plus_fat_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
```

```
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Mount each disk. This assumes the disk is already partitioned and formatted. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
    handle_ff_error(ff_err);
 /* Add the disk to the file system. */
    FF_FS_Add("/", &disk);
 /* Open a source file for writing. */
    FF_FILE * pxSourceFile = ff_fopen((const char *)
RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME, "w");
    assert(NULL != pxSourceFile);
 /* Write file data. */
 size_t size_return = ff_fwrite(g_file_data, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
 int close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Open the source file in read mode. */
    pxSourceFile = ff_fopen((const char *) RM_FREERTOS_PLUS_FAT_EXAMPLE_FILE_NAME,
"r");
    assert(NULL != pxSourceFile);
 /* Read file data. */
    size_return = ff_fread(g_read_buffer, sizeof(g_file_data), 1, pxSourceFile);
    assert(1 == size_return);
 /* Close the file. */
    close_err = ff_fclose(pxSourceFile);
    assert(0 == close_err);
 /* Verify the file data read matches the file written. */
    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

### Format Example

This shows how to partition and format a disk if it is not already partitioned and formatted.

```
void rm_freertos_plus_fat_format_example (void)
{
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
 /* Try to mount the disk. If the disk is not formatted, mount will fail. */
    FF_Error_t ff_err = FF_Mount(&disk,
RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
 if (FF_isERR((uint32_t) ff_err))
    {
 /* The disk is likely not formatted. Partition and format the disk, then mount
again. */
       FF_PartitionParameters_t partition_params;
       partition_params.ulSectorCount   =
g_rm_freertos_plus_fat_disk_cfg.device.sector_count;
       partition_params.ulHiddenSectors = 1;
       partition_params.ulInterSpace    = 0;
       memset(partition_params.xSizes, 0, sizeof(partition_params.xSizes));
       partition_params.xSizes[RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER] =
```

```
            (BaseType_t) partition_params.ulSectorCount - 1;
       partition_params.xPrimaryCount = 1;
       partition_params.eSizeType    = eSizeIsSectors;
       ff_err = FF_Partition(&disk, &partition_params);
      handle_ff_error(ff_err);
       ff_err = FF_Format(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER,
pdFALSE, pdFALSE);
      handle_ff_error(ff_err);
       ff_err = FF_Mount(&disk, RM_FREERTOS_PLUS_FAT_EXAMPLE_PARTITION_NUMBER);
      handle_ff_error(ff_err);
    }
}
```

### Media Insertion Example

This shows how to use the callback to wait for media insertion.

```
#if 2 == BSP_CFG_RTOS
static EventGroupHandle_t xUSBEventGroupHandle = NULL;
#else
volatile uint32_t g_rm_freertos_plus_fat_insertion_events = 0;
volatile uint32_t g_rm_freertos_plus_fat_removal_events = 0;
#endif
/* Callback called by media driver when a removable device is inserted or removed. */
void rm_freertos_plus_fat_test_callback (rm_freertos_plus_fat_callback_args_t *
p_args)
{
#if 2 == BSP_CFG_RTOS
 /* Post an event if FreeRTOS is available. */
    BaseType_t xHigherPriorityTaskWoken = pdFALSE;
    xEventGroupSetBitsFromISR(xUSBEventGroupHandle, p_args->event,
&xHigherPriorityTaskWoken);
    portYIELD_FROM_ISR(xHigherPriorityTaskWoken);
#else
 /* If FreeRTOS is not used, set a global flag. */
```

```
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED)
    {
       g_rm_freertos_plus_fat_insertion_events++;
    }
 if (p_args->event & RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_REMOVED)
    {
       g_rm_freertos_plus_fat_removal_events++;
    }
#endif
}
void rm_freertos_plus_fat_media_insertion_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
    TEST_ASSERT_NOT_EQUAL(NULL, xUSBEventGroupHandle);
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for media insertion. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
                                                       pdTRUE,
                                                       pdFALSE,
                                                       portMAX_DELAY);
    assert(RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED ==
          (RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED & xEventGroupValue));
#else
 while (0U == g_rm_freertos_plus_fat_insertion_events)
    {
```

```
 /* Wait for media insertion. */
    }
#endif
 /* Initialize the media and the disk. If the media is removable, it must be inserted
before calling
  * RM_FREERTOS_PLUS_FAT_MediaInit. */
    err = RM_FREERTOS_PLUS_FAT_MediaInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg.device);
    assert(FSP_SUCCESS == err);
 /* Initialize one disk for each partition used in the application. */
    FF_Disk_t disk;
    err = RM_FREERTOS_PLUS_FAT_DiskInit(&g_freertos_plus_fat0_ctrl,
&g_rm_freertos_plus_fat_disk_cfg, &disk);
    assert(FSP_SUCCESS == err);
}
```

### Media Insertion Example for USB

This shows how to use the callback to read and write to USB media.

```
void rm_freertos_plus_fat_usb_example (void)
{
#if 2 == BSP_CFG_RTOS
 /* Create event flags if FreeRTOS is used. */
    xUSBEventGroupHandle = xEventGroupCreate();
#endif
 /* Open media driver.*/
 fsp_err_t err = RM_FREERTOS_PLUS_FAT_Open(&g_freertos_plus_fat0_ctrl,
&g_freertos_plus_fat0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Wait for the USB media to be attached. */
#if 2 == BSP_CFG_RTOS
    EventBits_t xEventGroupValue = xEventGroupWaitBits(xUSBEventGroupHandle,
 RM_FREERTOS_PLUS_FAT_EVENT_MEDIA_INSERTED,
```

```
                                                    pdTRUE,
                                                    pdFALSE,

    assert(0U == memcmp(g_file_data, g_read_buffer, sizeof(g_file_data)));
}
```

## Data Structures

| | |
|---|---|
| struct | rm_freertos_plus_fat_instance_ctrl_t |

## Data Structure Documentation

### ◆ rm_freertos_plus_fat_instance_ctrl_t

| struct rm_freertos_plus_fat_instance_ctrl_t |
|---|
| FreeRTOS plus FAT private control block. DO NOT MODIFY. Initialization occurs when RM_FREERTOS_PLUS_FAT_Open is called. |

## Function Documentation

### ◆ RM_FREERTOS_PLUS_FAT_Open()

fsp_err_t RM_FREERTOS_PLUS_FAT_Open ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_cfg_t const *const *p_cfg* )

Initializes lower layer media device.

Implements rm_freertos_plus_fat_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_OUT_OF_MEMORY | Not enough memory to create semaphore. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::open

### ◆ RM_FREERTOS_PLUS_FAT_MediaInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_MediaInit ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_device_t *const *p_device* )

Initializes the media device. This function blocks until all identification and configuration commands are complete.

Implements rm_freertos_plus_fat_api_t::mediaInit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module has not been initialized. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::mediaInit
- rm_block_media_api_t::infoGet

### ◆ RM_FREERTOS_PLUS_FAT_DiskInit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskInit ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, rm_freertos_plus_fat_disk_cfg_t const *const *p_disk_cfg*, FF_Disk_t *const *p_disk* )

Initializes a FreeRTOS+FAT disk structure. This function calls FF_CreateIOManger.

Implements rm_freertos_plus_fat_api_t::diskInit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module has not been initialized. |
| FSP_ERR_INTERNAL | Call to FF_CreateIOManger failed. |

### ◆ RM_FREERTOS_PLUS_FAT_DiskDeinit()

fsp_err_t RM_FREERTOS_PLUS_FAT_DiskDeinit ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk* )

Deinitializes a FreeRTOS+FAT disk structure. This function calls FF_DeleteIOManger.

Implements rm_freertos_plus_fat_api_t::diskDeinit().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Module is initialized and ready to access the memory device. |
| FSP_ERR_ASSERTION | An input parameter is invalid. |
| FSP_ERR_NOT_OPEN | Module has not been initialized. |

### ◆ RM_FREERTOS_PLUS_FAT_InfoGet()

fsp_err_t RM_FREERTOS_PLUS_FAT_InfoGet ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*, FF_Disk_t *const *p_disk*, rm_freertos_plus_fat_info_t *const *p_info* )

Get partition information. This function can only be called after rm_freertos_plus_fat_api_t::diskInit() .

Implements rm_freertos_plus_fat_api_t::infoGet().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Information stored in p_info. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |
| FSP_ERR_NOT_FOUND | The value of p_iomanager is NULL. |

### ◆ RM_FREERTOS_PLUS_FAT_Close()

fsp_err_t RM_FREERTOS_PLUS_FAT_Close ( rm_freertos_plus_fat_ctrl_t *const *p_ctrl*)

Closes media device.

Implements rm_freertos_plus_fat_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Media device closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- rm_block_media_api_t::close

### Detailed Description

Middleware for using Azure RTOS LevelX on NOR SPI memory.

# Overview

This module provides the hardware port layer for LevelX on NOR SPI flash memory. Setup for this module is done solely through calling LevelX APIs. Please refer to the LevelX API reference: https://docs.microsoft.com/en-us/azure/rtos/levelx/

# Configuration

### Build Time Configurations for rm_levelx_nor_spi

The following build time configurations are defined in fsp_cfg/middleware/rm_levelx_nor_spi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | Selects if code for parameter checking is to be included in the |

| | | | |
|---|---|---|---|
| | | | build. |
| Page Buffer Size (bytes) | Size should be greater than zero | 256 | When direct read is enabled in LevelX a situation can occur where the driver has to write to SPI memory with the source locaiton also being within the SPI memory address range. In this situation the driver needs a buffer that is at least the same size as a page in order to temporarily store data to write out. |

**Configurations for Storage > LevelX NOR Port (rm_levelx_nor_spi)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_levelx_nor_spi0 | Module name. |
| Memory Start Address Offset (bytes) | Offset should be greater than or equal to zero | 0 | Enter the starting offset to use in the SPI memory. The starting address for LevelX memory will be the SPI memory base address plus this offset. |
| Memory Size (bytes) | Size should be greater than zero | 33554432 | Enter the size that the LevelX Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory. |
| Poll Status Count | Poll Status Count should be greater than or equal to zero | 0xFFFFFFFF | Number of times to poll for operation complete status for blocking memory operations. |

**Build Time Configurations for lx**

The following build time configurations are defined in fsp_cfg/azure/lx/lx_user.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| NOR | | | |
| Direct Read | • Enabled (default)<br>• Disabled | Enabled (default) | When enabled, this option bypasses the NOR flash driver read routine in favor or |

| | | | |
|---|---|---|---|
| | | | reading the NOR memory directly, resulting in a significant performance increase. |
| Free Sector Data Verify | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, this causes the LevelX NOR instance open logic to verify free NOR sectors are all ones. |
| Extended Cache | • Enabled (default)<br>• Disabled | Enabled (default) | Enables the extended NOR cache. |
| Extended Cache Size | Manual Entry | | If not set this value defaults to 8, which represents a maximum of 8 sectors that can be cached in a NOR instance. |
| Sector Mapping Cache Size | Value must be greater than or equal to 8 and a power of 2, or empty | | If not set this value defaults to 16 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2. |
| NAND | | | |
| Sector Mapping Cache Size | Value must be greater than or equal to 8 and a power of 2, or empty | | If not set this value defaults to 128 and defines the logical sector mapping cache size. Large values improve performance, but cost memory. The minimum size is 8 and all values must be a power of 2. |
| Flash Direct Mapping Cache | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, this creates a direct mapping cache, such that there are no cache misses. It also required that LX_NAND_SECTOR_MAPPING_CACHE_SIZE represents the exact number of total pages in your flash device. |

| | | | |
|---|---|---|---|
| Thread Safe | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, this makes LevelX thread-safe by using a ThreadX mutex object throughout the API. |
| Standalone Mode | • Enabled<br>• Disabled (default) | Disabled (default) | When enabled, allows LevelX to be used in standalone mode (without Azure RTOS). |

# Usage Notes

### Pending during Erase/Write

The LevelX NOR SPI driver is blocking on all SPI operations and will poll device status for operation completion on Writes and Erases. A callback can be provided by the user to wait with an OS-specific thread wait in these instances.

### Closing the driver

When lx_nor_flash_close is called to close the LevelX instance it does not call any services within the LevelX NOR SPI driver to close out the driver instance. The user should call the generated close function (i.e. g_rm_levelx_nor_spi0_close) in order to close out the driver instance.

### Erasing Flash Memory Prior to Usage

The area of the flash memory being used for the LevelX instance should be erased using the lower level flash API prior to usage. Otherwise, LevelX API may fail on lx_nor_flash_open due to any areas in flash memory that have been written/set.

# Examples

### Basic Example

This is a basic example of using the LevelX NOR SPI driver with the LevelX API in an application.

```
#define RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE (512)
#define RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE (0xA5)
#define RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE (4096)
extern rm_levelx_nor_spi_instance_ctrl_t g_levelx_nor_spi0_ctrl;
extern rm_levelx_nor_spi_cfg_t g_levelx_nor_spi0_cfg;
extern LX_NOR_FLASH g_lx_nor_flash0;
void rm_levelx_nor_spi_example (void)
{
    uint8_t               read_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
    uint8_t               write_buffer[RM_LEVELX_NOR_SPI_EXAMPLE_SECTOR_SIZE];
```

```
 spi_flash_instance_t * p_spi_flash_instance = (spi_flash_instance_t *)
g_levelx_nor_spi0_cfg.p_lower_lvl;
 spi_flash_status_t    status;
    memset(write_buffer, RM_LEVELX_NOR_SPI_EXAMPLE_BUFFER_FILL_VALUE, sizeof
(write_buffer));
 /* Erase flash prior to usage */
 fsp_err_t err = p_spi_flash_instance->p_api->open(p_spi_flash_instance->p_ctrl,
p_spi_flash_instance->p_cfg);
    assert(FSP_SUCCESS == err);
 for (uint32_t i = g_levelx_nor_spi0_cfg.address_offset;
         i < g_levelx_nor_spi0_cfg.size;
         i += RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE)
    {
       err = p_spi_flash_instance->p_api->erase(p_spi_flash_instance->p_ctrl,
                                                (uint8_t *)
g_levelx_nor_spi0_cfg.base_address + i,

RM_LEVELX_NOR_SPI_EXAMPLE_SPI_SECTOR_SIZE);
      assert(FSP_SUCCESS == err);
       status.write_in_progress = true;
 while (status.write_in_progress)
      {
           err =
p_spi_flash_instance->p_api->statusGet(p_spi_flash_instance->p_ctrl, &status);
      assert(FSP_SUCCESS == err);
       }
    }
    err = p_spi_flash_instance->p_api->close(p_spi_flash_instance->p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Initialize LevelX */
    lx_nor_flash_initialize();
    UINT lx_err = lx_nor_flash_open(&g_lx_nor_flash0, "LX_NOR_SPI_EXAMPLE",
g_levelx_nor_spi0_initialize);
    handle_lx_error(lx_err);
```

```
 /* Write test value to sector 0 then read back to verify */
    lx_err = lx_nor_flash_sector_write(&g_lx_nor_flash0, 0, write_buffer);
    handle_lx_error(lx_err);
    lx_err = lx_nor_flash_sector_read(&g_lx_nor_flash0, 0, read_buffer);
    handle_lx_error(lx_err);
    assert(0 == memcmp(read_buffer, write_buffer, sizeof(read_buffer)));
}
```

### Callback Wait Example

This shows how to use the LevelX NOR SPI driver callback with ThreadX in order to wait for operations to complete.

```
/* Callback called by LevelX NOR SPI driver needs to wait on operation. */
void rm_levelx_nor_spi_callback_wait_example (rm_levelx_nor_spi_callback_args_t *
p_args)
{
 if (p_args->event & RM_LEVELX_NOR_SPI_EVENT_BUSY)
    {
 /* Put the thread to sleep while waiting for operation to complete. */
       tx_thread_sleep(1);
    }
}
```

## Data Structures

|---|---|---|
| SF_EL_LX_NOR Control Block Type | | |
| Data Fields | | |
| rm_levelx_nor_spi_cfg_t const * | p_cfg | Pointer to instance configuration. |
| uint32_t | start_address | Start address of partition to use within memory mapped region. |
| uint32_t | minimum_erase_size | Minimum erase size of SPI memory. |
| uint8_t | page_buffer[RM_LEVELX_NOR_SPI_CFG_BUFFER_SIZE] | Page buffer for situations when writing to SPI memory from a source within SPI memory. |
| uint32_t | open | Used to determine if module is initialized. |

## Enumeration Type Documentation

### ◆ rm_levelx_nor_spi_event_t

| enum rm_levelx_nor_spi_event_t | |
|---|---|
| Common macro for FSP header files. There is also a corresponding FSP_FOOTER macro at the end of this file. Options for the callback events. | |
| Enumerator | |
| RM_LEVELX_NOR_SPI_EVENT_BUSY | Pending operation, user can define their own wait functionality. |

## Function Documentation

### ◆ RM_LEVELX_NOR_SPI_Open()

fsp_err_t RM_LEVELX_NOR_SPI_Open ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, rm_levelx_nor_spi_cfg_t const *const *p_cfg* )

Initializes LevelX NOR SPI port read/write and control.

Calls lower level SPI memory functions.

**Parameters**

| | | |
|---|---|---|
| [in,out] | p_ctrl | Control block for the LevelX NOR SPI instance. |
| [in,out] | p_cfg | Configuration for LevelX NOR SPI port. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX NOR driver is successfully opened. |
| FSP_ERR_ASSERTION | p_ctrl or p_cfg is NULL. |
| FSP_ERR_ALREADY_OPEN | Driver is already in OPEN state. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:open

### ◆ RM_LEVELX_NOR_SPI_Read()

fsp_err_t RM_LEVELX_NOR_SPI_Read ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_dest*, ULONG *word_count* )

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of this service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Control block for the LevelX NOR SPI instance. |
| [in] | p_flash_addr | Specifies the address of a logical sector within a NOR flash block of memory. |
| [in,out] | p_dest | Specifies where to place the sector contents. |
| [in] | word_count | Specifies how many 32-bit words to read. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX NOR flash sector read successful. |
| FSP_ERR_ASSERTION | p_ctrl, p_flash_addr or p_dest is NULL. |
| FSP_ERR_NOT_OPEN | Driver not in OPEN state for reading. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes.

### ◆ RM_LEVELX_NOR_SPI_Write()

fsp_err_t RM_LEVELX_NOR_SPI_Write ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash_addr*, ULONG *const *p_src*, ULONG *word_count* )

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Control block for the LevelX NOR SPI instance. |
| [in,out] | p_flash_addr | Specifies the address of a logical sector within a NOR flash block of memory. |
| [in] | p_src | Specifies the source of the write. |
| [in] | word_count | Specifies how many 32-bit words to write. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX NOR flash sector write successful. |
| FSP_ERR_ASSERTION | p_ctrl, p_flash_addr or p_src is NULL. |
| FSP_ERR_NOT_OPEN | Driver not in OPEN state for writing. |
| FSP_ERR_TIMEOUT | Timeout occurred while waiting for operation to complete. |
| FSP_ERR_WRITE_FAILED | Verification of Write operation failed. |
| FSP_ERR_INVALID_ADDRESS | Write address or size falls outside of flash memory range. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:write

### ◆ RM_LEVELX_NOR_SPI_BlockErase()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErase ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block*, ULONG *erase_count* )

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Control block for the LevelX NOR SPI instance. |
| [in] | block | Specifies which NOR block to erase. |
| [in] | erase_count | Provided for diagnostic purposes(currently unused). |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX NOR flash block erase successful. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not in OPEN state for erasing. |
| FSP_ERR_TIMEOUT | Timeout occurred while waiting for operation to complete. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:erase

### ◆ RM_LEVELX_NOR_SPI_BlockErasedVerify()

fsp_err_t RM_LEVELX_NOR_SPI_BlockErasedVerify ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*, ULONG *block* )

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Control block for the LevelX NOR SPI instance. |
| [in] | block | Specifies which block to verify that it is erased. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX flash block erase verification successful. |
| FSP_ERR_ASSERTION | p_ctrl or lower level driver is NULL. |
| FSP_ERR_NOT_OPEN | Driver not in OPEN state for verifying. |
| FSP_ERR_NOT_ERASED | The block is not erased properly. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes.

### ◆ RM_LEVELX_NOR_SPI_Close()

fsp_err_t RM_LEVELX_NOR_SPI_Close ( rm_levelx_nor_spi_instance_ctrl_t *const *p_ctrl*)

LevelX NOR driver close service.

This is responsible for closing the driver properly.

**Parameters**

| | | |
|---|---|---|
| [in] | p_ctrl | Control block for the LevelX NOR SPI instance. |

**Return values**

| | |
|---|---|
| FSP_SUCCESS | LevelX flash is available and is now open for read, write, and control access. |
| FSP_ERR_ASSERTION | p_ctrl is NULL. |
| FSP_ERR_NOT_OPEN | Driver not in OPEN state for closing. |

**Returns**

See Common_Error_Codes or lower level drivers for other possible return codes. This function calls

- spi_flash_api_t:close

### 5.2.17.12 LittleFS on Flash (rm_littlefs_flash)

Modules » Storage

**Functions**

| fsp_err_t | RM_LITTLEFS_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg) |
| fsp_err_t | RM_LITTLEFS_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl) |

**Detailed Description**

Middleware for the LittleFS File System control on RA MCUs.

# Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

# Configuration

### Build Time Configurations for rm_littlefs_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_flash_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Storage > LittleFS on Flash (rm_littlefs_flash)

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_littlefs0 | Module name. |
| Read Size | Must be a non-negative integer | 1 | Minimum size of a block read. All read operations will be a multiple of this value. |
| Program Size | Must be a non-negative integer | 4 | Minimum size of a block program. All program operations will be a multiple of this value. |

| | | | |
|---|---|---|---|
| Memory Start Address | Manual Entry | BSP_FEATURE_FLASH_DATA_FLASH_START | Start address of the memory allocated for the LittleFS Volume. |
| Block Size (bytes) | Must be a multiple of 64 | 128 | Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes. |
| Block Count | Manual Entry | (BSP_DATA_FLASH_SIZE_BYTES/128) | Number of erasable blocks on the device. |
| Block Cycles | Must be an integer | 1024 | Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling. |
| Cache Size | Must be a non-negative integer | 64 | Size of block caches. Each cache buffers a portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size. |
| Lookahead Size | Must be a non-negative multiple of 8 | 16 | Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number |

| | | | |
|---|---|---|---|
| | | | of blocks found during an allocation pass. The lookahead buffer is stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8. |

### Common LittleFS Configuration

### Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Custom lfs_util.h | Manual Entry | | Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Thread Safe | • Enabled<br>• Disabled | Disabled | Enables thread safety in LittleFS. |
| Read Only | • Enabled<br>• Disabled | Disabled | Enables Read Only mode in LittleFS. |
| Use Malloc | • Enabled<br>• Disabled | Enabled | Configures the use of malloc by LittleFS. |
| Use Assert | • Enabled<br>• Disabled | Enabled | Configures the use of assert by LittleFS. |
| Debug Messages | • Enabled<br>• Disabled | Disabled | Configures debug messages. |
| Warning Messages | • Enabled<br>• Disabled | Disabled | Configures warning messages. |
| Error Messages | • Enabled<br>• Disabled | Disabled | Configures error messages. |
| Trace Messages | • Enabled<br>• Disabled | Disabled | Configures trace messages. |
| Intrinsics | • Enabled<br>• Disabled | Enabled | Configures intrinsic functions such as __builtin_clz. |
| Instance Name for STDIO wrapper | Name must be a valid C symbol | g_rm_littlefs0 | The rm_littlefs instance name to use with the STDIO wrapper. |

# Usage Notes

### Memory Address

LittleFS requrires a section of non volatile memory to store data. It is recommended to use Data Flash when available. In other cases, such as MRAM, a section of memory should be reserved in the Memories Tab using an RA Solution project. The address of this memory section must be entered in the rm_littlefs_flash configuration. If the memory is not reserved in the RA Solution it is possible unrelated data will be linked in this section and will cause conflicts at runtime.

### Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

### Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the data flash erase size of the MCU. It must be greater than 104 bytes which is the minimum block size of a LittleFS block. For information about data flash erase sizes refer to the "Specifications of the code flash memory and data flash memory" table of the "Flash Memory" chapter's "Overview" section.

## Examples

### Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_FLASH_Open(&g_rm_littlefs_flash0_ctrl,
&g_rm_littlefs_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
```

```
 int lfs_err = lfs_format(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /**********************************************************************************
***********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  **********************************************************************************
*********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_WRONLY |
LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
```

```
/* Apply butter to toast 10 times. */
for (uint32_t i = 0; i < 10; i++)
   {
      lfs_err = lfs_file_write(&g_rm_littlefs_flash0_lfs, &file, contents, len);
if (lfs_err < 0)
     {
     handle_lfs_error(lfs_err);
      }
   }
/* Close the file. */
   lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
   handle_lfs_error(lfs_err);
/* Unmount the filesystem. */
   lfs_err = lfs_unmount(&g_rm_littlefs_flash0_lfs);
   handle_lfs_error(lfs_err);
/* Remount the filesystem. */
   lfs_err = lfs_mount(&g_rm_littlefs_flash0_lfs, &g_rm_littlefs_flash0_lfs_cfg);
   handle_lfs_error(lfs_err);
/* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
   lfs_err = lfs_file_opencfg(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY,
&g_file_cfg);
   handle_lfs_error(lfs_err);
#else
   lfs_err = lfs_file_open(&g_rm_littlefs_flash0_lfs, &file, path, LFS_O_RDONLY);
   handle_lfs_error(lfs_err);
#endif
   handle_lfs_error(lfs_err);
/* Verify the toast is buttered the correct amount. */
for (uint32_t i = 0; i < 10; i++)
   {
      lfs_err = lfs_file_read(&g_rm_littlefs_flash0_lfs, &file, buffer, len);
if (lfs_err < 0)
     {
```

```
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

### Function Documentation

#### ◆ RM_LITTLEFS_FLASH_Open()

fsp_err_t RM_LITTLEFS_FLASH_Open ( rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg* )

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_SIZE | The provided block size is invalid. |
| FSP_ERR_INVALID_ARGUMENT | Flash BGO mode must be disabled. |
| FSP_ERR_INTERNAL | Failed to create the semaphore. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- flash_api_t::open

### ◆ RM_LITTLEFS_FLASH_Close()

fsp_err_t RM_LITTLEFS_FLASH_Close ( rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Media device closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- flash_api_t::close

#### 5.2.17.13 LittleFS on SPI Flash (rm_littlefs_spi_flash)

Modules » Storage

**Functions**

| | |
|---|---|
| fsp_err_t | RM_LITTLEFS_SPI_FLASH_Open (rm_littlefs_ctrl_t *const p_ctrl, rm_littlefs_cfg_t const *const p_cfg) |
| fsp_err_t | RM_LITTLEFS_SPI_FLASH_Close (rm_littlefs_ctrl_t *const p_ctrl) |

**Detailed Description**

Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.

# Overview

This module provides the hardware port layer for the LittleFS file system. After initializing this module, refer to the LittleFS documentation to use the file system:
https://github.com/ARMmbed/littlefs

# Configuration

### Build Time Configurations for rm_littlefs_spi_flash

The following build time configurations are defined in fsp_cfg/rm_littlefs_spi_flash_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

**Configurations for Storage > LittleFS on SPI Flash (rm_littlefs_spi_flash)**

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_rm_littlefs0 | Module name. |
| Delay Callback | Name must be a valid C symbol | g_rm_littlefs_spi_flash0_callback | Optional delay callback for custom delay while waiting for the flash erase/write operation to complete. |
| Read Size | Must be a non-negative integer | 1 | Minimum size of a block read. All read operations will be a multiple of this value. |
| Program Size | Must be a non-negative integer | 4 | Minimum size of a block program. All program operations will be a multiple of this value. |
| Block Size (bytes) | Must be a multiple of 64 | 4096 | Size of an erasable block. This does not impact RAM consumption and may be larger than the physical erase size. However, non-inlined files take up at minimum one block. Must be a multiple of the read and program sizes. |
| Block Cycles | Must be an integer | 1024 | Number of erase cycles before LittleFS evicts metadata logs and moves the metadata to another block. Suggested values are in the range 100-1000, with large values having better performance at the cost of less consistent wear distribution. Set to -1 to disable block-level wear-leveling. |
| Cache Size | Must be a non-negative integer | 64 | Size of block caches. Each cache buffers a |

| | | | |
|---|---|---|---|
| | | | portion of a block in RAM. The LittleFS needs a read cache, a program cache, and one additional cache per file. Larger caches can improve performance by storing more data and reducing the number of disk accesses. Must be a multiple of the read and program sizes, and a factor of the block size. |
| Lookahead Size | Must be a non-negative multiple of 8 | 16 | Size of the lookahead buffer in bytes. A larger lookahead buffer increases the number of blocks found during an allocation pass. The lookahead buffer is stored as a compact bitmap, so each byte of RAM can track 8 blocks. Must be a multiple of 8. |
| Memory Start Address Offset (bytes) | Offset should be greater than or equal to zero | 0 | Enter the starting offset to use in the SPI memory. The starting address for LittleFS memory will be the SPI memory base address plus this offset. |
| Memory Size (bytes) | Size should be greater than zero | 33554432 | Enter the size that the LittleFS Memory should be. This can be smaller than the SPI memory size in order to use a subset of SPI memory. |
| Poll Status Count | Poll Status Count should be greater than or equal to zero | 0xFFFFFFFF | Number of times to poll for operation complete status for blocking memory operations. |

### Common LittleFS Configuration

### Build Time Configurations for LittleFS

The following build time configurations are defined in arm/littlefs/lfs_util.h:

| Configuration | Options | Default | Description |
|---|---|---|---|

| | | | |
|---|---|---|---|
| Custom lfs_util.h | Manual Entry | | Add a path to your custom lfs_util.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations. |
| Thread Safe | • Enabled<br>• Disabled | Disabled | Enables thread safety in LittleFS. |
| Read Only | • Enabled<br>• Disabled | Disabled | Enables Read Only mode in LittleFS. |
| Use Malloc | • Enabled<br>• Disabled | Enabled | Configures the use of malloc by LittleFS. |
| Use Assert | • Enabled<br>• Disabled | Enabled | Configures the use of assert by LittleFS. |
| Debug Messages | • Enabled<br>• Disabled | Disabled | Configures debug messages. |
| Warning Messages | • Enabled<br>• Disabled | Disabled | Configures warning messages. |
| Error Messages | • Enabled<br>• Disabled | Disabled | Configures error messages. |
| Trace Messages | • Enabled<br>• Disabled | Disabled | Configures trace messages. |
| Intrinsics | • Enabled<br>• Disabled | Enabled | Configures intrinsic functions such as __builtin_clz. |
| Instance Name for STDIO wrapper | Name must be a valid C symbol | g_rm_littlefs0 | The rm_littlefs instance name to use with the STDIO wrapper. |

# Usage Notes

### Blocking Read/Write/Erase

The LittleFS port blocks on Read/Write/Erase calls until the operation has completed.

### Memory Constraints

The block size defined in the LittleFS configuration must be a multiple of the sector erase size of the SPI Flash. It must be greater than 104 bytes which is the minimum block size of a LittleFS block.

# Examples

### Basic Example

This is a basic example of LittleFS on Flash in an application.

```
extern const rm_littlefs_cfg_t g_rm_littlefs_spi_flash0_cfg;
#ifdef LFS_NO_MALLOC
static uint8_t g_file_buffer[LFS_CACHE_SIZE];
static struct lfs_file_config g_file_cfg =
{
    .buffer = g_file_buffer
};
#endif
void rm_littlefs_example (void)
{
    uint8_t    buffer[30];
    lfs_file_t file;
 /* Open LittleFS Flash port.*/
 fsp_err_t err = RM_LITTLEFS_SPI_FLASH_Open(&g_rm_littlefs_spi_flash0_ctrl,
&g_rm_littlefs_spi_flash0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Format the filesystem. */
 int lfs_err = lfs_format(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Mount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Create a breakfast directory. */
    lfs_err = lfs_mkdir(&g_rm_littlefs_spi_flash0_lfs, "breakfast");
    handle_lfs_error(lfs_err);
 /* Create a file toast in the breakfast directory. */
 const char * path = "breakfast/toast";
#ifdef LFS_NO_MALLOC
 /**********************************************************************************
**********************************
  * By default LittleFS uses malloc to allocate buffers. This can be disabled in the
```

```
RA Configuration editor.
  * Buffers will be generated from the configuration for the read, program and
lookahead buffers.
  * When opening a file a unique buffer must be passed in for use as a file buffer.
  * The buffer size must be equal to the cache size.
  ********************************************************************************
*********************************/
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs,
                               &file,
                               path,
                               LFS_O_WRONLY | LFS_O_CREAT | LFS_O_APPEND,
                               &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path, LFS_O_WRONLY
| LFS_O_CREAT | LFS_O_APPEND);
    handle_lfs_error(lfs_err);
#endif
 const char * contents = "butter";
    lfs_size_t   len      = strlen(contents);
 /* Apply butter to toast 10 times. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_write(&g_rm_littlefs_spi_flash0_lfs, &file, contents, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
 /* Unmount the filesystem. */
    lfs_err = lfs_unmount(&g_rm_littlefs_spi_flash0_lfs);
```

```
    handle_lfs_error(lfs_err);
 /* Remount the filesystem. */
    lfs_err = lfs_mount(&g_rm_littlefs_spi_flash0_lfs,
&g_rm_littlefs_spi_flash0_lfs_cfg);
    handle_lfs_error(lfs_err);
 /* Open breakfast/toast. */
#ifdef LFS_NO_MALLOC
    lfs_err = lfs_file_opencfg(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY, &g_file_cfg);
    handle_lfs_error(lfs_err);
#else
    lfs_err = lfs_file_open(&g_rm_littlefs_spi_flash0_lfs, &file, path,
LFS_O_RDONLY);
    handle_lfs_error(lfs_err);
#endif
    handle_lfs_error(lfs_err);
 /* Verify the toast is buttered the correct amount. */
 for (uint32_t i = 0; i < 10; i++)
    {
       lfs_err = lfs_file_read(&g_rm_littlefs_spi_flash0_lfs, &file, buffer, len);
 if (lfs_err < 0)
      {
      handle_lfs_error(lfs_err);
       }
       assert(0 == memcmp(buffer, contents, len));
    }
 /* Close the file. */
    lfs_err = lfs_file_close(&g_rm_littlefs_spi_flash0_lfs, &file);
    handle_lfs_error(lfs_err);
}
```

## Function Documentation

### ◆ RM_LITTLEFS_SPI_FLASH_Open()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Open ( rm_littlefs_ctrl_t *const *p_ctrl*, rm_littlefs_cfg_t const *const *p_cfg* )

Opens the driver and initializes lower layer driver.

Implements rm_littlefs_api_t::open().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Success. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_ALREADY_OPEN | Module is already open. |
| FSP_ERR_INVALID_SIZE | The provided block size is invalid. |
| FSP_ERR_INVALID_ARGUMENT | Flash BGO mode must be disabled. |
| FSP_ERR_INTERNAL | Failed to create the semaphore. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::open

### ◆ RM_LITTLEFS_SPI_FLASH_Close()

fsp_err_t RM_LITTLEFS_SPI_FLASH_Close ( rm_littlefs_ctrl_t *const *p_ctrl*)

Closes the lower level driver.

Implements rm_littlefs_api_t::close().

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Media device closed. |
| FSP_ERR_ASSERTION | An input parameter was invalid. |
| FSP_ERR_NOT_OPEN | Module not open. |

**Returns**

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- spi_flash_api_t::close

### Detailed Description

Driver for the MRAM memory on RA MCUs. This module implements the Flash Interface.

# Overview

The MRAM HAL module APIs allow an application to write and erase MRAM areas that reside within the MCU. The amount of MRAM memory available varies across MCU parts.

### Features

The R_MRAM module has the following key features:

- Blocking writing and erasing of MRAM.
- ECC Error Detection
- Boot block-swapping.
- Anti-rollback counter support (select MCUs).

# Configuration

### Build Time Configurations for r_mram

The following build time configurations are defined in fsp_cfg/r_mram_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |

### Configurations for Storage > MRAM (r_mram)

This module can be added to the Stacks tab via New Stack > Storage > MRAM (r_mram). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

| Configuration | Options | Default | Description |
|---|---|---|---|
| Name | Name must be a valid C symbol | g_mram0 | Module name. |
| Callback | Name must be a valid C symbol | NULL | A user callback function can be specified. Callback function called when an ECC Detection Event occurs. |
| MRAM Error Interrupt | MCU Specific Options | | Select the MRAM error |

Priority interrupt priority.

### Clock Configuration

MRAM uses MRAM bus clock for Code MRAM and MRAM clock for Extra MRAM.

### Pin Configuration

This module does not use I/O pins.

# Usage Notes

### Code MRAM Precautions

Code MRAM cannot be accessed while writing or erasing code MRAM. In order to support modifying code MRAM all supporting code must reside in RAM. Code MRAM operation will not return before the operation has completed. By default, the vector table resides in the code MRAM. If an interrupt occurs during the code MRAM operation, then code MRAM will be accessed to fetch the interrupt's starting address and an error will occur. The simplest work-around is to disable interrupts during code MRAM operations. Another option is to copy the vector table to RAM, update the VTOR (Vector Table Offset Register) accordingly and ensure that any interrupt service routines execute out of RAM. Similarly, you must ensure that if in a multi-threaded environment, threads running from code MRAM cannot become active while a code MRAM operation is in progress.

### Erase condsiderations

The erase API was designed with flash blocks in mind. The Erase API provides a mechanism for quickly overwriting blocks of data at a single time. The block size is determined by the MRAM Unit of Programming size.

### Anti Rollback Counter

Anti-rollback counters are available on select MCUs and can be used to prevent or limit firmware downgrade. The counters can only be incremented and never decremented or reset, even with an external programming tool.

*Note*

***The OEM bootloader anti-rollback counter is protected by the security engine and cannot be incremented past the version number specified in the code certificate. This counter works with the First Stage Bootloader (FSBL) set to enabled. For more information, read the 'Secure Boot' section in the 'Security Features' chapter of the user manual of the target MCU and refer to Application Note R11AN0774.***

### Anti-Rollback Counter Configuration Setting

When anti-rollback counters are used for one or more non-secure applications, the Anti-Rollback Counter Configuration Setting for ARC_NSEC (ARCCS) must be configured as either a single line (1xn bits) or multi-line counter (mxn bits). Single line is suitable when there is only one non-secure application using the anti-rollback counter. Multi-line is suitable when there are multiple non-secure applications. Before the counter is configured, it can't be used.

This configuration setting is permanent and must be performed with an external programming tool such as Renesas Flash Programmer (RFP). It cannot be configured in e2 studio.

The secure application and OEM bootloader anti-rollback counters do not require any initial configuration.

### Anti-Rollback Counter Lock Setting

Select MCUs have the ability to permanently lock the anti-rollback counters using the Anti-Rollback Counter Lock Setting (ARCLS). It cannot be set with e2 studio, but if needed, it can be configured with an external programming tool such as Renesas Flash Programmer (RFP). **Once the lock protection is applied to a counter, the counter value can never be incremented again.** It is still possible to read the value of a locked counter.

### Viewing MRAM contents in e2 studio

By default, the contents of code MRAM are cached by e$^2$ studio. This means that during a debug session, modifications to these memory regions will not be observed by e$^2$ studio. When debugging applications using e$^2$ studio, disable the "Allow caching of flash contents" option in the debug configuration in order to view modified MRAM contents (Debug Configuration > Debugger > Debug Tool Settings > Allow caching of flash contents).

### Fault Correction and Error Detection

MRAM systems are equipped with ECC circuitry to correct and detect errors. Interrupts can be enabled to detect certain error conditions. If an error condition has occurred at a given address in memory the interrupt will continue to trigger each time it is accessed until the error condition is resolved. The error condition can be resolved by writing data to the MRAM programming size starting at the address given to the callback.

## Examples

### MRAM Basic Example

This is a basic example of writing to MRAM.

```
uint8_t g_dest[TRANSFER_LENGTH];
uint8_t g_src[TRANSFER_LENGTH];
void r_mram_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the MRAM instance. */
 fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
    assert(FSP_SUCCESS == err);
 /* Disable interrupts to prevent vector table access while MRAM is programming. */
    __disable_irq();
 /* Write 32 bytes to an area of MRAM. */
```

```
    err = R_MRAM_Write(&g_mram_ctrl, (uint32_t) g_src, MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE);
 /* Enable interrupts after MRAM operations are complete. */
    __enable_irq();
    assert(FSP_SUCCESS == err);
    assert(0 == memcmp(g_src, (uint8_t *) MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE));
}
```

### Anti-Rollback Counter Basic Example

This example demonstrates basic usage of the anti-rollback counter functions.

```
void r_mram_anti_rollback_counter_example (void)
{
 /* Open the MRAM instance. */
 fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
 /* Handle any errors. */
    assert(FSP_SUCCESS == err);
    uint32_t current_count;
 /* Read the current counter value for the secure application */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_SEC,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the OEM bootloader */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_OEMBL,
&current_count);
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for the non-secure application if counter is
configured as 1xn bits */
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App
    assert(FSP_SUCCESS == err);
 /* Read the current counter value for 4 non-secure applications if counter is
configured as mxn bits */
```

```
    err = R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_0,
&current_count); // NSEC App 0
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_1,
&current_count); // NSEC App 1
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_2,
&current_count); // NSEC App 2
    err |= R_MRAM_AntiRollbackCounterRead(&g_mram_ctrl, FLASH_ARC_NSEC_3,
&current_count); // NSEC App 3
    assert(FSP_SUCCESS == err);
 /* Increment the counter value for the secure application. Caution: The increment
cannot be reversed. */
    err = R_MRAM_AntiRollbackCounterIncrement(&g_mram_ctrl, FLASH_ARC_SEC);
    assert(FSP_SUCCESS == err);
}
```

### MRAM Two-Bit Error Detection and Correction

This is an example of how a two-bit error condition can be resolved.

```
uint32_t mram_example_refresh[BSP_FEATURE_MRAM_PROGRAMMING_SIZE_BYTES];
static void mram_callback (flash_callback_args_t * p_args)
{
 if (FLASH_EVENT_ERR_TWO_BIT == p_args->event)
    {
 /* Disable interrupts to prevent vector table access while MRAM is programming. */
      __disable_irq();
       memcpy(mram_example_refresh, (uint32_t *) p_args->data,
BSP_FEATURE_MRAM_PROGRAMMING_SIZE_BYTES);
 R_MRAM_Write(&g_mram_ctrl,
                    (uint32_t) mram_example_refresh,
                    p_args->data,
                    BSP_FEATURE_MRAM_PROGRAMMING_SIZE_BYTES);
 /* Enable interrupts after MRAM operations are complete. */
      __enable_irq();
    }
```

```
}
```

### Data Structures

| | |
|---|---|
| struct | mram_instance_ctrl_t |

## Data Structure Documentation

### ◆ mram_instance_ctrl_t

| struct mram_instance_ctrl_t |
|---|
| MRAM instance control block. DO NOT INITIALIZE. |

## Function Documentation

### ◆ R_MRAM_Open()

fsp_err_t R_MRAM_Open ( flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg* )

Initializes the MRAM peripheral. Implements flash_api_t::open.

The Open function initializes the MRAM.

Example:

```
/* Open the MRAM instance. */
fsp_err_t err = R_MRAM_Open(&g_mram_ctrl, &g_mram_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Initialization was successful. |
| FSP_ERR_ALREADY_OPEN | The MRAM control block is already open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_cfg. |
| FSP_ERR_IRQ_BSP_DISABLED | Caller is requesting BGO but the MRAM interrupts are not supported. |

### ◆ R_MRAM_Write()

fsp_err_t R_MRAM_Write ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *mram_address*, uint32_t const *num_bytes* )

Writes to the specified MRAM memory area. Implements flash_api_t::write.

Example:

```
/* Disable interrupts to prevent vector table access while MRAM is programming. */
   __disable_irq();
/* Write 32 bytes to an area of MRAM. */
   err = R_MRAM_Write(&g_mram_ctrl, (uint32_t) g_src, MRAM_WRITE_ADDRESS,
MRAM_EXAMPLE_WRITE_SIZE);
/* Enable interrupts after MRAM operations are complete. */
   __enable_irq();
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Operation successful. |
| FSP_ERR_IN_USE | The MRAM peripheral is busy with a prior on-going transaction. |
| FSP_ERR_NOT_OPEN | The MRAM API is not Open. |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. This may be returned if the requested MRAM area is not blank. |
| FSP_ERR_TIMEOUT | Timed out waiting for write operation to complete. |
| FSP_ERR_INVALID_SIZE | Number of bytes provided was invalid |
| FSP_ERR_INVALID_ADDRESS | Invalid address was input or address not on programming boundary. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |

### ◆ R_MRAM_Erase()

fsp_err_t R_MRAM_Erase ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks* )

Erases the specified MRAM blocks. Implements flash_api_t::erase by the block_erase_address.

Example:

```
/* Disable interrupts to prevent vector table access while MRAM is programming. */
   __disable_irq();
/* Erase 10 programmable units of MRAM */
fsp_err_t err = R_MRAM_Erase(&g_mram_ctrl, MRAM_ERASE_ADDRESS, 10);
/* Enable interrupts after MRAM operations are complete. */
   __enable_irq();
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful open. |
| FSP_ERR_INVALID_BLOCKS | Invalid number of blocks specified |
| FSP_ERR_INVALID_ADDRESS | Invalid address specified. |
| FSP_ERR_IN_USE | Other MRAM operation in progress, or API not initialized |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | The MRAM API is not Open. |
| FSP_ERR_ERASE_FAILED | Status is indicating a Erase error. |
| FSP_ERR_TIMEOUT | Timed out waiting for the MACI to become ready. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |

### ◆ R_MRAM_BlankCheck()

fsp_err_t R_MRAM_BlankCheck ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result* )

Stub function Implements flash_api_t::blankCheck.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Blank Check is not supported on this MCU. |

### ◆ R_MRAM_StatusGet()

fsp_err_t R_MRAM_StatusGet ( flash_ctrl_t *const *p_api_ctrl*, flash_status_t *const *p_status* )

Query the MRAM peripheral for its status. Implements flash_api_t::statusGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MRAM peripheral is ready to use. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The MRAM API is not Open. |

### ◆ R_MRAM_IdCodeSet()

fsp_err_t R_MRAM_IdCodeSet ( flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode* )

Stub function Implements flash_api_t::idCodeSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | ID Code is not supported on this MCU. |

### ◆ R_MRAM_AccessWindowSet()

fsp_err_t R_MRAM_AccessWindowSet ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr* )

Stub function Implements flash_api_t::accessWindowSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Access window is not supported on this MCU. |

### ◆ R_MRAM_AccessWindowClear()

fsp_err_t R_MRAM_AccessWindowClear ( flash_ctrl_t *const *p_api_ctrl*)

Stub function Implements flash_api_t::accessWindowClear.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Access window is not supported on this MCU. |

### ◆ R_MRAM_Reset()

fsp_err_t R_MRAM_Reset ( flash_ctrl_t *const *p_api_ctrl*)

Reset the MRAM peripheral. Implements flash_api_t::reset.

No attempt is made to check if the MRAM is busy before executing the reset since the assumption is that a reset will terminate any existing operation.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | MRAM circuit successfully reset. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the MACI to become ready. |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |

### ◆ R_MRAM_StartUpAreaSelect()

fsp_err_t R_MRAM_StartUpAreaSelect ( flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary* )

Selects which block, Default (Block 0) or Alternate (Block 1), is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Implements flash_api_t::startupAreaSelect.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | MRAM peripheral is busy with a prior operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_PE_FAILURE | Failed to enter or exit MRAM P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the MACI to become ready. |
| FSP_ERR_WRITE_FAILED | Status is indicating a Programming error for the requested operation. |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |

### ◆ R_MRAM_BankSwap()

fsp_err_t R_MRAM_BankSwap ( flash_ctrl_t *const *p_api_ctrl*)

Stub function flash_api_t::bankSwap.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Bank Swap is not supported on this MCU. |

### ◆ R_MRAM_UpdateFlashClockFreq()

fsp_err_t R_MRAM_UpdateFlashClockFreq ( flash_ctrl_t *const *p_api_ctrl*)

Indicate to the MRAM module that the system clock has changed. Implements flash_api_t::updateFlashClockFreq.

This should be the case if the application has changed the system clock.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Start-up area successfully toggled. |
| FSP_ERR_IN_USE | MRAM is busy with an on-going operation. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl |
| FSP_ERR_NOT_OPEN | MRAM API has not yet been opened. |

### ◆ R_MRAM_InfoGet()

fsp_err_t R_MRAM_InfoGet ( flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info* )

Returns the information about the MRAM regions. Implements flash_api_t::infoGet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful retrieved the request information. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_info. |

### ◆ R_MRAM_Close()

fsp_err_t R_MRAM_Close ( flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent MRAM operations. Implements flash_api_t::close.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Successful close. |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_ctrl or p_cfg. |

### ◆ R_MRAM_CallbackSet()

fsp_err_t R_MRAM_CallbackSet ( flash_ctrl_t *const *p_api_ctrl*, void(*)(flash_callback_args_t *) *p_callback*, void *const *p_context*, flash_callback_args_t *const *p_callback_memory* )

Updates the user callback with the option to provide memory for the callback argument structure. Implements flash_api_t::callbackSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Callback updated successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | The control block has not been opened. |
| FSP_ERR_NO_CALLBACK_MEMORY | p_callback is non-secure and p_callback_memory is either secure or NULL. |

### ◆ R_MRAM_AntiRollbackCounterIncrement()

fsp_err_t R_MRAM_AntiRollbackCounterIncrement ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Increments the selected anti-rollback counter.

***Note***

*The counter is read internally before increment.*

Implements flash_api_t::antiRollbackCounterIncrement

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Counter incremented successfully |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_api_ctrl |
| FSP_ERR_NOT_ENABLED | The specified counter has not been configured (configuration is only required for ARC_NSEC) |
| FSP_ERR_OVERFLOW | The counter cannot be incremented because it is already at its max value |
| FSP_ERR_PE_FAILURE | Failed to enter or exit MRAM P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the MACI to become ready. |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |
| FSP_ERR_UNSUPPORTED | Selected anti-rollback counter is not supported on this MCU |

### ◆ R_MRAM_AntiRollbackCounterRefresh()

fsp_err_t R_MRAM_AntiRollbackCounterRefresh ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter* )

Stub function Implements flash_api_t::antiRollbackCounterRefresh

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | Anti-Rollback counter refresh is not supported on this MCU |

### ◆ R_MRAM_AntiRollbackCounterRead()

fsp_err_t R_MRAM_AntiRollbackCounterRead ( flash_ctrl_t *const *p_api_ctrl*, flash_arc_t *counter*, uint32_t *const *p_count* )

Reads the selected anti-rollback counter and returns the number of counter bits set.

Implements flash_api_t::antiRollbackCounterRead

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Counter read successfully into p_count |
| FSP_ERR_NOT_OPEN | The control block is not open. |
| FSP_ERR_ASSERTION | NULL provided for p_api_ctrl or p_count |
| FSP_ERR_NOT_ENABLED | The specified counter has not been configured (configuration is only required for ARC_NSEC) |
| FSP_ERR_PE_FAILURE | Failed to enter or exit MRAM P/E mode. |
| FSP_ERR_TIMEOUT | Timed out waiting for the MACI to become ready. |
| FSP_ERR_CMD_LOCKED | MRAM Application Command Interface is in locked state |

### ◆ R_MRAM_UserLockableAreaWrite()

fsp_err_t R_MRAM_UserLockableAreaWrite ( flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *mram_address*, uint32_t const *num_bytes* )

Stub function Implements flash_api_t::userLockableAreaWrite

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | User Lockable Area is not supported on this MCU |

### Detailed Description

Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.

# Overview

The OSPI peripheral interfaces with an external OctaFlash and/or OctaRAM chip(s) to perform data I/O Operations. When both OctaFlash and OctaRAM devices are interfaced, they must be connected to their own chip-select lines. The devices cannot share a single chip-select line.

### Features

The OSPI driver has the following key features to support the **OctaFlash** device:

- Perform data I/O Operation in both SPI and OPI modes
- Can be configured with OctaFlash device on either of the 2 channels
- Memory mapped read access to the OctaFlash
- Programming the OctaFlash device using single continuous write
- Erasing the OctaFlash device

- Sending device specific commands and reading back responses
- Entering and exiting XIP (Single Continuous Read) mode
- 3 byte addressing for SPI
- 4 byte addressing for SPI and OPI
- Auto-calibration for OPI mode (SOPI and DOPI)

The OSPI driver has the following key features to support the **OctaRAM** device:

- Perform data I/O Operation in DOPI mode
- Can be configured with OctaRAM device on either of the 2 channels
- Memory mapped read amd write access to the OctaRAM using single continuous mode
- Sending device specific commands and reading back responses
- Auto-calibration for DOPI mode
- Uninitialized global variables or buffers can be allocated in the OSPI RAM address space.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OctaFlash.

*Note*

*For OctaFlash, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.*

# Configuration

**OSPI Flash:**

**Build Time Configurations for r_ospi**

The following build time configurations are defined in driver/r_ospi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | • Enable<br>• Disable | Disable | Enable DMAC support for the OSPI module. |

**Configurations for Storage > OSPI Flash (r_ospi)**

This module can be added to the Stacks tab via New Stack > Storage > OSPI Flash (r_ospi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| General > Single Continuous Mode | | | |
| Read Idle Time | Must be an integer greater than 0 with maximum configurable value of 127 | 100 | Specify the read idle time. |

| | | | |
|---|---|---|---|
| Write Idle Time | Must be an integer greater than 0 with maximum configurable value of 127 | 100 | Specify the write idle time. |
| Name | Name must be a valid C symbol | g_ospi0 | Module name. |
| Channel | Channel should be 0 or 1 | 0 | Specify the OSPI chip select line to use. |
| Flash Size | Must be an integer greater than 0 with maximum configurable value of 0x3FFFFFFF | 0x04000000 | Specify the OctaFlash size in bytes. |
| SPI Protocol | • SPI<br>• Single data rate OPI<br>• Dual data rate OPI | SPI | Select the initial SPI protocol. SPI protocol can be changed on the OctaFlash using R_OSPI_DirectTransfer( ). |
| Address Bytes | • 3<br>• 4 | 4 | Select the number of address bytes. |
| OPI Mode | | | |
| OPI Mode > Auto-Calibration | | | |
| Data latching delay | Must be a valid non-negative integer with maximum configurable value of 0xFF | 0x80 | Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C |
| Auto-Calibration Address | Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF | 0x00 | Set the address of the read/write destination to be performed for auto-calibration. |
| OPI Mode > Command Definitions | | | |
| Page Program Command | Must be a 16-bit OSPI Page Program Command under OPI Mode\|Command Definitions | 0x12ED | The command to program a page in OPI mode. |
| Read Command | Must be a 16-bit OSPI Read Command under OPI Mode\|Command Definitions | 0xEC13 | The command to read in SOPI mode (8READ). |
| Dual Read Command | Must be a 16-bit OSPI Dual Read Command under OPI Mode\|Command Definitions | 0xEE11 | The command to read in DOPI mode (8DTRD). |

| | | | |
|---|---|---|---|
| Write Enable Command | Must be a 16-bit OSPI Write Enable Command under OPI Mode\|Command Definitions | 0x06F9 | The command to enable write in OPI mode. |
| Status Command | Must be a 16-bit OSPI Status Command under OPI Mode\|Command Definitions | 0x05FA | The command to query the status of a write or erase command in OPI mode. |
| OPI Mode > OM_DQS Enable Counter | | | |
| SOPI | Must be an integer between 0 and 255 | 9 | OM_DQS enable counter for memory access. Setting for SOPI mode. |
| DOPI | Must be an integer between 0 and 255 | 6 | OM_DQS enable counter for memory access. Setting for DOPI mode. |
| Command Length Bytes | Must be an integer between 1 and 2 | 2 | Command length in bytes |
| Memory Read Dummy Cycles | Must be an integer between 0 and 255 | 10 | Memory read dummy cycles |
| Status Read Dummy Cycles | Must be an integer between 0 and 255 | 4 | Status read dummy cycles |
| DOPI Byte Order | • Byte0, Byte1, Byte2, Byte3<br>• Byte1, Byte0, Byte3, Byte2 | Byte0, Byte1, Byte2, Byte3 | Byte order on the external bus |
| SPI Mode | | | |

*Note*

*The user is expected to modify the command definitions based on the OctaFlash chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for OPI mode based on Macronix OctaFlash MX25LM51245G.*

**OSPI RAM:**

**Build Time Configurations for r_ospi**

The following build time configurations are defined in driver/r_ospi_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Parameter Checking | • Default (BSP)<br>• Enabled<br>• Disabled | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | • Enable<br>• Disable | Disable | Enable DMAC support for the OSPI module. |

**Configurations for Storage > OSPI RAM (r_ospi)**

This module can be added to the Stacks tab via New Stack > Storage > OSPI RAM (r_ospi).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| General > Single Continuous Mode | | | |
| Read Idle Time | Must be an integer greater than 0 with maximum configurable value of 127 | 127 | Specify the read idle time. |
| Write Idle Time | Must be an integer greater than 0 with maximum configurable value of 127 | 127 | Specify the write idle time. |
| Name | Name must be a valid C symbol | g_ospi_ram0 | Module name. |
| Channel | Channel should be 0 or 1 [Channel 0 recommended] | 0 | Specify the OSPI chip select line to use. |

| | | | |
|---|---|---|---|
| RAM Size | Must be an integer greater than 0 with maximum configurable value of 0x00800000 | 0x00800000 | Specify the OctaRam size in bytes. |
| SPI Protocol | Dual data rate OPI | Dual data rate OPI | Select the initial SPI protocol. OctaRAM only supports DOPI mode. |
| Address Bytes | 4 | 4 | Select the number of address bytes. OctaRAM only supports 4 byte addresses in DOPI mode. |
| Auto-Calibration | | | |
| Data latching delay | Must be a valid non-negative integer with maximum configurable value of 0xFF | 0x80 | Set this to 0 to enable auto-calibration. 0x80 is the default value calculated at 3.3V and 25°C |
| Auto-Calibration Address | Must be a valid non-negative integer with maximum configurable value of 0xFFFFFFFF | 0x00 | Set the address of the read/write destination to be performed for auto-calibration. |
| Command Definitions | | | |
| Memory Read Command | Must be a 16-bit OSPI Dual Read Command under Command Definitions | 0xA000 | The command to read in DOPI mode. |
| Memory Write Command | Must be a 16-bit OSPI Write Command under Command Definitions | 0x2000 | The command to write in DOPI mode. |
| OM_DQS Enable Counter | | | |
| DOPI | Must be an integer between 0 and 255 | 3 | OM_DQS enable counter for memory access. Setting for DOPI mode. |
| Chip Select Timing Setting | | | |
| Memory Mapped Read Command Interval | • 2<br>• 5<br>• 7<br>• 9<br>• 11<br>• 13<br>• 15<br>• 17 | 2 | Memory mapped read command execution interval setting in OCTACLK units |
| Memory Mapped Write Command Interval | • 2<br>• 5<br>• 7 | 2 | Memory mapped write command execution interval setting in |

| | | | |
|---|---|---|---|
| | • 9<br>• 11<br>• 13<br>• 15<br>• 17 | | OCTACLK units |
| Command Interval | • 2<br>• 5<br>• 7<br>• 9<br>• 11<br>• 13<br>• 15<br>• 17 | 2 | Command execution interval setting in OCTACLK units |
| Memory Mapped Read Pull-up Timing | • 6.5 DOPI<br>• 7.5 DOPI<br>• 8.5 DOPI | 6.5 DOPI | Memory mapped read signal pull-up timing setting in OCTACLK units |
| Memory Mapped Write Pull-up Timing | • 1.5 DOPI<br>• 2.5 DOPI<br>• 3.5 DOPI<br>• 4.5 DOPI<br>• 5.5 DOPI<br>• 6.5 DOPI<br>• 7.5 DOPI<br>• 8.5 DOPI | 1.5 DOPI | Memory mapped write signal pull-up timing setting in OCTACLK units |
| Pull-up Timing | • 6.5 DOPI<br>• 7.5 DOPI<br>• 8.5 DOPI | 6.5 DOPI | Signal pull-up timing setting in OCTACLK units |
| Memory Mapped Read Pull-down Timing | • 2.5 DOPI<br>• 3.5 DOPI<br>• 4.5 DOPI | 2.5 DOPI | Memory mapped read signal pull-down timing setting in OCTACLK units |
| Memory Mapped Write Pull-down Timing | • 2.5 DOPI<br>• 3.5 DOPI<br>• 4.5 DOPI | 2.5 DOPI | Memory mapped write signal pull-down timing setting in OCTACLK units |
| Pull-down Timing | • 2.5 DOPI<br>• 3.5 DOPI<br>• 4.5 DOPI | 2.5 DOPI | Signal pull-down timing setting in OCTACLK units |
| Command Length Bytes | Must be an integer between 1 and 2 | 2 | Command length in bytes |
| Memory Read Dummy Cycles | Must be an integer between 0 and 255 | 4 | Memory read dummy cycles |
| Memory Write Dummy Cycles | Must be an integer between 0 and 255 | 4 | Memory write dummy cycles |
| DOPI Byte Order | • Byte0, Byte1, Byte2, Byte3<br>• Byte1, Byte0, | Byte1, Byte0, Byte3, Byte2 | Byte order on the external bus |

| | | | |
|---|---|---|---|
| | Byte3, Byte2 | | |
| Chip Select Maximum Low Time (us) | Must be an integer between 0 to 511 | 4 | Chip Select Maximum Low Time (tCSM). |

### Clock Configuration

PCLKA is the Octal-SPI bus interface, and PCLKB is used to set OSPI registers.

The signals to the OSPI device are derived from OCTACLK. The OMSCLK signal is OCTACLK / 2. Data can be output at the OCTACLK rate if SPI Protocol is set to Dual Data Rate OPI.

The PCLKB, PCLKA, and OCTACLK frequencies can be set on the **Clocks** tab of the RA Configuration editor.

### Pin Configuration

The following pins are available to connect to an external OSPI device:

- OMSCLK: OSPI clock output (OCTACLK / 2)
- OMDQS: OSPI data strobe signal
- OMCS0: OSPI device 0 select
- OMCS1: OSPI device 1 select
- OMSIO0: Data 0 I/O
- OMSIO1: Data 1 I/O
- OMSIO2: Data 2 I/O
- OMSIO3: Data 3 I/O
- OMSIO4: Data 4 I/O
- OMSIO5: Data 5 I/O
- OMSIO6: Data 6 I/O
- OMSIO7: Data 7 I/O

*Note*

*Data pins must be configured with IOPORT_CFG_DRIVE_HS_HIGH.*
*Chip Select pins should be configured with at least IOPORT_CFG_DRIVE_MEDIUM.*

# Usage Notes

### Usage Notes for OctaFlash support

### Enabling DMAC

DMAC data transmission support is configurable for OSPI Flash and is disabled from the build by default. Use of a high-priority (low channel number) DMAC for data transmission is strongly recommended.

For further details on DMAC please refer Transfer (r_dmac).

### OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaFlash device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be read like on-chip flash. Channel 0 supports 128 MB while Channel 1 supports 256 MB of address space.

### Auto-calibration

Auto-calibration procedure is triggered automatically when the 'Data latching delay' field in the configurator properties is set to 0. The user application is responsible for setting the appropriate preamble pattern before calling R_OSPI_Open() with SOPI/DOPI mode or changing the SPI protocol to SOPI/DOPI using R_OSPI_SpiProtocolSet() API. The appropriate preamble pattern can be written to the desired address using the R_OSPI_Write() API while in the SPI mode (recommended). Ensure that the same address is passed through the configurator. If the OctaFlash chip is already in SOPI/DOPI mode, the preamble pattern must be programmed using the debugger before calling R_OSPI_Open().

### Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support SOPI and SPI at minimum latency. In case the driver is opened in SPI mode and will be switched to DOPI mode later using R_OSPI_SpiProtocolSet(), please select latencies required for DOPI before calling R_OSPI_Open().

### OctaFlash Commands

- Set the erase commands based on intended mode of operation (SPI or OPI). These commands cannot be changed during run-time.
- Read, Write and Status commands for both SPI and OPI are configured allowing switching between the modes at run-time.

## Usage Notes for OctaRAM support

### OSPI Memory Mapped Access

After R_OSPI_Open() completes successfully, the OctaRAM device contents are mapped to address 0x68000000 (channel 0) or 0x70000000 (channel 1) based on the channel configured and can be written to or read from like on-chip RAM. Channel 0 and 1 support 8 MB of address space.

### Auto-calibration

Since the OctaRAM only supports DOPI mode, the driver allows the user to call R_OSPI_Open() without performing the auto-calibration procedure automatically when 'Data latching delay' field is set to 0 in the configurator properties. This is done so that the user can write the appropriate preamble pattern to the desired address using memory mapped writes while in DOPI mode. Ensure that the same address is passed through the configurator. R_OSPI_AutoCalibrate() should be then called to perform auto-calibration.

### Chip Select Latencies

Chip select latencies can be set through the configurator. The default settings support DOPI at minimum latency.

### Limitations

Developers should be aware of the following limitations when using the OSPI driver:

### OctaFlash

- Single continuous read in SPI mode is not supported by the peripheral. The maximum amount of data that can be read using a single read command is 4-bytes (When doing a 32-bit access).

- Fast Reads would be slower than regular reads as the SPI mode cannot be operated with an OMSCLK greater than 50MHz.

# Examples

### OSPI Flash:

### Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaFlash.

```
#define OSPI_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_EXAMPLE_DATA_LENGTH];
/* Place data in the .ospi0_cs1 section to flash it during programming. */
const uint8_t g_src[OSPI_EXAMPLE_DATA_LENGTH] BSP_PLACE_IN_SECTION(".ospi0_cs1") =
"ABCDEFGHIJKLMNOPQRSTUVWXYZ";
/* Place code in the .ospi0_cs1 section to flash it during programming. */
void r_ospi_example_function(void) BSP_PLACE_IN_SECTION(".ospi0_cs1_code")
__attribute__((noinline));
void r_ospi_example_function (void)
{
 /* Add code here. */
}
void r_ospi_basic_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* (Optional) Change SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read directly from the OSPI flash. */
    memcpy(&g_dest[0], &g_src[0], OSPI_EXAMPLE_DATA_LENGTH);
 /* After R_OSPI_Open() and any required device specific intiialization, functions in
the OSPI flash can be called. */
    r_ospi_example_function();
}
```

### Reading Status Register Example (R_OSPI_DirectTransfer)

This is an example of using R_OSPI_DirectWrite followed by R_OSPI_DirectRead to send the read status register command and read back the status register from the device.

```
#define OSPI_COMMAND_READ_STATUS_REGISTER (0x05U)
void r_ospi_direct_example (void)
{
 spi_flash_direct_transfer_t ospi_test_direct_transfer =
    {
       .command       = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE,
       .address       = 0U,
       .data          = 0U,
       .command_length = 1U,
       .address_length = 0U,
       .data_length    = 0U,
       .dummy_cycles   = 0U
    };
 /* Open the OSPI instance. */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
 /* Read Status Register */
    ospi_test_direct_transfer.command    = OSPI_TEST_READ_STATUS_COMMAND_SPI_MODE;
    ospi_test_direct_transfer.data_length = 1U;
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
 /* Check if Write Enable is set */
 if (OSPI_WEN_BIT_MASK != (ospi_test_direct_transfer.data & OSPI_WEN_BIT_MASK))
    {
       __BKPT(0);
    }
```

```
}
```

### Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_Write, R_OSPI_SpiProtocolSet)

This is an example of using R_OSPI_SpiProtocolSet to change the operating mode from SPI to SOPI and allow the driver to initiate auto-calibration.

```
#define OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES (16U)
#define OSPI_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
const uint8_t g_preamble_bytes[OSPI_DOPI_PREAMBLE_PATTERN_LENGTH_BYTES] =
{
    0x00, 0x00, 0xFF, 0xFF, 0xFF, 0x00, 0x08, 0x00, 0x00, 0xF7, 0xFF, 0x00, 0x08,
0xF7, 0x00, 0xF7
};
void ospi_example_wait_until_wip (void)
{
 fsp_err_t          err = FSP_SUCCESS;
 spi_flash_status_t status;
    status.write_in_progress = true;
    uint32_t timeout = UINT32_MAX;
 while ((status.write_in_progress) && (--timeout))
    {
       err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
 if (0 == timeout)
    {
      assert(FSP_SUCCESS == err);
    }
}
void r_ospi_auto_calibrate_example (void)
{
 /* Open the OSPI instance. */
 /* Set data_latch_delay_clocks to 0x0 to enable auto-calibration */
 fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

```
    assert(FSP_SUCCESS == err);
    uint8_t * preamble_pattern_addr = (uint8_t *) OSPI_EXAMPLE_PREAMBLE_ADDRESS;
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
 /* Wait until write has been completed */
    ospi_example_wait_until_wip();
 /* Change from SPI to DOPI mode */
    r_ospi_example_spi_to_dopi();
}
```

### Octaclk Update Example (R_OSPI_SpiProtocolSet)

This is an example of using R_BSP_OctaclkUpdate to change the Octal-SPI clock frequency during run time. The OCTACLK frequency must be updated before calling the R_OSPI_SpiProtocolSet with appropriate clock source and divider settings required to be set for the new SPI protocol mode. Ensure that the clock source selected is started.

```
static void ospi_example_change_omclk (void)
{
 /* Ensure clock source (PLL2 in this example) is running before changing the OCTACLK
frequency */
    bsp_octaclk_settings_t octaclk_settings;
    octaclk_settings.source_clock = BSP_CLOCKS_CLOCK_PLL2;
    octaclk_settings.divider      = BSP_CLOCKS_OCTACLK_DIV_2;
    R_BSP_OctaclkUpdate(&octaclk_settings);
}
```

### OSPI Data and IAR

When using the IAR compiler, OSPI data must be const qualified to be downloaded by the debugger.

### OSPI RAM:

### Basic Example

This is a basic example of minimal use of the OSPI in an application with OctaRAM.

```
#define OSPI_RAM_EXAMPLE_DATA_LENGTH (1024)
uint8_t g_dest[OSPI_RAM_EXAMPLE_DATA_LENGTH];
```

```
/* Place uninitialized data buffers in the ospi0_cs1_noinit section.
 * Use ospi0_cs1_noinit section if the OctaRAM is configured on channel 1.
 */
uint8_t g_src_1[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi0_cs1_noinit");
uint8_t g_src_2[OSPI_RAM_EXAMPLE_DATA_LENGTH]
BSP_PLACE_IN_SECTION(".ospi0_cs1_noinit");
void r_ospi_ram_basic_example (void)
{
 /* Open the OSPI instancee.
  * Ensure valid setting of the 'Data latching delay' field in the configurator.
  * To successfully perform OSPI RAM reads this value must not be 0.
  */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
 /* After R_OSPI_Open() and any required device specific intiialization, data can be
read from or written to directly from the OSPI RAM. */
    memcpy(&g_dest[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
    memcpy(&g_src_2[0], &g_src_1[0], OSPI_RAM_EXAMPLE_DATA_LENGTH);
}
```

### Auto-calibration Example (R_OSPI_DirectTransfer, R_OSPI_AutoCalibrate)

This is an example of using R_OSPI_AutoCalibrate to calibrate OSPI peripheral to read data from the OctaRAM device.

```
#define OSPI_RAM_EXAMPLE_PREAMBLE_ADDRESS (0x68000000U) /* Device connected to CS0 */
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_MASK (0x00F0U)
#define OSPI_RAM_EXAMPLE_OCTARAM_CR_LATENCY_COUNTER_POS (4U)
#define OSPI_RAM_EXAMPLE_OCTARAM_100MHZ_4CLOCKS_CR_SETTING (1U)
void r_ospi_ram_auto_calibrate_example (void)
{
 /* Open the OSPI instancee */
 fsp_err_t err = R_OSPI_Open(&g_ospi_ram0_ctrl, &g_ospi_ram0_cfg);
    assert(FSP_SUCCESS == err);
```

```
 /* OctaRAM Configuration Register (cr) read and write command definition */
 spi_flash_direct_transfer_t read_cr =
    {
       .command       = 0xC000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
 /* Dummy Cycles set to the default value specified in the OctaRAM device
Configuration Register */
       .dummy_cycles   = 5U
    };
 spi_flash_direct_transfer_t write_cr =
    {
       .command       = 0x4000U,    // NOLINT(readability-magic-numbers)
       .address       = 0x00040000U, // NOLINT(readability-magic-numbers)
       .data          = 0U,
       .command_length = 2U,
       .address_length = 4U,
       .data_length    = 2U,
       .dummy_cycles   = 0U
    };
 /* Read OctaRAM device Configuration Register */
    err = R_OSPI_DirectTransfer(&g_ospi_ram0_ctrl, &read_cr,
SPI_FLASH_DIRECT_TRANSFER_DIR_READ);
    assert(FSP_SUCCESS == err);
    uint16_t config_reg = (uint16_t) (((uint16_t) (read_cr.data) &

## Function Documentation

### ◆ R_OSPI_Open()

fsp_err_t R_OSPI_Open ( spi_flash_ctrl_t *const *p_ctrl*, spi_flash_cfg_t const *const *p_cfg* )

Open the OSPI driver module. After the driver is open, the OSPI can be accessed like internal flash memory.

Implements spi_flash_api_t::open.

Example:

```
/* Open the OSPI instancee */
fsp_err_t err = R_OSPI_Open(&g_ospi0_ctrl, &g_ospi0_cfg);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | Configuration was successful. |
| FSP_ERR_ASSERTION | The parameter p_ctrl or p_cfg is NULL. |
| FSP_ERR_ALREADY_OPEN | Driver has already been opened with the same p_ctrl. |
| FSP_ERR_CALIBRATE_FAILED | Failed to perform auto-calibrate. |
| FSP_ERR_INVALID_ARGUMENT | Attempting to open the driver with an invalid SPI protocol for OctaRAM. |

### ◆ R_OSPI_DirectWrite()

fsp_err_t R_OSPI_DirectWrite ( spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, bool const *read_after_write* )

Writes raw data directly to the OctaFlash. API not supported. Use R_OSPI_DirectTransfer

Implements spi_flash_api_t::directWrite.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | API not supported by OSPI. |

### ◆ R_OSPI_DirectRead()

fsp_err_t R_OSPI_DirectRead ( spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes* )

Reads raw data directly from the OctaFlash. API not supported. Use R_OSPI_DirectTransfer.

Implements spi_flash_api_t::directRead.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | API not supported by OSPI. |

### ◆ R_OSPI_DirectTransfer()

fsp_err_t R_OSPI_DirectTransfer ( spi_flash_ctrl_t *const *p_ctrl*, spi_flash_direct_transfer_t *const *p_transfer*, spi_flash_direct_transfer_dir_t *direction* )

Read/Write raw data directly with the OctaFlash/OctaRAM device.

Implements spi_flash_api_t::directTransfer.

Example:

```
 /* Write Enable */
    err = R_OSPI_DirectTransfer(&g_ospi0_ctrl, &ospi_test_direct_transfer,
SPI_FLASH_DIRECT_TRANSFER_DIR_WRITE);
    assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The flash was programmed successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |

### ◆ R_OSPI_XipEnter()

fsp_err_t R_OSPI_XipEnter ( spi_flash_ctrl_t *const *p_ctrl*)

Enters Single Continuous Read/Write mode.

Implements spi_flash_api_t::xipEnter.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The flash was programmed successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaRAM. |

### ◆ R_OSPI_XipExit()

fsp_err_t R_OSPI_XipExit ( spi_flash_ctrl_t *const *p_ctrl*)

Exits XIP (execute in place) mode.

Implements spi_flash_api_t::xipExit.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The flash was programmed successfully. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaRAM. |

### ◆ R_OSPI_Write()

fsp_err_t R_OSPI_Write ( spi_flash_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint32_t *byte_count* )

Program a page of data to the flash.

Implements spi_flash_api_t::write.

Example:

```
    err = R_OSPI_Write(&g_ospi0_ctrl, g_preamble_bytes, preamble_pattern_addr,
OSPI_EXAMPLE_PREAMBLE_ADDRESS);
    assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The flash was programmed successfully. |
| FSP_ERR_ASSERTION | p_instance_ctrl, p_dest or p_src is NULL, or byte_count crosses a page boundary. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_DEVICE_BUSY | Another Write/Erase transaction is in progress. |
| FSP_ERR_INVALID_SIZE | Write operation crosses page-boundary. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaRAM. |
| FSP_ERR_WRITE_FAILED | The write enable bit was not set. |

### ◆ R_OSPI_Erase()

fsp_err_t R_OSPI_Erase ( spi_flash_ctrl_t *const *p_ctrl*, uint8_t *const *p_device_address*, uint32_t *byte_count* )

Erase a block or sector of flash. The byte_count must exactly match one of the erase sizes defined in spi_flash_cfg_t. For chip erase, byte_count must be SPI_FLASH_ERASE_SIZE_CHIP_ERASE.

Implements spi_flash_api_t::erase.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The command to erase the flash was executed successfully. |
| FSP_ERR_ASSERTION | p_instance_ctrl or p_device_address is NULL, byte_count doesn't match an erase size defined in spi_flash_cfg_t, or byte_count is set to 0. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_DEVICE_BUSY | The device is busy. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaRAM. |
| FSP_ERR_WRITE_FAILED | The write enable bit was not set. |

### ◆ R_OSPI_StatusGet()

fsp_err_t R_OSPI_StatusGet ( spi_flash_ctrl_t *const *p_ctrl*, spi_flash_status_t *const *p_status* )

Gets the write or erase status of the flash.

Implements spi_flash_api_t::statusGet.

Example:

```
      err = R_OSPI_StatusGet(&g_ospi0_ctrl, &status);
     assert(FSP_SUCCESS == err);
```

**Return values**

| | |
|---|---|
| FSP_SUCCESS | The write status is in p_status. |
| FSP_ERR_ASSERTION | p_instance_ctrl or p_status is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaRAM. |

### ◆ R_OSPI_BankSet()

fsp_err_t R_OSPI_BankSet ( spi_flash_ctrl_t *const *p_ctrl*, uint32_t *bank* )

Selects the bank to access.

Implements spi_flash_api_t::bankSet.

**Return values**

| | |
|---|---|
| FSP_ERR_UNSUPPORTED | API not supported by OSPI. |

### ◆ R_OSPI_SpiProtocolSet()

fsp_err_t R_OSPI_SpiProtocolSet ( spi_flash_ctrl_t *const *p_ctrl*, spi_flash_protocol_t *spi_protocol* )

Sets the SPI protocol.

Implements spi_flash_api_t::spiProtocolSet.

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SPI protocol updated on MCU peripheral. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_CALIBRATE_FAILED | Failed to perform auto-calibrate. |
| FSP_ERR_INVALID_ARGUMENT | Attempting to set an invalid SPI protocol for OctaRAM. |

### ◆ R_OSPI_AutoCalibrate()

fsp_err_t R_OSPI_AutoCalibrate ( spi_flash_ctrl_t *const *p_ctrl*)

Auto-calibrate the OctaRAM device using the preamble pattern.

***Note***

*The preamble pattern must be written to the configured address before calling this API. Implements spi_flash_api_t::autoCalibrate.*

**Return values**

| | |
|---|---|
| FSP_SUCCESS | SPI protocol updated on MCU peripheral. |
| FSP_ERR_ASSERTION | A required pointer is NULL. |
| FSP_ERR_NOT_OPEN | Driver is not opened. |
| FSP_ERR_CALIBRATE_FAILED | Failed to perform auto-calibrate. |
| FSP_ERR_UNSUPPORTED | API not supported by OSPI - OctaFlash. |

### ◆ R_OSPI_Close()

| fsp_err_t R_OSPI_Close ( spi_flash_ctrl_t *const *p_ctrl*) |
|---|
| Close the OSPI driver module.<br><br>Implements spi_flash_api_t::close.<br><br>**Return values**<br><br>FSP_SUCCESS — Configuration was successful.<br>FSP_ERR_ASSERTION — p_instance_ctrl is NULL.<br>FSP_ERR_NOT_OPEN — Driver is not opened. |

### Detailed Description

Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.

# Overview

The OSPI_B peripheral supports xSPI (or OSPI) compatible external memory devices, and it interfaces with these devices to perform data I/O Operations. The OSPI_B peripheral does not support addressable devices, so all connected memory devices must be connected to an individual chip-select pin. Please note that this document will reference the xSPI protocol to which OSPI is a subset. The OSPI_B peripheral is compatible with a variety of xSPI protocol operating modes.

### Features

The OSPI_B driver has the following key features to support the **xSPI** device:

- Perform data I/O Operation
- Direct memory-mapped access to the xSPI device memory up to 256 MB.
- Can be configured with xSPI devices on either of the 2 channels
- Programming the xSPI device using combination write (up to 64 bytes)
- Erasing the xSPI device
- Sending device specific commands and reading back responses of up to 8 bytes
- 1- and 2-byte addressing intended for row-column memories
- 3 byte addressing
- 4 byte addressing
- Auto-calibration
- Decryption-on-the-fly
- Support for standard SPI frames, xSPI Protocol 1.0, xSPI Protocol 2.0, and xSPI Protocol 2.0 Extended frames.

Additional build-time features:

- Optional (build-time) DMAC support for data transmission when used with OSPI_B.
- Optional (build-time) XiP support for entering/exiting XiP mode of the target device.
- Optional (build-time) Data-strobe (DS) auto-calibration support for target devices using the

DS signal.
- Optional (build-time) Decryption on the fly (DOTF)
- Optional (build-time) Support for memory which use row-column addressing.
- Optional (build-time) BSP initialization of SiP Flash.

*Note*

*For OSPI_B, use of DMAC for data transmission is strongly recommended. Without the use of DMAC, due to the high-speed hardware design of the OSPI peripheral, data transmission can be sensitive to timing variance, which could cause software-based memory-mapped operations to fail unexpectedly.*

# Configuration

### OSPI_B Flash:

### Build Time Configurations for r_ospi_b

The following build time configurations are defined in fsp_cfg/r_ospi_b_cfg.h:

| Configuration | Options | Default | Description |
|---|---|---|---|
| Memory-mapping Support | | | |
| Prefetch Function | • Enable<br>• Disable | Enable | Enable prefetch function on memory-mapped reads. |
| Combination Function | Refer to the RA Configuration tool for available options. | 64 Bytes | Enable combination function on memory-mapped writes. |
| XiP Support | • Enable<br>• Disable | Disable | Enable the use of XiP enter and exit codes. |
| Parameter Checking | • Default (BSP)<br>• Enable<br>• Disable | Default (BSP) | If selected code for parameter checking is included in the build. |
| DMAC Support | • Enable<br>• Disable | Disable | Enable DMAC support for the OSPI module. |
| Autocalibration Support | • Enable<br>• Disable | Disable | Enable DS autocalibration for dual-data-rate modes. |
| DOTF Support | • Enable (Protected Mode)<br>• Enable (Compatibility Mode)<br>• Disable | Disable | Enable DOTF support for the OSPI module. |
| Row Addressing Support | • Enable<br>• Disable | Disable | Enable support for xSPI devices which utilize row-column addressing of the memory array. |

### Configurations for Storage > OSPI (r_ospi_b)

This module can be added to the Stacks tab via New Stack > Storage > OSPI (r_ospi_b).

| Configuration | Options | Default | Description |
|---|---|---|---|
| General | | | |
| Name | Must be a valid C symbol name. | g_ospi0 | Module name. |
| Unit | MCU Specific Options | | Specify the OSPI peripheral to use. |
| Chip Select | • CS0<br>• CS1 | CS1 | Specify the OSPI chip select line to use. |
| Write Status Bit | • b0<br>• b1<br>• b2<br>• b3<br>• b4<br>• b5<br>• b6<br>• b7 | b0 | Which bit contains the write in progress status returned from the Write Status Command. |
| Write Enable Bit | • b0<br>• b1<br>• b2<br>• b3<br>• b4<br>• b5<br>• b6<br>• b7 | b1 | Which bit contains the write enable status returned from the Write Enable Command. |
| DS Auto-calibration Pattern Address | Must be a valid pointer address. | 0 | Address to the auto-calibration pattern in the target flash memory's address space. |
| Command Sets | | | |
| Command Sets > Custom Table | | | |
| Table Pointer | Must be a valid C symbol name. | | Specify the custom command set table ( ospi_b_xspi_command_set_t[]) to use. If provided, all other command set settings are ignored. |
| Table Length | Must be an integer greater-than or equal to 0. | 0 | Length of the custom command set table. |
| Command Sets > Erase Sizes | | | |
| Sector Erase | Erase size must be an | 4096 | Size of memory region |

| | | | |
|---|---|---|---|
| | integer greater-than or equal-to zero and less than 4,294,967,296 (0xFFFF_FFFF). | | erased by Sector Erase. |
| Block Erase | Erase size must be an integer greater-than or equal-to zero and less than 4,294,967,296 (0xFFFF_FFFF). | 262144 | Size of memory region erased by Block Erase. |
| Command Sets > Initial Mode | | | |
| Command Sets > Initial Mode > Read | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x13 | Read command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Read commands. Set to 0 to disable dummy cycles. |
| Command Sets > Initial Mode > Program | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x12 | Program command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Program commands. Set to 0 to disable dummy cycles. |
| Command Sets > Initial Mode > Row Load | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x0 | Row Load command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Row Load commands. Set to 0 to disable dummy cycles. |
| Command Sets > Initial Mode > Row Store | | | |
| Command Code | Command codes must be positive and fit in the selected command | 0x0 | Row Store command code. Set to 0x00 to disable. |

| | | | |
|---|---|---|---|
| | byte length. | | |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Row Store commands. Set to 0 to disable dummy cycles. |
| Command Sets > Initial Mode > Write Enable | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x06 | Write Enable command code. Set to 0x00 to disable. |
| Command Sets > Initial Mode > Status Read | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x05 | Status Read command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Status Read commands. Set to 0 to disable dummy cycles. |
| Command Sets > Initial Mode > Sector Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x21 | Sector Erase command code. Set to 0x00 to disable. |
| Command Sets > Initial Mode > Block Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0xDC | Block Erase command code. Set to 0x00 to disable. |
| Command Sets > Initial Mode > Chip Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x60 | Chip Erase command code. Set to 0x00 to disable. |
| Protocol Mode | • SPI (1S-1S-1S)<br>• DSPI (1S-2S-2S)<br>• DSPI (2S-2S-2S)<br>• QSPI (1S-4S-4S)<br>• QSPI (4S-4S-4S)<br>• QSPI (4S-4D-4D)<br>• Dual data rate OPI (8D-8D-8D) | SPI (1S-1S-1S) | Signal protocol mode to use for this command set. |

| | | | |
|---|---|---|---|
| Frame Format | • Standard<br>• xSPI Profile 1.0<br>• xSPI Profile 2.0<br>• xSPI Profile 2.0 Extended | Standard | Frame format to use with this command set. |
| Latency Mode | • Fixed<br>• Variable (DQS) | Fixed | Latency mode to use with this command set. |
| Address Length | • 1 byte<br>• 2 bytes<br>• 3 bytes<br>• 4 bytes | 3 bytes | Number of bytes used to address data in a memory page or row. |
| Address MSB Mask | Address mask must be between 0x00 and 0xFF. | 0xF0 | Mask of bits to zero for the most-significant byte of the address stage during memory-mapped operations. |
| Command Code Length | • 1 byte<br>• 2 bytes | 1 byte | Number of bytes used for command codes. |
| Status Register | • No address<br>• 1 byte<br>• 2 bytes<br>• 3 bytes<br>• 4 bytes | No address | Number of bytes used for addressing the status register. |
| Status Register Address | Status register address must be between 0x00 and 0xFFFF_FFFF, inclusive. | 0x0 | Address of the status register that reports Write-in-Progress and Write-Enable flags. |
| Command Sets > High-speed Mode | | | |
| Command Sets > High-speed Mode > Read | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0xEEEE | Read command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 20 | Dummy cycles to use between the address and data phase for Read commands. Set to 0 to disable dummy cycles. |
| Command Sets > High-speed Mode > Program | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x1212 | Program command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer | 0 | Dummy cycles to use between the address |

| | | | |
|---|---|---|---|
| | between 0 and 31. | | and data phase for Program commands. Set to 0 to disable dummy cycles. |
| Command Sets > High-speed Mode > Row Load | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x0 | Row Load command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Row Load commands. Set to 0 to disable dummy cycles. |
| Command Sets > High-speed Mode > Row Store | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x0 | Row Store command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 0 | Dummy cycles to use between the address and data phase for Row Store commands. Set to 0 to disable dummy cycles. |
| Command Sets > High-speed Mode > Write Enable | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x0606 | Write Enable command code. Set to 0x00 to disable. |
| Command Sets > High-speed Mode > Status Read | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x0505 | Status Read command code. Set to 0x00 to disable. |
| Dummy Cycles | Dummy cycle counts must be an integer between 0 and 31. | 3 | Dummy cycles to use between the address and data phase for Status Read commands. Set to 0 to disable dummy cycles. |
| Command Sets > High-speed Mode > Sector Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x2121 | Sector Erase command code. Set to 0x00 to disable. |

| | | | |
|---|---|---|---|
| Command Sets > High-speed Mode > Block Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0xDCDC | Block Erase command code. Set to 0x00 to disable. |
| Command Sets > High-speed Mode > Chip Erase | | | |
| Command Code | Command codes must be positive and fit in the selected command byte length. | 0x6060 | Chip Erase command code. Set to 0x00 to disable. |
| Protocol Mode | • SPI (1S-1S-1S)<br>• DSPI (1S-2S-2S)<br>• DSPI (2S-2S-2S)<br>• QSPI (1S-4S-4S)<br>• QSPI (4S-4S-4S)<br>• QSPI (4S-4D-4D)<br>• Dual data rate OPI (8D-8D-8D) | Dual data rate OPI (8D-8D-8D) | Signal protocol mode to use for this command set. |
| Frame Format | • Standard<br>• xSPI Profile 1.0<br>• xSPI Profile 2.0<br>• xSPI Profile 2.0 Extended | xSPI Profile 1.0 | Frame format to use with this command set. |
| Latency Mode | • Fixed<br>• Variable (DQS) | Fixed | Latency mode to use with this command set. |
| Address Length | • 1 byte<br>• 2 bytes<br>• 3 bytes<br>• 4 bytes | 4 bytes | Number of bytes used to address data in a memory page or row. |
| Address MSB Mask | Address mask must be between 0x00 and 0xFF. | 0xF0 | Mask of bits to zero for the most-significant byte of the address stage during memory-mapped operations. |
| Command Code Length | • 1 byte<br>• 2 bytes | 2 bytes | Number of bytes used for command codes. |
| Status Register | • No address<br>• 1 byte<br>• 2 bytes<br>• 3 bytes<br>• 4 bytes | 4 bytes | Number of bytes used for addressing the status register. |
| Status Register Address | Status register address must be between 0x00 and 0xFFFF_FFFF, inclusive. | 0x00 | Address of the status register that reports Write-in-Progress and Write-Enable flags. |
| Timing Settings | | | |

| | | | |
|---|---|---|---|
| Timing Settings > Chip Select | | | |
| Command Interval | Refer to the RA Configuration tool for available options. | 2 cycles | Minimum clock cycles between two consecutive xSPI frames (CS idle time). |
| Assertion Extension | • No extension<br>• 1 cycle extension | No extension | Signal pull-up timing (CS asserting extension) setting in OCTACLK units. |
| Negation Extension | • No extension<br>• 1 cycle extension | module.driver.ospi_b.pull_down_timing.clocks_5 | Signal pull-down timing (CS negating extension) setting in OCTACLK units. |
| Timing Settings > SDR | | | |
| Drive Timing | • Drive 1/2 cycle before CK<br>• Drive at CK | Drive 1/2 cycle before CK | Data signal timing relative to the rising-edge of the CK signal. |
| CK Sampling Edge | • Falling edge<br>• Rising edge | Falling edge | Data signal timing relative to the rising-edge of the CK signal. |
| Sampling Delay | • None<br>• 1 cycle<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | None | Number of cycles to delay before sampling the data signal. |
| Timing Settings > DDR | | | |
| Sampling Window Extension | • None<br>• 1 cycle<br>• 2 cycles<br>• 3 cycles<br>• 4 cycles<br>• 5 cycles<br>• 6 cycles<br>• 7 cycles | None | Number of cycles to delay before sampling the data signal. |
| DS Latching Delay | Refer to the RA Configuration tool for available options. | Auto-calibrate | Number of delay cells for the data strobe signal. This value must be set to zero if auto-calibration is used. |
| XiP Mode | | | |
| XiP Enter Code | Must be an integer between 0 and 255, inclusive. | 0 | XiP enter code. |
| XiP Exit Code | Must be an integer | 0 | XiP exit code. |

| | | | |
|---|---|---|---|
| | between 0 and 255, inclusive. | | |
| DOTF | | | |
| Name | Must be a valid C symbol name. | g_ospi_dotf | DOTF configuration name. |
| AES Key | Must be a valid C symbol name. | g_ospi_dotf_key | Name of the encryption key variable. |
| AES IV | Must be a valid C symbol name. | g_ospi_dotf_iv | Name of the encryption IV variable. |
| AES Key Length | MCU Specific Options | | AES key length. |
| Key Format | MCU Specific Options | | Key format. |
| Decryption Start Address | Must be an integer between 0x80000000 and 0x9FFFF000, inclusive. | 0x90000000 | OSPI decryption start address |
| Decryption End Address | Must be an integer between 0x80000FFF and 0x9FFFFFFF, inclusive. | 0x90001FFF | OSPI decryption end address |
| Row Addressing | | | |
| Row Address Length | • No address<br>• 1 byte<br>• 2 bytes<br>• 3 bytes<br>• 4 bytes | No address | Number of bytes used for addressing the row index. |

*Note*

*The user is expected to modify the command definitions based on the xSPI chip and SPI communication mode. The default mode is SPI mode and default erase commands are set for DOPI mode based on Infineon S28HS256.*

### Clock Configuration

The signals to the xSPI target device are derived from OCTACLK. OCTACLK must be set to twice the desired OMSCLK signal frequency. This allows data to be latched on either clock edge for Dual-Data-Rate modes (4S-4D-4D or 8D-8D-8D).

Please refer to the Hardware User Manual for the clocks which control the OSPI_B registers. These along with OCTACLK can be set on the **Clocks** tab of the RA Configuration editor.

### Pin Configuration
