Name	Name must be a valid C symbol	g_comms_spi_bus0	Module name.
Bus Timeout	Value must be a non-negative integer less than or equal to 0xFFFFFFFF	0xFFFFFFFF	Set timeout for locking bus in using RTOS.
Semaphore for Blocking (RTOS only)	• Unuse • Use	Use	Set Semaphore for blocking in using RTOS.
Recursive Mutex for Bus (RTOS only)	• Unuse • Use	Use	Set Mutex for locking bus in using RTOS.

Configurations for Connectivity > SPI Communication Device (rm_comms_spi)

This module can be added to the Stacks tab via New Stack > Connectivity > SPI Communication Device (rm_comms_spi).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_comms_spi_device0	Module name.
SSL Port Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output port number to select slave device.
SSL Pin Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output pin number to select slave device.
SSL Next Access Delay (Microseconds)	Value must be a non-negative integer	1	SSL next access delay.
Slave Select Polarity	• Active Low • Active High	Active Low	Select the slave select active level.
Semaphore Timeout (RTOS only)	Value must be a non-negative integer less than or equal to 0xFFFFFFFF	0xFFFFFFFF	Set timeout for blocking in using RTOS.
Callback	Name must be a valid C symbol	NULL	A user callback function can be

provided.

Pin Configuration

A GPIO can be configured for slave select.

Usage Notes

If an RTOS is used, blocking and bus lock is available via SPI shared bus. Bus lock is only available when blocking is used.

Limitations

- Only 8-bit data width is supported
- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_SPI_Write(), RM_COMMS_SPI_Read() and RM_COMMS_SPI_WriteRead() cannot be called in callback.
- COMMS SPI devices on the same SPI bus must sit on the same SPI shared bus.

Examples

Basic Example

This is a basic example of minimal use of SPI communications implementation in an application.

```
void rm_comms_spi_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_SPI_Open(&g_comms_spi_ctrl, &g_comms_spi_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_error    = 0;
       g_completed = 0;
       err = RM_COMMS_SPI_Write(&g_comms_spi_ctrl, g_tx_buf, TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
 /* Handle any errors. */
     }
```

```
 while ((0 == g_completed) && (0 == g_error))
      {
 /* Wait callback */
      }
 /* Receive data. */
       g_error    = 0;
       g_completed = 0;
 /* Wait for minimum time required between transfers. */
 R_BSP_SoftwareDelay(SSL_NEXT_ACCESS_DELAY, BSP_DELAY_UNITS_MICROSECONDS);
       err = RM_COMMS_SPI_Read(&g_comms_spi_ctrl, g_rx_buf, RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_completed) && (0 == g_error))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_user_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_OPERATION_COMPLETE)
    {
       g_completed = 1;
    }
 else
    {
       g_error = 1;
    }
}
```

Data Structures

struct	rm_comms_spi_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_spi_instance_ctrl_t

struct rm_comms_spi_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg
	Middleware configuration.
rm_comms_spi_bus_extended_cfg_t *	p_bus
	Pointer to extended configuration structure.
rm_comms_spi_device_extended_cfg_t *	p_device
	Pointer to device specific settings (lower level configuration structure)
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a spi_event_t occurs.
void *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_SPI_Open()

fsp_err_t RM_COMMS_SPI_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the SPI Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	SPI Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SPI_Close()

fsp_err_t RM_COMMS_SPI_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SPI Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SPI_CallbackSet()

fsp_err_t RM_COMMS_SPI_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context*)

Updates the SPI Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_SPI_Read()

fsp_err_t RM_COMMS_SPI_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the SPI bus. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SPI_Write()

fsp_err_t RM_COMMS_SPI_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the SPI bus. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SPI_WriteRead()

fsp_err_t RM_COMMS_SPI_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs simultaneous read and write. Implements rm_comms_api_t::writeRead..

Return values

FSP_SUCCESS	Transfer was started successfully.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Read bytes and write bytes are not the same.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

fsp_err_t	R_SAU_UART_ReceiveResume (uart_ctrl_t *const p_api_ctrl)

Detailed Description

UART driver for the SAU peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SAU UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1

Configuration

Build Time Configurations for r_sau_uart

The following build time configurations are defined in fsp_cfg/r_sau_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Critical Section Guarding	• Enabled • Disabled	Disabled	Enable critical section guarding around peripheral

			configuration updates. This should be enabled if the R_SAU_I2C module is being used simultaneously with this module.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SAU_UART module.
Enable Single Channel	MCU Specific Options		Enable single channel to reduce code size if only channel 0, 1, or 2 is needed.
Enable Fixed Baudrate	• Enable • Disable	Enable	Disable baudrate calculation and setter functions to reduce code size.

Configurations for Connectivity > UART (r_sau_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sau_uart).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the UART channel.
Data Bits	• 7 bits • 8 bits • 9 bits	8 bits	Select the number of bits per word.
Parity	• None • Zero • Odd • Even	None	Select the parity mode.
Stop Bits	• 1 bit • 2 bits	1 bit	Select the number of stop bits. In receive, 2 bit is not available.
Bit Order	• LSB First • MSB First	LSB First	Select of data transfer sequence.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, adjust the operation clock

			frequency until the baud rate is achievable. The calculated baud rate is printed in a comment in the generated sau_uart_baudrate_setting_t structure.
Extra			
Operation Clock	• CKm0 • CKm1	CKm0	Select the operation clock. Use the Clocks tab to set the operation clock divider.
Tx Signal Level	• Standard • Inverted	Standard	Select the level of transmitted signal.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Receive End Interrupt Priority	MCU Specific Options		Select the receive end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The SAU clock uses the system clock (ICLK) as its clock source.

A prescaler is applied to the ICLK in order to produce the operation clock frequency. The operation clock is used to generate the desired transfer period of the SAU module.

SAU operation clocks are shared among all channels within a SAU unit. Check the Hardware User's Manual for your MCU for available units and channels. SAU operation clock dividers are configurable in the Clocks tab.

The operation clock dividers are named SAU CKmn where m is the SAU unit, and n is the operation clock. For example, SAU CK01 applies to all SAU0 instances using CK1 as the operation clock (m=0, n=1).

Pin Configuration

This module uses TXD and RXD to communicate to external devices.

Usage Notes

9-bit data transfers

- p_src: the address for the send data buffer. p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary. (the data order in buffer: the lower 8-bits of the first number, the highest 1-bit of the first number, the lower 8-bits of the second number, the highest 1-bit of the second number, etc)
- byte: the size of send data buffer.

Selecting Operation Clock Frequency

The relationship between operation clock frequency and bitrate is: bitrate = f_mck / [2 * (SDRmn.STCLK + 1)] where:

- SDRmn.STCLK is an integer in the range [2, 127] for SAU UART
- f_mck is the operation clock (SAU CKmn) frequency

By plugging in the minimum and maximum SDRmn.STCLK values, the range of bitrates for a given operation clock frequency can be obtained.

Note that due to STCLK being set as discrete integers, the actual bitrate may not be exact. The actual bitrate and percent errors can be calculated by the formulas:

```
actual_bitrate = f_mck / [ 2 * (SDRmn.STCLK + 1) ]

percent_error = 100 * abs [(actual_bitrate - expected_bitrate) / expected_bitrate]
```

Using the fastest possible operation clock for the desired bitrate will result in the lowest deviation from the requested baud rate. Set the CKmn operation clock divider in the Clocks tab to select the desired operation clock frequency.

Example of Selecting Operation Clock Frequency

Suppose an example application with a 32MHz ICLK requires:

- 1 SAU0 UART0 instance running at 1000 bps
- 1 SAU0 UART1 instance running at 115200 bps

The following operation clocks could be used:

```
# Operation clock frequency of 250 kHz with 32 Mhz ICLK (32MHz/128=250 kHz)

bitrate_min = 250e3 / [ 2 * (127 + 1) ] = ~976 bps

bitrate_max = 250e3 / [ 2 * (2 + 1) ] = ~41,666 bps

# Operation clock frequency of 16 MHz with 32 MHz ICLK (32MHz/2=16 MHz)

bitrate_min = 16e6 / [ 2 * (127 + 1) ] = ~62,500 bps

bitrate_max = 16e6 / [ 2 * (2 + 1) ] = ~2,666,666 bps
```

An operation clock of 250 kHz works for UART0 because 1000 is in the range [976, 41.6k]. An operation clock of 16 MHz works for UART1 because 115200 is in the range [62.5k, 2.6M].

Applying the settings:

- Select CK0 for UART0 and CK1 for UART1 using the SAU UART "Extra > Operation Clock" property
- Set CK00 Div to /128 for SAU0, CK0 (UART0) in the Clocks tab
- Set CK01 Div to /2 for for SAU0, CK1 (UART1) in the Clocks tab

Runtime Baud Rate Change

In order to change the baud rate at runtime, "Common > Enable Fixed Baudrate" must be set to "Disabled" in the module properties.

If changing the baud rate is required at runtime, use a unique operation clock for each SAU instance. This is required because R_SAU_UART_BaudSet may change the operation clock divider. Since the operation clocks are shared between SAU channels on each SAU unit, changing a shared operation clock of one instance will cause an incorrect bitrate to be generated on the other instance(s).

If the system clock frequency is changed at runtime, this setting should be disabled, as the baud rate settings will need to be updated after the system clock change.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- If 9-bit data length is specified at R_SAU_UART_Open call, p_src in R_SAU_UART_Write must be aligned on a 16-bit boundary.
- When multiple channels on the same SAU unit need to be used, and one is configured as UART, then critical section property needs to be enabled.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SAU_UART_Read(). The logic required to combine bytes received through R_SAU_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SAU UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];
```

```
uint8_t g_out_of_band_received[TRANSFER_LENGTH];
uint32_t g_transfer_complete = 0;
uint32_t g_receive_complete = 0;
uint32_t g_out_of_band_index = 0;
void r_sau_uart_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SAU_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
```

```
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
   }
```

```
}
```

SAU UART Baud Set Example

```
#define SAU_UART_BAUDRATE_19200 (19200)
#define SAU_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sau_uart_baud_example (void)
{
    sau_uart_baudrate_setting_t baud_setting;
    uint32_t baud_rate = SAU_UART_BAUDRATE_19200;
 fsp_err_t err = R_SAU_UART_BaudCalculate(&g_uart0_ctrl, baud_rate, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SAU_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

enum sau_uart_signal_level_t	
UART data signal level definition	
Enumerator	
SAU_UART_SIGNAL_LEVEL_STANDARD	Uart data signal level standard.
SAU_UART_SIGNAL_LEVEL_INVERTED	Uart data signal level inverted.

Function Documentation

◆ R_SAU_UART_Open()

fsp_err_t R_SAU_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SAU_UART_Close()

fsp_err_t R_SAU_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SAU_UART_Read()

fsp_err_t R_SAU_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	current operation mode is transmission only.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SAU_UART_Write()

fsp_err_t R_SAU_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SAU_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SAU_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SAU_UART_BaudSet()

fsp_err_t R_SAU_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sau_uart_baudrate_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.
This function may change the operation clock frequency. Select a unique operation clock for each SAU instance if using this function.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer p_ctrl is NULL
FSP_ERR_INVALID_ARGUMENT	p_api_ctrl is empty.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_UNSUPPORTED	Fixed baud rate is enabled

◆ R_SAU_UART_CallbackSet()

fsp_err_t R_SAU_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	Pointer p_ctrl is NULL or p_callback_memory is not NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_SAU_UART_InfoGet()

fsp_err_t R_SAU_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_INVALID_ARGUMENT	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SAU_UART_Abort()

fsp_err_t R_SAU_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SAU_UART_ReadStop()

fsp_err_t R_SAU_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SAU_UART_BaudCalculate()

fsp_err_t R_SAU_UART_BaudCalculate (sau_uart_instance_ctrl_t *const *p_ctrl*, uint32_t *baudrate*, sau_uart_baudrate_setting_t *const *p_baud_setting*)

Calculates baud rate register settings (SDR.STCLK) for the specified SAU unit.

Parameters

[in]	p_ctrl	Pointer to the SAU UART control block.
[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is successfully calculated
FSP_ERR_UNSUPPORTED	Fixed baudrate is being used
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is not achievable with selected operation clock frequency

◆ R_SAU_UART_ReceiveSuspend()

fsp_err_t R_SAU_UART_ReceiveSuspend (uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

Return values

FSP_ERR_UNSUPPORTED	Functionality not supported by this driver instance

◆ R_SAU_UART_ReceiveResume()

fsp_err_t R_SAU_UART_ReceiveResume (uart_ctrl_t *const *p_api_ctrl*)

Resume Reception

Return values

FSP_ERR_UNSUPPORTED	Functionality not supported by this driver instance

5.2.6.29 UART (r_sci_b_uart)

Modules » Connectivity

Functions

fsp_err_t	R_SCI_B_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg)
fsp_err_t	R_SCI_B_UART_Close (uart_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SCI_B_UART_Read (uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t	R_SCI_B_UART_Write (uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes)
fsp_err_t	R_SCI_B_UART_CallbackSet (uart_ctrl_t *const p_api_ctrl, void(*p_callback)(uart_callback_args_t *), void *const p_context, uart_callback_args_t *const p_callback_memory)
fsp_err_t	R_SCI_B_UART_BaudSet (uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting)
fsp_err_t	R_SCI_B_UART_InfoGet (uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info)
fsp_err_t	R_SCI_B_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)
fsp_err_t	R_SCI_B_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t *remaining_bytes)
fsp_err_t	R_SCI_B_UART_BaudCalculate (uint32_t baudrate, bool bitrate_modulation, uint32_t baud_rate_error_x_1000, sci_b_baud_setting_t *const p_baud_setting)
fsp_err_t	R_SCI_B_UART_ReceiveSuspend (uart_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SCI_B_UART_ReceiveResume (uart_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels

Supported Devices

Device Group	Devices
RA6	RA6T2
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_sci_b_uart

The following build time configurations are defined in fsp_cfg/r_sci_b_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	• Enable • Disable	Disable	Enable FIFO support for the SCI_UART module.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	• Enable • Disable	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.

Configurations for Connectivity > UART (r_sci_b_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_b_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Data Bits	• 8bits • 7bits • 9bits	8bits	Select the number of bits per word.
Parity	• None • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated sci_b_baud_setting_t structure.
Baud Rate Modulation	• Disabled • Enabled	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.
Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings. NOTE: The baud

			calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated sci_b_baud_setting_t structure.
Flow Control			
CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and channels).
Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra			
Extra > RS-485			
DE Pin	• Disable • Enable	Disable	Enable or disable the DE pin for use in RS-485 half-duplex mode.
DE Pin Polarity	• Active Low • Active High	Active High	Select the polarity of the DE pin.
DE Pin Assertion Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between assertion of the DE pin and the start of a write transfer. The time is specified in multiples of the SCI base clock period.
DE Pin Negation Time	Must be a valid integer greater than 0 and less than or equal to 31.	1	Configure the time between the end of a write transfer and the negation of the DE pin. The time is specified in multiples of the SCI

			base clock period.
Clock Source	• Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Start bit detection	• Falling Edge • Low Level	Falling Edge	Start bit detected as falling edge or low level.
Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Receive FIFO Trigger Level	Refer to the RA Configuration tool for available options.	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
TXI/TEI Synchronization Delay Cycles	Must be an integer between 0 and 3.	0	Configure the optional delay, in SCICLK/SCISPICLK cycles, between writing the last data byte in the transmit data empty (TXI) interrupt and enabling the transmit end (TEI) interrupt. Only required when SCICLK/SCISPICLK (TCLK) is much slower than the bus clock (PCLK).
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service

		routine (ISR).
Receive Interrupt Priority	MCU Specific Options	Select the receive interrupt priority.
Transmit Data Empty Interrupt Priority	MCU Specific Options	Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options	Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options	Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA6T2	SCISPICLK
RA8D1	SCICLK
RA8D2	SCICLK
RA8E1	SCICLK
RA8E2	SCICLK
RA8M1	SCICLK
RA8M2	SCICLK
RA8P1	SCICLK
RA8T1	SCICLK
RA8T2	SCICLK

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS can be controlled by the hardware. CTS or RTS or both (CTS and RTS) can be controlled by the hardware When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is

connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected. The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- When SCICLK/SCISPICLK is much slower than PCLK, it may be necessary to delay up to 3 cycles of SCICLK/SCISPICLK after writing the last data to TDR to avoid early termination of the transmission. The delay can be configured using the property Extra > TXI/TEI Synchronization Delay Cycles.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SCI_B_UART_Read(). The logic required to combine bytes received through R_SCI_B_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];

uint8_t g_out_of_band_received[TRANSFER_LENGTH];

uint32_t g_transfer_complete = 0;

uint32_t g_receive_complete = 0;

uint32_t g_out_of_band_index = 0;

void r_sci_b_uart_basic_example (void)

{

 /* Initialize p_src to known data */

 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)

    {

       g_src[i] = (uint8_t) ('A' + (i % 26));

    }
```

```
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_B_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
```

```
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
     }
     }
 break;
     }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
     {
           g_receive_complete = 1;
 break;
     }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
     {
           g_transfer_complete = 1;
 break;
     }
 default:
     {
     }
   }
}
```

SCI UART Baud Set Example

```
#define SCI_B_UART_BAUDRATE_19200 (19200)
#define SCI_B_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
void r_sci_b_uart_baud_example (void)
{
 sci_b_baud_setting_t baud_setting;
    uint32_t             baud_rate                = SCI_B_UART_BAUDRATE_19200;
 bool                enable_bitrate_modulation = false;
    uint32_t             error_rate_x_1000         =
```

```
SCI_B_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_B_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_B_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ sci_b_uart_instance_ctrl_t

struct sci_b_uart_instance_ctrl_t
UART instance control block.

◆ sci_b_baud_setting_t

struct sci_b_baud_setting_t
Register settings to achieve a desired baud rate and modulation duty.

◆ sci_b_uart_rs485_setting_t

struct sci_b_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
sci_b_uart_rs485_enable_t	enable	Enable the DE signal.
sci_b_uart_rs485_de_polarity_t	polarity	DE signal polarity.
uint8_t	assertion_time: 5	Time in baseclock units after assertion of the DE signal and before the start of the write transfer.
uint8_t	negation_time: 5	Time in baseclock units after the end of a write transfer and before the DE signal is negated.

◆ sci_b_uart_extended_cfg_t

struct sci_b_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
sci_b_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_b_uart_start_bit_detect_t	rx_edge_start	Start reception on falling edge.
sci_b_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
sci_b_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_b_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_b_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_b_uart_rs485_setting_t	rs485_setting	RS-485 settings.
uint8_t	delay_cycles	Number of SCICLK cycles to delay after writing last byte to TDR.

Enumeration Type Documentation

◆ sci_b_clk_src_t

enum sci_b_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_B_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_B_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_B_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_B_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_b_uart_flow_control_t

enum sci_b_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_B_UART_FLOW_CONTROL_RTS	Use CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTS	Use CTSn_RTSn pin for CTS.
SCI_B_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn pin for CTS, CTSn_RTSn pin for RTS.
SCI_B_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.

◆ sci_b_uart_rx_fifo_trigger_t

enum sci_b_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_B_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_B_UART_RX_FIFO_TRIGGER_2	Callback when FIFO having 2 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_3	Callback when FIFO having 3 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_4	Callback when FIFO having 4 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_5	Callback when FIFO having 5 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_6	Callback when FIFO having 6 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_7	Callback when FIFO having 7 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_8	Callback when FIFO having 8 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_9	Callback when FIFO having 9 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_10	Callback when FIFO having 10 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_11	Callback when FIFO having 11 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_12	Callback when FIFO having 12 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_13	Callback when FIFO having 13 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_14	Callback when FIFO having 14 bytes.
SCI_B_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_b_uart_start_bit_detect_t

enum sci_b_uart_start_bit_detect_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_B_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_B_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ sci_b_uart_noise_cancellation_t

enum sci_b_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_B_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_B_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ sci_b_uart_rs485_enable_t

enum sci_b_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_B_UART_RS485_DISABLE	RS-485 disabled.
SCI_B_UART_RS485_ENABLE	RS-485 enabled.

◆ sci_b_uart_rs485_de_polarity_t

enum sci_b_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_B_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_B_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

Function Documentation

◆ R_SCI_B_UART_Open()

fsp_err_t R_SCI_B_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SCI_B_UART_Close()

fsp_err_t R_SCI_B_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_Read()

fsp_err_t R_SCI_B_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SCI_B_UART_Write()

fsp_err_t R_SCI_B_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_B_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_B_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SCI_B_UART_CallbackSet()

fsp_err_t R_SCI_B_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_B_UART_BaudSet()

fsp_err_t R_SCI_B_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a sci_b_baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_InfoGet()

fsp_err_t R_SCI_B_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_B_UART_Abort()

fsp_err_t R_SCI_B_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_B_UART_ReadStop()

fsp_err_t R_SCI_B_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_B_UART_BaudCalculate()

fsp_err_t R_SCI_B_UART_BaudCalculate (uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, sci_b_baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

◆ R_SCI_B_UART_ReceiveSuspend()

fsp_err_t R_SCI_B_UART_ReceiveSuspend (uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

Return values

FSP_ERR_UNSUPPORTED	Functionality not supported by this driver instance

◆ R_SCI_B_UART_ReceiveResume()

fsp_err_t R_SCI_B_UART_ReceiveResume (uart_ctrl_t *const *p_api_ctrl*)
Resume Reception **Return values** FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance

5.2.6.30 UART (r_sci_uart)

Modules » Connectivity

Functions

fsp_err_t	R_SCI_UART_Open (uart_ctrl_t *const p_api_ctrl, uart_cfg_t const *const p_cfg)
fsp_err_t	R_SCI_UART_Close (uart_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SCI_UART_Read (uart_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes)
fsp_err_t	R_SCI_UART_Write (uart_ctrl_t *const p_api_ctrl, uint8_t const *const p_src, uint32_t const bytes)
fsp_err_t	R_SCI_UART_CallbackSet (uart_ctrl_t *const p_api_ctrl, void(*p_callback)(uart_callback_args_t *), void *const p_context, uart_callback_args_t *const p_callback_memory)
fsp_err_t	R_SCI_UART_BaudSet (uart_ctrl_t *const p_api_ctrl, void const *const p_baud_setting)
fsp_err_t	R_SCI_UART_InfoGet (uart_ctrl_t *const p_api_ctrl, uart_info_t *const p_info)
fsp_err_t	R_SCI_UART_Abort (uart_ctrl_t *const p_api_ctrl, uart_dir_t communication_to_abort)
fsp_err_t	R_SCI_UART_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t *remaining_bytes)
fsp_err_t	R_SCI_UART_BaudCalculate (uint32_t baudrate, bool bitrate_modulation, uint32_t baud_rate_error_x_1000, baud_setting_t *const p_baud_setting)

fsp_err_t	R_SCI_UART_ReceiveSuspend (uart_ctrl_t *const p_api_ctrl)
fsp_err_t	R_SCI_UART_ReceiveResume (uart_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the SCI peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The SCI UART module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Invoking the user-callback function with an event code (RX/TX complete, TX data empty, RX char, error, etc)
- Baud-rate change at run-time
- Bit rate modulation and noise cancellation
- CTS/RTS hardware flow control (with an associated pin)
- RS-485 Half Duplex driver support with external RS-485 transceiver
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- FIFO support on supported channels
- IrDA is supported on devices that have IrDA interface

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T3

Configuration

Build Time Configurations for r_sci_uart

The following build time configurations are defined in fsp_cfg/r_sci_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
FIFO Support	• Enable	Disable	Enable FIFO support for

	• Disable		the SCI_UART module.
DTC Support	• Enable • Disable	Disable	Enable DTC support for the SCI_UART module.
Flow Control Support	• Enable • Disable	Disable	Enable RS232 and RS-485 flow control support using a user provided pin.
RS-485 Support	• Enable • Disable	Disable	Enable support for controlling the RS-485 DE pin.
IrDA Support	• Enabled • Disabled	Disabled	Enable support for IrDA pulse encoding/decoding.

Configurations for Connectivity > UART (r_sci_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_sci_uart). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the SCI channel.
Data Bits	• 8bits • 7bits • 9bits	8bits	Select the number of bits per word.
Parity	• None • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment

			in the generated baud_setting_t structure. For RA4 and RA6 MCUs, refer the datasheet to calculate baud rate considering the SEMR.ABCSE bit restriction.
Baud Rate Modulation	• Disabled • Enabled	Disabled	Enabling baud rate modulation reduces the percent error of the actual baud rate with respect to the requested baud rate. It does this by modulating the number of cycles per clock, so some bits are slightly longer than others.
Max Error (%)	Must be a valid non-negative integer with a maximum configurable value of 100	5	Maximum percent error allowed during baud calculation. This is used by the algorithm to determine whether or not to consider using less accurate alternative register settings. NOTE: The baud calculation does not show an error in the tool if this percent error was not achieved. The calculated percent error is recorded in a comment in the generated baud_setting_t structure.
Flow Control			
CTS/RTS Selection	MCU Specific Options		Select either CTS or RTS function on the CTSn_RTSn pin of SCI channel n or select CTS function on CTSn pin and RTS function on CTSn_RTSn pin of SCI channel n (Available on selected MCUs and

			channels).
Software RTS Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin port for the MCU.
Software RTS Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the flow control pin for the MCU.
Extra			
Extra > IrDA			
Enable	• Disabled • Enabled	Disabled	Enable IrDA on this channel.
RXD Polarity Switching	• Normal • Inverted	Normal	IRRXD Pulse polarity (Normal: High Pulse=0) and (Inverted: Low Pulse=0)..
TXD Polarity Switching	• Normal • Inverted	Normal	IRTXD Pulse polarity (Normal: High Pulse 0) and (Inverted: Low Pulse=0).
Extra > RS-485			
DE Pin	• Disable • Enable	Disable	Enable or disable the DE pin for use in RS-485 half-duplex mode.
DE Pin Polarity	• Active Low • Active High	Active High	Select the polarity of the DE pin.
DE Port Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output port number to use for generating the DE signal.
DE Pin Number	Refer to the RA Configuration tool for available options.	Disabled	GPIO output pin number to use for generating the DE signal.
Clock Source	• Internal Clock • Internal Clock With Output on SCK • External Clock 8x baud rate • External Clock 16x baud rate	Internal Clock	Selection of the clock source to be used in the baud-rate clock generator. When internal clock is used the baud rate can be output on the SCK pin.
Start bit detection	• Falling Edge • Low Level	Falling Edge	Start bit detected as falling edge or low level.

Noise Filter	• Enable • Disable	Disable	Enable the digital noise filter on RXDn pin. The digital noise filter block in SCI consists of two-stage flipflop circuits.
Receive FIFO Trigger Level	Refer to the RA Configuration tool for available options.	Max	Unused if the channel has no FIFO or if DTC is used for reception. Set to One to get a callback immediately when each byte is received. Set to Max to get a callback when FIFO is full or after 15 bit times with no data (fewer interrupts).
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Data Empty Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Transmit End Interrupt Priority	MCU Specific Options		Select the transmit end interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA2A1	PCLKB
RA2A2	PCLKB
RA2E1	PCLKB
RA2E2	PCLKB
RA2E3	PCLKB
RA2L1	PCLKB

RA2L2	PCLKB
RA2T1	PCLKB
RA4C1	PCLKA
RA4E1	PCLKA
RA4E2	PCLKA
RA4L1	PCLKA
RA4M1	PCLKA
RA4M2	PCLKA
RA4M3	PCLKA
RA4T1	PCLKA
RA4W1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M1	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T1	PCLKA
RA6T3	PCLKA

The clock source for the baud-rate clock generator can be selected from the internal clock, the external clock times 8 or the external clock times 16. The external clock is supplied to the SCK pin.

Pin Configuration

This module uses TXD and RXD to communicate to external devices. CTS or RTS or both (CTS and RTS) can be controlled by the hardware. Some MCUs support hardware flow control for both CTS and RTS on some channels. Some MCUs and channels support hardware flow control for either CTS or RTS but not both. If both are desired a GPIO pin can be used for RTS. When the internal clock is the source for the baud-rate generator the SCK pin can be used to output a clock with the same frequency as the bit rate.

Usage Notes

- When configured for Hardware CTS and Software RTS the configured flow control pin will be used for RTS. The pin will be set high inside of the receive ISR while data is being read. It will be set low when all data is read.
- When configured for Hardware CTS and Hardware RTS the CSTn_RTSn pin will be used for RTS function and the CTSn pin will be used for CTS function on channel n.
- The driver will follow correct hardware flow control function when CTSn_RTSn pin is connected to CTSn pin when "Hardware CTS and Hardware RTS" flow control is selected.

The data will still be transferred when CTSn_RTSn and CTSn are disconnected as the CTSn pin is internally pulled low on the hardware when CTSn pin is configured as a peripheral pin for SCI module. Do not configure CTSn pin if the hardware flow control is not desired.

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The R_SCI_UART_BaudCalculate() and R_SCI_UART_Open() APIs are used to obtain the baud rate register settings for a specific baudrate. On RA4 and RA6 MCU groups, there is a restriction on SEMR.ABSCE bit for certain channels (refer to 'SEMR : Serial Extended Mode' Register section of MCU User Manual). The API does not enforce this restriction and it may return invalid settings.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_SCI_UART_Read(). The logic required to combine bytes received through R_SCI_UART_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.
- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.
- When using 9-bit reception with DTC, clear the upper 7 bits of data before processing the read data. The upper 7 bits contain status flags that are part of the register used to read data in 9-bit mode.

IrDA Limitations

- The IrDA interface works in cooperation with a particular SCI channel based on the IrDA standard 1.0.
- If optics placement yields the echo of transmitted data on the receiver, the application should disable the RX irq during transmission.
- R_SCI_UART_BaudCalculate shall not be called for IrDA baud rate calculation. The correct use is to create the baud rate by using the configurator. If run-time changes to baud rate are required, multiple instances of different baud rates should be created with the configurator.

Examples

SCI UART Example

```
uint8_t g_dest[TRANSFER_LENGTH];

uint8_t g_src[TRANSFER_LENGTH];

uint8_t g_out_of_band_received[TRANSFER_LENGTH];

uint32_t g_transfer_complete = 0;

uint32_t g_receive_complete = 0;

uint32_t g_out_of_band_index = 0;

void r_sci_uart_basic_example (void)
```

```
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_SCI_UART_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
```

```
                    g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                    uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                    *p_dest             = (uint16_t) p_args->data;
                    g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
 break;
      }
 default:
      {
      }
    }
}
```

SCI UART Baud Set Example

```
#define SCI_UART_BAUDRATE_19200 (19200)
#define SCI_UART_BAUDRATE_ERROR_PERCENT_5 (5000)
```

```
void r_sci_uart_baud_example (void)
{
 baud_setting_t baud_setting;
    uint32_t       baud_rate                = SCI_UART_BAUDRATE_19200;
 bool          enable_bitrate_modulation = false;
    uint32_t       error_rate_x_1000         = SCI_UART_BAUDRATE_ERROR_PERCENT_5;
 fsp_err_t err = R_SCI_UART_BaudCalculate(baud_rate, enable_bitrate_modulation,
error_rate_x_1000, &baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_SCI_UART_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ sci_uart_instance_ctrl_t

struct sci_uart_instance_ctrl_t
UART instance control block.

◆ baud_setting_t

struct baud_setting_t		
Register settings to achieve a desired baud rate and modulation duty.		
Data Fields		
union baud_setting_t	__unnamed__	
uint8_t	cks: 2	CKS value to get divisor (CKS = N)
uint8_t	brr	Bit Rate Register setting.
uint8_t	mddr	Modulation Duty Register setting.

◆ sci_uart_rs485_setting_t

struct sci_uart_rs485_setting_t		
Configuration settings for controlling the DE signal for RS-485.		
Data Fields		
sci_uart_rs485_enable_t	enable	Enable the DE signal.
sci_uart_rs485_de_polarity_t	polarity	DE signal polarity.
bsp_io_port_pin_t	de_control_pin	UART Driver Enable pin.

◆ sci_uart_irda_setting_t

struct sci_uart_irda_setting_t
Configuration settings for IrDA interface.

◆ sci_uart_extended_cfg_t

struct sci_uart_extended_cfg_t		
UART on SCI device Configuration		
Data Fields		
sci_clk_src_t	clock	The source clock for the baud-rate generator. If internal optionally output baud rate on SCK.
sci_uart_start_bit_t	rx_edge_start	Start reception on falling edge.

sci_uart_noise_cancellation_t	noise_cancel	Noise cancellation setting.
baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.
sci_uart_rx_fifo_trigger_t	rx_fifo_trigger	Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.
bsp_io_port_pin_t	flow_control_pin	UART Driver Enable pin.
sci_uart_flow_control_t	flow_control	CTS/RTS function of the SSn pin.
sci_uart_rs485_setting_t	rs485_setting	RS-485 settings.
sci_uart_irda_setting_t	irda_setting	IrDA settings.

Enumeration Type Documentation

◆ sci_clk_src_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_UART_CLOCK_INT	Use internal clock for baud generation.
SCI_UART_CLOCK_INT_WITH_BAUDRATE_OUTPUT	Use internal clock for baud generation and output on SCK.
SCI_UART_CLOCK_EXT8X	Use external clock 8x baud rate.
SCI_UART_CLOCK_EXT16X	Use external clock 16x baud rate.

◆ sci_uart_flow_control_t

enum sci_uart_flow_control_t	
UART flow control mode definition	
Enumerator	
SCI_UART_FLOW_CONTROL_RTS	Use SCI pin for RTS.
SCI_UART_FLOW_CONTROL_CTS	Use SCI pin for CTS.
SCI_UART_FLOW_CONTROL_CTSRTS	Use SCI pin for CTS, external pin for RTS.
SCI_UART_FLOW_CONTROL_HARDWARE_CTSRTS	Use CTSn_RTSn pin for RTS and CTSn pin for CTS. Available only for some channels on selected MCUs. See hardware manual for channel specific options.

◆ sci_uart_rx_fifo_trigger_t

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_2	Callback when FIFO having 2 bytes.
SCI_UART_RX_FIFO_TRIGGER_3	Callback when FIFO having 3 bytes.
SCI_UART_RX_FIFO_TRIGGER_4	Callback when FIFO having 4 bytes.
SCI_UART_RX_FIFO_TRIGGER_5	Callback when FIFO having 5 bytes.
SCI_UART_RX_FIFO_TRIGGER_6	Callback when FIFO having 6 bytes.
SCI_UART_RX_FIFO_TRIGGER_7	Callback when FIFO having 7 bytes.
SCI_UART_RX_FIFO_TRIGGER_8	Callback when FIFO having 8 bytes.
SCI_UART_RX_FIFO_TRIGGER_9	Callback when FIFO having 9 bytes.
SCI_UART_RX_FIFO_TRIGGER_10	Callback when FIFO having 10 bytes.
SCI_UART_RX_FIFO_TRIGGER_11	Callback when FIFO having 11 bytes.
SCI_UART_RX_FIFO_TRIGGER_12	Callback when FIFO having 12 bytes.
SCI_UART_RX_FIFO_TRIGGER_13	Callback when FIFO having 13 bytes.
SCI_UART_RX_FIFO_TRIGGER_14	Callback when FIFO having 14 bytes.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

◆ sci_uart_start_bit_t

enum sci_uart_start_bit_t	
Asynchronous Start Bit Edge Detection configuration.	
Enumerator	
SCI_UART_START_BIT_LOW_LEVEL	Detect low level on RXDn pin as start bit.
SCI_UART_START_BIT_FALLING_EDGE	Detect falling level on RXDn pin as start bit.

◆ sci_uart_noise_cancellation_t

enum sci_uart_noise_cancellation_t	
Noise cancellation configuration.	
Enumerator	
SCI_UART_NOISE_CANCELLATION_DISABLE	Disable noise cancellation.
SCI_UART_NOISE_CANCELLATION_ENABLE	Enable noise cancellation.

◆ sci_uart_rs485_enable_t

enum sci_uart_rs485_enable_t	
RS-485 Enable/Disable.	
Enumerator	
SCI_UART_RS485_DISABLE	RS-485 disabled.
SCI_UART_RS485_ENABLE	RS-485 enabled.

◆ sci_uart_rs485_de_polarity_t

enum sci_uart_rs485_de_polarity_t	
The polarity of the RS-485 DE signal.	
Enumerator	
SCI_UART_RS485_DE_POLARITY_HIGH	The DE signal is high when a write transfer is in progress.
SCI_UART_RS485_DE_POLARITY_LOW	The DE signal is low when a write transfer is in progress.

◆ sci_uart_irda_enable_t

enum sci_uart_irda_enable_t	
IrDA Enable/Disable.	
Enumerator	
SCI_UART_IRDA_DISABLED	IrDA disabled.
SCI_UART_IRDA_ENABLED	IrDA enabled.

◆ sci_uart_irda_polarity_t

enum sci_uart_irda_polarity_t	
IrDA Polarity Switching.	
Enumerator	
SCI_UART_IRDA_POLARITY_NORMAL	IrDA Tx/Rx polarity not inverted.
SCI_UART_IRDA_POLARITY_INVERTED	IrDA Tx/Rx polarity inverted.

Function Documentation

◆ R_SCI_UART_Open()

fsp_err_t R_SCI_UART_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Flow control is enabled but flow control pin is not defined or selected channel does not support "Hardware CTS and Hardware RTS" flow control. (or) restricted channel is selected.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	IrDA is requested for a channel that does not support IrDA.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_SCI_UART_Close()

fsp_err_t R_SCI_UART_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Read()

fsp_err_t R_SCI_UART_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_dest must be aligned 16-bit boundary.

◆ R_SCI_UART_Write()

fsp_err_t R_SCI_UART_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UART transmission is in progress
FSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

If 9-bit data length is specified at R_SCI_UART_Open call, p_src must be aligned on a 16-bit boundary.

◆ R_SCI_UART_CallbackSet()

fsp_err_t R_SCI_UART_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_SCI_UART_BaudSet()

fsp_err_t R_SCI_UART_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Restricted channel is selected.

◆ R_SCI_UART_InfoGet()

fsp_err_t R_SCI_UART_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_SCI_UART_Abort()

fsp_err_t R_SCI_UART_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_UART_ReadStop()

fsp_err_t R_SCI_UART_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UART transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_UART_BaudCalculate()

fsp_err_t R_SCI_UART_BaudCalculate (uint32_t *baudrate*, bool *bitrate_modulation*, uint32_t *baud_rate_error_x_1000*, baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Note

For limitations of this API, refer to the 'Limitations' section of r_sci_uart module in FSP User Manual.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	bitrate_modulation	Enable bitrate modulation
[in]	baud_rate_error_x_1000	Max baud rate error. At most <baud_rate_percent_error> x 1000 required for module to function. Absolute max baud_rate_error is 15000 (15%).
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Baud rate is '0', error in calculated baud rate is larger than requested max error, or requested max error in baud rate is larger than 15%.

◆ R_SCI_UART_ReceiveSuspend()

fsp_err_t R_SCI_UART_ReceiveSuspend (uart_ctrl_t *const *p_api_ctrl*)

Suspend Reception

Return values

FSP_ERR_UNSUPPORTED	Functionality not supported by this driver instance

◆ R_SCI_UART_ReceiveResume()

fsp_err_t R_SCI_UART_ReceiveResume (uart_ctrl_t *const *p_api_ctrl*)
Resume Reception **Return values** FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance

5.2.6.31 UART (r_uarta)

fsp_err_t	R_UARTA_ReadStop (uart_ctrl_t *const p_api_ctrl, uint32_t *p_remaining_bytes)
fsp_err_t	R_UARTA_BaudCalculate (uint32_t baudrate, uint32_t baud_rate_percent_error_x1000, uarta_clock_source_t clock_source, uarta_baud_setting_t *const p_baud_setting)

fsp_err_t	R_UARTA_ReceiveSuspend (uart_ctrl_t *const p_api_ctrl)
fsp_err_t	R_UARTA_ReceiveResume (uart_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the UARTA peripheral on RA MCUs. This module implements the UART Interface.

Overview

Features

The UARTA module supports the following features:

- Full-duplex UART communication
- Interrupt-driven data transmission and reception
- Baud-rate change at run-time
- Integration with the DTC transfer module
- Abort in-progress read/write operations
- MSB or LSB first transfer selectable
- Inversion control of communication logic level provided
- Clock output function (Not available on all MCUs)

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0L1
RA2	RA2L2
RA4	RA4C1, RA4L1

Configuration

Build Time Configurations for r_uarta

The following build time configurations are defined in fsp_cfg/r_uarta_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
DTC Support	MCU Specific Options		Enable DTC support for the UARTA module.
Receive Error Interrupt Mode	• Disabled • Enabled	Enabled	Selection receive interrupt mode . Disabled: The UARTA0_ERRI interrupt is generated when a reception error occurs.

			Enabled: The UARTA0_RXI interrupt is generated when a reception error occurs.

Configurations for Connectivity > UART (r_uarta)

This module can be added to the Stacks tab via New Stack > Connectivity > UART (r_uarta). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_uart0	Module name.
Channel	Value must be a non-negative integer	0	Select the UARTA channel.
Data Bits	• 8bits • 7bits • 5bits	8bits	Select the number of bits per word.
Parity	• None • Zero • Odd • Even	None	Select the parity mode.
Stop Bits	• 1bit • 2bits	1bit	Select the number of stop bits. Note: For the receive data, only the first 1 bit of the stop bits is checked regardless of the stop bit length.
Baud			
Baud Rate	Value must be an integer greater than 0	115200	Enter the desired baud rate. If the requested baud rate cannot be achieved, the settings with the smallest percent error are used. The theoretical calculated baud rate and percent error are printed in a comment in the generated baud_setting_t structure.
Extra			

Transfer Order	• LSB first • MSB first	LSB first	Selection of the transmission/reception order.
Transfer level	• Positive logic • Negative logic	Positive logic	Selection of the transmission/reception level.
Clock output	MCU Specific Options		Enable Clock output
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR).
Receive Interrupt Priority	MCU Specific Options		Select the receive interrupt priority.
Transmit Interrupt Priority	MCU Specific Options		Select the transmit interrupt priority.
Error Interrupt Priority	MCU Specific Options		Select the error interrupt priority.

Clock Configuration

The baud-rate clock generator can be selected from the clock source MOSC, HOCO, MOCO, SOSC/LOCO.

Pin Configuration

This module uses TXDA and RXDA pin to communicate to external devices.

Usage Notes

Limitations

- Reception is still enabled after uart_api_t::communicationAbort API is called. Any characters received after abort and before the next call to read will arrive via the callback function with event UART_EVENT_RX_CHAR.
- The UARTA module does not have CTS or RTS signals.
- UARTA 0ch and 1ch cannot be configured for secure and non-secure usage simultaneously.

DTC Limitations

- DTC support is available for reception, but labeled as [Not recommended]. This is because the UART bytes are received asynchronously. Bytes can be received between calls to R_UARTA_Read(). The logic required to combine bytes received through R_UARTA_Read() (UART_EVENT_RX_COMPLETE) and bytes received between calls (UART_EVENT_RX_CHAR) is complex. Reception length may also be unknown, and the driver will not issue an interrupt unless the entire DTC buffer is filled.

- Transfer size must be less than or equal to 64K bytes if DTC interface is used for transfer. uart_api_t::infoGet API can be used to get the max transfer size allowed.

Examples

UARTA Example

```
uint8_t          g_dest[TRANSFER_LENGTH];
uint8_t          g_src[TRANSFER_LENGTH];
uint8_t          g_out_of_band_received[TRANSFER_LENGTH];
volatile uint32_t g_transfer_complete = 0;
volatile uint32_t g_receive_complete = 0;
uint32_t          g_out_of_band_index = 0;
void r_uarta_basic_example (void)
{
 /* Initialize p_src to known data */
 for (uint32_t i = 0; i < TRANSFER_LENGTH; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the transfer instance with initial configuration. */
 fsp_err_t err = R_UARTA_Open(&g_uart0_ctrl, &g_uart0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Read(&g_uart0_ctrl, g_dest, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_Write(&g_uart0_ctrl, g_src, TRANSFER_LENGTH);
    assert(FSP_SUCCESS == err);
 while (!g_transfer_complete)
    {
    }
 while (!g_receive_complete)
    {
    }
}
void example_callback (uart_callback_args_t * p_args)
{
 /* Handle the UART event */
```

```
 switch (p_args->event)
    {
 /* Received a character */
 case UART_EVENT_RX_CHAR:
      {
 /* Only put the next character in the receive buffer if there is space for it */
 if (sizeof(g_out_of_band_received) > g_out_of_band_index)
      {
 /* Write either the next one or two bytes depending on the receive data size */
 if (UART_DATA_BITS_8 >= g_uart0_cfg.data_bits)
      {
                  g_out_of_band_received[g_out_of_band_index++] = (uint8_t)
p_args->data;
      }
 else
      {
                  uint16_t * p_dest = (uint16_t *)
&g_out_of_band_received[g_out_of_band_index];
                  *p_dest             = (uint16_t) p_args->data;
                  g_out_of_band_index += 2;
      }
      }
 break;
      }
 /* Receive complete */
 case UART_EVENT_RX_COMPLETE:
      {
            g_receive_complete = 1;
 break;
      }
 /* Transmit complete */
 case UART_EVENT_TX_COMPLETE:
      {
            g_transfer_complete = 1;
```

```
 break;
      }
 default:
      {
      }
    }
}
```

UARTA Baud Set Example

```
#define UARTA_BAUDRATE_19200 (19200)
#define UARTA_BAUDRATE_ERROR_PERCENT_4740 (4740)
void r_uarta_baud_example (void)
{
 uarta_baud_setting_t baud_setting;
    uint32_t             baud_rate         = UARTA_BAUDRATE_19200;
    uint32_t             error_rate_x_1000 = UARTA_BAUDRATE_ERROR_PERCENT_4740;
 uarta_clock_source_t clock_source      = UARTA_CLOCK_SOURCE_HOCO;
 fsp_err_t err = R_UARTA_BaudCalculate(baud_rate, error_rate_x_1000, clock_source,
&baud_setting);
    assert(FSP_SUCCESS == err);
    err = R_UARTA_BaudSet(&g_uart0_ctrl, (void *) &baud_setting);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	uarta_baud_setting_t
struct	uarta_extended_cfg_t

enum	uarta_alv_bit_t

Data Structure Documentation

◆ uarta_baud_setting_t

struct uarta_baud_setting_t		
Register settings to achieve a desired baud rate and modulation duty.		
Data Fields		
union uarta_baud_setting_t	__unnamed__	
uint8_t	brgca	Baud rate generator control setting.
uint16_t	delay_time	Delay time (us) required to enable TX at open.

◆ uarta_extended_cfg_t

struct uarta_extended_cfg_t		
UART on UARTA device Configuration		
Data Fields		
uarta_dir_bit_t	transfer_dir	Transmission/reception order configuration.
uarta_alv_bit_t	transfer_level	Transmission/reception level configuration.
uarta_clock_out_t	clock_output	Disable/Enable clock output.
uarta_baud_setting_t *	p_baud_setting	Register settings for a desired baud rate.

◆ uarta_instance_ctrl_t

struct uarta_instance_ctrl_t
UARTA instance control block.

Enumeration Type Documentation

◆ uarta_clock_source_t

enum uarta_clock_source_t	
Enumeration for UARTA clock source	
Enumerator	
UARTA_CLOCK_SOURCE_SOSC_LOCO	SOSC/LOCO.
UARTA_CLOCK_SOURCE_LOCO	LOCO.
UARTA_CLOCK_SOURCE_MOSC	MOSC.
UARTA_CLOCK_SOURCE_HOCO	HOCO.
UARTA_CLOCK_SOURCE_MOCO	MOCO.
UARTA_CLOCK_SOURCE_SOSC	SOSC.

◆ uarta_clock_div_t

enum uarta_clock_div_t	
Enumeration for UARTA clock divider	
Enumerator	
UARTA_CLOCK_DIV_1	fSEL/1
UARTA_CLOCK_DIV_2	fSEL/2
UARTA_CLOCK_DIV_4	fSEL/4
UARTA_CLOCK_DIV_8	fSEL/8
UARTA_CLOCK_DIV_16	fSEL/16
UARTA_CLOCK_DIV_32	fSEL/32
UARTA_CLOCK_DIV_64	fSEL/64
UARTA_CLOCK_DIV_COUNT	Total number of clock divider options.

◆ uarta_clock_out_t

enum uarta_clock_out_t	
Enabled/Disabled Clock output	
Enumerator	
UARTA_CLOCK_OUTPUT_DISABLED	Disables CLKAn output.
UARTA_CLOCK_OUTPUT_ENABLED	Enables CLKAn output.

◆ uarta_dir_bit_t

enum uarta_dir_bit_t	
Transmission/reception order configuration.	
Enumerator	
UARTA_DIR_BIT_MSB_FIRST	MSB first.
UARTA_DIR_BIT_LSB_FIRST	LSB first.

◆ uarta_alv_bit_t

enum uarta_alv_bit_t	
Transmission/reception level configuration.	
Enumerator	
UARTA_ALV_BIT_POSITIVE_LOGIC	Positive logic (wait state = high level, start bit = low level, stop bit = high level)
UARTA_ALV_BIT_NEGATIVE_LOGIC	Negative logic (wait state = low level, start bit = high level, stop bit = low level)

Function Documentation

◆ R_UARTA_Open()

fsp_err_t R_UARTA_Open (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UARTA driver based on the input configurations. If transmission/reception is enabled at compile time, transmission/reception is enabled at the end of this function. Implements uart_api_t::open

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block or configuration structure is NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The requested channel does not exist on this MCU.
FSP_ERR_INVALID_ARGUMENT	Invalid clock select (f_UTA0) and baudrate configuration.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open

◆ R_UARTA_Close()

fsp_err_t R_UARTA_Close (uart_ctrl_t *const *p_api_ctrl*)

Aborts any in progress transfers. Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power. Implements uart_api_t::close

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_Read()

fsp_err_t R_UARTA_Read (uart_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer. Implements uart_api_t::read

Return values

FSP_SUCCESS	Data reception successfully ends.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A previous read operation is still in progress.
FSP_ERR_UNSUPPORTED	UARTA_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_UARTA_Write()

fsp_err_t R_UARTA_Write (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer. Implements uart_api_t::write

Return values

FSP_SUCCESS	Data transmission finished successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_IN_USE	A UARTA transmission is in progress
FSP_ERR_UNSUPPORTED	UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

◆ R_UARTA_CallbackSet()

fsp_err_t R_UARTA_CallbackSet (uart_ctrl_t *const *p_api_ctrl*, void(*)(uart_callback_args_t *) *p_callback*, void *const *p_context*, uart_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements uart_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_UARTA_BaudSet()

fsp_err_t R_UARTA_BaudSet (uart_ctrl_t *const *p_api_ctrl*, void const *const *p_baud_setting*)

Updates the baud rate using the clock selected in Open. p_baud_setting is a pointer to a uarta_baud_setting_t structure. Implements uart_api_t::baudSet

Warning

This terminates any in-progress transmission.

Return values

FSP_SUCCESS	Baud rate was successfully changed.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL or the UART is not configured to use the internal clock.
FSP_ERR_INVALID_ARGUMENT	Invalid clock select (f_UTA0) and baudrate configuration.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_InfoGet()

fsp_err_t R_UARTA_InfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time. Implements uart_api_t::infoGet

Return values

FSP_SUCCESS	Information stored in provided p_info.
FSP_ERR_ASSERTION	Pointer to UART control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_UARTA_Abort()

fsp_err_t R_UARTA_Abort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::communicationAbort

Return values

FSP_SUCCESS	UARTA transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

◆ R_UARTA_ReadStop()

fsp_err_t R_UARTA_ReadStop (uart_ctrl_t *const *p_api_ctrl*, uint32_t * *p_remaining_bytes*)

Provides API to abort ongoing read. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR. Implements uart_api_t::readStop

Return values

FSP_SUCCESS	UARTA transaction aborted successfully.
FSP_ERR_ASSERTION	Pointer to UARTA control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls: transfer_api_t::disable

◆ R_UARTA_BaudCalculate()

fsp_err_t R_UARTA_BaudCalculate (uint32_t *baudrate*, uint32_t *baud_rate_percent_error_x1000*, uarta_clock_source_t *clock_source*, uarta_baud_setting_t *const *p_baud_setting*)

Calculates baud rate register settings. Evaluates and determines the best possible settings set to the baud rate related registers.

Parameters

[in]	baudrate	Baud rate [bps]. For example, 19200, 57600, 115200, etc.
[in]	baud_rate_percent_error_x1000	Max baud rate error. At most baud_rate_percent_error x 1000 required for module to function. Absolute max baud_rate_error is 4740 (4.74%).
[in]	clock_source	Clock Source. Required for module to generate baudrate. The clock sources can be select include UARTA_CLOCK_SOURCE_MOSC, UARTA_CLOCK_SOURCE_HOCO, UARTA_CLOCK_SOURCE_MOCO, UARTA_CLOCK_SOURCE_SOSC_LOCO.
[out]	p_baud_setting	Baud setting information stored here if successful

Return values

FSP_SUCCESS	Baud rate is set successfully
FSP_ERR_ASSERTION	Null pointer
FSP_ERR_INVALID_ARGUMENT	Argument is out of available range, baud rate is '0'.
FSP_ERR_INVALID_RATE	Baud rate error is outside the range or the baud rate could not be set given the current clock source.

◆ R_UARTA_ReceiveSuspend()

fsp_err_t R_UARTA_ReceiveSuspend (uart_ctrl_t *const *p_api_ctrl*)
Suspend Reception **Return values** FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance

◆ R_UARTA_ReceiveResume()

fsp_err_t R_UARTA_ReceiveResume (uart_ctrl_t *const *p_api_ctrl*)
Resume Reception **Return values** FSP_ERR_UNSUPPORTED — Functionality not supported by this driver instance

5.2.6.32 UART Communication Device (rm_comms_uart)

Modules » Connectivity

Functions

fsp_err_t	RM_COMMS_UART_Open (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg) Opens and configures the UART Comms module. Implements rm_comms_api_t::open. More...
fsp_err_t	RM_COMMS_UART_Close (rm_comms_ctrl_t *const p_api_ctrl) Disables specified UART Comms module. Implements rm_comms_api_t::close. More...
fsp_err_t	RM_COMMS_UART_CallbackSet (rm_comms_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void *const p_context) Updates the UART Comms callback. Implements rm_comms_api_t::callbackSet. More...

fsp_err_t	RM_COMMS_UART_Read (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes) Performs a read from the UART device. Implements rm_comms_api_t::read. More...
fsp_err_t	RM_COMMS_UART_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes) Performs a write to the UART device. Implements rm_comms_api_t::write. More...
fsp_err_t	RM_COMMS_UART_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params) Performs a write to, then a read from the UART device. Implements rm_comms_api_t::writeRead. More...

Detailed Description

Middleware to implement a generic communications interface over UART. This module implements the Communications Middleware Interface.

Overview

The RM_COMMS_UART module implements COMMS API for UART interface.

Features

The implementation of the UART communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS

Configuration

Build Time Configurations for rm_comms_uart

The following build time configurations are defined in fsp_cfg/rm_comms_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > UART Communication Device (rm_comms_uart)

This module can be added to the Stacks tab via New Stack > Connectivity > UART Communication Device (rm_comms_uart).

Configuration	Options	Default	Description
RTOS			
Recursive Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Recursive Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_uart0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.

Usage Notes

Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_UART_Write() and RM_COMMS_UART_Read() cannot be called in callback.
- RM_COMMS_UART_WriteRead API is not implemented

Examples

Basic Example

This is a basic example of minimal use of UART communications implementation in an application.

```
void rm_comms_uart_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_UART_Open(&g_comms_uart_ctrl, &g_comms_uart_cfg);
 if (FSP_SUCCESS != err)
    {
```

```
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_UART_Write(&g_comms_uart_ctrl, g_tx_buf, TX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors. */
      }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_UART_Read(&g_comms_uart_ctrl, g_rx_buf, RX_BUF_LEN);
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_uart_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
```

```
       g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
       g_rx_flag = 1;
    }
 else
    {
       g_err_flag = 1;
    }
}
```

Data Structures

struct	rm_comms_uart_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_uart_instance_ctrl_t

struct rm_comms_uart_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg
	Middleware configuration.
rm_comms_uart_extended_cfg_t const *	p_extend
	Pointer to extended configuration structure.
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a uart_event_t occurs.

void *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_UART_Open()

fsp_err_t RM_COMMS_UART_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the UART Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	UART Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_Close()

fsp_err_t RM_COMMS_UART_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified UART Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_CallbackSet()

fsp_err_t RM_COMMS_UART_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context*)

Updates the UART Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_UART_Read()

fsp_err_t RM_COMMS_UART_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the UART device. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_Write()

fsp_err_t RM_COMMS_UART_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the UART device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_UART_WriteRead()

fsp_err_t RM_COMMS_UART_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs a write to, then a read from the UART device. Implements rm_comms_api_t::writeRead.

Return values

FSP_ERR_UNSUPPORTED	Not supported.

5.2.6.33 USB (r_usb_basic)

fsp_err_t	R_USB_VbusSet (usb_ctrl_t *const p_api_ctrl, uint16_t state) Specifies starting or stopping the VBUS supply. More...
fsp_err_t	R_USB_InfoGet (usb_ctrl_t *const p_api_ctrl, usb_info_t *p_info, uint8_t destination) Obtains completed USB-related events. More...
fsp_err_t	R_USB_PipeRead (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number) Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument. More...
fsp_err_t	R_USB_PipeWrite (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size, uint8_t pipe_number) Requests a data write (Bulk/Interrupt transfer). More...
fsp_err_t	R_USB_PipeStop (usb_ctrl_t *const p_api_ctrl, uint8_t pipe_number) Terminates a data read/write operation. More...
fsp_err_t	R_USB_UsedPipesGet (usb_ctrl_t *const p_api_ctrl, uint16_t *p_pipe, uint8_t destination) Gets the selected pipe number (number of the pipe that has

	completed initialization) via bit map information. More...
fsp_err_t	R_USB_PipeInfoGet (usb_ctrl_t *const p_api_ctrl, usb_pipe_t *p_info, uint8_t pipe_number) Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size. More...
fsp_err_t	R_USB_PullUp (usb_ctrl_t *const p_api_ctrl, uint8_t state) This API enables or disables pull-up of D+/D- line. More...
fsp_err_t	R_USB_HostControlTransfer (usb_ctrl_t *const p_api_ctrl, usb_setup_t *p_setup, uint8_t *p_buf, uint8_t device_address) Performs settings and transmission processing when transmitting a setup packet. More...
fsp_err_t	R_USB_PeriControlDataGet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size) Receives data sent by control transfer. More...
fsp_err_t	R_USB_PeriControlDataSet (usb_ctrl_t *const p_api_ctrl, uint8_t *p_buf, uint32_t size) Performs transfer processing for control transfer. More...
fsp_err_t	R_USB_PeriControlStatusSet (usb_ctrl_t *const p_api_ctrl, usb_setup_status_t status) Set the response to the setup packet. More...
fsp_err_t	R_USB_RemoteWakeup (usb_ctrl_t *const p_api_ctrl) Sends a remote wake-up signal to the connected Host. More...
fsp_err_t	R_USB_DriverActivate (usb_ctrl_t *const p_api_ctrl) Activate USB Driver for USB Peripheral BareMetal. More...
fsp_err_t	R_USB_CallbackMemorySet (usb_ctrl_t *const p_api_ctrl, usb_callback_args_t *p_callback_memory) Set callback memory to USB Driver for USB Peripheral BareMetal. More...

fsp_err_t	R_USB_ModuleNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *module_number) This API gets the module number. More...
fsp_err_t	R_USB_ClassTypeGet (usb_ctrl_t *const p_api_ctrl, usb_class_t *class_type) This API gets the class type. More...
fsp_err_t	R_USB_DeviceAddressGet (usb_ctrl_t *const p_api_ctrl, uint8_t *device_address) This API gets the device address. More...
fsp_err_t	R_USB_PipeNumberGet (usb_ctrl_t *const p_api_ctrl, uint8_t *pipe_number) This API gets the pipe number. More...
fsp_err_t	R_USB_DeviceStateGet (usb_ctrl_t *const p_api_ctrl, uint16_t *state) This API gets the state of the device. More...
fsp_err_t	R_USB_DataSizeGet (usb_ctrl_t *const p_api_ctrl, uint32_t *data_size) This API gets the read data size. More...
fsp_err_t	R_USB_SetupGet (usb_ctrl_t *const p_api_ctrl, usb_setup_t *setup) This API gets the setup information. More...
fsp_err_t	R_USB_OtgCallbackSet (usb_ctrl_t *const p_api_ctrl, usb_otg_callback_t *p_callback) Set callback function to be called when the OTG role swap was completed on Azure RTOS. More...
fsp_err_t	R_USB_OtgSRP (usb_ctrl_t *const p_api_ctrl) Start the SRP processing for OTG on Azure RTOS. More...

Detailed Description

Driver for the USB peripheral on RA MCUs. This module implements the USB Interface.

Overview

The USB module operates in combination with the device class drivers provided by Renesas to form a complete USB stack.

Features

The USB module has the following key features:

- USB Host mode
  - Enumerates Low/Full/High-speed devices (see note below)
  - Automatic transfer error determination and retry
- USB Peripheral mode
  - Supports USB1.1/2.0/3.0 hosts
- Automatic processing of device connect/disconnect, suspend/resume, and USB bus reset
- Up to 10 pipes
  - Control transfers supported on pipe 0
  - Data transfer on pipes 1 to 9 (Bulk or Interrupt)
- Functions with or without an RTOS

Note

Supported speeds are dependent on the MCU.

Support Device Class

This driver supports the following device classes.

Host/Peripheral	Device Class	BareMetal	FreeRTOS	AzureRTOS
Host	HCDC (ACM)	Yes	Yes	Yes
	HCDC (ECM)	–	Yes	–
	HHID	Yes	Yes	Yes
	HMSC	Yes	Yes	Yes
	HPRN	–	–	Yes
	HUVC	–	–	Yes
	HVND	Yes	Yes	–
	HAUD	Yes	Yes	Yes
	HCDC+HMSC (Composite)	–	Yes	–
Peripheral	PCDC	Yes	Yes	Yes
	PHID	Yes	Yes	Yes
	PMSC	Yes	Yes	Yes
	PPRN	Yes	Yes	Yes
	PAUD	Yes	Yes	Yes
	DFU	–	–	Yes

	PVND	Yes	Yes	–
	PCDC+PMSC	Yes	Yes	Yes
	PHID+PMSC	Yes	Yes	–
	PCDC+PHID	Yes	Yes	–
	PCDC+PCDC	Yes	Yes	–
	PHID+PHID	Yes	Yes	–
	PCDC+PVND	Yes	Yes	–
Other	OTG (CDC)	–	–	Yes
	OTG (HID)	–	–	Yes
	OTG (MSC)	–	–	Yes

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_basic

The following build time configurations are defined in fsp_cfg/r_usb_basic_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
CL Only Mode	• Disabled • Enabled	Disabled	To reduce power consumption, a classic-only mode where operation is only in accord with the USB 1.1 standard is selectable.
CPU Bus Access Wait Cycles	MCU Specific Options		This setting controls the delay for consecutive USB peripheral register access. Set this value

			to a number of CPU cycles that is equivalent to 40.8ns or more.
Battery Charging	MCU Specific Options		Specify whether or not to include battery charging functionality.
Power IC Shutdown Polarity	MCU Specific Options		Select the polarity of the Shutdown signal on the power supply IC (if provided).
Dedicated Charging Port (DCP) Mode	MCU Specific Options		When enabled, USB communication is disabled and the port is used for charging only.
Notifications for SET_INTERFACE/SET_FEATURE/CLEAR_FEATURE	• Disabled • Enabled	Enabled	When enabled, the application will receive notifications for SET_INTERFACE, SET_FEATURE and CLEAR_FEATURE messages.
Double Buffering	• Disabled • Enabled	Enabled	When enabled, the FIFOs for Pipes 1-5 are double-buffered.
Continuous Transfer Mode	MCU Specific Options		Enable or disable continuous transfer mode.
LDO Regulator	MCU Specific Options		Enable or disable LDO regulator.
DMA/DTC Support	MCU Specific Options		Enable or disable DMA/DTC support for the USB module.
USB Multiport Enable	MCU Specific Options		When enabled, both IP0 and IP1 can run simultaneously.
USB Compliance Test mode	• Enabled • Disabled	Disabled	Display the information required to take the compliance test.
USB TPL table name	Enter the TPL table name.	NULL	Enter the name of the TPL Table.

Configurations for Connectivity > USB (r_usb_basic)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_basic0	Module name.

USB Mode	• Host mode • Peri mode • OTG mode	Host mode	Select the usb mode.
USB Speed	• Full Speed • Hi Speed • Low Speed	Full Speed	Select the USB speed.
USB Module Number	• USB_IP0 Port • USB_IP1 Port	USB_IP0 Port	Specify the USB module number to be used.
USB Descriptor	USB Descriptor must be a valid C symbol.	g_usb_descriptor	Enter the name of the descriptor to be used. For how to create a descriptor structure, refer to the Descriptor definition chapter in the usb_basic manual. Specify NULL when using the Host class.
USB Compliance Callback	Compliance Callback must be a valid C symbol.	NULL	Set the callback for compliance tests here.
USBFS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBFS ISR.
USBFS Resume Priority	MCU Specific Options		Select the interrupt priority used by the USBFS Resume ISR.
USBFS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D0FIFO.
USBFS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBFS D1FIFO.
USBHS Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the main USBHS ISR.
USBHS D0FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D0FIFO ISR.
USBHS D1FIFO Interrupt Priority	MCU Specific Options		Select the interrupt priority used by the USBHS D1FIFO ISR.
USB Callback	Enter the address of the function.	NULL	A user callback function can be defined here.
USB Callback Context	Enter the address of the context.	NULL	Set the callback context here.

Clock Configuration

The USB module uses PLL as the clock source. The PLL frequency can be set in the **Clocks** tab of the configuration editor or by using the CGC Interface at run-time.

Note

When using HOCO as the PLL source on Cortex M33 parts the FLL function must be enabled for correct USB operation. Refer to the MCU Family -> Clocks group of the BSP properties in the RA configuration tool to adjust FLL settings.

Pin Configuration

In peripheral mode the USB_VBUS and/or USBHS_VBUS pins are used to detect the USB connection status (connected or disconnected) and should be connected to the USB VBUS signal.

Note

USB_VBUS and USBHS_VBUS are 5V-tolerant pins.

In host mode the USBHS_VBUSEN, USBHS_OVRCURA and USBHS_OVRCURB pins should be connected to the relevant pins of an external power supply IC, if available. These pins will be used to manage the USB VBUS supply.

DMA Configuration

When using DMA with USB the following properties must be configured for each DMAC module:

Config Name	Select Name	Description
Transfer Size	2 Bytes 4 Bytes	In FS mode, select "2 Bytes" In HS mode, select "4 Bytes"
Activation source	USBFS FIFO 0 USBFS FIFO 1 USBHS FIFO 0 USBHS FIFO 1	USB FS Reception USB FS Transmission USB HS Reception USB HS Transmission

Descriptor definition

In Peripheral mode, the usb_descriptor_t structure stores descriptor information including the device and configuration descriptors. The values set in this structure are sent to the USB host as part of enumeration.

```
typedef struct usb_descriptor
{
    uint8_t *p_device;    /* Pointer to device descriptor */
    uint8_t *p_config_f; /* Pointer to full-speed configuration descriptor */
    uint8_t *p_config_h; /* Pointer to high-speed configuration descriptor (HS only)
*/
    uint8_t *p_qualifier; /* Pointer to device qualifier descriptor (HS only) */
```

```
    uint8_t **pp_string; /* Pointer to string descriptor table */
    uint8_t num_string;   /* Number of strings in table */
} usb_descriptor_t;
```

Note

Even in high-speed mode the full-speed configuration must be made available:

```
/* Example USB FS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    NULL,
    NULL,
    smp_str_table,
    3,
};
/* Example USB HS descriptor struct */
usb_descriptor_t g_usb_descriptor =
{
    smp_device,
    smp_config_f,
    smp_config_h,
    smp_qualifier,
    smp_str_table,
    3,
};
```

String Descriptor

This USB driver requires string descriptors to be registered in the string descriptor table. Use the following format to define the elements:

```
/* String descriptor 0 is reserved for language ID information */
uint8_t str_descriptor_0[]
{
```

```
    0x04,      /* Length */
    0x03,      /* Descriptor type */
    0x09, 0x04 /* Language ID */
};
uint8_t str_descriptor_manufacturer[] =
{
    0x10,      /* Length */
    0x03,      /* Descriptor type */
 'R', 0x00,
 'E', 0x00,
 'N', 0x00,
 'E', 0x00,
 'S', 0x00,
 'A', 0x00,
 'S', 0x00
};
uint8_t str_descriptor_product[] =
{
    0x12,      /* Length */
    0x03,      /* Descriptor type */
 'C', 0x00,
 'D', 0x00,
 'C', 0x00,
 '_', 0x00,
 'D', 0x00,
 'E', 0x00,
 'M', 0x00,
 'O', 0x00
};
/* String descriptor table */
uint8_t * smp_str_table[] =
{
    str_descriptor_0,            /* Index: 0 */
    str_descriptor_manufacturer, /* Index: 1 */
```

```
    str_descriptor_product,      /* Index: 2 */
};
```

Note

Set the string index values in the device/configuration descriptors (iManufacturer, iConfiguration etc.) to the index of the desired string in the string descriptor table. For example, in the table below, the manufacturer is described in ***str_descriptor_manufacturer*** *and the value of iManufacturer in the device descriptor is* ***1****.*

Other Descriptors

Refer to the Universal Serial Bus Revision 2.0 specification (http://www.usb.org/developers/docs/) for details on how to construct the device, configuration and qualifier descriptors.

Usage Notes

Program Structure

USB applications (whether using an RTOS or not) should be written as an event-handling loop. Either a callback function (RTOS only) or R_USB_EventGet should be used to provide event data to the application loop where a switch statement handles the event.

Note

1.The USB_STATUS_CONFIGURED event should be confirmed before calling R_USB_Read or R_USB_Write.
2.When attaching or detaching USB cable, the suspend or resume event may be notified to the application program in USB peripheral mode. Please ignore these events since the notification of these events to the application program does not affect the operation.
3.USB applications always need to check the USB device status member(status) of usb_event_info_t control structure before proceeding to event-handling loop. If device status is success (FSP_SUCCESS) then only proceed with handling of received events.

Limitations

Developers should be aware of the following limitations when using the USB driver:

- In USB host mode, the module does not support suspend during data transfers. Execute suspend only after confirming that all transfers are complete.
- Multiconfigurations are not supported.
- This driver does not support CPU transfers using the D0FIFO/D1FIFO register.
- In USB host mode, this USB driver does not support the composite device other than "HMSC + HCDC (for FreeRTOS)".
- In USB host mode, When using a USB High-speed module, enumeration may not start when the user slowly detach the USB cable and attach USB cable.

Compliance Test

Please set as follows to the following items in RA configuration (r_usb_basic) when doing the compliance test.

1.USB Compliance Test mode Set "Enabled" in this item.

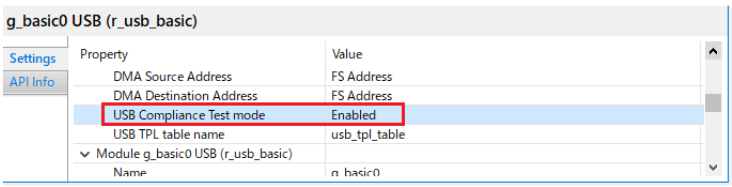

Figure 224: Compliance Test Setting

2.USB TPL table name. Set the start address of TPL(Target Peripheral List) defined in the application program.

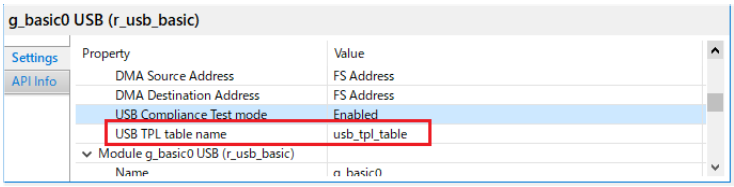

Figure 225: TPL Start Address Setting

Please refer to the following about how to define for TPL.
The following example is when two devices are set in TPL.

```
const uint16_t usb_tpl_table[] =
{
    2,                  /* Number of tpl */
    0,                  /* Reserved */
    0x0123, 0x4567,     /* Vendor ID, Product ID (1st device) */
    0x89ab, 0xcdef      /* Vendor ID, Product ID (2nd device) */
};
```

3.USB Compliance Callback Set the start address of the callback function defined in the application program.

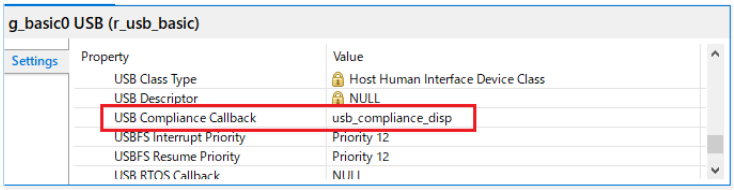

Figure 226: Compliance Callback Setting

The user needs to create this callback function by referring to the following.

```
void usb_compliance_disp (void * param)
{
    usb_compliance_t    *disp_data;
    uint8_t             print_data[32];
    disp_data = (usb_compliance_t*)param;
 switch(disp_data->status)
    {
 case USB_COMPLIANCETEST_ATTACH:            /* Device Attach Detection */
           display("\nATTACH \n");
 break;
 case USB_COMPLIANCETEST_DETACH:            /* Device Detach Detection */
           display("\nDETACH \n");
 break;
 case USB_COMPLIANCETEST_TPL:               /* TPL device connect */
           display("\nTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_NOTTPL:            /* Not TPL device connect */
           display("\nNOTPL PID:%04x VID:%04x \n",disp_data->pid, disp_data->vid);
 break;
 case USB_COMPLIANCETEST_HUB:               /* USB Hub connect */
           display("\nHub    \n");
 break;
 case USB_COMPLIANCETEST_OVRC:             /* over current */
 break;
 case USB_COMPLIANCETEST_NORES:             /* Response Time out for Control Read
Transfer */
           display("\nNOTRESP \n");
 break;
 case USB_COMPLIANCETEST_SETUP_ERR:         /* Setup Transaction Error */
 break;
 default:
 break;
    }
} /* End of function usb_compliance_disp() */
```

Please replace the display function described in the example with the display function created by the customer.

Callback function for USB Peripheral

The user can get completed USB event using callback function in USB Peripheral for BareMetal.

- Please specify user callback function in the following item.

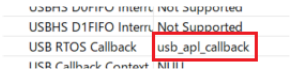

Figure 227: User Callback Function Setting

- Please call the *R_USB_DriverActivate* function using one of the following methods.
  - Infinite loop in user application program
  - Timer Interrupt (Add r_gpt module in user system)
- Please sepecify the area to store USB events to USB driver using *R_USB_CallbackMemorySet* function after calling *R_USB_Open* function.

```
usb_callback_args_t g_apl_usb_event_callback;
```

- Please allocate a buffer area such as a ring buffer to store USB event information in user application program.

```
#define BUFSIZE 10

usb_callback_args_t g_apl_usb_event_buffer[BUFSIZE];
```

- The USB driver calls the callback function when the USB event completes. USB event information is stored in the area indicated by the callback function argument.Copy the callback function argument to the ring buffer area or other area secured above.

```
g_apl_usb_event_buffer[g_apl_buffer_wp] = g_apl_usb_event_callback;

g_apl_buffer_wp++;

g_apl_buffer_wp %= BUFSIZE;
```

TrustZone

1. The USB driver for FreeRTOS cannot be allocated in Secure region.
2. Please place the descriptor file in Secure region when using Non-Secure Callable.
3. The user callback function should be specified using the *R_USB_Callback* function after calling the *R_USB_Open* function when using Non-Secure Callable.
4. For Non-Secure region, please do USB clock setting when creating Secure project.
5. Please do USB pin setting when creating USB driver project.

Support Composite Device

This driver for FreeRTOS supports the following compoiste device when this driver for FreeRTOS works in USB Host mode.

1. PCDC + PMSC

How to Configuration

- Add HMSC and HCDC stack as follow.

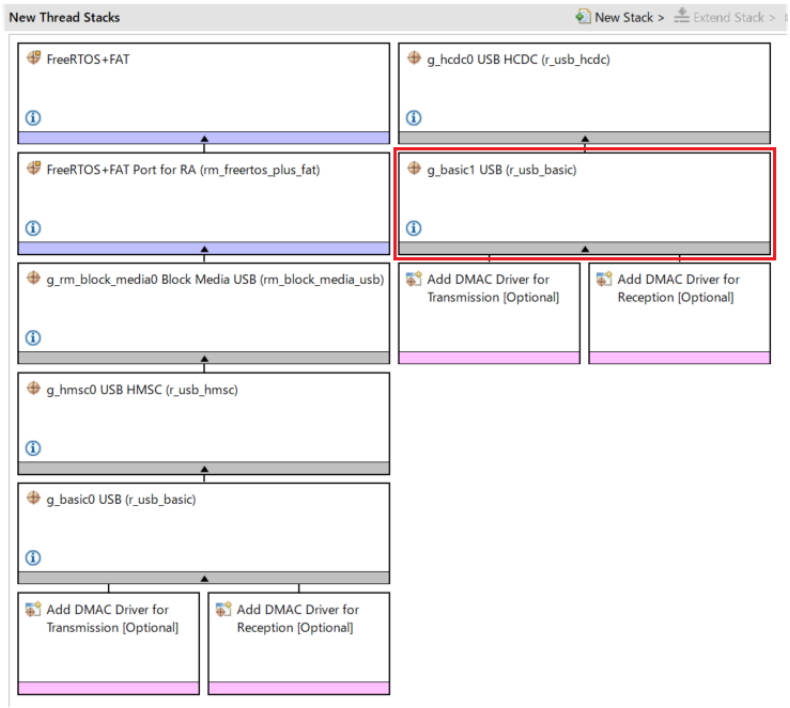

Figure 228: Add HMSC and HCDC Stack

- Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the red frame in the above figure.)

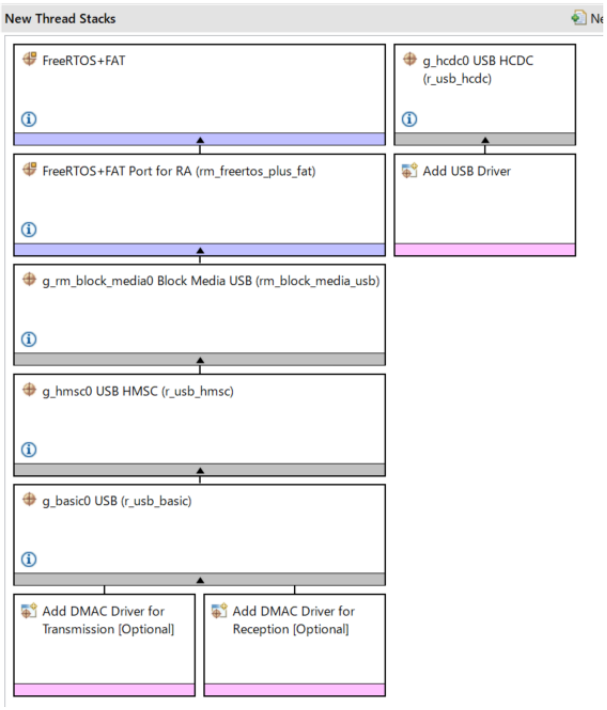

Figure 229: Delete g_basic1 instance

Using Hub

- The user can use USB Hub when using the following device classes (Bare Metal + FreeRTOS):
    - Host Communication Device Class (HCDC)
    - Host Human Interface Device Class (HHID)
    - Host Mass Storage Class (HMSC)
- When configuring single-class host hub, be sure to enable hub support property in each class stack:

Figure 230: USB Hub CDC-CDC setting

Note

- For USB Hub usage with Azure RTOS, please refer to Azure RTOS USBX Port (rm_usbx_port).
- The followings are the limitation when using USB Hub:
    - The current USB driver does not support for multi-class host hub and DMA transfer.
    - The USB driver allocates USB PIPE9 for USB Hub.
    - For HCDC, the user cannot connect more than 2 CDC devices to USB Hub.
    - For HHID, the user cannot connect more than 3 HID devices to USB Hub.
    - For HMSC, the user cannot connect more than 4 MSC devices to USB Hub.
- Depending on the Hub used, it may be necessary to supply power to the Hub.
- For HHID Hub, do not connect two HID devices that support both Interrupt IN and Interrupt Out transfer.
- For HMSC Hub, HMSC driver may not work properly due to the combination of the Hub

device and USB stick.
- HVND and HCDC-ECM do not support USB Hub.

Using Multi-port feature

- The user can specify DMA transfer to USB IP0 and IP1 modules at the same time when using USB multi-port feature.
- Currently USB multi-port feature only supports following combinations:
    - Host-Host Combinations (except combinations with HCDC_ECM USB Class)
    - Host Mass Storage Class (HMSC) + Peripheral Communications Device Class Driver (PCDC)

Note

- **Important** :
    - To use multi-port feature, the user must enable USB Multiport Enable in Common property. This operation is **mandatory**, skipping it shall lead to unexpected behavior.
    - When using USB multi-port in Azure RTOS:
        - Each IP operation code should be executed in its own dedicated thread. This separation ensures that operations do not block or interfere with one another.
        - It is recommended that the Open/Close APIs are invoked from a dedicated thread or USB operation thread associated with the corresponding USB IP, in both cases, the thread must have priority 10 or higher (e.g., priority 9, 8, … in the ThreadX priority scheme).
    - When running multi-port using FreeRTOS/AzureRTOS, thread of each instance should have different priority since some resources are shared between instances.
- **Limitation**:
    - Multi-port mode must be disabled when using the USB Host Composite. Failure to perform this step will result in operation failures.
    - All USB Host class combinations are supported except:
        - The classes are not supported together on the same OS/bare-metal configuration.
        - The classes have built-in limitations that prevent multi-instance use:
            - HUVC_HUVC
            - HAUD_HAUD

UCLK setting

Enable UCLK in "Clocks" tab on e² studio when using the following MCU.

1. RA6M4

Examples

USB Basic Example

This is a basic example of minimal use of the USB in an application.

```
void usb_basic_example (void)
{
    usb_event_info_t event_info;
```

```
usb_status_t    event;
   g_usb_on_usb.open(&g_basic0_ctrl, &g_basic0_cfg);
   memset(&event_info, 0, sizeof(usb_event_info_t));
/* Loop back between PC(TerminalSoft) and USB MCU */
while (1)
   {
      g_usb_on_usb.eventGet(&event_info, &event);
switch (event)
     {
case USB_STATUS_CONFIGURED:
               g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
break;
case USB_STATUS_WRITE_COMPLETE:
if (FSP_SUCCESS == event_info.status)
     {
                g_usb_on_usb.read(&g_basic0_ctrl, g_buf, DATA_LEN, USB_CLASS_PCDC);
     }
break;
case USB_STATUS_READ_COMPLETE:
if ((FSP_SUCCESS == event_info.status) || (FSP_ERR_USB_SIZE_SHORT ==
event_info.status))
     {
                 g_usb_on_usb.write(&g_basic0_ctrl, g_buf, event_info.data_size,
USB_CLASS_PCDC);
     }
break;
case USB_STATUS_REQUEST:   /* Receive Class Request */
if (USB_PCDC_SET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
     {
                 g_usb_on_usb.periControlDataGet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
     }
else if (USB_PCDC_GET_LINE_CODING == (event_info.setup.request_type & USB_BREQUEST))
     {
```

```
                    g_usb_on_usb.periControlDataSet(&g_basic0_ctrl, (uint8_t *)
&g_line_coding, LINE_CODING_LENGTH);
      }
 else
      {
                    g_usb_on_usb.periControlStatusSet(&g_basic0_ctrl,
USB_SETUP_STATUS_ACK);
      }
 break;
 case USB_STATUS_SUSPEND:
 case USB_STATUS_DETACH:
 break;
 default:
 break;
      }
    }
} /* End of function usb_main() */
```

Typedefs

typedef usb_event_info_t	usb_instance_ctrl_t

Typedef Documentation

◆ usb_instance_ctrl_t

typedef usb_event_info_t usb_instance_ctrl_t
USB private control block. DO NOT MODIFY. Initialization occurs when R_USB_Open is called.

Function Documentation

◆ R_USB_EventGet()

fsp_err_t R_USB_EventGet (usb_ctrl_t *const *p_api_ctrl*, usb_status_t * *event*)
Obtains completed USB related events. (OS-less Only) In USB host mode, the device address value of the USB device that completed an event is specified in the usb_ctrl_t structure member (address) specified by the event's argument. In USB peripheral mode, USB_NULL is specified in member (address). If this function is called in the RTOS execution environment, a failure is returned. **Return values** FSP_SUCCESS — Event Get Success. FSP_ERR_USB_FAILED — If called in the RTOS environment, an error is returned. ***Note*** *Do not use the same variable as the first argument of R_USB_Open for the first argument.* *Do not call this API in the interrupt function.*

◆ R_USB_Callback()

fsp_err_t R_USB_Callback (usb_callback_t * *p_callback*)

Register a callback function to be called upon completion of a USB related event. (RTOS only)

This function registers a callback function to be called when a USB-related event has completed. If this function is called in the OS-less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Do not call this API in the interrupt function.

◆ R_USB_Open()

fsp_err_t R_USB_Open (usb_ctrl_t *const *p_api_ctrl*, usb_cfg_t const *const *p_cfg*)

Applies power to the USB module specified in the argument (p_ctrl).

Return values

FSP_SUCCESS	Success in open.
FSP_ERR_USB_BUSY	Specified USB module now in use.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Close()

fsp_err_t R_USB_Close (usb_ctrl_t *const *p_api_ctrl*)

Terminates power to the USB module specified in argument (p_ctrl). USB0 module stops when USB_IP0 is specified to the member (module), USB1 module stops when USB_IP1 is specified to the member (module).

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Read()

fsp_err_t R_USB_Read (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *destination*)

Bulk/Interrupt data transfer.

Requests USB data read (bulk/interrupt transfer). The read data is stored in the area specified by argument (p_buf). After data read is completed, confirm the operation by checking the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function. The received data size is set in member (size) of the usb_ctrl_t structure. To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

Return values

FSP_SUCCESS	Successfully completed (Data read request completed).
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data receive request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ R_USB_Write()

fsp_err_t R_USB_Write (usb_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_buf*, uint32_t *size*, uint8_t *destination*)

Bulk/Interrupt data transfer.

Requests USB data write (bulk/interrupt transfer). Stores write data in area specified by argument (p_buf). Set the device class type in usb_ctrl_t structure member (type). Confirm after data write is completed by checking the return value (USB_STATUS_WRITE_COMPLETE) of the R_USB_GetEvent function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed. (Data write request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Data write request already in process for USB device with same device address.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_Write function as follow.
e.g)
R_USB_Write (&g_basic0_ctrl, &g_buf, USB_NULL);
2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.
3. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Stop()

fsp_err_t R_USB_Stop (usb_ctrl_t *const *p_api_ctrl*, usb_transfer_t *direction*, uint8_t *destination*)

Requests a data read/write transfer be terminated when a data read/write transfer is being performed.

To stop a data read, set USB_TRANSFER_READ as the argument (type); to stop a data write, specify USB_TRANSFER_WRITE as the argument (type).

Return values

FSP_SUCCESS	Successfully completed. (stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Stop processing is called multiple times.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Suspend()

fsp_err_t R_USB_Suspend (usb_ctrl_t *const *p_api_ctrl*)

Sends a SUSPEND signal from the USB module assigned to the member (module) of the usb_crtl_t structure.

After the suspend request is completed, confirm the operation with the return value (USB_STATUS_SUSPEND) of the R_USB_EventGet function.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	During a suspend request to the specified USB module, or when the USB module is already in the suspended state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_Resume()

fsp_err_t R_USB_Resume (usb_ctrl_t *const *p_api_ctrl*)

Sends a RESUME signal from the USB module assigned to the member (module) of the usb_ctrl_tstructure.

After the resume request is completed, confirm the operation with the return value (USB_STATUS_RESUME) of the R_USB_EventGet function

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_BUSY	Resume already requested for same device address. (USB host mode only)
FSP_ERR_USB_NOT_SUSPEND	USB device is not in the SUSPEND state.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_VbusSet()

fsp_err_t R_USB_VbusSet (usb_ctrl_t *const *p_api_ctrl*, uint16_t *state*)

Specifies starting or stopping the VBUS supply.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_InfoGet()

fsp_err_t R_USB_InfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_info_t * *p_info*, uint8_t *destination*)

Obtains completed USB-related events.

Return values

FSP_SUCCESS	Successful completion. (VBUS supply start/stop completed)
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PipeRead()

fsp_err_t R_USB_PipeRead (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number*)

Requests a data read (Bulk/Interrupt transfer) via the pipe specified in the argument.

The read data is stored in the area specified in the argument (p_buf). After the data read is completed, confirm the operation with the R_USB_GetEvent function return value(USB_STATUS_READ_COMPLETE). To figure out the size of the data when a read is complete, check the return value (USB_STATUS_READ_COMPLETE) of the R_USB_GetEvent function, and then refer to the member (size) of the usb_crtl_t structure.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).
2. Allocate the following the storage area when using DMA transfer and specify the start address of the allocated storage area to the 2nd argument(p_buf).
(1). When using High-speed and enabling continuous transfer mode, allocate the storage area with a size that is a multiple of 2048.
(2). When using High-speed and disabling continuous transfer mode, allocate the storage area with a size that is a multiple of 512.
(3). When using Full-speed, allocate the storage area with a size that is a multiple of 64.
3. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.

◆ R_USB_PipeWrite()

fsp_err_t R_USB_PipeWrite (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*, uint8_t *pipe_number*)

Requests a data write (Bulk/Interrupt transfer).

The write data is stored in the area specified in the argument (p_buf). After data write is completed, confirm the operation with the return value (USB_STATUS_WRITE_COMPLETE) of the EventGet function. For sending a zero-length packet, please refer the following Note.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

1. The user needs to send the zero-length packet(ZLP) since this USB driver does not send the ZLP automatically. When sending a ZLP, the user sets USB_NULL in the third argument (size) of R_USB_PipeWrite function as follow.
e.g)
R_USB_PipeWrite (&g_basic0_ctrl, &g_buf, USB_NULL, pipe_number);
2. Specify the following address to the 2nd argument (p_buf) when using DMA transfer.
(1). When using High-speed module, specify start address of the buffer area aligned on 4-byte boundary.
(2). When using Full-speed module, specify start address of the buffer area aligned on 2-byte boundary.
3. Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PipeStop()

fsp_err_t R_USB_PipeStop (usb_ctrl_t *const *p_api_ctrl*, uint8_t *pipe_number*)

Terminates a data read/write operation.

Return values

FSP_SUCCESS	Successfully completed. (Stop request completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_UsedPipesGet()

fsp_err_t R_USB_UsedPipesGet (usb_ctrl_t *const *p_api_ctrl*, uint16_t * *p_pipe*, uint8_t *destination*)

Gets the selected pipe number (number of the pipe that has completed initialization) via bit map information.

The bit map information is stored in the area specified in argument (p_pipe). Based on the information (module member and address member) assigned to the usb_ctrl_t structure, obtains the PIPE information of that USB device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PipeInfoGet()

fsp_err_t R_USB_PipeInfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_pipe_t * *p_info*, uint8_t *pipe_number*)

Gets the following pipe information regarding the pipe specified in the argument (p_ctrl) member (pipe): endpoint number, transfer type, transfer direction and maximum packet size.

The obtained pipe information is stored in the area specified in the argument (p_info).

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_PullUp()

fsp_err_t R_USB_PullUp (usb_ctrl_t *const *p_api_ctrl*, uint8_t *state*)

This API enables or disables pull-up of D+/D- line.

Return values

FSP_SUCCESS	Successful completion. (Pull-up enable/disable setting completed)
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HostControlTransfer()

fsp_err_t R_USB_HostControlTransfer (usb_ctrl_t *const *p_api_ctrl*, usb_setup_t * *p_setup*, uint8_t * *p_buf*, uint8_t *device_address*)

Performs settings and transmission processing when transmitting a setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlDataGet()

fsp_err_t R_USB_PeriControlDataGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*)

Receives data sent by control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlDataSet()

fsp_err_t R_USB_PeriControlDataSet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_buf*, uint32_t *size*)

Performs transfer processing for control transfer.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_BUSY	Specified pipe now handling data receive/send request.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_PeriControlStatusSet()

fsp_err_t R_USB_PeriControlStatusSet (usb_ctrl_t *const *p_api_ctrl*, usb_setup_status_t *status*)

Set the response to the setup packet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_RemoteWakeup()

fsp_err_t R_USB_RemoteWakeup (usb_ctrl_t *const *p_api_ctrl*)

Sends a remote wake-up signal to the connected Host.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.
FSP_ERR_USB_NOT_SUSPEND	Device is not suspended.
FSP_ERR_USB_BUSY	The device is in resume operation.

Note

Do not call this API in the following function.
(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_DriverActivate()

fsp_err_t R_USB_DriverActivate (usb_ctrl_t *const *p_api_ctrl*)

Activate USB Driver for USB Peripheral BareMetal.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Call this API in the in the infinite loop of the application program or a timer interrupt.

◆ R_USB_CallbackMemorySet()

fsp_err_t R_USB_CallbackMemorySet (usb_ctrl_t *const *p_api_ctrl*, usb_callback_args_t * *p_callback_memory*)

Set callback memory to USB Driver for USB Peripheral BareMetal.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

Note

Call this API after calling R_USB_Open function.

◆ R_USB_ModuleNumberGet()

fsp_err_t R_USB_ModuleNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *module_number*)

This API gets the module number.

Return values

FSP_SUCCESS	Successful completion.

◆ R_USB_ClassTypeGet()

fsp_err_t R_USB_ClassTypeGet (usb_ctrl_t *const *p_api_ctrl*, usb_class_t * *class_type*)

This API gets the class type.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DeviceAddressGet()

fsp_err_t R_USB_DeviceAddressGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *device_address*)

This API gets the device address.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_PipeNumberGet()

fsp_err_t R_USB_PipeNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *pipe_number*)

This API gets the pipe number.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DeviceStateGet()

fsp_err_t R_USB_DeviceStateGet (usb_ctrl_t *const *p_api_ctrl*, uint16_t * *state*)

This API gets the state of the device.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_DataSizeGet()

fsp_err_t R_USB_DataSizeGet (usb_ctrl_t *const *p_api_ctrl*, uint32_t * *data_size*)

This API gets the read data size.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_SetupGet()

fsp_err_t R_USB_SetupGet (usb_ctrl_t *const *p_api_ctrl*, usb_setup_t * *setup*)

This API gets the setup information.

Return values

FSP_SUCCESS	Successful completion.

Note

In Bare-Metal, In the Bare-Metal version, please specify the variable specified by the 1st argument of the R_USB_EventGet function to the 1st argument of this API.
In the FreeRTOS, please specify one of the following to the 1st argument of this API.
1. The 1st argument of the callback function specified in Conguration.
2. The start address of the area where the structure area of the 1st argument was copied.

◆ R_USB_OtgCallbackSet()

fsp_err_t R_USB_OtgCallbackSet (usb_ctrl_t *const *p_api_ctrl*, usb_otg_callback_t * *p_callback*)

Set callback function to be called when the OTG role swap was completed on Azure RTOS.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter is NULL error.

◆ R_USB_OtgSRP()

fsp_err_t R_USB_OtgSRP (usb_ctrl_t *const *p_api_ctrl*)
Start the SRP processing for OTG on Azure RTOS. **Return values** FSP_SUCCESS — Successful completion. FSP_ERR_USB_FAILED — The function could not be completed successfully. FSP_ERR_ASSERTION — Parameter is NULL error. ***Note*** *Do not support the VBUS Pulsing since OTG 2.0 does not support the VBUS Pulsing..*

5.2.6.34 USB Composite (r_usb_composite)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB composite device works as a USB Peripheral by combining two peripheral device classes and r_usb_basic module.
This USB driver supports the following composite devices:

1. PCDC + PMSC
2. PCDC + PHID
3. PHID + PMSC
4. PCDC + PCDC
5. PHID + PHID
6. PCDC + PVND

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3

RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

How to Configuration

The following shows FSP configuration procedure for USB composite device.

- Select [New Stack]->[USB]->[USB Composite]

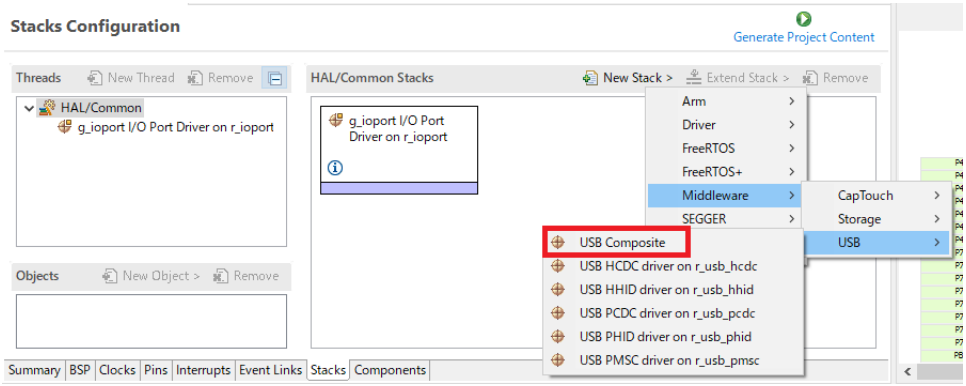

Figure 231: Select USB Composite

- The following is displayed when selecting [USB Composite].

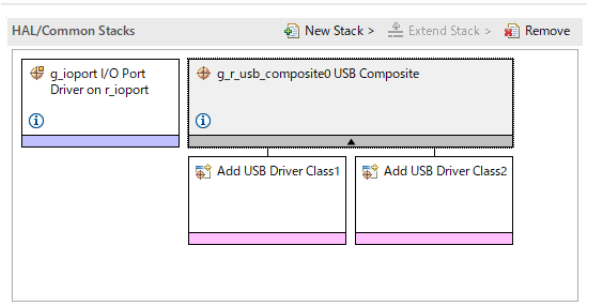

Figure 232: USB Composite Stack

- Select the supported 2 device classes as follows.

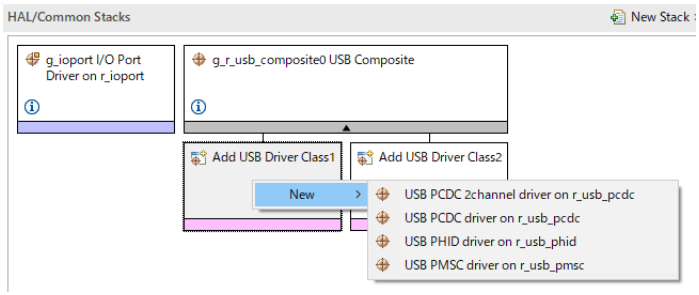

Figure 233: Select Device Classes

Note

1. *Be sure to select "USB PCDC driver on r_usb_pcdc" and "USB PCDC 2channel driver on r_usb_pcdc" when configurating for "PCDC + PCDC".*
2. *Be sure to select "USB PHID driver on r_usb_phid" and "USB PHID 2channel driver on r_usb_phid" when configurating for "PHID + PHID".*

- Select the supported 2 device classes as follows. The following is displayed when selecting 2 device classes.

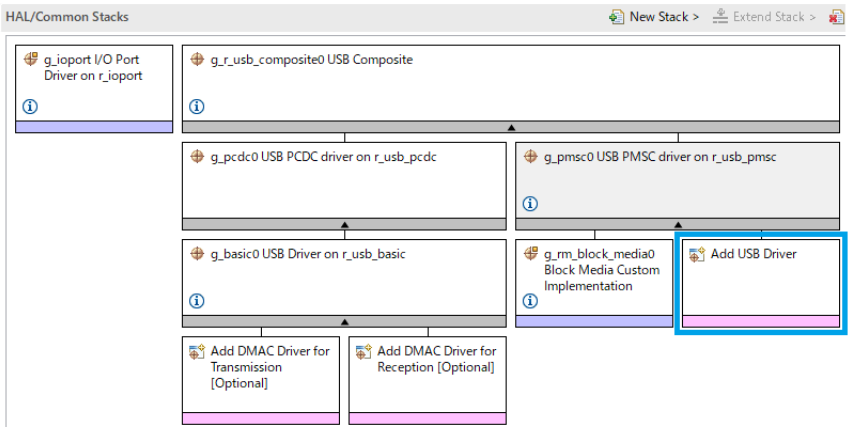

Figure 234: Delete USB Basic Instance

Note

1. *Delete the "g_basic1" instance manually since this instance is not used in composite device. (Refer to the blue frame in the above figure.)*
2. *The error is output when selecting the following device classes.*
    a. PMSC + PMSC

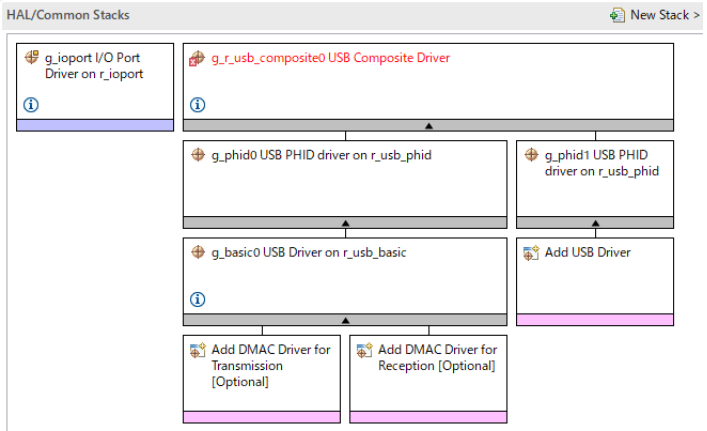

Figure 235: Device Class Selection Error

Limitations

- The following composite device is not suppored when using RA2A1(MCU).

- PMSC + PCDC
- PCDC + PCDC

- If you use PMSC, make sure to use usb_basic module with PMSC.

  There is a risk that the information on the PMSC storage media cannot be registered normally in the "USB Callback Context".

Notes

Please determine by refer to the member "type" in "usb_event_info" structure when getting PCDC channel number which the write event is completed in PCDC + PCDC, PHID + PHID, etc.

Descriptor

Templates for composite device descriptors can be found in ra/fsp/src/r_usb_composite folder. Also, please be sure to use your vendor ID.

1. r_usb_pcdc_pmsc_descriptor.c.template (for PCDC + PMSC)
2. r_usb_pcdc_phid_descriptor.c.template (for PCDC + PHID)
3. r_usb_phid_pmsc_descriptor.c.template (for PHID + PMSC)
4. r_usb_pcdc_pcdc_descriptor.c.template (for PCDC + PCDC)
5. r_usb_phid_phid_descriptor.c.template (for PHID + PHID)
6. r_usb_pcdc_pvnd_descriptor.c.template (for PCDC + PVND) and r_usb_pcdc_pvnd_descriptor.h.template (for PCDC + PVND)

Examples

USB COMPOSITE Example

- PCDC + PHID

```

Detailed Description

This module provides a USB Peripheral Audio Device Class Driver (HAUD). It implements the USB HAUD Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_haud module combines with the r_usb_basic module to provide USB Host Audio Device Class (HAUD) driver.

Features

The r_usb_haud module has the following key features:

- Data transfer to and from USB peripheral audio device.
- Transmissio Audio class request to USB peripheal audio device.
- Supports Audio 1.0

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5

RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

- Audio 1.0

Request	Code	Description
SET_CUR	0x01	Current setting attribute
GET_CUR	0x81	Current setting attribute

Note:

For details about each device class, please refer to Audio Class specification.

Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB HAUD Example

1. Example code for Audio 1.0

```
#define CONTROL_BUFFER_SIZE (256)
#define AUDIO_BUFFER_SIZE (3 * 1024) + 1024
#define REQUEST_SIZE (3 * 1024)
#define FIRST_PACKET_TEST_SIZE (200) /* for Test Device (USBX-PAUD Sample Project :
EK-RA6M5 Board) */
 /* The first 200 bytes of the loopback data are all 0x00.      */
#define READ_REQUEST_SIZE (REQUEST_SIZE + FIRST_PACKET_TEST_SIZE)
```

```
#define BMREQUESTTYPEDIR (0x0080U)
#define BMREQUESTTYPETYPE (0x0060U)
#define ALT_NUM_0 (0)
#define SAMPLING_FREQUENCY_CHANNNELS (2)
#define SAMPLING_FREQUENCY_FREQUENCY (48000)
#define SAMPLING_FREQUENCY_RESOLUTION (16)
#define SAMPLING_FREQUENCY_DATA_SIZE (3)

Function Documentation

◆ R_USB_HAUD_DeviceInfoGet()

fsp_err_t R_USB_HAUD_DeviceInfoGet (usb_ctrl_t *const *p_api_ctrl*, usb_haud_device_info_t * *p_info*, uint8_t *device_address*)

Check audio version of connected device.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HAUD_ClockSourceGet()

fsp_err_t R_USB_HAUD_ClockSourceGet (usb_ctrl_t *const *p_api_ctrl*, usb_haud_sampling_t * *p_info*, uint8_t *direction*, uint8_t *device_address*)

Get the Clock Souuce (Audio 2.0 support only)

Restriction: This API does not support fallback handling if a Clock Source descriptor is not found.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HAUD_AlternateNumberGet()

fsp_err_t R_USB_HAUD_AlternateNumberGet (usb_ctrl_t *const *p_api_ctrl*, usb_haud_sampling_t * *p_info*, uint8_t *direction*, uint8_t *device_address*)

Get the alternate number for SET_INTERFACE. (Audio 1.0 support only)

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

◆ R_USB_HAUD_PipeSet()

fsp_err_t R_USB_HAUD_PipeSet (usb_ctrl_t *const *p_api_ctrl*, uint32_t *interface_number*, uint32_t *alternate_number*, uint8_t *device_address*)

Find the interface descriptor for streaming data transfer and configure the pipe.

Return values

FSP_SUCCESS	Successfully completed.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

(1). Interrupt function.
(2). Callback function (for RTOS).

Detailed Description

This module provides a USB Host Communications Device Class (HCDC) driver. It implements the USB HCDC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_hcdc module, when used in combination with the r_usb_basic module, operates as a USB Host Communications Device Class (HCDC) driver. The HCDC conforms to the PSTN device subclass abstract control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

Features

The r_usb_hcdc module has the following key features:

- Checks for connected devices
- Implementation of communication line settings
- Acquisition of the communication line state
- Data transfer to and from a CDC peripheral device

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_hcdc

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

Configuration	Options	Default	Description
Target Peripheral Device Class ID	• CDC class supported device • Vendor class device	CDC class supported device	Specify the device class ID of the CDC device to be connected.
USB Hub Multi CDC	• Disabled • Enabled	Disabled	Enable or disable HUB support for CDC-CDC.

Configurations for Connectivity > USB HCDC (r_usb_hcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hcdc0	Module name.

Note

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Communications Device Class (CDC), PSTN and ACM

This software conforms to the Abstract Control Model (ACM) subclass of the Communications Device Class specification as defined in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2. The Abstract Control Model subclass is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections) enabling use of application programs designed for older modems.

Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Make communication line settings
- Acquire the communication line state

- Transfer data to and from the CDC peripheral device

Abstract Control Model Class Requests - Host to Device

This driver supports the following class requests:

Request	Code	Description
SendEncapsulatedCommand	0x00	Transmits an AT command as defined by the protocol used by the device (normally 0 for USB).
GetEncapsulatedResponse	0x01	Requests a response to a command transmitted by SendEncapsulatedCommand.
SetCommFeature	0x02	Enables or disables features such as device-specific 2-byte code and country setting.
GetCommFeature	0x03	Acquires the enabled/disabled state of features such as device-specific 2-byte code and country setting.
ClearCommFeature	0x04	Restores the default enabled/disabled settings of features such as device-specific 2-byte code and country setting.
SetLineCoding	0x20	Makes communication line settings (communication speed, data length, parity bit, and stop bit length).
GetLineCoding	0x21	Acquires the communication line setting state.
SetControlLineState	0x22	Makes communication line control signal (RTS, DTR) settings.
SendBreak	0x23	Transmits a break signal.

Note

For more information about Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

The expected data format for each command is shown below followed by dependent structures.

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SEND_ENCAPSULATED_COMMAND (0x00)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t

0x21	GET_ENCAPSULATED_RESPONSE (0x01)	0x0000	0x0000	Data length	usb_hcdc_encapsulated_t
0x21	SET_COMM_FEATURE (0x02)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_commfeature_t
0x21	GET_COMM_FEATURE (0x03)	usb_hcdc_feature_selector_t	0x0000	Data length	usb_hcdc_commfeature_t
0x21	CLEAR_COMM_FEATURE (0x04)	usb_hcdc_feature_selector_t	0x0000	Data length	None
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0000	usb_hcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_hcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_hcdc_controllinestate_t	0x0000	0x0000	None
0x21	SEND_BREAK (0x23)	usb_hcdc_breakduration_t	0x0000	0x0000	None

ACM Notifications from Device to Host

The following class notifications are supported:

Notification	Code	Description
RESPONSE_AVAILABLE	0x01	Response to GET_ENCAPSULATED_RESPONSE
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	RESPONSE_AVAILABLE (0x01)	0x0000	0x0000	0x0000	None
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_hcdc_serialstate_t

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected.

Limitations

This driver is subject to the following limitations:

- Suspend is not supported when a data transfer is in progress. Confirm that data transfer

has completed before executing suspend.
- Use of compound USB devices with CDC class support is not supported.
- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

Examples

USB HCDC Loopback Example

The main functions of the HCDC loopback example are as follows:

1. Virtual UART control settings are configured by transmitting the class request SET_LINE_CODING to the CDC device.
2. Sends receive (Bulk In transfer) requests to a CDC peripheral device and receives data.
3. Loops received data back to the peripheral by means of Bulk Out transfers.

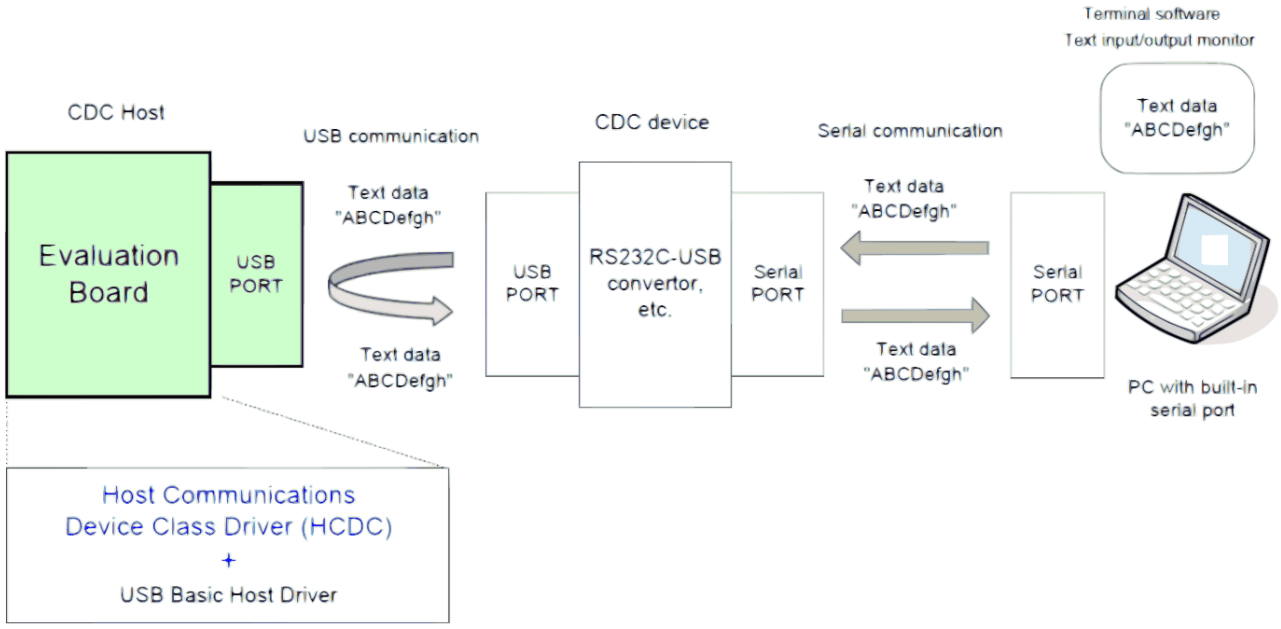

Figure 236: Data Transfer (Loopback)

The main loop performs loopback processing in which data received from a CDC peripheral device is transmitted unaltered back to the peripheral.

Detailed Description

This module provides a USB Host Communications Device Class (HCDC-ECM) driver. It implements the USB HCDC_ECM (r_usb_hcdc_ecm).

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_hcdc_ecm module, when used in combination with the r_usb_basic and r_usb_hcdc modules, operates as a USB Host Communications Device Class (HCDC-ECM) driver. The HCDC-ECM conforms to subclass ethernet control model of the USB Communications Device Class (CDC) specification and enables communication with a CDC peripheral device.

Features

The r_usb_hcdc_ecm module has the following key features:

- Checks for connected devices
- Data transfer to and from a CDC-ECM peripheral device

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_hcdc_ecm

The following build time configurations are defined in fsp_cfg/r_usb_hcdc_cfg.h:

Configuration	Options	Default	Description
Target Peripheral Device Class ID	• CDC class supported device • Vendor class	CDC class supported device	Specify the device class ID of the CDC device to be connected.

device

Configurations for Connectivity > USB HCDC (r_usb_hcdc_ecm)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HCDC (r_usb_hcdc_ecm).

Configuration	Options	Default	Description
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called from the interrupt service routine (ISR) each time a interrupt occurs.
Name	Name must be a valid C symbol	g_hcdc_ecm0	Module name.

Note

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Basic Functions

The main functions of HCDC are the following:

- Verify connected devices
- Transfer data to and from the CDC-ECM peripheral device

Class Request

This driver uses the following class request.

- SetEthernetPacketFilter

Limitations

This driver has the following limitations:

Dependencies

- This driver works on FreeRTOS and FreeRTOS Plus TCP.

Requirements

- Please use a USB-LAN converter that supports the CDC-ECM class. If the USB-LAN converter does not support CDC-ECM class, this driver does not work properly.
- Please confirm with the manufacturer of using USB-LAN converter to see if it supports the CDC-ECM class.

Constraints

This driver has the following constrains.

- Use of compound USB devices with CDC class support is not supported.
- This driver does not support Low-speed.
- This driver does not support simultaneous operation with the other device class.

Operation Checking Converters

The following converters have been confirmed to work properly:

- UGREEN USB to Ethernet Adapter RJ45 (Manufacture: Ugreen Group Limited, Item model number: 50922)
- ELECOM USB to Ethernet Adapter EDC-GUA3V2-B (Manufacture: Elecom Co., Ltd, Item model number: EDC-GUA3V2-B)
- HP USB-C to RJ45 Adapter (Manufacture: Hewlett-Packard Company, Item model number: 7W66AA)

Examples

USB HCDC-ECM Example

The following is the porting layere example code for FreeRTOS Plus TCP

```

Data Structures

struct	usb_hcdc_ecm_instance_ctrl_t

Data Structure Documentation

◆ usb_hcdc_ecm_instance_ctrl_t

struct usb_hcdc_ecm_instance_ctrl_t	
USB HCDC ECM control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called.	
Public Member Functions	
uint8_t read_buffer [HCDC_ECM_READ_DATA_LEN]	__attribute__ ((__aligned__(4)))
	Buffer area for read data.
Data Fields	
uint32_t	open

	Used to determine if the channel is configured.
uint32_t	receive_size
	Received data size.
uint32_t	receive_status
	Status of receive result.

Function Documentation

◆ R_USB_HCDC_ECM_Open()

fsp_err_t R_USB_HCDC_ECM_Open (ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg*)

After USB, CDC are reset in software.Implements ether_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_USB_NOT_OPEN	USB module is not open..
FSP_ERR_ALREADY_OPEN	RTOS internal error.

◆ R_USB_HCDC_ECM_Close()

fsp_err_t R_USB_HCDC_ECM_Close (ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.

◆ R_USB_HCDC_ECM_BufferRelease()

fsp_err_t R_USB_HCDC_ECM_BufferRelease (ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

Return values

FSP_ERR_UNSUPPORTED	This function is not supported.

◆ R_USB_HCDC_ECM_RxBufferUpdate()

fsp_err_t R_USB_HCDC_ECM_RxBufferUpdate (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*)

Not support this function in HCDC-ECM. Implements ether_api_t::rxBufferUpdate.

Return values

FSP_ERR_UNSUPPORTED	This function is not supported.

◆ R_USB_HCDC_ECM_LinkProcess()

fsp_err_t R_USB_HCDC_ECM_LinkProcess (ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_USB_FAILED	Link is not up.

◆ R_USB_HCDC_ECM_WakeOnLANEnable()

fsp_err_t R_USB_HCDC_ECM_WakeOnLANEnable (ether_ctrl_t *const *p_ctrl*)

Not support this function in HCDC-ECM. Implements ether_api_t::wakeOnLANEnable.

Return values

FSP_ERR_UNSUPPORTED	This function is not supported.

◆ R_USB_HCDC_ECM_Read()

fsp_err_t R_USB_HCDC_ECM_Read (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *p_length_bytes*)

Receive USB data. Receives data to the location specified by the pointer to the receive buffer. Implements ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_STATE	USB data read failure.

◆ R_USB_HCDC_ECM_Write()

fsp_err_t R_USB_HCDC_ECM_Write (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *length*)

Transmit USB data. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. Implements ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_STATE	USB data write failure.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ R_USB_HCDC_ECM_TxStatusGet()

fsp_err_t R_USB_HCDC_ECM_TxStatusGet (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address*)

Not support this function in HCDC-ECM. Implements ether_api_t::txStatusGet.

Return values

FSP_ERR_UNSUPPORTED	This function is not supported.

◆ R_USB_HCDC_ECM_CallbackSet()

fsp_err_t R_USB_HCDC_ECM_CallbackSet (ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

This module provides a USB Host Human Interface Device Class Driver (HHID). It implements the USB HHID Interface.

Overview

The r_usb_hhid module combines with the r_usb_basic module to provide a USB Host Human Interface Device Class (HHID) driver. The HHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID device.

Features

The r_usb_hhid module has the following key features:

- Data communication with a connected HID device (USB mouse, keyboard etc.)
- Issuing of HID class requests to a connected HID device
- Supports Interrupt OUT transfer

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_hhid

The following build time configurations are defined in fsp_cfg/r_usb_hhid_cfg.h:

Configuration	Options	Default	Description
USB Hub Multi HID	• Disabled • Enabled	Disabled	Enable or disable HUB support for HID-HID.

Configurations for Connectivity > USB HHID (r_usb_hhid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB HHID (r_usb_hhid). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hhid0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB peripherals.

Class Requests

The class requests supported by this driver are shown below:

Request	Code	Description
USB_GET_REPORT	0x01	Receives a report from the HID device.
USB_SET_REPORT	0x09	Sends a report to the HID device.
USB_GET_IDLE	0x02	Receives a duration (time) from the HID device.
USB_SET_IDLE	0x0A	Sends a duration (time) to the HID device.
USB_GET_PROTOCOL	0x03	Reads a protocol from the HID device.
USB_SET_PROTOCOL	0x0B	Sends a protocol to the HID device.
USB_GET_REPORT_DESCRIPTOR	0x06	Requests a report descriptor.
USB_GET_HID_DESCRIPTOR	0x06	Requests a HID descriptor.

Data Format

The boot protocol data format of data received from the keyboard or mouse through interrupt-IN transfers is shown below:

offset	Keyboard (8 Bytes)	Mouse (3 Bytes)
0 (Top Byte)	Modifier keys	b0 : Button 1 b1 : Button 2 b2 : Button 3 b3-b7 : Reserved
+1	Reserved	X displacement
+2	Keycode 1	Y displacement
+3	Keycode 2	-
+4	Keycode 3	-
+5	Keycode 4	-
+6	Keycode 5	-
+7	Keycode 6	-

Limitations

- The HID driver does not analyze the report descriptor. This driver determines the report format from the interface protocol.
- This driver does not support DMA transfers.
- This driver does not support High-speed.
- The transfer rates of Full-speed and Low-speed are the same when the max packet sizes of Full-speed and Low-speed are the same.

- This driver does not support simultaneous operation with the other device class.

Examples

USB HHID Example

The main functions of the application are as follows:

1. Performs enumeration and initialization of HID devices.
2. Transfers data to and from a connected HID device (mouse or keyboard). Data received from the device is read and discarded.
3. When an RTOS is used, the USB driver calls the callback (usb_apl_callback) in order to pass events to the main loop through a queue.

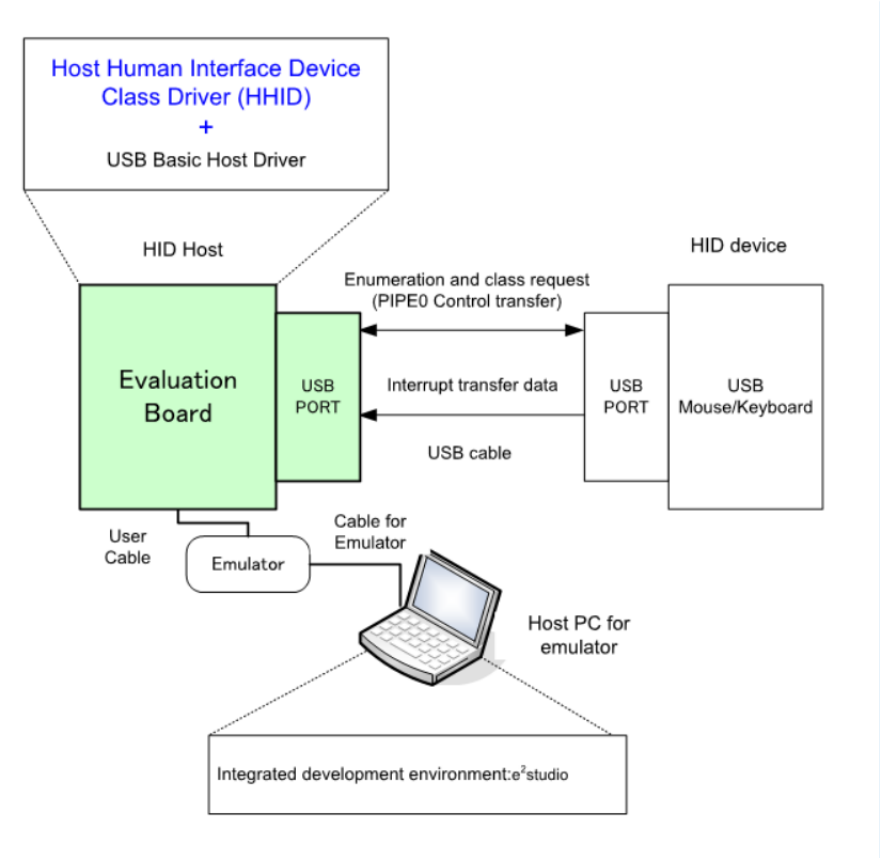

Figure 237: Example Operating Environment

Application Processing (for RTOS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing performed by the loop is shown below.

1. When a USB-related event has completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task (APL) is notified of the USB completion event using the real-time OS functionality.
2. In APL, information regarding the USB completion event was notified from the callback function is retrieved using the real-time OS functionality.
3. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step

2 above is USB_STATUS_CONFIGURED, APL sends the class request (SET_PROTOCOL) to the HID device.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STATUS_REQUEST_COMPLETE, APL performs a data reception request to receive data transmitted from the HID device by calling the R_USB_Read function.
5. The above processing is repeated.

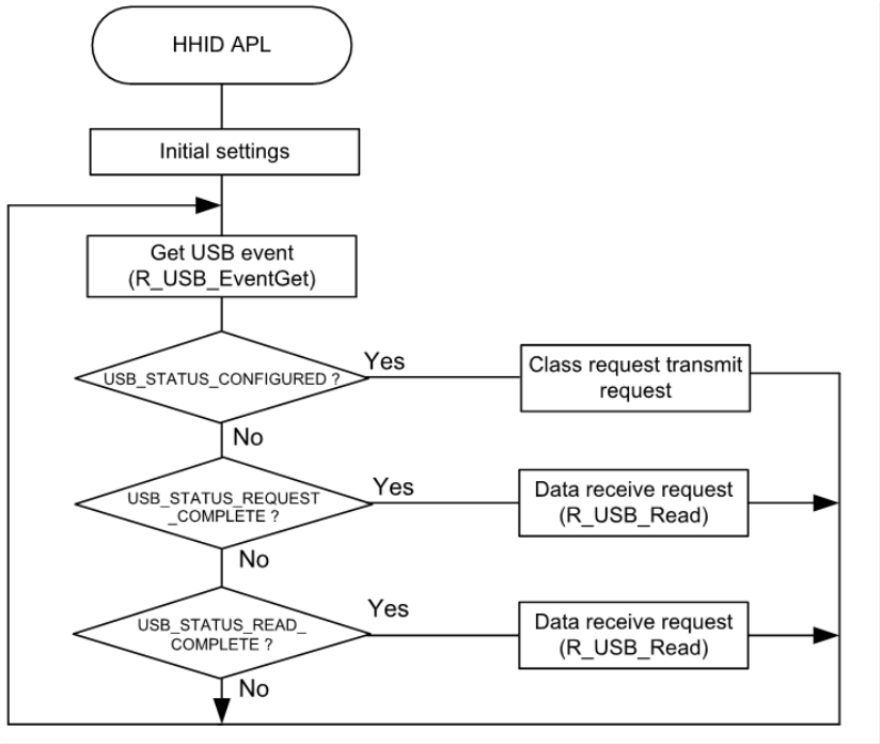

Figure 238: Main Loop (Normal mode)

Application Processing (for Non-OS)

The main loop performs processing to receive data from the HID device as part of the main routine. An overview of the processing of the main loop is presented below.

1. When the R_USB_GetEvent function is called after an HID device attaches to the USB host and enumeration completes, USB_STATUS_CONFIGURED is set as the return value. When the APL confirms USB_STATUS_CONFIGURED, it calls the R_USB_Write function to request transmission of data to the HID device.
2. When the R_USB_GetEvent function is called after sending of class request SET_PROTOCOL to the HID device has completed, USB_STATUS_REQUEST_COMPLETE is set as the return value. When the APL confirms USB_STATUS_REQUEST_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
3. When the R_USB_GetEvent function is called after reception of data from the HID device has completed, USB_STATUS_READ_COMPLETE is set as the return value. When the APL confirms USB_STATUS_READ_COMPLETE, it calls the R_USB_Read function to make a data receive request for data sent by the HID device.
4. The processing in step 3, above, is repeated.

Detailed Description

This module provides a USB Host Mass Storage Class (HMSC) driver. It implements the USB HMSC Interface.

Overview

The r_usb_hmsc module, when used in combination with the r_usb_basic module, operates as a USB Host Mass Storage Class (HMSC) driver. It is built on the USB Mass Storage Class Bulk-Only Transport (BOT) protocol. It is possible to communicate with BOT-compatible USB storage devices by combining this module with a file system and storage device driver.

Note

This module should be used in combination with the FreeRTOS+FAT File System.

Features

The r_usb_hmsc module has the following key features:

- Checking of connected USB storage devices to determine whether or not operation is supported
- Storage command communication using the BOT protocol
- Support for SFF-8070i (ATAPI) USB mass storage subclass
- Sharing of a single pipe for IN/OUT directions or multiple devices
- Supports up to 4 connected USB storage devices

Known Issues

- Users can not use TrustZone features that use Non-secure Callable.

Class Requests

The class requests supported by this driver are shown below.

Request	Description
GetMaxLun	Gets the maximum number of units that are supported.
MassStorageReset	Cancels a protocol error.

Storage Commands

This driver supports the following storage commands:

- TEST_UNIT_READY
- MODE_SELECT10
- MODE_SENSE10
- PREVENT_ALLOW
- READ_FORMAT_CAPACITY
- READ10
- WRITE10

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_hmsc

The following build time configurations are defined in fsp_cfg/r_usb_hmsc_cfg.h:

Configuration	Options	Default	Description
USB Hub Multi MSC	• Disabled • Enabled	Disabled	Enable or disable HUB support for MSC-MSC.

Refer to the USB (r_usb_basic) module.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Warning

Due to the wide variety of USB mass storage device implementations, this driver is not guaranteed to work with all devices. When implementing the driver it is important to verify correct operation with the mass storage devices that the end user is expected to use.

For Bare Metal

1. To use FreeRTOS+FAT without FreeRTOS, copy FreeRTOSConfigMinimal.h to one of your project's include paths and rename it FreeRTOSConfig.h.
2. In RA configurator, enter the appropriate values in the Main stack size and Heap size fields. The figure below is an example of the RA6M3-EK board.

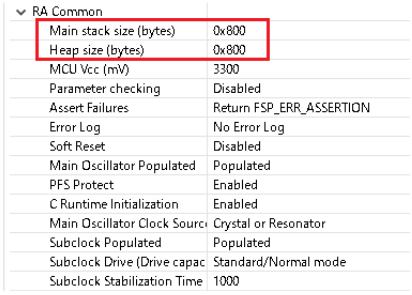

Figure 240: BSP Setting

1. In the Bare Metal version, specify "NULL" in the Callback item.

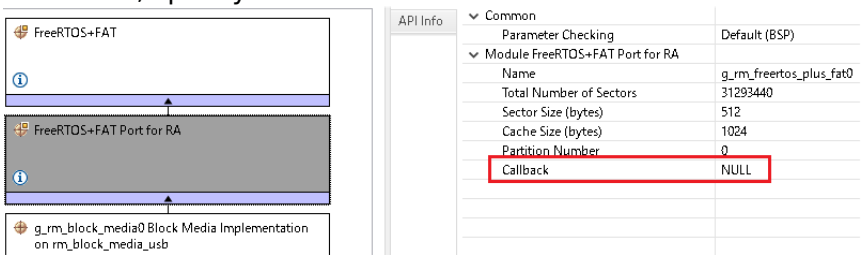

Figure 241: For Bare Metal Setting

Limitations

1. Some MSC devices may be unable to connect because they are not recognized as storage devices.
2. MSC devices that return values of 1 or higher in response to the GetMaxLun command (mass storage class command) are not supported.
3. A maximum of 4 USB storage devices can be connected.
4. Only USB storage devices with a sector size of 512 bytes can be connected.
5. A device that does not respond to the READ_CAPACITY command operates as a device with a sector size of 512 bytes.
6. The continuous transfer mode cannot be used when using DMA.
7. This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
8. This driver does not support Low-speed.

Examples

USB HMSC Example

Example Operating Environment

The following shows an example operating environment for the HMSC.

Refer to the associated instruction manuals for details on setting up the evaluation board and using the emulator, etc.

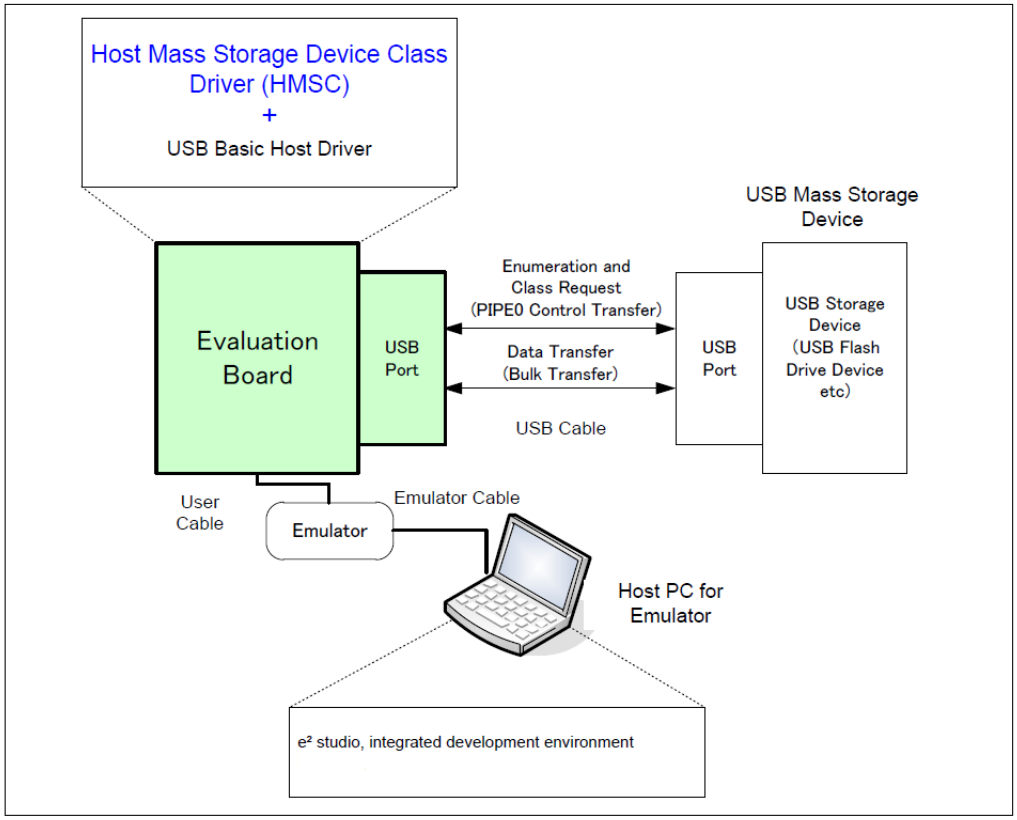

Figure 242: Example Operating Environment

Application Specifications

The main functions of the application are as follows:

1. Performs enumeration and drive recognition processing on MSC devices.
2. After the above processsing finisihes, the application writes the file to the MSC device once.
3. After writing the above file, the APL repeatedly reads the file. It continues to read the file repeatedly until the switch is pressed again.

Application Processing (for RTOS)

This application has two tasks. An overview of the processing in these two tasks is provided below.

usb_apl_task

1. After start up, MCU pin setting, USB controller initialization, and application program initialization are performed.
2. The MSC device is attached to the kit. When enumeration and drive recognition processing have completed, the USB driver calls the callback function (usb_apl_callback). In the callback function (usb_apl_callback), the application task is notified of the USB completion event using the FreeRTOS functionality.
3. In the application task, information regarding the USB completion event about which notification was received from the callback function is retrieved using the real-time OS functionality.
4. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_CONFIGURED then, based on the USB completion event, the MSC device is mounted and the file is written to the MSC device.
5. If the USB completion event (the event member of the usb_ctrl_t structure) retrieved in step 2 above is USB_STS_DETACH, the application initializes the variables for state management.

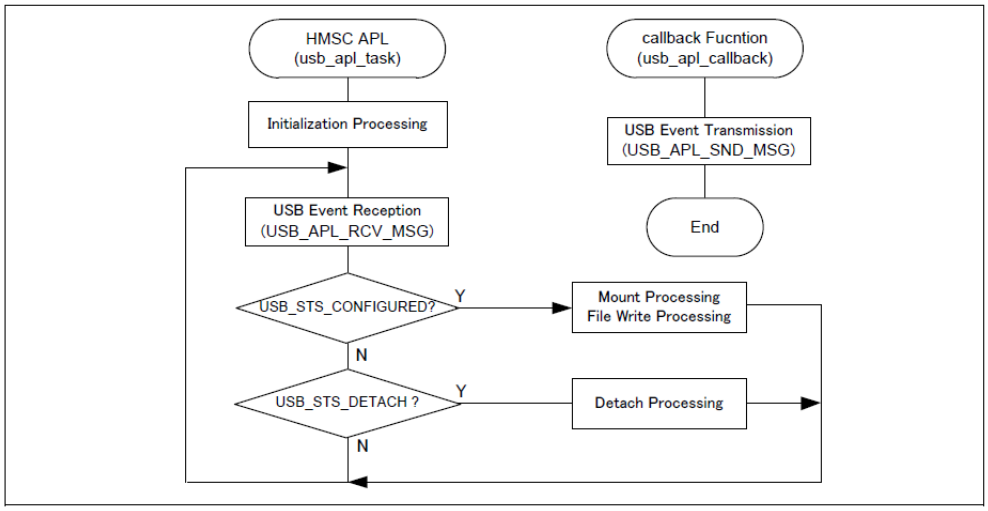

Figure 243: usb_apl_task

file_read_task

Of the application tasks usb_apl_task and file_read_task, file_read_task is processed while usb_apl_task is in the wait state. This task performs file read processing on the file that was written to the MSC device.

```

Function Documentation

◆ R_USB_HMSC_StorageCommand()

fsp_err_t R_USB_HMSC_StorageCommand (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *buf*, uint8_t *command*, uint8_t *destination*)
Processing for MassStorage(ATAPI) command. **Return values** FSP_SUCCESS — Success. FSP_ERR_USB_FAILED — The function could not be completed successfully. FSP_ERR_ASSERTION — Parameter Null pointer error. FSP_ERR_USB_PARAMETER — Parameter error.

◆ R_USB_HMSC_DriveNumberGet()

fsp_err_t R_USB_HMSC_DriveNumberGet (usb_ctrl_t *const *p_api_ctrl*, uint8_t * *p_drive*, uint8_t *destination*)

Get number of Storage drive.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

◆ R_USB_HMSC_StorageReadSector()

fsp_err_t R_USB_HMSC_StorageReadSector (uint16_t *drive_number*, uint8_t *const *buff*, uint32_t *sector_number*, uint16_t *sector_count*)

Read sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument buff must be 4-byte aligned.

◆ R_USB_HMSC_StorageWriteSector()

fsp_err_t R_USB_HMSC_StorageWriteSector (uint16_t *drive_number*, uint8_t const *const *buff*, uint32_t *sector_number*, uint16_t *sector_count*)

Write sector information.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.
FSP_ERR_ASSERTION	Parameter Null pointer error.
FSP_ERR_USB_PARAMETER	Parameter error.

Note

The address specified in the argument buff must be 4-byte aligned.

◆ R_USB_HMSC_SemaphoreGet()

fsp_err_t R_USB_HMSC_SemaphoreGet (void)

Get a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

◆ R_USB_HMSC_SemaphoreRelease()

fsp_err_t R_USB_HMSC_SemaphoreRelease (void)

Release a semaphore. (RTOS only)

If this function is called in the OS less execution environment, a failure is returned.

Return values

FSP_SUCCESS	Success.
FSP_ERR_USB_FAILED	The function could not be completed successfully.

5.2.6.40 USB Host Vendor class (r_usb_hvnd)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB Host Vendor class works by combining r_usb_basic module.

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

How to Configuration

The following shows FSP configuration procedure for USB Host Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Host Vendor class driver on r_usb_hvnd].

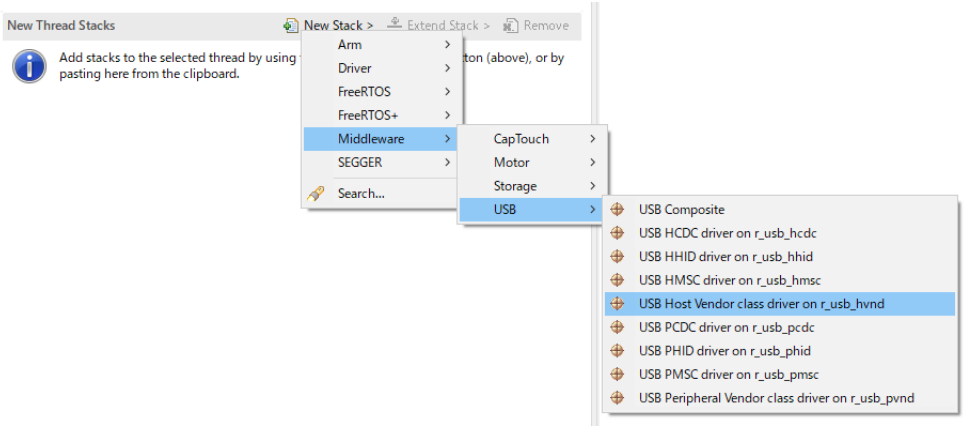

Figure 244: Select USB Host Vendor Class

- The following is displayed when selecting [USB Host Vendor class driver on r_usb_hvnd]. The user does not specify USB pipe number in Vendor class.

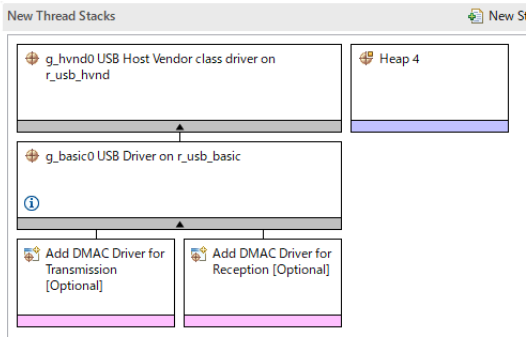

Figure 245: USB Host Vendor Class Stack

API

Use the following APIs in Host Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()
  2. R_USB_PipeWrite()
  3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_HostControlTransfer()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class. Use the following APIs to get the allocated USB pipe information.

  1. R_USB_UsedPipesGet()
  2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

5.2.6.41 USB PAUD (r_usb_paud)

Modules » Connectivity

This module provides a USB Peripheral Audio Device Class Driver (PAUD). It implements the USB PAUD Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_paud module combines with the r_usb_basic module to provide a USB Peripheral Audio Device Class (PAUD) driver.

Features

The r_usb_paud module has the following key features:

- Data transfer to and from a USB host
- Response to Audio class requests
- Supports Audio 1.0 and Audio 2.0

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

- Audio 1.0

Request	Code	Description

GET MIN	0x82	Minimum setting attribute
GET_MAX	0x83	Maximum setting attribute
GET_RES	0x84	Resolution attribute
SET_CUR	0x01	Current setting attribute
GET_CUR	0x81	Current setting attribute

- Audio 2.0

Request	Code	Description
CUR	0x01	Current setting attribute
RANGE	0x02	Range attribute

Note:

For details about each device class, please refer to Audio Class specification.

Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB PAUD Example

1. Example code for Audio 1.0

```
#define A10_FU_ID_0 (5)
#define A10_FU_ID_1 (8)
#define A10_EP_ADDR_OUT (0x02)
#define A10_EP_ADDR_IN (0x81)
#define A10_MUTE_0 (0)
#define A10_MUTE_1 (0x10)
#define A10_VOL_0 (0)
#define A10_VOL_MIN_0 (0)
#define A10_VOL_MAX_0 (0x80)
#define A10_VOL_RES_0 (0x40)
#define A10_VOL_1 (0)
#define A10_VOL_MIN_1 (0)
#define A10_VOL_MAX_1 (0xF0)
```

Descriptor

A template for PAUD descriptors can be found in ra/fsp/src/r_usb_paud/r_usb_paud_descriptor.c.template. Also, please be sure to use your vendor ID.

5.2.6.42 USB PCDC (r_usb_pcdc)

Modules » Connectivity

This module provides a USB Peripheral Communications Device Class Driver (PCDC). It implements the USB PCDC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pcdc module combines with the r_usb_basic module to provide a USB Peripheral Communications Device Class (PCDC) driver. The PCDC driver conforms to Abstract Control Model of the USB Communications Device Class (CDC) specification and enables communication with a CDC host device.

Features

The r_usb_pcdc module has the following key features:

- Data transfer to and from a USB host
- Response to CDC class requests
- Supports CDC notifications

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

Configuration	Options	Default	Description

Configurations for Connectivity > USB PCDC (r_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC (r_usb_pcdc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pcdc0	Module name.

Note

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Abstract Control Model Overview

The Abstract Control Model subclass of CDC is a technology that bridges the gap between USB devices and earlier modems (employing RS-232C connections), enabling use of application programs

designed for older modems.

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
SetLineCoding	0x20	Sets communication line settings (bitrate, data length, parity, and stop bit length)
GetLineCoding	0x21	Acquires the communication line setting state
SetControlLineState	0x22	Set communication line control signals (RTS, DTR)

Note

For details concerning the Abstract Control Model requests, refer to Table 11 "Requests - Abstract Control Model" in the "USB Communications Class Subclass Specification for PSTN Devices", Revision 1.2.

Data Format of Class Requests

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0x21	SET_LINE_CODING (0x20)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0xA1	GET_LINE_CODING (0x21)	0x0000	0x0000	0x0007	usb_pcdc_linecoding_t
0x21	SET_CONTROL_LINE_STATE (0x22)	usb_pcdc_ctrllinestate_t	0x0000	0x0000	None

Class Notifications (Peripheral to Host)

The following class notifications are supported:

Notification	Code	Description
SERIAL_STATE	0x20	Notification of serial line state

The data types returned are as follows:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	SERIAL_STATE (0x20)	0x0000	0x0000	0x0002	usb_serial_state_bitmap_t

Note

The host is notified with SERIAL_STATE whenever a change in the UART port state is detected. This driver will automatically detect overrun, parity and framing errors. A state notification is performed when a transition from normal to error state is detected.

Virtual COM-port Usage

When connected to a PC the CDC device can be used as a virtual COM port. After enumeration, the CDC class requests GetLineCoding and SetControlLineState are executed by the target, and the CDC device is registered in Windows Device Manager as a virtual COM device.

Registering the CDC device as a virtual COM-port in Windows Device Manager enables data communication with the CDC device via a terminal app such as PuTTY. When changing settings of the serial port in the terminal application, the UART setting is propagated to the firmware via the class request SetLineCoding.

Data input (or file transmission) from the terminal app window is transmitted to the board using endpoint 2 (EP2); data from the board side is transmitted to the PC using EP1.

When the last packet of data received is the maximum packet size, and the terminal determines that there is continuous data, the received data may not be displayed in the terminal. If the received data is smaller than the maximum packet size, the data received up to that point is displayed in the terminal.

Limitations

- This module must be incorporated into a project using r_usb_basic and does not provide any public APIs.
- This driver does not support Low-speed.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB PCDC Loopback Example

The main functions of the PCDC loopback example are as follows:

1. Receives virtual UART configuration data from the host terminal
2. Loops all other received data back to the host terminal

Descriptor

A template for PCDC descriptors can be found in ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template. Also, please be sure to use your vendor ID.

5.2.6.43 USB PHID (r_usb_phid)

Modules » Connectivity

This module is USB Peripheral Human Interface Device Class Driver (PHID). It implements the USB PHID Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_phid module combines with the r_usb_basic module to provide a USB Peripheral Human Interface Device Class (PHID) driver. The PHID driver conforms to the USB Human Interface Device class specifications and implements communication with a HID host.

Features

The r_usb_phid module has the following functions:

- Data transfer to and from a USB host
- Response to HID class requests
- Response to function references from the HID host

Note

This driver is not guaranteed to provide USB HID operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_phid

The following build time configurations are defined in fsp_cfg/r_usb_phid_cfg.h:

Configuration	Options	Default	Description

Configurations for Connectivity > USB PHID (r_usb_phid)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PHID (r_usb_phid).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_phid0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
Get_Report	0x01	Receives a report from the HID host
Set_Report	0x09	Sends a report to the HID host
Get_Idle	0x02	Receives a duration (time) from the HID host
Set_Idle	0x0A	Sends a duration (time) to the HID host
Get_Protocol	0x03	Reads a protocol from the HID host
Set_Protocol	0x0B	Sends a protocol to the HID host
Get_Descriptor	0x06	Transmits a report or HID descriptor

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_REPORT (0x01)	ReportType & ReportID	Interface	ReportLength	Report
0x21	SET_REPORT (0x09)	ReportType & ReportID	Interface	ReportLength	Report
0xA1	GET_IDLE (0x02)	0 & ReportID	Interface	1	Idle rate
0x21	SET_IDLE (0x0A)	Duration & ReportID	Interface	0	Idle rate
0xA1	GET_PROTOCOL (0x03)	0	Interface	0	0 (Boot) or 1 (Report)
0x21	SET_PROTOCOL (0x0B)	0 (Boot) or 1 (Report)	Interface	0	Not applicable

Limitations

- This driver does not support USB Hi-speed mode.
- This driver does not support USB Low-speed mode.
- This driver does not support DMA transfers.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

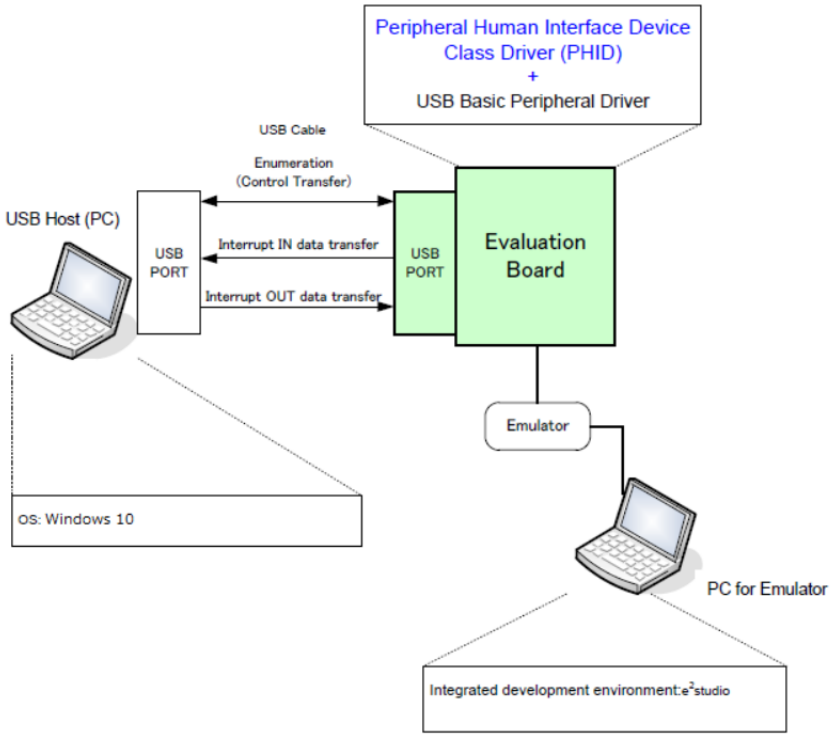

Figure 248: Example Operating Environment

USB PHID Example

This is a minimal example for implementing PHID in a non-RTOS application.

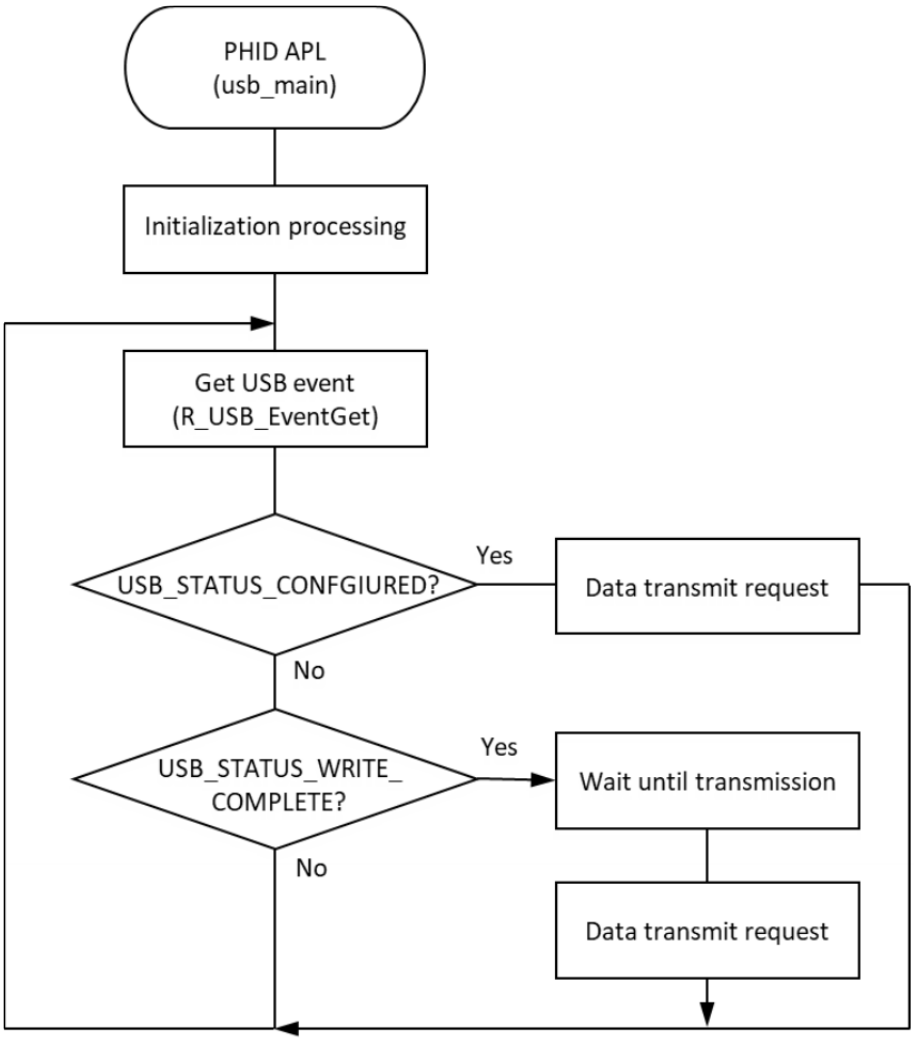

Figure 249: Main Loop processing for non-RTOS example

5.2.6.44 USB PMSC (r_usb_pmsc)

Modules » Connectivity

This module provides a USB Peripheral Mass Storage Class (PMSC) driver. It implements the USB PMSC Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pmsc module combines with the r_usb_basic module to provide USB Peripheral It operates as a Mass Storage class driver (hereinafter referred to as PMSC).
The USB peripheral mass storage class driver (PMSC) comprises a USB mass storage class bulk-only transport (BOT) protocol.
When combined with a USB peripheral control driver and media driver, it enables communication with a USB host as a BOT-compatible storage device.

Features

The r_usb_pmsc module has the following key features:

- Storage command control using the BOT protocol

- Supports only SFF-8070i (ATAPI) Interface Sub-Class
- Response to mass storage device class requests from a USB host

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_pmsc

The following build time configurations are defined in fsp_cfg/r_usb_pmsc_cfg.h:

Configuration	Options	Default	Description
Vendor Information	Vendor Information must be 8 bytes long; pad with spaces if shorter.	Vendor	Specify the vendor information field (part of the Inquiry command response).
Product Information	Product Information must be 16 bytes long; pad with spaces if shorter.	Mass Storage	Specify the product information field (part of the Inquiry command response).
Product Revision Level	Product Revision Level must be 4 bytes long; pad with spaces if shorter.	1.00	Specify the product revision level field (part of the Inquiry command response).
Sector size	• 512 • 4096	512	Specifies the sector size.
Number of Transfer Sectors	Please enter a number between 1 and 255.	8	Specify the maximum sector size to request with one data transfer.

Configurations for Connectivity > USB PMSC (r_usb_pmsc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PMSC (r_usb_pmsc).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pmsc0	Module name.

Refer to the USB (r_usb_basic) module for hardware configuration options.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests

The class requests supported by this driver are shown below.

Request	Code	Description
Bulk-Only Mass Storage Reset	0xFF	Resets the connection interface to the mass storage device.
Get Max Logical Unit Number	0xFE	Reports the logical numbers supported by the device.

Storage Commands

This driver supports the following storage commands.

Command	Code	Description
TEST_UNIT_READY	0x00	Checks the state of the peripheral device.
REQUEST_SENSE	0x03	Gets the error information of the previous storage command execution result.
INQUIRY	0x12	Gets the parameter information of the logical unit.
READ_FORMAT_CAPACITY	0x23	Gets the formattable capacity.
READ_CAPACITY	0x25	Gets the capacity information of the logical unit.
READ10	0x28	Reads data.
WRITE10	0x1A	Writes data.
MODE_SENSE10	0x5A	Gets the parameters of the logical unit.

Note

A STALL or FAIL error is sent to the host upon receipt of any command not listed in the above table.

BOT Protocol Overview

BOT (USB MSC Bulk-Only Transport) is a transfer protocol that encapsulates command, data, and status (results of commands) using only two endpoints (one bulk in and one bulk out). The ATAPI storage commands and the response status are embedded in a Command Block Wrapper (CBW) and a Command Status Wrapper (CSW). The below image shows an overview of how the BOT protocol progresses with command and status data flowing between USB host and peripheral.

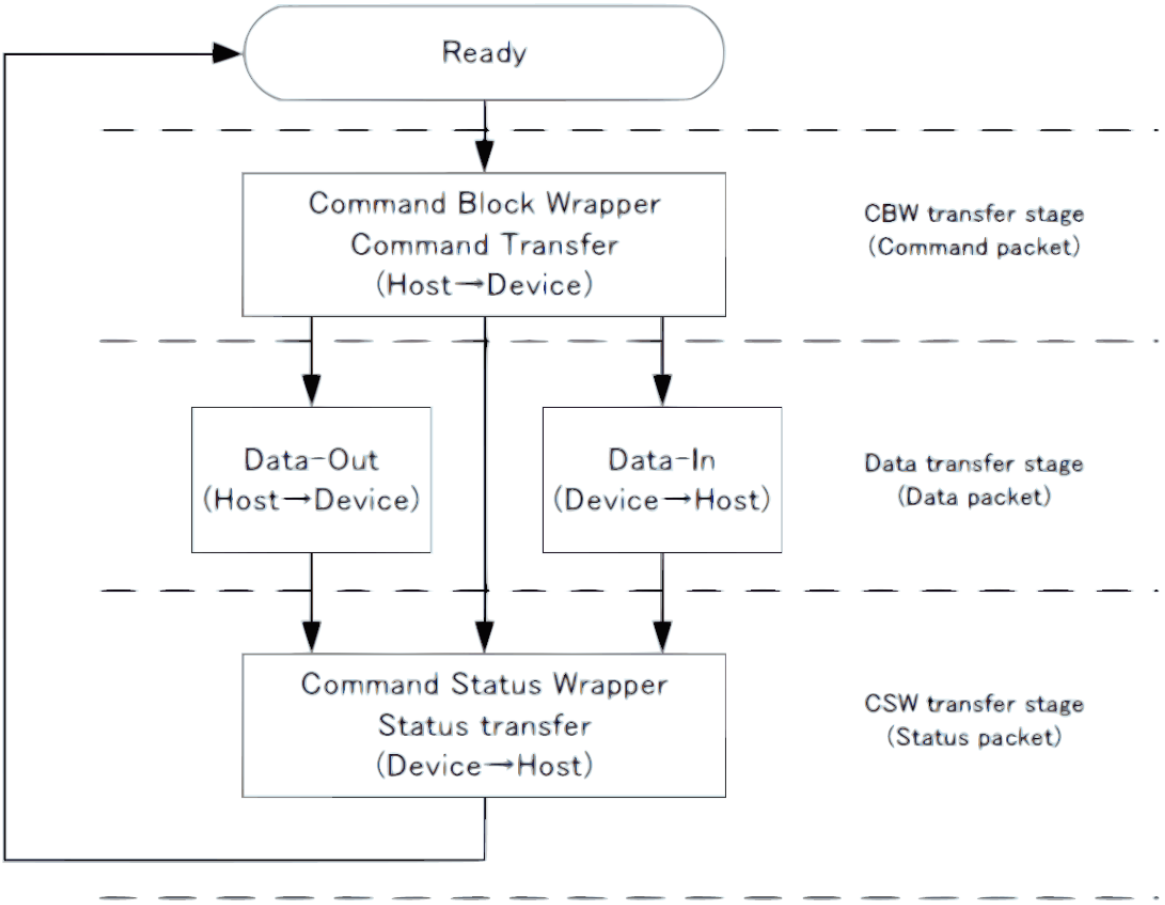

Figure 251: BOT protocol Overview

Block Media Interface

PMSC implements a block media interface to enable access to higher-level modules. If the block media interface supports multiple media, users can select any media to access.

Note

When the user develops the storage media driver, be sure to define the instance named "g_rm_block_media0".

Limitations

1. The driver always returns 0 in response to the GetMaxLun command.
2. The driver supports a sector size of 512 bytes only.
3. The only media currently supported by the block media interface is an SD card. The card must be inserted before initializing the driver.
4. When using DMA for Hi-Speed transfers continuous transfer mode must not be used in the USB Basic driver.
5. The storage area must be formatted before use.
6. When using the SD/MMC Block Media Implementation (rm_block_media_sdmmc), "Card

Detection" must be set to "Not Used" in the SD/MMC Host Interface (r_sdhi) settings.
7. The driver does not support Low-speed.
8. This driver does not support simultaneous operation with USB Host device class.
9. Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Examples

USB PMSC Example

In this example, when the evaluation board is connected to the host PC it is recognized as a removable disk and reading/writing files is possible. The FAT type is either FAT12, FAT16, or FAT32 depending on the size of the media used.

5.2.6.45 USB PPRN (r_usb_pprn)

Modules » Connectivity

This module is USB Peripheral Printer Device Class Driver (PPRN). It implements the USB PPRN Interface.

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Detailed Description

Overview

The r_usb_pprn module combines with the r_usb_basic module to provide a USB Peripheral Printer Device Class (PPRN) driver. The PPRN driver conforms to the USB Printer Device class specifications and implements communication with a printer host.

Features

The r_usb_pprn module has the following functions:

- Data transfer to and from a USB host
- Response to the printer class requests
- Response to function references from the printer host

Note

This driver is not guaranteed to provide USB printer operation in all scenarios. The developer must verify correct operation when connected to the targeted USB hosts.

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_usb_pprn

The following build time configurations are defined in fsp_cfg/r_usb_pprn_cfg.h:

Configuration	Options	Default	Description

Configurations for Connectivity > USB PPRN (r_usb_pprn)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PPRN (r_usb_pprn).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_pprn0	Module name.

Clock Configuration

Refer to the USB (r_usb_basic) module.

Pin Configuration

Refer to the USB (r_usb_basic) module.

Usage Notes

Class Requests (Host to Peripheral)

This driver notifies the application when receiving the following class requests:

Request	Code	Description
GET_DEVICE_ID	0x00	Get IEEE 1284 Device ID String
GET_PORT_STATUS	0x01	Get Printer's Status
SOFT_RESET	0x02	Flushes all buffers and resets the Bulk OUT and Bulk IN pipes

The data format of supported class requests is described below:

bmRequestType	bRequest	wValue	wIndex	wLength	Data
0xA1	GET_DEVICE_ID (0x00)	Config Index	Interface Alternate Setting	Maximum Length	1284 Device ID String
0xA1	GET_PORT_STATUS (0x01)	0	Interface	1	Printer Status
0x21	SOFT_RESET (0x02)	0	Interface	0	None

Limitations

- This driver does not support USB Low-speed mode.
- This driver does not support simultaneous operation with USB Host device class.
- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

USB PPRN Example

This is a minimal example for implementing PPRN in bare metal and FreeRTOS application.

Descriptors

A template for PPRN descriptors can be found in ra/fsp/src/r_usb_pprn folder. Be sure to replace the vendor ID with your own.

5.2.6.46 USB Peripheral Vendor class (r_usb_pvnd)

Modules » Connectivity

Functions

Refer to USB (r_usb_basic) for the common API (r_usb_basic) to be called from the application.

Overview

USB Peripheral Vendor class works by combining r_usb_basic module.

Target Devices

Device Group	Devices
RA2	RA2A1, RA2L2
RA4	RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

How to Configuration

The following shows FSP configuration procedure for USB Peripheral Vendor class.

- Select [New Stack]->[Middleware]->[USB]->[USB Peripheral Vendor class driver on r_usb_pvnd].

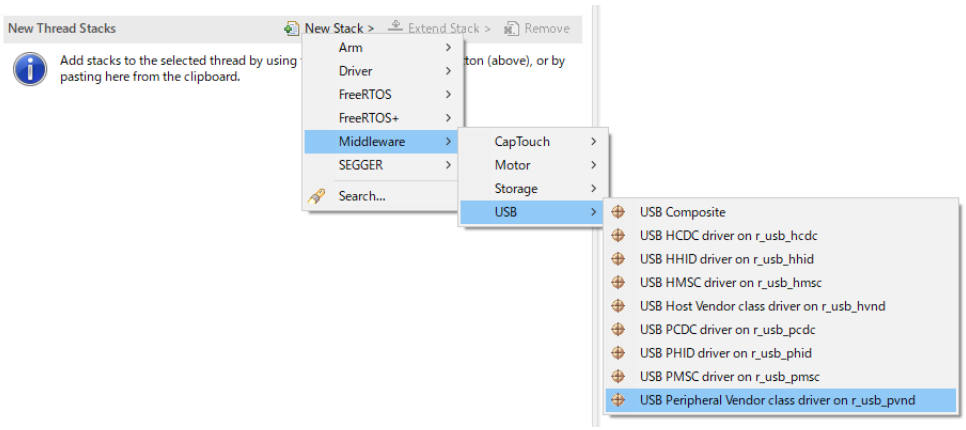

Figure 253: Select USB Peripheral Vendor Class

- The following is displayed when selecting [USB Peripheral Vendor class driver on r_usb_pvnd]. The user does not specify USB pipe number in Vendor class.

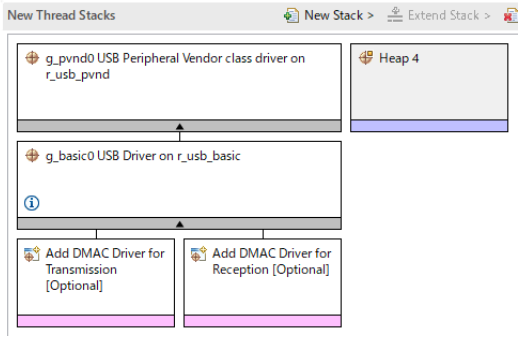

Figure 254: USB Peripheral Vendor Class Stack

API

Use the following APIs in Peripheral Vendor class application program.

- For Data Transfer
  Use the following APIs for data transfer for Bulk transfer or Interrupt transfer.

  1. R_USB_PipeRead()
  2. R_USB_PipeWrite()
  3. R_USB_PipeStop()

- For Control Transfer
  Use the following API for the class request processing.

  1. R_USB_PeriControlDataGet()
  2. R_USB_PeriControlDataSet()
  3. R_USB_PeriControlStatusSet()

- For USB Pipe Information
  The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor

class. Use the following APIs to get the allocated USB pipe information.

1. R_USB_UsedPipesGet()
2. R_USB_PipeInfoGet()

USB PIPE Allocation

The USB driver allocates USB PIPE by analyzing the descriptor of USB device in Vendor class.
The USB PIPE related to the Endpoint Descriptor are allocated in order from USB PIPE1 according to the description order of the Endpoint Descriptor.
FSP driver pipe configuration behaviors for the PVND Class, when it is used with the Composite PCDC+PVND Class is mentioned below.

- In Composite PCDC+PVND class, PCDC class interface is placed next to the PVND class interface in descriptor file. PVND Class Pipe configurations are as follows.
  - FSP driver(PVND) allocates Pipes in order from USB PIPE1 according to the order of the endpoint in descriptor(Bulk transfer).
  - FSP driver(PVND) allocates Pipes in order(decremental order) from USB PIPE9 according to the order of the endpoint in descriptor(Interrupt transfer).
  - PCDC and PVND must always use different USB PIPEs.

For example:

- In the Composite PCDC+PVND class, if there are 3 number of bulk transfers endpoints and one Interrupt transfer endpoint in descriptor file for PVND class and for this configuration FSP driver configures USB PIPE1, USB PIPE2 and USB PIPE3 for bulk data transfer and USB PIPE9 for Interrupt data transfer.
- Since hardware support total 5 number of Bulk transfer pipe configuration. So, in this scenario, for the PCDC class we have configurable USB PCDC Stack property to select available Pipes(USB PIPE 4 and USB PIPE 5 for Bulk and USB PIPE 6 for Interrupt transfer) from USB PCDC Stack configurator.

Limitaions

- Please ignore the suspend or resume event occurs when attaching or detaching the USB cable.

Descriptor

Template for Vendor class descriptor can be found in ra/fsp/src/r_usb_pvnd folder. Also, please be sure to use your vendor ID.

Examples

This application program processes the following after the enumeration completes with USB device.

1. Getting USB Pipe Infomattion
2. Vendor Class Request Processing
3. Loopback processing of bulk transfer and interrupt transfer.

5.2.6.47 USB-TYPEC (r_usb_typec)

Modules » Connectivity

Functions

fsp_err_t	R_USB_TYPEC_Open (usb_typec_ctrl_t *const p_ctrl, usb_typec_cfg_t const *const p_cfg) Initialize USB Type-C module and USB Type-C driver. Implements usb_typec_api_t::open. More...
fsp_err_t	R_USB_TYPEC_Close (usb_typec_ctrl_t *const p_ctrl) Uninitialize USB Type-C module and disable interrupts. Implements usb_typec_api_t::close. More...
fsp_err_t	R_USB_TYPEC_InfoGet (usb_typec_ctrl_t *const p_ctrl, usb_typec_info_t *p_info) Get USB Type-C connect Information. Implements usb_typec_api_t::infoGet. More...

fsp_err_t	R_USB_TYPEC_LowPowerModeSet (usb_typec_ctrl_t *const p_ctrl, usb_typec_ccs_status_t status) Set IRQ Mode for USB Type-C module by Low Power Mode. Implements usb_typec_api_t::lowPowerModeSet. More...

Detailed Description

Driver for the USB_TYPEC peripheral on RA MCUs. This module implements the USB TYPEC Interface.

Overview

The r_usb_typec module is used in combination with r_usb_basic and other device class for USB communication and with the Type C module alone for Type-C charging.

Target Devices

Device Group	Devices
RA2	RA2L2

Features

The r_usb_typec module has the following key features:

- Detection of Source Connect/Disconnect (CC1/CC2 pin and USB_VBUS pin)
- Detection of Source Partner's Current Capability, Default USB, Type-C 1.5A, or Type-C 3.0A

Usage Notes

Basic Functions

The main functions of thie module are the following:

- Initialization and un-initialization of USB Type-C module.
- Getting of Type-C module information.

Note

- Port Setting

If the user is using an MCU that supports the USB Type-C module and all of the following conditions are satisfied, please add code to control the port connected to External Rd immediately after calling the R_USB_TYPEC_Open function. (Because it is necessary to control External Rd after Internal Rd is turned ON.)

1. The USB operating mode is Device mode.
2. The power mode is BusPower. (External Rd is mounted on board)

```
R_USB_TYPEC_Open(&g_usbcc0_ctrl, &g_usbcc0_cfg);

R_IOPORT_PinCfg(&g_ioport_ctrl, BSP_IO_PORT_01_PIN_09, (uint32_t)
```

```
IOPORT_CFG_PORT_DIRECTION_OUTPUT | (uint32_t) IOPORT_CFG_PORT_OUTPUT_LOW);
```

- Debounce

Depending on the user board, the user may need code to debaunce the USB_VBUS pin.

Examples

USB Type-C Example

The following is example code for USB Type-C.

```
/******************************************************************************

 default:
 /* None */
 break;
            }
 /* USB Type-C Callback Flag Clear */
            g_typec_callback_flg = 0;
```

```
        }
    }
} /* End of function usb_typec_example() */
```

Data Structures

struct	usb_typec_instance_ctrl_t

Data Structure Documentation

◆ usb_typec_instance_ctrl_t

struct usb_typec_instance_ctrl_t	
USB TYPE-C control block. DO NOT INITIALIZE. Initialization occurs when usb_typec_api_t::open is called.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
usb_typec_cfg_t *	p_cfg
	Pointer to initial configurations.
uint32_t	module_number
	USB module number (USB_IP0/USB_IP1)
IRQn_Type	irq_typec_cci
	USBCC_CCI interrupt number storage variable.
IRQn_Type	irq_typec_ccs
	USBCC_CCS interrupt number storage variable.
uint32_t	ipl_typec_cci
	Variable to store the interrupt priority of USBCC_CCI.

uint32_t	ipl_typec_ccs
	Variable to store the interrupt priority of USBCC_CCS.

Function Documentation

◆ R_USB_TYPEC_Open()

fsp_err_t R_USB_TYPEC_Open (usb_typec_ctrl_t *const *p_ctrl*, usb_typec_cfg_t const *const *p_cfg*)

Initialize USB Type-C module and USB Type-C driver. Implements usb_typec_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_NOT_OPEN	USB TYPEC module is not open.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.

◆ R_USB_TYPEC_Close()

fsp_err_t R_USB_TYPEC_Close (usb_typec_ctrl_t *const *p_ctrl*)

Uninitialize USB Type-C module and disable interrupts. Implements usb_typec_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_NOT_OPEN	USB TYPEC module is not open.

◆ R_USB_TYPEC_InfoGet()

fsp_err_t R_USB_TYPEC_InfoGet (usb_typec_ctrl_t *const *p_ctrl*, usb_typec_info_t * *p_info*)

Get USB Type-C connect Information. Implements usb_typec_api_t::infoGet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_NOT_OPEN	USB TYPEC module is not open.

◆ R_USB_TYPEC_LowPowerModeSet()

fsp_err_t R_USB_TYPEC_LowPowerModeSet (usb_typec_ctrl_t *const *p_ctrl*, usb_typec_ccs_status_t *status*)

Set IRQ Mode for USB Type-C module by Low Power Mode. Implements usb_typec_api_t::lowPowerModeSet.

Return values

FSP_SUCCESS	Successful completion.
FSP_ERR_NOT_OPEN	USB TYPEC module is not open.
FSP_ERR_USB_PARAMETER	Parameter error.

5.2.6.48 USB_PCDC Communication Device (rm_comms_usb_pcdc)

Modules » Connectivity

Functions

fsp_err_t	RM_COMMS_USB_PCDC_Open (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_cfg_t const *const p_cfg) Opens and configures the USB PCDC Comms module. Implements rm_comms_api_t::open. More...
fsp_err_t	RM_COMMS_USB_PCDC_Close (rm_comms_ctrl_t *const p_api_ctrl) Disables specified USB PCDC Comms module. Implements rm_comms_api_t::close. More...
fsp_err_t	RM_COMMS_USB_PCDC_CallbackSet (rm_comms_ctrl_t *const p_api_ctrl, void(*p_callback)(rm_comms_callback_args_t *), void *const p_context) Updates the USB PCDC Comms callback. Implements rm_comms_api_t::callbackSet. More...
fsp_err_t	RM_COMMS_USB_PCDC_Read (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_dest, uint32_t const bytes) Performs a read from the USB PCDC device. Implements rm_comms_api_t::read. More...
fsp_err_t	RM_COMMS_USB_PCDC_Write (rm_comms_ctrl_t *const p_api_ctrl, uint8_t *const p_src, uint32_t const bytes)

	Performs a write to the USB PCDC device. Implements rm_comms_api_t::write. More...
fsp_err_t	RM_COMMS_USB_PCDC_WriteRead (rm_comms_ctrl_t *const p_api_ctrl, rm_comms_write_read_params_t const write_read_params) Performs a write to, then a read from the USB device. Implements rm_comms_api_t::writeRead. More...
void	rm_comms_usb_pcdc_notify_application (rm_comms_usb_pcdc_instance_ctrl_t const *p_ctrl, rm_comms_event_t event)
void	rm_comms_usb_pcdc_callback_handler (usb_instance_ctrl_t *p_args, usb_hdl_t usb_handle, usb_onoff_t usb_onoff_status) Common callback function called in the USB PCDC driver callback function.

Detailed Description

Middleware to implement a generic communications interface over USB_PCDC. This module implements the Communications Middleware Interface.

Overview

The RM_COMMS_USB_PCDC module implements COMMS API for USB_PCDC interface.

Features

The implementation of the USB_PCDC communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS
- USB connection detection mode

Configuration

Build Time Configurations for rm_comms_usb_pcdc

The following build time configurations are defined in fsp_cfg/r_usb_pcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc)

This module can be added to the Stacks tab via New Stack > Connectivity > USB PCDC Communication Device (rm_comms_usb_pcdc).

Configuration	Options	Default	Description
RTOS			
Recursive Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Recursive Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_usb_pcdc0	Module name.
USB Connection Detection	• Disabled • Baudrate Configuration • Control Line State	Disabled	Enable it only when application wants to process the error of USB host tool not opened.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.

Usage Notes

USB connection detection has two modes: Baudrate Configuration mode and Control Line State mode. The former depends on line coding request, and the latter relies on control line state request. When it is enabled, rm_comms_usb_pcdc_write API will return FSP_ERR_NOT_ENABLED when USB host tool is not opened. By default it is disabled.

Limitations

- RM_COMMS_API are not reentrant in non blocking mode
- When in blocking mode, RM_COMMS_USB_PCDC_Write() and RM_COMMS_USB_PCDC_Read() cannot be called in callback.
- RM_COMMS_USB_PCDC_WriteRead API is not implemented
- USB connection detection could be platform specific when it is enabled. For Windows USB

host, Baudrate configuration mode should be used.

Examples

Basic Example

This is a basic example of minimal use of USB_PCDC communications implementation in an application.

```
void rm_comms_usb_pcdc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = RM_COMMS_USB_PCDC_Open(&g_comms_usb_pcdc_ctrl, &g_comms_usb_pcdc_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle any errors. */
    }
 while (true)
    {
 /* Send data. */
       g_err_flag = 0;
       g_tx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Write(&g_comms_usb_pcdc_ctrl, g_tx_buf,
TX_BUF_LEN);
 if (FSP_SUCCESS != err)
     {
 /* Handle any errors. */
     }
 while ((0 == g_tx_flag) && (0 == g_err_flag))
     {
 /* Wait callback */
     }
 /* Receive data. */
       g_err_flag = 0;
       g_rx_flag = 0;
       err       = RM_COMMS_USB_PCDC_Read(&g_comms_usb_pcdc_ctrl, g_rx_buf,
RX_BUF_LEN);
```

```
 if (FSP_SUCCESS != err)
      {
 /* Handle any errors.*/
      }
 while ((0 == g_rx_flag) && (0 == g_err_flag))
      {
 /* Wait callback */
      }
    }
}
static void rm_comms_usb_pcdc_callback (rm_comms_callback_args_t * p_args)
{
 if (p_args->event == RM_COMMS_EVENT_TX_OPERATION_COMPLETE)
    {
       g_tx_flag = 1;
    }
 else if (p_args->event == RM_COMMS_EVENT_RX_OPERATION_COMPLETE)
    {
       g_rx_flag = 1;
    }
 else
    {
       g_err_flag = 1;
    }
}
```

Descriptor

A template for PCDC descriptors can be found in ra/fsp/src/r_usb_pcdc/r_usb_pcdc_descriptor.c.template. Also, please be sure to use your vendor ID.

Data Structures

struct	rm_comms_usb_pcdc_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_usb_pcdc_instance_ctrl_t

struct rm_comms_usb_pcdc_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg
	Middleware configuration.
rm_comms_usb_pcdc_extended_cfg_t const *	p_extend
	Pointer to extended configuration structure.
usb_callback_args_t *	p_usb_args
	Pointer to usb callback args.
usb_pcdc_ctrllinestate_t	ctrl_line_state
	Line State Control.
usb_pcdc_linecoding_t	line_coding
	Line Coding to store COM port settings.
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a usb_status_t occurs.
void *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_USB_PCDC_Open()

fsp_err_t RM_COMMS_USB_PCDC_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the USB PCDC Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	USB PCDC Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_Close()

fsp_err_t RM_COMMS_USB_PCDC_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified USB PCDC Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_CallbackSet()

fsp_err_t RM_COMMS_USB_PCDC_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context*)

Updates the USB PCDC Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_USB_PCDC_Read()

fsp_err_t RM_COMMS_USB_PCDC_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the USB PCDC device. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_ENABLED	USB device needs connecting from USB host to operate.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_Write()

fsp_err_t RM_COMMS_USB_PCDC_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the USB PCDC device. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_ENABLED	USB device needs connecting from USB host to operate.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_USB_PCDC_WriteRead()

fsp_err_t RM_COMMS_USB_PCDC_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs a write to, then a read from the USB device. Implements rm_comms_api_t::writeRead.

Return values

FSP_ERR_UNSUPPORTED	Not supported.

◆ rm_comms_usb_pcdc_notify_application()

void rm_comms_usb_pcdc_notify_application (rm_comms_usb_pcdc_instance_ctrl_t const * *p_ctrl*, rm_comms_event_t *event*)

(end addtogroup RM_COMMS_USB_PCDC)

5.2.7 DSP

Modules

Detailed Description

DSP Modules.

Modules

	CMSIS DSP H/W Acceleration (rm_cmsis_dsp) Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).
	IIR Filter Accelerator (r_iirfa) Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface.

5.2.7.1 CMSIS DSP H/W Acceleration (rm_cmsis_dsp)

Modules » DSP

Middleware to implement Arm CMSIS DSP by using 32-bit Multiply-Accumulator (MACL).

Overview

The 32-bit Multiply-Accumulator (MACL) provides hardware acceleration for calculation of CMSIS DSP functions. After initializing this module, refer to the Arm documentation to use the file system: https://www.keil.com/pack/doc/CMSIS/DSP/html/index.html

Features

The MACL module supports the following features:

No	MACL API	Feature
1	arm_mult_q31	Q31 vector multiplication
2	arm_scale_q31	Multiplies a Q31 vector by a scalar
3	arm_mat_mult_q31	Q31 matrix multiplication
4	arm_mat_vec_mult_q31	Q31 matrix and vector multiplication
5	arm_mat_scale_q31	Q31 matrix scaling
6	arm_biquad_cascade_df1_q31	Processing function for the Q31 Biquad cascade filter
7	arm_conv_partial_q31	Partial convolution of Q31 sequences
8	arm_conv_q31	Convolution of Q31 sequences
9	arm_correlate_q31	Correlation of Q31 sequences

10	arm_fir_decimate_q31	Processing function for the Q31 FIR decimator
11	arm_fir_interpolate_q31	Processing function for the Q31 FIR interpolator
12	arm_fir_q31	Processing function for Q31 FIR filter
13	arm_fir_sparse_q31	Processing function for the Q31 sparse FIR filter
14	arm_lms_norm_q31	Processing function for Q31 normalized LMS filter
15	arm_lms_q31	Processing function for Q31 LMS filter

Note

The MACL hardware acceleration when executing 5 APIs including arm_scale_q31, arm_mat_scale_q31, arm_correlate_q31, arm_fir_q31, and arm_lms_q31 with 1-element input on IAR compiler will not be better than ARM CMSIS software. The MACL hardware is useful when executing with larger amounts of input.

Configuration

CMSIS DSP Acceleration Configuration

To enable hardware acceleration for Arm CMSIS DSP, the stack "Arm CMSIS6 DSP Acceleration" of CMSIS DSP must be filled with MACL (rm_cmsis_dsp). Otherwise the CMSIS DSP functions will perform the calculation by using software. This can be done at the Stack Configuration.

Usage Notes

Hardware Support

MACL module is required for using this middleware. Refer to the MCU hardware user's manual or datasheet to determine if it has MACL support.

Examples

Basic Example

About examples, how to use the CMSIS DSP APIs refer to the link: https://github.com/ARM-software/CMSIS-DSP/tree/main/Examples/ARM.

5.2.7.2 IIR Filter Accelerator (r_iirfa)

Modules » DSP

Functions

fsp_err_t	R_IIRFA_Open (iir_ctrl_t *const p_api_ctrl, iir_cfg_t const *const p_cfg)

fsp_err_t	R_IIRFA_Filter (iir_ctrl_t *const p_api_ctrl, float const *p_data_in, float *p_data_out, uint16_t const num_samples)
fsp_err_t	R_IIRFA_Configure (iir_ctrl_t *const p_api_ctrl, iir_filter_cfg_t const *const p_filter_cfg)
fsp_err_t	R_IIRFA_StatusGet (iir_ctrl_t *const p_api_ctrl, iir_status_t *const p_status)
fsp_err_t	R_IIRFA_Close (iir_ctrl_t *const p_api_ctrl)
__STATIC_INLINE float	R_IIRFA_SingleFilter (iir_ctrl_t *const p_api_ctrl, float data_in)

Detailed Description

Driver for the IIRFA peripheral on RA MCUs. This module implements the IIR Interface.

Overview

The IIR Filter Accelerator (IIRFA) provides hardware acceleration for calculation of single-precision floating point direct form 2 biquad IIR filters. Up to 32 biquad stages can be configured at a time.

Features

The IIRFA module supports the following features:

- Up to 16 different concurrent configurations/channels
- 32 biquad filter stages (shared between all channels)
- Runtime filter configuration
- ECC error detection for coefficient and delay data
    - 1-bit error correction, 2-bit error detection

Supported Devices

Device Group	Devices
RA6	RA6T2

Configuration

Build Time Configurations for r_iirfa

The following build time configurations are defined in fsp_cfg/r_iirfa_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Polling Mode	• Enabled • Disabled	Enabled	When enabled the IIRFA driver will poll for completion before reading the output register. This prevents IIRFA operations from delaying global interrupt processing at the cost of slower filter performance.
Software Loop Unroll Depth	Refer to the RA Configuration tool for available options.	1 Sample	Select the number of samples to process for every loop. This setting generally only affects filters that use 1 biquad stage.
ECC Support	• Disabled • Enabled • Enabled (no writeback)	Enabled	Select whether to detect ECC errors. When set to 'Enabled (no writeback)' 1-bit ECC errors will not be corrected.
Rounding Mode	• Nearest • Toward zero	Nearest	Select how to round calculation results.

Configurations for DSP > IIR Filter Accelerator (r_iirfa)

This module can be added to the Stacks tab via New Stack > DSP > IIR Filter Accelerator (r_iirfa). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_iirfa0	Module name.
Channel	Value must be an integer between 0 and 15	0	Select the IIRFA channel.

Clock Configuration

The clock source for the IIRFA peripheral is ICLK.

Pin Configuration

IIRFA does not have any pin connections.

Filter Configuration

Before using IIRFA to filter data the coefficients and state variables must be initialized. See the Filter Configuration example for how to initialize an iir_filter_cfg_t struct to pass to R_IIRFA_Configure.

Note

There are 32 total biquad stages in the peripheral shared across all channels. Channels may not select the same stages, so it is important to choose iir_filter_cfg_t::stage_base and iir_filter_cfg_t::stage_num carefully to ensure no overlap.

Usage Notes

Maximizing Performance

The optimum configuration for IIRFA is dependent on the application. It is recommended to consider the following in regards to your project to determine what settings may be ideal.

Regardless of configuration, each filter stage takes 2 ICLK cycles to process per sample and an additional 5 cycles to write state values back to registers. This means single-sample operations only take 2 cycles per stage while multi-sample operations take 7. Additional overhead cycles are required to load and store each sample. The following suggestions may improve performance:

- Either process more data at a time with R_IIRFA_Filter or only one sample at a time using R_IIRFA_SingleFilter
- Use the unrolled software loop option
    - Provide data in a multiple of the unroll depth
- Disable polling (see warning)

Polling Mode

By default, the driver will poll a status flag for completion after writing input data to IIRFA. Disabling polling significantly improves performance when using a low number of stages, but may cause higher global interrupt latency during processing.

Note

If only one stage is used it is recommended to disable polling as IIRFA will typically execute faster than code resulting in no wait cycles. If polling must be used with a one stage filter, please note that in some situations the Arm CMSIS DSP Library functions arm_biquad_cascade_df2T_init_f32 and arm_biquad_cascade_df2T_f32 may provide better performance. It up to the user to evaluate performance within their own project.

Warning

When polling is disabled, filter operation works by writing a value to IIRCHnINP then immediately reading IIRCHnOUT. While this maximizes performance, the core will wait for output data to become available before continuing execution. **While execution waits for IIRCHnOUT no interrupts will be processed by the core.** The maximum wait time for a 32-stage filter may be up to approximately 64 ICLK cycles for single sample processing or 224 ICLK cycles for multi-sample processing (decreasing linearly with the number of stages used).

Single Sample Processing

In applications such as motor control where each sample needs immediate processing, the inline function R_IIRFA_SingleFilter is provided. This function has no parameter checking, takes one sample, and returns a filtered sample. Polling is supported by this function (if configured).

ECC Errors

If configured, R_IIRFA_Filter will return an error if a 1- or 2-bit ECC error has occurred.

1-bit errors are automatically corrected unless writeback is disabled. 2-bit errors cannot be automatically corrected. Reset the coefficient and filter data by calling R_IIRFA_Configure if a non-correctable ECC error is reported.

Limitations

- A total of 32 stages may be configured at any one time across all channels.
- When polling is disabled core execution is halted while waiting for data to become available. (See warning)

Examples

Filter Configuration

Below is an example of how to initialize a filter configuration to pass to R_IIRFA_Configure.

```
#define FILTER_STAGE_NUM (2)
/* Biquad coefficients (4th order Butterworth 200Hz lowpass on 44.1KHz input) */
iir_filter_coeffs_t gp_iirfa0_filter_coeffs[FILTER_STAGE_NUM] =
{
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
        .b2 = 1.000000000F,
        .a1 = -1.947914029F,
        .a2 = 0.948705125F,
    },
    {
        .b0 = 1.000000000F,
        .b1 = 2.000000000F,
        .b2 = 1.000000000F,
        .a1 = -1.977625722F,
        .a2 = 0.978428884F,
    },
};
/* Biquad state data (clear to start) */
iir_filter_state_t gp_iirfa0_filter_state[FILTER_STAGE_NUM] = {0};
/* Filter configuration */
iir_filter_cfg_t g_iirfa0_filter_cfg =
{
```

```
    .p_filter_coeffs = gp_iirfa0_filter_coeffs, // Pointer to filter coefficient
array
    .p_filter_state = gp_iirfa0_filter_state, // Pointer to filter state data array
    .stage_base      = 0,                     // Which hardware biquad stage to
start allocation from (0-31)
    .stage_num       = 2,                     // Number of stages to allocate
};
```

Software Example

The following is a basic example of configuring and using a filter with IIRFA.

```
#define NUM_SAMPLES (128)
#define TWO_PI (2.0F * (float) M_PI)
float gp_data_in[NUM_SAMPLES];
float gp_data_out[NUM_SAMPLES];
void iirfa_filter_example (void)
{
 fsp_err_t err;
 /* Initialize the IIRFA module */
    err = R_IIRFA_Open(&g_iirfa0_ctrl, &g_iirfa0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize filter coefficients and state variables */
    err = R_IIRFA_Configure(&g_iirfa0_ctrl, &g_iirfa0_filter_cfg);
    assert(FSP_SUCCESS == err);
 /* Get input data to be filtered */
    get_input_data(gp_data_in);
 /* Filter data */
    err = R_IIRFA_Filter(&g_iirfa0_ctrl, gp_data_in, gp_data_out, NUM_SAMPLES);
 /* R_IIRFA_Filter will return FSP_ERR_INVALID_RESULT when one or more calculations
results in infinity. */
 if (FSP_ERR_INVALID_RESULT == err)
    {
 /* Handle error */
```

```
    }
 else
    {
      assert(FSP_SUCCESS == err);
    }
}
```

Data Structures

struct	iirfa_instance_ctrl_t

Data Structure Documentation

◆ iirfa_instance_ctrl_t

struct iirfa_instance_ctrl_t
IIRFA instance control block.

Function Documentation

◆ R_IIRFA_Open()

fsp_err_t R_IIRFA_Open (iir_ctrl_t *const *p_api_ctrl*, iir_cfg_t const *const *p_cfg*)

Prepare an IIR channel for filtering.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was selected.
FSP_ERR_ALREADY_OPEN	The instance is already opened.

◆ R_IIRFA_Filter()

fsp_err_t R_IIRFA_Filter (iir_ctrl_t *const *p_api_ctrl*, float const * *p_data_in*, float * *p_data_out*, uint16_t const *num_samples*)

Start a filter operation on the specified data.

Return values

FSP_SUCCESS	Data has been successfully filtered.
FSP_ERR_ASSERTION	One of the provided pointers is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	num_samples is zero.
FSP_ERR_INVALID_RESULT	The result of one or more calculations was +/- infinity.
FSP_ERR_NOT_INITIALIZED	The filter is not configured.
FSP_ERR_IIRFA_ECC_1BIT	A 1-bit ECC error was detected.
FSP_ERR_IIRFA_ECC_2BIT	A 2-bit ECC error was detected.

◆ R_IIRFA_Configure()

fsp_err_t R_IIRFA_Configure (iir_ctrl_t *const *p_api_ctrl*, iir_filter_cfg_t const *const *p_filter_cfg*)

Configure filter coefficients and state values.

Return values

FSP_SUCCESS	Configuration successful.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid filter stage selection.
FSP_ERR_IN_USE	One or more requested filter stages are currently in use.

◆ R_IIRFA_StatusGet()

fsp_err_t R_IIRFA_StatusGet (iir_ctrl_t *const *p_api_ctrl*, iir_status_t *const *p_status*)

Read the current filter state variables.

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_IIRFA_Close()

fsp_err_t R_IIRFA_Close (iir_ctrl_t *const *p_api_ctrl*)

Stop filter operations and close the channel instance.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_IIRFA_SingleFilter()

__STATIC_INLINE float R_IIRFA_SingleFilter (iir_ctrl_t *const *p_api_ctrl*, float *data_in*)

Perform a single inline filter operation.

Note

This function is intended to be used in performance-critical applications. As such, no parameter checking or error validation is provided.

5.2.8 Graphics

Modules

Detailed Description

Graphics Modules.

Modules

	Azure RTOS GUIX Port (rm_guix_port)
	Capture Engine Unit (r_ceu) Driver for the CEU peripheral on RA MCUs. This module implements the CAPTURE Interface.
	D/AVE 2D Port Interface (r_drw) Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.
	Display Serial Interface (r_vin) Driver for the VIN peripheral on RA MCUs. This module implements the CAPTURE Interface.
	Graphics LCD (r_glcdc) Driver for the GLCDC peripheral on RA MCUs. This module implements the Display Interface.
	JPEG Codec (r_jpeg) Driver for the JPEG peripheral on RA MCUs. This module implements the JPEG Codec Interface.
	LVGL Port (rm_lvgl_port) LVGL graphics library port for RA MCUs.
	MIPI Display Serial Interface (r_mipi_dsi) Driver for the MIPI DSI peripheral on RA MCUs. This module implements the Display Interface.
	Parallel Data Capture (r_pdc) Driver for the PDC peripheral on RA MCUs. This module implements the CAPTURE Interface.
	SEGGER emWin RA Port (rm_emwin_port) SEGGER emWin port for RA MCUs.
	Segment LCD (r_slcdc)

	Driver for the SLCDC peripheral on RA MCUs. This module implements the SLCDC Interface.

5.2.8.1 Azure RTOS GUIX Port (rm_guix_port)

Modules » Graphics

Functions

UINT	rm_guix_port_hw_initialize (GX_DISPLAY *p_display)

Detailed Description

Overview

The Azure RTOS GUIX Port module provides the configuration and hardware acceleration support necessary for use of GUIX on RA products. The port provides full integration with the graphics peripherals (GLCDC, DRW and JPEG).

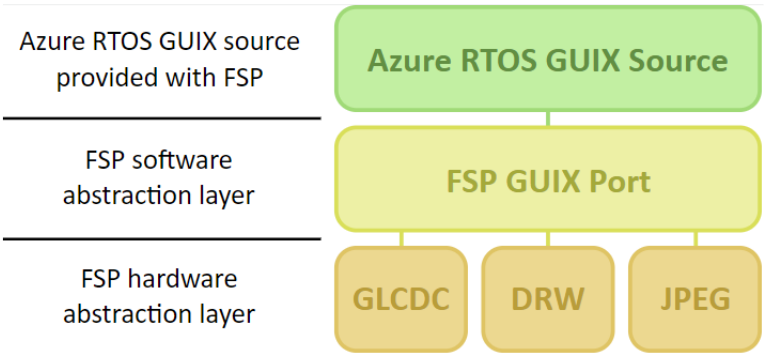

Figure 255: Azure RTOS GUIX Port Block Diagram

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. For information about how to use GUIX and GUIX Studio (including example code) please consult the Azure RTOS GUIX documentation.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (D/AVE 2D Port Interface (r_drw))
  - Drawing bitmaps
  - 8, 4 and 1bpp uncompressed and compressed (RLE) font rendering
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill

        - Lines and arcs
- JPEG Codec (r_jpeg)
    - JPEG decoding
- Graphics LCD (r_glcdc)
    - Brightness, contrast and gamma correction
    - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for gx

The following build time configurations are defined in fsp_cfg/azure/gx/gx_user.h:

Configuration	Options	Default	Description
Hardware Acceleration			
JPEG Codec Support	MCU Specific Options		Select whether or not to use the JPEG Codec for hardware acceleration.
DRW Engine Support	• Enabled • Disabled	Enabled	Select whether or not to use the DRW Engine for hardware acceleration.
Max DRW Operations	Value must be a positive integer	30	Specifies the maximum number of DRW operations before flushing the display list. Reducing this value may reduce the peak heap used by the application but may reduce performance.
Internal Thread			
Stack Size	Value must be greater than zero	4096	GUIX internal thread stack size in bytes. Must be greater than zero.
Priority	Value must be between 0 to 31	30	Priority of the GUIX Internal Thread. The value must be between 0 to 31.
Time Slice	Value must be in range 0 to 0xFFFFFFFF	10	Time Slice value of the GUIX Internal Thread. The value must be between 0 (TX_NO_TIME_SLICE) to 0xFFFFFFFF.
System Timer (ms)	Value must be greater	20	GUIX system timer

	than or equal to 10		period (GX_SYSTEM_TIMER_MS). This value will be internally converted to RTOS ticks and will be rounded down to the next smallest multiple of the RTOS tick period (1000 / TX_TIMER_TICKS_PER_SECOND).
Multithread Support	• Disabled • Enabled	Enabled	Must be enabled if GUIX functions are called from multiple threads. Set to Disabled when calling GUIX from only one thread to reduce system overhead.
UTF8 Support	• Disabled • Enabled	Enabled	Select whether to enable or disable support for UTF8 characters.
Event Queue Size	Value must be greater than zero	48	Maximum number of events in the GUIX event queue.
Enable GX_WIDGET User Data	• Enabled • Disabled	Disabled	Set to Enabled to to use the gx_widget_user_data member in the GX_WIDGET structure.

Build Time Configurations for rm_guix_port

The following build time configurations are defined in fsp_cfg/middleware/rm_guix_port_cfg.h:

Configuration	Options	Default	Description
DRW Buffer Cache	• Enabled • Disabled	Enabled	Enabling this option significantly improves DRW Engine performance. Set to Disabled only if Display underflow events are triggered under high graphics load.

Configurations for Graphics > Azure RTOS GUIX Port (rm_guix_port)

Configuration	Options	Default	Description
Display Rotation			
Screen Orientation	• None	None	Select the display

	• CW (90 degrees) • FLIP (180 degrees) • CCW (270 degrees)		orientation specified in the GUIX Studio project. The Canvas Buffer must be enabled when rotating 180 degrees (FLIP).
Use Canvas Buffer	• Enabled • Disabled	Disabled	When screen rotation is set to 180 degrees (FLIP), a canvas buffer must be used. The canvas buffer size will be the same as a frame buffer for the display module.
Canvas Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the GUIX Canvas Buffer will be allocated.
JPEG Decoding			
Work Buffer Size	Must be a positive integer greater than 0	0xC800	Specify the JPEG work buffer size in bytes. A larger buffer can reduce JPEG decode/draw times. The buffer will not be allocated if JPEG Codec support is disabled. Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
Buffer Memory Section	This property must be a valid section name	bss	Specify the memory section where the JPEG Work Buffer will be allocated.
Name	Name must be a valid C symbol	g_rm_guix_port0	Module name.
Target Display Layer	• Graphics Layer 1 • Graphics Layer 2	Graphics Layer 1	Specify which graphics screen to inherit the buffer and display dimensions from.
Callback Function	Must be a valid C symbol	NULL	If a callback function is provided it will be called when Display events occur.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Usage Notes

Getting Started

To get started with GUIX in an RA project the following must be performed:

1. In e² studio, open the RA Configuration editor for your GUIX project
2. Select or create a thread
3. Add GUIX to your project in the Stacks view by clicking **New Stack -> Azure RTOS -> GUIX**
4. Ensure the configuration options for GUIX and the port layer are set as necessary for your application
5. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
6. Set the input color format in the GLCDC module (Input -> Graphics Layer * -> General -> Color format) and the output color format in the JPEG Codec module if applicable (Decode -> Output color format) per your project specification
7. Click the BSP tab in the configuration editor and confirm the heap size in the Properties pane is sufficient (see Note below)
8. Click Generate Project Content to save and commit configuration changes
9. Drop the Quick Setup entry in Developer Assistance into the desired thread entry C file and update the items marked with TODO as necessary
10. Call the Quick Setup function from the thread entry function (or where desired)

At this point the project is now ready to build and run your GUIX Studio project. Please refer to the documentation for Azure RTOS GUIX and GUIX Studio for details on how to create and edit a GUI application.

Note

It is recommended to start with 8K-32K of heap to begin development. Actual heap use is typically far lower than this but must be characterized by the developer.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed:

- Avoid transparent pixelmaps in 8-bit display mode as they are rendered in software. In particular, ensure PNGs to be used in 8bpp GUIX Studio projects are saved without transparency data if no transparency is needed.
- The following items may require a large heap to draw successfully:
  - Polygons (more sides = more heap)
  - Filled arcs and ellipses (more framebuffer lines occupied = more heap)
  - gx_canvas_pixelmap_tile (more tiles = more heap)
- When using hardware acceleration, images used for tile fill of shapes must have dimensions that are a power of 2. This limitation does not apply to gx_canvas_pixelmap_tile as well as certain arc/ellipse fill functions as GUIX manually draws pixelmaps to fill these shapes (at the expense of heap space).

Examples

Basic Example

This is a basic example demonstrating how to get GUIX up and running given an existing GUIX Studio project. A template for this code is available in Developer Assistance for the GUIX Port module.

Note

GUIX manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
GX_WINDOW_ROOT * p_window_root;
void guix_user_start (void)
{
 /* Initialize GUIX */
    gx_system_initialize();
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
 /* Set pointer to the first buffer generated by the configuration
(rm_guix_port_canvas) */
    gx_canvas_memory_define(p_window_root->gx_window_root_canvas,
                            rm_guix_port_canvas,

p_window_root->gx_window_root_canvas->gx_canvas_memory_size);
 /* Create and show the root window in the GUIX Studio project */
    gx_studio_named_widget_create("root_widget_name", (GX_WIDGET *) p_window_root,
GX_NULL);
    gx_widget_show(p_window_root);
 /* Start GUIX */
    gx_system_start();
 /* GUIX will continue to run in its own thread */
}
```

Data Structure Documentation

◆ rm_guix_port_callback_args_t

struct rm_guix_port_callback_args_t		
Callback arguments for the FSP GUIX Port		
Data Fields		
rm_guix_port_device_t	device	Device code.
rm_guix_port_event_t	event	Event code of the low level hardware.
uint32_t	error	Error code if RM_GUIX_PORT_EVENT_ERROR.

Enumeration Type Documentation

◆ rm_guix_port_device_t

enum rm_guix_port_device_t	
Low level device code for the GUIX	
Enumerator	
RM_GUIX_PORT_DEVICE_NONE	Non hardware.
RM_GUIX_PORT_DEVICE_DISPLAY	Display device.
RM_GUIX_PORT_DEVICE_DRW	2D Graphics Engine
RM_GUIX_PORT_DEVICE_JPEG	JPEG Codec.

◆ rm_guix_port_event_t

enum rm_guix_port_event_t	
Display event codes	
Enumerator	
RM_GUIX_PORT_EVENT_ERROR	Low level driver error occurs.
RM_GUIX_PORT_EVENT_DISPLAY_VSYNC	Display interface VSYNC.
RM_GUIX_PORT_EVENT_UNDERFLOW	Display interface underflow.

Function Documentation

◆ rm_guix_port_hw_initialize()

UINT rm_guix_port_hw_initialize (GX_DISPLAY * *p_display*)

Callback function to be passed to gx_studio_display_configure in order to start hardware modules.

Example:

```
 /* Configure GUIX Studio project main display and get a pointer to the root window
*/
    gx_studio_display_configure(MAIN_DISPLAY,
 rm_guix_port_hw_initialize,
                                MAIN_DISPLAY_LANGUAGE_ENGLISH,
                                MAIN_DISPLAY_THEME,
                                &p_window_root);
```

Note

This function should only be called by GUIX.

Return values

GX_SUCCESS	Device driver setup is successfully done.
GX_FAILURE	Device driver setup failed.

5.2.8.2 Capture Engine Unit (r_ceu)

fsp_err_t	R_CEU_StatusGet (capture_ctrl_t *const p_ctrl, capture_status_t *p_status)

Detailed Description

Driver for the CEU peripheral on RA MCUs. This module implements the CAPTURE Interface.

Overview

The CEU peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked for each V-Sync event, frame of data accepted, or when certain errors occur.

Features

- Supports 8 or 16-bit camera bus
- Capture images up to 5 MP (2560x1920)
- Capture incoming data directly into a user defined memory location without the need for DTC/DMAC
- Capture specified size 'raw' image data using Data Synchronous Fetch Mode (e.g. RGB565, YUV422, etc.)
- Capture binary image data using Data Enable Fetch Mode (e.g. JPEG)
- Capture YCbCr image data using Image Capture Mode
    - Optional hardware conversion from YCbCr422 to YCbCr420
    - Optional scale down
- Perform basic timing signal validation

Supported Devices

Device Group	Devices
RA8	RA8D1, RA8D2, RA8E1, RA8M1, RA8M2, RA8P1

Configuration

Build Time Configurations for r_ceu

The following build time configurations are defined in fsp_cfg/r_ceu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Capture Engine Unit (r_ceu)

This module can be added to the Stacks tab via New Stack > Graphics > Capture Engine Unit (r_ceu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ceu0	Module name.
Input			
Input > Data Bus Specifications			
Data Bus Size	MCU Specific Options		Data bus-width of CEU physical connection.
HSYNC Polarity	• High • Low	High	Specify the active polarity of the HSYNC signal.
VSYNC Polarity	• High • Low	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications			
Input > Capture Specifications > Sample Points			
Data Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for fetching the image data (D15 to D0) from the external module.
H-Sync Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for capturing H-Sync from the external module.
V-Sync Sample Point	• Rising edge of the camera clock • Falling edge of the camera clock	Rising edge of the camera clock	Specify the external camera clock transition state for capturing V-Sync from the external module.
Horizontal capture	Value must be an	640	Specify the number of

resolution	integer.		horizontal pixels to capture.
Vertical capture resolution	Value must be an integer.	480	Specify the number of vertical pixels to capture.
Horizontal pixel offset	Value must be an integer.	0	Number of pixels from H-sync signal up to the start of a valid data period.
Vertical pixel offset	Value must be an integer.	0	Specify the vertical line to start capturing image data.
Capture Mode	• Image Capture • Data Synchronous Fetch • Data Enable Fetch	Data Synchronous Fetch	Capture mode of incoming data.
Image Component Input Order (Image Capture Mode Only)	• Cb0, Y0, Cr0, Y1 • Cr0, Y0, Cb0, Y1 • Y0, Cb0, Y1, Cr0 • Y0, Cr0, Y1, Cb0	Cb0, Y0, Cr0, Y1	Set the input order of the luminance component and chrominance component (Image Capture Mode only). This setting must match your camera's output format.
Output			
Output > Format			
Conversion	• YCbCr422 (No Conversion) • YCbCr420 (Hardware Conversion from YCbCr422)	YCbCr422 (No Conversion)	Set the output format for captured CEU data. This setting is applicable in Image Capture Mode only.
Output > Scale-Down			
Horizontal Size	Value must be an integer.	0	Specify the scaled down output image horizontal size (pixels). This setting is applicable in Image Capture Mode only. If set to 0, horizontal scale-down is disabled.
Vertical Size	Value must be an integer.	0	Specify the scaled down output image vertical size (lines). This setting is

			applicable in Image Capture Mode only. If set to 0, vertical scale-down is disabled.
Output > Buffer			
Data Enable Buffer Size	Value must be a positive integer.	0	Specify size of image region available for use by CEU data bus. (Only applicable to Data Enable Fetch capture mode)
Byte Swapping	• Swap 8-bit units • Swap 16-bit units • Swap 32-bit units		Byte swapping configuration. Bytes may be swapped in 8-bit, 16-bit, or 32-bit units.
Burst Transfer Mode	• Transfer in 32-byte units • Transfer in 64-byte units • Transfer in 128-byte units • Transfer in 256-byte units	Transfer in 256-byte units	Specify the unit for transferring data to the bus bridge module.
Interrupts			
Interrupts > Selectable CEU Events			
One-Frame Capture End Event	• Enabled • Disabled	Enabled	Capturing one frame from an external module has finished.
Horizontal Sync Event	• Enabled • Disabled	Disabled	Horizontal sync signal was input from an external module.
Vertical Sync Event	• Enabled • Disabled	Enabled	Vertical sync signal was input from an external module.
CRAM Buffer Overflow Error	• Enabled • Disabled	Enabled	Data overflowed in the CRAM write buffer.
H-Sync Validation Error	• Enabled • Disabled	Disabled	The number of configured H-sync cycles is different than the H-sync cycles input from the external module.
V-Sync Validation Error	• Enabled • Disabled	Disabled	The number of configured V-sync cycles is different than the V-sync cycles input

			from the external module.
V-Sync Error	• Enabled • Disabled	Enabled	V-sync has been input while CEU holds data (insufficient vertical-sync front porch).
No H-Sync error	• Enabled • Disabled	Enabled	No H-sync signal was input.
No V-Sync error	• Enabled • Disabled	Enabled	No V-sync signal was input.
Callback	Name must be a valid C symbol.	g_ceu0_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture as well as other status or error conditions.
CEU Interrupt Priority	MCU Specific Options		Select the CEU interrupt priority.

Clock Configuration

The CEU peripheral is clocked both from PCLKA and externally, from the camera module (VIO_CLK). The external input clock (VIO_CLK) should have a frequency at most the same as the CEU operating clock (PCLKA) frequency, with jitter on both sides included. The PCLKA frequency may be set using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time.

Note

At least 10 external clock cycles (VIO_CLK) must elapse after opening the CEU module, before starting a capture.

Pin Configuration

The VIO_CLK pin is a clock input to the MCU and should be connected to the clock output from the camera. The VIO_HD and VIO_VD pins must be connected to the horizontal and vertical sync signal output of the camera respectively. The VIO_D0 to VIO_D15 pins are the data bus input pins and should be connected to the relevant output pins of the camera. For 8-bit camera data bus VIO_D0 to VIO_D7 should be used.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Capture Resolution

- For Data Synchronous Fetch Mode and Image Capture Mode, capture size is calculated using the configured Horizontal Resolution, Vertical Resolution, and Bytes Per Pixel.
- For Data Enable Fetch Mode, the capture size is controlled by the external module and is defined as a period from a VD rising edge to the VD falling edge. For this mode Horizontal Resolution and Vertical Resolution are not used. However, the maximum capture size is configured using the 'Data Enable Buffer Size' option, which is used to configure the maximum write 'Firewall Address' location.

Note

For Data Enable Fetch Mode, the external module must transmit data in 4-byte units.

Capture Offset

The blanking period from a horizontal or vertical sync signal differs among external modules. Therefore, the capture start location must be specified in terms of external cycles from the sync signal so that an image can be captured from the valid image area. Some external modules output a horizontal sync signal as a data enable signal. In this case, there is no blanking period so the configured offsets must be cleared to 0.

- The horizontal capture start location must be specified in terms of the number of pixels from a horizontal sync signal.
- The vertical capture start location must be specified in terms of the number of H-cycles from a vertical sync signal.

Note

Capture offset is not used when Data Enable Fetch Mode is configured.

Scale Down

Scale down is configured by setting Output > Scale-Down properties to the desired output image dimensions in the configurator. When the configured output image size is less than the output input image size, the image will be scaled down to the output size before writing the data to memory.

The configurator automatically calculates the appropriate capture filter register scaling settings based on the requested output size. The filter output must be a multiple of 4 (vertical lines) or 8 (horizontal pixels).

Note

Hardware scale-down is available only in Image Capture Mode.
See also: Scale Down Limitations.

Usage Notes

Interrupt Configuration

- CEU V-sync, capture-end, and error interrupts are used by this module for reporting capture status and error events such as overrun, vertical line number setting and other capture errors.

Note

If both a capture complete event and capture error event occur simultaneously, the capture complete event should be disregarded.

CEU Setup With External Camera

- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- Ensure that the capture buffer address is 4-byte aligned and the buffer size is divisible by 32 bytes.

Note

Any required configuration for external cameras must be performed by the application.

Notes on Buffer Allocation in Data Synchronous Fetch Mode

- When Data Synchronous Fetch Mode is configured, the amount of space required (in bytes) may be calculated as size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel.

Notes on Buffer Allocation in Image Capture Mode

Image Capture Mode captures luminance (Y) and chrominance (Cb/Cr) components of the image in separate memory locations and can be selected by the Input > Capture Mode property.

- The Y and Cb/Cr buffers must be contiguously allocated in memory, with the chrominance buffer located immediately after the luminance buffer.
- The size of the luminance buffer in bytes should be the image width (pixels) * image height (lines) * 2.
- The size of the chrominance buffer varies depending on whether YCbCr420 format conversion is enabled
  - **YCbCr422 (no conversion)**: Same size as luminance buffer
  - **YCbCr420 (format conversion enabled)**: Half size of luminance buffer
- Pass the contiguous buffer pointer to R_CEU_CaptureStart. The firmware will automatically calculate the chrominance buffer address based on the expected luminance data size.

YCbCr422 Buffer Example in Image Capture Mode

```
/* Allocation example */
#define LUMINANCE_BUFFER_SIZE_BYTES (IMAGE_WIDTH * IMAGE_HEIGHT)
#define CHROMINANCE_BUFFER_SIZE_BYTES (LUMINANCE_BUFFER_SIZE_BYTES)
__ALIGNED(32) uint8_t buffer_ycbcr422[LUMINANCE_BUFFER_SIZE_BYTES +
                                      CHROMINANCE_BUFFER_SIZE_BYTES]
__attribute__((section(BSP_UNINIT_SECTION_PREFIX

     ".sdram_noinit")));
/* Access example */
uint8_t * p_luma_ycbcr422   = &buffer_ycbcr422[0];
uint8_t * p_chroma_ycbcr422 = &buffer_ycbcr422[LUMINANCE_BUFFER_SIZE_BYTES];
```

YCbCr420 Buffer Example in Image Capture Mode

```
/* Allocation example */
#define LUMINANCE_BUFFER_SIZE_BYTES (IMAGE_WIDTH * IMAGE_HEIGHT)
#define CHROMINANCE_BUFFER_SIZE_BYTES (LUMINANCE_BUFFER_SIZE_BYTES / 2)
__ALIGNED(32) uint8_t buffer_ycbcr420[LUMINANCE_BUFFER_SIZE_BYTES +
                                      CHROMINANCE_BUFFER_SIZE_BYTES]
```

```
__attribute__((section(BSP_UNINIT_SECTION_PREFIX

     ".sdram_noinit")));
/* Access example */
uint8_t * p_luma_ycbcr420   = &buffer_ycbcr420[0];
uint8_t * p_chroma_ycbcr420 = &buffer_ycbcr420[LUMINANCE_BUFFER_SIZE_BYTES];
```

Limitations

Scale Down Limitations

- Scale down is available only in Image Capture Mode
- When the input image is larger than VGA (640×480) the output image size must be between SubQCIF (128×96) and VGA (640×480), inclusive.
- The scaled output image cannot be larger than VGA, regardless of input size
- Images cannot be scaled down by more than 1/16

Examples

Basic Example

This is a basic example of minimal use of the CEU in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
bool g_ceu_capture_error;
bool g_ceu_capture_complete;
void ceu_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ceu_capture_error    = false;
    g_ceu_capture_complete = false;
    err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
    assert(FSP_SUCCESS == err);
    err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
 while (!g_ceu_capture_complete && !g_ceu_capture_error)
    {
 /* Wait for capture to complete. */
    }
/* Process image here if capture was successful. */
```

```
    err = R_CEU_Close(&g_ceu0_ctrl);
    assert(FSP_SUCCESS == err);
}
void ceu_callback (capture_callback_args_t * p_args)
{
 /* Multiple event flags may be set simultaneously */
 if (p_args->event & (uint32_t) ~(CEU_EVENT_HD | CEU_EVENT_VD | CEU_EVENT_FRAME_END))
    {
 /* Error processing should occur first. Application should not process complete
event if error occurred. */
       g_ceu_capture_error = true;
    }
 else
    {
 if (p_args->event & CEU_EVENT_VD)
      {
 /* Capture has started. Process V-Sync event. */
      }
 if (p_args->event & CEU_EVENT_FRAME_END)
      {
 /* Capture is complete and no error has occurred */
            g_ceu_capture_complete = true;
      }
    }
}
```

Data Structure Documentation

◆ ceu_byte_swapping_t

struct ceu_byte_swapping_t		
Swap bits configuration		
Data Fields		
uint8_t	swap_8bit_units: 1	Byte swapping in 8-bit units.
uint8_t	swap_16bit_units: 1	Byte swapping in 16-bit units.
uint8_t	swap_32bit_units: 1	Byte swapping in 32-bit units.

◆ ceu_edge_info_t

struct ceu_edge_info_t		
Edge information for latching signals		
Data Fields		
uint8_t	dsel: 1	Sets the edge for fetching the image data (D15 to D0) from an external module.
uint8_t	hdsel: 1	Sets the edge for capturing hd from external module.
uint8_t	vdsel: 1	Sets the edge for capturing vd from external module.

◆ ceu_extended_cfg_t

struct ceu_extended_cfg_t
Extended configuration structure for CEU.
Data Fields

ceu_capture_format_t	capture_format	Capture format for incoming data.
ceu_input_order_t	input_order	Input Y and CbCr order (Used for image capture mode)
ceu_output_format_t	output_format	Output format for storing to memory (Used for image capture mode)
ceu_data_bus_size_t	data_bus_width	Size of camera data bus.
ceu_edge_info_t	edge_info	
ceu_hsync_polarity_t	hsync_polarity	Polarity of HSYNC input.
ceu_vsync_polarity_t	vsync_polarity	Polarity of VSYNC input.
uint32_t	image_area_size	Image capture size. Used when setting firewall address for Data Enable Fetch mode.
ceu_byte_swapping_t	byte_swapping	Controls byte swapping in 8-bit, 16-bit and 32-bit units.
ceu_burst_transfer_mode_t	burst_mode	Bus transfer data size.
uint32_t	scale_down_factor	Scale down capture filter register setting (Used for image capture mode)
uint16_t	h_output_size	Output image horizontal size, in pixels (Used for image capture mode)
uint16_t	v_output_size	Output image vertical size, in lines (Used for image capture mode)
uint32_t	interrupts_enabled	Enabled interrupt events bit mask.
uint8_t	ceu_ipl	PDC interrupt priority.
IRQn_Type	ceu_irq	PDC IRQ number.

◆ ceu_instance_ctrl_t

struct ceu_instance_ctrl_t
CEU instance control block. DO NOT INITIALIZE.

Enumeration Type Documentation

◆ ceu_capture_mode_t

enum ceu_capture_mode_t	
Capture mode	
Enumerator	
CEU_CAPTURE_MODE_SINGLE	Single image capture.
CEU_CAPTURE_MODE_CONTINUOUS	Continuous image capture.

◆ ceu_data_bus_size_t

enum ceu_data_bus_size_t	
Data bus width	
Enumerator	
CEU_DATA_BUS_SIZE_8_BIT	Data bus is 8-bit.
CEU_DATA_BUS_SIZE_16_BIT	Data bus is 16-bit.

◆ ceu_hsync_polarity_t

enum ceu_hsync_polarity_t	
Polarity of input HSYNC signal	
Enumerator	
CEU_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
CEU_HSYNC_POLARITY_LOW	HSYNC signal is active low.

◆ ceu_vsync_polarity_t

enum ceu_vsync_polarity_t	
Polarity of input VSYNC signal	
Enumerator	
CEU_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
CEU_VSYNC_POLARITY_LOW	VSYNC signal is active low.

◆ ceu_burst_transfer_mode_t

enum ceu_burst_transfer_mode_t	
Enumerator	
CEU_BURST_TRANSFER_MODE_X1	Transferred to the bus in 32-byte units */.
CEU_BURST_TRANSFER_MODE_X2	Transferred to the bus in 64-byte units */.
CEU_BURST_TRANSFER_MODE_X4	Transferred to the bus in 128-byte units */.
CEU_BURST_TRANSFER_MODE_X8	Transferred to the bus in 256-byte units */.

◆ ceu_event_t

enum ceu_event_t	
Enumerator	
CEU_EVENT_FRAME_END	Frame end event (CPE)
CEU_EVENT_HD	(Not Used) HD received (HD)
CEU_EVENT_VD	VD received (VD)
CEU_EVENT_CRAM_OVERFLOW	Data overflowed in the CRAM buffer (CDTOF)
CEU_EVENT_HD_MISMATCH	HD mismatch (IGHS)
CEU_EVENT_VD_MISMATCH	VD mismatch (IGVS)
CEU_EVENT_VD_ERROR	Invalid VD condition (VBP)
CEU_EVENT_FIREWALL	Data write address exceeds firewall (FWF)
CEU_EVENT_HD_MISSING	HD was expected but not input (NHD)
CEU_EVENT_VD_MISSING	VD was expected but not input (NVD)

◆ ceu_capture_format_t

enum ceu_capture_format_t	
Capture mode for CEU.	
Enumerator	
CEU_CAPTURE_FORMAT_IMAGE_CAPTURE	YCbCr data.
CEU_CAPTURE_FORMAT_DATA_SYNCHRONOUS	Raw formatted data.
CEU_CAPTURE_FORMAT_DATA_ENABLE	JPG formatted data.

◆ ceu_input_order_t

enum ceu_input_order_t	
Set the input order of the luminance component and chrominance component (Y and CbCr). Used for image capture mode only.	
Enumerator	
CEU_INPUT_ORDER_CB0Y0CR0Y1	Image input data is fetched in the order of Cb0, Y0, Cr0, Y1.
CEU_INPUT_ORDER_CR0Y0CB0Y1	Image input data is fetched in the order of Cr0, Y0, Cb0, Y1.
CEU_INPUT_ORDER_Y0CB0Y1CR0	Image input data is fetched in the order of Y0, Cb0, Y1, Cr0.
CEU_INPUT_ORDER_Y0CR0Y1CB0	Image input data is fetched in the order of Y0, Cr0, Y1, Cb0.

◆ ceu_output_format_t

enum ceu_output_format_t	
Format for outputting captured CEU data to memory.	
Enumerator	
CEU_OUTPUT_FORMAT_YCBCR420	Output the data in YCbCr 4:2:0 format (hardware conversion from YCbCr 4:2:2)
CEU_OUTPUT_FORMAT_YCBCR422	Output the data in YCbCr 4:2:2 format (no conversion)

Function Documentation

◆ R_CEU_Open()

fsp_err_t R_CEU_Open (capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg*)

CEU module initialization.

Implements capture_api_t::open

The function provides initial configuration for the CEU module. Further initialization may be performed in capture_api_t::captureStart. This function should be called once prior to calling any other CEU API functions. After the CEU is opened the Open function should not be called again without first calling the Close function.

Example:

```
err = R_CEU_Open(&g_ceu0_ctrl, &g_ceu0_cfg);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_CEU_Close()

fsp_err_t R_CEU_Close (capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface.

Implements capture_api_t::close

Stops any active captures, clears internal driver state-data, disables interrupts, and powers off the CEU peripheral.

Example:

```
err = R_CEU_Close(&g_ceu0_ctrl);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_CEU_CaptureStart()

fsp_err_t R_CEU_CaptureStart (capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer*)

Starts a capture.

Implements capture_api_t::captureStart.

Sets up the interface to transfer data from the CEU into the specifiec buffer. Configures the CEU settings as previously set by the capture_api_t::open API. When a capture is complete the callback registered during capture_api_t::open API call or by capture_api_t::callbackSet API will be called.

Example:

```
err = R_CEU_CaptureStart(&g_ceu0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_INVALID_ADDRESS	Invalid buffer address alignment.
FSP_ERR_IN_USE	Capture is in progress.
FSP_ERR_INVALID_STATE	Capture is pending.
FSP_ERR_NOT_INITIALIZED	Callback function has not been set.

◆ R_CEU_CallbackSet()

fsp_err_t R_CEU_CallbackSet (capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void *const *p_context*, capture_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CEU_StatusGet()

fsp_err_t R_CEU_StatusGet (capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status*)
Provides the ceu operating status. Implements capture_api_t::statusGet. **Return values** FSP_SUCCESS — Initialization was successful. FSP_ERR_ASSERTION — One or more parameters is NULL. FSP_ERR_NOT_OPEN — Open has not been successfully called.

5.2.8.3 D/AVE 2D Port Interface (r_drw)

Modules » Graphics

Driver for the DRW peripheral on RA MCUs. This module is a port of D/AVE 2D.

Overview

Note

The D/AVE 2D Port Interface (D1 layer) is a HAL layer for the D/AVE D2 layer API and does not provide any interfaces to the user. Consult the TES Dave2D Driver Documentation for further information on using the D2 API.
For cross-platform compatibility purposes the D1 and D2 APIs are not bound by FSP coding guidelines for function names and general module functionality.
The d1_cacheflush() and d1_cacheblockflush() functions provided by the D1 layer are weakly defined and may be overridden by the user to perform cache maintenance if necessary for a given RA device and configuration.

Supported Devices

Device Group	Devices
RA6	RA6M3
RA8	RA8D1, RA8D2, RA8E2, RA8M1, RA8P1, RA8T1

Configuration

Build Time Configurations for r_drw

The following build time configurations are defined in fsp_cfg/r_drw_cfg.h:

Configuration	Options	Default	Description
Allow Indirect Mode	• Enabled • Disabled	Enabled	Enable indirect mode to allow no-copy mode for d2_adddlist (see the TES Dave2D Driver Documentation for details).
Memory Allocation	• Default • Custom	Default	Set Memory Allocation to Default to use built-in dynamic memory allocation for the D2 heap. This will use an RTOS heap if configured; otherwise, standard C malloc and free will be used. Set to Custom to define your own allocation scheme for the D2 heap. In this case, the developer will need to define the following functions: void * d1_malloc(size_t size) void d1_free(void * ptr)

Configurations for Graphics > D/AVE 2D Port Interface (r_drw)

This module can be added to the Stacks tab via New Stack > Graphics > D/AVE 2D Port Interface (r_drw).

Configuration	Options	Default	Description
D2 Device Handle Name	Name must be a valid C symbol	d2_handle0	Set the name for the d2_device handle used when calling D2 layer functions.
DRW Interrupt Priority	MCU Specific Options		Select the DRW_INT (display list completion) interrupt priority.

Heap Size

The D1 port layer allows the D2 driver to allocate memory as needed. There are three ways the driver can accomplish this:

1. Allocate memory using the main heap
2. Allocate memory using a heap provided by an RTOS
3. Allocate memory via user-provided functions

When the "Memory Allocation" configuration option is set to "Default" the driver will use an RTOS implementation if available and the main heap otherwise. Setting the option to "Custom" allows the user to define their own scheme using the following prototypes:

```
void * d1_malloc(size_t size);
void d1_free(void * ptr);
```

Warning

If there is no RTOS-based allocation scheme the main heap will be used. Be sure that it is enabled by setting the "Heap size (bytes)" property under RA Common on the **BSP** tab of the RA Configuration editor.

Note

It is recommended to add 32KB of additional heap space for the D2 driver until the actual usage can be determined in your application.

Interrupt

The D1 port includes one interrupt to handle various events like display list completion or bus error. This interrupt is managed internally by the D2 driver and no callback function is available.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the DRW engine:

- The DRW module supports two additional interrupt types - bus error and render complete. These interrupts are not needed for D2 layer operation and thus are not supported.
- If the DRW module is stopped during rendering the render will continue once the module is started again. If this behavior is undesirable in your application it is recommended to call d2_flushframe before stopping the peripheral.
- The resolution and size limits for D/AVE 2D are as follows:

Item	Limit (pixels)
Coordinate range	-2048 to 2047 (1:11:4 fixedpoint)
Object/primitive size	1024 x 1024 (10:4 fixedpoint)
Framebuffer size	2048 x 2048
Texture size	1024 x 1024
Blit size	2047 x 1024

fsp_err_t	R_VIN_StatusGet (capture_ctrl_t *const p_api_ctrl, capture_status_t *p_status)

Detailed Description

Driver for the VIN peripheral on RA MCUs. This module implements the CAPTURE Interface.

Overview

The VIN peripheral relies on the use of a Camera Serial Interface (CSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats and writes image data to memory according to the MIPI_CSI and R_VIN configurations.

Features

The module has one video channel that can control the capture of data into a capture area of up to 4096 × 4096 pixels when scaling is off (2048 × 2048 pixels when scaling is on). It can also provide vertical and horizontal scaling of the data by up to three and two times, respectively.

For captured video data, the VIN provides a color space conversion function from YCbCr-422 to RGB or RGB to YCbCr-422 and a format conversion function from RGB to ARGB.

As the VIN internally generates a field signal, it can capture progressive data.

Supported Data Types:

Image Format	Input Camera Format (MIPI CSI)	Output Memory Format
YCbCr-422 8-bit	Supported	Supported
YCbCr-422 10-bit	Supported	Supported
RGB-565		Supported
ARGB-1555		Supported
RGB-888	Supported	
ARGB-8888		Supported
RAW8	Supported	Supported

Target Devices

Device Group	Devices

RA8	RA8D2, RA8P1

Configuration

Build Time Configurations for r_vin

The following build time configurations are defined in fsp_cfg/r_vin_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Clock Configuration

AXI bus clock (aclk) runs on ICLK and is the main clock for VIN, processing one pixel per clock cycle. In the case of CSI-2, VIN processes the following depths with aclk, so select a clock that is higher than the transfer rate.

- RGB 888: depth = 24 bit
- YCbCr8bit: depth = 16 bit
- YCbCr10bit: depth = 20 bit
- RAW8: depth = 16 bit Example: When setting up for a 720 Mbps 2 lane MIPI CSI transfer rate, with YCbCr 8bit scaling bypass, aclk must be set to a frequency of 720*2/16 = 90 MHz or higher.

Pin Configuration

VIN does not require pin configuration.

Usage Notes

Color Space Conversion

VIN may (optionally) be configured to convert between RGB and YCbCr data.

RGB to YCbCr Conversion

Formulas are below for the conversion of RGB to YCbCr formats Y = ((C_RtoY × R + C_GtoY × G + C_BtoY × B) × 2 ^ YCLSFT) + Y_Addition Cb = ((C_RtoCb × R + C_GtoCb × G + C_BtoCb × B) × 2 ^ CBCLSFT) + Cb_Addition Cr = ((C_RtoCr × R + C_GtoCr × G + C_BtoCr × B) × 2 ^ CRCLSFT) + Cr_Addition

Note
: YCLSFT, CBCLSFT, and CRCLSFT values are all fixed to 10.

YCbCr to RGB Conversion

When enabled, YCbCr to RGB conversion is carried out according to the configured matrix coefficients. The color conversion input is extended to 12 bits by the data extension selection. See User Manual for additional information.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the VIN module.

```
void vin_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = R_VIN_Open(&g_vin0_ctrl, &g_vin0_cfg);
    assert(FSP_SUCCESS == err);
    USER_CODE_camera_open();          // Prepare camera for capture
    err = R_VIN_CaptureStart(&g_vin0_ctrl, NULL);
    assert(FSP_SUCCESS == err);
    USER_CODE_camera_stream_on();      // Camera begin outputting image data
 capture_status_t capture_status;
    err = R_VIN_StatusGet(&g_vin0_ctrl, &capture_status);
    assert(FSP_SUCCESS == err);
    err = R_VIN_Close(&g_vin0_ctrl);
    assert(FSP_SUCCESS == err);
}
void vin0_callback (capture_callback_args_t * p_args)
{
 vin_event_t event            = (vin_event_t) p_args->event;
 vin_module_status_t    module_status    = (vin_module_status_t)
p_args->event_status;
 vin_interrupt_status_t interrupt_status = (vin_interrupt_status_t)
p_args->interrupt_status;
    switch (event)
    {
 case VIN_EVENT_NOTIFY:
      {
            USER_CODE_vin_process_notify(module_status, interrupt_status);
 if (interrupt_status.bits.frame_complete)
      {
 /* Capture Complete - Process data buffer pointer and index */
```

```
                USER_CODE_vin_process_completed_frame(p_args->p_buffer,
module_status.bits.latest_buffer);
            }
 break;
       }
 case VIN_EVENT_ERROR:
      {
 // Process Error based on interrupt and module status;
            USER_CODE_vin_process_error(module_status, interrupt_status);
 break;
       }
 default:
      {
 /* Do nothing */
 break;
       }
    }
}
void USER_CODE_camera_open (void)
{
 // Pre-transmission Camera Configuration
}
void USER_CODE_camera_stream_on (void)
{
 // Begin Streaming Image Data
}
void USER_CODE_vin_process_error (vin_module_status_t module_status,
vin_interrupt_status_t interrupt_status)
{
 FSP_PARAMETER_NOT_USED(module_status);
 FSP_PARAMETER_NOT_USED(interrupt_status);
 // Process Error
}
void USER_CODE_vin_process_notify (vin_module_status_t module_status,
```

```
vin_interrupt_status_t interrupt_status)
{
 FSP_PARAMETER_NOT_USED(module_status);
 FSP_PARAMETER_NOT_USED(interrupt_status);
 // Process Status Notification
}
void USER_CODE_vin_process_completed_frame (uint8_t * p_complete_frame, uint8_t
frame_idx)
{
 FSP_PARAMETER_NOT_USED(p_complete_frame);
 FSP_PARAMETER_NOT_USED(frame_idx);
 // Process Frame Data
}
```

VIN_DATA_TYPE_RGB888_BIT	Data Type RGB888.
VIN_DATA_TYPE_RAW8_BIT	Data Type RAW8.

◆ vin_yuv444_conversion_mode_t

enum vin_yuv444_conversion_mode_t	
VIN Input YUV444 Conversion Mode	
Enumerator	
VIN_YUV444_CONVERSION_MODE_DATA_EXTEND	The data of CbCr to be interpolated holds the data one pixel before.
VIN_YUV444_CONVERSION_MODE_INTERPOLATE	Generates CbCr data to be interpolated.

◆ vin_pixel_data_clipping_t

enum vin_pixel_data_clipping_t	
VIN Pixel Data Clipping	
Enumerator	
VIN_PIXEL_DATA_CLIPPING_DEFAULT	Default clipping mode.
VIN_PIXEL_DATA_CLIPPING_NIBBLE	Lower 4-bits clipping mode.
VIN_PIXEL_DATA_CLIPPING_DISABLED	Clipping mode disabled.

◆ vin_conversion_mode_t

enum vin_conversion_mode_t	
VIN Conversion Mode	
Enumerator	
VIN_CONVERSION_MODE_NONE	Data is not converted before output.
VIN_CONVERSION_MODE_RGB_TO_ARGB	RGB input Data is converted to ARGB before output.
VIN_CONVERSION_MODE_YC_SEPARATED	Y and CbCr data are separated before output.

◆ vin_yc_transform_mode_t

enum vin_yc_transform_mode_t	
VIN YC Transform Mode	
Enumerator	
VIN_YC_TRANSFORM_MODE_Y_CBCR	Y and CbCr data are transferred to memory.
VIN_YC_TRANSFORM_MODE_Y	Y data is transferred to memory as 8-bit data.
VIN_YC_TRANSFORM_MODE_Y10_CBCR	10-bit Y data and 8-bit CbCr data are transferred to memory
VIN_YC_TRANSFORM_MODE_Y10	10-bit Y data is transferred to memory

◆ vin_interpolation_mode_t

enum vin_interpolation_mode_t	
VIN Interpolation Mode	
Enumerator	
VIN_INTERPOLATION_MODE_BILINEAR	Y and CbCr data are transferred to memory.
VIN_INTERPOLATION_MODE_NEIGHBOR	Y data is transferred to memory as 8-bit data.

◆ vin_event_t

enum vin_event_t	
VIN instance control block. Implements	
Enumerator	
VIN_EVENT_NONE	No Event.
VIN_EVENT_NOTIFY	Notification Event.
VIN_EVENT_ERROR	Error Event.

Function Documentation

◆ R_VIN_Open()

fsp_err_t R_VIN_Open (capture_ctrl_t *const *p_api_ctrl*, capture_cfg_t const *const *p_cfg*)

Initialize the VIN peripheral.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_ALREADY_OPEN	The instance is already opened.

◆ R_VIN_Close()

fsp_err_t R_VIN_Close (capture_ctrl_t *const *p_api_ctrl*)

Close VIN and display data instances, disable interrupts, and power-off the module.

- NOTE: Application shall issue stop command to the peripheral and wait at least one full frame before calling CSI_Stop, after ensuring MIPI CSI reception is no longer active by checking data returned by MIPI_CSI GetStatus()

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_VIN_CaptureStart()

fsp_err_t R_VIN_CaptureStart (capture_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_buffer*)

Start video capture.

- NOTE: For best results, camera should not be transmitting data until after VIN capture start has been called.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	The physical interface is currently in use.
FSP_ERR_INVALID_STATE	VIN is already in video mode.
FSP_ERR_UNSUPPORTED	p_buffer parameter is not supported.

◆ R_VIN_StatusGet()

fsp_err_t R_VIN_StatusGet (capture_ctrl_t *const *p_api_ctrl*, capture_status_t * *p_status*)

Provide information about current VIN status.

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

Detailed Description

Driver for the GLCDC peripheral on RA MCUs. This module implements the Display Interface.

Overview

The GLCDC is a multi-stage graphics output peripheral designed to automatically generate timing and data signals for LCD panels. As part of its internal pipeline the two internal graphics layers can be repositioned, alpha blended, color corrected, dithered and converted to and from a wide variety of pixel formats.

Features

The following features are available:

Feature	Options
Input color formats	ARGB8888, ARGB4444, ARGB1555, RGB888 (32-bit), RGB565, CLUT 8bpp, CLUT 4bpp, CLUT 1bpp
Output color formats	RGB888, RGB666, RGB565, Serial RGB888 (8-bit parallel)
Correction processes	Alpha blending, positioning, brightness and

	contrast, gamma correction, dithering
Timing signals	Dot clock, Vsync, Hsync, Vertical and horizontal data enable (DE)
Maximum resolution	Up to 2038 x 2043 pixels (dependent on sync signal width)
Maximum dot clock	60MHz for serial RGB mode, 54MHz otherwise
Internal clock divisors	1-9, 12, 16, 24, 32
Interrupts	Line detect (Vblank), Layer 1 underflow, Layer 2 underflow
Other functions	Byte-order and endianness control, line repeat function

Supported Devices

Device Group	Devices
RA6	RA6M3
RA8	RA8D1, RA8D2, RA8E2, RA8P1

Configuration

Build Time Configurations for r_glcdc

The following build time configurations are defined in fsp_cfg/r_glcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build.
Color Correction	• On • Off	Off	If selected, code to adjust brightness, contrast and gamma settings is included in the build. When disabled all color correction configuration options are ignored.

Configurations for Graphics > Graphics LCD (r_glcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Graphics LCD (r_glcdc).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_display0	Module name.

Interrupts			
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be defined here.
Line Detect Interrupt Priority	MCU Specific Options		Select the line detect (Vsync) interrupt priority.
Underflow 1 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 1.
Underflow 2 Interrupt Priority	MCU Specific Options		Select the underflow interrupt priority for layer 2.
Input			
Input > Graphics Layer 1			
Input > Graphics Layer 1 > General			
Enabled	• Yes • No	Yes	Specify Used if the graphics layer 1 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.
Horizontal size	Value must be an integer from 16 to 2040	480	Specify the number of horizontal pixels.
Vertical size	Value must be an integer from 16 to 2043	854	Specify the number of vertical pixels.
Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Color format	• ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit)	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.

	• CLUT4 (4-bit) • CLUT1 (1-bit)		
Line descending mode	• Enabled • Disabled	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 1 > Framebuffer			
Framebuffer name	This property must be a valid C symbol	fb_background	Specify the name for the framebuffer for Layer 1.
Number of framebuffers	Must be a valid non-negative integer	2	Number of framebuffers allocated for Graphics Layer 1.
Section for framebuffer allocation	Manual Entry	.sdram_noinit	Specify the section in which to allocate the framebuffer.
Input > Graphics Layer 1 > Line Repeat			
Enable	• On • Off	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e (vertical size) x (lines repeat times) must be equal to the panel vertical size	0	Specify the number of times the image is repeated.
Input > Graphics Layer 1 > Fading			
Mode	• None • Fade-in • Fade-out	None	Select the fade method.
Speed	Value must be an integer from 0 to 255	0	Specify the number of frames for the fading transition to complete.
Input > Graphics Layer 2			
Input > Graphics Layer 2 > General			
Enabled	• Yes • No	No	Specify Used if the graphics layer 2 is used. If so a framebuffer will be automatically generated based on the specified height and horizontal stride.

Horizontal size	Value must be be an integer from 16 to 2040	480	Specify the number of horizontal pixels.
Vertical size	Value must be be an integer from 16 to 2043	854	Specify the number of vertical pixels.
Horizontal position	Must be a valid non-negative integer with a maximum configurable value of 4091	0	Specify the horizontal offset in pixels of the graphics layer from the background layer.
Vertical position	Must be a valid non-negative integer with a maximum configurable value of 4094	0	Specify the vertical offset in pixels of the graphics layer from the background layer.
Color format	• ARGB8888 (32-bit) • RGB888 (32-bit) • RGB565 (16-bit) • ARGB1555 (16-bit) • ARGB4444 (16-bit) • CLUT8 (8-bit) • CLUT4 (4-bit) • CLUT1 (1-bit)	RGB565 (16-bit)	Specify the graphics layer Input format. If selecting CLUT formats, you must write the CLUT table data before starting output.
Line descending mode	• Enabled • Disabled	Disabled	Select Used if the framebuffer starts from the bottom of the line.
Input > Graphics Layer 2 > Framebuffer			
Framebuffer name	This property must be a valid C symbol	fb_foreground	Specify the name for the framebuffer for Layer 2.
Number of framebuffers	Must be a valid non-negative integer	2	Number of framebuffers allocated for Graphics Layer 2.
Section for framebuffer allocation	Manual Entry	.sdram_noinit	Specify the section in which to allocate the framebuffer.
Input > Graphics Layer 2 > Line Repeat			
Enable	• On • Off	Off	Select On if the display will be repeated from a smaller section of the framebuffer.
Repeat count	Must be a valid non-negative integer with a maximum configurable value of 65535 i.e	0	Specify the number of times the image is repeated.

	(vertical size) x (lines repeat times) must be equal to the panel vertical size		
Input > Graphics Layer 2 > Fading			
Mode	• None • Fade-in • Fade-out	None	Select the fade method.
Speed	Value must be an integer from 0 to 255	0	Specify the number of frames for the fading transition to complete.
Output			
Output > Timing			
Horizontal total cycles	Value must be an integer from 24 to 2047	559	Specify the total cycles in a horizontal line. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system
Horizontal active video cycles	Value must be an integer from 16 to 2040	480	Specify the number of active video cycles in a horizontal line (including front and back porch). Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal back porch cycles	Value must be an integer from 5 to 2029	5	Specify the number of back porch cycles in a horizontal line. Back porch starts from the beginning of Hsync cycles, which means back porch cycles contain Hsync cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal sync signal cycles	Value must be an integer from 0 to 2046	2	Specify the number of Hsync signal assertion cycles. Set to the number of cycles defined in the data sheet of LCD panel sheet in your system.
Horizontal sync signal	• Low active	Low active	Select the polarity of

polarity	• High active		Hsync signal to match your system.
Vertical total lines	Value must be an integer from 20 to 2047	894	Specify number of total lines in a frame (including front and back porch).
Vertical active video lines	Value must be an integer from 16 to 2043	854	Specify the number of active video lines in a frame.
Vertical back porch lines	Value must be an integer from 3 to 2030	20	Specify the number of back porch lines in a frame. Back porch starts from the beginning of Vsync lines, which means back porch lines contain Vsync lines.
Vertical sync signal lines	Value must be an integer from 0 to 2046	3	Specify the Vsync signal assertion lines in a frame.
Vertical sync signal polarity	• Low active • High active	Low active	Select the polarity of Vsync signal to match to your system.
Data Enable Signal Polarity	• Low active • High active	High active	Select the polarity of Data Enable signal to match to your system.
Sync edge	• Rising edge • Falling edge	Falling edge	Select the polarity of Sync signals to match to your system.
Output > Format			
Color format	• 24bits RGB888 • 18bits RGB666 • 16bits RGB565 • 8bits serial	24bits RGB888	Specify the graphics layer output format to match to your LCD panel.
Color order	• RGB • BGR	RGB	Select data order for output signal to LCD panel.
Endian	• Little endian • Big endian	Little endian	Select data endianness for output signal to LCD panel.
Output > Background			
Alpha	Value must be an integer from 0 to 255	255	Alpha component of the background color.
Red	Value must be an integer from 0 to 255	0	Red component of the background color.

Green	Value must be an integer from 0 to 255	0	Green component of the background color.
Blue	Value must be an integer from 0 to 255	0	Blue component of the background color.
CLUT			
Enabled	• Yes • No	No	Specify Used if selecting CLUT formats for a graphics layer input format. If used, a buffer (CLUT_buffer) will be automatically generated based on the selected pixel width.
Size	Must be a valid non-negative integer with a maximum configurable value of 256	256	Specify the number of entries for the CLUT source data buffer. Each entry consumes 4 bytes (1 word).
TCON			
Hsync pin select	• Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3	LCD_TCON1	Select the TCON pin used for the Hsync signal to match to your system.
Vsync pin select	• Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3	LCD_TCON0	Select TCON pin used for Vsync signal to match to your system.
Data enable (DE) pin select	• Not used • LCD_TCON0 • LCD_TCON1 • LCD_TCON2 • LCD_TCON3	LCD_TCON2	Select TCON pin used for DataEnable signal to match to your system.
Panel clock source	• Internal clock (GLCDCLK) • External clock (LCD_EXTCLK)	Internal clock (GLCDCLK)	Choose between an internal GLCDCLK generated from PCLKA or an external clock provided to the LCD_EXTCLK pin.
Panel clock division ratio	Refer to the RA Configuration tool for available options.	1/8	Select the clock source divider value.
Color Correction			
Color Correction > Brightness			
Enabled	• Yes	No	Enable brightness color

	• No		correction.
Red channel	Value must be an integer from 0 to 1023	512	Red component of the brightness calibration. This value is divided by 512 to determine gain.
Green channel	Value must be an integer from 0 to 1023	512	Green component of the brightness calibration. This value is divided by 512 to determine gain.
Blue channel	Value must be an integer from 0 to 1023	512	Blue component of the brightness calibration. This value is divided by 512 to determine gain.
Color Correction > Contrast			
Enabled	• Yes • No	No	Enable contrast color correction.
Red channel gain	Value must be an integer from 0 to 255	128	Red component of the contrast calibration. This value is divided by 128 to determine gain.
Green channel gain	Value must be an integer from 0 to 255	128	Green component of the contrast calibration. This value is divided by 128 to determine gain.
Blue channel gain	Value must be an integer from 0 to 255	128	Blue component of the contrast calibration. This value is divided by 128 to determine gain.
Color Correction > Gamma			
Color Correction > Gamma > Tables			
Color Correction > Gamma > Tables > Red			
Color Correction > Gamma > Tables > Red > Gain			
0	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
1	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
2	Value must be an	1024	Enter a gain value from

	integer from 0 to 2047		0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
3	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
4	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
5	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
6	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
7	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
8	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
9	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
10	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
11	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).

12	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
13	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
14	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
15	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).
Color Correction > Gamma > Tables > Red > Threshold			
1	Value must be an integer from 0 to 1023	64	Enter a threshold value between the surrounding values less than or equal to 1023.
2	Value must be an integer from 0 to 1023	128	Enter a threshold value between the surrounding values less than or equal to 1023.
3	Value must be an integer from 0 to 1023	192	Enter a threshold value between the surrounding values less than or equal to 1023.
4	Value must be an integer from 0 to 1023	256	Enter a threshold value between the surrounding values less than or equal to 1023.
5	Value must be an integer from 0 to 1023	320	Enter a threshold value between the surrounding values less than or equal to 1023.
6	Value must be an integer from 0 to 1023	384	Enter a threshold value between the surrounding values less than or equal to 1023.
7	Value must be an integer from 0 to 1023	448	Enter a threshold value between the surrounding values less

			than or equal to 1023.
8	Value must be an integer from 0 to 1023	512	Enter a threshold value between the surrounding values less than or equal to 1023.
9	Value must be an integer from 0 to 1023	576	Enter a threshold value between the surrounding values less than or equal to 1023.
10	Value must be an integer from 0 to 1023	640	Enter a threshold value between the surrounding values less than or equal to 1023.
11	Value must be an integer from 0 to 1023	704	Enter a threshold value between the surrounding values less than or equal to 1023.
12	Value must be an integer from 0 to 1023	768	Enter a threshold value between the surrounding values less than or equal to 1023.
13	Value must be an integer from 0 to 1023	832	Enter a threshold value between the surrounding values less than or equal to 1023.
14	Value must be an integer from 0 to 1023	896	Enter a threshold value between the surrounding values less than or equal to 1023.
15	Value must be an integer from 0 to 1023	960	Enter a threshold value between the surrounding values less than or equal to 1023.

Color Correction > Gamma > Tables > Green

Color Correction > Gamma > Tables > Green > Gain

0	Value must be an integer from 0 to 2047	1024	Enter a gain value from 0 to 2047 (corresponding to gain of 0 and 1.999, respectively).

6	Value must be an integer from 0 to 1023	384	Enter a threshold value between the surrounding values less than or equal to 1023.
7	Value must be an integer from 0 to 1023	448	Enter a threshold value between the surrounding values less than or equal to 1023.

8	Value must be an integer from 0 to 1023	512	Enter a threshold value between the surrounding values less than or equal to 1023.
9	Value must be an integer from 0 to 1023	576	Enter a threshold value between the surrounding values less than or equal to 1023.
10	Value must be an integer from 0 to 1023	640	Enter a threshold value between the surrounding values less than or equal to 1023.
11	Value must be an integer from 0 to 1023	704	Enter a threshold value between the surrounding values less than or equal to 1023.
12	Value must be an integer from 0 to 1023	768	Enter a threshold value between the surrounding values less than or equal to 1023.
13	Value must be an integer from 0 to 1023	832	Enter a threshold value between the surrounding values less than or equal to 1023.
14	Value must be an integer from 0 to 1023	896	Enter a threshold value between the surrounding values less than or equal to 1023.
15	Value must be an integer from 0 to 1023	960	Enter a threshold value between the surrounding values less than or equal to 1023.
Red	• On • Off	Off	Enable gamma color correction for the red channel.
Green	• On • Off	Off	Enable gamma color correction for the green channel.
Blue	• On • Off	Off	Enable gamma color correction for the blue channel.
Table Mode	• Constant • Variable	Variable	Set to Constant to override the automatically-generated RAM gamma tables with a constant declaration using the provided values.

Process order	• Brightness/contrast first • Gamma first	Brightness/contrast first	Select the color correction processing order.
Dithering			
Enabled	• Yes • No	No	Enable dithering to reduce the effect of color banding.
Mode	• Truncate • Round off • 2x2 Pattern	Truncate	Select the dithering mode.
Pattern A	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern B	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern C	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.
Pattern D	• Pattern 00 • Pattern 01 • Pattern 10 • Pattern 11	Pattern 11	Select the dithering pattern.

Clock Configuration

The peripheral clock for this module is PCLKA.

The dot clock is typically generated from the PLL with a maximum output frequency of 54 MHz in most pixel formats (60 MHz for serial RGB). Optionally, a clock signal can be provided to the LCD_EXTCLK pin for finer framerate control (60 MHz maximum input). With either clock source dividers of 1-9, 12, 16, 24 and 32 may be used. Clocks must be initialized and settled prior to starting this module.

Pin Configuration

This module controls a variety of pins necessary for LCD data and timing signal output:

Pin Name	Function	Notes
LCD_EXTCLK	External clock signal input	The maximum input clock frequency is 60MHz.
LCD_CLK	Dot clock output	The maximum output frequency is 54MHz (60MHz in serial RGB mode).
LCD_DATAn	Pixel data output lines	Pin assignment and color order

		is based on the output block configuration. See "Output Control for Data Format" in the GLCDC section of the relevant hardware manual for details.
LCD_TCONn	Panel timing signal output	These pins can be configured to output vertical and horizontal synchronization and data valid signals.

Note

There are two banks of pins listed for the GLCDC in the RA6M3 User's Manual (_A and _B). In most cases the _B bank will be used as _A conflicts with SDRAM pins. In either case, it is generally recommended to only use pins from only one bank at a time as this allows for superior signal routing both inside and outside the package. If _A and _B pins must be mixed be sure to note the timing precision penalty detailed in Table 60.33 in in the RA6M3 User's Manual.

Usage Notes

Overview

The GLCDC peripheral is a combination of several sub-peripherals that form a pixel data processing pipeline. Each block passes pixel data to the next but otherwise they are disconnected from one another - in other words, changing timing block parameters does not affect the output generation block configuration and vice versa.

Initial Configuration

During R_GLCDC_Open all configured parameters are set in the GLCDC peripheral fully preparing it for operation. Once opened, calling R_GLCDC_Start is typically all that is needed for basic operation. Background generation, timing and output parameters are not configurable at runtime, though layer control and color correction options can be altered.

Framebuffer Allocation

The framebuffer should be allocated in the highest-speed region available without displacing the stack, heap and other program-critical structures. Regardless of the placement two rules must be followed to ensure correct operation of the GLCDC:

- The framebuffer must be aligned on a 64-byte boundary
- The horizontal stride of the buffer must be a multiple of 64 bytes

Note

Framebuffers allocated through the RA Configuration tool automatically follow the alignment and size requirements.

If your framebuffer will be placed in internal memory it is recommended to avoid any high-speed RAM regions as there is typically no speed advantage for doing so. In particular, it is important to ensure the framebuffer does not push the stack or any heaps outside of high-speed RAM areas to preserve CPU performance.

Graphics Layers and Timing Parameters

The GLCDC synthesizes graphics data through two configurable graphics layers onto a background

layer. The background is used as a solid-color canvas upon which to composite data from the graphics layers. The two graphics layers are blended on top of each other (Layer 2 above Layer 1) and overlaid on the background layer based on their individual configuration. The placement of the layers (as well as LCD timing parameters) are detailed in Figure 1. The colors of the dimensions indicate which element of the display_cfg_t struct is being referenced - for example, the width of the background layer would be [display_cfg].output.htiming.display_cyc as shown in the figure below.

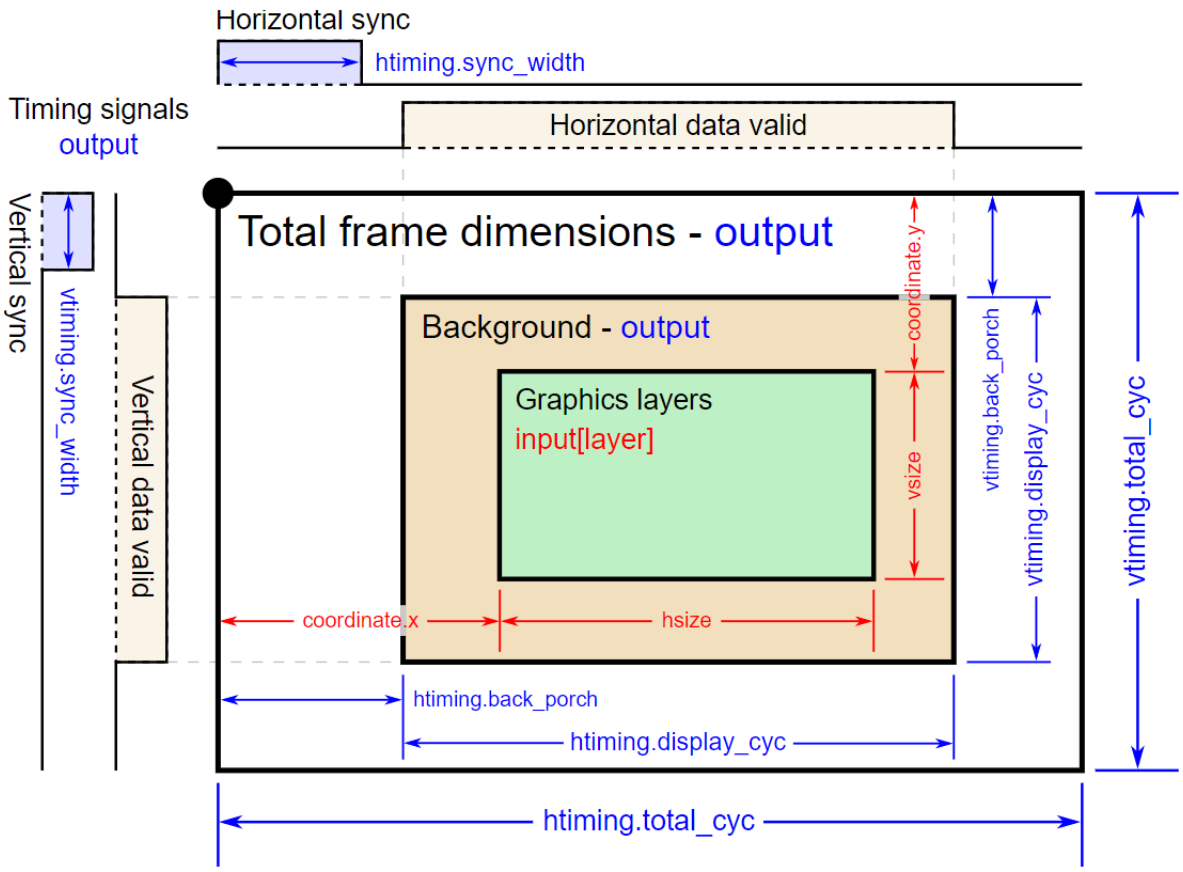

Figure 256: GLCDC layers and timing

Note

The data enable signal (if configured) is the logical AND of the horizontal and vertical data valid signals. In the GLCDC layers and timing figure, only one graphics layer is shown for simplicity. Additionally, in most applications the graphics layer(s) will be the same dimensions as the background layer.

Runtime Configuration Options

Note

All runtime configurations detailed below are also automatically configured during R_GLCDC_Open based on the options selected in the RA Configuration editor.

Blend processing

Control of layer positioning, alpha blending and fading is possible at runtime via R_GLCDC_LayerChange. This function takes a display_runtime_cfg_t parameter which contains the same input and layer elements as the display_cfg_t control block. Refer to the documentation for display_runtime_cfg_t as well as the Examples below to see what options are configurable.

Brightness and contrast

Brightness and contrast correction can be controlled through R_GLCDC_ColorCorrection. The display_correction_t parameter is used to control enabling, disabling and gain values for both corrections as shown below:

```
display_correction_t correction;
/* Brightness values are 0-1023 with +512 offset being neutral */
   correction.brightness.r = 512;
   correction.brightness.g = 512;
   correction.brightness.b = 512;
/* Contrast values are 0-255 representing gain of 0-2 (128 is gain of 1) */
   correction.contrast.r = 128;
   correction.contrast.g = 128;
   correction.contrast.b = 128;
/* Brightness and contrast correction can be enabled or disabled independent of one
another */
   correction.brightness.enable = true;
   correction.contrast.enable   = true;
/* Enable correction */
R_GLCDC_ColorCorrection(&g_disp_ctrl, &correction);
```

Color Look-Up Table (CLUT) Modes

The GLCDC supports 1-, 4- and 8-bit color look-up table (CLUT) formats for input pixel data. By using these modes the framebuffer size in memory can be reduced significantly, allowing even high-resolution displays to be buffered in on-chip SRAM. To enable CLUT modes for a layer the color format must be set to a CLUT mode (either at startup or through R_GLCDC_LayerChange) in addition to filling the CLUT as appropriate via R_GLCDC_ClutUpdate as shown below:

```
/* Basic 4-bit (16-color) CLUT definition */
   uint32_t clut_4[16] =
   {
      0xFF000000,                  // Black
      0xFFFFFFFF,                  // White
      0xFF0000FF,                  // Blue
      0xFF0080FF,                  // Turquoise
      0xFF00FFFF,                  // Cyan
      0xFF00FF80,                  // Mint Green
```

```
      0xFF00FF00,                    // Green
      0xFF80FF00,                    // Lime Green
      0xFFFFFF00,                    // Yellow
      0xFFFF8000,                    // Orange
      0xFFFF0000,                    // Red
      0xFFFF0080,                    // Pink
      0xFFFF00FF,                    // Magenta
      0xFF8000FF,                    // Purple
      0xFF808080,                    // Gray
      0x00000000                      // Transparent
   };
/* Define the CLUT configuration */
display_clut_cfg_t clut_cfg =
   {
      .start = 0,
      .size   = 16,
      .p_base = clut_4
   };
/* Update the CLUT in the GLCDC */
R_GLCDC_ClutUpdate(&g_disp_ctrl, &clut_cfg, DISPLAY_FRAME_LAYER_1);
```

Note

If individual elements of the CLUT must be changed or if elements must be changed one at a time (for instance, when using emWin) it is recommended to use R_GLCDC_ClutEdit to avoid repeated memcpy operations.

Other Configuration Options

Gamma correction

Gamma correction is performed based on a gain curved defined in the RA Configuration editor. Each point on the curve is defined by a threshold and a gain value - each gain value represents a multiplier from 0x-2x (set as 0-2047) that sets the Y-value of the slope of the gain curve, while each threshold interval sets the X-value respectively. For a more detailed explanation refer to Figure "Calculation of gamma correction value" and the related description above it in the GLCDC section of the relevant hardware manual.

When setting threshold values three rules must be followed:

- Each threshold value must be greater than the previous value
- Threshold values must be greater than zero and less than 1024
- Threshold values can equal the previous value only if they are 1023 (maximum)

Note

Gamma correction can only be applied via R_GLCDC_Open.

Dithering

Dithering is a method of pixel blending that allows for smoother transitions between colors when using a limited palette. A full description of dithering is outside the scope of this document. For more information on the pattern settings and how to configure them refer to the Figures "Configuration of dither correction block" and "Addition value selection method for 2x2 pattern dither" in the GLCDC section of the relevant hardware manual.

Maximum Resolution

Though the GLCDC is capable of outputting resolutions in excess of HD, maximum clockspeeds and bus throughput limit what can be realistically achieved. Below is a table of maximum recommended widescreen resolutions at various input color depths **based on clock and bus limits at 60 FPS.**

Device	8bpp	16bpp	24/32bpp
RA6M3	960x540 (qHD)	800x480 (WVGA)	640x360 (nHD)
RA8	1920x1200 (WUXGA)	1280x800 (WXGA)	960x540 (qHD)

Note

The above values are estimated conservatively based on effective SDRAM bus throughput at a standard framerate. To calculate estimated maximum values for other situations the following equations can be used:
*bytes per frame = (SDCLK speed (Hz) * SDRAM bus width / 8) / framerate*
*width = sqrt(16/9 * (bytes per frame) / (pixel bit depth / 8))*
*height = 9/16 * width*
These equations provide values that are theoretically possible but may or may not be attainable depending on a number of other factors. It is the responsibility of the developer to test and confirm performance on each system to determine a suitable panel size for the application.

Warning

The maximum resolution for GLCDC may exceed the limits for single texture or primitive rending operations with the DRW peripheral (D/AVE 2D). See the Limitations section in the DRW Usage Notes for details.

Limitations

Developers should be aware of the following limitations when using the GLCDC API:

- Due to a limitation of the GLCDC hardware, if the horizontal back porch is less than the number of pixels in a graphics burst read (64 bytes) for a layer and the layer is positioned at a negative X-value then the layer X-position will be locked to the nearest 64-byte boundary, rounded toward zero.
- The GLCDC peripheral offers a chroma-key function that can be used to perform a green-screen-like color replacement. This functionality is not exposed through the GLCDC API. See the descriptions for GR1_AB7/GR2_AB7 through GR1_AB9/GR2_AB9 in the device's User's Manual for further details.
- Use of R_GLCDC_ClutUpdate and R_GLCDC_ClutEdit may not be mixed on the same frame.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the GLCDC module. If the entire display can be drawn within the vertical blanking period no further code may be necessary.

```
void glcdc_init (void)
{
 fsp_err_t err;
 // Open the GLCDC driver
    err = R_GLCDC_Open(&g_disp_ctrl, &g_disp_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 // Start display output
    err = R_GLCDC_Start(&g_disp_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Layer Transitions

This example demonstrates how to set up and execute both a sliding and fading layer transition. This is most useful in static image transition scenarios as switching between two actively-drawing graphics layers may require up to four framebuffers to eliminate tearing.

```
volatile uint32_t g_vsync_count = 0;
/* Callback function for GLCDC interrupts */
static void glcdc_callback (display_callback_args_t * p_args)
{
 if (p_args->event == DISPLAY_EVENT_LINE_DETECTION)
    {
       g_vsync_count++;
    }
}
/* Simple wait that returns 1 if no Vsync happened within the timeout period */
uint8_t vsync_wait (void)
{
    uint32_t timeout_timer = GLCDC_VSYNC_TIMEOUT;
    g_vsync_count = 0;
 while (!g_vsync_count && --timeout_timer)
```

```
    {
 /* Spin here until DISPLAY_EVENT_LINE_DETECTION callback or timeout */
    }
 return timeout_timer ? 0 : 1;
}
/* Initiate a fade on Layer 2
 *
 * Parameters:
 * direction True for fade in, false for fade out
 * speed number of frames over which to fade
 */
void glcdc_layer_transition_fade (display_runtime_cfg_t * disp_rt_cfg, bool
direction, uint16_t speed)
{
 fsp_err_t err;
 if (direction)
    {
 /* Set the runtime struct to the desired buffer */
       disp_rt_cfg->input.p_base       = (uint32_t *) g_framebuffer_1;
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEIN;
    }
 else
    {
       disp_rt_cfg->layer.fade_control = DISPLAY_FADE_CONTROL_FADEOUT;
    }
 /* Ensure speed is at least 1 frame */
 if (!speed)
    {
       speed = 1;
    }
 /* Set the fade speed to the desired change in alpha per frame */
    disp_rt_cfg->layer.fade_speed = UINT8_MAX / speed;
 /* Initiate the fade (will start on the next Vsync) */
    err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg, DISPLAY_FRAME_LAYER_2);
```

```
    assert(FSP_SUCCESS == err);
}
/* Slide Layer 1 out to the left while sliding Layer 2 in from the right */
void glcdc_layer_transition_sliding (display_runtime_cfg_t * disp_rt_cfg_in,
display_runtime_cfg_t * disp_rt_cfg_out)
{
 fsp_err_t err;
 /* Set the config for the incoming layer to be just out of bounds on the right side
*/
    disp_rt_cfg_in->input.p_base       = (uint32_t *) g_framebuffer_1;
    disp_rt_cfg_in->layer.coordinate.x = DISPLAY_WIDTH;
 /* Move layer 1 out and layer 2 in at a fixed rate of 4 pixels per frame */
 for (int32_t x = disp_rt_cfg_in->layer.coordinate.x; x >= 0; x -= 4)
    {
 /* Wait for a Vsync before starting */
       vsync_wait();
 /* Set the X-coordinate of both layers then update them */
       disp_rt_cfg_out->layer.coordinate.x = (int16_t) (x - DISPLAY_WIDTH);
       disp_rt_cfg_in->layer.coordinate.x = (int16_t) x;
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_out, DISPLAY_FRAME_LAYER_1
);
      assert(FSP_SUCCESS == err);
       err = R_GLCDC_LayerChange(&g_disp_ctrl, disp_rt_cfg_in, DISPLAY_FRAME_LAYER_2
);
      assert(FSP_SUCCESS == err);
    }
}
```

Double-Buffering

Using a double-buffer allows one to be output to the LCD while the other is being drawn to memory, eliminating tearing and in some cases reducing bus load. The following is a basic example showing integration of the line detect (Vsync) interrupt to set the timing for buffer swapping and drawing.

```
/* User-defined function to draw the current display to a framebuffer */
void display_draw (uint8_t * framebuffer)
```

```
{
 FSP_PARAMETER_NOT_USED(framebuffer);
 /* Draw buffer here */
}
/* This function is an example of a basic double-buffered display thread */
void display_thread (void)
{
    uint8_t * p_framebuffer = NULL;
 fsp_err_t err;
 /* Initialize and start the R_GLCDC module */
    glcdc_init();
 while (1)
    {
 /* Swap the active framebuffer */
       p_framebuffer = (p_framebuffer == g_framebuffer_0) ? g_framebuffer_1 :
g_framebuffer_0;
 /* Draw the new framebuffer now */
       display_draw(p_framebuffer);
 /* Now that the framebuffer is ready, update the GLCDC buffer pointer on the next
Vsync */
       err = R_GLCDC_BufferChange(&g_disp_ctrl, p_framebuffer, DISPLAY_FRAME_LAYER_1
);
      assert(FSP_SUCCESS == err);
 /* Wait for a Vsync event */
       vsync_wait();
    }
}
```

Data Structure Documentation

◆ glcdc_instance_ctrl_t

struct glcdc_instance_ctrl_t
Display control block. DO NOT INITIALIZE.

◆ glcdc_extended_cfg_t

struct glcdc_extended_cfg_t		
GLCDC hardware specific configuration		
Data Fields		
glcdc_tcon_pin_t	tcon_hsync	GLCDC TCON output pin select.
glcdc_tcon_pin_t	tcon_vsync	GLCDC TCON output pin select.
glcdc_tcon_pin_t	tcon_de	GLCDC TCON output pin select.
glcdc_correction_proc_order_t	correction_proc_order	Correction control route select.
glcdc_clk_src_t	clksrc	Clock Source selection.
glcdc_panel_clk_div_t	clock_div_ratio	Clock divide ratio for dot clock.
glcdc_dithering_mode_t	dithering_mode	Dithering mode.
glcdc_dithering_pattern_t	dithering_pattern_A	Dithering pattern A.
glcdc_dithering_pattern_t	dithering_pattern_B	Dithering pattern B.

glcdc_dithering_pattern_t	dithering_pattern_C	Dithering pattern C.
glcdc_dithering_pattern_t	dithering_pattern_D	Dithering pattern D.
void *	phy_layer	Alternate PHY layer, such as MIPI DSI.

Enumeration Type Documentation

◆ glcdc_clk_src_t

enum glcdc_clk_src_t	
Clock source select	
Enumerator	
GLCDC_CLK_SRC_INTERNAL	Internal.
GLCDC_CLK_SRC_EXTERNAL	External.

◆ glcdc_panel_clk_div_t

enum glcdc_panel_clk_div_t	
Clock frequency division ratio	
Enumerator	
GLCDC_PANEL_CLK_DIVISOR_1	Division Ratio 1/1.
GLCDC_PANEL_CLK_DIVISOR_2	Division Ratio 1/2.
GLCDC_PANEL_CLK_DIVISOR_3	Division Ratio 1/3.
GLCDC_PANEL_CLK_DIVISOR_4	Division Ratio 1/4.
GLCDC_PANEL_CLK_DIVISOR_5	Division Ratio 1/5.
GLCDC_PANEL_CLK_DIVISOR_6	Division Ratio 1/6.
GLCDC_PANEL_CLK_DIVISOR_7	Division Ratio 1/7.
GLCDC_PANEL_CLK_DIVISOR_8	Division Ratio 1/8.
GLCDC_PANEL_CLK_DIVISOR_9	Division Ratio 1/9.
GLCDC_PANEL_CLK_DIVISOR_12	Division Ratio 1/12.
GLCDC_PANEL_CLK_DIVISOR_16	Division Ratio 1/16.
GLCDC_PANEL_CLK_DIVISOR_24	Division Ratio 1/24.
GLCDC_PANEL_CLK_DIVISOR_32	Division Ratio 1/32.

◆ glcdc_tcon_pin_t

enum glcdc_tcon_pin_t	
LCD TCON output pin select	
Enumerator	
GLCDC_TCON_PIN_NONE	No output.
GLCDC_TCON_PIN_0	LCD_TCON0.
GLCDC_TCON_PIN_1	LCD_TCON1.
GLCDC_TCON_PIN_2	LCD_TCON2.
GLCDC_TCON_PIN_3	LCD_TCON3.

◆ glcdc_bus_arbitration_t

enum glcdc_bus_arbitration_t	
Bus Arbitration setting	
Enumerator	
GLCDC_BUS_ARBITRATION_ROUNDROBIN	Round robin.
GLCDC_BUS_ARBITRATION_FIX_PRIORITY	Fixed.

◆ glcdc_correction_proc_order_t

enum glcdc_correction_proc_order_t	
Correction circuit sequence control	
Enumerator	
GLCDC_CORRECTION_PROC_ORDER_BRIGHTNESS_CONTRAST2GAMMA	Brightness -> contrast -> gamma correction.
GLCDC_CORRECTION_PROC_ORDER_GAMMA2BRIGHTNESS_CONTRAST	Gamma correction -> brightness -> contrast.

◆ glcdc_tcon_signal_select_t

enum glcdc_tcon_signal_select_t	
Timing signals for driving the LCD panel	
Enumerator	
GLCDC_TCON_SIGNAL_SELECT_STVA_VS	STVA/VS.
GLCDC_TCON_SIGNAL_SELECT_STVB_VE	STVB/VE.
GLCDC_TCON_SIGNAL_SELECT_STHA_HS	STH/SP/HS.
GLCDC_TCON_SIGNAL_SELECT_STHB_HE	STB/LP/HE.
GLCDC_TCON_SIGNAL_SELECT_DE	DE.

◆ glcdc_clut_plane_t

enum glcdc_clut_plane_t	
Clock phase adjustment for serial RGB output	
Enumerator	
GLCDC_CLUT_PLANE_0	GLCDC CLUT plane 0.
GLCDC_CLUT_PLANE_1	GLCDC CLUT plane 1.

◆ glcdc_dithering_mode_t

enum glcdc_dithering_mode_t	
Dithering mode	
Enumerator	
GLCDC_DITHERING_MODE_TRUNCATE	No dithering (truncate)
GLCDC_DITHERING_MODE_ROUND_OFF	Dithering with round off.
GLCDC_DITHERING_MODE_2X2PATTERN	Dithering with 2x2 pattern.

◆ glcdc_dithering_pattern_t

enum glcdc_dithering_pattern_t	
Dithering mode	
Enumerator	
GLCDC_DITHERING_PATTERN_00	2x2 pattern '00'
GLCDC_DITHERING_PATTERN_01	2x2 pattern '01'
GLCDC_DITHERING_PATTERN_10	2x2 pattern '10'
GLCDC_DITHERING_PATTERN_11	2x2 pattern '11'

◆ glcdc_input_interface_format_t

enum glcdc_input_interface_format_t	
Output interface format	
Enumerator	
GLCDC_INPUT_INTERFACE_FORMAT_RGB565	Input interface format RGB565.
GLCDC_INPUT_INTERFACE_FORMAT_RGB888	Input interface format RGB888.
GLCDC_INPUT_INTERFACE_FORMAT_ARGB1555	Input interface format ARGB1555.
GLCDC_INPUT_INTERFACE_FORMAT_ARGB4444	Input interface format ARGB4444.
GLCDC_INPUT_INTERFACE_FORMAT_ARGB8888	Input interface format ARGB8888.
GLCDC_INPUT_INTERFACE_FORMAT_CLUT8	Input interface format CLUT8.
GLCDC_INPUT_INTERFACE_FORMAT_CLUT4	Input interface format CLUT4.
GLCDC_INPUT_INTERFACE_FORMAT_CLUT1	Input interface format CLUT1.

◆ glcdc_output_interface_format_t

enum glcdc_output_interface_format_t	
Output interface format	
Enumerator	
GLCDC_OUTPUT_INTERFACE_FORMAT_RGB888	Output interface format RGB888.
GLCDC_OUTPUT_INTERFACE_FORMAT_RGB666	Output interface format RGB666.
GLCDC_OUTPUT_INTERFACE_FORMAT_RGB565	Output interface format RGB565.
GLCDC_OUTPUT_INTERFACE_FORMAT_SERIAL_RGB	Output interface format Serial RGB.

◆ glcdc_dithering_output_format_t

enum glcdc_dithering_output_format_t	
Dithering output format	
Enumerator	
GLCDC_DITHERING_OUTPUT_FORMAT_RGB888	Dithering output format RGB888.
GLCDC_DITHERING_OUTPUT_FORMAT_RGB666	Dithering output format RGB666.
GLCDC_DITHERING_OUTPUT_FORMAT_RGB565	Dithering output format RGB565.

Function Documentation

◆ R_GLCDC_Open()

fsp_err_t R_GLCDC_Open (display_ctrl_t *const *p_api_ctrl*, display_cfg_t const *const *p_cfg*)

Open GLCDC module. Implements display_api_t::open.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ALREADY_OPEN	Device was already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock source.
FSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
FSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
FSP_ERR_INVALID_ALIGNMENT	Input buffer alignment invalid.
FSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

◆ R_GLCDC_Close()

fsp_err_t R_GLCDC_Close (display_ctrl_t *const *p_api_ctrl*)

Close GLCDC module. Implements display_api_t::close.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to DISPLAY_STATE_CLOSED.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCDC is updating register values internally.

Note

This API can be called when the driver is not in DISPLAY_STATE_CLOSED state. It returns an error if the register update operation for the background screen generation block is being held.

◆ R_GLCDC_Start()

fsp_err_t R_GLCDC_Start (display_ctrl_t *const *p_api_ctrl*)

Start GLCDC module. Implements display_api_t::start.

Return values

FSP_SUCCESS	Device was started successfully.
FSP_ERR_NOT_OPEN	GLCDC module has not been opened.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called when the driver is not in DISPLAY_STATE_OPENED status.

◆ R_GLCDC_Stop()

fsp_err_t R_GLCDC_Stop (display_ctrl_t *const *p_api_ctrl*)

Stop GLCDC module. Implements display_api_t::stop.

Return values

FSP_SUCCESS	Device was stopped successfully
FSP_ERR_ASSERTION	Pointer to the control block is NULL
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

◆ R_GLCDC_LayerChange()

fsp_err_t R_GLCDC_LayerChange (display_ctrl_t const *const *p_api_ctrl*, display_runtime_cfg_t const *const *p_cfg*, display_frame_layer_t *layer*)

Change layer parameters of GLCDC module at runtime. Implements display_api_t::layerChange.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ R_GLCDC_BufferChange()

fsp_err_t R_GLCDC_BufferChange (display_ctrl_t const *const *p_api_ctrl*, uint8_t *const *framebuffer*, display_frame_layer_t *layer*)

Change the framebuffer pointer for a layer. Implements display_api_t::bufferChange.

Return values

FSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_ALIGNMENT	The framebuffer pointer is not 64-byte aligned.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_OPENED state or higher. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

◆ R_GLCDC_ColorCorrection()

fsp_err_t R_GLCDC_ColorCorrection (display_ctrl_t const *const *p_api_ctrl*, display_correction_t const *const *p_correction*)

Perform color correction through the GLCDC module. Implements display_api_t::correction.

Return values

FSP_SUCCESS	Color correction by GLCDC module was performed successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
FSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
FSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.
FSP_ERR_UNSUPPORTED	Feature not supported with the current configuration.
FSP_ERR_INVALID_BRIGHTNESS_SETTING	Invalid brightness correction setting found

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

◆ R_GLCDC_ClutUpdate()

fsp_err_t R_GLCDC_ClutUpdate (display_ctrl_t const *const *p_api_ctrl*, display_clut_cfg_t const *const *p_clut_cfg*, display_frame_layer_t *layer*)

Write an entire color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clut.

Return values

FSP_SUCCESS	CLUT written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
FSP_ERR_INVALID_UPDATE_TIMING	R_GLCDC_ClutEdit was already used to edit the specified CLUT this frame.
FSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ R_GLCDC_ClutEdit()

fsp_err_t R_GLCDC_ClutEdit (display_ctrl_t const *const *p_api_ctrl*, display_frame_layer_t *layer*, uint8_t *index*, uint32_t *color*)

Update an element of a color look-up table (CLUT) in the GLCDC module. Implements display_api_t::clutEdit.

Return values

FSP_SUCCESS	CLUT element updated successfully.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.

Note

This API can be called any time. The written data will be used after the next vertical sync event.

◆ R_GLCDC_ColorKeySet()

fsp_err_t R_GLCDC_ColorKeySet (display_ctrl_t const *const *p_api_ctrl*, display_colorkeying_layer_t *key_cfg*, display_frame_layer_t *layer*)

Configuring color key is not supported for GLCDC.

Return values

FSP_ERR_UNSUPPORTED	

◆ R_GLCDC_StatusGet()

fsp_err_t R_GLCDC_StatusGet (display_ctrl_t const *const *p_api_ctrl*, display_status_t *const *p_status*)

Get status of GLCDC module. Implements display_api_t::statusGet.

Return values

FSP_SUCCESS	Got status successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

Note

The GLCDC hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_PENDING, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

5.2.8.6 JPEG Codec (r_jpeg)

Modules » Graphics

Detailed Description

Driver for the JPEG peripheral on RA MCUs. This module implements the JPEG Codec Interface.

Overview

The JPEG Codec is a hardware block providing accelerated JPEG image encode and decode functionality independent of the CPU. Images can optionally be partially processed facilitating streaming applications.

Features

The JPEG Codec provides a number of options useful in a variety of applications:

- Basic encoding and decoding
- Streaming input and/or output
- Decoding JPEGs of unknown size
- Shrink (sub-sample) an image during the decoding process
- Rearrange input and output byte order (byte, word and/or longword swap)
- JPEG error detection

The specifications for the codec are as follows:

Feature	Options
Decompression input formats	Baseline JPEG Y'CbCr 4:4:4, 4:2:2, 4:2:0 and 4:1:1
Decompression output formats	ARGB8888, RGB565
Compression input formats	Raw Y'CbCr 4:2:2 only
Compression output formats	Baseline JPEG Y'CbCr 4:2:2 only
Byte reordering	Byte, halfword and/or word swapping on input and output
Interrupt sources	Image size acquired, input/output data pause, decode complete, error
Compatible image sizes	See Minimum Coded Unit (MCU) below

Supported Devices

Device Group	Devices
RA6	RA6M3

Configuration

Build Time Configurations for r_jpeg

The following build time configurations are defined in fsp_cfg/r_jpeg_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build.
Decode Support	• Enabled • Disabled	Enabled	If selected, code for decoding JPEG images is included in the build.
Encode Support	• Enabled • Disabled	Disabled	If selected, code for encoding JPEG images is included in the build.

Configurations for Graphics > JPEG Codec (r_jpeg)

This module can be added to the Stacks tab via New Stack > Graphics > JPEG Codec (r_jpeg).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_jpeg0	Module name.
Default mode	• Decode • Encode	Decode	Set the mode to use when calling R_JPEG_Open. This parameter is only used when both Encode and Decode support are enabled.
Decode			
Input byte order	MCU Specific Options		Select the byte order of the input data for decoding.
Output byte order	MCU Specific Options		Select the byte order of the output data for decoding.
Output color format	• ARGB8888 (32-bit) • RGB565 (16-bit)	RGB565 (16-bit)	Select the output pixel format for decode operations.
Output alpha (ARGB8888 only)	Value must be an 8-bit integer (0-255)	255	Specify the alpha value to apply to each output pixel when ARGB8888 format is chosen.
Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Encode			
Horizontal resolution	Value cannot be greater than 65535 and must be a non-negative integer divisible by 16	480	Horizontal resolution of the raw image (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet.
Vertical resolution	Value cannot be greater than 65535 and must be a non-negative integer	272	Vertical resolution of the raw image. This value can be configured at runtime

	divisible by 8		via R_JPEG_ImageSizeSet.
Horizontal stride	Value cannot be greater than 65535 and must be a non-negative integer	480	Horizontal stride of the raw image buffer (in pixels). This value can be configured at runtime via R_JPEG_ImageSizeSet.
Input byte order	MCU Specific Options		Select the byte order of the input data for encoding.
Output byte order	MCU Specific Options		Select the byte order of the output data for encoding.
Reset interval	Value cannot be greater than 65535 and must be a non-negative integer	512	Set the number of MCUs between RST markers. A value of 0 will disable DRI and RST marker output.
Quality factor	Value must be between 1 and 100 and must be an integer	50	Set the quality factor for encoding (1-100). Lower values produce smaller images at the cost of image quality.
Callback	Name must be a valid C symbol	NULL	If a callback function is provided it will be called from the interrupt service routine (ISR) each time a related IRQ triggers.
Interrupts			
Decode Process Interrupt Priority	MCU Specific Options		Select the decompression interrupt priority.
Data Transfer Interrupt Priority	MCU Specific Options		Select the data transfer interrupt priority.

Clock Configuration

The peripheral clock for this module is PCLKA. No clocks are provided by this module.

Pin Configuration

This module does not have any input or output pin connections.

Usage Notes

Overview

The JPEG Codec contains both decode and encode hardware. While these two functions are largely independent in configuration only one can be used at a time.

To switch from decode to encode mode (or vice versa) use R_JPEG_ModeSet while the JPEG Codec is idle.

Status

The status value (jpeg_status_t) provided by the callback and by R_JPEG_StatusGet is a bitfield that encompasses all potential status indication conditions. One or more statuses can be set simultaneously.

Decoding Process

JPEG decoding can be performed in several ways depending on the application:

- To perform the simplest decode operation where all dimensions are known:
  - Set the input buffer, stride and output buffer then wait for a callback with status JPEG_STATUS_OPERATION_COMPLETE.
- To pause after decoding the JPEG header (in order to acquire image dimensions and secure an output buffer):
  - Call R_JPEG_InputBufferSet before setting the output buffer and wait for a callback with status JPEG_STATUS_IMAGE_SIZE_READY.
- To decode a partial JPEG image then pause until the next chunk is available:
  - Specify a size smaller than the full JPEG data when calling R_JPEG_InputBufferSet.
- To pause decoding once an output buffer is filled:
  - Specify a size smaller than the full decoded image when calling R_JPEG_OutputBufferSet.

The flowchart below illustrates the steps necessary to handle any decode operation. The statuses given in blue are part of jpeg_status_t with the JPEG_DECODE_STATUS prefix omitted.

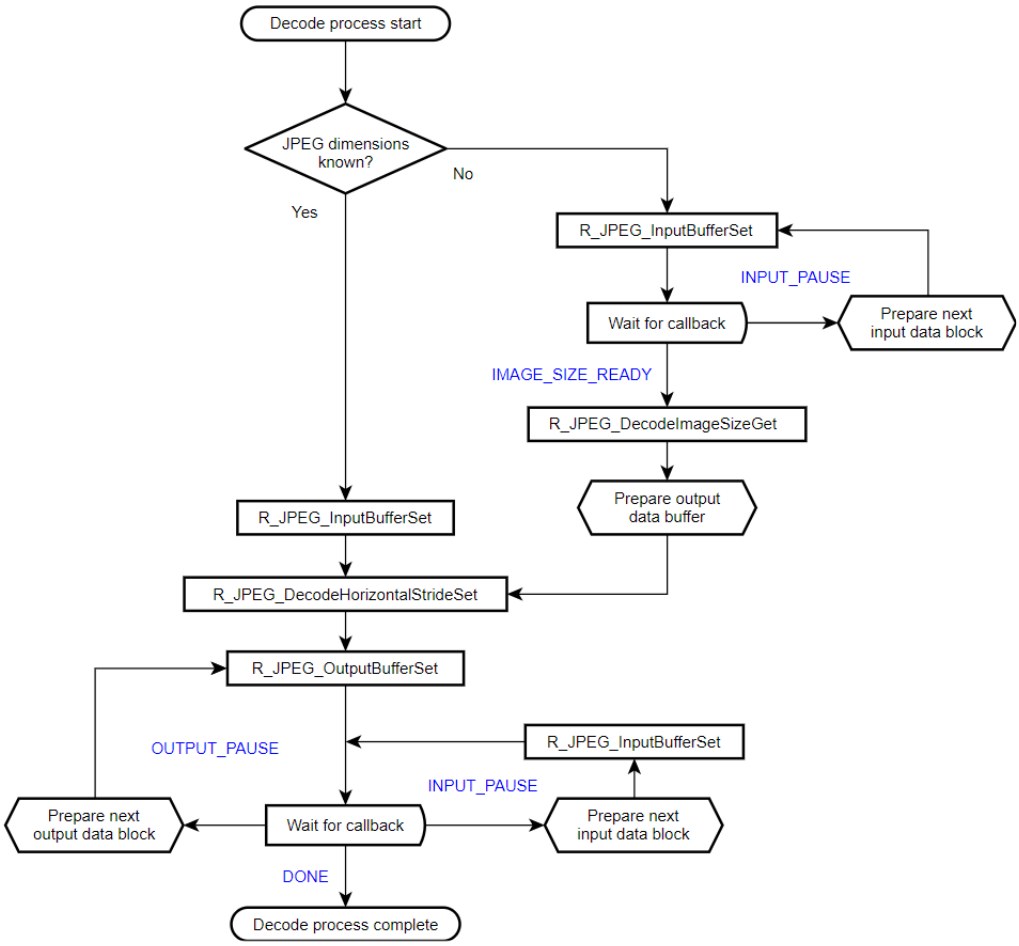

Figure 257: JPEG Decode Operational Flow

Encoding Process

As compared to decoding, encoding is fairly straightforward. The only option available is to stream input data if desired. The flowchart below details the steps needed to compress an image.

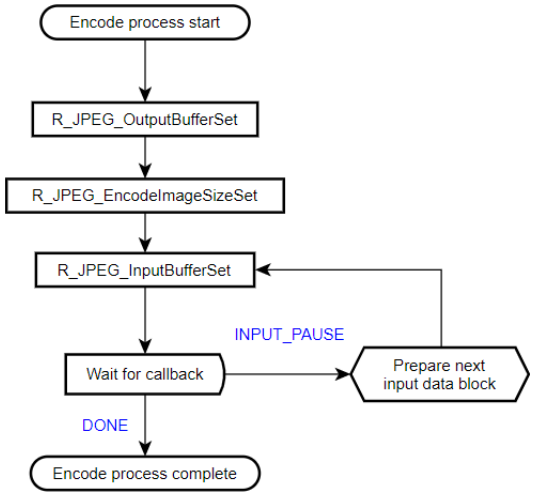

Figure 258: JPEG Encode Operational Flow

Handling Failed Operations

If an encode or decode operation fails or times out while the codec is running, the peripheral must be reset before it is used again. To reset the JPEG Codec simply close and re-open the module by calling R_JPEG_Close followed by R_JPEG_Open.

Limitations

Developers should be aware of the following limitations when using the JPEG API.

Minimum Coded Unit (MCU)

The JPEG Codec can only correctly process images that are an even increment of minimum coded units (MCUs). In other words, depending on the format the width and height of an image to be encoded or decoded must be divisible by the following:

Format	Horizontal	Vertical
Y'CbCr 4:4:4	8 pixels	8 lines
Y'CbCr 4:2:2	16 pixels	8 lines
Y'CbCr 4:1:1	32 pixels	8 lines
Y'CbCr 4:2:0	16 pixels	16 lines

Note

Because encoding is limited to Y'CbCr 4:2:2, raw pixel input data must always be in whole increments of 16x8 pixels.

Encoding Input Format

The encoding unit only supports Y'CbCr 4:2:2 input. Raw RGB888 data can be converted to this format as follows:

```
y =       (0.299000f * r) + (0.587000f * g) + (0.114000f * b);
cb = 128 - (0.168736f * r) - (0.331264f * g) + (0.500000f * b);
cr = 128 + (0.500000f * r) - (0.418688f * g) - (0.081312f * b);
```

While these equations are mathematically simple they do use the floating-point unit. To speed things up we can multiply the coefficients by 256 and divide the sum by 256...

```
y =       ((76.5440f * r) + (150.272f * g) + (29.1840f * b)) / 256;
cb = 128 - ((43.1964f * r) - (84.8036f * g) + (128.000f * b)) / 256;
cr = 128 + ((128.000f * r) - (107.184f * g) - (20.8159f * b)) / 256;
```

...which allows the formulas to be calculated entirely with shifts and addition (coefficients rounded to the nearest integer):

```
y =       (   (r << 6) + (r << 3) + (r << 2) + r
            + (g << 7) + (g << 4) + (g << 2) + (g << 1)
            + (b << 4) + (b << 3) + (b << 2) + b
           ) >> 8;
cb = 128 - (   (r << 5) + (r << 3) + (r << 1) + r
            + (g << 6) + (g << 4) + (g << 2) + g
            - (b << 7)
           ) >> 8;
cr = 128 + (   (r << 7)
            - (g << 6) - (g << 5) - (g << 3) - (g << 1) - g
            - (b << 4) - (b << 2) - b)
           ) >> 8;
```

To compose the final Y'CbCr 4:2:2 data the chroma of every two pixels must be averaged. **In addition, the JPEG Codec expects chrominance values to be in the range -127..127 instead of the standard 1..255.**

```
cb = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - 128);
cr = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - 128);
```

Finally, the below equation composes two 4:2:2 output pixels at a time with standard byte order (JPEG_DATA_ORDER_NORMAL):

```
out = y0 + (cb << 8) + (y1 << 16) + (cr << 24);
```

Note

RGB565 pixels must be upscaled to RGB888 before using the above formulas. Refer to the below example on Y'CbCr Conversion for implementation details.

Examples

Basic Decode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and decode an image.

```
void jpeg_decode_basic (void)
{
```

```
fsp_err_t err;
/* Open JPEG Codec */
   err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Set input buffer */
   err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, JPEG_PTR, JPEG_SIZE_BYTES);
   assert(FSP_SUCCESS == err);
/* Set horizontal stride of output buffer */
   err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, JPEG_HSIZE);
   assert(FSP_SUCCESS == err);
/* Set output buffer */
   err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, decode_buffer, sizeof(decode_buffer));
   assert(FSP_SUCCESS == err);
/* Wait for decode completion */
jpeg_status_t status = (jpeg_status_t) 0;
while (!(status & (JPEG_STATUS_OPERATION_COMPLETE | JPEG_STATUS_ERROR)))
   {
      err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
     assert(FSP_SUCCESS == err);
   }
}
```

Streaming Input/Output Example

In this example JPEG data is read in 512-byte chunks. Decoding is paused when a chunk is read and once the JPEG header is decoded. The image is decoded 16 lines at a time.

Note

Streaming is always bypassed when a given buffer's size encompasses the entire input or output image, respectively. Though this example decodes via smaller chunks the input and output data are still contiguous for ease of demonstration. Refer to the comments for further insight as to how to implement streaming with different JPEG/output buffer size combinations.

```
#define JPEG_INPUT_SIZE_BYTES 512U
/* JPEG Codec status */
static volatile jpeg_status_t g_jpeg_status = JPEG_STATUS_NONE;
/* JPEG event flag */
```

```
static volatile uint8_t jpeg_event = 0;
/* Callback function for JPEG decode interrupts */
void jpeg_decode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
/* Simple wait that returns 1 if no event happened within the timeout period */
static uint8_t jpeg_event_wait (void)
{
    uint32_t timeout_timer = JPEG_EVENT_TIMEOUT;
 while (!jpeg_event && --timeout_timer)
    {
 /* Spin here until an event callback or timeout */
    }
    jpeg_event = 0;
 return timeout_timer ? 0 : 1;
}
/* Decode a JPEG image to a buffer using streaming input and output */
void jpeg_decode_streaming (void)
{
    uint8_t    * p_jpeg = (uint8_t *) JPEG_PTR;
 jpeg_status_t status = (jpeg_status_t) 0;
    uint8_t       timeout = 0;
 fsp_err_t    err;
 /* Number of input bytes to read at a time */
    uint32_t input_bytes = JPEG_INPUT_SIZE_BYTES;
 /* Open JPEG unit and start decode */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (!(status & JPEG_STATUS_ERROR) && !timeout)
```

```
    {
 /* Set the input buffer to read `input_bytes` bytes at a time */
       err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
      assert(FSP_SUCCESS == err);
 /* This delay is required for streaming input mode to function correctly.
  * (Without this delay the JPEG Codec will not correctly locate markers in the file
header.) */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MICROSECONDS);
 /* Wait for a callback */
       timeout = jpeg_event_wait();
 /* Get the status from the callback */
       status = g_jpeg_status;
 /* Break if the header has finished decoding */
 if (status & JPEG_STATUS_IMAGE_SIZE_READY)
      {
 break;
      }
 /* Move pointer to next block of input data (if needed) */
       p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
    }
 /* Get image size */
    uint16_t horizontal;
    uint16_t vertical;
    err = R_JPEG_DecodeImageSizeGet(&g_jpeg_ctrl, &horizontal, &vertical);
    assert(FSP_SUCCESS == err);
 /* Prepare output data buffer here if needed (already allocated in this example) */
    uint8_t * p_output = decode_buffer;
 /* Set horizontal stride */
    err = R_JPEG_DecodeHorizontalStrideSet(&g_jpeg_ctrl, horizontal);
    assert(FSP_SUCCESS == err);
 /* Calculate the number of bytes that will fit in the buffer (16 lines in this
example) */
    uint32_t output_size = horizontal * 16U * 4U;
 /* Start decoding by setting the output buffer */
```

```
   err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
   assert(FSP_SUCCESS == err);
while (!(status & JPEG_STATUS_ERROR) && !timeout)
   {
/* Wait for a callback */
      timeout = jpeg_event_wait();
/* Get the status from the callback */
      status = g_jpeg_status;
/* Break if decoding is complete */
if (status & JPEG_STATUS_OPERATION_COMPLETE)
     {
break;
     }
if (status & JPEG_STATUS_OUTPUT_PAUSE)
     {
/* Draw the JPEG work buffer to the framebuffer here (if needed) */
/* Move pointer to next block of output data (if needed) */
           p_output += output_size;
/* Set the output buffer to the next 16-line block */
     err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, p_output, output_size);
     assert(FSP_SUCCESS == err);
     }
if (status & JPEG_STATUS_INPUT_PAUSE)
     {
/* Get next block of input data */
        p_jpeg = (uint8_t *) ((uint32_t) p_jpeg + input_bytes);
/* Set the new input buffer pointer */
        err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_jpeg, input_bytes);
     assert(FSP_SUCCESS == err);
     }
   }
/* Close driver to allow encode operations if needed */
   err = R_JPEG_Close(&g_jpeg_ctrl);
   assert(FSP_SUCCESS == err);
```

```
}
```

Encode Example

This is a basic example showing the minimum code required to initialize the JPEG Codec and encode an image.

Note

This example assumes image dimensions are provided in the configuration. If this is not the case, R_JPEG_EncodeImageSizeSet must be used to set the size before calling R_JPEG_InputBufferSet.

```
void jpeg_encode_basic (void)
{
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
 /* Set input buffer */
    err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, RAW_YCBCR_IMAGE_PTR, IMAGE_SIZE_BYTES);
    assert(FSP_SUCCESS == err);
 /* Wait for decode completion */
 jpeg_status_t status = (jpeg_status_t) 0;
 while (!(status & JPEG_STATUS_OPERATION_COMPLETE))
    {
       err = R_JPEG_StatusGet(&g_jpeg_ctrl, &status);
      assert(FSP_SUCCESS == err);
    }
}
```

Streaming Encode Example

In this example the raw input data is provided in smaller chunks. This can help significantly reduce buffer size and improve throughput when streaming in raw data from an outside source.

```
```

```
/* Callback function for JPEG encode interrupts */
void jpeg_encode_callback (jpeg_callback_args_t * p_args)
{
 /* Get JPEG Codec status */
    g_jpeg_status = p_args->status;
 /* Set JPEG flag */
    jpeg_event = 1;
}
void jpeg_encode_streaming (void)
{
    uint8_t   timeout = 0;
    uint8_t * p_chunk = (uint8_t *) RAW_YCBCR_IMAGE_PTR;
 fsp_err_t err;
 /* Open JPEG Codec */
    err = R_JPEG_Open(&g_jpeg_ctrl, &g_jpeg_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set output buffer */
    err = R_JPEG_OutputBufferSet(&g_jpeg_ctrl, jpeg_buffer, sizeof(jpeg_buffer));
    assert(FSP_SUCCESS == err);
 /* Set the image size */
 jpeg_encode_image_size_t image_size;
    image_size.horizontal_resolution    = X_RESOLUTION;
    image_size.vertical_resolution      = Y_RESOLUTION;
    image_size.horizontal_stride_pixels = H_STRIDE;
    err = R_JPEG_EncodeImageSizeSet(&g_jpeg_ctrl, &image_size);
    assert(FSP_SUCCESS == err);
 /* Calculate the size of the input data chunk (16 lines in this example) */
    uint32_t chunk_size = H_STRIDE * 16U * YCBCR_BYTES_PER_PIXEL;
 while (!timeout)
    {
 /* Set the input buffer */
       err = R_JPEG_InputBufferSet(&g_jpeg_ctrl, p_chunk, chunk_size);
      assert(FSP_SUCCESS == err);
```

```
 /* Wait for a callback */
       timeout = jpeg_event_wait();
 if (g_jpeg_status & JPEG_STATUS_OPERATION_COMPLETE)
      {
 /* Encode complete */
 break;
      }
 if (g_jpeg_status & JPEG_STATUS_INPUT_PAUSE)
      {
 /* Load next block of input data here (if needed) */
            p_chunk += chunk_size;
      }
    }
}
```

Y'CbCr Conversion

The below function is provided as a reference for how to convert RGB values to Y'CbCr for use with the JPEG Codec.

Note

This function is only partially optimized for clarity. Further appllication-specific size- or speed-based optimizations should be considered when implementing in an actual project.

```
#define RGB565_G_MASK 0x07E0
#define RGB565_B_MASK 0x001F
#define C_0 128
typedef enum e_pixel_format
{
    PIXEL_FORMAT_ARGB8888,
    PIXEL_FORMAT_RGB565
} pixel_format_t;
/* 5-bit to 8-bit LUT */
const uint8_t lut_32[] =
{
    0,   8,   16, 25, 33, 41, 49, 58,
    66, 74, 82, 90, 99, 107, 115, 123,
```

```
    132, 140, 148, 156, 165, 173, 181, 189,
    197, 206, 214, 222, 230, 239, 247, 255
};
/* 6-bit to 8-bit LUT */
const uint8_t lut_64[] =
{
    0,   4,   8,   12, 16, 20, 24, 28,
    32, 36, 40, 45, 49, 53, 57, 61,

/* Calculate Y'CbCr 4:4:4 values for the two pixels */
/* Algorithm based on method shown here: https://sistenix.com/rgb2ycbcr.html */
/* Original coefficients from https://en.wikipedia.org/wiki/YCbCr#JPEG_conversion */
      y0 = (uint8_t) (((r0 << 6) + (r0 << 3) + (r0 << 2) + r0 +
                       (g0 << 7) + (g0 << 4) + (g0 << 2) + (g0 << 1) +
                       (b0 << 4) + (b0 << 3) + (b0 << 2) + b0
                       ) >> 8);
      cb0 = (uint8_t) (C_0 - (((r0 << 5) + (r0 << 3) + (r0 << 1) + r0 +
                               (g0 << 6) + (g0 << 4) + (g0 << 2) + g0 -
                               (b0 << 7)
                               ) >> 8));
      cr0 = (uint8_t) (C_0 + (((r0 << 7) -
```

```
                                (g0 << 6) - (g0 << 5) - (g0 << 3) - (g0 << 1) - g0 -
                                (b0 << 4) - (b0 << 2) - b0
                                ) >> 8));
      y1 = (uint8_t) (((r1 << 6) + (r1 << 3) + (r1 << 2) + r1 +
                       (g1 << 7) + (g1 << 4) + (g1 << 2) + (g1 << 1) +
                       (b1 << 4) + (b1 << 3) + (b1 << 2) + b1
                       ) >> 8);
      cb1 = (uint8_t) (C_0 - (((r1 << 5) + (r1 << 3) + (r1 << 1) + r1 +
                                (g1 << 6) + (g1 << 4) + (g1 << 2) + g1 -
                                (b1 << 7)
                                ) >> 8));
      cr1 = (uint8_t) (C_0 + (((r1 << 7) -
                                (g1 << 6) - (g1 << 5) - (g1 << 3) - (g1 << 1) - g1 -
                                (b1 << 4) - (b1 << 2) - b1
                                ) >> 8));
 /* The above code is based on the floating point method shown here: */
 // y0 = (uint8_t) ((0.299F * (float) r0) + (0.587F * (float) g0) + (0.114F * (float)
b0));
 // y1 = (uint8_t) ((0.299F * (float) r1) + (0.587F * (float) g1) + (0.114F * (float)
b1));
 // cb0 = (uint8_t) (128.0F - (0.168736F * (float) r0) - (0.331264F * (float) g0) +
(0.5F * (float) b0));
 // cb1 = (uint8_t) (128.0F - (0.168736F * (float) r1) - (0.331264F * (float) g1) +
(0.5F * (float) b1));
 // cr0 = (uint8_t) (128.0F + (0.5F * (float) r0) - (0.418688F * (float) g0) -
(0.081312F * (float) b0));
 // cr1 = (uint8_t) (128.0F + (0.5F * (float) r1) - (0.418688F * (float) g1) -
(0.081312F * (float) b1));
 /* NOTE: The JPEG Codec expects signed instead of unsigned chrominance values. */
 /* Convert chrominance to -127..127 instead of 1..255 */
      cb0 = (uint8_t) ((int8_t) ((cb0 + cb1 + 1) >> 1) - C_0);
      cr0 = (uint8_t) ((int8_t) ((cr0 + cr1 + 1) >> 1) - C_0);
 /* Convert the two 4:4:4 values into 4:2:2 by averaging the chroma, then write to
output */
```

```
        *out++ = (uint32_t) (y0 + (cb0 << 8) + (y1 << 16) + (cr0 << 24));
        len--;
    }
}
```

Data Structures

struct jpeg_instance_ctrl_t

Data Structure Documentation

◆ jpeg_instance_ctrl_t

struct jpeg_instance_ctrl_t		
JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called.		
Data Fields		
uint32_t	open	JPEG Codec driver status.
jpeg_status_t	status	JPEG Codec operational status.
fsp_err_t	error_code	JPEG Codec error code (if any).
jpeg_mode_t	mode	Current mode (decode or encode).
uint32_t	horizontal_stride_bytes	Horizontal Stride settings.
uint32_t	output_buffer_size	Output buffer size.
jpeg_cfg_t const *	p_cfg	JPEG Decode configuration struct.
void const *	p_extend	JPEG Codec hardware dependent configuration */.
jpeg_decode_pixel_format_t	pixel_format	Pixel format.
uint16_t	total_lines_decoded	Track the number of lines decoded so far.
jpeg_decode_subsample_t	horizontal_subsample	Horizontal sub-sample setting.
uint16_t	lines_to_encode	Number of lines to encode.
uint16_t	vertical_resolution	vertical size
uint16_t	total_lines_encoded	Number of lines encoded.

Function Documentation

◆ R_JPEG_Open()

fsp_err_t R_JPEG_Open (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_cfg_t const *const *p_cfg*)

Initialize the JPEG Codec module.

Note

This function configures the JPEG Codec for operation and sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support callbacks.

Return values

FSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
FSP_ERR_ALREADY_OPEN	JPEG Codec is already open.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_IRQ_BSP_DISABLED	JEDI interrupt does not have an IRQ number.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

◆ R_JPEG_OutputBufferSet()

fsp_err_t R_JPEG_OutputBufferSet (jpeg_ctrl_t * *p_api_ctrl*, void * *p_output_buffer*, uint32_t *output_buffer_size*)

Assign a buffer to the JPEG Codec for storing output data.

Note

In Decode mode, the number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set and the output buffer is big enough to hold at least eight lines of decoded image data.

Return values

FSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
FSP_ERR_ASSERTION	Pointer to the control block or output_buffer is NULL or output_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_JPEG_UNSUPPORTED_IMAGE_SIZE	The number of horizontal pixels exceeds horizontal memory stride.
FSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size.
FSP_ERR_IN_USE	The output buffer cannot be changed during codec operation.

◆ R_JPEG_InputBufferSet()

fsp_err_t R_JPEG_InputBufferSet (jpeg_ctrl_t *const *p_api_ctrl*, void * *p_data_buffer*, uint32_t *data_buffer_size*)

Assign an input data buffer to the JPEG codec for processing.

Note

After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_PRV_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so processing can resume.
The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

If zero is provided for the decode data buffer size the JPEG Codec will never pause for more input data and will continue to read until either an image has been fully decoded or an error condition occurs.

Note

When encoding images the minimum data buffer size is 8 lines by 16 Y'CbCr 4:2:2 pixels (256 bytes). This corresponds to one minimum coded unit (MCU) of the resulting JPEG output.

Return values

FSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
FSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
FSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	The input buffer cannot be changed while the codec is running.
FSP_ERR_INVALID_CALL	In encode mode the output buffer must be set first.
FSP_ERR_JPEG_IMAGE_SIZE_ERROR	The buffer size is smaller than the minimum coded unit (MCU).

◆ R_JPEG_DecodeLinesDecodedGet()

fsp_err_t R_JPEG_DecodeLinesDecodedGet (jpeg_ctrl_t * *p_api_ctrl*, uint32_t * *p_lines*)

Returns the number of lines decoded into the output buffer.

Note

Use this function to retrieve the number of image lines written to the output buffer after a partial decode operation. Combined with the horizontal stride settings and the output pixel format the application can compute the amount of data to read from the output buffer.

Return values

FSP_SUCCESS	Line count successfully returned.
FSP_ERR_ASSERTION	Pointer to the control block or p_lines is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeImageSubsampleSet()

fsp_err_t R_JPEG_DecodeImageSubsampleSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_decode_subsample_t *horizontal_subsample*, jpeg_decode_subsample_t *vertical_subsample*)

Configure horizontal and vertical subsampling.

Note

This function can be used to scale the output of decoded image data.

Return values

FSP_SUCCESS	Horizontal subsample value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeHorizontalStrideSet()

fsp_err_t R_JPEG_DecodeHorizontalStrideSet (jpeg_ctrl_t * *p_api_ctrl*, uint32_t *horizontal_stride*)

Configure horizontal stride setting for decode operations.

Note

If the image size is known prior to the open call and/or the output buffer stride is constant, pass the horizontal stride value in the jpeg_cfg_t structure. Otherwise, after the image size becomes available use this function to set the output buffer horizontal stride value.

Return values

FSP_SUCCESS	Horizontal stride value is properly configured.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or is not 8-byte aligned.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_DecodeImageSizeGet()

fsp_err_t R_JPEG_DecodeImageSizeGet (jpeg_ctrl_t * *p_api_ctrl*, uint16_t * *p_horizontal_size*, uint16_t * *p_vertical_size*)

Obtain the size of an image being decoded.

Return values

FSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by p_horizontal_size and p_vertical_size.
FSP_ERR_ASSERTION	Pointer to the control block is NULL and/or size is not ready.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_DecodePixelFormatGet()

fsp_err_t R_JPEG_DecodePixelFormatGet (jpeg_ctrl_t * *p_api_ctrl*, jpeg_color_space_t * *p_color_space*)

Get the color format of the JPEG being decoded.

Return values

FSP_SUCCESS	The color format was successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_EncodeImageSizeSet()

fsp_err_t R_JPEG_EncodeImageSizeSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_encode_image_size_t * *p_image_size*)

Set the image dimensions for an encode operation.

Note

Image dimensions must be set before setting the input buffer.

Return values

FSP_SUCCESS	Image size was successfully written to the JPEG Codec.
FSP_ERR_ASSERTION	Pointer to the control block or p_image_size is NULL.
FSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.
FSP_ERR_INVALID_ARGUMENT	Horizontal or vertical resolution is invalid or zero.
FSP_ERR_NOT_OPEN	JPEG not opened.
FSP_ERR_IN_USE	Image parameters cannot be changed while the codec is running.

◆ R_JPEG_ModeSet()

fsp_err_t R_JPEG_ModeSet (jpeg_ctrl_t *const *p_api_ctrl*, jpeg_mode_t *mode*)

Switch between encode and decode mode (or vice-versa).

Note

The codec must not be idle in order to switch modes.

Return values

FSP_SUCCESS	Mode changed successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_IN_USE	JPEG Codec is currently in use.
FSP_ERR_INVALID_ARGUMENT	(Encode only) Quality factor, horizontal resolution and/or vertical resolution are invalid.
FSP_ERR_INVALID_ALIGNMENT	(Encode only) The horizontal resolution (at 16bpp) is not divisible by 8 bytes.

◆ R_JPEG_Close()

fsp_err_t R_JPEG_Close (jpeg_ctrl_t * *p_api_ctrl*)

Cancel an outstanding JPEG codec operation and close the device.

Return values

FSP_SUCCESS	The JPEG unit is stopped and the driver is closed.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_StatusGet()

fsp_err_t R_JPEG_StatusGet (jpeg_ctrl_t * *p_api_ctrl*, jpeg_status_t * *p_status*)
Get the status of the JPEG codec. This function can also be used to poll the device.

Return values

FSP_SUCCESS	The status information is successfully retrieved.
FSP_ERR_ASSERTION	Pointer to the control block or p_status is NULL.
FSP_ERR_NOT_OPEN	JPEG is not opened.

5.2.8.7 LVGL Port (rm_lvgl_port)

Modules » Graphics

Functions

fsp_err_t	RM_LVGL_PORT_Open (rm_lvgl_port_instance_ctrl_t *const p_instance_ctrl, rm_lvgl_port_cfg_t const *const p_cfg)

Detailed Description

LVGL graphics library port for RA MCUs.

Overview

The LVGL RA Port module provides the configuration necessary for use of the LVGL graphics library on RA products. The port provides integration for GLCDC into the LVGL display system, a time source for LVGL timer logic, and optional integration with FreeRTOS.

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the LVGL Project Documentation for details on how to use LVGL in your project.

Hardware Acceleration

Hardware acceleration is optionally provided by DRW using a lightly modified fork of the upstream driver provided by the LVGL project. Most rendering operations are supported.

Configuration

Build Time Configurations for lvgl

The following build time configurations are defined in fsp_cfg/lvgl/lvgl/lv_conf.h:

Configuration	Options	Default	Description
General			
Custom lv_conf.h	Manual Entry		Add a path to your custom lv_conf.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
LVGL			
LVGL > Display			
LV_COLOR_DEPTH	Value must equal 16 or 32.	16	Color depth. 16 or 32 supported.
LVGL > Memory			
LV_MEM_SIZE	Value must be an integer multiple of 1024 between 0x800 and 0xFFFFFFFF.	0x10000	Size of the memory available for `lv_malloc()` in bytes.
LV_DRAW_LAYER_SIMPLE_BUF_SIZE	Value must be an integer multiple of 1024 between 0x400 and 0xFFFFFFFF.	0x6000	Buffer size for simple layer chunks.
LV_DRAW_LAYER_MAX_MEMORY	Value must be an integer.	0	Limit the max allocated memory for simple and transformed layers. 0 for no limit. Otherwise, should be greater than or equal to LV_DRAW_LAYER_SIMPLE_BUF_SIZE. If transformed layers are used, it should be large enough for the largest widget (width x height x 4 area).
LV_DRAW_THREAD_STACK_SIZE	Value must be an integer multiple of 1024 between 0x400 and 0xFFFFFFFF.	0x2000	Stack size of the drawing thread in bytes. Only used when FreeRTOS integration is used.
LVGL > OS Integration			
LV_USE_OS	• LV_OS_NONE • LV_OS_FREERTOS	LV_OS_FREERTOS	Select LVGL RTOS integration.

LV_DRAW_THREAD_PRIO	• LV_THREAD_PRIO_LOWEST • LV_THREAD_PRIO_LOW • LV_THREAD_PRIO_MID • LV_THREAD_PRIO_HIGH • LV_THREAD_PRIO_HIGHEST	LV_THREAD_PRIO_HIGH	Thread priority of the drawing task.
LVGL > Software Rendering			
LV_DRAW_SW_SUPPORT_RGB565	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_RGB565_SWAPPED	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_RGB565A8	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_RGB888	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_XRGB8888	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format.

			Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_ARGB8888	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_ARGB8888_PREMULTIPLIED	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_L8	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_AL88	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPORT_A8	• Enabled • Disabled	Enabled	Enable software rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LV_DRAW_SW_SUPPOR	• Enabled	Enabled	Enable software

T_I1	• Disabled		rendering support for the specified color format. Disable to reduce code size. Some formats may be used internally for some features.
LVGL > Hardware Rendering			
LV_USE_DRAW_DAVE2D	• Enabled • Disabled	Enabled	Enable built-in DRW Engine support.
LVGL > Debug			
LV_ASSERT_HANDLER_INCLUDE	Manual Entry	<stdint.h>	Header file to include to support LV_ASSERT_HANDLER macro.
LV_ASSERT_HANDLER	Manual Entry		Macro to execute when an LV_ASSERT occurs.
LVGL > Widgets			
LV_USE_OBJ_NAME	• Enabled • Disabled	Disabled	Enable support for widget names.
LVGL > Input Devices			
LV_USE_GESTURE_RECOGNITION	• Enabled • Disabled	Disabled	Enable support for multi-touch gesture recognition. Requires floating point support.
LV_USE_IME_PINYIN	• Enabled • Disabled	Disabled	Enable Pinyin input method.
LV_IME_PINYIN_USE_DEFAULT_DICT	• Enabled • Disabled	Enabled	Use default thesaurus.
LV_IME_PINYIN_CAND_TEXT_NUM	Value must be positive.	6	Maximum number of displayed candidate panels. Adjust according to screen size.
LV_IME_PINYIN_USE_K9_MODE	• Enabled • Disabled	Enabled	Use nine key (K9) input.
LV_IME_PINYIN_K9_CAND_TEXT_NUM	Value must be positive.	3	Maximum number of displayed candidate panels in K9 mode. Adjust according to screen size.
LVGL > Fonts			
LVGL > Fonts > Montserrat			

LV_FONT_MONTSERRAT_8	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 8.
LV_FONT_MONTSERRAT_10	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 10.
LV_FONT_MONTSERRAT_12	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 12.
LV_FONT_MONTSERRAT_14	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 14.
LV_FONT_MONTSERRAT_16	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 16.
LV_FONT_MONTSERRAT_18	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 18.
LV_FONT_MONTSERRAT_20	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 20.
LV_FONT_MONTSERRAT_22	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 22.
LV_FONT_MONTSERRAT_24	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 24.
LV_FONT_MONTSERRAT_26	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 26.
LV_FONT_MONTSERRAT_28	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 28.
LV_FONT_MONTSERRAT_30	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 30.
LV_FONT_MONTSERRAT_32	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 32.
LV_FONT_MONTSERRAT_34	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 34.
LV_FONT_MONTSERRAT_36	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 36.

LV_FONT_MONTSERRAT_38	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 38.
LV_FONT_MONTSERRAT_40	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 40.
LV_FONT_MONTSERRAT_42	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 42.
LV_FONT_MONTSERRAT_44	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 44.
LV_FONT_MONTSERRAT_46	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 46.
LV_FONT_MONTSERRAT_48	• Enabled • Disabled	Enabled	Enable built-in font (FontAwesome5, Montserrat) size 48.
LVGL > Fonts > DejaVu			
LV_FONT_DEJAVU_16_PERSIAN_HEBREW	• Enabled • Disabled	Enabled	Enable built-in font DejaVu (Arabic, Hebrew, Persian) size 16.
LVGL > Fonts > SourceHanSansSC			
LV_FONT_SOURCE_HAN_SANS_SC_14_CJK	• Enabled • Disabled	Enabled	Enable built-in font SourceHanSansSC size 14.
LV_FONT_SOURCE_HAN_SANS_SC_16_CJK	• Enabled • Disabled	Enabled	Enable built-in font SourceHanSansSC size 16.
LVGL > Fonts > Unscii			
LV_FONT_UNSCII_8	• Enabled • Disabled	Enabled	Enable built-in font unscii-8 size 8.
LV_FONT_UNSCII_16	• Enabled • Disabled	Enabled	Enable built-in font unscii-8 size 16.
LV_FONT_DEFAULT	Name must be a valid C symbol.	lv_font_montserrat_14	Set a default font for LVGL. Required.
LV_USE_FONT_PLACEHOLDER	• Enabled • Disabled	Enabled	Draw a placeholder when a glyph is not found.
LV_USE_BIDI	• Enabled • Disabled	Disabled	Enable bidirectional text.
LV_USE_ARABIC_PERSIAN_CHARS	• Enabled • Disabled	Disabled	Enable Arabic and Persian language

			processing.
LV_USE_FONT_MANAGER	• Enabled • Disabled	Disabled	Enable the font manager.
LV_FONT_MANAGER_NAME_MAX_LEN	Value must be positive.	32	Maximum font name length when font manager is enabled.

Build Time Configurations for rm_lvgl_port

The following build time configurations are defined in fsp_cfg/middleware/rm_lvgl_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Provide Tick Callback	• Enabled • Disabled	Enabled	Enable the LVGL port driver to provide a tick callback to LVGL.

Configurations for Graphics > LVGL Port (rm_lvgl_port)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_lvgl_port0	Module name.
Target Display Layer	• Graphics Layer 1 • Graphics Layer 2	Graphics Layer 1	Specify which graphics screen to inherit the buffer and display dimensions from.
Callback Function	Must be a valid C symbol	NULL	If a callback function is provided it will be called when Display events occur.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the GLCDC Usage Guide for its requirements here: Graphics LCD (r_glcdc)

LVGL Configuration

LVGL is configured via the use of a configuration header. The port layer provides configuration options within e2 Studio for commonly changed LVGL settings and autogenerates the required header files. It is also possible to provide a custom LVGL configuration header which overrides the LVGL configuration options set in e2 Studio, or configures options that are not exposed in the port layer in e2 Studio.

Usage Notes

Getting Started

To get started with LVGL in an RA project the following must be performed:

1. In e2 studio, open the RA Configuration editor for your project
2. Add LVGL to your project in the Stacks view by clicking **New Stack -> Graphics -> LVGL**
    - If using FreeRTOS, first create a new thread and add the LVGL stack to it
3. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
4. Ensure interrupts on all modules are enabled:
    - GLCDC Vertical Position (GLCDC_VPOS) Interrupt
    - DRW Interrupt (if applicable)
5. Confirm stack size and global heap size are configured as needed
    - If using FreeRTOS, it is suggested to add the Heap_4 stack to provide memory allocation to DRW
    - Stack size must be adequate for the thread executing the LVGL timer handler loop
    - Stack size is configured per thread if FreeRTOS is used
    - Final heap and stack usage must be characterized
6. Ensure the configuration options for LVGL are set as necessary for your application
7. Confirm LVGL heap size is configured as needed
    - Final LVGL heap usage must be characterized
8. Confirm other LVGL memory parameters are configured as needed
    - Final memory usage for miscellaneous memory parameters must be characterized
9. Resolve any remaining constraints
10. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with LVGL. Please refer to the LVGL Project Documentation for details on how to use LVGL in your project, as well as LVGL demo and example code.

Demos and Examples

The LVGL packed with FSP also includes the demos and examples directories that are in the LVGL project. To allow the demos to be included and built in a user project:

1. Create a custom LVGL configuration header, for example lv_conf_custom.h
2. Specify the header file name in the **General|Custom lv_conf.h** LVGL stack configuration property
3. Set the LV_BUILD_DEMOS macro to 1 in the custom header, to override the value set in the generated lv_conf.h
4. Set the desired LV_USE_DEMO_* macro to 1 in the the custom header, to enable the desired demo
5. Call the desired demo function prior to lv_timer_handler() to set up the demo

Including and building the examples in a user project are the same steps, but set the LV_BUILD_EXAMPLES macro to 1 in the custom header instead. No LV_USE_ macros should be required for the examples.

Note

Not all upstream demos and examples material are available, so some demos or examples may not build or execute.

Libraries

The LVGL packed with FSP also includes the src/libs directory that is in the LVGL project. Only bin_decoder is a mandatory library used by LVGL. Other libraries are either first-party or third-party libraries available for use within LVGL.

Note

The included libraries may not be applicable to an RA embedded context. The included libraries may not compile or function without further modification. Libraries like ThorVG require a C++ based FSP project. These libraries are included for convenience but are not validated or officially supported as part of the FSP LVGL integration. Not all libraries have been included.

Multi-thread Support

LVGL is not a thread safe library. Please refer to Tasks and threads for information on how to use LVGL in a multi-thread environment.

Note

This includes both bare metal and FreeRTOS projects. RTOS support is optionally configured depending on whether FreeRTOS is used in the project.

Limitations

Developers should be aware of the following limitations when using LVGL with FSP:

- Compilers may produce different results at this time (v9.3.0). AC6 is known to produce different software rendering output when blending certain image formats with a 32-bit color depth. LLVM is known to create artifacts with LVGL image decoding and blending.
- The DRW upstream driver does not support all LVGL rendering features. Some unsupported features are horizontal gradients, dashed lines, and blitting of certain image formats. In some cases, the LVGL software renderer will act as a fallback renderer, such as when an unsupported image format is used.

Examples

Basic Example

This is a basic example demonstrating the initialization of LVGL and the port layer within a FreeRTOS thread entry function, then servicing LVGL timer logic in a loop.

Note

The port layer manages the GLCDC submodule internally, while the LVGL project manages the DRW submodule; they do not need to be opened directly.

```
void lvgl_thread_entry (void * pvParameters)
{
 FSP_PARAMETER_NOT_USED(pvParameters);
 fsp_err_t error;
 /* Initialize LVGL. */
    lv_init();
 /* TODO: Perform any initialization necessary for the physical display. */
 /* Initialize the LVGL port driver. */
    error = RM_LVGL_PORT_Open(&g_lvgl_port_ctrl, &g_lvgl_port_cfg);
```

```
 /* TODO: Handle fsp_err_t return values as required. */
    (void) error;
 /* TODO: Create an input device using LVGL. */
 /* TODO: Create a user defined UI using LVGL widgets. */
 /* For example, add a label to the LVGL active screen on the default display. */
    lv_obj_t * active_screen = lv_screen_active();
    lv_obj_set_style_text_color(active_screen, lv_color_black(), 0);
    lv_obj_set_style_bg_color(active_screen, lv_color_white(), 0);
    lv_obj_t * label_object = lv_label_create(active_screen);
    lv_label_set_text(label_object, "Hello World!");
 /* Call lv_timer_handler() to process LVGL timer tasks, which includes display
refresh. */
 while (1)
    {
       lv_timer_handler();
       vTaskDelay(1);
    }
}
```

Note

For further example code please consult the LVGL Project Documentation.

Data Structures

struct	rm_lvgl_port_callback_args_t
struct	rm_lvgl_port_cfg_t

Enumerations

enum	rm_lvgl_port_device_t
enum	rm_lvgl_port_event_t

Data Structure Documentation

◆ rm_lvgl_port_callback_args_t

struct rm_lvgl_port_callback_args_t

Callback arguments for the FSP LVGL Port		
Data Fields		
rm_lvgl_port_device_t	device	Device code.
rm_lvgl_port_event_t	event	Event code of the low level hardware.
uint32_t	error	Error code if RM_LVGL_PORT_EVENT_ERROR.

◆ rm_lvgl_port_cfg_t

struct rm_lvgl_port_cfg_t
Configuration structure for the FSP LVGL Port

◆ rm_lvgl_port_instance_ctrl_t

struct rm_lvgl_port_instance_ctrl_t
Instance control block for LVGL Port

Enumeration Type Documentation

◆ rm_lvgl_port_device_t

enum rm_lvgl_port_device_t	
Low level device code for the LVGL Port	
Enumerator	
RM_LVGL_PORT_DEVICE_NONE	Non hardware.
RM_LVGL_PORT_DEVICE_DISPLAY	Display device.

◆ rm_lvgl_port_event_t

enum rm_lvgl_port_event_t	
Display event codes	
Enumerator	
RM_LVGL_PORT_EVENT_DISPLAY_VPOS	Display interface VPOS.
RM_LVGL_PORT_EVENT_UNDERFLOW	Display interface underflow.

Function Documentation

◆ RM_LVGL_PORT_Open()

fsp_err_t RM_LVGL_PORT_Open (rm_lvgl_port_instance_ctrl_t *const *p_instance_ctrl*, rm_lvgl_port_cfg_t const *const *p_cfg*)

Open the LVGL port driver module.

Example:

```
/* Initialize the LVGL port driver. */
   error = RM_LVGL_PORT_Open(&g_lvgl_port_ctrl, &g_lvgl_port_cfg);
/* TODO: Handle fsp_err_t return values as required. */
   (void) error;
```

Note

This function should be called after the LVGL function lv_init() has been called.

Return values

FSP_SUCCESS	LVGL port successfully opened.
FSP_ERR_OUT_OF_MEMORY	Internal call to lv_display_create() failed to allocate memory for a display.

See Common_Error_Codes for other possible return codes. This function calls R_GLCDC_Open(), R_GLCDC_Start(), and R_GLCDC_BufferChange().

Detailed Description

Driver for the MIPI DSI peripheral on RA MCUs. This module implements the Display Interface.

Overview

The MIPI DSI peripheral consists of the Display Serial Interface (DSI-2) Host, physical layer (D-PHY), and supporting sub-systems. Together, these form a high-speed graphics serial bus that formats data from the GLCDC layer and sends it to an external display. The DSI-2 and D-Phy peripherals support MIPI Alliance for Display Serial Interface 2 Version 1.1 (with Errata 01) and MIPI Alliance Specification for D-PHY Version 2.1 (with Errata 01).

Features

The following features are available:

Feature	Options
Pixel formats	RGB888, RGB666, RGB565
Number of lanes	Up to 2
Maximum resolution	See GLCDC specifications
Maximum bandwidth	Up to 750 Mbps per high-speed lane

Features:

- Supports up to 2 Lanes.
- Bidirectional LP mode transfer/receipt (LP-TX / LP-RX).
- Unidirectional High-Speed mode transfer (HS-TX).
- Data rates of up to 720 Mbps per lane.
- Ultra-Low-Power State (ULPS).
- Video input from GLCDC (RGB888, RGB666, RGB565).
- ECC/Checksum generation and verification for packets.
- Generation of scrambled packets.
- Automatic transition from HP to LP during blanking/porch periods.

Supported Devices

Device Group	Devices
RA8	RA8D1, RA8D2, RA8P1

Configuration

Build Time Configurations for r_mipi_dsi

The following build time configurations are defined in fsp_cfg/r_mipi_dsi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > MIPI Physical Layer (r_mipi_phy)

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_mipi_phy0	Module name.
Timing			
Timing > THSPREP			
ns	Value must be a number, greater than or equal to zero.	40	(Nanosecond portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (ns)
UI	Value must be a number, greater than or equal to zero.	5	(UI portion) Duration of the data lane LP-00 state, immediately before entry to the HS-0 state (UI)
Timing > THSSETT			
ns	Value must be a number, greater than or equal to zero.	200	(Nanosecond portion) Period over which a transition to the HS state is to be ignored after the TCLK-PREPARE period has begun in the data lane. (ns)
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Period over which a transition to the HS state is to be ignored after the TCLK-PREPARE period has begun in the data lane. (UI)
Timing > THSZERO			
ns	Value must be a number, greater than or equal to zero.	140	(Nanosecond portion) Specify the data lane zero time before sending data (ns).
UI	Value must be a number, greater than	10	(UI portion) Specify the data lane zero time

	or equal to zero.		before sending data (UI).
Timing > THSTRAIL			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the data lane trail time before exiting HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	4	(UI portion) Specify the data lane trail time before exiting HS mode (UI).
Timing > TCLKPOST			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (ns).
UI	Value must be a number, greater than or equal to zero.	52	(UI portion) Specify the duration after HS data lane trail time elapses before stopping the clock lane (UI).
Timing > TCLKPRE			
ns	Value must be a number, greater than or equal to zero.	0	(Nanosecond portion) Specify the time clock is active before transitioning data lane into HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	8	(UI portion) Specify the time clock is active before transitioning data lane into HS mode (UI).
Timing > TCLKPREP			
ns	Value must be a number, greater than or equal to zero.	75	(Nanosecond portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (ns)
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Duration of the clock lane LP-00 state, immediately before entry to the HS-0 state (UI)
Timing > TCLKSETT			

ns	Value must be a number, greater than or equal to zero.	500	(Nanosecond portion) Duration over which a transition to the HS state is to be ignored after the TCLK_PREPARE period has begun in the clock lane (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Duration over which a transition to the HS state is to be ignored after the TCLK_PREPARE period has begun in the clock lane (ui).
Timing > TCLKMISS			
ns	Value must be a number, greater than or equal to zero.	300	(Nanosecond portion) Period from detection of the absence of a clock until disabling of the HS-RX in the clock lane (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Period from detection of the absence of a clock until disabling of the HS-RX in the clock lane (ui).
Timing > TLPX			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the time for the clock lane to exit low power mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time for the clock lane to exit low power mode (UI).
Timing > TCLKTRL			
ns	Value must be a number, greater than or equal to zero.	60	(Nanosecond portion) Specify the time after clock lane stop before exiting HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time after clock lane stop before exiting HS mode (UI).
Timing > TCLKZERO			
ns	Value must be a	230	(Nanosecond portion)

	number, greater than or equal to zero.		Specify the time clock lane is zero before starting in HS mode (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the time clock lane is zero before starting in HS mode (UI)
Timing > THSEXIT			
ns	Value must be a number, greater than or equal to zero.	100	(Nanosecond portion) Specify the data lane HS mode exit time (ns).
UI	Value must be a number, greater than or equal to zero.	0	(UI portion) Specify the data lane HS mode exit time (UI)
LP Clock Divider	Value must be an integer.	5	Specify the MIPI PHY LP clock division ratio (Resulting frequency must be from 2-17 MHz)
TINIT (ns)	Value must be a number, greater than or equal to zero.	600000	Minimum duration of the TINIT state (ns)
DSI PLL Frequency (MHz)	Value must be between 160 MHz and 1440.0 MHz.	1000.00	Specify the MIPI PHY PLL frequency in MHz.

Configurations for Graphics > MIPI Display (r_mipi_dsi)

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_mipi_dsi0	Module name.
Options			
LCD External Clock Hz	Value must be an integer.	0	Specify the GLCDC external clock frequency in Hz (Set to 0 when GLCDC clock source is set to Internal).
Data Scramble Enable	• Disable • Enable	Disable	Data Scramble Enable. Do not enable unless peripheral has data scramble function.
EoTP Enable	• Disable • Enable	Enable	Disable to support devices that do not support EoTP

			transmission.
ECC Check Enable	• Disable • Enable	Enable	ECC Check support enable.
CRC Enable	• Virtual Channel 0 • Virtual Channel 1 • Virtual Channel 2 • Virtual Channel 3		
Maximum Return Packet Size	Value must be an integer.	1	Specify the maximum return packet size to be received in LP-RX mode.
External Tearing Effect Detection Sense Select	• Rising Edge • Falling Edge	1	Specify the maximum return packet size to be received in LP-RX mode.
HS-TX Timeout Count (us)	Value must be an integer.	0	Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled)
LP-RX Host Processor Timeout (us)	Value must be an integer.	0	Set LP-RX Timeout (LRX-H_TO) value. (0 is disabled)
Turnaround Acknowledge Timeout (us)	Value must be an integer.	0	Set Turnaround Acknowledge Timeout value. (0 is disabled)
Peripheral Response Timeout (us)	Value must be an integer.	0	Set Peripheral Response Timeout BTA value. (0 is disabled)
LP Write Response Timeout (us)	Value must be an integer.	0	Set Low Power Write Acknowledge Timeout value. (0 is disabled)
LP Read Response Timeout (us)	Value must be an integer.	0	Set Low Power Read Acknowledge Timeout value. (0 is disabled)
HS Write Response Timeout (us)	Value must be an integer.	0	Set High Speed Write Acknowledge Timeout value. (0 is disabled)
HS Read Response Timeout (us)	Value must be an integer.	0	Set High Speed Read Acknowledge Timeout value. (0 is disabled)
Low Power			
Ultra Low Power State Wakeup Period (us)	Value must be a positive integer or	1000	Set ultra low power state wakeup period

	zero.		(us).
Clock Lane			
Continuous Mode	• Disable • Enable	Enable	Enable or disable continuous clock mode.
Data Lane			
Number of Data Lanes	Value must be an integer.	2	Specify the number of data lanes. Note: not all data lanes are capable of HS operation. See Usage Notes for additional information.
Video Mode			
Video Mode > Pixel Packet			
Sync Pulse	• HSE and VSE are not transmitted • HSE and VSE are transmitted	HSE and VSE are not transmitted	Select if HSE and VSE are transmitted. Disable for Burst Mode sequence or Non-Burst Mode with Sync Events.
Virtual Channel ID	Value must be an integer.	0	Select the video mode virtual channel ID.
Delay Override (0 to disable)	Value must be an integer.	0	Override FSP calculated delay value (not recommended for most users). Delay for DSI Host between first data reception from display module until DSI output begins. (Unit: 32xUI). Set to 0 to use FSP calculated value (recommended).
Prevent LP Transition	• No LP during the HSA period • No LP during the HBP period • No LP during the HFP period		Prevent LP transition during specified periods.
Interrupts			
dsi_seq0 Interrupt Priority	MCU Specific Options		Select the Low-Power Sequence command operation interrupt priority.
dsi_seq1 Interrupt Priority	MCU Specific Options		Select the High-Speed Sequence command operation interrupt priority.

dsi_vin1 Interrupt Priority	MCU Specific Options		Select the Video Input interrupt priority.
dsi_rcv Interrupt Priority	MCU Specific Options		Select the Receive interrupt priority.
dsi_ferr Interrupt Priority	MCU Specific Options		Select the Fatal Error interrupt priority.
dsi_ppi Interrupt Priority	MCU Specific Options		Select the PHY-Protocol Interface interrupt priority.
Receive Interrupt Enable	Refer to the RA Configuration tool for available options.	Multiple options are selected; refer to the RA Configuration tool for selected options.	Enable receive interrupts.
Fatal Error Interrupt Enable	• HS TX Timeout • LP-RX Host Processor Timeout • Turnaround Acknowledge Timeout • Escape mode Entry Error • LPDT Sync Error • Control Error • LP0 Contention Error • LP1 Contention Error	• HS TX Timeout • LP-RX Host Processor Timeout • Turnaround Acknowledge Timeout • Escape mode Entry Error • LPDT Sync Error • Control Error • LP0 Contention Error • LP1 Contention Error	Enable Fatal Error interrupts.
Physical Lane Interrupt Enable	• Data Lane-0 Rx to Tx Transition • Data Lane-0 Tx to Rx Transition • Clock Lane ULPS Enter • Clock Lane ULPS Exit • Clock Lane LP to HS Transition • Clock Lane HS to LP Transition • Data Lane ULPS Enter • Data Lane ULPS Exit		Enable Physical Lane interrupts.
Video Mode Interrupt Enable	• Video Mode Operation Start • Video Mode Operation Stop • Video Mode Operation	• Video Buffer Underflow Error • Video Buffer Overflow Error	Enable Video Mode interrupts.

	Ready • Timing Error • Video Buffer Underflow Error • Video Buffer Overflow Error		
Sequence Channel 0 Interrupt Enable	• All Actions Finish • All Descriptors Finish • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	• All Actions Finish • All Descriptors Finish • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	Enable Sequence Channel 0 interrupts.
Sequence Channel 1 Interrupt Enable	• All Actions Finish • All Descriptors Finish • Packet Size Error • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	• All Actions Finish • All Descriptors Finish • Packet Size Error • Tx Internal Bus Error • Receive Fatal Error • Receive Fail • Receive Packet Data Fail • Receive Correctable Error Interrupt • Receive Acknowledge and Error Report Packet	Enable Sequence Channel 1 interrupts.
Callback	Name must be a valid C symbol	mipi_dsi0_callback	A user callback function. If this callback function is provided it is called from the interrupt service routine (ISR) each time any interrupt occurs.
Callback Context	Name must be a valid	NULL	Pointer to the context

	C symbol	structure to be passed through the callback argument.

Clock Configuration

The MIPI DSI D-PHY has a dedicated regulator (D-PHY LDO) and PLL (D-PHY PLL), which are managed by the driver. The D-PHY PLL frequency must be configured between 160 MHz and 1.44 GHz.

Note

The D-PHY High-Speed data transmission rate is determined by the following formula: Line rate [Mbps] = fDPHYPLL [MHz] / 2

Pin Configuration

Communication to the external display occurs via one or more data lanes and one clock lane. Each of these lanes has dedicated pins. Lane 0 is capable of low-power data transfer and bidirectional communication with a display. Lane 1 is capable of low-power or high-speed data transfer to the external display. Additionally, an optional tearing effect connection (DSI_TE) may be used with this module.

Usage Notes

Display Data

The DSI-2 Host consumes data from the GLCDC module and prepares it for output via the D-PHY and connections to the display.

MIPI DSI Operating Modes

MIPI DSI is capable of several operating modes: Non-Burst Mode with Sync Pulse, Non-Burst Mode with Sync Event, and Burst Mode. Each operational mode is achieved by configuring the peripheral with specific timimg and option settings.

Non-Burst Mode with Sync Pulse:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is enabled (HSE and VSE are transmitted)

Non-Burst Mode with Sync Event:

- GLCDC Video Clock bandwidth == MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

Burst Mode:

- GLCDC Video Clock bandwidth < MIPI Phy PLL bandwidth
- Sync Pulse is disabled (HSE and VSE are not transmitted)

For the purpose of this section:

- GLCDC Video Clock bandwidth is defined as: (Panel Clock MHz) * (Bits per pixel)
- MIPI Phy PLL bandwidth is defined as: (MIPI Phy PLL Clock MHz / 2) * (Number of MIPI data lanes) * 8 - (Configuration Dependent Transmission Overhead)

Note

Consult the MIPI DSI Specification and the connected display's User Manual to calculate the desired bandwidth utilization. Additionally, especially with strict timing requirements, it is recommended to empirically validate the configuration and use the API to check for reported errors.

MIPI PHY Data Lanes

The DSI-2 Host supports two basic types of operations: Command Mode and Video Mode. While a data lane is in Low-Power (LP) operation, Command Mode may be used for bi-directional communication with a connected display using a pre-defined set of command descriptors.

Note

GLCDC Video Clock bandwidth must not exceed Data Bus bandwidth or MIPI Phy PLL bandwidth.

MIPI PHY Timing Configuration

The MIPI DSI D-PHY configuration controls timing aspects of Low Power (LP) and High Speed (HS) communication. Configure these values to match specifications listed in the datasheet for the display.

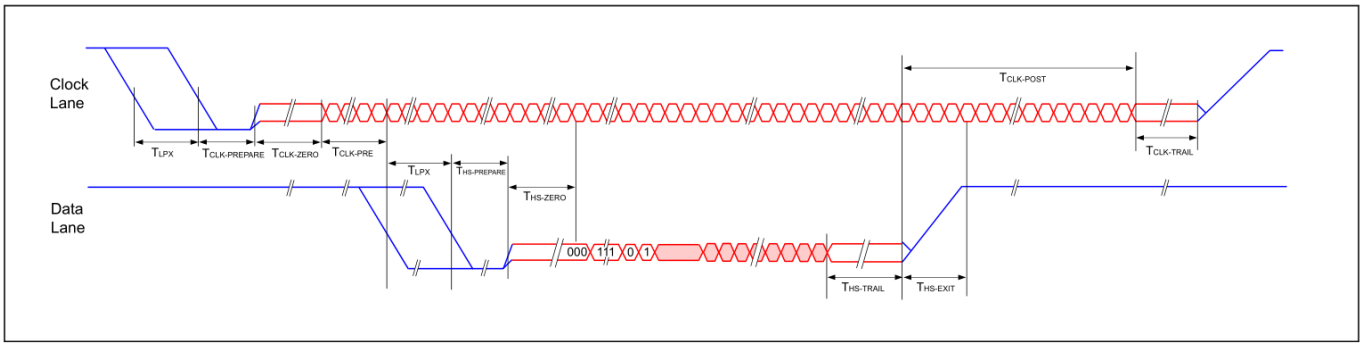

Figure 259: High-Speed data transmission in normal mode

Command Mode Operation

Two internal channels may be used for command mode operations, available for all physical lane configurations. Channel-0 supports only LP mode (LP-TX, LP-RX), while Channel-1 supports LP mode (LP-TX, LP-RX) and HS mode (HS-TX).

There are two basic packet formats, short and long. Each format may be transmitted in high-speed or low-power modes. Packets may be followed by a Bus Turn-Around (BTA) request for reading information from the display. Once configured and started, video packets are transmitted automatically, until video output is stopped.

In addition to the full set of MIPI DSI commands, the application may trigger any of four special commands by setting flags in the message structure. These special commands are Reset Signal, Initial Skew Calibration, Periodic Skew Calibration, and No-Operation.

Note

For peripherals with more than one lane, physical Lane 0 is used for all peripheral-to-processor transmissions. Other lanes are unidirectional, from the host processor to the peripheral.

Acknowledge and Error Reporting

The application is notified of Acknowledge and Error Reporting (AwER) via an optional receive interrupt event. The most recent and accumulated AwER data may be retrieved by calling R_MIPI_DSI_StatusGet(). The application may send a MIPI_DSI_CMD_FLAG_BTA_NO_WRITE message with tx size of zero to request AwER from the peripheral.

Ultra-low Power State

Ultra-low Power State (ULPS) may be actived when HS and LP operations are not occurring. Clock and Data lanes may be transitioned into ULPS independently from each other.

Limitations

Developers should be aware of the following limitations when using the MIPI DSI API:

- MIPI DSI must be closed before transitioning MCU into low-power modes.
- Data bus bandwidth limitations should be considered when setting GLCDC and MIPI DSI clock speeds.
- When the MIPI DSI is used, voltage of VCC and AVCC_MIPI pin must be same and 3V or larger(VCC=AVCC_MIPI≧3V)

Interrupt Configuration

When enabled, Interrupts will invoke the configured callback function. Low-power and High-Speed command status should be determined by checking Sequence 0 and Sequence 1 events, respectively. See the DSI Error Handling section of the user manual for information about how to handle error events.

MIPI DSI Setup with External Display

Especially for use with display middleware such as emWin or GUIX, the callback will be invoked with post-open and pre-video-start events. Depending on your hardware, it may be necessary to use these events to configure the display.

Examples

Basic Example

This is a basic example showing the minimum code required to initialize and start the MIPI DSI module.

```
void mipi_dsi_minimal_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    err = R_MIPI_DSI_Open(&g_mipi_dsi0_ctrl, &g_mipi_dsi0_cfg);
    assert(FSP_SUCCESS == err);
 /* Application to perform display specific initialization. */
    uint8_t       cmd_tx_buffer[] = {0x30, 0x01}; // NOLINT(readability-magic-
numbers)
 mipi_dsi_cmd_t cmd             =
```

```
   {
      .channel    = 0,
      .cmd_id      = MIPI_CMD_ID_DCS_SHORT_WRITE_1_PARAM,
      .flags       = (mipi_dsi_cmd_flag_t) (MIPI_DSI_CMD_FLAG_LOW_POWER |
MIPI_DSI_CMD_FLAG_BTA_READ),
      .tx_len      = 1,
      .p_tx_buffer = cmd_tx_buffer,
   };
   err = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &cmd);
   assert(FSP_SUCCESS == err);
/* Wait for tx/rx complete before sending additional messages */
while (!message_tx_complete)
   {
      ;
   }
while (!message_rx_complete)
   {
      ;
   }
   err = R_MIPI_DSI_Start(&g_mipi_dsi0_ctrl);
   assert(FSP_SUCCESS == err);
/* Trigger status message from peripheral by sending LP BTA
 * NOTE: This is required for ack_err status data to be populated */
mipi_dsi_cmd_t read_cmd = {0};
   read_cmd.cmd_id = MIPI_CMD_ID_DCS_READ;
   read_cmd.flags |= MIPI_DSI_CMD_FLAG_BTA_NO_WRITE | MIPI_DSI_CMD_FLAG_LOW_POWER;
   message_rx_complete = false;
   err               = R_MIPI_DSI_Command(&g_mipi_dsi0_ctrl, &read_cmd);
   assert(FSP_SUCCESS == err);
while (!message_rx_complete)
   {
      ;
   }
/* Read peripheral and local MIPI DSI status
```

```
  * Note: peripheral ack_err status is cleared each time it is read using StatusGet
*/
 mipi_dsi_status_t status;
    err = R_MIPI_DSI_StatusGet(&g_mipi_dsi0_ctrl, &status);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Stop(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsEnter(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_UlpsExit(&g_mipi_dsi0_ctrl, (mipi_dsi_lane_t)
(MIPI_DSI_LANE_CLOCK | MIPI_DSI_LANE_DATA_ALL));
    assert(FSP_SUCCESS == err);
    err = R_MIPI_DSI_Close(&g_mipi_dsi0_ctrl);
    assert(FSP_SUCCESS == err);
}
void mipi_dsi0_callback (mipi_dsi_callback_args_t * p_args)
{
 switch (p_args->event)

struct	mipi_dsi_extended_cfg_t
struct	mipi_dsi_instance_ctrl_t

Data Structure Documentation

◆ mipi_dsi_irq_cfg_t

struct mipi_dsi_irq_cfg_t		
MIPI DSI interrupt configuration		
Data Fields		
uint8_t	ipl	Interrupt priority.
IRQn_Type	irq	Interrupt vector number.

◆ mipi_dsi_extended_cfg_t

struct mipi_dsi_extended_cfg_t		
Extended configuration structure for MIPI DSI.		
Data Fields		
mipi_dsi_irq_cfg_t	dsi_seq0	Sequence 0 interrupt.
mipi_dsi_irq_cfg_t	dsi_seq1	Sequence 1 interrupt.

mipi_dsi_irq_cfg_t	dsi_ferr	DSI Fatal Error interrupt.
mipi_dsi_irq_cfg_t	dsi_ppi	D-PHY PPI interrupt.
mipi_dsi_irq_cfg_t	dsi_rcv	Receive interrupt.
mipi_dsi_irq_cfg_t	dsi_vin1	Video Input Operation interrupt.
uint32_t	dsi_rxie	Receive interrupt enable configuration.
uint32_t	dsi_ferrie	Fatal error interrupt enable configuration.
uint32_t	dsi_plie	Physical lane interrupt enable configuration.
uint32_t	dsi_vmie	Video mode interrupt enable configuration.
uint32_t	dsi_sqch0ie	Sequence Channel 0 interrupt enable configuration.
uint32_t	dsi_sqch1ie	Sequence Channel 1 interrupt enable configuration.

◆ mipi_dsi_instance_ctrl_t

struct mipi_dsi_instance_ctrl_t	
MIPI DSI instance control block.	
Data Fields	
uint32_t	open
	Interface is open.
bool	data_ulps_active
	Data lane ULPS status.
bool	clock_ulps_active
	Data lane ULPS status.
mipi_dsi_lane_t	ulps_status
	Ultra-low Power State active status.
mipi_dsi_cfg_t const *	p_cfg

	Pointer to configuration structure used to open the interface.
void(*	p_callback)(mipi_dsi_callback_args_t *)
	Pointer to callback that is called when an adc_event_t occurs.
void *	p_context
	Pointer to context to be passed into callback function.
mipi_dsi_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.

Function Documentation

◆ R_MIPI_DSI_Open()

fsp_err_t R_MIPI_DSI_Open (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cfg_t const *const *p_cfg*)

Initialize the MIPI DSI peripheral.

Return values

FSP_SUCCESS	The channel was successfully opened.
FSP_ERR_ASSERTION	One or both of the parameters was NULL.
FSP_ERR_ALREADY_OPEN	The instance is already opened.
FSP_ERR_INVALID_STATE	Display module must be opened before DSI.

◆ R_MIPI_DSI_Close()

fsp_err_t R_MIPI_DSI_Close (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Close MIPI DSI and display data instances, disable interrupts, and power-off the module.

Return values

FSP_SUCCESS	The channel is successfully closed.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	Operation in progress and must be stopped before closing.

◆ R_MIPI_DSI_Start()

fsp_err_t R_MIPI_DSI_Start (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Start video output. Initialize Video Output Registers Perform sequence steps 3 to 5 from "Start of Video Mode Operation" in the MIPI DSI section of the relevant hardware manual.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	The physical interface is currently in use.
FSP_ERR_INVALID_STATE	DSI is already in video mode.

◆ R_MIPI_DSI_Stop()

fsp_err_t R_MIPI_DSI_Stop (mipi_dsi_ctrl_t *const *p_api_ctrl*)

Stop video output.

Return values

FSP_SUCCESS	Data is successfully written to the D/A Converter.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	DSI cannot be closed while ULPS is active.

◆ R_MIPI_DSI_UlpsEnter()

fsp_err_t R_MIPI_DSI_UlpsEnter (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane*)

Enter Ultra-low Power State (ULPS).

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_INVALID_MODE	Invalid mode for transition.

◆ R_MIPI_DSI_UlpsExit()

fsp_err_t R_MIPI_DSI_UlpsExit (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_lane_t *lane*)

Exit Ultra-low Power State (ULPS).

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

◆ R_MIPI_DSI_Command()

fsp_err_t R_MIPI_DSI_Command (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_cmd_t * *p_cmd*)

Send a command to the peripheral device.

Note

p_data will be used as either write data or a read buffer depending on the data id.
p_data memory must not be updated until sequence operation is complete if byte_count is greater than 16.

Return values

FSP_SUCCESS	Command(s) queued successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL. cmd_id specifies a long packet but p_data is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.
FSP_ERR_IN_USE	The physical interface is currently in use or video mode is in operation.
FSP_ERR_INVALID_POINTER	Invalid pointer provided
FSP_ERR_INVALID_ARGUMENT	Invalid message configuration

◆ R_MIPI_DSI_StatusGet()

fsp_err_t R_MIPI_DSI_StatusGet (mipi_dsi_ctrl_t *const *p_api_ctrl*, mipi_dsi_status_t * *p_status*)

Provide information about current MIPI DSI status.

Note: Accumulated Acknowledge and Error (AwER) Status is cleared by calling this function. Latest AwER status is only set upon reception from peripheral.

Return values

FSP_SUCCESS	Information read successfully.
FSP_ERR_ASSERTION	p_api_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance is not open.

Detailed Description

Driver for the PDC peripheral on RA MCUs. This module implements the CAPTURE Interface.

Overview

The PDC peripheral supports interfacing with external cameras by accepting timing and data signals in order to capture incoming data. A callback is invoked every time a frame of data is accepted.

Features

- Capture incoming data into a user defined buffer
- Data bytes per pixel can be configured
- Endianess of the incoming data can be specified
- Supports configuring capture width and height
- Supports configuring vertical and horizontal sync polarity
- Horizontal and Vertical position for image/data capture can be specified
- External clock to the camera module can be adjusted
- Choice between DMA and DTC to transfer out the captured data
- The specified user callback is invoked when a data frame is captured

Supported Devices

Device Group	Devices
RA6	RA6M2, RA6M3

Configuration

Build Time Configurations for r_pdc

The following build time configurations are defined in fsp_cfg/r_pdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Parallel Data Capture (r_pdc)

This module can be added to the Stacks tab via New Stack > Graphics > Parallel Data Capture (r_pdc).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_pdc0	Module name.
Input			
Input > Signal polarity			
HSYNC	• High • Low	High	Specify the active polarity of the HSYNC signal.
VSYNC	• High • Low	High	Specify the active polarity of the VSYNC signal.
Input > Capture Specifications			
Number of pixels to capture horizontally	Value must be an integer greater than 0	640	Specify the number of horizontal pixels to capture.
Number of lines to capture vertically	Value must be an integer greater than 0	480	Specify the number of vertical pixels to capture.
Horizontal pixel to start capture from	Value must be an integer	0	Specify the horizontal pixel to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Line to start capture from	Value must be an integer	0	Specify the vertical line to start capturing image data from. Allows an image smaller than the native resolution of a camera to be captured.
Bytes per pixel	Value must be an	2	Specify the number of

	integer greater than 0		bytes per pixel of the captured image data.
Clock divider	• CLK/2 • CLK/4 • CLK/6 • CLK/8 • CLK/10 • CLK/12 • CLK/14 • CLK/16	CLK/2	Specify the clock divider for clock frequency of the clock input PCKO to the PDC peripheral.
Endianess	• Little • Big	Little	Specify the endianness of the captured image data.
Output			
Output > Buffer			
Number of image buffers	Value must be an integer greater than 0	1	Specify the number of buffers to create.
Interrupts			
Callback	Name must be a valid C symbol	g_pdc_user_callback	A user callback function must be provided. This callback is invoked for every successful frame capture and any error conditions
PDC Interrupt Priority	MCU Specific Options		Select the PDC interrupt priority.
DTC Interrupt Priority	MCU Specific Options		Select the DTC interrupt priority.

Clock Configuration

The PDC peripheral module uses the PCLKB as its clock source. The maximum clock to the camera module is PCLKB / 2.

Pin Configuration

The PCKO pin is a clock output and should be connected to the clock input of the camera. The PIXCLK pin is a clock input and should be connected to the output pixel clock of the camera. Likewise, the HSYNC and VSYNC pins must be connected to the horizontal and vertical sync signals of the camera, respectively. The PIXD0-PIXD7 pins are the 8-bit data bus input and should be connected to the relevant output pins of the camera.

Note

Camera control and serial communication pins must be configured separately and are not controlled by this module.

Usage Notes

Interrupt Configuration

- PDC error interrupts are used by this module for reporting errors such as overrun, underrun, vertical line number setting and horizontal byte number setting errors.
- In addition to the PDC error interrupts, DMA or DTC interrupts are also used internally to perform data transfer from this peripheral to the specified image buffer.
- Receive data ready interrupt is used as activation source for DMA and DTC trigger.

Enabling Transfer Modules

- An option to select between DMAC or DTC is provided with DMA as the default transfer choice.
- For further details on DMA please refer Transfer (r_dmac)
- For further details on DTC please refer Transfer (r_dtc)

PDC setup with external camera

- Before configuring the external camera device the PDC Open API must be called in order to start clock output.
- Ensure that the memory pointed to by p_buffer is both valid and large enough to store a complete image.
- The amount of space required (in bytes) can be calculated as: size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel
- Ensure that the size above is divisible by and aligned to 32 bytes.

Examples

Basic Example

This is a basic example of minimal use of the PDC in an application. This example shows how this driver can be used for capturing data from an external I/O device such as an image sensor.

```
void g_pdc_user_callback (capture_callback_args_t * p_args)
{
 if (PDC_EVENT_TRANSFER_COMPLETE == p_args->event)
    {
       g_capture_ready = true;
    }
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the PDC module */
    err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Initialize the camera module at this point. This implementation is camera vendor
specific. */
    camera_module_initialization();
 /* Initialize capture ready flag to false. This gets set to true in PDC callback
upon successful frame capture. */
    g_capture_ready = false;
    err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
    assert(FSP_SUCCESS == err);
    uint32_t timeout_ms = PDC_DELAY_MS;
 /* Since there is nothing else to do, block until Callback triggers*/
 while ((true != g_capture_ready) && timeout_ms)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;;
    }
 if (0U == timeout_ms)
    {
       __BKPT(0);
    }
}
static void camera_module_initialization (void)
{
 /* Camera vendor specific initialization to be done here */
}
```

Data Structure Documentation

◆ pdc_extended_cfg_t

struct pdc_extended_cfg_t		
Extended configuration structure for PDC.		
Data Fields		
pdc_clock_division_t	clock_division	Clock divider.
pdc_endian_t	endian	Endian of capture data.
pdc_hsync_polarity_t	hsync_polarity	Polarity of HSYNC input.
pdc_vsync_polarity_t	vsync_polarity	Polarity of VSYNC input.
uint8_t	pdc_ipl	PDC interrupt priority.
uint8_t	transfer_req_ipl	Transfer interrupt priority.
IRQn_Type	pdc_irq	PDC IRQ number.
IRQn_Type	transfer_req_irq	Transfer request IRQ number.
transfer_instance_t const *	p_lower_lvl_transfer	Pointer to the transfer instance the PDC should use.

◆ pdc_instance_ctrl_t

struct pdc_instance_ctrl_t
PDC instance control block. DO NOT INITIALIZE.

Enumeration Type Documentation

◆ pdc_event_t

enum pdc_event_t	
PDC events	
Enumerator	
PDC_EVENT_TRANSFER_COMPLETE	Complete frame transferred by DMAC/DTC.
PDC_EVENT_RX_DATA_READY	Receive data ready interrupt.
PDC_EVENT_FRAME_END	Frame end interrupt.
PDC_EVENT_ERR_OVERRUN	Overrun interrupt.
PDC_EVENT_ERR_UNDERRUN	Underrun interrupt.
PDC_EVENT_ERR_V_SET	Vertical line setting error interrupt.
PDC_EVENT_ERR_H_SET	Horizontal byte number setting error interrupt.

◆ pdc_clock_division_t

enum pdc_clock_division_t	
Clock divider applied to PDC clock to provide PCKO output frequency	
Enumerator	
PDC_CLOCK_DIVISION_2	CLK / 2.
PDC_CLOCK_DIVISION_4	CLK / 4.
PDC_CLOCK_DIVISION_6	CLK / 6.
PDC_CLOCK_DIVISION_8	CLK / 8.
PDC_CLOCK_DIVISION_10	CLK / 10.
PDC_CLOCK_DIVISION_12	CLK / 12.
PDC_CLOCK_DIVISION_14	CLK / 14.
PDC_CLOCK_DIVISION_16	CLK / 16.

◆ pdc_endian_t

enum pdc_endian_t	
Endian of captured data	
Enumerator	
PDC_ENDIAN_LITTLE	Data is in little endian format.
PDC_ENDIAN_BIG	Data is in big endian format.

◆ pdc_hsync_polarity_t

enum pdc_hsync_polarity_t	
Polarity of input HSYNC signal	
Enumerator	
PDC_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
PDC_HSYNC_POLARITY_LOW	HSYNC signal is active low.

◆ pdc_vsync_polarity_t

enum pdc_vsync_polarity_t	
Polarity of input VSYNC signal	
Enumerator	
PDC_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
PDC_VSYNC_POLARITY_LOW	VSYNC signal is active low.

Function Documentation

◆ R_PDC_Open()

fsp_err_t R_PDC_Open (capture_ctrl_t *const *p_ctrl*, capture_cfg_t const *const *p_cfg*)

Powers on PDC, handles required initialization described in the hardware manual.

Implements capture_api_t::open.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in capture_api_t::captureStart. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Example:

```
/* Initialize the PDC module */
   err = R_PDC_Open(&g_pdc0_ctrl, &g_pdc0_cfg);
```

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL 1. p_cfg is NULL 2. p_api_ctrl is NULL 3. The pointer to the transfer interface in the p_cfg parameter is NULL 4. Callback parameter is NULL. 5. Invalid IRQ number assigned
FSP_ERR_INVALID_ARGUMENT	One or more of the following parameters is incorrect 1. bytes_per_pixel is zero 2. x_capture_pixels is zero 3. y_capture_pixels is zero 4. x_capture_start_pixel + x_capture_pixels is greater than 4095, OR 5. y_capture_start_pixel + y_capture_pixels is greater than 4095
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ R_PDC_Close()

fsp_err_t R_PDC_Close (capture_ctrl_t *const *p_ctrl*)

Stops and closes the transfer interface, disables and powers off the PDC, clears internal driver data and disables interrupts.

Implements capture_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	p_api_ctrl is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_PDC_CaptureStart()

fsp_err_t R_PDC_CaptureStart (capture_ctrl_t *const *p_ctrl*, uint8_t *const *p_buffer*)

Starts a capture. Enables interrupts.

Implements capture_api_t::captureStart.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the capture_api_t::open API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during capture_api_t::open API call will be called.

Example:

```
err = R_PDC_CaptureStart(&g_pdc0_ctrl, g_user_buffer);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Capture start successful.
FSP_ERR_ASSERTION	One or more of the following parameters is NULL 1. p_api_ctrl is NULL 2. p_buffer is NULL
FSP_ERR_NOT_OPEN	Open has not been successfully called.
FSP_ERR_IN_USE	PDC transfer is already in progress.
FSP_ERR_TIMEOUT	Reset operation timed out.
FSP_ERR_NOT_INITIALIZED	Callback function has not been set

◆ R_PDC_StatusGet()

fsp_err_t R_PDC_StatusGet (capture_ctrl_t *const *p_ctrl*, capture_status_t * *p_status*)

Provides the pdc operating status.

Implements capture_api_t::statusGet.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One or more parameters is NULL.
FSP_ERR_NOT_OPEN	Open has not been successfully called.

◆ R_PDC_CallbackSet()

fsp_err_t R_PDC_CallbackSet (capture_ctrl_t *const *p_ctrl*, void(*)(capture_callback_args_t *) *p_callback*, void *const *p_context*, capture_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure.

Implements capture_api_t::callbackSet.

Return values

FSP_ERR_UNSUPPORTED	This is just a stub at present

5.2.8.10 SEGGER emWin RA Port (rm_emwin_port)

Modules » Graphics

SEGGER emWin port for RA MCUs.

Overview

The SEGGER emWin RA Port module provides the configuration and hardware acceleration support necessary for use of emWin on RA products. The port provides full integration with the graphics peripherals as well as FreeRTOS.

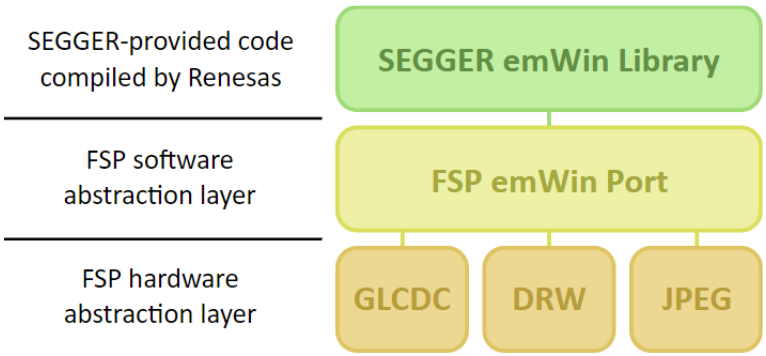

Figure 260: SEGGER emWin FSP Port Block Diagram (using RA6M3 as example)

Note

This port layer primarily enables hardware acceleration and background handling of many display operations and does not contain code intended to be directly called by the user. Please consult the SEGGER emWin User Guide (UM03001) for details on how to use emWin in your project.

Hardware Acceleration

The following functions are currently performed with hardware acceleration:

- DRW Engine (r_drw)
  - Drawing bitmaps (ARGB8888 and RGB565)
  - 4bpp font rendering
  - Rectangle fill
  - Line and shape drawing
  - Anti-aliased operations
    - Circle stroke and fill
    - Polygon stroke and fill
    - Lines and arcs
- JPEG Codec (r_jpeg)
  - JPEG decoding
- Graphics LCD Controller (r_glcdc)
  - Brightness, contrast and gamma correction
  - Pixel format conversion (framebuffer to LCD)

Configuration

Build Time Configurations for rm_emwin_port

The following build time configurations are defined in fsp_cfg/rm_emwin_port_cfg.h:

Configuration	Options	Default	Description
Memory Allocation			
GUI Heap Size	Value must be a non-negative integer	32768	Set the size of the heap to be allocated for use exclusively by emWin.
Section for GUI Heap	Manual Entry	.ram_noinit	Specify the section in which to allocate the GUI heap.

Maximum Layers	Value must be a non-negative integer	16	Set the maximum number of available display layers in emWin. This setting is not related to GLCDC Layer 1 or 2.
AA Font Conversion Buffer Size	Value must be a non-negative integer	400	Set the size of the conversion buffer for anti-aliased font glyphs. This should be set to the size (in bytes) of the largest AA character to be rendered.
LCD Settings			
Wait for Vertical Sync	• Enabled • Disabled	Enabled	When enabled emWin will wait for a vertical sync event each time the display is updated. If an RTOS is used the thread will yield; otherwise each frame will block until Vsync. WARNING: Disabling vertical sync will result in tearing. It is recommended to always leave this setting Enabled if an RTOS is used.
JPEG Decoding			
JPEG Decoding > General			
Input Alignment	• 8-byte aligned (faster) • Unaligned (slower)	8-byte aligned (faster)	Setting this option to 8-bit alignment can allow the hardware JPEG Codec to directly read JPEG data. This speeds up JPEG decoding operations and reduces RAM overhead, but all JPEG images must reside on an 8-byte boundary. When this option is enabled the input buffer is not allocated.

Double-Buffer Output	• Enabled • Disabled	Disabled	Enable this option to configure JPEG decoding operations to use a double-buffered output pipeline. This allows the JPEG to be rendered to the display at the same time as decoding at the cost of additional RAM usage. Enabling this option automatically allocates double the output buffer size.
Error Timeout	Value must be a non-negative integer	50	Set the timeout for JPEG decoding operations (in RTOS ticks) in the event of a decode error.
JPEG Decoding > Buffers			
Input Buffer Size	Value must be a non-negative integer	0x1000	Set the size of the JPEG decode input buffer (in bytes). This buffer is used to ensure 8-byte alignment of input data. Specifying a size smaller than the size of the JPEG to decode will use additional interrupts to stream data in during the decoding process.
Output Buffer Size	Value must be a non-negative integer	0x3C00	Set the size of the JPEG decode output buffer (in bytes). An output buffer smaller than the size of a decoded image will use additional interrupts to stream the data into a framebuffer. Unless you are sure of the subsampling used in and the size of the input JPEG images it is recommended to allocate at least 16 framebuffer lines of memory.
Section for Buffers	Manual Entry	.ram_noinit	Specify the section in

which to allocate the JPEG work buffers.

Hardware Configuration

No clocks or pins are directly required by this module. Please consult the submodules' documentation for their requirements.

Library Configuration

emWin is provided as a pre-compiled library. To maximize compatibility the build-time options are configured as follows:

```
#define GUI_OS (1) // Context switch support enabled
#define GUI_MAXTASK (1) // One task supported by default (can be increased at runtime
via GUITASK_SetMaxTask())
#define GUI_NUM_LAYERS (3) // Up to three displays supported
#define GUI_SUPPORT_TOUCH (1) // Support touch screens
#define GUI_SUPPORT_MOUSE (1) // Support a mouse
#define GUI_SUPPORT_MEMDEV (1) // Memory devices available
#define GUI_WINSUPPORT (1) // Window manager available
#define GUI_SUPPORT_BIDI (1) // Bidirectional text enabled
#define GUI_DEBUG_LEVEL (2) // Parameter and consistency checks enabled (no logging)
```

All other options are left at the default settings in GUI_ConfDefaults.h.

Usage Notes

Getting Started

To get started with emWin in an RA project the following must be performed:

1. Open the RA Configuration editor for your project
2. Add emWin to your project in the Stacks view by clicking **New Stack -> SEGGER -> SEGGER emWin**
3. Ensure the configuration options for emWin are set as necessary for your application
4. Set the properties for the GLCDC module to match the timing and memory requirements of your display panel
5. Set the JPEG decode color depth to the desired value (if applicable)
6. Ensure interrupts on all modules are enabled:
    - GLCDC Vertical Position (Vpos) Interrupt
    - DRW Interrupt (if applicable)
    - JPEG Encode/Decode and Data Transfer Interrupts (if applicable)
7. Confirm stack and heap are configured as needed
    - When starting development a minimum stack of 0x1000 (4K) and heap of 0x4000 (16K) are recommended until actual usage can be characterized
8. Click Generate Project Content to save and commit configuration changes

At this point the project is now ready to build with emWin. Please refer to the SEGGER emWin User Guide (UM03001) as well as demo and sample code for details on how to create a GUI application.

Using Hardware Acceleration

In most cases there is no need to perform additional configuration to ensure the DRW Engine is used. However, there are some guidelines that should be followed depending on the item in question:

- Bitmaps:
  - ARGB8888, RGB888 and RGB565 bitmaps require no additional settings.
- Anti-aliased shapes:
  - Anti-aliased lines, circles, polygons, polygon outlines and arcs are rendered with the DRW Engine.
- Anti-aliased (4bpp) fonts:
  - Set the text mode to GUI_TM_TRANS or create the relevant widget with WM_CF_HASTRANS set.
  - Ensure the "AA Font Conversion Buffer Size" configuration option is set to a size equal to or greater than the size (in bytes) of the largest glyph.
- 8bpp palletized images:
  - When creating these images ensure transparency is not enabled as the SEGGER method for this is not compatible with the DRW Engine.
- RLE-encoded images:
  - Hardware acceleration is not available for SEGGER's RLE format.
- JPEG images:
  - Align any user-declared JPEG data to an 8-byte boundary. If 8-byte alignment cannot be guaranteed disable the **JPEG Decoding -> General -> Input Alignment** option in the RA Configuration.

Multi-thread Support

When the "Multi-thread Support" configuration is enabled, emWin can be called from multiple threads. This comes with advantages and disadvantages:

Advantages:

- High flexibility in development of applications
- Threads can pend and post on emWin events

Disadvantages:

- Slightly higher RAM/ROM use
- Large GUI projects can become difficult to debug

Note

Multi-thread support is independent of RTOS support. RTOS support is managed internally and cannot be manually configured.

Limitations

Developers should be aware of the following limitations when using SEGGER emWin with FSP:

- Hardware acceleration is not available when using color modes lower than 16 bits.
- Hardware acceleration is not available for SEGGER's RLE image format.
- Rotated screen modes are not supported.
- Because emWin is provided as a pre-compiled library the build-time options are fixed. See

the Library Configuration section for the supplied configuration.

Examples

Basic Example

This is a basic example demonstrating a very simple emWin application. The screen is cleared to white and "Hello World!" is printed in the center.

Note

emWin manages the GLCDC, DRW and JPEG Codec submodules internally; they do not need to be opened directly.

```
#include "DIALOG.h"
#define COLOR_WHITE 0x00FFFFFFU
#define COLOR_BLACK 0x00000000U
#define GUI_DRAW_DELAY 100
static void _cbMain (WM_MESSAGE * pMsg)
{
    GUI_RECT Rect;
 switch (pMsg->MsgId)
    {
 case WM_CREATE:
      {
 break;
       }
 case WM_PAINT:
      {
 /* Clear background to white */
            GUI_SetBkColor(COLOR_WHITE);
            GUI_Clear();
 /* Draw "Hello World!" in black in the center */
            WM_GetClientRect(&Rect);
            GUI_SetColor(COLOR_BLACK);
            GUI_DispStringInRect("Hello World!", &Rect, GUI_TA_VCENTER |
GUI_TA_HCENTER);
 break;
```

```
      }
 default:
     {
          WM_DefaultProc(pMsg);
 break;
      }
   }
}
void emWinTask (void)
{
   int32_t xSize;
   int32_t ySize;
 /* Initialize emWin */
   GUI_Init();
 /* Get screen dimensions */
   xSize = LCD_GetXSize();
   ySize = LCD_GetYSize();
 /* Create main window */
   WM_CreateWindowAsChild(0, 0, xSize, ySize, WM_HBKWIN, WM_CF_SHOW, _cbMain, 0);
 /* Enter main drawing loop */
 while (1)
   {
      GUI_Delay(GUI_DRAW_DELAY);
   }
}
```

Note

For further example code please consult SEGGER emWin documentation, which can be downloaded here, as well as the Quick Start Guide and example project(s) provided with your Evaluation Kit (if applicable).

fsp_err_t	R_SLCDC_Close (slcdc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the SLCDC peripheral on RA MCUs. This module implements the SLCDC Interface.

Overview

The segment LCD controller (SLCDC) utilizes two to four reference voltages to provide AC signals for driving traditional segment LCD panels. Depending on the LCD and MCU package, up to 272 segments can be driven. A built-in link to the RTC allows for up to 152 segments to switch between two patterns at regular intervals. An on-chip boost driver can be used to provide configurable reference voltages up to 5.25V allowing for simple contrast adjustment.

Features

The SLCDC module can perform the following functions:

- Initialize, start and stop the SLCDC
- Set and modify the output pattern
- Blink between two patterns based on a periodic RTC interrupt signal
- Adjust display contrast (only when using internal voltage boosting)
- Select reference voltage mode: VL1 reference mode (1/3 or 1/4 Bias) and VL2 reference mode (1/3 Bias) can be selected at internal voltage boosting method, conventional VCC reference mode (1/3 Bias) and VL4 reference mode (1/3) Bias can be selected at capacitor split method

Supported Devices

Device Group	Devices
RA2	RA2A2

RA4	RA4C1, RA4L1, RA4M1, RA4W1

Configuration

Build Time Configurations for r_slcdc

The following build time configurations are defined in fsp_cfg/r_slcdc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Graphics > Segment LCD (r_slcdc)

This module can be added to the Stacks tab via New Stack > Graphics > Segment LCD (r_slcdc).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_slcdc0	Module Name
Clock			
Source	MCU Specific Options		Select the clock source.
Divisor	MCU Specific Options		Select the clock divisor.
Output			
Bias method	• 1/2 bias • 1/3 bias • 1/4 bias	1/2 bias	Select the bias method. This determines the number of voltage levels used to create the waveforms.
Timeslice	MCU Specific Options		Select the LCD time slice. The number of slices should match the number of common (COM) pins for your LCD panel.
Waveform	• Waveform A • Waveform B	Waveform A	Select the LCD waveform.
Drive method	MCU Specific Options		Select the LCD drive method.
Reference Voltage	MCU Specific Options		Select the LCD reference voltage.
Default contrast (if available)	MCU Specific Options		Select the default contrast level.

Valid Configurations

Though there are many setting combinations only a limited subset are supported by the SLCDC peripheral hardware:

Boards have feature Select reference voltage mode (see relevant hardware manual for details)

Waveform	Slices	Bias	External Resistance	Internal boosting VL1	Internal boosting VL2	Capacitor split VCC	Capacitor split VL4
A	8	1/4	Available	Available	—	—	—
A	6	1/4	—	Available	—	—	—
A	8	1/3	Available	Available	Available	Available	Available
A	6	1/3	Available	Available	Available	Available	Available
A	4	1/3	Available	Available	Available	Available	Available
A	3	1/3	Available	Available	Available	Available	Available
A	3	1/2	Available	—	—	—	—
A	2	1/2	Available	—	—	—	—

B	8	1/4	Available	Available	—	—	—
B	8	1/3	Available	Available	Available	Available	Available
B	6	1/3	Available	Available	Available	Available	Available
B	4	1/3	Available	Available	Available	Available	Available
B	3	1/3	Available	Available	Available	Available	Available

Others:

Waveform	Slices	Bias	External Resistance	Internal Boost	Capacitor Split
A	8	1/4	Available	Available	—
A	4	1/3	Available	Available	Available
A	3	1/3	Available	Available	Available
A	3	1/2	Available	—	—
A	2	1/2	Available	—	—
A	Static	—	Available	—	—
B	8	1/4	Available	Available	Available
B	4	1/3	Available	Available	—

Clock Configuration

See relevant hardware manual: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO, LOCO or MOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 1048576 are for MOSC/HOCO/MOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz (some conditions have a frame frequency 24 to 128 Hz - see Table "Combinations of display waveform, time slices, bias method, and frame frequency" in the SLCDC section of the relevant hardware manual).

Others: The SLCDC clock can be sourced from the main clock (MOSC), sub-clock (SOSC), HOCO or LOCO. Dividers of 4 to 1024 are available for SOSC/LOCO and 256 to 524288 for MOSC/HOCO. It is recommended to adjust the divisor such that the resulting clock provides a frame frequency of 32-128 Hz.

Note

Make sure your desired source clock is enabled and running before starting SLCDC output.
Do not set the segment LCD clock over 512 Hz when using internal boost or capacitor split modes.

Pin Configuration

This module controls a variety of pins necessary for segment LCD voltage generation and signal output:

Pin Name	Function	Notes
SEGn	Segment data output	Connect these signals to the segment pins of the LCD.
COMn	Common signal output	Connect these signals to the common pins of the LCD.
VLn	Voltage reference	These pins should be connected to passive components based on the selected drive method (see "Supplying LCD Drive Voltages VL1, VL2, VL3, and VL4" in the SLCDC section of the relevant hardware manual).
CAPH, CAPL	Drive voltage generator capacitor	Connect a nonpolar 0.47uF capacitor across these pins when using internal boost or capacitor split modes. This pin is not needed when using resistance division.

Interrupt Configuration

The SLCDC provides no interrupt signals.

Note

Blinking output timing is driven directly from the RTC periodic interrupt. Once the interrupt is enabled setting the display to SLCDC_DISP_BLINK will swap between A- and B-pattern each time it occurs. The ELC is not required for this functionality.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the SLCDC:

- Different packages provide different numbers of segment pins. Check the User's Manual for your device to confirm availability and mapping of segment signals.
- When using internal boost mode a delay of 5ms is required between calling R_SLCDC_Open and R_SLCDC_Start to allow the boost circuit to charge.
- When using the internal boost or capacitor split method do not set the segment LCD clock higher than 512 Hz.

Examples

Basic Example

Below is a basic example of minimal use of the SLCDC in an application. The SLCDC driver is initialized, output is started and a pattern is written to the segment registers.

```
void slcdc_init (void)
{
 fsp_err_t err;
 /* Open SLCDC driver */
    err = R_SLCDC_Open(&g_slcdc_ctrl, &g_slcdc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When using internal boost mode this delay is required to allow the boost circuit
to charge. See
  * "Segment LCD Source Clock Control Register (SLCDSCKCR)" description in SLCDC
section of the relevant
  * hardware manual for details. */
 R_BSP_SoftwareDelay(5, BSP_DELAY_UNITS_MILLISECONDS);
 /* Start SLCDC output */
    err = R_SLCDC_Start(&g_slcdc_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write pattern to display */
    err = R_SLCDC_Write(&g_slcdc_ctrl, 0, segment_data, NUM_SEGMENTS);
    assert(FSP_SUCCESS == err);
}
```

Note

While the SLCDC is running, pattern data is constantly being output. No latching or buffering is required when writing or reading segment data.

Blinking Output

This example demonstrates how to set up blinking output using the RTC periodic interrupt. In this example it is assumed that the SLCDC has already been started.

```
void slcdc_blink (void)
{
 fsp_err_t err;
 /* Open RTC and set time/date */
    err = R_RTC_Open(&r_rtc_ctrl, &r_rtc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_RTC_CalendarTimeSet(&r_rtc_ctrl, &g_rtc_time);
    assert(FSP_SUCCESS == err);
 /* Set RTC periodic interrupt to 2 Hz (display blink cycle will be 1 Hz) */
    err = R_RTC_PeriodicIrqRateSet(&r_rtc_ctrl,
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND);
    assert(FSP_SUCCESS == err);
 /* Set display to blink */
    err = R_SLCDC_SetDisplayArea(&g_slcdc_ctrl, SLCDC_DISP_BLINK);
    assert(FSP_SUCCESS == err);
 /* Display will now continuously blink */
}
```

Data Structures

struct	slcdc_instance_ctrl_t

Data Structure Documentation

◆ slcdc_instance_ctrl_t

struct slcdc_instance_ctrl_t
SLCDC control block. DO NOT INITIALIZE. Initialization occurs when slcdc_api_t::open is called

Function Documentation

◆ R_SLCDC_Open()

fsp_err_t R_SLCDC_Open (slcdc_ctrl_t *const *p_ctrl*, slcdc_cfg_t const *const *p_cfg*)

Opens the SLCDC driver. Implements slcdc_api_t::open.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Invalid display mode.

◆ R_SLCDC_Write()

fsp_err_t R_SLCDC_Write (slcdc_ctrl_t *const *p_ctrl*, uint8_t const *start_segment*, uint8_t const *p_data*, uint8_t const *segment_count*)

Writes a sequence of display data to the segment data registers. Implements slcdc_api_t::write.

Return values

FSP_SUCCESS	Data was written successfully.
FSP_ERR_ASSERTION	Pointer to the control block or data is NULL.
FSP_ERR_INVALID_ARGUMENT	Segment index is (or will be) out of range.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Modify()

fsp_err_t R_SLCDC_Modify (slcdc_ctrl_t *const *p_ctrl*, uint8_t const *segment*, uint8_t const *data*, uint8_t const *data_mask*)

Modifies a single segment register based on a mask and the desired data. Implements slcdc_api_t::modify.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_Start()

fsp_err_t R_SLCDC_Start (slcdc_ctrl_t *const *p_ctrl*)

Starts output of LCD signals. Implements slcdc_api_t::start.

Return values

FSP_SUCCESS	SLCDC timing, output, and voltage generation(if configured) activated
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_Stop()

fsp_err_t R_SLCDC_Stop (slcdc_ctrl_t *const *p_ctrl*)

Stops output of LCD signals. Implements slcdc_api_t::stop.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

◆ R_SLCDC_SetContrast()

fsp_err_t R_SLCDC_SetContrast (slcdc_ctrl_t *const *p_ctrl*, slcdc_contrast_t const *contrast*)

Sets contrast to the specified level. Implements slcdc_api_t::setContrast.

Note

Contrast can be adjusted when the SLCDC is operating in internal boost mode only. The range of values is 0-5 when 1/4 bias setting is used and 0-15 otherwise. See "LCD Boost Level Control Register (VLCD)" description in the SLCDC section of the relevant hardware manual for voltage levels at each setting.

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized
FSP_ERR_UNSUPPORTED	Unsupported operation

◆ R_SLCDC_SetDisplayArea()

fsp_err_t R_SLCDC_SetDisplayArea (slcdc_ctrl_t *const *p_ctrl*, slcdc_display_area_t const *display_area*)
Sets output to Waveform A, Waveform B or blinking output. Implements slcdc_api_t::setDisplayArea .

Return values

FSP_SUCCESS	Device was opened successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_UNSUPPORTED	Pattern selection has no effect in 8-time-slice mode.
FSP_ERR_NOT_OPEN	Device is not opened or initialized.

◆ R_SLCDC_Close()

fsp_err_t R_SLCDC_Close (slcdc_ctrl_t *const *p_ctrl*)
Closes the SLCDC driver. Implements slcdc_api_t::close.

Return values

FSP_SUCCESS	Device was closed successfully.
FSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
FSP_ERR_NOT_OPEN	Device is not opened or initialized

5.2.9 Input

Modules

Detailed Description

Input Modules.

Modules

	External IRQ (r_icu) Driver for the ICU peripheral on RA MCUs. This module implements the External IRQ Interface.

	Key Matrix (r_kint) Driver for the KINT peripheral on RA MCUs. This module implements the Key Matrix Interface.

Modules » Input

Functions

fsp_err_t	R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const p_api_ctrl, external_irq_cfg_t const *const p_cfg)
fsp_err_t	R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const p_api_ctrl)
fsp_err_t	R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const p_api_ctrl)
fsp_err_t	R_ICU_ExternalIrqCallbackSet (external_irq_ctrl_t *const p_api_ctrl, void(*p_callback)(external_irq_callback_args_t *), void *const p_context, external_irq_callback_args_t *const p_callback_memory)
fsp_err_t	R_ICU_ExternalIrqClose (external_irq_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the ICU peripheral on RA MCUs. This module implements the External IRQ Interface.

Overview

The Interrupt Controller Unit (ICU) controls which event signals are linked to the NVIC, DTC, and DMAC modules. The R_ICU software module only implements the External IRQ Interface. The external_irq interface is for configuring interrupts to fire when a trigger condition is detected on an external IRQ pin.

Note

Multiple instances are used when more than one external interrupt is needed. Configure each instance with different channels and properties as needed for the specific interrupt.

Features

- Supports configuring interrupts for IRQ pins on the target MCUs
  - Enabling and disabling interrupt generation.
  - Configuring interrupt trigger on rising edge, falling edge, both edges, or low level signal.
  - Enabling and disabling the IRQ noise filter.
- Supports configuring a user callback function, which will be invoked by the HAL module

when an external pin interrupt is generated.

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_icu

The following build time configurations are defined in fsp_cfg/r_icu_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Input > External IRQ (r_icu)

This module can be added to the Stacks tab via New Stack > Input > External IRQ (r_icu). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_external_irq0	Module name.
Channel	Value must be a non-negative integer	0	Specify the hardware channel.
Trigger	MCU Specific Options		Select the signal edge or state that triggers an interrupt.
Digital Filtering	MCU Specific Options		Select if the digital noise filter should be enabled.
Filter Source	MCU Specific Options		Select the clock source for digital filter (Only

			affected when the digital filter is enabled).
Digital Filtering Sample Clock (Only valid when Digital Filtering is Enabled)	MCU Specific Options		Select the clock divider for the digital noise filter.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) each time the IRQn triggers
Pin Interrupt Priority	MCU Specific Options		Select the PIN interrupt priority.

Clock Configuration

The ICU peripheral module doesn't require any specific clock settings.

Note

The digital filter uses PCLKB as the clock source for sampling the IRQ pin.

Pin Configuration

The pin for the external interrupt channel must be configured as an input with IRQ Input Enabled.

Limitation

Pin configuration does not show conflicts when same IRQ is used by multiple pins.

Usage Notes

Digital Filter

The digital filter is used to reject trigger conditions that are too short. The trigger condition must be longer than three periods of the filter clock. The filter clock frequency is determined by PCLKB and the external_irq_pclk_div_t setting.

MIN_PULSE_WIDTH = EXTERNAL_IRQ_PCLKB_DIV / PCLKB_FREQUENCY * 3

DMAC/DTC

When using an External IRQ pin to trigger a DMAC/DTC transfer, the External IRQ pin must be opened before the transfer instance is opened.

Examples

Basic Example

This is a basic example of minimal use of the ICU in an application.

```
#define ICU_IRQN_PIN BSP_IO_PORT_02_PIN_06
#define ICU_IRQN 6
/* Called from icu_irq_isr */
void external_irq_callback (external_irq_callback_args_t * p_args)
{
    (void) p_args;
    g_external_irq_complete = 1;
}
void simple_example ()
{
 /* Example Configuration */
 external_irq_cfg_t icu_cfg =
    {
       .channel          = ICU_IRQN,
       .trigger          = EXTERNAL_IRQ_TRIG_RISING,
       .filter_enable    = false,
       .clock_source_div = EXTERNAL_IRQ_CLOCK_SOURCE_DIV_1,
       .p_callback       = external_irq_callback,
       .p_context       = 0,
       .ipl              = 0,
       .irq              = (IRQn_Type) 0,
    };
 /* Configure the external interrupt. */
 fsp_err_t err = R_ICU_ExternalIrqOpen(&g_icu_ctrl, &icu_cfg);
    assert(FSP_SUCCESS == err);
 /* Enable the external interrupt. */
 /* Enable not required when used with ELC or DMAC. */
    err = R_ICU_ExternalIrqEnable(&g_icu_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_external_irq_complete)
    {
 /* Wait for interrupt. */
    }
```

```
}
```

Data Structures

struct	icu_extended_cfg_t
struct	icu_instance_ctrl_t

Enumerations

enum	e_external_irq_digital_filter_t

Data Structure Documentation

◆ icu_extended_cfg_t

struct icu_extended_cfg_t		
Extended ICU interface configuration		
Data Fields		
e_external_irq_digital_filter_t	filter_src	Select digital filter clock source when digital filter is enabled.

◆ icu_instance_ctrl_t

struct icu_instance_ctrl_t	
ICU private control block. DO NOT MODIFY. Initialization occurs when R_ICU_ExternalIrqOpen is called.	
Data Fields	
uint32_t	open
	Used to determine if channel control block is in use.
IRQn_Type	irq
	NVIC interrupt number.
uint8_t	channel
	Channel.
void *	p_context

Field Documentation

◆ p_context

void* icu_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.

Enumeration Type Documentation

◆ e_external_irq_digital_filter_t

enum e_external_irq_digital_filter_t	
External IRQ input pin digital filtering clock selection.	
Enumerator	
EXTERNAL_IRQ_DIGITAL_FILTER_PCLK_DIV	Digital filter using clock PCLK dividers.
EXTERNAL_IRQ_DIGITAL_FILTER_LOCO	Digital filter using clock LOCO.

Function Documentation

◆ R_ICU_ExternalIrqOpen()

fsp_err_t R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const *p_api_ctrl*, external_irq_cfg_t const *const *p_cfg*)

Configure an IRQ input pin for use with the external interrupt interface. Implements external_irq_api_t::open.

The Open function is responsible for preparing an external IRQ pin for operation.

Return values

FSP_SUCCESS	Open successful.
FSP_ERR_ASSERTION	One of the following is invalid: • p_ctrl or p_cfg is NULL
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
FSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function.
FSP_ERR_UNSUPPORTED	An input argument is not supported by selected mode.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

◆ R_ICU_ExternalIrqEnable()

fsp_err_t R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt for specified channel at NVIC. Implements external_irq_api_t::enable.

Return values

FSP_SUCCESS	Interrupt Enabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ R_ICU_ExternalIrqDisable()

fsp_err_t R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const *p_api_ctrl*)

Disable external interrupt for specified channel at NVIC. Implements external_irq_api_t::disable.

Return values

FSP_SUCCESS	Interrupt disabled successfully.
FSP_ERR_ASSERTION	The p_ctrl parameter was null.
FSP_ERR_NOT_OPEN	The channel is not opened.
FSP_ERR_IRQ_BSP_DISABLED	Requested IRQ is not defined in this system

◆ R_ICU_ExternalIrqCallbackSet()

fsp_err_t R_ICU_ExternalIrqCallbackSet (external_irq_ctrl_t *const *p_api_ctrl*, void(*)(external_irq_callback_args_t *) *p_callback*, void *const *p_context*, external_irq_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements external_irq_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_ICU_ExternalIrqClose()

fsp_err_t R_ICU_ExternalIrqClose (external_irq_ctrl_t *const *p_api_ctrl*)

Close the external interrupt channel. Implements external_irq_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The channel is not opened.

5.2.9.2 Key Matrix (r_kint)

Modules » Input

Functions

fsp_err_t	R_KINT_Open (keymatrix_ctrl_t *const p_api_ctrl, keymatrix_cfg_t const *const p_cfg)
fsp_err_t	R_KINT_Close (keymatrix_ctrl_t *const p_api_ctrl)
fsp_err_t	R_KINT_Enable (keymatrix_ctrl_t *const p_api_ctrl)
fsp_err_t	R_KINT_Disable (keymatrix_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the KINT peripheral on RA MCUs. This module implements the Key Matrix Interface.

Overview

The KINT module configures the Key Interrupt (KINT) peripheral to detect rising or falling edges on any of the KINT channels. When such an event is detected on any of the configured pins, the module generates an interrupt.

Features

- Detect rising or falling edges on KINT channels
- Callback for notifying the application when edges are detected on the configured channels

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4M1, RA4W1
RA6	RA6M1, RA6M2, RA6M3, RA6T1, RA6T2

Configuration

Build Time Configurations for r_kint

The following build time configurations are defined in fsp_cfg/r_kint_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	• Enabled • Disabled		parameter checking is included in the build.

Configurations for Input > Key Matrix (r_kint)

This module can be added to the Stacks tab via New Stack > Input > Key Matrix (r_kint).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_kint0	Module name.
Input			
Key Interrupt Flag Mask	MCU Specific Options		Select channels to enable.
Interrupts			
Trigger Type	• Falling Edge • Rising Edge	Rising Edge	Specifies if the enabled channels detect a rising edge or a falling edge. NOTE: either all channels detecting a rising edge or all channels detecting a falling edge.
Callback	Name must be a valid C symbol	kint_callback	A user callback function can be provided. If this callback function is provided, it will be called from the interrupt service routine (ISR) each time the IRQ triggers.
Key Interrupt Priority	MCU Specific Options		Select the key interrupt priority.

Clock Configuration

The KINT peripheral runs on PCLKB.

Pin Configuration

The KRn pins are key switch matrix row input pins.

Usage Notes

Connecting a Switch Matrix

The KINT module is designed to scan the rows of a switch matrix where each row is connected to a number of columns through switches. A periodic timer (or other mechanism) sets one column pin

high at a time. Any switches that are pressed on the driven column cause a rising (or falling) edge on the row pin (KRn) causing an interrupt.

Note

In applications where multiple keys may be pressed at the same time it is recommended to put a diode inline with each switch to prevent ghosting.

Handling Multiple Pins

When an edge is detected on multiple pins at the same time, a single IRQ will be generated. A mask of all the pins that detected an edge will be passed to the callback.

Examples

Basic Example

This is a basic example of minimal use of the KINT in an application.

```
static volatile uint32_t g_channel_mask;
static volatile uint32_t g_kint_edge_detected = 0U;
/* Called from key_int_isr */
void r_kint_callback (keymatrix_callback_args_t * p_args)
{
    g_channel_mask       = p_args->channel_mask;
    g_kint_edge_detected = 1U;
}
void r_kint_example ()
{
 /* Configure the KINT. */
 fsp_err_t err = R_KINT_Open(&g_kint_ctrl, &g_kint_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Enable the KINT. */
    err = R_KINT_Enable(&g_kint_ctrl);
    assert(FSP_SUCCESS == err);
 while (0 == g_kint_edge_detected)
    {
 /* Wait for interrupt. */
    }
}
```

Data Structures

struct	kint_instance_ctrl_t

Data Structure Documentation

◆ kint_instance_ctrl_t

struct kint_instance_ctrl_t
Channel instance control block. DO NOT INITIALIZE. Initialization occurs when keymatrix_api_t::open is called.

Function Documentation

◆ R_KINT_Open()

fsp_err_t R_KINT_Open (keymatrix_ctrl_t *const *p_api_ctrl*, keymatrix_cfg_t const *const *p_cfg*)
Configure all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. Implements keymatrix_api_t::open.

Return values

FSP_SUCCESS	Initialization was successful.
FSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback.
FSP_ERR_ALREADY_OPEN	The module has already been opened.
FSP_ERR_IP_CHANNEL_NOT_PRESENT	The channel mask is invalid.

◆ R_KINT_Close()

fsp_err_t R_KINT_Close (keymatrix_ctrl_t *const *p_api_ctrl*)
Clear the KINT configuration and disable the KINT IRQ. Implements keymatrix_api_t::close.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The module is not opened.

◆ R_KINT_Enable()

fsp_err_t R_KINT_Enable (keymatrix_ctrl_t *const *p_api_ctrl*)
This function enables interrupts for the KINT peripheral after clearing any pending requests. Implements keymatrix_api_t::enable. **Return values** FSP_SUCCESS — Interrupt enabled successfully. FSP_ERR_ASSERTION — The p_ctrl parameter was null. FSP_ERR_NOT_OPEN — The peripheral is not opened.

◆ R_KINT_Disable()

fsp_err_t R_KINT_Disable (keymatrix_ctrl_t *const *p_api_ctrl*)
This function disables interrupts for the KINT peripheral. Implements keymatrix_api_t::disable. **Return values** FSP_SUCCESS — Interrupt disabled successfully. FSP_ERR_ASSERTION — The p_ctrl parameter was null. FSP_ERR_NOT_OPEN — The channel is not opened.

5.2.10 Monitoring

Modules

Detailed Description

Monitoring Modules.

Modules

	CRC (r_crc) Driver for the CRC peripheral on RA MCUs. This module implements the CRC Interface.
	Clock Accuracy Circuit (r_cac) Driver for the CAC peripheral on RA MCUs. This module implements the CAC Interface.

	Data Operation Circuit (r_doc) Driver for the DOC peripheral on RA MCUs. This module implements the DOC Interface.
	Independent Watchdog (r_iwdt) Driver for the IWDT peripheral on RA MCUs. This module implements the WDT Interface.
	Low/Programmable Voltage Detection (r_lvd) Driver for the LVD and PVD peripherals on RA MCUs. This module implements the Low Voltage Detection Interface.
	Watchdog (r_wdt) Driver for the WDT peripheral on RA MCUs. This module implements the WDT Interface.

5.2.10.1 CRC (r_crc)

Modules » Monitoring

Functions

fsp_err_t	R_CRC_Open (crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg)
fsp_err_t	R_CRC_Close (crc_ctrl_t *const p_ctrl)
fsp_err_t	R_CRC_Calculate (crc_ctrl_t *const p_ctrl, crc_input_t *const p_crc_input, uint32_t *calculatedValue)
fsp_err_t	R_CRC_CalculatedValueGet (crc_ctrl_t *const p_ctrl, uint32_t *calculatedValue)
fsp_err_t	R_CRC_SnoopEnable (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)
fsp_err_t	R_CRC_SnoopDisable (crc_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CRC peripheral on RA MCUs. This module implements the CRC Interface.

Overview

The CRC module provides a API to calculate 8, 16 and 32-bit CRC values on a block of data in memory or a stream of data over a Serial Communication Interface (SCI) channel using industry-standard polynomials.

Features

- CRC module supports the following 8 and 16 bit CRC polynomials which operates on 8-bit data in parallel
  - X^8+X^2+X+1 (CRC-8)
  - X^16+X^15+X^2+1 (CRC-16)
  - X^16+X^12+X^5+1 (CRC-CCITT)
- CRC module supports the following 32 bit CRC polynomials which operates on 32-bit data in parallel
  - X^32+X^26+X^23+X^22+X^16+X^12+X^11+X^10+X^8+X^7+X^5+X^4+X^2+X+ 1 (CRC-32)
  - X^32+ X^28+ X^27+ X^26+ X^25+ X^23+ X^22+ X^20+ X^19+ X^18+X^14+X^13+X^11+X^10+X^9+X^8+X^6+1 (CRC-32C)
- CRC module can calculate CRC with LSB first or MSB first bit order.

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_crc

The following build time configurations are defined in fsp_cfg/r_crc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > CRC (r_crc)

This module can be added to the Stacks tab via New Stack > Monitoring > CRC (r_crc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_crc0	Module name.
CRC Polynomial	MCU Specific Options		Select the CRC polynomial.
Bit Order	MCU Specific Options		Select the CRC bit order.
Snoop Address	MCU Specific Options		Select the SCI register address CRC snoop

Clock Configuration

There is no clock configuration for the CRC module.

Pin Configuration

This module does not use I/O pins.

Usage Notes

CRC Snoop

The CRC snoop function monitors reads from and writes to a specified I/O register address and performs CRC calculation on the data read from and written to the register address automatically. Instead of calling R_CRC_Calculate on a block of data, R_CRC_SnoopEnable is called to start monitoring reads/writes and R_CRC_CalculatedValueGet is used to obtain the current CRC.

Note

Snoop mode is available for transmit/receive operations on SCI only.

Limitations

When using CRC32 polynomial functions the CRC module produces the same results as popular online CRC32 calculators, but it is important to remember a few important points.

- Online CRC32 calculators allow the input to be any number of bytes. The FSP CRC32 API function uses 32-bit words. This means the online calculations must be 'padded' to end on a 32-bit boundary.
- Online CRC32 calculators usually invert the output prior to presenting it as a result. It is up to the application program to include this step if needed.
- The seed value of 0xFFFFFFFF needs to be used by both the online calculator and the R_CRC module API (CRC32 polynomials)
- Make sure the bit orientation of the R_CRC CRC32 is set for LSB and that you have CRC32 selected and not CRC32C.
- Some online CRC tools XOR the final result with 0xFFFFFFFF.

Examples

Basic Example

This is a basic example of minimal use of the CRC module in an application.

```
void crc_example ()
{
    uint32_t length;
    uint32_t uint8_calculated_value;
    length = sizeof(g_data_8bit) / sizeof(g_data_8bit[0]);
 crc_input_t example_input =
    {
       .p_input_buffer = g_data_8bit,
       .num_bytes      = length,
       .crc_seed       = 0,
    };
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* 8-bit CRC calculation */
 R_CRC_Calculate(&crc_ctrl, &example_input, &uint8_calculated_value);
}
```

Snoop Example

This example demonstrates CRC snoop operation.

```
void crc_snoop_example ()
{
 /* Open CRC module with 8 bit polynomial */
 R_CRC_Open(&crc_ctrl, &g_crc_test_cfg);
 /* Open SCI Driver */
 /* Configure Snoop address and enable snoop mode */
 R_CRC_SnoopEnable(&crc_ctrl, 0);
 /* Perfrom SCI read/Write operation depending on the SCI snoop address configure */
 /* Read CRC value */
 R_CRC_CalculatedValueGet(&crc_ctrl, &g_crc_buff);
}
```

Data Structures

struct	crc_instance_ctrl_t

Data Structure Documentation

◆ crc_instance_ctrl_t

struct crc_instance_ctrl_t
Driver instance control structure.

Function Documentation

◆ R_CRC_Open()

fsp_err_t R_CRC_Open (crc_ctrl_t *const *p_ctrl*, crc_cfg_t const *const *p_cfg*)

Open the CRC driver module

Implements crc_api_t::open

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
FSP_ERR_ALREADY_OPEN	Module already open
FSP_ERR_UNSUPPORTED	Hardware not support this feature.

◆ R_CRC_Close()

fsp_err_t R_CRC_Close (crc_ctrl_t *const *p_ctrl*)

Close the CRC module driver.

Implements crc_api_t::close

Return values

FSP_SUCCESS	Configuration was successful.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_Calculate()

fsp_err_t R_CRC_Calculate (crc_ctrl_t *const *p_ctrl*, crc_input_t *const *p_crc_input*, uint32_t * *calculatedValue*)

Perform a CRC calculation on a block of 8-bit/32-bit (for 32-bit polynomial) data.

Implements crc_api_t::calculate

This function performs a CRC calculation on an array of 8-bit/32-bit (for 32-bit polynomial) values and returns an 8-bit/32-bit (for 32-bit polynomial) calculated value

Return values

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
FSP_ERR_INVALID_ARGUMENT	length value is NULL, or not 4-byte aligned when 32-bit CRC polynomial function is configured.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_CalculatedValueGet()

fsp_err_t R_CRC_CalculatedValueGet (crc_ctrl_t *const *p_ctrl*, uint32_t * *calculatedValue*)

Return the current calculated value.

Implements crc_api_t::crcResultGet

CRC calculation operates on a running value. This function returns the current calculated value.

Return values

FSP_SUCCESS	Return of calculated value successful.
FSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.

◆ R_CRC_SnoopEnable()

fsp_err_t R_CRC_SnoopEnable (crc_ctrl_t *const *p_ctrl*, uint32_t *crc_seed*)

Configure the snoop channel and set the CRC seed.

Implements crc_api_t::snoopEnable

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Return values

FSP_SUCCESS	Snoop configured successfully.
FSP_ERR_ASSERTION	Pointer to control structure is NULL
FSP_ERR_NOT_OPEN	The driver is not opened.
FSP_ERR_UNSUPPORTED	SNOOP operation is not supported.

◆ R_CRC_SnoopDisable()

fsp_err_t R_CRC_SnoopDisable (crc_ctrl_t *const *p_ctrl*)

Disable snooping.

Implements crc_api_t::snoopDisable

Return values

FSP_SUCCESS	Snoop disabled.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The driver is not opened.
FSP_ERR_UNSUPPORTED	SNOOP operation is not supported.

5.2.10.2 Clock Accuracy Circuit (r_cac)

Modules » Monitoring

Functions

fsp_err_t	R_CAC_Open (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)
fsp_err_t	R_CAC_StartMeasurement (cac_ctrl_t *const p_ctrl)
fsp_err_t	R_CAC_StopMeasurement (cac_ctrl_t *const p_ctrl)

fsp_err_t	R_CAC_Read (cac_ctrl_t *const p_ctrl, uint32_t *const p_counter)
fsp_err_t	R_CAC_CallbackSet (cac_ctrl_t *const p_ctrl, void(*p_callback)(cac_callback_args_t *), void *const p_context, cac_callback_args_t *const p_callback_memory)
fsp_err_t	R_CAC_Close (cac_ctrl_t *const p_ctrl)

Detailed Description

Driver for the CAC peripheral on RA MCUs. This module implements the CAC Interface.

Overview

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to check a system clock frequency with a reference clock signal by counting the number of measurement clock edges that occur between two edges of the reference clock.

Features

- Supports clock frequency-measurement and monitoring based on a reference signal input
- Reference can be either an externally supplied clock source or an internal clock source
- An interrupt request may optionally be generated by a completed measurement, a detected frequency error, or a counter overflow.
- A digital filter is available for an externally supplied reference clock, and dividers are available for both internally supplied measurement and reference clocks.
- Edge-detection options for the reference clock are configurable as rising, falling, or both.

Supported Devices

Device Group	Devices
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_cac

The following build time configurations are defined in fsp_cfg/r_cac_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Clock Accuracy Circuit (r_cac)

This module can be added to the Stacks tab via New Stack > Monitoring > Clock Accuracy Circuit (r_cac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_cac0	Module name.
Reference clock divider	• 32 • 128 • 1024 • 8192	32	Reference clock divider.
Reference clock source	MCU Specific Options		Reference clock source.
Reference clock digital filter	• Disabled • Sampling clock =Measuring freq • Sampling clock =Measuring freq/4 • Sampling clock =Measuring freq/16	Disabled	Reference clock digital filter.
Reference clock edge detect	• Rising • Falling • Both	Rising	Reference clock edge detection.
Measurement clock divider	• 1 • 4 • 8 • 32	1	Measurement clock divider.
Measurement clock source	MCU Specific Options		Measurement clock source.
Upper Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Top end of allowable range for measurement completion.
Lower Limit Threshold	Value must be a non-negative integer, between 0 to 65535	0	Bottom end of allowable range for measurement completion.
Frequency Error Interrupt Priority	MCU Specific Options		CAC frequency error interrupt priority.
Measurement End	MCU Specific Options		CAC measurement end

Interrupt Priority			interrupt priority.
Overflow Interrupt Priority	MCU Specific Options		CAC overflow interrupt priority.
Callback	Name must be a valid C symbol	NULL	Function name for callback

Clock Configuration

The CAC measurement clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT

The CAC reference clock source can be configured as the following:

1. MAIN_OSC
2. SUBCLOCK
3. HOCO
4. MOCO
5. LOCO
6. PCLKB
7. IWDT
8. External Clock Source (CACREF)

Pin Configuration

The CACREF pin can be configured to provide the reference clock for CAC measurements.

Usage Notes

Measurement Accuracy

The clock measurement result may be off by up to one pulse depending on the phase difference between the edge detection circuit, digital filter, and CACREF pin signal, if applicable.

Frequency Error Interrupt

The frequency error interrupt is only triggered at the end of a CAC measurement. This means that there will be a measurement complete interrupt in addition to the frequency error interrupt.

Examples

Basic Example

This is a basic example of minimal use of the CAC in an application.

```
volatile uint32_t g_callback_complete;
```

```
void cac_basic_example ()
{
    g_callback_complete = 0;
 fsp_err_t err = R_CAC_Open(&g_cac_ctrl, &g_cac_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    (void) R_CAC_StartMeasurement(&g_cac_ctrl);
 /* Wait for measurement to complete. */
 while (0 == g_callback_complete)
    {
    }
    uint32_t value;
 /* Read the CAC measurement. */
    (void) R_CAC_Read(&g_cac_ctrl, &value);
}
/* Called when measurement is completed. */
static void r_cac_callback (cac_callback_args_t * p_args)
{
 if (CAC_EVENT_MEASUREMENT_COMPLETE == p_args->event)
    {
       g_callback_complete = 1U;
    }
}
```

Data Structures

struct	cac_instance_ctrl_t

Data Structure Documentation

◆ cac_instance_ctrl_t

struct cac_instance_ctrl_t
CAC instance control block. DO NOT INITIALIZE.

Function Documentation

◆ R_CAC_Open()

fsp_err_t R_CAC_Open (cac_ctrl_t *const *p_ctrl*, cac_cfg_t const *const *p_cfg*)

The Open function configures the CAC based on the provided user configuration settings.

Return values

FSP_SUCCESS	CAC is available and available for measurement(s).
FSP_ERR_ASSERTION	An argument is invalid.
FSP_ERR_ALREADY_OPEN	The CAC has already been opened.

Note

There is only a single CAC peripheral.

◆ R_CAC_StartMeasurement()

fsp_err_t R_CAC_StartMeasurement (cac_ctrl_t *const *p_ctrl*)

Start the CAC measurement process.

Return values

FSP_SUCCESS	CAC measurement started.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_StopMeasurement()

fsp_err_t R_CAC_StopMeasurement (cac_ctrl_t *const *p_ctrl*)

Stop the CAC measurement process.

Return values

FSP_SUCCESS	CAC measuring has been stopped.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_Read()

fsp_err_t R_CAC_Read (cac_ctrl_t *const *p_ctrl*, uint32_t *const *p_counter*)

Read and return the CAC status and counter registers.

Return values

FSP_SUCCESS	CAC read successful.
FSP_ERR_ASSERTION	An argument is NULL.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

◆ R_CAC_CallbackSet()

fsp_err_t R_CAC_CallbackSet (cac_ctrl_t *const *p_ctrl*, void(*)(cac_callback_args_t *) *p_callback*, void *const *p_context*, cac_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements cac_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_CAC_Close()

fsp_err_t R_CAC_Close (cac_ctrl_t *const *p_ctrl*)

Release any resources that were allocated by the Open() or any subsequent CAC operations.

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	NULL provided for p_instance_ctrl or p_cfg.
FSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

5.2.10.3 Data Operation Circuit (r_doc)

Modules » Monitoring

Functions

fsp_err_t	R_DOC_Open (doc_ctrl_t *const p_api_ctrl, doc_cfg_t const *const p_cfg)
fsp_err_t	R_DOC_Close (doc_ctrl_t *const p_api_ctrl)
fsp_err_t	R_DOC_Read (doc_ctrl_t *const p_api_ctrl, uint32_t *p_result)
fsp_err_t	R_DOC_Write (doc_ctrl_t *const p_api_ctrl, uint32_t data)
fsp_err_t	R_DOC_CallbackSet (doc_ctrl_t *const p_api_ctrl, void(*p_callback)(doc_callback_args_t *), void *const p_context, doc_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the DOC peripheral on RA MCUs. This module implements the DOC Interface.

Overview

Features

The DOC HAL module peripheral is used to compare, add or subtract 16-bit or 32-bit[1] data and can detect the following events:

- Comparison Mode
  - Data is equal to the configured reference data setting.
  - Data is not equal to the configured reference data setting.
  - Data is less than the configured reference data setting[2].
  - Data is greater than the configured reference data setting[2].
  - Data is inside of a configurable pair of reference data settings[2].
  - Data is outside of a configurable pair of reference data settings[2].
- Addition Mode - Overflow of an addition operation
- Subtraction Mode - Underflow of a subtraction operation

A user-defined callback can be created to inform the CPU when any of above events occur.

Note

1. *Operating on 32-bit data is not supported on all MCUs.*
2. *This comparison mode is not supported on all MCUs.*

Supported Devices

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_doc

The following build time configurations are defined in fsp_cfg/r_doc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_doc0	Module name.
Event	MCU Specific Options		Select the event that will trigger the DOC interrupt.
Bit Width	MCU Specific Options		The bit width for DOC operations.
Reference/Initial Data	Value must be an integer greater than or equal to 0.	0	Enter Initial Value for Addition/Subtraction or enter reference value for comparison.

Additional Reference Data	Value must be an integer greater than or equal to 0.	0	Additional reference data used for Window Compare modes.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs.
DOC Interrupt Priority	MCU Specific Options		Select the DOC interrupt priority.

Configurations for Monitoring > Data Operation Circuit (r_doc)

This module can be added to the Stacks tab via New Stack > Monitoring > Data Operation Circuit (r_doc). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_doc0	Module name.
Event	MCU Specific Options		Select the event that will trigger the DOC interrupt.
Bit Width	MCU Specific Options		The bit width for DOC operations.
Reference/Initial Data	Value must be an integer greater than or equal to 0.	0	Enter Initial Value for Addition/Subtraction or enter reference value for comparison.
Additional Reference Data	Value must be an integer greater than or equal to 0.	0	Additional reference data used for Window Compare modes.
Callback	Name must be a valid C symbol	NULL	A user callback function must be provided. This will be called from the interrupt service routine (ISR) when the configured DOC event occurs.
DOC Interrupt Priority	MCU Specific Options		Select the DOC interrupt priority.

Clock Configuration

The DOC HAL module does not require a specific clock configuration.

Pin Configuration

The DOC HAL module does not require and specific pin configurations.

Usage Notes

DMAC/DTC Integration

DOC can be used with Transfer (r_dmac) or Transfer (r_dtc) to write to the input register without CPU intervention. DMAC is more useful for most DOC applications because it can be started directly from software. To write DOC input data with DTC/DMAC, set transfer_info_t::p_dest to R_DOC->DODIR.

Examples

Basic Example

This is a basic example of minimal use of the R_DOC in an application. This example shows how this driver can be used for continuous 16 bit addition operation while reading the result at every overflow event.

```
#define DOC_EXAMPLE_VALUE 0xF000
uint32_t g_callback_event_counter = 0;
/* This callback is called when DOC overflow event occurs. It is registered in
doc_cfg_t when R_DOC_Open is
 * called. */
void doc_callback (doc_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
    g_callback_event_counter++;
}
void basic_example (void)
{
 fsp_err_t err;
 /* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
    err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Write data to the DOC Data Input Register and read the result of addition from
status register when an
  * interrupt occurs. */
```

```
for (int i = 0; i < 5; i++)
   {
      err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
     assert(FSP_SUCCESS == err);
if (g_callback_event_counter >= 1)
     {
           uint32_t result;
/* Read the result of the operation */
           err = R_DOC_Read(&g_doc_ctrl, &result);
     assert(FSP_SUCCESS == err);
      }
   }
}
```

Function Documentation

◆ R_DOC_Open()

fsp_err_t R_DOC_Open (doc_ctrl_t *const *p_api_ctrl*, doc_cfg_t const *const *p_cfg*)

Opens and configures the Data Operation Circuit (DOC) in comparison, addition or subtraction mode and sets initial data for addition or subtraction, or reference data for comparison.

Example:

```
/* Initialize the DOC module for addition with initial value specified in
doc_cfg_t::doc_data. */
   err = R_DOC_Open(&g_doc_ctrl, &g_doc_cfg);
```

Return values

FSP_SUCCESS	DOC successfully configured.
FSP_ERR_ALREADY_OPEN	Module already open.
FSP_ERR_ASSERTION	One or more pointers point to NULL or callback is NULL or the interrupt vector is invalid.

◆ R_DOC_Close()

fsp_err_t R_DOC_Close (doc_ctrl_t *const *p_api_ctrl*)

Closes the module driver. Enables module stop mode.

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function will disable the DOC interrupt in the NVIC.

◆ R_DOC_Read()

fsp_err_t R_DOC_Read (doc_ctrl_t *const *p_api_ctrl*, uint32_t * *p_result*)

Returns the result of addition/subtraction.

Example:

```
           uint32_t result;
/* Read the result of the operation */
           err = R_DOC_Read(&g_doc_ctrl, &result);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Status successfully read.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ R_DOC_Write()

fsp_err_t R_DOC_Write (doc_ctrl_t *const *p_api_ctrl*, uint32_t *data*)

Writes to the DODIR - DOC Input Register.

Example:

```
err = R_DOC_Write(&g_doc_ctrl, DOC_EXAMPLE_VALUE);
assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Values successfully written to the registers.
FSP_ERR_NOT_OPEN	Driver not open.
FSP_ERR_ASSERTION	One or more pointers point to NULL.

◆ R_DOC_CallbackSet()

fsp_err_t R_DOC_CallbackSet (doc_ctrl_t *const *p_api_ctrl*, void(*)(doc_callback_args_t *) *p_callback*, void *const *p_context*, doc_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements doc_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_IWDT_CallbackSet (wdt_ctrl_t *const p_ctrl, void(*p_callback)(wdt_callback_args_t *), void *const p_context, wdt_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the IWDT peripheral on RA MCUs. This module implements the WDT Interface.

Overview

The independent watchdog timer is used to recover from unexpected errors in an application. The timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the IWDT resets the device or generates an NMI.

Features

The IWDT HAL module has the following key features:

- When the IWDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT supports following modes:[1]
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application[1].

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	On most of MCUs, the IWDT can only be configured by hardware to start automatically[1].

Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Note

1. Refer to the MCU hardware user's manual or datasheet to determine if IWDT supports register start mode.

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab. These settings include the following:*

- *Start Mode*
- *Timeout Period*
- *Dedicated Clock Frequency Divisor*
- *Window End Position*
- *Window Start Position*
- *Reset Interrupt Request Select*
- *Stop Control*

Review the OFS0 properties window to see additional details.

Build Time Configurations for r_iwdt

The following build time configurations are defined in fsp_cfg/r_iwdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	MCU Specific Options		If enabled, code for NMI support in register start mode is included in the build.

Configurations for Monitoring > Independent Watchdog (r_iwdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Independent Watchdog (r_iwdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	MCU Specific Options		Select the independent watchdog timeout in cycles.
Clock Division Ratio	MCU Specific Options		Select the independent watchdog clock divisor.
Window Start Position	MCU Specific Options		Select the allowed independent watchdog refresh start point in %.
Window End Position	MCU Specific Options		Select the allowed independent watchdog refresh end point in %.
Reset Control	MCU Specific Options		Select what happens when the independent watchdog timer expires.
Stop Control	MCU Specific Options		Select the independent watchdog state in low power mode.
NMI callback	Name must be a valid C symbol	NULL	A user callback function can be provided here. If this callback function is provided, it is called from the interrupt service routine (ISR) when the watchdog triggers.

Clock Configuration

The IWDT clock is based on the IWDTCLK frequency. You can set the IWDTCLK frequency divider using the **BSP** tab of the RA Configuration editor.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The independent watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the IWDT in software start mode with NMI and the timer underflows, the IWDT status must be reset by calling R_IWDT_StatusClear before restarting the timer via R_IWDT_Refresh.

Period Calculation

The IWDT operates from IWDTCLK. With a IWDTCLK of 15000 Hz, the maximum time from the last refresh to device reset or NMI generation will be just below 35 seconds as detailed below.

IWDTCLK = 15000 Hz
Clock division ratio = IWDTCLK / 256
Timeout period = 2048 cycles
WDT clock frequency = 15000 Hz / 256 = 58.59 Hz
Cycle time = 1 / 58.59 Hz = 17.067 ms
Timeout = 17.067 ms x 2048 cycles = 34.95 seconds

Limitations

Developers should be aware of the following limitations when using the IWDT:

- When using a J-Link debugger the IWDT counter does not count and therefore will not reset the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the IWDT to count and generate NMI or reset when the
 * debugger is connected. */
  R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
```

- If the IWDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_IWDT_Refresh() after the MCU wakes from low power mode.

Examples

IWDT Basic Example

This is a basic example of minimal use of the IWDT in an application.

```
void iwdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the IWDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

```
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
       (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

IWDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define IWDT_TIMEOUT_COUNTS (2048U)
#define IWDT_MAX_COUNTER (IWDT_TIMEOUT_COUNTS - 1U)
#define IWDT_START_WINDOW_75 ((IWDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void iwdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
```

```
void iwdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the IWDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_IWDT = 0;
#if defined(R_SYSTEM_RSTSR1_IWDTRF_Msk)
 /* (Optional) Check if the IWDTRF flag is set to know if the system is
  * recovering from a IWDT reset. */
 if (R_SYSTEM->RSTSR1_b.IWDTRF)
    {
 /* Clear the flag. */
       R_SYSTEM->RSTSR1 = 0U;
    }
#endif
 /* Open the module. */
    err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize other application code. */
 /* Do not call R_IWDT_Refresh() in auto start mode unless the
  * counter is in the acceptable refresh window. */
    (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
 while (true)
    {
 /* Application work here. */
 /* (Optional) If there is a chance the application takes less time than
  * the start window, verify the IWDT counter is past the start window
  * before refreshing the IWDT. */
       uint32_t iwdt_counter = 0U;
 do
     {
 /* Read the current IWDT counter value. */
           err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
```

```
      assert(FSP_SUCCESS == err);
      } while (iwdt_counter >= IWDT_START_WINDOW_75);
 /* Refresh before the counter underflows to prevent reset or NMI. */
       (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
    }
}
```

Data Structures

struct	iwdt_instance_ctrl_t

Data Structure Documentation

◆ iwdt_instance_ctrl_t

struct iwdt_instance_ctrl_t	
IWDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called.	
Data Fields	
uint32_t	wdt_open
	Indicates whether the open() API has been successfully called.
void *	p_context
	Placeholder for user data. Passed to the user callback in wdt_callback_args_t.
void(*	p_callback)(wdt_callback_args_t *p_args)
	Callback provided when a WDT NMI ISR occurs.

Function Documentation

◆ R_IWDT_Open()

fsp_err_t R_IWDT_Open (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t const *const *p_cfg*)

Register the IWDT NMI callback.

Example:

```
/* Initializes the module. */
   err = R_IWDT_Open(&g_iwdt0_ctrl, &g_iwdt0_cfg);
```

Return values

FSP_SUCCESS	IWDT successfully configured.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_ENABLED	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

◆ R_IWDT_Refresh()

fsp_err_t R_IWDT_Refresh (wdt_ctrl_t *const *p_api_ctrl*)

Refresh the Independent Watchdog Timer. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI based on the
setting. */
      (void) R_IWDT_Refresh(&g_iwdt0_ctrl);
```

Return values

FSP_SUCCESS	IWDT successfully refreshed.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_StatusGet()

fsp_err_t R_IWDT_StatusGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_status_t *const *p_status*)

Read the IWDT status flags.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_IWDT_StatusGet(&g_iwdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.
FSP_ERR_UNSUPPORTED	This function is only valid if the IWDT generates an NMI when an error occurs.

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_IWDT_StatusClear()

fsp_err_t R_IWDT_StatusClear (wdt_ctrl_t *const *p_api_ctrl*, const wdt_status_t *status*)

Clear the IWDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_IWDT_StatusClear(&g_iwdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.
FSP_ERR_UNSUPPORTED	This function is only valid if the IWDT generates an NMI when an error occurs.

Note

When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_IWDT_CounterGet()

fsp_err_t R_IWDT_CounterGet (wdt_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_count*)

Read the current count value of the IWDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current IWDT counter value. */
           err = R_IWDT_CounterGet(&g_iwdt0_ctrl, &iwdt_counter);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	IWDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_TimeoutGet()

fsp_err_t R_IWDT_TimeoutGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

FSP_SUCCESS	IWDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	One or more parameters are NULL pointers.
FSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

◆ R_IWDT_CallbackSet()

fsp_err_t R_IWDT_CallbackSet (wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void *const *p_context*, wdt_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

Detailed Description

Driver for the LVD and PVD peripherals on RA MCUs. This module implements the Low Voltage Detection Interface.

Note

In the below usage notes, "LVD" refers to both LVD and PVD.

Overview

The Low Voltage Detection module configures the voltage monitors to detect when a power supply pin or a voltage detector pin voltages crosses a specified threshold.

Features

The LVD HAL module supports the following functions:

- Seven run-time configurable voltage monitors (Voltage Monitor 1, Voltage Monitor 2, Voltage Monitor 4, Voltage Monitor 5, LVD VBAT, LVD VRTC, EXLVD)
  - Configurable voltage threshold
  - Digital filter (Available on specific MCUs)
  - Support for both interrupt or polling
    - NMI or maskable interrupt can be configured (NMI support for Voltage Monitor 1 & Voltage Monitor 2 only).
  - Voltage monitor interrupt generation condition can be configured (rising, falling, or both edge event detection).
  - Support for resetting the MCU when V_{CC} falls below/rises above configured threshold.
    Note: Voltage monitor availability is limited based on the selected MCU.

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_lvd

The following build time configurations are defined in fsp_cfg/r_lvd_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Monitoring > Low/Programmable Voltage Detection (r_lvd)

This module can be added to the Stacks tab via New Stack > Monitoring > Low/Programmable Voltage Detection (r_lvd). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_lvd0	Module name.
Monitor Number	MCU Specific Options		Select the LVD monitor.
Digital Filter	MCU Specific Options		Enable the digital filter and select the digital filter clock divider.
Voltage Threshold	MCU Specific Options		Select the low voltage detection threshold.
Detection Response	MCU Specific Options		Select what happens when the voltage crosses the threshold voltage.
Voltage Slope	MCU Specific Options		Select interrupt generation on rising voltage, falling voltage or both.
Negation Delay	MCU Specific Options		Negation of the monitor signal can either be delayed from the reset event or from voltage returning to normal range.
Monitor Interrupt Callback	Name must be a valid C symbol.	NULL	A user callback function can be provided. If this callback function is provided, it will be called from the

		interrupt service routine (ISR) each time the IRQ triggers.
LVD Monitor Interrupt Priority	MCU Specific Options	Select the LVD Monitor interrupt priority.

Clock Configuration

The LOCO clock must be enabled in order to use the digital filter.

Pin Configuration

To use LVD module, you need to switch pin function of EXLVDVBAT pin, VRTC pin, EXLVD pin to enable LVD function on this pin.

Usage Notes

Startup Edge Detection

If V_{CC} is below the threshold prior to configuring the voltage monitor for falling edge detection, the monitor will immediately detect the a falling edge condition. If V_{CC} is above the threshold prior to configuring the monitor for rising edge detection, the monitor will not detect a rising edge condition until V_{CC} falls below the threshold and then rises above it again.

Voltage Monitor 0

The LVD HAL module only supports configuring voltage monitor 1 and voltage monitor 2. Voltage monitor 0 can be configured by setting the appropriate bits in the OFS1 register. This means that voltage monitor 0 settings cannot be changed at runtime.

Voltage monitor 0 supports the following features

- Configurable Voltage Threshold (V_{DET0})
- Reset the device when V_{CC} falls below V_{DET0}

Limitations

- The digital filter must be disabled when using voltage monitors in Software Standby or Deep Software Standby.
- Deep Software Standby mode is not possible if the voltage monitor is configured to reset the MCU.
- Reset generated by the VCC-rise detection is supported only on devices with PVD.
- On RA0, when LVD0 is used the detection voltage of LVD1 must be higher than LVD0's. See in hardware manual: LVD > Register Descriptions > LVD1CR.
- Voltage Monitor 4, Voltage Monitor 5 does not support interrupt feature.
- LVD Monitor 1 and LVD Monitor 2 must have the same security attribution. Either both monitors are used in the secure project, or both monitors are used in the non-secure project.

Examples

Basic Example

This is a basic example of minimal use of the LVD in an application.

```
void basic_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
    assert(FSP_SUCCESS == err);
 while (1)
    {
 lvd_status_t status;
       err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
      assert(FSP_SUCCESS == err);
 if (LVD_THRESHOLD_CROSSING_DETECTED == status.crossing_detected)
      {
            err = R_LVD_StatusClear(&g_lvd_ctrl);
      assert(FSP_SUCCESS == err);
 /* Do something */
       }
    }
}
```

Interrupt Example

This is a basic example of using a LVD instance that is configured to generate an interrupt.

```
void interrupt_example (void)
{
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (1)
    {
 /* Application Process */
 /* Application will be interrupted when Vcc crosses the configured threshold. */
    }
}
/* Called when Vcc crosses configured threshold. */
```

```
void lvd_callback (lvd_callback_args_t * p_args)
{
 if (LVD_CURRENT_STATE_BELOW_THRESHOLD == p_args->current_state)
    {
 /* Do Something */
    }
}
```

Reset Example

This is a basic example of using a LVD instance that is configured to reset the MCU.

```
void reset_example (void)
{
 if (1U == R_SYSTEM->RSTSR0_b.LVD1RF)
    {
 /* The system is coming out of reset because Vcc crossed configured voltage
threshold. */
 /* Clear Voltage Monitor 1 Reset Detect Flag. */
       R_SYSTEM->RSTSR0_b.LVD1RF = 0;
    }
 fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 while (1)
    {
 /* Application Process */
 /* Application will reset when Vcc crosses the configured threshold. */
    }
}
```

Data Structures

struct	lvd_instance_ctrl_t

Data Structure Documentation

◆ lvd_instance_ctrl_t

struct lvd_instance_ctrl_t
LVD instance control structure

Function Documentation

◆ R_LVD_Open()

fsp_err_t R_LVD_Open (lvd_ctrl_t *const *p_api_ctrl*, lvd_cfg_t const *const *p_cfg*)

Initializes a voltage monitor and detector according to the passed-in configuration structure.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

Note

Digital filter is not to be used with standby modes.
Startup time can take on the order of milliseconds for some configurations.

Example:

```
fsp_err_t err = R_LVD_Open(&g_lvd_ctrl, &g_lvd_cfg);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	Requested configuration was invalid
FSP_ERR_ALREADY_OPEN	The instance was already opened
FSP_ERR_IN_USE	Another instance is already using the desired monitor
FSP_ERR_UNSUPPORTED	Digital filter was enabled on a device that does not support it

◆ R_LVD_StatusGet()

fsp_err_t R_LVD_StatusGet (lvd_ctrl_t *const *p_api_ctrl*, lvd_status_t * *p_lvd_status*)

Get the current state of the monitor (threshold crossing detected, voltage currently above or below threshold).

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance
[out]	p_lvd_status	Pointer to status structure

Example:

```
err = R_LVD_StatusGet(&g_lvd_ctrl, &status);
```

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open
FSP_ERR_UNSUPPORTED	This monitor does not support status feature

◆ R_LVD_StatusClear()

fsp_err_t R_LVD_StatusClear (lvd_ctrl_t *const *p_api_ctrl*)

Clears the latched status of the monitor.

Parameters

[in]	p_api_ctrl	Pointer to the control structure for the driver instance

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open
FSP_ERR_UNSUPPORTED	This monitor does not support status feature

◆ R_LVD_CallbackSet()

fsp_err_t R_LVD_CallbackSet (lvd_ctrl_t *const *p_api_ctrl*, void(*)(lvd_callback_args_t *) *p_callback*, void *const *p_context*, lvd_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements lvd_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_LVD_Close()

fsp_err_t R_LVD_Close (lvd_ctrl_t *const *p_api_ctrl*)

Disables the LVD peripheral. Closes the driver instance.

Parameters

[in]	p_api_ctrl	Pointer to the control block structure for the driver instance

Return values

FSP_SUCCESS	Successful
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_NOT_OPEN	Driver is not open

Detailed Description

Driver for the WDT peripheral on RA MCUs. This module implements the WDT Interface.

Overview

The watchdog timer is used to recover from unexpected errors in an application. The watchdog timer must be refreshed periodically in the permitted count window by the application. If the count is allowed to underflow or refresh occurs outside of the valid refresh period, the WDT resets the device or generates an NMI.

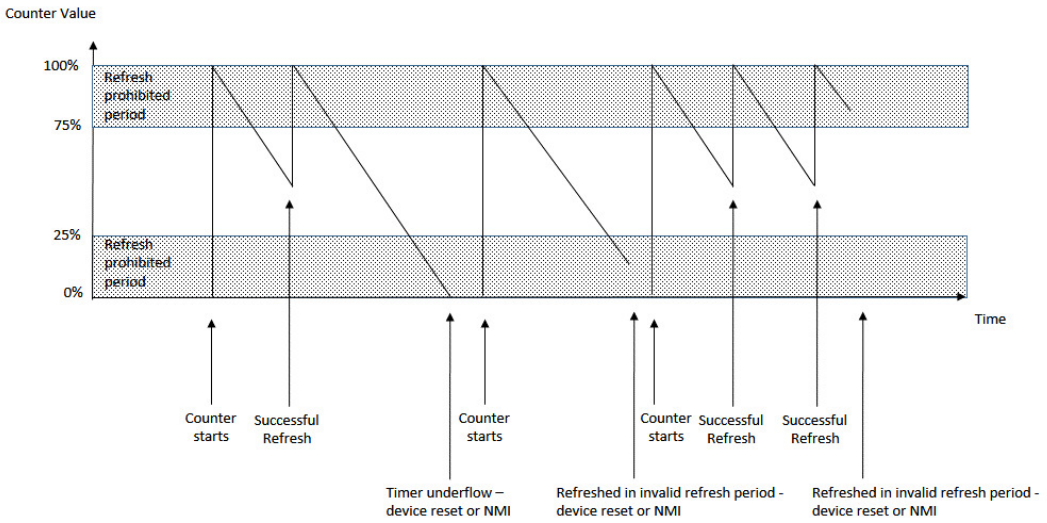

Figure 261: Watchdog Timer Operation Example

Features

The WDT HAL module has the following key features:

- When the WDT underflows or is refreshed outside of the permitted refresh window, one of the following events can occur:
  - Resetting of the device
  - Generation of an NMI
- The WDT has two supported modes:
  - In auto start mode, the WDT begins counting at reset.
  - In register start mode, the WDT can be started from the application.

Selecting a Watchdog

RA MCUs have two watchdog peripherals: the watchdog timer (WDT) and the independent watchdog timer (IWDT). When selecting between them, consider these factors:

	WDT	IWDT
Start Mode	The WDT can be started from the application (register start mode) or configured by hardware to start automatically (auto start mode).	The IWDT can only be configured by hardware to start automatically.
Clock Source	The WDT runs off a peripheral clock.	The IWDT has its own clock source which improves safety.

Target Devices

Device Group	Devices
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

When using register start mode, configure the watchdog timer on the Stacks tab.

Note

*When using auto start mode, configurations on the **Stacks** tab are ignored. Configure the watchdog using the OFS settings on the BSP tab.*

Build Time Configurations for r_wdt

The following build time configurations are defined in fsp_cfg/r_wdt_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Register Start NMI Support	• Enabled • Disabled	Disabled	If enabled, code for NMI support in register start mode is included in the build.

Configurations for Monitoring > Watchdog (r_wdt)

This module can be added to the Stacks tab via New Stack > Monitoring > Watchdog (r_wdt). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_wdt0	Module name.
Timeout	• 1,024 Cycles • 4,096 Cycles • 8,192 Cycles • 16,384 Cycles	16,384 Cycles	Select the watchdog timeout in cycles.
Clock Division Ratio	• PCLK/4 • PCLK/64 • PCLK/128 • PCLK/512 • PCLK/2048 • PCLK/8192	PCLK/8192	Select the watchdog clock divisor.
Window Start Position	• 100 (Window Position Not Specified) • 75 • 50 • 25	100 (Window Position Not Specified)	Select the allowed watchdog refresh start point in %.
Window End Position	• 0 (Window Position Not Specified) • 25 • 50 • 75	0 (Window Position Not Specified)	Select the allowed watchdog refresh end point in %.
Reset Control	• Reset Output • NMI Generated	Reset Output	Select what happens when the watchdog timer expires.
Stop Control	• WDT Count Enabled in Low Power Mode	WDT Count Disabled in Low Power Mode	Select the watchdog state in low power mode.

	• WDT Count Disabled in Low Power Mode		
NMI Callback	Name must be a valid C symbol	NULL	A user callback function must be provided if the WDT is configured to generate an NMI when the timer underflows or a refresh error occurs. If this callback function is provided, it will be called from the NMI handler each time the watchdog triggers.

Clock Configuration

The WDT clock is based on the PCLKB frequency. You can set the PCLKB frequency using the **Clocks** tab of the RA Configuration editor or by using the CGC Interface at run-time. The maximum timeout period with PCLKB running at 60 MHz is approximately 2.2 seconds.

Pin Configuration

This module does not use I/O pins.

Usage Notes

NMI Interrupt

The watchdog timer uses the NMI, which is enabled by default. No special configuration is required. When the NMI is triggered, the callback function registered during open is called.

Note

When using the WDT in software start mode with NMI and the timer underflows, the WDT status must be reset by calling R_WDT_StatusClear before restarting the timer via R_WDT_Refresh.

Period Calculation

The WDT operates from PCLKB. With a PCLKB of 60 MHz, the maximum time from the last refresh to device reset or NMI generation will be just over 2.2 seconds as detailed below.

PLCKB = 60 MHz
Clock division ratio = PCLKB / 8192
Timeout period = 16384 cycles
WDT clock frequency = 60 MHz / 8192 = 7.324 kHz
Cycle time = 1 / 7.324 kHz = 136.53 us
Timeout = 136.53 us x 16384 cycles = 2.23 seconds

Limitations

Developers should be aware of the following limitations when using the WDT:

- When using a J-Link debugger the WDT counter does not count and therefore will not reset

the device or generate an NMI. To enable the watchdog to count and generate a reset or NMI while debugging, add this line of code in the application:

```
/* (Optional) Enable the WDT to count and generate NMI or reset when the
 * debugger is connected. */
   R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
```

- If the WDT is configured to stop the counter in low power mode, then your application must restart the watchdog by calling R_WDT_Refresh() after the MCU wakes from low power mode.

Examples

WDT Basic Example

This is a basic example of minimal use of the WDT in an application.

```
void wdt_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* In auto start mode, the WDT starts counting immediately when the MCU is powered
on. */
 /* Initializes the module. */
    err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* In register start mode, start the watchdog by calling R_WDT_Refresh. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 while (true)
    {
 /* Application work here. */
 /* Refresh before the counter underflows to prevent reset or NMI. */
      err = R_WDT_Refresh(&g_wdt0_ctrl);
      assert(FSP_SUCCESS == err);
    }
}
```

WDT Advanced Example

This example demonstrates using a start window and gives an example callback to handle an NMI generated by an underflow or refresh error.

```
#define WDT_TIMEOUT_COUNTS (16384U)
#define WDT_MAX_COUNTER (WDT_TIMEOUT_COUNTS - 1U)
#define WDT_START_WINDOW_75 ((WDT_MAX_COUNTER * 3) / 4)
/* Example callback called when a watchdog NMI occurs. */
void wdt_callback (wdt_callback_args_t * p_args)
{
 FSP_PARAMETER_NOT_USED(p_args);
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Determine the source of the NMI. */
 wdt_status_t status = WDT_STATUS_NO_ERROR;
    err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 /* (Optional) Log source of NMI and any other debug information. */
 /* (Optional) Clear the error flags. */
    err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
    assert(FSP_SUCCESS == err);
 /* (Register start mode) In register start mode, call R_WDT_Refresh() to
  * continue using the watchdog after an error. */
    err = R_WDT_Refresh(&g_wdt0_ctrl);
    assert(FSP_SUCCESS == err);
 /* (Optional) Issue a software reset to reset the MCU. */
    __NVIC_SystemReset();
}
void wdt_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* (Optional) Enable the WDT to count and generate NMI or reset when the
  * debugger is connected. */
    R_DEBUG->DBGSTOPCR_b.DBGSTOP_WDT = 0;
 /* (Optional) Check if the WDTRF flag is set to know if the system is
  * recovering from a WDT reset. */
 if (R_SYSTEM->RSTSR1_b.WDTRF)
```

```
   {
/* Clear the flag. */
      R_SYSTEM->RSTSR1 = 0U;
   }
/* Open the module. */
   err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Initialize other application code. */
/* (Register start mode) Call R_WDT_Refresh() to start the WDT in register
 * start mode. Do not call R_WDT_Refresh() in auto start mode unless the
 * counter is in the acceptable refresh window. */
   err = R_WDT_Refresh(&g_wdt0_ctrl);
   assert(FSP_SUCCESS == err);
while (true)
   {
/* Application work here. */
/* (Optional) If there is a chance the application takes less time than
 * the start window, verify the WDT counter is past the start window
 * before refreshing the WDT. */
      uint32_t wdt_counter = 0U;
do
     {
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
     } while (wdt_counter >= WDT_START_WINDOW_75);
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
   }
}
```

Data Structures

struct	wdt_instance_ctrl_t

Data Structure Documentation

◆ wdt_instance_ctrl_t

struct wdt_instance_ctrl_t
WDT private control block. DO NOT MODIFY. Initialization occurs when R_WDT_Open() is called.

Function Documentation

◆ R_WDT_Open()

fsp_err_t R_WDT_Open (wdt_ctrl_t *const *p_ctrl*, wdt_cfg_t const *const *p_cfg*)

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements wdt_api_t::open.

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = R_WDT_Open(&g_wdt0_ctrl, &g_wdt0_cfg);
```

Return values

FSP_SUCCESS	WDT successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_STATE	The security state of the NMI and the module do not match.

Note

In auto start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.

◆ R_WDT_TimeoutGet()

fsp_err_t R_WDT_TimeoutGet (wdt_ctrl_t *const *p_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

FSP_SUCCESS	WDT timeout information retrieved successfully.
FSP_ERR_ASSERTION	Null Pointer.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ R_WDT_Refresh()

fsp_err_t R_WDT_Refresh (wdt_ctrl_t *const *p_ctrl*)

Refresh the watchdog timer. Implements wdt_api_t::refresh.

In addition to refreshing the watchdog counter this function can be used to start the counter in register start mode.

Example:

```
/* Refresh before the counter underflows to prevent reset or NMI. */
     err = R_WDT_Refresh(&g_wdt0_ctrl);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT successfully refreshed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function only returns FSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

◆ R_WDT_StatusGet()

fsp_err_t R_WDT_StatusGet (wdt_ctrl_t *const *p_ctrl*, wdt_status_t *const *p_status*)

Read the WDT status flags. Implements wdt_api_t::statusGet.

Indicates both status and error conditions.

Example:

```
/* (Optional) Determine the source of the NMI. */
wdt_status_t status = WDT_STATUS_NO_ERROR;
   err = R_WDT_StatusGet(&g_wdt0_ctrl, &status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT status successfully read.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_WDT_StatusClear()

fsp_err_t R_WDT_StatusClear (wdt_ctrl_t *const *p_ctrl*, const wdt_status_t *status*)

Clear the WDT status and error flags. Implements wdt_api_t::statusClear.

Example:

```
/* (Optional) Clear the error flags. */
   err = R_WDT_StatusClear(&g_wdt0_ctrl, status);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT flag(s) successfully cleared.
FSP_ERR_ASSERTION	Null pointer as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.
FSP_ERR_UNSUPPORTED	This function is only valid if the watchdog generates an NMI when an error occurs.

Note

When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

◆ R_WDT_CounterGet()

fsp_err_t R_WDT_CounterGet (wdt_ctrl_t *const *p_ctrl*, uint32_t *const *p_count*)

Read the current count value of the WDT. Implements wdt_api_t::counterGet.

Example:

```
/* Read the current WDT counter value. */
           err = R_WDT_CounterGet(&g_wdt0_ctrl, &wdt_counter);
     assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	WDT current count successfully read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Instance control block is not initialized.

◆ R_WDT_CallbackSet()

fsp_err_t R_WDT_CallbackSet (wdt_ctrl_t *const *p_ctrl*, void(*)(wdt_callback_args_t *) *p_callback*, void *const *p_context*, wdt_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements wdt_api_t::callbackSet

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

5.2.11 Motor

Modules

Detailed Description

Motor Modules.

Modules

	120-degree conduction control sensorless (rm_motor_120_control_sensorless) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.
	120-degree conduction control with Hall sensors (rm_motor_120_control_hall) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.
	ADC and PWM Modulation (rm_motor_driver) Calculation process for the motor control on RA MCUs. This module implements the Motor driver Interface.

	ADC and PWM modulation (rm_motor_120_driver) Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.
	Advanced Motor Middleware Advanced Motor Middleware.
	Motor 120 degree control (rm_motor_120_degree) Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the Motor 120 degree control (rm_motor_120_degree).
	Motor Angle (rm_motor_estimate) Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle (rm_motor_sense_encoder) Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall) Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction) Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.
	Motor Current Controller (rm_motor_current) Calculation process for the motor control on RA MCUs. This module implements the Motor current Interface.
	Motor Encoder Vector Control (rm_motor_encoder) Control a SPM motor on RA MCUs. This module implements the Motor Encoder Vector Control (rm_motor_encoder).

	Motor Inertia estimate (rm_motor_inertia_estimate) Measurement and calculation process for the motor control on RA MCUs. This module implements the Motor Inertia Estimate Interface.
	Motor Position Controller (rm_motor_position) Calculation process for the motor control on RA MCUs. This module implements the Motor position Interface.
	Motor Sensorless Vector Control (rm_motor_sensorless) Usual control of a SPM motor on RA MCUs. This module implements the Motor Sensorless Vector Control (rm_motor_sensorless).
	Motor Speed Controller (rm_motor_speed) Calculation process for the motor control on RA MCUs. This module implements the Motor speed Interface.
	Motor Vector Control with hall sensors (rm_motor_hall) Usual control of a SPM motor on RA MCUs. This module implements the Motor Vector Control with hall sensors (rm_motor_hall).
	Motor return origin (rm_motor_return_origin) Search origin position process for the motor control on RA MCUs. This module implements the Motor Return Origin Function Interface.
	Motor vector control with induction sensor (rm_motor_induction) Control a SPM motor on RA MCUs. This module implements the Motor vector control with induction sensor (rm_motor_induction).

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control sensorless module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control sensorless (rm_motor_120_control_sensorless).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_control_sensorless0	Module name.
Conduction type	• First 60 degree PWM • Complementary First 60 degree PWM	First 60 degree PWM	Select conduction type
Stop BEMF	Must be a valid non-negative value.	0.5	Value of stop motor BEMF (U+V+W)
Timeout counts (msec)	Must be a valid integer.	2000	Undetected time
Maximum voltage for BOOT (V)	Must be a valid non-negative value.	8.0	Maximum output voltage for boot mode (V)
Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
Carrier frequency (kHz)	Must be a valid non-negative value.	20.0	PWM carrier frequency (kHz)
Adjusting angle	Must be a valid non-negative value.	0	Adjusting angle
Speed PI decimation	Must be a valid integer.	1	Speed PI control decimation count
Free run timer frequency (MHz)	Must be a valid integer.	120	Freerun timer frequency (MHz)

Speed LPF K	Must be a valid non-negative value.	1.0	Speed LPF parameter
Step of speed change	Must be a valid non-negative value.	0.2	Speed reference change step
Boot reference voltage (V)	Must be a valid non-negative value.	3.0	Voltage reference for boot mode
Voltage lamping time	Must be a valid integer.	128	Voltage lamping time
Voltage constant adjust time	Must be a valid integer.	64	Voltage constant adjust time value (msec)
Open loop start speed (rpm)	Must be a valid integer value.	150	Open loop start speed (rpm)
Open loop mode2 speed (rpm)	Must be a valid integer value.	185	to mode2 change speed (rpm)
Open loop mode3 speed (rpm)	Must be a valid integer value.	1000	to mode3 change speed (rpm)
Open loop start voltage (V)	Must be a valid non-negative value.	3.0	start reference voltage (V)
Open loop mode1 speed rate	Must be a valid non-negative value.	0.25	increase rate of reference speed (rpm/control period)
Open loop mode2 voltage rate	Must be a valid non-negative value.	0.00285	increase rate of reference voltage (v/control period)
Open loop mode2 speed rate	Must be a valid non-negative value.	0.71	increase rate of reference speed (rpm/control period)
Open loop mode3 voltage rate	Must be a valid non-negative value.	0.002	increase rate of reference voltage (v/control period)
Open loop maximum voltage (V)	Must be a valid non-negative value.	6.5	openloop maximum voltage (V)
PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
PI control KI	Must be a valid non-negative value.	0.004	PI control gain of integral term
PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term
Motor Parameter			
Pole pairs	Must be a valid integer.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Inductance of d-axis	Must be a valid non-	0.0045	Inductance of d-axis

(H)	negative value.		
Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	callback function

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control sensorless in an application.

```
void motor_120_control_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                         g_motor_120_control_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,
```

```
DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
 /* Get current motor speed */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                          &smpl_timeout_error_fl
ag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                          &smpl_pattern_error_fl
ag);
 /* Get voltage ref */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
    (void)
```

```
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);
 /* Stop motor rotation */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
 /* Reset the process. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
 /* Close the module. */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
}
```

Data Structures

Enumerations

enum	motor_120_control_sensorless_draw_in_position_t
enum	motor_120_control_sensorless_pattern_change_flag_t

Data Structure Documentation

◆ motor_120_control_sensorless_extended_cfg_t

struct motor_120_control_sensorless_extended_cfg_t		
Extended configurations for motor 120 control sensorless		
Data Fields		
float	f4_stop_bemf	Value of stop motor BEMF (U+V+W)
float	f4_max_boot_v	Max output voltage for boot mode (V)
float	f4_carrier_freq	Carrier wave frequency (kHz)
int32_t	s4_angle_shift_adjust	Adjusting angle.
float	f4_boot_ref_v	Voltage reference when zero

		speed (V)
uint32_t	u4_v_up_time	Voltage lamping time.
uint32_t	u4_v_const_time	Voltage constant adjust time value (ms)
int32_t	s4_ol_start_rpm	Start speed (rpm)
int32_t	s4_ol_mode1_change_rpm	To mode2 change speed (rpm)
int32_t	s4_ol_mode2_change_rpm	To mode3 change speed (rpm)
float	f4_ol_start_refv	Start reference voltage (V)
float	f4_ol_mode1_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode2_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode2_rate_rpm	Increase rate of reference speed (rpm/control period)
float	f4_ol_mode3_rate_refv	Increase rate of reference voltage (v/control period)
float	f4_ol_mode3_max_refv	Openloop max voltage (V)
motor_120_driver_instance_t const *	p_motor_120_driver_instance	Motor 120 driver access module.
timer_instance_t const *	p_speed_cyclic_timer_instance	Cyclic process of speed control timer module.
timer_instance_t const *	p_speed_calc_timer_instance	Speed calculate timer module.

◆ motor_120_control_sensorless_instance_ctrl_t

struct motor_120_control_sensorless_instance_ctrl_t		
120 control sensorless instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
motor_120_control_status_t	active	Flag to set active/inactive the motor 120 control.
motor_120_control_run_mode_t	run_mode	Drive mode.
motor_120_control_timeout_error_flag_t	timeout_error_flag	Timeout error status.
motor_120_control_pattern_error_flag_t	pattern_error_flag	Bemf pattern error status.
motor_120_control_rotation_direction_t	direction	Rotational direction (0:CW ,1:CCW)
float	f4_ol_pattern_set_calc	Counts to change timing of open loop pattern.

float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
uint32_t	u4_pwm_duty	PWM duty.
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
float	f4_vn_ad	Neutral voltage.
uint32_t	u4_cnt_adj_v	Voltage lamping count adjustment.
motor_120_control_sensorless_draw_in_position_t	flag_draw_in	Status of draw in a initial position.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
uint32_t	u4_v_pattern_num	Selecting pattern number for openloop drive.
uint32_t	u4_bemf_signal	Pattern of BEMF.
uint32_t	u4_pre_bemf_signal	Previous pattern of BEMF.
motor_120_control_sensorless_pattern_change_flag_t	flag_pattern_change	Pattern change flag.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.
uint32_t	u4_ol_signal	Pattern of BEMF.
uint32_t	u4_ol_pattern_set	Openloop frequency.
uint32_t	u4_cnt_ol_pattern_set	Counter for openloop pattern change.
uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_bemf_timer_cnt	Value of timer counter.
uint32_t	u4_pre_bemf_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.

uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_SENSORLESS_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
uint32_t	u4_cnt_carrier	Counter for carrier interrupt.
uint32_t	u4_pre_cnt_carrier	Previous carrier interrupt count.
uint32_t	u4_angle_shift_cnt	Shift degrees count.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
timer_direction_t	timer_direction	Hold timer direction.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Enumeration Type Documentation

◆ motor_120_control_sensorless_draw_in_position_t

enum motor_120_control_sensorless_draw_in_position_t	
Draw in a initial position	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_INIT	Initial parameter.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_1ST_TIME	Draw in a initial position of the 1st time.
MOTOR_120_CONTROL_SENSORLESS_DRAW_IN_POSITION_2ND_TIME	Draw in a initial position of the 2nd time.

◆ motor_120_control_sensorless_pattern_change_flag_t

enum motor_120_control_sensorless_pattern_change_flag_t	
Pattern change	
Enumerator	
MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_CLEAR	Initial parameter.
MOTOR_120_CONTROL_SENSORLESS_PATTERN_CHANGE_FLAG_SET	Voltage pattern change.

Function Documentation

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Open()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Open (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Opens and configures the motor sensorless 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err =
RM_MOTOR_120_CONTROL_SENSORLESS_Open(g_motor_120_control_sensorless0.p_ctrl,
                                     g_motor_120_control_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	Motor driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Close()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Close (motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor sensorless 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Close(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Run()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Run (motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Run(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Stop (motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Stop(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_Reset (motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor sensorless 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_Reset(g_motor_120_control_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet (motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedSet(g_motor_120_control_sensorless0.p_ctrl,

DEF_120_CONTROL_SENSORLESSHALL_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet (motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_SpeedGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_CurrentGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_WaitStopFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                  &smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag*)

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_TimeoutErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_timeout_error_fl
ag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag*)

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_PatternErrorFlagGet
(g_motor_120_control_sensorless0.p_ctrl,
                                                    &smpl_pattern_error_fl
ag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref*)

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void)
RM_MOTOR_120_CONTROL_SENSORLESS_VoltageRefGet(g_motor_120_control_sensorless0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Update the parameters of sensorless 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_SENSORLESS_ParameterUpdate
(g_motor_120_control_sensorless0.p_ctrl,

g_motor_120_control_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Control Interface.

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The motor 120 control hall module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling control.
- Voltage error compensation.

Configuration

Build Time Configurations for rm_motor_120_control_hall

The following build time configurations are defined in fsp_cfg/rm_motor_120_control_hall_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > 120-degree conduction control with Hall sensors

(rm_motor_120_control_hall)

This module can be added to the Stacks tab via New Stack > Motor > 120-degree conduction control with Hall sensors (rm_motor_120_control_hall).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_control_hall0	Module name.
Conduction type	• First 60 degree PWM • Complementary First 60 degree PWM	First 60 degree PWM	Select conduction type
Timeout counts (msec)	Must be a valid integer.	200	Counts to judge rotor unrotate
Maximum voltage (V)	Must be a valid non-negative value.	20.0	Maximum output voltage (V)
Minimum voltage (V)	Must be a valid non-negative value.	3.0	Minimum output voltage (V)
Speed PI decimation	Must be a valid integer.	0	Speed PI control decimation count
Freerun timer frequency (MHz)	Must be a valid integer.	120	Freerun timer frequency (MHz)
Speed LPF	Must be a valid non-negative value.	1.0	Speed LPF parameter
Step of speed reference change	Must be a valid non-negative value.	0.2	Speed ref change step
Start reference voltage (V)	Must be a valid non-negative value.	5.8	Reference voltage for boot mode (V)
Hall wait counts	Must be a valid integer.	12	Wait counts of hall interrupts to start speed calculation
Stop judge time	Must be a valid integer.	1000	Stop judge time
Minimum limit speed (rpm)	Must be a valid integer.	550	Minimum limit speed (rpm) (mechanical angle)
PI control KP	Must be a valid non-negative value.	0.02	PI control gain of proportional term
PI control KI	Must be a valid non-negative value.	0.0005	PI control gain of integral term
PI control limit	Must be a valid non-negative value.	24.0	PI control limit of integral term

Hall interrupt mask value	Must be a valid integer.	15	For limiting hall interrupt processing. Limited by the number of ADC interrupts
Motor Parameter			
Pole pairs	Must be a valid integer.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value.	6.447	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value.	0.0045	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value.	0.02159	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value.	1.8	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	Callback function
Hall sensor port U	Manual Entry	BSP_IO_PORT_04_PIN_11	Hall sensor port U
Hall sensor port V	Manual Entry	BSP_IO_PORT_04_PIN_10	Hall sensor port V
Hall sensor port W	Manual Entry	BSP_IO_PORT_04_PIN_09	Hall sensor port W

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

Depend on included ICU module.

Usage Notes

Limitations

- Set the period of current control with none-negative value.
- Set the reference voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 control hall in an application.

```
void motor_120_control_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
 /* Get current motor speed */
    (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
 /* Get current */
    (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
 /* Get wait stop flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
 /* Get timeout error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
 /* Get pattern error flag */
    (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
 /* Get voltage ref */
    (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
    (void)
```

```
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
 /* Reset the process. */
    (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
}
```

120 control hall instance control block		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
motor_120_control_status_t	active	Flag to set active/inactive the motor 120 control.
motor_120_control_run_mode_t	run_mode	Drive mode.
motor_120_control_timeout_error_flag_t	timeout_error_flag	Timeout error status.
motor_120_control_pattern_error_flag_t	pattern_error_flag	Hall pattern error status.
motor_120_control_rotation_direction_t	direction	Rotational direction (0:CW ,1:CCW)
float	f4_speed_calc_base	Base counts to calculate rotation speed.
float	f_rpm2rad	Translate value to radian/second to rpm.
float	f4_v_ref	Voltage reference (output of speed PI control)
float	f4_ref_speed_rad	Motor speed reference.
float	f4_ref_speed_rad_ctrl	Motor speed reference for speed PI control.
float	f4_speed_rad	Motor speed.
uint32_t	u4_cnt_speed_pi	Counter for period of speed PI control.
motor_120_control_wait_stop_flag_t	flag_wait_stop	Flag for waiting for motor stop.
uint32_t	u4_cnt_wait_stop	Counter for waiting motor stop.
motor_120_driver_phase_pattern_t	v_pattern	Voltage pattern.
motor_120_control_speed_ref_t	flag_speed_ref	Speed reference flag.
motor_120_control_voltage_ref_t	flag_voltage_ref	Voltage reference flag.

uint32_t	u4_cnt_timeout	Counter for timeout error.
uint32_t	u4_hall_timer_cnt	Value of timer counter.
uint32_t	u4_pre_hall_timer_cnt	Previous value of timer counter.
int32_t	s4_timer_cnt_ave	Counts for 360 degrees.
uint32_t	u4_timer_cnt_buf[MOTOR_120_CONTROL_HALL_TIMES]	Counts for 60 degrees.
uint32_t	u4_timer_cnt_num	Array element number before 360 degrees.
float	f4_pi_ctrl_err	PI control error.
float	f4_pi_ctrl_refi	PI control buffer of integral term.
uint32_t	u4_hall_intr_cnt	For start timing of speed calculation.
uint32_t	u4_adc_interrupt_cnt	Number of ADC interrupt processing.
motor_120_control_cfg_t const *	p_cfg	Pointer of configuration structure.
timer_direction_t	timer_direction	Hold timer direction.
external_irq_callback_args_t	hall_interrupt_args	For call IRQ callbackSet function.
timer_callback_args_t	timer_args	For call timer callbackSet function.

Function Documentation

◆ RM_MOTOR_120_CONTROL_HALL_Open()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Open (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Opens and configures the motor hall 120 detection module. Implements motor_120_control_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_CONTROL_HALL_Open(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_Close()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Close (motor_120_control_ctrl_t *const *p_ctrl*)

Disables specified motor hall 120 detection module. Implements motor_120_control_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_CONTROL_HALL_Close(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Run()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Run (motor_120_control_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_control_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Run(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Stop()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Stop (motor_120_control_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_control_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_CONTROL_HALL_Stop(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_Reset()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_Reset (motor_120_control_ctrl_t *const *p_ctrl*)

Reset variables of motor hall 120 detection module. Implements motor_120_control_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_CONTROL_HALL_Reset(g_motor_120_control_hall0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedSet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedSet (motor_120_control_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed[rpm]. Implements motor_120_control_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedSet(g_motor_120_control_hall0.p_ctrl,
DEF_120_CONTROL_HALL_TEST_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_CONTROL_HALL_SpeedGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_SpeedGet (motor_120_control_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get speed. Implements motor_120_control_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_CONTROL_HALL_SpeedGet(g_motor_120_control_hall0.p_ctrl,
&smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_CurrentGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_CurrentGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get current. Implements motor_120_control_api_t::currentGet.

Example:

```
/* Get current */
   (void) RM_MOTOR_120_CONTROL_HALL_CurrentGet(g_motor_120_control_hall0.p_ctrl,
&smpl_current_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_120_control_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_WaitStopFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_timeout_error_flag_t *const *p_timeout_error_flag*)

Get timeout error flag. Implements motor_120_control_api_t::timeoutErrorFlagGet.

Example:

```
/* Get timeout error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_TimeoutErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_timeout_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_pattern_error_flag_t *const *p_pattern_error_flag*)

Get pattern error flag. Implements motor_120_control_api_t::patternErrorFlagGet.

Example:

```
/* Get pattern error flag */
   (void)
RM_MOTOR_120_CONTROL_HALL_PatternErrorFlagGet(g_motor_120_control_hall0.p_ctrl,
&smpl_pattern_error_flag);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_VoltageRefGet()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_VoltageRefGet (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_voltage_ref_t *const *p_voltage_ref*)

Get voltage ref. Implements motor_120_control_api_t::voltageRefGet.

Example:

```
/* Get voltage ref */
   (void) RM_MOTOR_120_CONTROL_HALL_VoltageRefGet(g_motor_120_control_hall0.p_ctrl,
&smpl_voltage_ref);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_CONTROL_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_120_CONTROL_HALL_ParameterUpdate (motor_120_control_ctrl_t *const *p_ctrl*, motor_120_control_cfg_t const *const *p_cfg*)

Update the parameters of hall 120 detection module. Implements motor_120_control_api_t::parameterUpdate.

Example:

```
    (void)
RM_MOTOR_120_CONTROL_HALL_ParameterUpdate(g_motor_120_control_hall0.p_ctrl,
g_motor_120_control_hall0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor driver Interface.

Overview

The motor driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current and main line voltage. This module should be called cyclically at included A/D Conversion finish interrupt.

Features

The Motor Driver Module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current and main line voltage.
- Detect and correct A/D offset at phase current channel

Configuration

Build Time Configurations for rm_motor_driver

The following build time configurations are defined in fsp_cfg/rm_motor_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	• Enabled • Disabled	Disabled	Select ADC_B module support.
Shared ADC support	• Enabled • Disabled	Disabled	Select Shared ADC support.
Supported Motor Number	Must be greater than 1.	1	

Configurations for Motor > ADC and PWM Modulation (rm_motor_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM Modulation (rm_motor_driver).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_driver0	Module name.
Shunt type	• 1 shunt • 2 shunt • 3 shunt	2 shunt	Select shunt type
Modulation method	• SVPWM • SPWM	SVPWM	Select PWM modulation method
PWM output port UP	Manual Entry	0	PWM output port UP
PWM output port UN	Manual Entry	0	PWM output port UN
PWM output port VP	Manual Entry	0	PWM output port VP
PWM output port VN	Manual Entry	0	PWM output port VN
PWM output port WP	Manual Entry	0	PWM output port WP
PWM output port WN	Manual Entry	0	PWM output port WN
PWM Timer Frequency (MHz)	Must be a valid integer.	120	GPT PWM timer frequency
PWM Carrier Period (Microseconds)	Must be a valid integer.	50	GPT PWM carrier period
Dead Time (Raw Counts)	Must be a valid integer.	240	GPT PWM dead time
Current Range (A)	Must be a valid value	27.5F	Current range to measure(Maximum

			input current)
Voltage Range (V)	Must be a valid value	111.0F	Voltage range to measure(Maximum input Main Line Voltage)
Counts for current offset measurement	Must be a valid integer.	500	How many times to measure current offset
A/D conversion channel for U Phase current	Value must be a supported channel number	0	Specify the A/D channel for U phase current (channel availability varies by MCU)
A/D conversion channel for W Phase current	Value must be a supported channel number	2	Specify the A/D channel for W phase current (channel availability varies by MCU)
A/D conversion channel for Main Line Voltage	Value must be a supported channel number	5	Specify the A/D channel for main line voltage (channel availability varies by MCU)
A/D conversion channel for V Phase current	Value must be a supported channel number	1	Specify the A/D channel for V phase current (channel availability varies by MCU)
A/D conversion channel for sin signal	Value must be a supported channel number	27	Specify the A/D channel for sin signal of induction sensor (channel availability varies by MCU)
A/D conversion channel for cos signal	Value must be a supported channel number	28	Specify the A/D channel for cos signal of induction sensor (channel availability varies by MCU)
Using ADC Scan Group	Value should be between 0 to 8 (valid only with ADC_B module)	0	For MCUs with ADC_B, select the scan group used.
A/D conversion unit for U Phase current	Must be a valid non-negative value.	0	Select the A/D conversion module for U phase current (only valid with adc module)
A/D conversion unit for W Phase current	Must be a valid non-negative value.	0	Select the A/D conversion module for W phase current (only

			valid with adc module)
A/D conversion unit for main line voltage	Must be a valid non-negative value.	0	Select the A/D conversion module for main line voltage (only valid with adc module)
A/D conversion unit for V Phase current	Must be a valid non-negative value.	0	Select the A/D conversion module for V phase current (only valid with adc module)
A/D conversion unit for sin signal	Must be a valid non-negative value.	0	Select the A/D conversion module for sin signal of induction sensor (only valid with adc module)
A/D conversion unit for cos signal	Must be a valid non-negative value.	0	Select the A/D conversion module for cos signal of induction sensor (only valid with adc module)
ADC interrupt module	• 1st • 2nd	1st	Select from which module ADC intterupt happens (only valid with adc module)
Adjustment value to current A/D	Must be a valid non-negative value.	20.0	Value to adjust 1shunt A/D double buffer
Minimum difference of PWM duty	Must be a valid non-negative value.	300	Minimum difference of PWM duty
Adjustment delay of A/D conversion	Must be a valid non-negative value.	240	Adjustment delay of A/D conversion
1shunt interrupt phase	• PHASE_U • PHASE_V • PHASE_W	PHASE_U	Select the phase which occures ADC end interrupt. (Only valid with 1shunt)
Input Voltage (V)	Must be a valid value	24.0F	Input voltage
Resolution of A/D conversion	Must be a valid Resolution of ADC.	0xFFF	Resolution of A/D conversion
Offset of A/D conversion for current	Must be a valid non-negative value.	0x745	Offset of A/D conversion for current
Conversion level of A/D conversion for voltage	Must be a valid value	0.66F	Conversion level of A/D conversion for voltage
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when

			the timer is stopped.
Modulation			
Maximum Duty	Must be a valid value	0.9375F	Maximum duty of PWM
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT Three Phase Module and ADC Module.

Usage Notes

When shared ADC instance is used, please perform below sequence.

1. Add (New) shared ADC instance.
2. Set configurations of below ADC module for your use.
3. Select "Common | Shared ADC support" to "Enabled".

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor Driver in an application.

```
void motor_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_DRIVER_Open(&g_motor_driver0.p_ctrl, &g_motor_driver0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
intterupt).
  * This implementation is an example. */
```

```
 // while (true)
    {
 /* Application work here. */
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_DRIVER_CurrentGet(&g_motor_driver0.p_ctrl, &f_get_iu,
&f_get_iw, &f_get_vdc, &f_get_va_max);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_DRIVER_FlagCurrentOffsetGet(&g_motor_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_DRIVER_PhaseVoltageSet(&g_motor_driver0.p_ctrl, 1.0F, 1.0F,
1.0F);
       (void) RM_MOTOR_DRIVER_ParameterUpdate(&g_motor_driver0.p_ctrl,
&g_motor_driver0.p_cfg);
    }
    (void) RM_MOTOR_DRIVER_Reset(&g_motor_driver0.p_ctrl);
 //

    (void) RM_MOTOR_DRIVER_Close(&g_motor_driver0.p_ctrl);
}
```

enum motor_driver_modulation_method_t	
Enumerator	
MOTOR_DRIVER_MODULATION_METHOD_SPWM	Sinusoidal pulse-width-modulation.
MOTOR_DRIVER_MODULATION_METHOD_SVPWM	Space vector pulse-width-modulation.

Function Documentation

◆ RM_MOTOR_DRIVER_Open()

fsp_err_t RM_MOTOR_DRIVER_Open (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg*)

Opens and configures the Motor Driver module. Implements motor_driver_api_t::open.

Return values

FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_DRIVER_Close()

fsp_err_t RM_MOTOR_DRIVER_Close (motor_driver_ctrl_t *const *p_ctrl*)

Disables specified Motor Driver Module. Implements motor_driver_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_Reset()

fsp_err_t RM_MOTOR_DRIVER_Reset (motor_driver_ctrl_t *const *p_ctrl*)

Reset variables of Motor Driver Module. Implements motor_driver_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_DRIVER_PhaseVoltageSet (motor_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage*)

Set Phase Voltage Data to calculate PWM duty. Implements motor_driver_api_t::phaseVoltageSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_DRIVER_CurrentGet (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_current_get_t *const *p_current_get*)

Get calculated phase Current, Vdc & Va_max data. Implements motor_driver_api_t::currentGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_DRIVER_FlagCurrentOffsetGet (motor_driver_ctrl_t *const *p_ctrl*, uint8_t *const *p_flag_offset*)

Get the flag of finish current offset detection. Implements motor_driver_api_t::flagCurrentOffsetGet .

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_DRIVER_CurrentOffsetRestart()

fsp_err_t RM_MOTOR_DRIVER_CurrentOffsetRestart (motor_driver_ctrl_t *const *p_ctrl*)

Restart the current offset detection. Implements motor_driver_api_t::currentOffsetRestart.

Return values

FSP_SUCCESS	Successfully restarted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_DRIVER_ParameterUpdate (motor_driver_ctrl_t *const *p_ctrl*, motor_driver_cfg_t const *const *p_cfg*)

Update the parameters of Driver Module. Implements motor_driver_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor 120-Degree Driver Interface.

Overview

The motor 120 degree driver module is used to translate phase voltage to PWM duty and output PWM, and detect phase current, voltage and main line voltage. This module should be called cyclically at included A/D conversion finish interrupt.

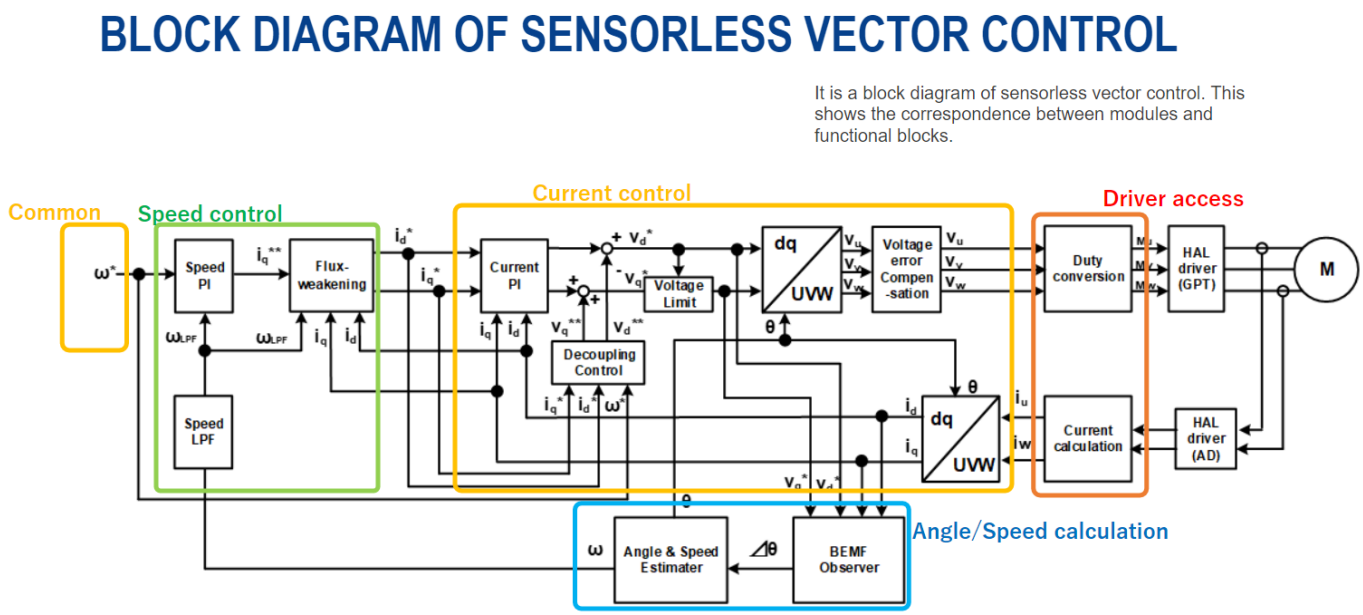

Figure 262: Image of Current Control Module(yellow block)

Features

The motor 120 degree driver module has below features.

- Calculate each phase(U/V/W) PWM duty according to reference and output PWM.
- Detect each phase current, phase voltage and main line voltage.
- Detect and correct A/D offset at phase current and voltage channel

Configuration

Build Time Configurations for rm_motor_120_driver

The following build time configurations are defined in fsp_cfg/rm_motor_120_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	• Enabled • Disabled	Disabled	Select ADC_B module support.
Shared ADC support	• Enabled • Disabled	Disabled	Select Shared ADC support.
Support Motor Number	Must be greater than 1.	1	

Configurations for Motor > ADC and PWM modulation (rm_motor_120_driver)

This module can be added to the Stacks tab via New Stack > Motor > ADC and PWM modulation (rm_motor_120_driver).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_120_driver0	Module name.
120 degree control type	• Sensorless • Hall	Sensorless	120 degree control type
PWM output port UP	Manual Entry	BSP_IO_PORT_06_PIN_01	PWM output port UP
PWM output port UN	Manual Entry	BSP_IO_PORT_06_PIN_00	PWM output port UN
PWM output port VP	Manual Entry	BSP_IO_PORT_01_PIN_13	PWM output port VP
PWM output port VN	Manual Entry	BSP_IO_PORT_01_PIN_14	PWM output port VN
PWM output port WP	Manual Entry	BSP_IO_PORT_01_PIN_11	PWM output port WP
PWM output port WN	Manual Entry	BSP_IO_PORT_01_PIN_12	PWM output port WN
PWM timer frequency (MHz)	Must be a valid positive integer.	120	GPT PWM timer frequency
PWM carrier period (Microseconds)	Must be a valid positive integer.	50	GPT PWM carrier period
Dead time (Raw counts)	Must be a valid positive integer.	240	GPT PWM dead time
Current range (A)	Must be a valid non-negative value.	27.5	Current range to measure(Maximum input current)
Voltage range (V)	Must be a valid non-	111.0	Voltage range to

	negative value.		measure(Maximum input main line voltage)
Resolution of A/D conversion	Must be a valid Resolution of ADC.	0xFFF	Resolution of A/D conversion
Offset of A/D conversion for current	Must be a valid non-negative value.	0x745	Offset of A/D conversion for current
Conversion level of A/D conversion for voltage	Must be a valid non-negative value.	0.66	Conversion level of A/D conversion for voltage
Counts for current offset measurement	Must be a valid positive integer.	500	How many times to measure current offset
Input voltage	Must be a valid non-negative value.	24.0	Input voltage
A/D conversion channel for U phase current	Value must be a supported channel number	0	Specify the A/D channel for U phase current
A/D conversion channel for W phase current	Value must be a supported channel number	2	Specify the A/D channel for W phase current
A/D conversion channel for main line voltage	Value must be a supported channel number	5	Specify the A/D channel for main line voltage
A/D conversion channel for U phase voltage	Value must be a supported channel number	18	Specify the A/D channel for U phase voltage
A/D conversion channel for V phase voltage	Value must be a supported channel number	20	Specify the A/D channel for V phase voltage
A/D conversion channel for W phase voltage	Value must be a supported channel number	6	Specify the A/D channel for W phase voltage
A/D conversion unit for U phase current	Must be a valid non-negative value.	0	Specify the A/D unit for U phase current
A/D conversion unit for W phase current	Must be a valid non-negative value.	0	Specify the A/D unit for W phase current
A/D conversion unit for main line voltage	Must be a valid non-negative value.	0	Specify the A/D unit for main line voltage
A/D conversion unit for U phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for U phase voltage
A/D conversion unit for V phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for V phase voltage
A/D conversion unit for W phase voltage	Must be a valid non-negative value.	0	Specify the A/D unit for W phase voltage
GTIOCA stop level	• Pin Level Low	Pin Level High	Select the behavior of

	• Pin Level High		the output pin when the timer is stopped.
GTIOCB stop level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.
ADC interrupt module	• 1st • 2nd	1st	Select from which module ADC intterupt happens
Modulation			
Maximum duty	Must be a valid non-negative value.	0.9375	Maximum duty of PWM
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Clock Configuration

Set used clock with included GPT timer.

Pin Configuration

Depend on included GPT three phase module and ADC module.

Usage Notes

Limitations

Basically no limitation exists.

Examples

Basic Example

This is a basic example of minimal use of the Motor 120 degree driver in an application.

```
void motor_120_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
 /* Start PWM output */
```

```
    err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM carrier
intterupt).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Caclutarion of current offset */
       (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
 /* Get electric current, main line voltage and maximum voltage component */
       (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
 /* Get the flag of A/D convderted current offset */
       (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
 // Perform current control process here
 /* Set phase voltage */
       (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
 /* Set phase pattern */
       (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
       (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
    }
    (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
    (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
 //

    (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_120_DRIVER_Open()

fsp_err_t RM_MOTOR_120_DRIVER_Open (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg*)

Opens and configures the motor 120 driver module. Implements motor_120_driver_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DRIVER_Open(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

FSP_SUCCESS	Motor 120 driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_Close()

fsp_err_t RM_MOTOR_120_DRIVER_Close (motor_120_driver_ctrl_t *const *p_ctrl*)

Disables specified motor 120 driver module. Implements motor_120_driver_api_t::close.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Close(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Run()

fsp_err_t RM_MOTOR_120_DRIVER_Run (motor_120_driver_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_120_driver_api_t::run.

Example:

```
/* Start PWM output */
   err = RM_MOTOR_120_DRIVER_Run(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Stop()

fsp_err_t RM_MOTOR_120_DRIVER_Stop (motor_120_driver_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_120_driver_api_t::stop.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Stop(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_Reset()

fsp_err_t RM_MOTOR_120_DRIVER_Reset (motor_120_driver_ctrl_t *const *p_ctrl*)

Reset variables of motor 120 driver module. Implements motor_120_driver_api_t::reset.

Example:

```
   (void) RM_MOTOR_120_DRIVER_Reset(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhaseVoltageSet (motor_120_driver_ctrl_t *const *p_ctrl*, float const *u_voltage*, float const *v_voltage*, float const *w_voltage*)

Set phase voltage data to calculate PWM duty. Implements motor_120_driver_api_t::phaseVoltageSet.

Example:

```
 /* Set phase voltage */
      (void) RM_MOTOR_120_DRIVER_PhaseVoltageSet(&g_motor_120_driver0.p_ctrl, 1.0F,
1.0F, 1.0F);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_PhasePatternSet()

fsp_err_t RM_MOTOR_120_DRIVER_PhasePatternSet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_phase_pattern_t const *pattern*)

Set phase voltage pattern. Implements motor_120_driver_api_t::phasePatternSet.

Example:

```
/* Set phase pattern */
      (void) RM_MOTOR_120_DRIVER_PhasePatternSet(&g_motor_120_driver0.p_ctrl,
MOTOR_120_DRIVER_API_VP_ON_WN_PWM);
```

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_120_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentGet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_current_status_t *const *p_current_status*)

Get calculated phase current, Vdc & Va_max data. Implements motor_120_driver_api_t::currentGet .

Example:

```
/* Get electric current, main line voltage and maximum voltage component */
      (void) RM_MOTOR_120_DRIVER_CurrentGet(&g_motor_120_driver0.p_ctrl,
&g_current_status);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_CurrentOffsetCalc()

fsp_err_t RM_MOTOR_120_DRIVER_CurrentOffsetCalc (motor_120_driver_ctrl_t *const *p_ctrl*)

current offset detection. Implements motor_120_driver_api_t::currentOffsetCalc

Example:

```
/* Caclutarion of current offset */
      (void) RM_MOTOR_120_DRIVER_CurrentOffsetCalc(&g_motor_120_driver0.p_ctrl);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_flag_offset_calc_t *const *p_flag_offset*)

Get the flag of finish current offset detection. Implements motor_120_driver_api_t::flagCurrentOffsetGet.

Example:

```
/* Get the flag of A/D convderted current offset */
      (void) RM_MOTOR_120_DRIVER_FlagCurrentOffsetGet(&g_motor_120_driver0.p_ctrl,
&u1_get_flg_offset);
```

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_120_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_120_DRIVER_ParameterUpdate (motor_120_driver_ctrl_t *const *p_ctrl*, motor_120_driver_cfg_t const *const *p_cfg*)

Update the parameters of 120 driver module. Implements motor_120_driver_api_t::parameterUpdate.

Example:

```
      (void) RM_MOTOR_120_DRIVER_ParameterUpdate(&g_motor_120_driver0.p_ctrl,
&g_motor_120_driver0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

5.2.11.5 Advanced Motor Middleware

Modules » Motor

Detailed Description

Advanced Motor Middleware.

Modules

	Motor control middleware (rm_motor_control) Motor control on RA MCUs. This module implements the Motor Interface.
	Motor PM FOC middleware (rm_motor_pm_foc) Motor PM FOC on RA MCUs. This module implements the Motor Interface.
	Motor Trajectory Linear middleware (rm_motor_trajectory_linear) Motor Trajectory Linear on RA MCUs. This module implements the Motor Trajectory Interface.

	Motor Tuner middleware (rm_motor_tuner_pm) Motor Tuner for PM motors on RA MCUs. This module implements the Motor tuner Interface.
	Motor Hal Driver middleware (rm_motor_hal_driver) Motor hal driver on RA MCUs. This module implements the Motor Hal Driver Interface.
	Motor Sensor BEMF middleware (rm_motor_sensor_bemf) Motor Sensor BEMF on RA MCUs. This module implements the Motor sensor Interface.
	Motor Sensor Hall middleware (rm_motor_sensor_hall) Motor Sensor Hall on RA MCUs. This module implements the Motor sensor Interface.

Detailed Description

Motor control on RA MCUs. This module implements the Motor Interface.

Overview

The Motor Control module provides a high-level interface for controlling motor rotation. It manages the motor state machine, handles speed control, and provides error detection and recovery mechanisms.

Features

The Motor Control HAL module has the following key features:

- State machine management for motor control (STOP, RUN, ERROR states)
- Speed reference setting and actual speed monitoring
- Error detection and handling with automatic state transitions
- Integration with motor algorithm layer (PM FOC)
- Optional trajectory control support
- Callback mechanism for event notification

Configuration

Build Time Configurations for rm_motor_control

The following build time configurations are defined in fsp_cfg/rm_motor_control_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Control Module (rm_motor_control)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Control Module (rm_motor_control).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_control	Module name.
Interrupts			

Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.

Pin Configuration

This module does not directly use I/O pins. Pin configuration is handled by the underlying motor algorithm and driver modules.

Usage Notes

State Machine

The motor control module uses a state machine with three states:

- **STOP**: Motor is stopped and not rotating
- **RUN**: Motor is active and rotating
- **ERROR**: An error has been detected

State transitions are triggered by the following events:

- **EVENT_STOP**: Transitions to STOP state (from RUN)
- **EVENT_RUN**: Transitions to RUN state (from STOP)
- **EVENT_ERROR**: Transitions to ERROR state (from any state)
- **EVENT_RESET**: Transitions to STOP state (from ERROR)

Error Handling

When an error is detected, the motor control module:

1. Stores the error information
2. Transitions to ERROR state
3. Resets the motor algorithm layer
4. Invokes the user callback (if registered)

To recover from an error:

1. Clear the error condition
2. Call RM_MOTOR_CONTROL_Reset to return to STOP state
3. Call RM_MOTOR_CONTROL_Run to restart motor rotation

Callback Events

The following callback events are supported:

- **MOTOR_CALLBACK_EVENT_SPEED_BACKWARD**: Speed control cycle completed
- **MOTOR_CALLBACK_EVENT_CURRENT_BACKWARD**: Current control cycle completed
- **MOTOR_CALLBACK_EVENT_ERROR**: Error detected

Limitations

Developers should be aware of the following limitations when using the Motor Control module:

- The module must be opened before any other API functions are called.
- Speed reference should be set after calling RM_MOTOR_CONTROL_Run.
- RM_MOTOR_CONTROL_Reset is only valid when the motor is in ERROR state.
- Position control functions (RM_MOTOR_CONTROL_PositionSet, RM_MOTOR_CONTROL_WaitStopFlagGet, RM_MOTOR_CONTROL_FunctionSelect) return FSP_ERR_UNSUPPORTED.

Examples

Basic Example

This is a basic example of minimal use of the motor control in an application.

```
/* Initializes the module. */
   err = RM_MOTOR_CONTROL_Open(&g_motor_control_ctrl, &g_motor_control_cfg);
```

```
/* Start motor rotation. */
   err = RM_MOTOR_CONTROL_Run(&g_motor_control_ctrl);
```

```
/* Set speed reference. */
   err = RM_MOTOR_CONTROL_SpeedSet(&g_motor_control_ctrl, 1000.0F);
```

```
/* Get current speed. */
float speed_rpm = 0.0F;
   err = RM_MOTOR_CONTROL_SpeedGet(&g_motor_control_ctrl, &speed_rpm);
```

```
/* Get motor status. */
   uint8_t status = 0;
   err = RM_MOTOR_CONTROL_StatusGet(&g_motor_control_ctrl, &status);
```

```
/* Check for errors. */
   uint16_t error = 0;
   err = RM_MOTOR_CONTROL_ErrorCheck(&g_motor_control_ctrl, &error);
```

```
/* Set error information. */
   err = RM_MOTOR_CONTROL_ErrorSet(&g_motor_control_ctrl, MOTOR_ERROR_NONE);
```

```
/* Stop motor rotation. */
   err = RM_MOTOR_CONTROL_Stop(&g_motor_control_ctrl);
```

```
/* Reset motor control. */
   err = RM_MOTOR_CONTROL_Reset(&g_motor_control_ctrl);
```

```
/* Close the module. */
   err = RM_MOTOR_CONTROL_Close(&g_motor_control_ctrl);
```

Complete Example

This example demonstrates a complete motor control sequence including initialization, running, and error handling.

```
#include "rm_motor_control.h"
/* Motor control instance */
extern motor_instance_t g_motor0;
/* Error handler callback */
void motor_callback (motor_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case MOTOR_CALLBACK_EVENT_SPEED_BACKWARD:
 /* Speed control processing completed */
 break;
 case MOTOR_CALLBACK_EVENT_CURRENT_BACKWARD:
 /* Current control processing completed */
 break;
 case MOTOR_CALLBACK_EVENT_ERROR:
 /* Error detected - handle appropriately */
 break;
 default:
 break;
    }
}
```

```
void motor_control_example (void)
{
 fsp_err_t err;
    uint8_t   status;
 float    speed_rpm;
    uint16_t error;
 /* Open the motor control module */
    err = RM_MOTOR_CONTROL_Open(g_motor0.p_ctrl, g_motor0.p_cfg);
 if (FSP_SUCCESS != err)
    {
 /* Handle error */
 return;
    }
 /* Start motor rotation */
    err = RM_MOTOR_CONTROL_Run(g_motor0.p_ctrl);
 if (FSP_SUCCESS != err)
    {
 /* Handle error */
 return;
    }
 /* Set target speed to 1000 RPM */
    err = RM_MOTOR_CONTROL_SpeedSet(g_motor0.p_ctrl, 1000.0F);
 /* Main loop */
 while (true)
    {
 /* Check for errors */
       err = RM_MOTOR_CONTROL_ErrorCheck(g_motor0.p_ctrl, &error);
 if (MOTOR_ERROR_NONE != error)
     {
 /* Error detected - stop and reset */
 RM_MOTOR_CONTROL_Stop(g_motor0.p_ctrl);
 RM_MOTOR_CONTROL_Reset(g_motor0.p_ctrl);
 break;
     }
```

```
/* Get current status */
RM_MOTOR_CONTROL_StatusGet(g_motor0.p_ctrl, &status);
/* Get current speed */
RM_MOTOR_CONTROL_SpeedGet(g_motor0.p_ctrl, &speed_rpm);
/* Application processing */
   }
/* Close the module */
RM_MOTOR_CONTROL_Close(g_motor0.p_ctrl);
}
```

Data Structures

struct	motor_control_statemachine_t
struct	motor_control_extended_cfg_t
struct	motor_control_instance_ctrl_t

Enumerations

enum	motor_control_status_t
enum	motor_control_event_t

Data Structure Documentation

◆ motor_control_statemachine_t

struct motor_control_statemachine_t		
Motor control state machine structure		
Data Fields		
motor_control_status_t	status	Current system status.
motor_control_status_t	status_next	Next system status.
motor_control_event_t	current_event	Current event index.
uint16_t	error_status	Error information.

◆ motor_control_extended_cfg_t

struct motor_control_extended_cfg_t		
Motor Extended Control congig structure		
Data Fields		
motor_algorithm_instance_t const *	p_motor_algorithm_instance	Vector Control Instance.

motor_trajectory_instance_t const *	p_motor_trajectory_instance	Trajectory Control Instance.

◆ motor_control_instance_ctrl_t

struct motor_control_instance_ctrl_t		
Motor control instance control block		
Data Fields		
uint32_t	open	Module open flag.
uint32_t	error_info	Happened error.
motor_control_statemachine_t	state_machine	State machine structure.
float	speed_ref_rpm_setpoint	Speed reference setpoint [rpm].
float	speed_rpm	Actual speed [rpm].
motor_cfg_t const *	p_cfg	Pointer of configuration structure.

Enumeration Type Documentation

◆ motor_control_status_t

enum motor_control_status_t	
Motor control status	
Enumerator	
MOTOR_CONTROL_STATUS_STOP	Motor control stop state.
MOTOR_CONTROL_STATUS_RUN	Motor control run state.
MOTOR_CONTROL_STATUS_ERROR	Motor control error state.

◆ motor_control_event_t

enum motor_control_event_t	
Motor control event	
Enumerator	
MOTOR_CONTROL_EVENT_STOP	Stop event.
MOTOR_CONTROL_EVENT_RUN	Run event.
MOTOR_CONTROL_EVENT_ERROR	Error event.
MOTOR_CONTROL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_CONTROL_Open()

fsp_err_t RM_MOTOR_CONTROL_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_CONTROL_Open(&g_motor_control_ctrl, &g_motor_control_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_CONTROL_Close()

fsp_err_t RM_MOTOR_CONTROL_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Control block. Implements motor_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_CONTROL_Close(&g_motor_control_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_Reset()

fsp_err_t RM_MOTOR_CONTROL_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control. */
   err = RM_MOTOR_CONTROL_Reset(&g_motor_control_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_Run()

fsp_err_t RM_MOTOR_CONTROL_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation. */
   err = RM_MOTOR_CONTROL_Run(&g_motor_control_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_Stop()

fsp_err_t RM_MOTOR_CONTROL_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation. */
   err = RM_MOTOR_CONTROL_Stop(&g_motor_control_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_ErrorSet()

fsp_err_t RM_MOTOR_CONTROL_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Set error information. */
   err = RM_MOTOR_CONTROL_ErrorSet(&g_motor_control_ctrl, MOTOR_ERROR_NONE);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_SpeedSet()

fsp_err_t RM_MOTOR_CONTROL_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference. */
   err = RM_MOTOR_CONTROL_SpeedSet(&g_motor_control_ctrl, 1000.0F);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_CONTROL_StatusGet()

fsp_err_t RM_MOTOR_CONTROL_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get motor status. */
   uint8_t status = 0;
   err = RM_MOTOR_CONTROL_StatusGet(&g_motor_control_ctrl, &status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_CONTROL_SpeedGet()

fsp_err_t RM_MOTOR_CONTROL_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current speed. */
float speed_rpm = 0.0F;
   err = RM_MOTOR_CONTROL_SpeedGet(&g_motor_control_ctrl, &speed_rpm);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_CONTROL_ErrorCheck()

fsp_err_t RM_MOTOR_CONTROL_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check for errors. */
   uint16_t error = 0;
   err = RM_MOTOR_CONTROL_ErrorCheck(&g_motor_control_ctrl, &error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_CONTROL_PositionSet()

fsp_err_t RM_MOTOR_CONTROL_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_CONTROL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_CONTROL_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_CONTROL_FunctionSelect()

fsp_err_t RM_MOTOR_CONTROL_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select function. Implements motor_api_t::functionSelect.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_CONTROL_TargetSet()

fsp_err_t RM_MOTOR_CONTROL_TargetSet (motor_ctrl_t *const *p_ctrl*, const motor_trajectory_target_t * *p_target*, motor_trajectory_command_status_t *const *p_cmd_status*)

Target set.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Motor PM FOC on RA MCUs. This module implements the Motor Interface.

Overview

The Motor PM FOC module provides Field Oriented Control (FOC) for Permanent Magnet (PM) motors. It implements inner loop (current control) and outer loop (speed control) algorithms for precise motor control.

FOC is a control technique that transforms the stator current into two orthogonal components: the direct (d-axis) and quadrature (q-axis) currents. This allows independent control of torque and flux, resulting in efficient and responsive motor control.

Features

The Motor PM FOC module has the following key features:

- Field Oriented Control for Permanent Magnet motors
- Inner loop current control with PI controllers for d-axis and q-axis
- Outer loop speed control with PI controller
- Flux weakening support for extended speed range operation
- Voltage error compensation for improved accuracy
- Multiple sensor slot support (dual sensor capability)
- Speed observer and disturbance observer support
- Position control mode support
- Configurable current and speed limits
- Error detection for overcurrent, overvoltage, low voltage, and overspeed conditions

Configuration

Build Time Configurations for rm_motor_pm_foc

The following build time configurations are defined in fsp_cfg/rm_motor_pm_foc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

• Enabled • Disabled		parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor PM FOC Module (rm_motor_pm_foc)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor PM FOC Module (rm_motor_pm_foc).

Configuration	Options	Default	Description
Inverter Parameters			
PWM Carrier Period (Microseconds)	Must be a valid non-negative value	50	Inverter carrier period
Dead Time (Microseconds)	Must be a valid value	2.0	PWM dead time
Design Parameter			
Current PI Loop Natural Frequency (Hz)	Must be a valid non-negative value	300.0F	Current PI loop natural frequency
Current PI Loop Damping Ratio	Must be a valid non-negative value	1.0F	Current PI loop dampin ratio
Speed PI Loop Natural Frequency (Hz)	Must be a valid non-negative value	12.0F	Speed PI loop natural frequency
Speed PI Loop Damping Ratio	Must be a valid non-negative value	1.0F	Speed PI loop damping ratio
Speed Observer Natural Frequency (Hz)	Must be a valid non-negative value	200.0F	Speed observer loop natural frequency
Speed Observer Damping Ratio	Must be a valid non-negative value	1.0F	Speed observer loop damping ratio
Speed LPF Natural Frequency (Hz)	Must be a valid non-negative value	10.0F	Design natural frequency for speed Low Pass Filter.
Disturbance Speed Observer Natural Frequency (Hz)	Must be a valid non-negative value.	100.0F	Natural frequency for disturbance speed observer.
Motor Sensor			
Selected Slot For Control	• MOTOR_INNER_SLOT_1_ENABLE • MOTOR_INNER_SLOT_2_ENABLE	MOTOR_INNER_SLOT_1_ENABLE	Select the sensor slot used for control.
General			
Speed Control Period (sec)	Must be a valid non-negative value	0.0005F	Period of speed control function.

Acceleration To Target Speed (rpm/sec)	Must be a valid non-negative value	1000.0F	The rate of acceleration to reach the target motor speed.
Current PI Output Limit (V)	Must be a valid non-negative value	24.0F	Current PI output limit
Limit Of Q-axis Current (A)	Must be a valid non-negative value	0.42F	Limit of q-axis current.
Protection			
Maximum Speed (rpm)	Must be a valid non-negative value.	2650.0F	Controllable maximum speed
Limit Of Over Current (A)	Must be a valid value	3.54F	Limit of over current.(Detection threshold, instantaneous value)
Limit Of Over Voltage (V)	Must be a valid value	28.0F	Limit of over voltage for DC Bus.(Detection threshold)
Limit Of Over Speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit Of Low Voltage (V)	Must be a valid value	14.0F	Limit of low voltage for DC Bus.(Detection threshold)
Sample Delay Compensation			
Status	• Disable • Enable	Enable	Select enable/disable sample delay compensation.
Period Magnification Value	Must be a valid value	1.5	Period magnification value for sampling delay compensation.
Voltage Error Compensation			
Status	• Disable • Enable	Enable	Select enable/disable voltage error compensation.
Reference Voltage (V)	Must be a valid value	24.0F	Reference voltage for compensation table.
Table Of Voltage 1 (V)	Must be a valid value	0.672F	Voltage error compensation table of voltage.
Table Of Voltage 2 (V)	Must be a valid value	0.945F	Voltage error compensation table of voltage.
Table Of Voltage 3 (V)	Must be a valid value	1.054F	Voltage error

			compensation table of voltage.
Table Of Voltage 4 (V)	Must be a valid value	1.109F	Voltage error compensation table of voltage.
Table Of Voltage 5 (V)	Must be a valid value	1.192F	Voltage error compensation table of voltage.
Table Of Current 1 (A)	Must be a valid value	0.013F	Voltage error compensation table of current.
Table Of Current 2 (A)	Must be a valid value	0.049F	Voltage error compensation table of current.
Table Of Current 3 (A)	Must be a valid value	0.080F	Voltage error compensation table of current.
Table Of Current 4 (A)	Must be a valid value	0.184F	Voltage error compensation table of current.
Table Of Current 5 (A)	Must be a valid value	0.751F	Voltage error compensation table of current.
Motor Parameter			
Pole Pairs	Must be a valid non-negative value.	4	Pole pairs
Resistance (ohm)	Must be a valid value	1.3F	Resistance
Inductance Of D-axis (H)	Must be a valid value	0.0013F	Inductance of d-axis
Inductance Of Q-axis (H)	Must be a valid value	0.0013F	Inductance of q-axis
Permanent Magnetic Flux (Wb)	Must be a valid value	0.01119F	Permanent magnetic flux
Motor Parameter > Rotor Inertia (kgm^2)	Must be a valid value	0.000003666F	Rotor inertia
Rated Current (A)	Must be a valid value	1.67F	Rated current
Extended Function			
MTPA	• Disabled • Enabled	module.middleware.motor_algorithm.-.mtpa.disabled	Select MTPA function.
Flux-Weakening	• Disabled • Enabled	Enabled	Select Flux weakening function.
Speed Feedback	• Direct	Direct	Select speed feedback

Process	• LPF • SpeedObserver		process.
Interrupts			
Callback	Name must be a valid C symbol	rm_motor_control_callback	A user callback function. If this callback function is provided, it is called from multiple internal events.
Name	Name must be a valid C symbol	g_motor0_pm_foc	Module name.

Clock Configuration

The Motor PM FOC module uses timer peripherals for inner loop and outer loop control timing. Configure the timer instances according to your control period requirements:

- Inner loop (current control): Typically 50-100 µs period
- Outer loop (speed control): Typically 1-10 ms period

Pin Configuration

This module does not use I/O pins directly. Pin configuration is handled by the motor driver module (motor_hal_driver_instance) and sensor module (motor_sensor_instance).

Usage Notes

Control Modes

The Motor PM FOC module supports multiple control modes that can be set using RM_MOTOR_PM_FOC_ControlModeSet and retrieved using RM_MOTOR_PM_FOC_ControlModeGet. The control mode determines how the motor is driven:

- Speed control mode: Motor speed follows the speed reference
- Position control mode: Motor position follows the position reference
- Current control mode: Direct control of d-axis and q-axis currents

Motor Status

The motor status can be retrieved using RM_MOTOR_PM_FOC_StatusGet. This provides information about the current operating state of the motor control system.

Error Handling

The Motor PM FOC module monitors for various error conditions:

- **Overcurrent**: Phase current exceeds the configured limit
- **Overvoltage**: DC bus voltage exceeds the configured limit
- **Low voltage**: DC bus voltage falls below the configured limit
- **Overspeed**: Motor speed exceeds the configured limit

When an error is detected, it can be retrieved using RM_MOTOR_PM_FOC_ErrorGet. After handling the error condition, use RM_MOTOR_PM_FOC_Reset to clear the error state and RM_MOTOR_PM_FOC_Run to restart motor operation.

Flux Weakening

Flux weakening allows the motor to operate above its base speed by reducing the magnetic flux. This is achieved by injecting negative d-axis current. The flux weakening feature can be enabled through the extended configuration.

Voltage Error Compensation

Voltage error compensation improves control accuracy by compensating for non-linearities in the inverter, such as dead-time effects and device voltage drops. The compensation table can be configured in the extended configuration.

Limitations

Developers should be aware of the following limitations when using the Motor PM FOC:

- The module must be opened using RM_MOTOR_PM_FOC_Open before any other API calls.
- Control mode should be set using RM_MOTOR_PM_FOC_ControlModeSet before activating motor run.
- The motor driver and sensor modules must be properly configured before opening this module.
- Parameter updates using RM_MOTOR_PM_FOC_ParameterUpdate should be performed when the motor is stopped or during controlled operation to avoid transients.
- Only the functions/types/macros exposed via rm_motor_pm_foc.h and rm_motor_algorithm_api.h should be accessed by user code and that the contents of the other headers is subject to change.

Examples

Motor PM FOC Basic Example

This is a basic example of minimal use of the Motor PM FOC in an application.

```
void rm_motor_pm_foc_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the motor PM FOC module. */
    err = RM_MOTOR_PM_FOC_Open(&g_motor_pm_foc_ctrl, &g_motor_pm_foc_cfg);
    handle_error(err);
 /* Activate the motor control. */
    err = RM_MOTOR_PM_FOC_Run(&g_motor_pm_foc_ctrl);
    handle_error(err);
 while (true)
    {
 /* Application work here. */
    }
```

```
}
```

Motor PM FOC Advanced Example

This example demonstrates status monitoring, control mode management, and error handling.

```
void rm_motor_pm_foc_advanced_example (void)
{
 fsp_err_t err          = FSP_SUCCESS;
    uint8_t   status       = 0U;
    uint32_t error_flags = 0U;
    uint8_t   control_mode = 0U;
 /* Open the motor PM FOC module. */
    err = RM_MOTOR_PM_FOC_Open(&g_motor_pm_foc_ctrl, &g_motor_pm_foc_cfg);
    handle_error(err);
 /* Set control mode. */
    err = RM_MOTOR_PM_FOC_ControlModeSet(&g_motor_pm_foc_ctrl, control_mode);
    handle_error(err);
 /* Activate the motor control. */
    err = RM_MOTOR_PM_FOC_Run(&g_motor_pm_foc_ctrl);
    handle_error(err);
 while (true)
    {
 /* Get motor status. */
       err = RM_MOTOR_PM_FOC_StatusGet(&g_motor_pm_foc_ctrl, &status);
      handle_error(err);
 /* Get current control mode. */
       err = RM_MOTOR_PM_FOC_ControlModeGet(&g_motor_pm_foc_ctrl, &control_mode);
      handle_error(err);
 /* Check for errors. */
       err = RM_MOTOR_PM_FOC_ErrorGet(&g_motor_pm_foc_ctrl, &error_flags);
      handle_error(err);
 if (error_flags != 0U)
      {
 /* Stop motor on error. */
```

```
            err = RM_MOTOR_PM_FOC_Stop(&g_motor_pm_foc_ctrl);
      handle_error(err);
 /* Reset the motor control module. */
            err = RM_MOTOR_PM_FOC_Reset(&g_motor_pm_foc_ctrl);
      handle_error(err);
 break;
      }
 /* Update parameters if needed. */
       err = RM_MOTOR_PM_FOC_ParameterUpdate(&g_motor_pm_foc_ctrl,
&g_motor_pm_foc_cfg);
      handle_error(err);
    }
 /* Close the motor PM FOC module. */
    err = RM_MOTOR_PM_FOC_Close(&g_motor_pm_foc_ctrl);
    handle_error(err);
}
```

Data Structure Documentation

◆ motor_pm_foc_inner_cfg_t

struct motor_pm_foc_inner_cfg_t		
Configuration parameters.		
Data Fields		
void const *	p_context	Placeholder for user data.
void const *	p_extend	Pointer to extended configuration.

◆ motor_pm_foc_outer_cfg_t

struct motor_pm_foc_outer_cfg_t	
Configuration parameters.	
Data Fields	
void const *	p_context
	Placeholder for user data.
void const *	p_extend
	Pointer to extended configuration.

◆ motor_inner_get_voltage_t

struct motor_inner_get_voltage_t
Structure to retrieve motor voltage references

Data Fields		
float	v_u_ref	U phase voltage reference [V].
float	v_v_ref	V phase voltage reference [V].
float	v_w_ref	W phase voltage reference [V].
float	v_d_ref	d-axis voltage reference
float	v_q_ref	q-axis voltage reference

◆ motor_mode_inner_to_outer_t

struct motor_mode_inner_to_outer_t		
Control mode data structure from inner to outer loop		
Data Fields		
float	id_ref_ow	d-axis current reference overwrite value [A]
float	iq_ref_ow	q-axis current reference overwrite value [A]
uint8_t	mode_outer	Control mode specification for outer loop.

◆ motor_pm_foc_outer_loop_func_table_t

struct motor_pm_foc_outer_loop_func_table_t		
Outerloop Function Pointer Table		
Data Fields		
OuterLoopFunction *	control_mode_ctrl	Position/Speed control function pointer.
OuterLoopFunction *	mtpa_ctrl	MTPA (Maximum Torque Per Ampere) control function pointer.
OuterLoopFunction *	fw_ctrl	Fluxweak Control function pointer.
OuterLoopFunction *	spdobsv_ctrl	Speed Observer function pointer.

◆ motor_outer_design_params_t

struct motor_outer_design_params_t		
Design parameter structure for outer control		
Data Fields		
float	speed_omega	Natural frequency[Hz] for speed loop gain design.
float	speed_zeta	Damping ratio for speed loop gain design.

float	observer_omega	Natural frequency[Hz] for speed observer and extended observer.
float	observer_zeta	Damping ratio for speed observer.

◆ motor_pm_foc_outer_instance_signals_ctrl_t

struct motor_pm_foc_outer_instance_signals_ctrl_t		
Motor outer control instance control block		
Data Fields		
uint32_t	error_info	Error flags detected during outer loop execution.
uint8_t	active	Flag to set active/inactive the speed control.
float	i_q_ref_disturbance	Anti disturbance Q-axis current reference [A].
float	speed_mech_que_ref	Command speed value for speed PI control[rad/s].
float	speed_mech_ref	Speed reference value [rad/s].
float	speed_mech_lpf	Low-pass filtered speed [rad/s].
float	speed_mech	Mechanical Speed used by outer control loop [rad/s].
float	angle_mech	Mechanical Angle Position used by outer control loop [rad].
motor_flux_weakening_t	flux_weakening_ctrl	Flux-weakening control data.
motor_mode_inner_to_outer_t	inner_mode_data	control mode data from inner loop (request to overwrite references)
pi_ctrl_t	speed_pi_ctrl	Speed PI controller data.
motor_common_lpf_t	speed_lpf_ctrl	Speed low-pass filter data.
motor_spdobserver_t	speed_observer_ctrl	Speed observer data.
motor_extobserver_t	extobserver_ctrl	Disturbance torque/speed observer data.

◆ motor_pm_foc_inner_instance_signals_ctrl_t

struct motor_pm_foc_inner_instance_signals_ctrl_t		
Motor inner control instance control block		
Data Fields		
uint32_t	error_info	Error flags detected during inner loop execution.

uint8_t	active	Flag to set active/inactive the current control.
motor_algorithm_control_mode_t	control_mode	Current control mode.
motor_shared_inner_to_position_speed_t	to_pos_speed	Data structure for sensor module (it includes iu, iv, iw)
float	v_dc	DC bus voltage [V].
float	angle_el	Electrical rotor angle [radian].
float	speed_el	Electrical rotor speed [radian/s].
float	v_u_ref	U phase voltage reference [V].
float	v_v_ref	V phase voltage reference [V].
float	v_w_ref	W phase voltage reference [V].
pi_ctrl_t	id_pi_ctrl	D-axis current PI controller.
pi_ctrl_t	iq_pi_ctrl	Q-axis current PI controller.
motor_volt_error_comp_t	vcomp_ctrl	Voltage error compensation data.

◆ motor_pm_foc_extended_data_cfg_t

struct motor_pm_foc_extended_data_cfg_t		
Extended configurations for motor PM FOC control		
Data Fields		
float	comp_v[MOTOR_VOLT_ERR_COMP_TABLE_ARRAY_SIZE]	Voltage error compensation table: voltage axis.
float	comp_i[MOTOR_VOLT_ERR_COMP_TABLE_ARRAY_SIZE]	Voltage error compensation table: current axis.
float	comp_vdc_ref	Voltage error compensation: DC bus reference voltage for table.
float	comp_limit_factor	Voltage error compensation: limit factor.
motor_volt_error_comp_select_t	vcomp_enable	Enable/disable voltage error compensation.
motor_inner_sample_delay_compensation_t	sample_delay_comp_enable	Enable/disable sample delay compensation.
motor_inner_sensor_selected_slot_t	sensor_slot	Selected sensor slot.
float	period_magnitude_value	Period magnification value for sampling delay compensation.
float	inner_control_period	Current control period [usec].
float	current_limit	Current limit [A].

float	outer_control_period	Speed control period [sec].
float	speed_mech_change_limit	Maximum speed reference change rate [rad/s^2].
float	speed_mech_cmd_limit	Maximum speed command value [rad/s].
float	speed_lpf_omega_t	Speed LPF design value.
float	iq_limit	Limit of q-axis current [A].
float	overcurrent_limit	Over-current detection limit [A].
float	overvoltage_limit	Over-voltage detection limit [V].
float	lowvoltage_limit	Low-voltage detection limit [V].
float	overspeed_limit	Over-speed detection limit [rpm].

◆ motor_pm_foc_instance_ctrl_t

struct motor_pm_foc_instance_ctrl_t		
PM FOC control instance control block		
Data Fields		
uint32_t	open	Vector control open flag.
uint8_t	sensor_control_mode	Sensor control mode.
uint8_t	motor_status	Motor Status.
motor_pm_foc_inner_instance_ctrl_t *	p_inner_instance_ctrl	Pointer to inner control instance.
motor_pm_foc_outer_instance_ctrl_t *	p_outer_instance_ctrl	Pointer to outer control instance.
motor_algorithm_cfg_t const *	p_cfg	

Typedef Documentation

◆ OuterLoopFunction

typedef void() OuterLoopFunction(void *p_ctrl, void *p_cfg)
Outer loop function pointer type definition

Enumeration Type Documentation

◆ motor_error_pm_foc_t

enum motor_error_pm_foc_t
Error information

◆ motor_inner_sample_delay_compensation_t

enum motor_inner_sample_delay_compensation_t	
Sample delay compensation enable/disable selection	
Enumerator	
MOTOR_INNER_SAMPLE_DELAY_COMPENSATION_DISABLE	Sample delay compensation disabled.
MOTOR_INNER_SAMPLE_DELAY_COMPENSATION_ENABLE	Sample delay compensation enabled.

◆ motor_inner_sensor_selected_slot_t

enum motor_inner_sensor_selected_slot_t	
Sensor slot selection for inner control	
Enumerator	
MOTOR_INNER_SLOT_1_ENABLE	Use sensor slot 1.
MOTOR_INNER_SLOT_2_ENABLE	Use sensor slot 2.

◆ motor_outer_ctrl_status_t

enum motor_outer_ctrl_status_t	
Outer control status enumeration	
Enumerator	
MOTOR_SPEED_CTRL_STATUS_INIT	Speed control initialization state.
MOTOR_SPEED_CTRL_STATUS_BOOT	Speed control bootstrap state.
MOTOR_SPEED_CTRL_STATUS_RUN	Speed control running state.

Function Documentation

◆ RM_MOTOR_PM_FOC_Open()

fsp_err_t RM_MOTOR_PM_FOC_Open (motor_algorithm_ctrl_t *const *p_ctrl*, motor_algorithm_cfg_t const *const *p_cfg*)

Opens and configures the Vector control module. Implements motor_driver_api_t::open.

Return values

FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_PM_FOC_Close()

fsp_err_t RM_MOTOR_PM_FOC_Close (motor_algorithm_ctrl_t *const *p_ctrl*)

Disables specified Motor Current Module.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_Reset()

fsp_err_t RM_MOTOR_PM_FOC_Reset (motor_algorithm_ctrl_t *const *p_ctrl*)

Disables specified Motor Current Module.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_Run()

fsp_err_t RM_MOTOR_PM_FOC_Run (motor_algorithm_ctrl_t *const *p_ctrl*)

Active run motor.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_Stop()

fsp_err_t RM_MOTOR_PM_FOC_Stop (motor_algorithm_ctrl_t *const *p_ctrl*)

Motor Stop.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_ControlModeGet()

fsp_err_t RM_MOTOR_PM_FOC_ControlModeGet (motor_algorithm_ctrl_t *const *p_ctrl*, motor_algorithm_control_mode_t * *p_control_mode*)

ControlModeGet.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_ControlModeSet()

fsp_err_t RM_MOTOR_PM_FOC_ControlModeSet (motor_algorithm_ctrl_t *const *p_ctrl*, motor_algorithm_control_mode_t *control_mode*)

ControlModeSet.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_StatusGet()

fsp_err_t RM_MOTOR_PM_FOC_StatusGet (motor_algorithm_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

StatusGet.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_ParameterUpdate()

fsp_err_t RM_MOTOR_PM_FOC_ParameterUpdate (motor_algorithm_ctrl_t *const *p_ctrl*, motor_algorithm_cfg_t const *const *p_cfg*)

Updates the parameters of the motor control module.

This function overwrites the configuration pointer of the motor control instance and updates managed variables such as current limits in the inner instance. It does not modify any gain parameters directly, but ensures that the new configuration is applied to the instance.

Parameters

[in]	p_ctrl	Pointer to the motor algorithm control structure.
[in]	p_cfg	Pointer to the new motor algorithm configuration structure.

Return values

FSP_SUCCESS	Successfully updated parameters.
FSP_ERR_ASSERTION	Null pointer detected.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_PM_FOC_ErrorGet()

fsp_err_t RM_MOTOR_PM_FOC_ErrorGet (motor_algorithm_ctrl_t *const *p_ctrl*, uint32_t * *p_error_flags*)

ErrorGet.

Return values

FSP_SUCCESS	Successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ algorithm_disabled()

void algorithm_disabled (void * *p_ctrl*, void * *p_cfg*)

Dummy function for disabled algorithms.

This function is used as a placeholder in the function pointer table when a specific algorithm (e.g., MTPA, flux weakening, speed observer) is disabled in the configuration.

Parameters

[in]	p_ctrl	Pointer to control structure (unused)
[in]	p_cfg	Pointer to configuration structure (unused)

Return values

None	Dammy configured function

◆ motor_outer_fnctbl_spdobsrv_ctrl()

void motor_outer_fnctbl_spdobsrv_ctrl (void * *p_ctrl*, void * *p_cfg*)

Speed observer control function.

This function applies the speed observer algorithm to estimate the mechanical speed based on q-axis current reference and measured speed. The estimated speed is stored in the low-pass filtered speed variable.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration

Return values

None	Speed Observer related for function pointer table

◆ motor_outer_fnctbl_spddirct_ctrl()

void motor_outer_fnctbl_spddirct_ctrl (void * *p_ctrl*, void * *p_cfg*)

Direct speed assignment control function.

This function directly assigns the measured mechanical speed to the low-pass filtered speed variable without applying any filtering or observer algorithm.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration (unused)

Return values

None	

◆ motor_outer_fnctbl_spdlpf_ctrl()

void motor_outer_fnctbl_spdlpf_ctrl (void * *p_ctrl*, void * *p_cfg*)

Low-pass filter processing for speed.

This function applies a first-order low-pass filter to the measured mechanical speed and updates the filtered speed value in the control instance.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration (unused)

Return values

None	

◆ motor_outer_fnctbl_extobsrv_ctrl()

void motor_outer_fnctbl_extobsrv_ctrl (void * *p_ctrl*, void * *p_cfg*)

Extended observer for disturbance torque and speed estimation.

This function applies an extended observer to estimate mechanical speed excluding disturbance torque effects. It also generates a disturbance compensation current reference for torque ripple suppression.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration

Return values

None	

◆ motor_outer_fnctbl_mtpa_ctrl()

void motor_outer_fnctbl_mtpa_ctrl (void * *p_ctrl*, void * *p_cfg*)

MTPA (Maximum Torque Per Ampere) control function.

This function applies the MTPA algorithm to optimize d- and q-axis current references for maximum torque efficiency. If flux weakening is active, it integrates flux weakening control with MTPA to select appropriate current commands. The function ensures that d-axis current reference remains non-positive for non-salient PMSM.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration

Return values

None	MTPA for function pointer table

◆ motor_outer_fnctbl_fw_ctrl()

void motor_outer_fnctbl_fw_ctrl (void * *p_ctrl*, void * *p_cfg*)

Flux weakening control function.

This function applies flux weakening control to adjust d- and q-axis current references for high-speed motor operation, ensuring the voltage limit is not exceeded. The function overwrites the dq-axis current commands when flux weakening is enabled.

Parameters

[in,out]	p_ctrl	Pointer to motor outer control instance
[in]	p_cfg	Pointer to extended configuration

Return values

None	Fluxweak control for function pointer table

◆ motor_outer_speed_control()

void motor_outer_speed_control (void * *p_ctrl*, void * *p_cfg*)

Calculates the d/q-axis current reference for speed control.

Control mode function for function pointer table

This function performs the main process of outer control, including speed filtering, trajectory control, speed reference setting, and current reference calculation. It also applies MTPA and flux weakening control via function pointers.

Parameters

[in,out]	p_ctrl	Pointer to control structure
[in]	p_cfg	Pointer to configuration structure

Return values

None	

◆ motor_outer_position_control()

void motor_outer_position_control (void * *p_ctrl*, void * *p_cfg*)

Calculates the d/q-axis current reference for position control.

This function is reserved for future implementation of position control.

Parameters

[in,out]	p_ctrl	Pointer to control structure
[in]	p_cfg	Pointer to configuration structure

Return values

None	

Motor Trajectory Linear middleware (rm_motor_trajectory_linear)

Detailed Description

Motor Trajectory Linear on RA MCUs. This module implements the Motor Trajectory Interface.

Overview

The Motor Trajectory Linear module provides linear trajectory generation for motor control applications. It calculates smooth reference values that transition linearly from the current position/speed to a target value at a specified slew rate.

Features

The Motor Trajectory Linear module has the following key features:

- Linear trajectory generation with configurable slew rate
- Command queuing support (one command can be queued while another is in progress)
- Immediate command execution with the IMMEDIATE flag
- Bypass mode for direct reference value pass-through
- Force alignment support for synchronization
- Direction (CW/CCW) and acceleration/deceleration state tracking
- User callback notification when trajectory completes

Trajectory States

The trajectory module operates in the following states:

State	Description
TRAJECTORY_STATE_IDLE	No trajectory is active. Ready to accept new commands.
TRAJECTORY_STATE_IN_PROGRESS	A trajectory is currently being executed.

TRAJECTORY_STATE_QUEUED	A trajectory is in progress and another command is queued.

Command Status

When setting a target, the following status values indicate how the command was processed:

Status	Description
MOTOR_TRAJECTORY_CMD_ACCEPTED_IMMEDIATE	Command was accepted and started immediately.
MOTOR_TRAJECTORY_CMD_QUEUED	Command was queued (will execute after current trajectory completes).
MOTOR_TRAJECTORY_CMD_REJECTED	Command was rejected (queue is full or invalid parameters).

Configuration

Build Time Configurations for rm_motor_trajectory_linear

The following build time configurations are defined in fsp_cfg/rm_motor_trajectory_linear_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Trajectory Module (rm_motor_trajectory_linear)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Trajectory Module (rm_motor_trajectory_linear).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_trajectory_linear	Module name.
Use custom trajectory	• true • false	false	Allows the controller to follow a linear trajectory provided by the user.
Bypass Mode	• true • false	false	Trajectory bypass control flag.
Force alignment	• true • false	false	Force alignment control flag.
Outer control period (sec)	Must be a valid non-negative value.	0.0005	Control period, same as the outer loop period of the algorithm layer.

Interrupt			
Callback	Name must be a valid C symbol	NULL	A user callback function.

Build Time Configurations for rm_motor_trajectory_linear

The following build time configurations are available for this module:

Configuration	Description	Default
Parameter Checking	Enables parameter checking for API functions.	Enabled

Configurations for Motor Trajectory Linear

Configuration	Description
Cycle Time (seconds)	The time interval between callback invocations. Used to calculate trajectory progression.
Bypass Mode	When enabled, the reference value is passed through without trajectory calculation.
Force Align	When enabled, forces alignment to a specified value.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Callback Function

The trajectory module requires periodic callback invocations from the motor control algorithm layer. The callback function RM_MOTOR_TRAJECTORY_LINEAR_Callback should be called at regular intervals (matching the configured cycle time) to:

- Calculate the next reference value based on the current trajectory
- Update direction and acceleration/deceleration states
- Handle trajectory completion and queued command transitions

Trajectory Parameters

Linear trajectory parameters are defined using the motor_trajectory_linear_params_t structure. The helper macro MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT can be used for convenient initialization:

```
motor_trajectory_linear_params_t linear_params = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT(
100.0F, 10.0F);
```

Where:

- First parameter: Target value (e.g., target speed in RPM or target position)
- Second parameter: Slew rate (rate of change per second)

Immediate Command Execution

To execute a command immediately (aborting any current trajectory and clearing the queue), set the IMMEDIATE flag in the command_flags:

```
motor_trajectory_linear_params_t linear_params = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT(
100.0F, 10.0F);
linear_params.base.command_flags = MOTOR_TRAJECTORY_COMMAND_STATUS_FLAG_IMMEDIATE;
```

Bypass Mode

Bypass mode can be enabled to pass the current reference value through without trajectory calculation. This is useful when:

- Direct control of the reference value is needed
- The trajectory module should be temporarily disabled

Enable bypass mode using RM_MOTOR_TRAJECTORY_LINEAR_BypassModeSet :

```
err = RM_MOTOR_TRAJECTORY_LINEAR_BypassModeSet(&g_motor_trajectory_ctrl, true);
```

Limitations

Developers should be aware of the following limitations when using the Motor Trajectory Linear module:

- Only one command can be queued at a time. If a command is already queued, subsequent commands will be rejected until the queue is cleared.
- The trajectory calculation assumes a constant cycle time. Variations in callback timing may affect trajectory accuracy.
- The module uses single-precision floating-point arithmetic.

Examples

Basic Example

This is a basic example of minimal use of the motor trajectory linear in an application.

```
void rm_motor_trajectory_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_Open(&g_motor_trajectory_ctrl,
&g_motor_trajectory_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 /* Close the module. */
```

```
    err = RM_MOTOR_TRAJECTORY_LINEAR_Close(&g_motor_trajectory_ctrl);
    handle_error(err);
}
```

Advanced Example

This example demonstrates setting targets, getting status, resetting, and configuring bypass mode.

```
void rm_motor_trajectory_advanced_example (void)
{
 fsp_err_t                        err = FSP_SUCCESS;
 motor_trajectory_state_t         state;
 motor_trajectory_command_status_t cmd_status;
 /* Open the module. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_Open(&g_motor_trajectory_ctrl,
&g_motor_trajectory_cfg);
    handle_error(err);
 /* Set target using linear trajectory parameters */
 motor_trajectory_linear_params_t linear_params = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT
(100.0F, 10.0F);
 motor_trajectory_target_t target =
    {
       .p_params = (motor_trajectory_params_base_t const *) &linear_params,
    };
    err = RM_MOTOR_TRAJECTORY_LINEAR_TargetSet(&g_motor_trajectory_ctrl, &target,
&cmd_status);
    handle_error(err);
 /* Get the current trajectory state. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_StatusGet(&g_motor_trajectory_ctrl, &state);
    handle_error(err);
 /* Reset the trajectory module. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_Reset(&g_motor_trajectory_ctrl);
    handle_error(err);
 /* Set bypass mode. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_BypassModeSet(&g_motor_trajectory_ctrl, true);
```

```
    handle_error(err);
 /* Close the module. */
    err = RM_MOTOR_TRAJECTORY_LINEAR_Close(&g_motor_trajectory_ctrl);
    handle_error(err);
}
```

Callback Integration Example

This example shows how to integrate the trajectory callback with a motor control loop:

```
/* Motor control periodic interrupt handler */
void motor_control_isr (void)
{
 fsp_err_t err;
 float    reference_value = 0.0F;
 motor_trajectory_callback_args_t args =
    {
       .p_reference = &reference_value,
       .force_align = false,
       .align_value = 0.0F,
    };
 /* Call trajectory callback to get next reference value */
    err = RM_MOTOR_TRAJECTORY_LINEAR_Callback(&g_motor_trajectory_ctrl, &args);
 if (FSP_SUCCESS == err)
    {
 /* Use reference_value for motor control */
       set_motor_speed_reference(reference_value);
    }
}
```

Queued Command Example

This example demonstrates command queuing behavior:

```
void trajectory_queued_command_example (void)
{
```

```
 fsp_err_t err;
 motor_trajectory_command_status_t cmd_status;
 /* First command - will be accepted immediately */
 motor_trajectory_linear_params_t first_target = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT
(100.0F, 10.0F);
 motor_trajectory_target_t       target1      =
    {
       .p_params = (motor_trajectory_params_base_t const *) &first_target,
    };
    err = RM_MOTOR_TRAJECTORY_LINEAR_TargetSet(&g_motor_trajectory_ctrl, &target1,
&cmd_status);
 /* cmd_status will be MOTOR_TRAJECTORY_COMMAND_STATUS_ACCEPTED_IMMEDIATE */
 /* Second command - will be queued */
 motor_trajectory_linear_params_t second_target = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT
(200.0F, 20.0F);
 motor_trajectory_target_t       target2       =
    {
       .p_params = (motor_trajectory_params_base_t const *) &second_target,
    };
    err = RM_MOTOR_TRAJECTORY_LINEAR_TargetSet(&g_motor_trajectory_ctrl, &target2,
&cmd_status);
 /* cmd_status will be MOTOR_TRAJECTORY_COMMAND_STATUS_QUEUED */
 /* Third command - will be rejected (queue full) */
 motor_trajectory_linear_params_t third_target = MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT
(300.0F, 30.0F);
 motor_trajectory_target_t       target3      =
    {
       .p_params = (motor_trajectory_params_base_t const *) &third_target,
    };
    err = RM_MOTOR_TRAJECTORY_LINEAR_TargetSet(&g_motor_trajectory_ctrl, &target3,
&cmd_status);
 /* cmd_status will be MOTOR_TRAJECTORY_COMMAND_STATUS_REJECTED */
}
```

Data Structures

	Force alignment flag and alignment value.
uint8_t	accel_state
	Acceleration/Deceleration state.
uint8_t	direction
	Rotation direction CW/CCW.
uint32_t	current_time_ms
	Current time in milliseconds.

Macro Definition Documentation

◆ MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT

#define MOTOR_TRAJECTORY_LINEAR_PARAMS_INIT (in_target, in_slew_rate)
Initialization Helper Macros

Function Documentation

◆ RM_MOTOR_TRAJECTORY_LINEAR_Open()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_Open (motor_trajectory_ctrl_t *const *p_ctrl*, motor_trajectory_cfg_t const *const *p_cfg*)

Opens and configures. Implements motor_trajectory_api_t::open.

Return values

FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_TRAJECTORY_LINEAR_Close()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_Close (motor_trajectory_ctrl_t *const *p_ctrl*)

Disables specified. Implements motor_trajectory_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TRAJECTORY_LINEAR_Reset()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_Reset (motor_trajectory_ctrl_t *const *p_ctrl*)

Resets the configurations Implements motor_trajectory_api_t::reset.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TRAJECTORY_LINEAR_TargetSet()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_TargetSet (motor_trajectory_ctrl_t *const *p_ctrl*, const motor_trajectory_target_t * *p_target*, motor_trajectory_command_status_t *const *p_cmd_status*)

Target set Implements motor_trajectory_api_t::targetSet.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ RM_MOTOR_TRAJECTORY_LINEAR_StatusGet()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_StatusGet (motor_trajectory_ctrl_t *const *p_ctrl*, motor_trajectory_state_t *const *p_state*)

Status get Implements motor_trajectory_api_t::statusGet.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TRAJECTORY_LINEAR_BypassModeSet()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_BypassModeSet (motor_trajectory_ctrl_t *const *p_ctrl*, motor_trajectory_bypass_mode_t *bypass_mode*)

Sets bypass mode Implements motor_trajectory_api_t::bypassModeSet.

Parameters

[in]	p_ctrl	Pointer to the control structure.
[in]	bypass_mode	True to enable bypass mode, false to disable

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TRAJECTORY_LINEAR_Callback()

fsp_err_t RM_MOTOR_TRAJECTORY_LINEAR_Callback (motor_trajectory_ctrl_t *const *p_ctrl*, motor_trajectory_callback_args_t *const *p_args*)

Callback function called by the algorithm layer to get the next reference value.

Parameters

[in]	p_ctrl	Pointer to the control structure.
[in]	p_args	Pointer to the control structure.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Motor Tuner for PM motors on RA MCUs. This module implements the Motor tuner Interface.

Overview

The Motor Tuner module provides automatic motor parameter identification functionality for Permanent Magnet Synchronous Motors (PMSM). It identifies key motor parameters required for Field Oriented Control (FOC) without requiring prior knowledge of motor specifications.

Features

The Motor Tuner HAL module has the following key features:

- Multiple identification methods:
  - Differential method for resistance identification
  - RLS (Recursive Least Squares) method for inductance identification
  - DFT (Discrete Fourier Transform) method for inductance verification
  - Open-loop method for back-EMF constant identification
- Progress monitoring during identification process
- Error detection and handling during tuning operations

Parameter Identification Stages

The motor tuner performs parameter identification in the following sequence:

Stage	Description	Parameters Identified
INIT	Initialization and offset calibration	-
VOLTERR	Voltage error measurement (Optional)	Voltage error LUT
R_DIFF	Resistance identification using differential method	R
RLD_RLS	d-axis inductance identification using RLS method	Ld (preliminary)
RLD_DFT	d-axis inductance verification using DFT method	Ld (refined)

LQ_RLS	q-axis inductance identification using RLS method	Lq (preliminary)
LQ_DFT	q-axis inductance verification using DFT method	Lq (refined)
KE	Back-EMF constant identification using open-loop method	Ke
JD	Mechanical parameter identification	J, D
END	Identification complete	-

Configuration

Build Time Configurations for rm_motor_tuner_pm

The following build time configurations are defined in fsp_cfg/rm_motor_tuner_pm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Tuner (rm_motor_tuner_pm)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Tuner (rm_motor_tuner_pm).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_tuner_pm	Module name.
PWM timer clock frequency (Hz)	Must be a valid positive integer value.	120000000	PWM timer clock frequency.
PWM cycle per control interrupt	Must be a valid positive integer value.	1	Number of PWM cycle per current control interrupt.
Speed control period (s)	Must be a valid non-negative value.	500e-6F	Speed control period in seconds.
MCU Setting			
ADC resolution	Must be a valid positive integer value.	4096	MCU ADC resolution.
Inverter Setting			
Current full range (A)	Must be a valid non-negative value.	16.5F	Inverter full scale current range in

			Amperes.
Current limit (A)	Must be a valid non-negative value.	12.0F	Inverter current limit in Amperes.
Overvoltage threshold (V)	Must be a valid non-negative value.	60.0F	Inverter overvoltage threshold in Volts.
Undervoltage threshold (V)	Must be a valid non-negative value.	8.0F	Inverter undervoltage threshold in Volts.
PWM cycle time (s)	Must be a valid non-negative value.	50.0e-6F	Inverter PWM cycle time in seconds.
PWM dead time (s)	Must be a valid non-negative value.	2.0e-6F	Inverter PWM dead time in seconds.
Minimum duty cycle	Must be a valid non-negative value.	0.1F	Minimum PWM duty cycle.
Maximum duty cycle	Must be a valid non-negative value.	0.9F	Maximum PWM duty cycle.
Rdiff Settings			
Target current A	Must be a valid non-negative value.	0.6F	Target current A (normalized).
Target current B	Must be a valid non-negative value.	0.8F	Target current B (normalized).
VD step wait (ms)	Must be a valid non-negative value.	5.0F	VD step wait time (ms).
Stabilization wait	Must be a valid non-negative value.	10.0F	Stabilization wait time (same unit as VD step wait).
LDQ Settings			
RLD frequency (Hz)	Must be a valid non-negative value.	200.0F	RLD injection frequency (Hz).
LQ frequency (Hz)	Must be a valid non-negative value.	1000.0F	LQ injection frequency (Hz).
Ke Settings			
Open-loop target frequency (Hz)	Must be a valid non-negative value.	200.0F	Open-loop target frequency (Hz).
Open-loop ramp-up rate (Hz/s)	Must be a valid non-negative value.	20.0F	Open-loop ramp-up rate (Hz/s).
JD Settings			
Speed oscillation frequency (Hz)	Must be a valid non-negative value.	5.0F	Speed oscillation frequency (Hz).
Speed oscillation amplitude coef	Must be a valid non-negative value.	0.15F	Speed oscillation amplitude coefficient.
Speed oscillation	Must be a valid non-	0.05F	Minimum speed

amplitude coef min	negative value.		oscillation amplitude coefficient.
FOC Base Settings			
Open-loop to Closed-loop speed threshold coefficient	Must be a valid non-negative value.	0.30F	Speed threshold coefficient for Open-loop to Closed-loop transition. Final value will be multiplied by the base speed of motor.
Closed-loop to Open-loop speed threshold coefficient	Must be a valid non-negative value.	0.25F	Speed threshold coefficient for Closed-loop to Open-loop transition. Final value will be multiplied by the base speed of motor.
Assumed inertia	Must be a valid non-negative value.	1.0E-6F	Assumed mechanical inertia.

Clock Configuration

The Motor Tuner module timing is based on the PWM carrier frequency and the configured control periods. Configure the PWM frequency and control periods according to your motor and inverter specifications.

Pin Configuration

This module does not directly use I/O pins. Pin configuration is handled by the underlying motor driver and ADC modules.

Usage Notes

State Machine

The motor tuner operates according to the following state machine:

- **READY**: Tuner is initialized and ready to start identification
- **RUNNING**: Parameter identification is in progress
- **COMPLETED**: All parameters have been successfully identified
- **ERROR**: An error occurred during identification
- **RESET**: Tuner is being reset to initial state

Callback Function

The motor tuner requires periodic calls to both inner loop and outer loop processing functions:

- innerLoopProcess: Should be called at the PWM carrier frequency (current control loop)
- outerLoopProcess: Should be called at the speed control frequency

Setting Known Parameters

If some motor parameters are already known, they can be set before starting the identification process using knownParamSet. Setting a non-zero value for a parameter will skip the identification of that parameter.

Voltage Error Compensation

The voltage error identification stage generates a lookup table that compensates for inverter non-linearities such as dead-time effects. This lookup table can be retrieved using identifiedVoltageErrorGet and applied to the motor control system.

Error Handling

When an error occurs during identification:

1. The tuner status changes to MOTOR_TUNER_STATUS_ERROR
2. The error code can be retrieved using errorGet
3. Call reset to return to the READY state
4. Optionally, call start to retry the identification

Limitations

Developers should be aware of the following limitations when using the Motor Tuner:

- The motor must be at standstill before starting the identification process for electrical parameter identification
- The motor shaft must be free to rotate during mechanical parameter (J, D) and back-EMF constant (Ke) identification
- The identification accuracy depends on the quality of current measurements and the stability of the DC bus voltage
- High-frequency noise in current measurements may affect inductance identification accuracy
- The motor should not be loaded during the identification process
- Only the functions/types/macros exposed via rm_motor_tuner_pm.h and rm_motor_tuner_api.h should be accessed by user code and that the contents of the other headers is subject to change.

Examples

Motor Tuner Basic Example

This is a basic example of minimal use of the motor tuner in an application.

```
    err = RM_MOTOR_TUNER_PM_Open(&g_motor_tuner_ctrl, &g_motor_tuner_cfg);
```

```
    err = RM_MOTOR_TUNER_PM_KnownParamSet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_POLE_PAIRS, known_pole_pairs);
    handle_error(err);
 /* Set rated current for identification. */
    err =
```

```
 RM_MOTOR_TUNER_PM_KnownParamSet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_RATED_CURRENT, motor_rated_current);
    handle_error(err);
```

```
    err = RM_MOTOR_TUNER_PM_Start(&g_motor_tuner_ctrl);
    handle_error(err);
```

```
      err = RM_MOTOR_TUNER_PM_StatusGet(&g_motor_tuner_ctrl, &status);
      handle_error(err);
```

```
            uint16_t error_code;
      err = RM_MOTOR_TUNER_PM_ErrorGet(&g_motor_tuner_ctrl, &error_code);
      handle_error(err);
```

```
      err = RM_MOTOR_TUNER_PM_Reset(&g_motor_tuner_ctrl);
      handle_error(err);
```

```
      err = RM_MOTOR_TUNER_PM_IsActive(&g_motor_tuner_ctrl, &is_active);
      handle_error(err);
```

Motor Tuner Progress and Parameter Retrieval Example

This example demonstrates how to monitor progress and retrieve identified parameters.

```
      err = RM_MOTOR_TUNER_PM_ProgressGet(&g_motor_tuner_ctrl, &progress);
      handle_error(err);
```

```
float resistance;
float ld;
float lq;
float ke;
float inertia;
float friction;
   err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
```

```
MOTOR_TUNER_PARAM_TYPE_PMSM_R, &resistance);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_LD, &ld);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_LQ, &lq);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_KE, &ke);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_INERTIA, &inertia);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_VISCOUS_FRICTION, &friction);
    handle_error(err);
```

Motor Tuner Inner Loop Example

This function should be called from the PWM interrupt handler.

```
    err = RM_MOTOR_TUNER_PM_InnerLoopProcess(&g_motor_tuner_ctrl, p_in, p_out);
```

Motor Tuner Outer Loop Example

This function should be called from a periodic timer interrupt.

```
 RM_MOTOR_TUNER_PM_OuterLoopProcess(&g_motor_tuner_ctrl);
```

Motor Tuner Voltage Error Table Example

This example shows how to retrieve the voltage error lookup table after identification.

```
    err = RM_MOTOR_TUNER_PM_IdentifiedVoltageErrorGet(&g_motor_tuner_ctrl,
&voltage_error_lut, &rdc);
```

Motor Tuner Set Voltage Error Table Example

This example shows how to set a voltage error lookup table with known values.

```
err = RM_MOTOR_TUNER_PM_VoltageErrorSet(&g_motor_tuner_ctrl, &voltage_error_lut);
handle_error(err);
```

Motor Tuner Stop Example

This example shows how to stop the tuner operation.

```
err = RM_MOTOR_TUNER_PM_Stop(&g_motor_tuner_ctrl);
handle_error(err);
```

Motor Tuner Abort Example

This example shows how to abort the tuner operation with an error code.

```
err = RM_MOTOR_TUNER_PM_Abort(&g_motor_tuner_ctrl, 1);
handle_error(err);
```

Modules

	Command Code Command code.
	Fault return code Fault codes that returned by some API functions, integer.
	The tuner core FOC module RM_MOTOR_TUNER_PM_CORE module handles calibrations, current/speed control and signals. Also launch events for upper layer.

Data Structure Documentation

◆ motor_tuner_pm_signal_conf_t

struct motor_tuner_pm_signal_conf_t

Signal configuration.		
Data Fields		
float	signal_amp	Signal amplitude.
float	signal_offset	Signal offset.
float	signal_freg_hz	Signal frequency in Hz.

◆ motor_tuner_pm_core_foc_cfg_t

struct motor_tuner_pm_core_foc_cfg_t		
Motor tuner core FOC configuration.		
Data Fields		
float	current_omega_hz	Current controller natural frequency[Hz].
float	current_zeta	Current controller damping factor.
float	e_obs_omega_hz	Back-EMF observer natural frequency[Hz].
float	e_obs_zeta	Back-EMF observer damping factor.
float	pll_est_omega_hz	PLL estimator natural frequency[Hz].
float	pll_est_zeta	PLL estimator damping factor.
float	offset_lpf_k	Low-pass filter constant for offset calibration.
float	offset_calc_time	Offset calibration time in ticks.
float	overcurrent_limit_mult	Over-current limit multiplier, related to rated current.
float	ol2cl_speed_th_coef	Open-loop to closed-loop speed threshold coefficient, related to base speed.
float	cl2ol_speed_th_coef	Closed-loop to open-loop speed threshold coefficient, related to base speed.
float	speed_change_rate_limit	Speed change rate limit in [rad/s^2].
float	iq_down_time	Time in ticks for IQ to ramp down to zero current.
float	id_up_time	Time in ticks for ID to ramp up to the specified value.
float	id_down_time	Time in ticks for ID to ramp down to zero current.

float	phaseerr_lpf_band_hz	Phase error low-pass filter bandwidth in Hz.
float	r_min	Minimum stator resistance limit.
float	num_pole_pair_limit	Maximum number of pole pairs allowed.
float	id_ref_coef	Coefficient to calculate the ID reference current during speed control.
float	speed_omega	Default speed omega used in various calculations.
float	speed_offset_coef	Speed offset coefficient used to calculate speed offset during startup.
float	assumed_inertia	Inertia value used in speed PI gain calculation when inertia is unknown.
float	default_rls_init	Default initial value for RLS method identification.
float	default_rls_forget_k	Default forgetting factor for RLS method identification.
uint32_t	mcu_adc_resolution	ADC resolution in digits, e.g. 12-bit ADC = 4096.
uint32_t	mcu_pwm_resolution	PWM resolution in digits, depends on timer period and mode.
float	inv_info_current_full_range	Full range current that can be measured by the inverter current sensing.
float	inv_info_current_limit	Current limitation of the inverter.
float	inv_info_overvoltage_th	Over-voltage threshold of the inverter.
float	inv_info_undervoltage_th	Under-voltage threshold of the inverter.
float	inv_info_pwm_duty_min	Minimum PWM duty cycle of the inverter.
float	inv_info_pwm_duty_max	Maximum PWM duty cycle of the inverter.
float	inv_info_pwm_cycle_s	PWM period of the inverter.
float	inv_info_pwm_deadtime_s	PWM dead-time of the inverter.

◆ motor_tuner_pm_volterr_cfg_t

struct motor_tuner_pm_volterr_cfg_t

Voltage error measurement configuration.		
Data Fields		
uint8_t	enable	Enable voltage error measurement.
float	rls_fgt_factor	Forgetting factor for RLS resistance identification.
float	avg_sample	Number of samples to average for each voltage error point.
float	avg_sample_fast	Number of samples to average for each voltage error point during fast identification.
float	avg_wait_time	Waiting time [ms] after reaching each current target before starting to sample.
uint32_t	point_num	Number of voltage error points to be identified.
float	min_current_step_lsb	Minimum current step in LSB for voltage error measurement.
uint32_t	iteration_num	Number of iterations for resistance identification.
float	rls_upper_current	Upper current limit for RLS resistance identification.
float	rls_lower_current	Lower current limit for RLS resistance identification.
float	init_r	Initial resistance value for RLS resistance identification.

◆ motor_tuner_pm_volterr_t

struct motor_tuner_pm_volterr_t		
Voltage error measurement structure.		
Data Fields		
motor_tuner_pm_volterr_status_t	e_status	The main status for voltage error measurement sequence.
float	current_table[MOTOR_TUNER_PM_VOLTERR_POINT_NUM]	Current column identified voltage error lookup table.
float	voltage_table[MOTOR_TUNER_PM_VOLTERR_POINT_NUM]	Voltage column identified voltage error lookup table.
float	slope_table[MOTOR_TUNER_PM_VOLTERR_POINT_NUM]	The slope of linear regression of the nearest 5 samples.

float	intercept_table[MOTOR_TUNER_PM_VOLTERR_POINT_NUM]	The intercept of linear regression of the nearest 5 samples.
float	sat_current	the current table will refer to this value Identified current that the voltage error dose not increase,
float	sat_voltage	Identified maximum voltage error.
float	r_dc	The R in DC condition used to calculate current step and store final result.
float	meas_volt_sum	The sum of sampled voltage in order to calculate mean voltage.
float	meas_current_sum	The sum of sampled current in order to calculate mean voltage.
float	current_target	The target current [A] that should be achieved by last voltage command.
float	voltage_step	The voltage step should be increased to achieve the next target current.
uint32_t	iteration_cnt	The counter of resistance measurement iteration.
uint32_t	count	The general counter.
uint32_t	meas_index	The index of voltage error point that is under measurement.
float	output_current_tab[MOTOR_TUNER_PM_VOLTERR_OUTPUT_TAB_SIZE]	Output current table for voltage error compensation.
float	output_voltage_tab[MOTOR_TUNER_PM_VOLTERR_OUTPUT_TAB_SIZE]	Output voltage table for voltage error compensation.
float	output_vdc_ref	Reference DC bus voltage for output table.
float	output_rdc	Stator resistance for output table.
motor_tuner_volterr_cfg_rid_t	rid_method	R identification method before VI measurement.

float	r_init	Initial resistance value for RLS resistance identification.
float	i_lsb	Current LSB value in [A/digit] during voltage error measurement.
float	current_step_ilsb	Current step in LSB for voltage error measurement.
int32_t	start_current_lsb	Starting current in LSB for voltage error measurement.
motor_tuner_pm_volterr_cfg_t *	p_cfg	

◆ motor_tuner_pm_rdiff_cfg_t

struct motor_tuner_pm_rdiff_cfg_t		
Motor tuner PM Rdiff configuration structure.		
Data Fields		
float	vd_step_lsb	Step voltage vd applied during Rdiff measurement.
float	target_current_a	Target current A coefficient (0.0 to 1.0), multiplied by rated current.
float	target_current_b	Target current B coefficient (0.0 to 1.0), multiplied by rated current.
float	target_current_margin	Tolerance upper margin for target current during Rdiff measurement.
float	vd_step_wait_ms	Waiting time after stepping [ms].
float	stab_wait	Stabilization wait time before sampling, unit is vd_step_wait_ms cycle counts.
float	measure_wait_ms	Waiting time before starting measurement [ms].
float	measure_time_ms	Measurement time duration [ms].
float	reset_time_ms	Reset time duration [ms].
uint32_t	vd_adjust_timeout	Timeout count, if the current do not stabilize within this vd_step_wait_ms cycles, the vd step adjustment is stopped.

◆ motor_tuner_pm_rdiff_t

struct motor_tuner_pm_rdiff_t

Motor tuner PM Rdiff measurement structure.

Data Fields		
e_tuner_pm_seq_r_diff_t	rdiff_status	The main status for Rdiff measurement sequence.
float	target_current_a_min	Minimum target current A.
float	target_current_a_max	Maximum target current A.
float	target_current_b_min	Minimum target current B.
float	target_current_b_max	Maximum target current B.
float	vd_sample1	Sampled vd for first measurement.
float	vd_sample2	Sampled vd for second measurement.
float	id_sample1	Sampled id for first measurement.
float	id_sample2	Sampled id for second measurement.
float	sum_vu	Sum of phase U voltage samples.
float	sum_iu	Sum of phase U current samples.
uint32_t	cnt_stab	Stabilization counter.
uint32_t	sample_cnt	Sample counter.
uint32_t	timeout_cnt	Timeout counter for vd step adjustment.
float	r_diff	Identified resistance difference.
float	volterr_est	Estimated voltage error from Rdiff measurement.
float	v_step	Actual applied vd step during Rdiff measurement.
motor_tuner_pm_rdiff_cfg_t *	p_cfg	Pointer to configuration structure.

◆ motor_tuner_pm_ldq_cfg_t

struct motor_tuner_pm_ldq_cfg_t

Motor tuner PM Ld and Lq identification configuration structure.

Data Fields		
float	reset_time_ms	Reset time duration [ms].
float	stab_time_coef	Stabilization wait time coefficient, final value is

		multiplied by motor time constant (L/R)
float	ldq_init_assumption	Initial assumption value of inductance for calculating wait time [H].
float	rld_freq	Frequency for R & Ld measurement.
float	rld_vd_amp_coef	Vd amplitude coefficient for R & Ld measurement, multiplied by (R*rated_current)
float	rld_vd_offset_coef	Vd offset coefficient for R & Ld measurement, multiplied by (R*rated_current) and added by v_err.
float	rld_rls_measure_offset_time	Measurement offset time for R & Ld RLS measurement [ms].
float	rld_rls_measure_num	Number of periods for R & Ld RLS measurement.
float	rld_dft_measure_num	Number of periods for R & Ld DFT measurement.
float	lq_freq	Frequency for Lq measurement [Hz].
float	lq_vq_amp_coef	Vq amplitude coefficient for Lq measurement, multiplied by inpedence*rated_current.
float	lq_vd_offset_coef	Vd offset coefficient for Lq measurement, multiplied by (R*rated_current) and added by v_err.
float	lq_rls_measure_num	Number of periods for Lq RLS measurement.
float	lq_dft_measure_num	Number of periods for Lq DFT measurement.

◆ motor_tuner_pm_ldq_t

struct motor_tuner_pm_ldq_t		
Motor tuner PM Ld and Lq identification structure.		
Data Fields		
float	r_dft	Identified resistance from DFT method.
float	r_rls	Identified resistance from RLS method.
float	ld_dft	Identified d-axis inductance

		from DFT method.
float	ld_rls	Identified d-axis inductance from RLS method.
float	lq_dft	Identified q-axis inductance from DFT method.
float	lq_rls	Identified q-axis inductance from RLS method.
motor_tuner_pm_ldq_cfg_t *	p_cfg	Pointer to configuration structure.
float	ldq_freq_ref_hz	Reference frequency for Ld & Lq measurement.
float	time_elapsed_ms	Elapsed time [ms].
motor_tuner_pm_seq_rld_rls_t	ldrls_status	Ld RLS measurement sequence status.
motor_tuner_pm_seq_rld_dft_t	lddft_status	Ld DFT measurement sequence status.
motor_tuner_pm_seq_rlq_rls_t	lqrls_status	Lq RLS measurement sequence status.
motor_tuner_pm_seq_rlq_dft_t	lqdft_status	Lq DFT measurement sequence status.
float	vd_ref_amp	Vd reference amplitude during Ld measurement.
float	vq_ref_amp	Vq reference amplitude during Lq measurement.
float	vd_ref_offset	Vd reference offset during Ld and Lq measurement.
float	dft_real	DFT real part accumulator.
float	dft_imag	DFT imaginary part accumulator.
float	dft_amp	DFT amplitude.
float	dft_amp2	DFT amplitude squared.
float	current_pre	Previous current sample.
float	voltage_pre	Previous voltage sample.
float	id_offset	Id offset.
float	id_sum	Id sum for calculating average current.
float	id_sum_cnt	Id sum counter.
float	a_est	RLS estimated parameter a.
float	b_est	RLS estimated parameter b.

uint16_t	stab_wait_ms	Stabilization wait time in ms.
float	angle_pre	Previous angle sample.
float	lddft_v	Ld DFT voltage magnitude.
float	lddft_i_mag	Ld DFT current magnitude.
float	lddft_i_img	Ld DFT current imaginary part.
float	lddft_i_real	Ld DFT current real part.
float	lqdft_v	Lq DFT voltage magnitude.
float	lqdft_i_mag	Lq DFT current magnitude.
float	lqdft_i_img	Lq DFT current imaginary part.
float	lqdft_i_real	Lq DFT current real part.

◆ motor_tuner_pm_jd_cfg_t

struct motor_tuner_pm_jd_cfg_t		
JD measurement configuration structure.		
Data Fields		
float	speedpi_omega	Speed PI natural frequency [Hz] used in inertia identification, should be larger than speed_osc_freq_hz * 2.
float	speed_osc_freq_hz	Speed sine wave frequency [Hz].
float	speed_osc_amp_coef	Speed sine wave amplitude coefficient, related to base speed.
float	speed_osc_amp_coef_min	Minimum speed sine wave amplitude coefficient, related to base speed.
float	rls_init	RLS initial value.
float	rls_forget_k	RLS forgetting factor.
float	dft_num	Number of cycles to be sampled by DFT method.
float	measure_start_amp_rate	When speed sine wave amplitude reaches this rate of the final amplitude, start to measure.
float	stab_wait	Wait time [ms] for the system to be stable before starting measurement.
float	stop_time	Stop time [ms] for slowing down the motor at the end of JD identification.

◆ motor_tuner_pm_jd_t

struct motor_tuner_pm_jd_t		
Motor tuner PM JD identification structure.		
Data Fields		
motor_tuner_pm_seq_j_t	e_status	JD main sequence status see definition of type motor_tuner_pm_seq_j_t.
uint8_t	j_seq	JD measure sequence status see macro with prefix JD_PRV_MEASURE_SEQ.
float	iq_sum	Iq sum from last measure function execution.
float	iq_amp	Amplitude of Iq.
float	iq	Iq used in JD measurement.
float	iq_lpf	Iq filtered by 1st order LPF.
float	refspeed_freq_hz	Frequency of the sine signal used as speed command.
float	refspeed_amp_max	Maximum amplitude of the sine signal in [rad/s].
float	refspeed_amp	Current amplitude of the sine signal in [rad/s].
float	refspeed_offset	Offset of the sine signal in [rad/s].
float	rls_respns_pre	The last response (the speed) from the mechanical system for RLS method.
float	speed_rad	Speed used in the JD measurement.
float	speed_amp	Speed vibration amplitude, measured by DFT method.
float	ol2cl_speed	The threshold that transient from open-loop drive mode to the closed-loop mode.
float	cl2ol_speed	The threshold that transient from closed-loop drive mode to the open-loop mode.
float	dft_cycle_cnt	The counter to count how many cycles has been sampled by DFT method */.
float	rls_coefa	The weight a estimated by RLS.
float	rls_coefb	The weight b estimated by RLS.

float	iq_offset	The iq offset measured with fixed speed command, to remove offset for RLS.
float	j_max	The maximum tolerable estimated inertia.
float	j_min	The minimum tolerable estimated inertia.
float	j_pi_ctrl	The inertia that is currently used to design speed PI controller.
float	time_elapsed_ms	Elapsed Time [ms].
float	setup_wait_cnt	Counter for waiting.
float	j_rls	The inertia estimated by RLS method.
float	d_rls	The viscous friction coefficient estimated by RLS method.
float	j_dft	The inertia estimated by DFT method.
float	d_dft	The viscous friction coefficient estimated by DFT method.
float	user_inertia_range	The inertia range set by user for tuning process, 0.0 ~ 1.0.
motor_tuner_pm_jd_cfg_t *	p_cfg	Pointer to configuration structure.

◆ motor_tuner_pm_ke_cfg_t

struct motor_tuner_pm_ke_cfg_t		
KE measurement configuration structure.		
Data Fields		
float	ol_target_freq_hz	Drive frequency [Hz] in open-loop drive for KE measurement The actual freq of open-loop drive may be lower if BEMF threshold is reached earlier. *Note* *For most motors, BEMF threshould should be reached before the this target frequency. Please adjust this value if you do not want to stress the motor too much during KE measurement.*
float	ol_ramp_up_rate_hzps	Ramp-up rate in [Hz/s] for open-

		loop speed during KE measurement This value should be tuned according to the motor inertia and frictional load. *Note* *High ramp-up rate may cause instability or even failure in the open-loop start-up. if the start-up fails (current injected but rotor not rotating), reduce this value.*
float	bemf_threshold_coef	Relative value to maximum voltage on dp frame for stopping open-loop acceleration If abs(bemf) > (voltage_max_on_dq * bemf_threshold_coef), the open-loop acceleration will be stopped since SNR is enough for KE measurement.
float	ol_stab_wait_ms	Waiting time for Id to stabilize before measuring KE [ms].
float	measure_time_ms	Time duration to measure KE at steady state [ms].
float	reset_time_ms	Time duration to wait after reset before starting next process [ms].

◆ motor_tuner_pm_ke_t

struct motor_tuner_pm_ke_t		
KE measurement structure.		
Data Fields		
float	ol_freq_ref_step_hz	Open-loop frequency reference step in [Hz] for each control cycle.
e_tuner_pm_seq_ke_t	ke_status	KE main sequence status see definition of type e_tuner_pm_seq_ke_t.
motor_tuner_pm_ke_sub_seq_t	ke_sub_seq	KE sub-sequence status see definition of type motor_tuner_pm_ke_sub_seq_t.
uint32_t	sample_cnt	Sample counter during KE measurement.
float	time_elapsed_ms	Elapsed Time [ms].
float	time_steady_ms	Time duration that speed is

		steady during KE measurement [ms].
float	ol_freq_ref_hz	Open-loop frequency reference in [Hz].
float	id_ref_step	D-axis current reference step for each control cycle during open-loop ramp-up.
float	e_sum	Back-EMF sum during KE measurement.
float	ed_sum	D-axis Back-EMF sum during KE measurement.
float	eq_sum	Q-axis Back-EMF sum during KE measurement.
float	speed_rad_sum	Speed sum during KE measurement.
float	vd_ref_sum	D-axis voltage reference sum during KE measurement.
float	vq_ref_sum	Q-axis voltage reference sum during KE measurement.
float	speed_rad_ave	Average speed during KE measurement.
float	vd_ref_ave	Average d-axis voltage reference during KE measurement.
float	vq_ref_ave	Average q-axis voltage reference during KE measurement.
float	ed_ave	Average d-axis Back-EMF during KE measurement.
float	eq_ave	Average q-axis Back-EMF during KE measurement.
float	id_ave	Average d-axis current during KE measurement.
float	ke_max	Maximum Ke value during KE measurement.
float	ke_min	Minimum Ke value during KE measurement.
float	ke_over_id[MOTOR_TUNER_PM_KE_LINEREG_NUM]	Ke over Id data points for linear regression.
float	id[MOTOR_TUNER_PM_KE_LINEREG_NUM]	Id data points for linear regression.

float	ke_open	Ke identified in open-loop stage.
float	ke_closed_loop	Ke identified in closed-loop stage.
uint32_t	index	Index for ke_over_id and id data points.
uint8_t	no_stop	Do not stop on finish if true, for skipping the start-up sequence in next stage to save time.
motor_tuner_pm_ke_cfg_t *	p_cfg	Pointer to configuration structure.

◆ motor_tuner_pm_extend_cfg_t

struct motor_tuner_pm_extend_cfg_t		
PMSM Tuner extended configuration		
Data Fields		
motor_tuner_pm_volterr_cfg_t	tuner_volterr_cfg	Voltage error identification configuration.
motor_tuner_pm_rdiff_cfg_t	tuner_rdiff_cfg	Resistance identification configuration.
motor_tuner_pm_ldq_cfg_t	tuner_ldq_cfg	Inductance identification configuration.
motor_tuner_pm_ke_cfg_t	tuner_ke_cfg	Back-EMF constant identification configuration.
motor_tuner_pm_jd_cfg_t	tuner_jd_cfg	Inertia and friction identification configuration.
motor_tuner_pm_core_foc_cfg_t	base_foc_cfg	Base FOC configuration.
uint8_t	pwm_tick_per_irq	PWM ticks per control interrupt.
float	speed_ctrl_period	Speed control period in seconds.

◆ motor_tuner_pm_instance_ctrl_t

struct motor_tuner_pm_instance_ctrl_t		
Tuner control structure		
Data Fields		
uint32_t	open	Open flag.
motor_tuner_pm_core_foc_t	base_foc	Base FOC control structure.
motor_tuner_pm_volterr_t	tuner_volterr	Voltage error identification structure.
motor_tuner_pm_rdiff_t	tuner_rdiff	Resistance identification structure.

motor_tuner_pm_ldq_t	tuner_ldq	Inductance identification structure.
motor_tuner_pm_ke_t	tuner_ke	Back-EMF constant identification structure.
motor_tuner_pm_jd_t	tuner_jd	Inertia and friction identification structure.
motor_tuner_request_t	last_request	Last request.
motor_tuner_status_t	tune_status	Overal tuning status.
uint16_t	tune_stage	Current tuning stage,. See also motor_tuner_pm_stage_t
float	total_time_elapsed	Indicates how long time elapsed from starting identification */.
struct st_motor_tuner_pm_user_inputs	user_inputs	
float	rated_speed_elec_rad	The rated speed (electrical) in [rad/s].
float	rated_speed_mech_rpm	The rated speed (mechanical) in [rpm].
float	rated_torque_nm	The rated torque [Nm].
float	rated_current_max	The maximum rated current [Arms] calculated from inverter parameter.
motor_tuner_cfg_t const *	p_cfg	Pointer to the runtime configuration.
void *	p_context	Placeholder for user data.

Macro Definition Documentation

◆ MOTOR_TUNER_PM_STAGE_INIT

#define MOTOR_TUNER_PM_STAGE_INIT
Defines initial identification stage code. TUNER_PM_STAGE Parameter Identification Stage. Indicates which stage is the identification process in

◆ MOTOR_TUNER_PM_KE_LINEREG_NUM

#define MOTOR_TUNER_PM_KE_LINEREG_NUM
Number of points for Ke calculation in open-loop, if > 1 linear regression is used for reduce offset error, but the time for Ke identification will be longer. Number of points for Ke calculation in open-loop

Enumeration Type Documentation

◆ motor_tuner_pm_rotor_angle_mode_t

enum motor_tuner_pm_rotor_angle_mode_t	
Rotor angle mode.	
Enumerator	
MOTOR_TUNER_PM_ROTOR_ANGLE_MODE_OPEN LOOP	Open-loop mode, angle are advanced by specified speed in each tick.
MOTOR_TUNER_PM_ROTOR_ANGLE_MODE_CLOS EDLOOP	Closed-loop mode (PLL), angle and speed is estimated by PLL.

◆ motor_tuner_pm_volterr_status_t

enum motor_tuner_pm_volterr_status_t	
Enumerator	
TUNER_PM_VOLTERR_SEQ_INIT	The INITIALIZATION stage, to determine parameters for measurement */.
TUNER_PM_VOLTERR_SEQ_ID_R	The READY stage equivalent, to retrieve resistance by RLS method */.
TUNER_PM_VOLTERR_SEQ_ID_V_OVER_I	The MEASURE stage equivalent, to acquire the IV characteristics */.
TUNER_PM_VOLTERR_SEQ_CALC	The CALCULATION stage, process bulk data */.
TUNER_PM_VOLTERR_SEQ_CHECK	The CHECK stage, performs sanity check on the results */.
TUNER_PM_VOLTERR_SEQ_RESET	The RESET ramp down the system */.
TUNER_PM_VOLTERR_SEQ_COMPLETED	The completed stage, sequence function returns 1, sequence will remain on this stage until being reset.

◆ motor_tuner_volterr_cfg_rid_t

enum motor_tuner_volterr_cfg_rid_t	
Voltage error measurement R identification method.	
Enumerator	
TUNER_PM_VOLTERR_RID_RLS	Identify R before VI measurement.
TUNER_PM_VOLTERR_RID_IGNORE	Use initial R.

◆ e_tuner_pm_seq_r_diff_t

enum e_tuner_pm_seq_r_diff_t	
Motor tuner PM Rdiff sequence enumeration.	
Enumerator	
TUNER_PM_SEQ_R_DIFF_INIT	Initialization stage.
TUNER_PM_SEQ_R_DIFF_READY1	Ready stage for first measurement.
TUNER_PM_SEQ_R_DIFF_READY12	Waiting stage after first measurement.
TUNER_PM_SEQ_R_DIFF_MEASURE1	Measurement stage for first measurement.
TUNER_PM_SEQ_R_DIFF_READY2	Ready stage for second measurement.
TUNER_PM_SEQ_R_DIFF_READY22	Waiting stage after second measurement.
TUNER_PM_SEQ_R_DIFF_MEASURE2	Measurement stage for second measurement.
TUNER_PM_SEQ_R_DIFF_CALC	Calculation stage.
TUNER_PM_SEQ_R_DIFF_CHECK	Check stage.
TUNER_PM_SEQ_R_DIFF_RESET	Reset stage.
TUNER_PM_SEQ_R_DIFF_COMPLETED	Completed stage.

◆ motor_tuner_pm_seq_rld_dft_t

enum motor_tuner_pm_seq_rld_dft_t	
Motor tuner PM R and Ld identification sequences (DFT method)	
Enumerator	
TUNER_PM_SEQ_RLD_DFT_INIT	Initialization stage.
TUNER_PM_SEQ_RLD_DFT_READY	Ready stage.
TUNER_PM_SEQ_RLD_DFT_MEASURE	Measurement stage.
TUNER_PM_SEQ_RLD_DFT_CALC	Calculation stage.
TUNER_PM_SEQ_RLD_DFT_CHECK	Check stage.
TUNER_PM_SEQ_RLD_DFT_RESET	Reset stage.
TUNER_PM_SEQ_RLD_DFT_COMPLETED	Completed stage.

◆ motor_tuner_pm_seq_rld_rls_t

enum motor_tuner_pm_seq_rld_rls_t	
Motor tuner PM R and Lq identification sequences (RLS method)	
Enumerator	
TUNER_PM_SEQ_RLD_RLS_INIT	Initialization stage.
TUNER_PM_SEQ_RLD_RLS_READY	Ready stage.
TUNER_PM_SEQ_RLD_RLS_MEASURE	Measurement stage.
TUNER_PM_SEQ_RLD_RLS_CALC	Calculation stage.
TUNER_PM_SEQ_RLD_RLS_CHECK	Check stage.
TUNER_PM_SEQ_RLD_RLS_RESET	Reset stage.
TUNER_PM_SEQ_RLD_RLS_COMPLETED	Completed stage.

◆ motor_tuner_pm_seq_rlq_dft_t

enum motor_tuner_pm_seq_rlq_dft_t	
Motor tuner PM Lq identification sequences (DFT method)	
Enumerator	
TUNER_PM_SEQ_RLQ_DFT_INIT	Initialization stage.
TUNER_PM_SEQ_RLQ_DFT_READY	Ready stage.
TUNER_PM_SEQ_RLQ_DFT_MEASURE	Measurement stage.
TUNER_PM_SEQ_RLQ_DFT_CALC	Calculation stage.
TUNER_PM_SEQ_RLQ_DFT_CHECK	Check stage.
TUNER_PM_SEQ_RLQ_DFT_RESET	Reset stage.
TUNER_PM_SEQ_RLQ_DFT_COMPLETED	Completed stage.

◆ motor_tuner_pm_seq_rlq_rls_t

enum motor_tuner_pm_seq_rlq_rls_t	
Motor tuner PM Lq identification sequences (RLS method)	
Enumerator	
TUNER_PM_SEQ_RLQ_RLS_INIT	Initialization stage.
TUNER_PM_SEQ_RLQ_RLS_READY	Ready stage.
TUNER_PM_SEQ_RLQ_RLS_MEASURE	Measurement stage.
TUNER_PM_SEQ_RLQ_RLS_CALC	Calculation stage.
TUNER_PM_SEQ_RLQ_RLS_CHECK	Check stage.
TUNER_PM_SEQ_RLQ_RLS_RESET	Reset stage.
TUNER_PM_SEQ_RLQ_RLS_COMPLETED	Completed stage.

◆ motor_tuner_pm_seq_j_t

enum motor_tuner_pm_seq_j_t	
Motor tuner PM JD identification sequences.	
Enumerator	
TUNER_PM_SEQ_J_INIT	Initialization stage.
TUNER_PM_SEQ_J_READY	Ready stage.
TUNER_PM_SEQ_J_MEASURE	Measurement stage.
TUNER_PM_SEQ_J_CALC	Calculation stage.
TUNER_PM_SEQ_J_CHECK	Check stage.
TUNER_PM_SEQ_J_RESET	Reset stage.
TUNER_PM_SEQ_J_COMPLETED	Completed stage.

◆ e_tuner_pm_seq_ke_t

enum e_tuner_pm_seq_ke_t	
Ke measurement sequences enumeration.	
Enumerator	
TUNER_PM_SEQ_KE_INIT	Initialization stage.
TUNER_PM_SEQ_KE_READY	Ready stage.
TUNER_PM_SEQ_KE_MEASURE	Measurement stage.
TUNER_PM_SEQ_KE_CALC	Calculation stage.
TUNER_PM_SEQ_KE_CHECK	Check stage.
TUNER_PM_SEQ_KE_RESET	Reset stage.
TUNER_PM_SEQ_KE_COMPLETED	Completed stage.

◆ motor_tuner_pm_ke_sub_seq_t

enum motor_tuner_pm_ke_sub_seq_t	
Sub-sequences for KE measurement.	
Enumerator	
KE_IDLE	Idle state.
KE_OL_ID_RAMPUP	Open-loop Id ramp-up.
KE_OL_SPEED_RAMPUP	Open-loop speed ramp-up.
KE_OL_MEASURE_WAIT_STAB	Open-loop waiting for Id to stabilize before measuring KE.
KE_OL_MEASURE_SAMPLING	Open-loop KE measurement sampling.
KE_OL_SPEED_SLOPE_DOWN	Open-loop speed slope down.
KE_CL_SPEED_RAMPUP	Closed-loop speed ramp-up.
KE_CL_WAIT_STAB	Closed-loop waiting for Id to stabilize before measuring KE.
KE_CL_MEASURE	Closed-loop KE measurement sampling.
KE_CL_SPEED_SLOPE_DOWN	Closed-loop speed slope down.

Function Documentation

◆ RM_MOTOR_TUNER_PM_Open()

fsp_err_t RM_MOTOR_TUNER_PM_Open (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_cfg_t const *const *p_cfg*)

Open the Motor Tuner instance. Implements motor_tuner_api_t::open.

Initializes the motor tuner system including GUI initialization and parameter setup for motor parameter estimation.

Example:

```
err = RM_MOTOR_TUNER_PM_Open(&g_motor_tuner_ctrl, &g_motor_tuner_cfg);
```

Return values

FSP_SUCCESS	Motor Tuner successfully configured.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_MOTOR_TUNER_PM_Start()

fsp_err_t RM_MOTOR_TUNER_PM_Start (motor_tuner_ctrl_t *const *p_ctrl*)

Start motor tuner. Implements motor_tuner_api_t::start.

Example:

```
err = RM_MOTOR_TUNER_PM_Start(&g_motor_tuner_ctrl);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully started the tuner.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_Stop()

fsp_err_t RM_MOTOR_TUNER_PM_Stop (motor_tuner_ctrl_t *const *p_ctrl*)

Stop motor tuner. Implements motor_tuner_api_t::stop.

Example:

```
err = RM_MOTOR_TUNER_PM_Stop(&g_motor_tuner_ctrl);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully stopped the tuner.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_Reset()

fsp_err_t RM_MOTOR_TUNER_PM_Reset (motor_tuner_ctrl_t *const *p_ctrl*)

Reset motor tuner. Implements motor_tuner_api_t::reset.

Example:

```
err = RM_MOTOR_TUNER_PM_Reset(&g_motor_tuner_ctrl);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully reset the tuner.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_StatusGet()

fsp_err_t RM_MOTOR_TUNER_PM_StatusGet (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_status_t * *p_status*)

Get motor tuner status. Implements motor_tuner_api_t::statusGet.

Retrieves the current status of the tuner. See motor_tuner_status_t for details.

Example:

```
err = RM_MOTOR_TUNER_PM_StatusGet(&g_motor_tuner_ctrl, &status);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully retrieved the status.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_ErrorGet()

fsp_err_t RM_MOTOR_TUNER_PM_ErrorGet (motor_tuner_ctrl_t *const *p_ctrl*, uint16_t * *p_error*)

Get motor tuner error code. Implements motor_tuner_api_t::errorGet.

Retrieves the current error code of the tuner.

Example:

```
uint16_t error_code;
err = RM_MOTOR_TUNER_PM_ErrorGet(&g_motor_tuner_ctrl, &error_code);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully retrieved the error code.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_ProgressGet()

fsp_err_t RM_MOTOR_TUNER_PM_ProgressGet (motor_tuner_ctrl_t *const *p_ctrl*, float * *p_progress*)

Get motor tuner progress. Implements motor_tuner_api_t::progressGet.

Retrieves the current progress of the tuner operation as a float between 0.0 and 1.0.

Example:

```
err = RM_MOTOR_TUNER_PM_ProgressGet(&g_motor_tuner_ctrl, &progress);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully retrieved the progress.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_Abort()

fsp_err_t RM_MOTOR_TUNER_PM_Abort (motor_tuner_ctrl_t *const *p_ctrl*, uint8_t *error_code*)

Abort motor tuner. Implements motor_tuner_api_t::abort.

Aborts the tuner operation with an optional error code. If the error code is zero, it is equivalent to a normal stop.

Example:

```
err = RM_MOTOR_TUNER_PM_Abort(&g_motor_tuner_ctrl, 1);
handle_error(err);
```

Return values

FSP_SUCCESS	Successfully aborted the tuner.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_IdentifiedParamGet()

fsp_err_t RM_MOTOR_TUNER_PM_IdentifiedParamGet (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_param_type_t *param_type*, float * *p_value*)

Get identified motor parameter. Implements motor_tuner_api_t::identifiedParamGet.

Retrieves the identified motor parameter based on the specified type.

Example:

```
float resistance;
```

```
float ld;
float lq;
float ke;
float inertia;
float friction;
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_R, &resistance);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_LD, &ld);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_LQ, &lq);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_PMSM_KE, &ke);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_INERTIA, &inertia);
    handle_error(err);
    err = RM_MOTOR_TUNER_PM_IdentifiedParamGet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_VISCOUS_FRICTION, &friction);
    handle_error(err);
```

Return values

FSP_SUCCESS	Successfully retrieved the identified parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ RM_MOTOR_TUNER_PM_InnerLoopProcess()

fsp_err_t RM_MOTOR_TUNER_PM_InnerLoopProcess (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_in_t * *p_in*, motor_tuner_out_t * *p_out*)

Process inner loop for motor tuner. Implements motor_tuner_api_t::innerLoopProcess.

Executes the inner loop(current control, rotor angle estimation, etc.) processing for motor parameter estimation when the tuner is initialized, running, and active.

Example:

```
err = RM_MOTOR_TUNER_PM_InnerLoopProcess(&g_motor_tuner_ctrl, p_in, p_out);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_in	Pointer to input structure.
[out]	p_out	Pointer to output structure.

Return values

FSP_SUCCESS	Successfully processed inner loop.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_OuterLoopProcess()

fsp_err_t RM_MOTOR_TUNER_PM_OuterLoopProcess (motor_tuner_ctrl_t *const *p_ctrl*)

Process outer loop for motor tuner. Implements motor_tuner_api_t::outerLoopProcess.

Executes the outer loop processing and main loop for motor parameter estimation. It also handles initialization if not yet completed.

Example:

```
RM_MOTOR_TUNER_PM_OuterLoopProcess(&g_motor_tuner_ctrl);
```

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Successfully processed outer loop.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_TUNER_PM_IsActive()

fsp_err_t RM_MOTOR_TUNER_PM_IsActive (motor_tuner_ctrl_t *const *p_ctrl*, bool * *p_is_active*)

Check if motor tuner is active. Implements motor_tuner_api_t::isActive.

Checks whether the motor tuner is currently active and running.

Example:

```
err = RM_MOTOR_TUNER_PM_IsActive(&g_motor_tuner_ctrl, &is_active);
handle_error(err);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_is_active	Pointer to active status flag.

Return values

FSP_SUCCESS	Successfully checked active status.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ RM_MOTOR_TUNER_PM_IdentifiedVoltageErrorGet()

fsp_err_t RM_MOTOR_TUNER_PM_IdentifiedVoltageErrorGet (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_volterr_lut_t * *p_lut*, float * *p_rdc*)

Get identified voltage error data. Implements motor_tuner_api_t::identifiedVoltageErrorGet.

Retrieves the identified voltage error data including current breakpoints, voltage error values, DC bus reference voltage, and DC resistance.

Example:

```
   err = RM_MOTOR_TUNER_PM_IdentifiedVoltageErrorGet(&g_motor_tuner_ctrl,
&voltage_error_lut, &rdc);
```

Return values

FSP_SUCCESS	Successfully retrieved the voltage error data.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ RM_MOTOR_TUNER_PM_VoltageErrorSet()

fsp_err_t RM_MOTOR_TUNER_PM_VoltageErrorSet (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_volterr_lut_t * *p_lut*)

Set voltage error lookup table. Implements motor_tuner_api_t::voltageErrorLutSet.

Sets the voltage error lookup table for the motor tuner.

Example:

```
    err = RM_MOTOR_TUNER_PM_VoltageErrorSet(&g_motor_tuner_ctrl, &voltage_error_lut);
    handle_error(err);
```

Return values

FSP_SUCCESS	Successfully set the voltage error lookup table.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ RM_MOTOR_TUNER_PM_KnownParamSet()

fsp_err_t RM_MOTOR_TUNER_PM_KnownParamSet (motor_tuner_ctrl_t *const *p_ctrl*, motor_tuner_param_type_t *param_type*, float *value*)

Set known motor parameter. Implements motor_tuner_api_t::knownParamSet.

Sets a known motor parameter based on the specified type and value.

Example:

```
    err = RM_MOTOR_TUNER_PM_KnownParamSet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_POLE_PAIRS, known_pole_pairs);
    handle_error(err);
 /* Set rated current for identification. */
    err =
 RM_MOTOR_TUNER_PM_KnownParamSet(&g_motor_tuner_ctrl,
MOTOR_TUNER_PARAM_TYPE_RATED_CURRENT, motor_rated_current);
    handle_error(err);
```

Return values

FSP_SUCCESS	Successfully set the known parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Invalid argument.

◆ tuner_pm_state_machine_event()

void tuner_pm_state_machine_event (motor_tuner_pm_instance_ctrl_t * *p_instance_ctrl*, uint16_t *event*)

State machine function event handler.

Parameters

[in]	p_instance_ctrl	Pointer to motor tuner instance control structure
[in]	event	The event code TUNER_PM_COMMAND_<CMD> group is available, in addition, TUNER_PM_PRV_EVENT_COMPLETED is also available for completed event

◆ tuner_pm_core_hook_on_error()

void tuner_pm_core_hook_on_error (motor_tuner_pm_core_foc_t * *p_foc*, uint16_t *error_code*)

Implementation of on error event in CORE module.

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	error_code	The error code

◆ tuner_pm_core_hook_before_current_ctrl()

void tuner_pm_core_hook_before_current_ctrl (void * *p_context*)

Hook function implementation called before current control in each inner loop cyclic execution.

Parameters

[in]	p_context	The pointer to the context of motor tuner instance control

◆ tuner_pm_core_hook_after_pwmoutput()

void tuner_pm_core_hook_after_pwmoutput (void * *p_context*)		
Hook function implementation called after PWM output in each inner loop cyclic execution. **Parameters**		
[in]	p_context	The pointer to the context of motor tuner instance control

Command Code

Modules » Motor » Advanced Motor Middleware » Motor Tuner middleware (rm_motor_tuner_pm)

Detailed Description

Command code.

Macros

#define TUNER_PM_COMMAND_NONE

Detailed Description

RM_MOTOR_TUNER_PM_CORE module handles calibrations, current/speed control and signals. Also launch events for upper layer

.

Macros

#define	TUNER_PM_CORE_DUTY_MARGIN_MULT

Macro Definition Documentation

◆ TUNER_PM_CORE_DUTY_MARGIN_MULT

#define TUNER_PM_CORE_DUTY_MARGIN_MULT

Multiplier for duty margin calculation, include non-linear deadtime region and margin for compensation

Function Documentation

◆ tuner_pm_core_assert_fail()

void tuner_pm_core_assert_fail (motor_tuner_pm_core_foc_t * *p_foc*, uint32_t *line*, uint32_t *file*)

Record debug data when assert failure happened.

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	line	The line where the assertion failure happened
[in]	file	The file code where the assertion failure happened

◆ tuner_pm_core_throw_error()

void tuner_pm_core_throw_error (motor_tuner_pm_core_foc_t * *p_foc*, uint16_t *error_code*)

Throw an error with the given error code and stop PWM output.

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	error_code	The error code of the error

◆ tuner_pm_core_set_startup_params()

void tuner_pm_core_set_startup_params (motor_tuner_pm_core_foc_t * *p_foc*, float *open_loop_id*, float *ol2cl_speed_rad*, float *cl2ol_speed_rad*)

Configure start-up sequence

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	open_loop_id	The Id[A] injected in open-loop mode
[in]	ol2cl_speed_rad	The open-loop to closed-loop switching threshold speed in [rad/s]
[in]	cl2ol_speed_rad	The closed-loop to open-loop switching threshold speed in [rad/s]

◆ tuner_pm_core_set_speed_pi()

void tuner_pm_core_set_speed_pi (motor_tuner_pm_core_foc_t * *p_foc*, float *kp*, float *kidt*)

Configure speed pi with given gains

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	kp	The proportional gain
[in]	kidt	The integral gain

◆ tuner_pm_core_set_rated_current()

void tuner_pm_core_set_rated_current (motor_tuner_pm_core_foc_t * *p_foc*, float *rated_current*)

Configure rated current, this will also change the current limits and the over-current threshold.

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	rated_current	The value [A] to be set as the rated current

◆ tuner_pm_core_set_volterr_table()

void tuner_pm_core_set_volterr_table (motor_tuner_pm_core_foc_t * *p_foc*, const float * *current_tab*, const float * *voltage_tab*, float *vdc_ref*)

Configures the voltage error compensation module with the given lookup table.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure
[in]	current_tab	The pointer to the current column array of the lookup table
[in]	voltage_tab	The pointer to the voltage column array of the lookup table
[in]	vdc_ref	The reference DC bus voltage which is the measurement condition of the given table

◆ tuner_pm_core_clear_error()

void tuner_pm_core_clear_error (motor_tuner_pm_core_foc_t * *p_foc*)

Clear the error status of the FOC core.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure

◆ tuner_pm_core_config_current_pi_gains()

void tuner_pm_core_config_current_pi_gains (motor_tuner_pm_core_foc_t * *p_foc*, float *omega*, float *zeta*)

Configure current pi with given gains

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	omega	The natural frequency in [Hz]
[in]	zeta	The damping factor

◆ tuner_pm_core_config_bemf_obsv()

void tuner_pm_core_config_bemf_obsv (motor_tuner_pm_core_foc_t * *p_foc*, float *omega*, float *zeta*)

Configure speed pi with given gains.

Parameters

[in]	p_foc	Pointer to motor tuner core FOC structure
[in]	omega	The natural frequency in [Hz]
[in]	zeta	The damping factor

◆ tuner_pm_core_crnt_ctrl_handler()

void tuner_pm_core_crnt_ctrl_handler (motor_tuner_pm_core_foc_t * *p_foc*, motor_tuner_in_t * *p_in*, motor_tuner_out_t * *p_out*)

Carrier interrupt handler of CORE module This function defines the process should be executed every PWM cycle.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure
[in]	p_in	Pointer to motor tuner input structure
[out]	p_out	Pointer to motor tuner output structure

Precondition

AD conversion of current and DC bus voltage must be done before calling this function

◆ tuner_pm_core_stop()

void tuner_pm_core_stop (motor_tuner_pm_core_foc_t * *p_foc*)

Stops driving motor, this also stops the PWM output.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure

◆ tuner_pm_core_init()

void tuner_pm_core_init (motor_tuner_pm_core_foc_t * *p_foc*, motor_tuner_pm_core_foc_cfg_t const * *p_cfg*, void * *p_context*, uint8_t *pwm_tick_per_irq*, float *speed_ctrl_period*)

Core module initialization.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure
[in]	p_cfg	Pointer to motor tuner FOC core configuration structure
[in]	p_context	Pointer to the upper layer context
[in]	pwm_tick_per_irq	The PWM tick per interrupt
[in]	speed_ctrl_period	The speed control period

◆ tuner_pm_core_set_ctrl_level()

void tuner_pm_core_set_ctrl_level (motor_tuner_pm_core_foc_t * *p_foc*, uint16_t *ctrl_level*)

Sets the control level of CORE module.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure
[in]	ctrl_level	The control level

◆ tuner_pm_core_reset()

void tuner_pm_core_reset (motor_tuner_pm_core_foc_t * *p_foc*)

Resets CORE modules includes gain and motor parameters.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure

Warning

This function will resets all parameters in the module, and should be used only when new identification starts

◆ tuner_pm_core_reset_startup_seq()

void tuner_pm_core_reset_startup_seq (motor_tuner_pm_core_foc_t * *p_foc*)

Resets start-up sequence and related variables.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure

◆ tuner_pm_core_spd_ctrl_handler()

void tuner_pm_core_spd_ctrl_handler (motor_tuner_pm_core_foc_t * *p_foc*)

Long period interrupt handler, for outer loop and start-up sequence control.

Parameters

[in]	p_foc	Pointer to motor tuner FOC core structure

Note

Wrapper of current control interrupt handler

Detailed Description

Motor hal driver on RA MCUs. This module implements the Motor Hal Driver Interface.

Overview

The Motor HAL Driver module provides hardware abstraction layer functions for motor control applications. It handles PWM modulation, ADC current sensing, and voltage control for three-phase motor drivers. This module serves as an interface between the motor control algorithm and the hardware peripherals (ADC, GPT).

Motor HAL Driver Block Diagram

Features

The Motor HAL Driver module has the following key features:

- Supports multiple current sensing configurations:
  - 1-shunt current sensing
  - 2-shunt current sensing
  - 3-shunt current sensing
- Multiple PWM modulation methods:
  - SPWM (Sinusoidal Pulse Width Modulation)
  - SVPWM (Space Vector Pulse Width Modulation)
  - DPWM (Discontinuous Pulse Width Modulation)
- Automatic current offset calibration
- Bootstrap circuit charging support
- Phase voltage and current measurement
- Support for multiple motor control (shared ADC instance)

Configuration

Configure the Motor HAL Driver module on the Stacks tab of the FSP Configuration editor.

Build Time Configurations for rm_motor_hal_driver

The following build time configurations are defined in fsp_cfg/rm_motor_hal_driver_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ADC_B Support	• Enabled • Disabled	Enabled	Select ADC_B module support.
Shared ADC support	• Enabled • Disabled	Disabled	Select Shared ADC support.
Supported Motor Number	Must be greater than 1.	1	
Saturation checking for PWM	• Enabled • Disabled	Disabled	If selected, saturation checking code for PWM modulation is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Hal Driver Module (rm_motor_hal_driver)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Hal Driver Module (rm_motor_hal_driver).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_hal_driver	Module name.
Resolution of A/D conversion	Must be a valid Resolution of ADC.	0xFFF	Resolution of A/D conversion
PWM config			
PWM config > Timer			
PWM Timer Frequency (MHz)	Must be a valid integer.	120	GPT PWM timer frequency
PWM Carrier Period (Microseconds)	Must be a valid integer.	50	GPT PWM carrier period
Dead Time (Microseconds)	Must be a valid value	2.0	GPT PWM dead time
GTIOCA Stop Level	• Pin Level Low • Pin Level High	Pin Level Low	Select the behavior of the output pin when the timer is stopped.
GTIOCB Stop Level	• Pin Level Low • Pin Level High	Pin Level High	Select the behavior of the output pin when the timer is stopped.
PWM config > Port			
PWM output port UP	Manual Entry	BSP_IO_PORT_11_PIN_04	PWM output port UP

PWM output port UN	Manual Entry	BSP_IO_PORT_11_PIN_05	PWM output port UN
PWM output port VP	Manual Entry	BSP_IO_PORT_11_PIN_06	PWM output port VP
PWM output port VN	Manual Entry	BSP_IO_PORT_11_PIN_07	PWM output port VN
PWM output port WP	Manual Entry	BSP_IO_PORT_11_PIN_08	PWM output port WP
PWM output port WN	Manual Entry	BSP_IO_PORT_11_PIN_09	PWM output port WN
Modulation			
Modulation method	• SVPWM • SPWM • DPWM	SVPWM	Select PWM modulation method
Input Voltage (V)	Must be a valid value	24.0F	Input voltage
Maximum Duty	Must be a valid value	0.9375F	Maximum duty of PWM
Current related			
Current Range (A)	Must be a valid value	16.5	Current range to measure(Maximum input current)
Counts for current offset measurement	Must be a valid integer.	512	How many times to measure current offset
Offset of A/D conversion for current	Must be a valid non-negative value.	0x7FF	Offset of A/D conversion for current
Voltage related			
VDC Range (V)	Must be a valid value	73.26	Voltage range to measure(Maximum input Main Line Voltage)
Voltage Range (V)	Must be a valid value	73.26	Voltage range to measure(Maximum output Voltage)
Offset of A/D conversion for VDC	Must be a valid non-negative value.	0x0	Offset of A/D conversion for VDC
Offset of A/D conversion for voltage	Must be a valid non-negative value.	0x0	Offset of A/D conversion for output voltage
Bootstrap config			
Counts for bootstrap charge	Must be a valid integer.	100	Counts for charging the bootstrap circuit
Shunt current config			
Shunt type	• 1 shunt	2 shunt	Select shunt type

	• 2 shunt • 3 shunt		
1shunt interrupt phase	• PHASE_U • PHASE_V • PHASE_W	PHASE_U	Select the phase which occures ADC end interrupt. (Only valid with 1shunt)
Minimum difference of PWM duty	Must be a valid non-negative value.	300	Minimum difference of PWM duty for 1shunt
ADC setting			
ADC setting > Channel			
U Phase current	Value must be a supported channel number	4	Specify the A/D channel for U phase current (channel availability varies by MCU)
V Phase current	Value must be a supported channel number	2	Specify the A/D channel for V phase current (channel availability varies by MCU)
W Phase current	Value must be a supported channel number	0	Specify the A/D channel for W phase current (channel availability varies by MCU)
Main Line Voltage	Value must be a supported channel number	7	Specify the A/D channel for main line voltage (channel availability varies by MCU)
U Phase voltage	Value must be a supported channel number	27	Specify the A/D channel for U phase current (channel availability varies by MCU)
V Phase voltage	Value must be a supported channel number	3	Specify the A/D channel for U phase current (channel availability varies by MCU)
W Phase voltage	Value must be a supported channel number	1	Specify the A/D channel for U phase current (channel availability varies by MCU)
ADC setting > Unit			
U Phase current	Must be a valid non-	0	Select the A/D

	negative value.		conversion module for U phase current (only valid with adc module)
V Phase current	Must be a valid non-negative value.	0	Select the A/D conversion module for V phase current (only valid with adc module)
W Phase current	Must be a valid non-negative value.	0	Select the A/D conversion module for W phase current (only valid with adc module)
Main line voltage	Must be a valid non-negative value.	0	Select the A/D conversion module for main line voltage (only valid with adc module)
U Phase voltage	Must be a valid non-negative value.	0	Select the A/D conversion module for V phase current (only valid with adc module)
V Phase voltage	Must be a valid non-negative value.	0	Select the A/D conversion module for V phase current (only valid with adc module)
W Phase voltage	Must be a valid non-negative value.	0	Select the A/D conversion module for V phase current (only valid with adc module)
Using ADC Scan Group	Value should be between 0 to 8 (valid only with ADC_B module)	0	For MCUs with ADC_B, select the scan group used.
ADC interrupt module	• 1st • 2nd	1st	Select from which module ADC intterupt happens (only valid with adc module)
Adjustment value to current A/D	Must be a valid non-negative value.	20.0	Value to adjust 1shunt A/D double buffer
Adjustment delay	Must be a valid non-negative value.	240	Adjustment delay of A/D conversion
Conversion level of A/D conversion for voltage	Must be a valid value	1.0	Conversion level of A/D conversion for voltage
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish

interrupt.

Clock Configuration

The Motor HAL Driver uses GPT (General PWM Timer) for PWM generation. The PWM carrier frequency is determined by the GPT timer frequency and the carrier base count setting.

Pin Configuration

This module uses the following pins:

Pin Type	Description
GPT PWM Output (UP, UN)	U-phase high-side and low-side PWM output
GPT PWM Output (VP, VN)	V-phase high-side and low-side PWM output
GPT PWM Output (WP, WN)	W-phase high-side and low-side PWM output
ADC Input	Phase current sensing (Iu, Iv, Iw)
ADC Input	DC bus voltage sensing (Vdc)
ADC Input	Phase voltage sensing (Vu, Vv, Vw) - optional

Usage Notes

Current Offset Calibration

Before motor operation begins, the module automatically performs current offset calibration. The calibration process measures the ADC offset values when no current is flowing through the motor.

The calibration count can be configured via offset_calc_count parameter. PWM output is disabled during calibration and automatically enabled after calibration completes. Use RM_MOTOR_HAL_DRIVER_FlagCurrentOffsetGet to check if calibration is complete. Use RM_MOTOR_HAL_DRIVER_CurrentOffsetRestart to restart calibration if needed.

Bootstrap Circuit Charging

For motor drivers with bootstrap circuits, the module provides bootstrap charging functionality:

Call RM_MOTOR_HAL_DRIVER_ChargeBootstrap periodically until charging is complete. Use RM_MOTOR_HAL_DRIVER_FlagBootstrapGet to check if bootstrap charging is complete. The charging time can be configured via charge_bootstrap_time parameter.

Shared ADC Instance Support

When using shared ADC instance for multiple motor control, follow these steps:

1. Add (New) shared ADC instance in FSP Configurator.
2. Configure the ADC module settings for your application.
3. Set "Common | Shared ADC support" to "Enabled".
4. Configure p_shared_cfg in the extended configuration.

Modulation Methods

The module supports three PWM modulation methods:

Method Description Voltage Utilization SPWM Sinusoidal PWM - Simple implementation ~86.6% SVPWM Space Vector PWM - Better DC bus utilization ~100% DPWM Discontinuous PWM - Reduced switching losses ~100%

Callback Function

The module calls the user-provided callback function at each PWM carrier cycle (ADC conversion complete). This callback is typically used for current control processing.

Example callback usage:

```
void motor_current_callback(motor_hal_driver_callback_args_t * p_args)
{
 if (MOTOR_HAL_DRIVER_EVENT_CURRENT == p_args->event)
    {
 /* Perform current control processing */
    }
}
```

Limitations

Examples

Motor HAL Driver Basic Example This is a basic example of minimal use of the Motor HAL Driver in an application.

```
void rm_motor_hal_driver_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_HAL_DRIVER_Open(&g_motor_hal_driver_ctrl,
&g_motor_hal_driver_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 /* Basically run this module at cyclic interrupt (e.g. included GPT PWM Carrier
intterupt).
  * This implementation is an example. */
 /* Set the active into hal_driver. */
    err = RM_MOTOR_HAL_DRIVER_Activate(&g_motor_hal_driver_ctrl);
```

```
    handle_error(err);
 /* Set phase voltage. */
    err = RM_MOTOR_HAL_DRIVER_PhaseVoltageSet(&g_motor_hal_driver_ctrl, 1.0F, 1.0F,
1.0F);
    handle_error(err);
 /* Get current data. */
 motor_hal_driver_current_dataset_t current_data = {0.0F, 0.0F, 0.0F, 0.0F, 1.0F};
    err = RM_MOTOR_HAL_DRIVER_CurrentGet(&g_motor_hal_driver_ctrl, &current_data);
    handle_error(err);
 /* Get voltage data. */
 motor_hal_driver_voltage_dataset_t voltage_data = {0.0F, 0.0F, 0.0F};
    err = RM_MOTOR_HAL_DRIVER_OutputVoltageGet(&g_motor_hal_driver_ctrl,
&voltage_data);
    handle_error(err);
 /* Get the flag of A/D convderted current offset */
    uint8_t offset_flag = 0U;
    err = RM_MOTOR_HAL_DRIVER_FlagCurrentOffsetGet(&g_motor_hal_driver_ctrl,
&offset_flag);
    handle_error(err);
 /* Get the flag of Bootstrap. */
    uint8_t bootstrap_flag = 0U;
    err = RM_MOTOR_HAL_DRIVER_FlagBootstrapGet(&g_motor_hal_driver_ctrl,
&bootstrap_flag);
    handle_error(err);
 /* Charge the Bootstrap circuit. */
    err = RM_MOTOR_HAL_DRIVER_ChargeBootstrap(&g_motor_hal_driver_ctrl);
    handle_error(err);
 /* Update the parameters. */
    err = RM_MOTOR_HAL_DRIVER_ParameterUpdate(&g_motor_hal_driver_ctrl,
&g_motor_hal_driver_cfg);
    handle_error(err);
 /* Clear the active into hal_driver. */
    err = RM_MOTOR_HAL_DRIVER_Deactivate(&g_motor_hal_driver_ctrl);
    handle_error(err);
```

```
 /* Recalculate the A/D convderted current offset. */
    offset_flag = 0U;
    err         = RM_MOTOR_HAL_DRIVER_CurrentOffsetRestart(&g_motor_hal_driver_ctrl);
    handle_error(err);
 /* Reset the module. */
    err = RM_MOTOR_HAL_DRIVER_Reset(&g_motor_hal_driver_ctrl);
    handle_error(err);
 /* Close the module. */
    err = RM_MOTOR_HAL_DRIVER_Close(&g_motor_hal_driver_ctrl);
    handle_error(err);
}
```

Motor HAL Driver Advanced Example

This example demonstrates a more complete motor control sequence including bootstrap charging and current control.

```
void rm_motor_hal_driver_advanced_example (void)
{
 fsp_err_t err            = FSP_SUCCESS;
    uint8_t   offset_flag    = 0U;
    uint8_t   bootstrap_flag = 0U;
 /* Open the module */
    err = RM_MOTOR_HAL_DRIVER_Open(&g_motor_hal_driver_ctrl,
&g_motor_hal_driver_cfg);
    assert(FSP_SUCCESS == err);
 /* Charge bootstrap circuit (if applicable) */
 do
    {
      err = RM_MOTOR_HAL_DRIVER_ChargeBootstrap(&g_motor_hal_driver_ctrl);
      assert(FSP_SUCCESS == err);
      err = RM_MOTOR_HAL_DRIVER_FlagBootstrapGet(&g_motor_hal_driver_ctrl,
&bootstrap_flag);
      assert(FSP_SUCCESS == err);
    } while (0U == bootstrap_flag);
```

```
 /* Wait for current offset calibration to complete */
 do
    {
      err = RM_MOTOR_HAL_DRIVER_FlagCurrentOffsetGet(&g_motor_hal_driver_ctrl,
&offset_flag);
      assert(FSP_SUCCESS == err);
    } while (0U == offset_flag);
 /* Motor control loop */
 while (true)
    {
 motor_hal_driver_current_dataset_t current_data;
 /* Get current data */
      err = RM_MOTOR_HAL_DRIVER_CurrentGet(&g_motor_hal_driver_ctrl, &current_data);
      assert(FSP_SUCCESS == err);
 /* Calculate phase voltages based on current feedback */
 /* (User implements current control algorithm here) */
       ccal_num_t v_u = 0.0F;
       ccal_num_t v_v = 0.0F;
       ccal_num_t v_w = 0.0F;
 /* Set phase voltage */
       err = RM_MOTOR_HAL_DRIVER_PhaseVoltageSet(&g_motor_hal_driver_ctrl, v_u, v_v,
v_w);
      assert(FSP_SUCCESS == err);
    }
}
```

Getting Output Voltage Example This example shows how to read the measured phase voltages.

```
void rm_motor_hal_driver_voltage_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 motor_hal_driver_voltage_dataset_t voltage_data;
 /* Get output voltage data */
    err = RM_MOTOR_HAL_DRIVER_OutputVoltageGet(&g_motor_hal_driver_ctrl,
```

```
&voltage_data);
    assert(FSP_SUCCESS == err);
}
```

Parameter Update Example This example shows how to update module parameters at runtime.

```
void rm_motor_hal_driver_parameter_update_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Update parameters with new configuration */
    err = RM_MOTOR_HAL_DRIVER_ParameterUpdate(&g_motor_hal_driver_ctrl,
&g_motor_hal_driver_cfg_updated);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ motor_hal_driver_modulation_t

struct motor_hal_driver_modulation_t		
Modulation instance block		
Data Fields		
ccal_num_t	v_dc	Main line voltage (Vdc) [V].

ccal_num_t	voltage_error_ratio	The voltage error ratio (VoltageError/Vdc)
ccal_num_t	max_duty	Maximum duty cycle.
ccal_num_t	min_duty	Minimum duty cycle.
ccal_num_t	neutral_duty	Duty cycle that represents 0[V].
uint8_t	saturation_flag	Saturation flag.

◆ motor_hal_driver_shared_instance_ctrl_t

struct motor_hal_driver_shared_instance_ctrl_t		
For multiple motor		
Data Fields		
uint32_t	open	Motor_hal_driver open flag.
uint8_t	registered_motor_count	Registered motor counts.
void const *	p_context[MOTOR_HAL_DRIVER_CFG_SUPPORT_MOTOR_NUM]	Each instance pointer for multiple motors.

◆ motor_hal_driver_extended_shared_cfg_t

struct motor_hal_driver_extended_shared_cfg_t		
For multiple motor		
Data Fields		
adc_instance_t const *	p_adc_instance_first	first ADC instance
adc_instance_t const *	p_adc_instance_second	second ADC instance
motor_hal_driver_shared_instance_ctrl_t *const	p_shared_instance_ctrl	Control instance for multiple motor.

◆ motor_hal_driver_extended_cfg_t

struct motor_hal_driver_extended_cfg_t		
Extended configuration for motor_hal_driver		
Data Fields		
uint16_t	pwm_timer_freq	PWM timer frequency [MHz].
ccal_num_t	pwm_carrier_freq	PWM carrier frequency [kHz].
uint32_t	carrier_base	PWM carrier raw count.
uint16_t	deadtime	PWM deadtime raw count.
ccal_num_t	current_range	A/D current measure range (max current) [A].
ccal_num_t	voltage_range	A/D voltage measure range (max phase voltage) [V].

ccal_num_t	v_dc_range	A/D main line voltage measure range (max voltage) [V].
ccal_num_t	sf_ad_current	conversion A/D to current value
ccal_num_t	sf_ad_vdc	conversion A/D to vdc value
ccal_num_t	sf_ad_voltage	conversion A/D to voltage value
uint16_t	ad_resolution	A/D resolution.
uint16_t	ad_current_offset	A/D current offset (Center value)
int16_t	ad_voltage_offset	A/D voltage offset (Error correction value)
int16_t	ad_vdc_offset	A/D vdc offset (Center value or Error correction value)
ccal_num_t	ad_voltage_conversion	A/D conversion level.
uint16_t	offset_calc_count	Calculation counts for current offset.
uint16_t	charge_bootstrap_time	Charge time for bootstrap circuit (counts)
motor_hal_driver_modulation_method_t	modulation_method	Modulation method.
bsp_io_port_pin_t	port_up	PWM output port UP.
bsp_io_port_pin_t	port_un	PWM output port UN.
bsp_io_port_pin_t	port_vp	PWM output port VP.
bsp_io_port_pin_t	port_vn	PWM output port VN.
bsp_io_port_pin_t	port_wp	PWM output port WP.
bsp_io_port_pin_t	port_wn	PWM output port WN.
motor_hal_driver_shunt_type_t	shunt	Selection of shunt type.
int32_t	difference_minimum	Minimum difference of PWM duty.
int32_t	adjust_adc_delay	Adjustment delay for A/D conversion.
motor_hal_driver_phase_t	trigger_phase	trigger phase of interrupt to get 1shunt current
adc_group_mask_t	adc_group	Used ADC scan group only valid for adc_b.
adc_channel_t	i_u_ad_ch	A/D Channel for U Phase Current.
adc_channel_t	i_v_ad_ch	A/D Channel for V Phase Current.
adc_channel_t	i_w_ad_ch	A/D Channel for W Phase

		Current.
adc_channel_t	v_dc_ad_ch	A/D Channel for Main Line Voltage.
adc_channel_t	v_u_ad_ch	A/D channel for U phase voltage.
adc_channel_t	v_v_ad_ch	A/D channel for V phase voltage.
adc_channel_t	v_w_ad_ch	A/D channel for W phase voltage.
uint8_t	i_u_ad_unit	Used A/D unit number for U phase current.
uint8_t	i_v_ad_unit	Used A/D unit number for V phase current.
uint8_t	i_w_ad_unit	Used A/D unit number for W phase current.
uint8_t	v_dc_ad_unit	Used A/D unit number for main line voltage.
uint8_t	v_u_ad_unit	Used A/D unit number for U phase voltage.
uint8_t	v_v_ad_unit	Used A/D unit number for V phase voltage.
uint8_t	v_w_ad_unit	Used A/D unit number for W phase voltage.
motor_hal_driver_modulation_t	mod_param	Modulation structure.
motor_hal_driver_select_adc_instance_t	interrupt_adc	Select which interrupt to use.
motor_hal_driver_extended_shared_cfg_t const *	p_shared_cfg	Shared extended config.

◆ motor_hal_driver_instance_ctrl_t

struct motor_hal_driver_instance_ctrl_t		
Motor_hal_driver instance control block		
Data Fields		
uint32_t	open	Motor_hal_driver open flag.
uint32_t	carrier_base	PWM carrier base counts.
uint16_t	deadtime_count	Deadtime counts.
ccal_num_t	i_u_ad	U phase current [A].
ccal_num_t	i_v_ad	V phase current [A].
ccal_num_t	i_w_ad	W phase current [A].

ccal_num_t	v_dc_ad	Main line voltage [V].
ccal_num_t	v_u_ad	U phase voltage (V)
ccal_num_t	v_v_ad	V phase voltage (V)
ccal_num_t	v_w_ad	W phase voltage (V)
ccal_num_t	ref_u	Calculated U Phase output voltage [V].
ccal_num_t	ref_v	Calculated V Phase output voltage [V].
ccal_num_t	ref_w	Calculated W Phase output voltage [V].
uint8_t	offset_calc_flag	The flag represents that the offset measurement is finished.
uint16_t	offset_calc_times	Calculation current times for current offset.
uint16_t	offset_calc_digit	Calculation reference level for current offset.
int32_t	offset_i_u	U phase current offset correction value [LSB].
int32_t	offset_i_v	V phase current offset correction value [LSB].
int32_t	offset_i_w	W phase current offset correction value [LSB].
int32_t	sum_i_u_ad	U phase current summation value to calculate offset [LSB].
int32_t	sum_i_v_ad	V phase current summation value to calculate offset [LSB].
int32_t	sum_i_w_ad	W phase current summation value to calculate offset [LSB].
uint8_t	active	Active/inactive flags for hal_driver.
motor_hal_driver_phase_t	min_phase	Minimum phase information to calculate 1shunt current.
motor_hal_driver_phase_t	mid_phase	Middle phase information to calculate 1shunt current.
uint8_t	charge_bootstrap_flag	Charge flag of bootstrap circuit.
uint16_t	charge_bootstrap_cnt	The number of samples for charging bootstrap circuit.
uint8_t	modulation_method	Modulation method.
uint8_t	maxvoltage_flag	Phase of maximum voltage in DPWM method.

uint32_t	gtioca_low_cfg	I/O port "Low" config for gtioca.
uint32_t	gtiocb_low_cfg	I/O port "Low" config for gtioca.
uint8_t	port_enable_flag	The flag represents that PWM port should be enabled.
motor_hal_driver_modulation_t	st_modulation	Modulation structure.
motor_hal_driver_cfg_t const *	p_cfg	Motor Driver configuration Structure.
adc_callback_args_t	adc_callback_args	For call ADC callbackSet function.
timer_callback_args_t	timer_callback_args	For call GPT(Timer) callbackSet function.
motor_hal_driver_shared_instance_ctrl_t *	p_shared_instance_ctrl	Control instance for multiple motor.

Enumeration Type Documentation

◆ motor_hal_driver_modulation_method_t

enum motor_hal_driver_modulation_method_t	
Modulation type selection	
Enumerator	
MOTOR_HAL_DRIVER_MODULATION_METHOD_SPWM	Sinusoidal pulse-width-modulation.
MOTOR_HAL_DRIVER_MODULATION_METHOD_SVPWM	Space vector pulse-width-modulation.
MOTOR_HAL_DRIVER_MODULATION_METHOD_DPWM	Discontinuous pulse-width-modulation.

◆ motor_hal_driver_select_adc_instance_t

enum motor_hal_driver_select_adc_instance_t	
Support two ADC instance valid for adc	
Enumerator	
MOTOR_HAL_DRIVER_SELECT_ADC_INSTANCE_FIRST	Use first ADC instance.
MOTOR_HAL_DRIVER_SELECT_ADC_INSTANCE_SECOND	Use second ADC instances.

◆ motor_hal_driver_phase_t

enum motor_hal_driver_phase_t	
For 1shunt phase detection	
Enumerator	
MOTOR_HAL_DRIVER_PHASE_U_PHASE	Use U-phase for 1shunt detection.
MOTOR_HAL_DRIVER_PHASE_V_PHASE	Use V-phase for 1shunt detection.
MOTOR_HAL_DRIVER_PHASE_W_PHASE	Use W-phase for 1shunt detection.

Function Documentation

◆ RM_MOTOR_HAL_DRIVER_Open()

fsp_err_t RM_MOTOR_HAL_DRIVER_Open (motor_hal_driver_ctrl_t *const *p_ctrl*, motor_hal_driver_cfg_t const *const *p_cfg*)

Opens and configures the Motor Driver module. Implements motor_hal_driver_api_t::open.

Return values

FSP_SUCCESS	Motor Driver successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_HAL_DRIVER_Close()

fsp_err_t RM_MOTOR_HAL_DRIVER_Close (motor_hal_driver_ctrl_t *const *p_ctrl*)

Disables specified Motor Driver Module. Implements motor_hal_driver_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_Reset()

fsp_err_t RM_MOTOR_HAL_DRIVER_Reset (motor_hal_driver_ctrl_t *const *p_ctrl*)

Reset variables of Motor Driver Module. Implements motor_hal_driver_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_PhaseVoltageSet()

fsp_err_t RM_MOTOR_HAL_DRIVER_PhaseVoltageSet (motor_hal_driver_ctrl_t *const *p_ctrl*, ccal_num_t const *u_voltage*, ccal_num_t const *v_voltage*, ccal_num_t const *w_voltage*)

Set Phase Voltage Data to calculate PWM duty. Implements motor_hal_driver_api_t::phaseVoltageSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_Activate()

fsp_err_t RM_MOTOR_HAL_DRIVER_Activate (motor_hal_driver_ctrl_t *const *p_ctrl*)

Set Active flag. Implements motor_hal_driver_api_t::activate.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_Deactivate()

fsp_err_t RM_MOTOR_HAL_DRIVER_Deactivate (motor_hal_driver_ctrl_t *const *p_ctrl*)

Clear Active flag. Implements motor_hal_driver_api_t::deactivate.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_CurrentGet()

fsp_err_t RM_MOTOR_HAL_DRIVER_CurrentGet (motor_hal_driver_ctrl_t *const *p_ctrl*, motor_hal_driver_current_dataset_t *const *p_current_dataset*)

Get calculated phase Current, Vdc & Va_max data. Implements motor_hal_driver_api_t::currentGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_HAL_DRIVER_OutputVoltageGet()

fsp_err_t RM_MOTOR_HAL_DRIVER_OutputVoltageGet (motor_hal_driver_ctrl_t *const *p_ctrl*, motor_hal_driver_voltage_dataset_t *const *p_voltage_dataset*)

Get calculated phase Voltage data. Implements motor_hal_driver_api_t::outputVoltageGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_HAL_DRIVER_FlagCurrentOffsetGet()

fsp_err_t RM_MOTOR_HAL_DRIVER_FlagCurrentOffsetGet (motor_hal_driver_ctrl_t *const *p_ctrl*, uint8_t *const *p_offset_flag*)

Get the flag of finish current offset detection. Implements motor_hal_driver_api_t::flagCurrentOffsetGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_HAL_DRIVER_CurrentOffsetRestart()

fsp_err_t RM_MOTOR_HAL_DRIVER_CurrentOffsetRestart (motor_hal_driver_ctrl_t *const *p_ctrl*)

Restart the current offset detection. Implements motor_hal_driver_api_t::currentOffsetRestart.

Return values

FSP_SUCCESS	Successfully restarted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_ParameterUpdate()

fsp_err_t RM_MOTOR_HAL_DRIVER_ParameterUpdate (motor_hal_driver_ctrl_t *const *p_ctrl*, motor_hal_driver_cfg_t const *const *p_cfg*)

Update the parameters of Driver Module. Implements motor_hal_driver_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_HAL_DRIVER_FlagBootstrapGet()

fsp_err_t RM_MOTOR_HAL_DRIVER_FlagBootstrapGet (motor_hal_driver_ctrl_t *const *p_ctrl*, uint8_t *const *p_bootstrap_flag*)

Get the flag of finish bootstrap. Implements motor_hal_driver_api_t::flagBootstrapGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_HAL_DRIVER_ChargeBootstrap()

fsp_err_t RM_MOTOR_HAL_DRIVER_ChargeBootstrap (motor_hal_driver_ctrl_t *const *p_ctrl*)

Charge the Bootstrap circuit. Implements motor_hal_driver_api_t::bootstrapCharge.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Motor Sensor BEMF on RA MCUs. This module implements the Motor sensor Interface.

Overview

The Motor Sensor BEMF module provides sensorless rotor angle and speed estimation using a Back-EMF (BEMF) observer combined with a Phase-Locked Loop (PLL). This module is designed for brushless DC (BLDC) and permanent magnet synchronous motor (PMSM) control applications where encoder or Hall sensor feedback is not available.

Features

The Motor Sensor BEMF module has the following key features:

- Sensorless rotor angle estimation using BEMF observer
- Speed estimation using PLL (Phase-Locked Loop)
- Open-loop startup with configurable d-axis current injection
- Smooth transition from open-loop to sensorless control

- Optional open-loop damping for improved stability
- Configurable observer and PLL bandwidth parameters

Configuration

BEMF Observer Parameters

Parameter	Description
e_obs_omega	Natural frequency of BEMF observer [Hz]
e_obs_zeta	Damping ratio of BEMF observer
pll_est_omega	Natural frequency of PLL speed estimate loop [Hz]
pll_est_zeta	Damping ratio of PLL speed estimate loop

Open-Loop Parameters

Parameter	Description
f4_ol_id_ref	Open-loop d-axis current reference [A]
f4_id_up_speed_mech_rad	Speed threshold for Id ramp-up [rad/s mech]
f4_id_down_speed_mech_rad	Speed threshold for Id ramp-down [rad/s mech]

Build Time Configurations for rm_motor_sensor_bemf

The following build time configurations are defined in fsp_cfg/rm_motor_sensor_bemf_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Angle and Speed Calculation with BEMF sensors (rm_motor_sensor_bemf)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Angle and Speed Calculation with BEMF sensors (rm_motor_sensor_bemf).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_sensor_bemf	Module name.
Open Loop			
Open Loop > Current Reference			
Open Loop > Current Reference > Id Reference[A]	Must be a valid non-negative value.	0.5	The d-axis current reference [A] in open-loop drive

Open Loop > Current Reference > Id Up Step [step]	Must be a valid non-negative value.	256	Number of steps required to reach the Id reference, with one step applied each inner-loop period.
Open Loop > Current Reference > Id Down Step [step]	Must be a valid non-negative value.	500	Number of steps required to ramp-down from the Id reference, with one step applied each inner-loop period.
Iq Down Proportion	Must be a valid non-negative value.	1.0	The Iq reference ramping down proportion to Iqref before open-loop
Open Loop > Transition			
Open Loop > Transition > Speed Threshold to FOC [rpm]	Must be a valid non-negative value.	600.0	The control method switches from Open-loop to FOC when speed exceeds this value
Open Loop > Transition > Speed Thereshold to Open-loop [rpm]	Must be a valid non-negative value.	400.0	The control method switches from FOC to Open-loop when speed falls below this value
Open Loop > Transition > Transition Time to FOC [s]	Must be a valid non-negative value.	0.025	Transition time from Open-loop to FOC
Open Loop > Transition > Phase Error Threshold to FOC [degree]	Must be a valid non-negative value.	10.0	Switches from Open-loop to FOC only when the phase error is below this threshold.
Open Loop > Design Parameter			
Open Loop > Design Parameter > Ed HPF Cut-off Frequency [Hz]	Must be a valid non-negative value.	2.5	Cut-off frequency for High Pass Filter in open-loop damping gain design
Open-loop Damping Zeta	Must be a valid non-negative value.	1.0	Damping ratio for open-loop damping gain design
Open Loop Damping	• Disable • Enable	Enable	Enables damping control in Open-loop
Soft Switch	• Disable • Enable	Enable	Enables soft switching to eliminate phase error during the transition from open-loop to FOC
Limit of Speed	Must be a valid non-	0.2	The limit of speed

Feedback Rate	negative value.		feedback rate
BEMF Observer			
BEMF Observer > Natural Frequency [Hz]	Must be a valid non-negative value.	1000.0	Natural frequency of BEMF observer
Damping Ratio	Must be a valid non-negative value.	1.0	Damping ratio of BEMF observer
PLL			
PLL > Natural Frequency [Hz]	Must be a valid non-negative value.	20.0	Natural frequency of PLL Speed estimate loop
Damping Ratio	Must be a valid non-negative value.	1.0	Damping ratio of PLL Speed estimate loop

Pin Configuration

This module does not use I/O pins directly. Current and voltage measurements are provided by the inner loop (FOC) module.

Usage Notes

Startup Sequence

The BEMF observer requires sufficient back-EMF voltage for accurate angle estimation. During startup:

1. The module injects d-axis current (Id) to establish rotor flux
2. Speed reference is ramped up in open-loop mode
3. When speed exceeds the threshold (f4_id_down_speed_mech_rad), the module transitions to sensorless mode
4. The PLL locks onto the estimated angle and provides continuous tracking

Parameter Tuning

- **Observer bandwidth (e_obs_omega)**: Higher values provide faster response but may amplify noise
- **PLL bandwidth (pll_est_omega)**: Should be lower than observer bandwidth for stability
- **Damping ratios (e_obs_zeta, pll_est_zeta)**: Values around 1.0 provide critically damped response

Open-Loop Damping

When openloop_damping is enabled, the module applies active damping during open-loop operation to suppress oscillations. This is particularly useful for motors with low inertia.

Limitations

Developers should be aware of the following limitations:

- The BEMF observer requires minimum motor speed for accurate estimation (typically > 5% of rated speed)
- Estimation accuracy depends on accurate motor parameter values (resistance, inductance,

flux linkage)
- High-frequency noise in current measurements can affect estimation quality
- The module assumes sinusoidal back-EMF waveform
- Only the functions/types/macros exposed via rm_motor_sensor_bemf.h and rm_motor_sensor_api.h should be accessed by user code and that the contents of the other headers is subject to change.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensor BEMF module in an application.

```
/* Configure BEMF observer extended parameters */
static const motor_sensor_bemf_extended_cfg_t g_motor_sensor_bemf_ext_cfg =
{
    .e_obs_omega   = 300.0F,          /* Natural frequency of BEMF observer [Hz] */
    .e_obs_zeta    = 1.0F,             /* Damping ratio of BEMF observer */
    .pll_est_omega = 20.0F,            /* Natural frequency of PLL speed estimate
loop [Hz] */
    .pll_est_zeta = 1.0F,             /* Damping ratio of PLL speed estimate loop */
    .openloop_damping = MOTOR_MCSENSOR_OPENLOOP_DAMPING_DISABLE,
    .less_switch      = MOTOR_MCSENSOR_LESS_SWITCH_DISABLE,
    .ol_param                      =
    {
       .f4_ol_id_ref             = 1.0F,   /* Open-loop d-axis current reference [A]
*/
       .f4_ol_id_up_step          = 0.001F, /* Id ramp-up step [A/control period] */
       .f4_ol_id_down_step       = 0.001F, /* Id ramp-down step [A/control period] */
       .f4_ol_iq_down_step_ratio = 0.1F,   /* Iq ramp-down step ratio */
       .f4_id_up_speed_mech_rad   = 10.0F, /* Speed threshold for Id ramp-up [rad/s
mech] */
       .f4_id_down_speed_mech_rad = 50.0F, /* Speed threshold for Id ramp-down [rad/s
mech] */
       .f4_opl2less_sw_time       = 0.5F,   /* Open-loop to sensorless switching time
[s] */
       .f4_switch_phase_err_rad   = 5.0F,   /* Phase error threshold for switching
[deg] */
    },
```

```
    .ol_sub_param                  =
    {
       .f_fb_speed_limit_rate    = 1.0F,
    },
    .d_param                       =
    {
       .ed_hpf_omega    = 10.0F,      /* HPF natural frequency for open-loop damping
[Hz] */
       .ol_damping_zeta = 1.0F,       /* Damping ratio for open-loop damping */
    },
};
/* Configure BEMF sensor module */
static const motor_sensor_cfg_t g_motor_sensor_bemf_cfg =
{
    .p_context = NULL,
    .p_extend = &g_motor_sensor_bemf_ext_cfg,
};
/* Control structure */
static motor_sensor_bemf_instance_ctrl_t g_motor_sensor_bemf_ctrl;
void rm_motor_sensor_bemf_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open and configure the BEMF sensor module */
    err = RM_MOTOR_SENSOR_BEMF_Open(&g_motor_sensor_bemf_ctrl,

    handle_error(err);
}
```

Advanced Example

This example demonstrates the complete usage including angle/speed calculation in a control loop.

```
/* Pointers for angle and speed output */
static float * gp_speed_el;
static float * gp_angle_el;
static motor_sensor_output_t * gp_sensor_output;
/* Example inner loop shared data (normally provided by FOC module) */
static motor_shared_inner_to_position_speed_t g_from_inner;
static motor_shared_inner_to_outer_foc_t g_inner_data;
static motor_shared_outer_to_position_speed_t g_outer_data;
void rm_motor_sensor_bemf_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the BEMF sensor module */
    err = RM_MOTOR_SENSOR_BEMF_Open(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
    handle_error(err);
 /* Set pointers for angle and speed, and configure shared data */
    err = RM_MOTOR_SENSOR_BEMF_AngleSpeedInit(&g_motor_sensor_bemf_ctrl,
                                              &gp_speed_el,
                                              &gp_angle_el,
                                              &gp_sensor_output,
                                              (motor_sensor_input_inner_t *)
&g_from_inner);
    handle_error(err);
 /* Update parameters (e.g., after motor parameter identification) */
    err = RM_MOTOR_SENSOR_BEMF_ParameterUpdate(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
    handle_error(err);
 /* Main control loop example */
 while (true)
    {
```

```
 /* (Inner loop would update g_inner_data with measured currents and voltages) */
 /* Calculate angle and speed estimation */
       err = RM_MOTOR_SENSOR_BEMF_AngleSpeedCalc(&g_motor_sensor_bemf_ctrl,
                                                 (motor_sensor_input_inner_t *)
&g_inner_data,
                                                 (motor_sensor_input_outer_t *)
&g_outer_data);
      handle_error(err);
 /* Access estimated angle and speed via pointers */
 float current_angle_el = *gp_angle_el;
 float current_speed_el = *gp_speed_el;
 /* Get mechanical position and speed */
 float pos_mech   = 0.0F;
 float speed_mech = 0.0F;
       err = RM_MOTOR_SENSOR_BEMF_PositionSpeedGet(&g_motor_sensor_bemf_ctrl,
&pos_mech, &speed_mech);
      handle_error(err);
 /* Use estimated values for motor control */
 FSP_PARAMETER_NOT_USED(current_angle_el);
 FSP_PARAMETER_NOT_USED(current_speed_el);
 FSP_PARAMETER_NOT_USED(pos_mech);
 FSP_PARAMETER_NOT_USED(speed_mech);
    }
}
```

API Usage Examples

Opening the Module

```
 /* Open and configure the BEMF sensor module */
    err = RM_MOTOR_SENSOR_BEMF_Open(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
```

Setting Angle and Speed Pointers

```
 /* Set pointers for angle and speed, and configure shared data */
```

```
    err = RM_MOTOR_SENSOR_BEMF_AngleSpeedInit(&g_motor_sensor_bemf_ctrl,
                                              &gp_speed_el,
                                              &gp_angle_el,
                                              &gp_sensor_output,
                                              (motor_sensor_input_inner_t *)
&g_from_inner);
```

Calculating Angle and Speed

```
 /* Calculate angle and speed estimation */
       err = RM_MOTOR_SENSOR_BEMF_AngleSpeedCalc(&g_motor_sensor_bemf_ctrl,
                                                 (motor_sensor_input_inner_t *)
&g_inner_data,
                                                 (motor_sensor_input_outer_t *)
&g_outer_data);
      handle_error(err);
```

Getting Mechanical Position and Speed

```
 /* Get mechanical position and speed */
 float pos_mech   = 0.0F;
 float speed_mech = 0.0F;
       err = RM_MOTOR_SENSOR_BEMF_PositionSpeedGet(&g_motor_sensor_bemf_ctrl,
&pos_mech, &speed_mech);
      handle_error(err);
```

Updating Parameters

```
 /* Update parameters (e.g., after motor parameter identification) */
    err = RM_MOTOR_SENSOR_BEMF_ParameterUpdate(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
```

Resetting the Module

```
 /* Reset the BEMF sensor module variables */
    err = RM_MOTOR_SENSOR_BEMF_Reset(&g_motor_sensor_bemf_ctrl);
```

Closing the Module

```
/* Close the BEMF sensor module */
   err = RM_MOTOR_SENSOR_BEMF_Close(&g_motor_sensor_bemf_ctrl);
```

Data Structures

motor_pll_est_t	pll_est_ctrl	PLL estimator structure.
uint8_t	activate_ol_adjust_mode	Open loop adjust mode activation flag (1: activated)
uint8_t	pll_engage_status	PLL engage status (0: not engaged, 1: engaged)
float	pll_start_speed	Speed threshold for PLL activation [rad/s electrical].
float	speed_el_pll	PLL estimated electrical speed [rad/s].
float	angle_el_pll	PLL estimated electrical angle [rad].
float	e_d	Estimated d-axis back-EMF voltage [V].
float	e_q	Estimated q-axis back-EMF voltage [V].
float	angle_err_el	Estimated electrical angle error [rad].

◆ motor_mcsensor_design_params_t

struct motor_mcsensor_design_params_t		
Design parameter for open-loop damping		
Data Fields		
float	ed_hpf_omega	Natural frequency[Hz] for HPF in open-loop damping gain design.
float	ol_damping_zeta	Damping ratio for open-loop damping gain design.

◆ motor_sensor_bemf_extended_cfg_t

struct motor_sensor_bemf_extended_cfg_t		
Extended configuration for sensor bemf module		
Data Fields		
motor_oldamp_t	ol_param	Parameter for open-loop damping.
motor_oldamp_sub_t	ol_sub_param	Sub parameter for open-loop damping.
motor_mcsensor_design_params_t	d_param	Design parameter for speed control.
motor_openloop_damping_t	openloop_damping	*Openloop damping active flag
motor_mcsensor_less_switch_t	less_switch	*Soft switching active flag
float	e_obs_omega	Natural frequency of BEMF observer [Hz].
float	e_obs_zeta	Damping ratio of BEMF observer.
float	pll_est_omega	Natural frequency of PLL speed estimate loop [Hz].
float	pll_est_zeta	Damping ratio of PLL speed estimate loop.

◆ motor_sensor_bemf_instance_signals_ctrl_t

struct motor_sensor_bemf_instance_signals_ctrl_t		
Signals for BEMF sensorless control		
Data Fields		
float	speed_el	Estimated electrical speed [rad/s].
float	angle_el	Estimated electrical angle [rad].
float	inner_control_period	Inner control cycle period [sec].
float	outer_control_period	Outer control cycle period [sec].

float	e_d	Estimated d-axis back-EMF voltage [V].
float	e_q	Estimated q-axis back-EMF voltage [V].
float	angle_err_el	Estimated electrical angle error [rad].
uint8_t	speed_pi_status_flag	Flag for speed pi ctrl.
uint8_t	pll_status_flag	Flag to start pll.
uint8_t	flag_id_up_executed	Initial rotor pole position detection executed flag.
uint8_t	flag_down_to_ol	Open-loop drive transition flag.
float	ol_iq_down_step	Q-axis current reference ramping down rate [A/control period].
float	phase_err_rad_lpf	LPF value of phase error [rad].
float	init_phase_err_rad	Initialization value of phase error.
float	opl_torque_current	Torque current (Iq) in sensor-less switching [A].
float	speed_el_damp_comp	Speed compensation for open-loop damping [rad/s].
float	speed_el_lpf	Low-pass filtered electrical speed [rad/s].
uint8_t	state_id_ref	D-axis current command state.
uint8_t	state_iq_ref	Q-axis current command state.
float	speed_ref_el_ctrl	Command electrical speed value [rad/s].
motor_shared_pos_speed_to_inner_t	to_inner	Structure of data to be sent to inner loop.
motor_oldamp_sub_t	openloop_ctrl	Open-loop damping control structure.
motor_bemf_observer_t	bemf_obs_ctrl	BEMF observer control structure.
motor_pll_est_t	pll_est_ctrl	PLL estimator control structure.
motor_ol_adjust_t	ol_adjust_ctrl	BEMF and PLL adjust/tuning structure for open-loop mode.

◆ motor_sensor_bemf_instance_ctrl_t

struct motor_sensor_bemf_instance_ctrl_t
BEMF sensor instance control block

Data Fields		
uint32_t	open	module open flag
motor_sensor_bemf_instance_signals_ctrl_t	signals	Signals and controls structure.
const motor_shared_inner_to_position_speed_t *	p_from_inner	pointer to data from inner loop
motor_sensor_cfg_t const *	p_cfg	Angle related configuration structure.

Function Documentation

◆ RM_MOTOR_SENSOR_BEMF_Open()

fsp_err_t RM_MOTOR_SENSOR_BEMF_Open (motor_sensor_ctrl_t *const *p_ctrl*, motor_sensor_cfg_t const *const *p_cfg*)

Opens and configures the Angle Estimation module. Implements motor_sensor_api_t::open.

Example:

```
/* Open and configure the BEMF sensor module */
   err = RM_MOTOR_SENSOR_BEMF_Open(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
```

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSOR_BEMF_Close()

fsp_err_t RM_MOTOR_SENSOR_BEMF_Close (motor_sensor_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_sensor_api_t::close.

Example:

```
/* Close the BEMF sensor module */
   err = RM_MOTOR_SENSOR_BEMF_Close(&g_motor_sensor_bemf_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_BEMF_Reset()

fsp_err_t RM_MOTOR_SENSOR_BEMF_Reset (motor_sensor_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_sensor_api_t::reset.

Example:

```
/* Reset the BEMF sensor module variables */
   err = RM_MOTOR_SENSOR_BEMF_Reset(&g_motor_sensor_bemf_ctrl);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_BEMF_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSOR_BEMF_ParameterUpdate (motor_sensor_ctrl_t *const *p_ctrl*, motor_sensor_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed Estimation. Implements motor_sensor_api_t::parameterUpdate.

Example:

```
/* Update parameters (e.g., after motor parameter identification) */
   err = RM_MOTOR_SENSOR_BEMF_ParameterUpdate(&g_motor_sensor_bemf_ctrl,
&g_motor_sensor_bemf_cfg);
```

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_BEMF_AngleSpeedInit()

fsp_err_t RM_MOTOR_SENSOR_BEMF_AngleSpeedInit (motor_sensor_ctrl_t *const *p_ctrl*, float ** *pp_speed*, float ** *pp_angle*, motor_sensor_data_exchange_t *const *p_out_extra_data*)

Sets pointers to angle and speed variables, and configures extra data structures for the BEMF observer.

Example:

```
/* Set pointers for angle and speed, and configure shared data */
   err = RM_MOTOR_SENSOR_BEMF_AngleSpeedInit(&g_motor_sensor_bemf_ctrl,
                                             &gp_speed_el,
                                             &gp_angle_el,
                                             &gp_sensor_output,
                                             (motor_sensor_input_inner_t *)
&g_from_inner);
```

This function initializes pointer outputs for speed and angle, sets up shared data pointers for communication between control layers, and updates motor parameters from the inner loop input. It also triggers parameter recalculation for the observer.

Parameters

[in]	p_ctrl	Pointer to motor angle control structure.
[out]	pp_speed	Pointer to output variable for speed pointer.
[out]	pp_angle	Pointer to output variable for angle pointer.
[out]	p_out_extra_data	Pointer to extra output data structure pointer.

Return values

FSP_SUCCESS	Successfully set pointers.

◆ RM_MOTOR_SENSOR_BEMF_AngleSpeedCalc()

fsp_err_t RM_MOTOR_SENSOR_BEMF_AngleSpeedCalc (motor_sensor_ctrl_t *const *p_ctrl*, motor_sensor_input_inner_t *const *p_input_inner*, motor_sensor_input_outer_t *const *p_input_outer*)

Calculates angle and speed using BEMF observer and open-loop estimator.

Example:

```
/* Calculate angle and speed estimation */
      err = RM_MOTOR_SENSOR_BEMF_AngleSpeedCalc(&g_motor_sensor_bemf_ctrl,
                                                (motor_sensor_input_inner_t *)
&g_inner_data,
                                                (motor_sensor_input_outer_t *)
&g_outer_data);
     handle_error(err);
```

This function estimates the rotor angle and speed based on motor feedback and control mode. It updates internal references and manages open-loop/PI transitions.

Parameters

[in]	p_ctrl	Pointer to motor angle control structure.
[in]	p_input_inner	Pointer to inner loop input data.
[in]	p_input_outer	Pointer to outer loop input data.

Return values

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Null pointer or not open.

◆ RM_MOTOR_SENSOR_BEMF_PositionSpeedGet()

fsp_err_t RM_MOTOR_SENSOR_BEMF_PositionSpeedGet (motor_sensor_ctrl_t *const *p_ctrl*, float *const *p_pos*, float *const *p_speed*)

Retrieves the rotor position and speed in mechanical [rad] and [rad/s].

Example:

```
/* Get mechanical position and speed */
float pos_mech   = 0.0F;
float speed_mech = 0.0F;
      err = RM_MOTOR_SENSOR_BEMF_PositionSpeedGet(&g_motor_sensor_bemf_ctrl,
&pos_mech, &speed_mech);
     handle_error(err);
```

This function calculates the mechanical speed from the internal electrical speed state, converting it using the motor's pole pair count. The position output is currently not implemented.

Parameters

[in]	p_ctrl	Pointer to the motor sensor control instance.
[out]	p_pos	Pointer to store the calculated mechanical position [rad]. (Currently not implemented.)
[out]	p_speed	Pointer to store the calculated mechanical speed [rad/s].

Return values

FSP_SUCCESS	Calculation successful.
FSP_ERR_ASSERTION	Null pointer or not open.

Detailed Description

Motor Sensor Hall on RA MCUs. This module implements the Motor sensor Interface.

Overview

The Motor Sensor Hall module provides rotor angle estimation and rotational speed calculation using Hall effect sensors. Hall sensors detect the magnetic field of the rotor and output digital signals that indicate the rotor position. By monitoring the transitions of these Hall signals, the module calculates the electrical angle and speed of the motor.

Features

The Motor Sensor Hall module has the following key features:

- Rotor electrical angle estimation based on Hall sensor signals (U, V, W)
- Rotational speed calculation with multiple estimation methods:
    - Moving average speed estimation
    - Last pulse speed estimation

    - Automatic weighted mixing of both methods
- Rotation direction detection (CW/CCW)
- Configurable Hall signal pattern for different motor configurations
- Angle correction coefficient for alignment adjustment
- Speed output clamping based on elapsed time for stability

Configuration

Build Time Configurations for rm_motor_sensor_hall

The following build time configurations are available for this module:

Configuration	Description	Default
Parameter Checking	Enables parameter checking for API functions	Enabled

Configurations for Motor Sensor Hall on Motor Sensor Hall

The following configurations are available when adding the Motor Sensor Hall module:

Configuration	Description	Default
Hall Sensor U Port	GPIO port pin for Hall sensor U signal input	-
Hall Sensor V Port	GPIO port pin for Hall sensor V signal input	-
Hall Sensor W Port	GPIO port pin for Hall sensor W signal input	-
Hall Pattern	The order of Hall signal pattern (6 patterns + wrap)	{5, 4, 6, 2, 3, 1, 5}
Angle Correction	Coefficient to correct the estimated angle [rad]	0.0
Default Counts	Default counts for Hall signal period reset	1000
Maximum Period	Maximum counts of Hall signal period before speed is assumed zero	60000
Speed Mix Deviation Threshold	Deviation threshold (0~1) for speed mixing weight adjustment	0.1
Speed Mix Switch Threshold	Speed threshold [rad/s] for switching between estimation methods	100.0
Speed Select	Speed output selection method	Auto

Build Time Configurations for rm_motor_sensor_hall

The following build time configurations are defined in fsp_cfg/rm_motor_sensor_hall_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Advanced Motor Middleware > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sensor_hall)

This module can be added to the Stacks tab via New Stack > Motor > Advanced Motor Middleware > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sensor_hall).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor0_sensor_hall	Module name.
Sensor Configuration			
Sensor Configuration > Port			
U phase input port	Manual Entry	BSP_IO_PORT_11_PIN_02	Hall sensor port U
V phase input port	Manual Entry	BSP_IO_PORT_12_PIN_00	Hall sensor port V
W phase input port	Manual Entry	BSP_IO_PORT_11_PIN_10	Hall sensor port W
Sensor Configuration > Hall Sensor pattern			
Pattern #1	Must be a valid integer	1	The order of hall signal pattern
Pattern #2	Must be a valid integer	5	The order of hall signal pattern
Pattern #3	Must be a valid integer	4	The order of hall signal pattern
Pattern #4	Must be a valid integer	6	The order of hall signal pattern
Pattern #5	Must be a valid integer	2	The order of hall signal pattern
Pattern #6	Must be a valid integer	3	The order of hall signal pattern
Estimator Configuration			
Estimator Configuration > Compensation Angle [rad]	Must be a valid value	0.0F	parameter for rotor angle compensation
Default Counts	Must be a valid non-negative value.	300U	Default counts set to period of hall signal

Maximum Counts	Must be a valid non-negative value.	500U	Maximum count limit for hall signal period
Speed Calculation			
Speed Calculation Method	• Select Auto • Moving Average • Last Pulse	Select Auto	Method used for calculating speed
Speed Mixing Deviation Threshold	Must be a value between 0.0 and 1.0.	0.1	Speed mixing deviation threshold (0 ~ 1), if the deviation ratio is above this value, the weight of faster speed estimation will be increased. Used when Speed Calculation method is [Select Auto]
Speed Calculation > Speed Mixing Threshold [rad/s]	Must be a valid value	100.0	Speed mixing switching threshold in [rad/s], the weight of more precise speed estimation will increase very fast above this value. Used when Speed Calculation method is [Select Auto].

Clock Configuration

This module does not require specific clock configuration. The speed calculation is based on the carrier interrupt period provided by the inner control loop.

Pin Configuration

This module requires three GPIO pins configured as inputs for the Hall sensor signals:

Pin	Description
Hall U	Hall sensor U-phase signal input
Hall V	Hall sensor V-phase signal input
Hall W	Hall sensor W-phase signal input

Configure these pins as digital inputs in the Pin Configuration tool.

Usage Notes

Hall Sensor Signal Pattern

The Hall sensor signal pattern must be configured according to the motor and sensor arrangement. The pattern array defines the sequence of Hall signal combinations (3-bit value from U, V, W signals) for one electrical revolution. The pattern should include 6 unique values plus a wrap-around value.

Example pattern for a typical BLDC motor: {5, 4, 6, 2, 3, 1, 5} // Pattern wraps from index 6 back to index 0

Speed Estimation Methods

The module supports three speed estimation methods selectable via the speed_select configuration:

Method	Description	Use Case
MOTOR_SENSOR_HALL_SPEED_SELECT_AUTO	Weighted average of both methods	General purpose (recommended)
MOTOR_SENSOR_HALL_SPEED_SELECT_MOVAVG	Moving average over 6 Hall periods	Smooth speed output, higher latency
MOTOR_SENSOR_HALL_SPEED_SELECT_LAST_PULSE	Speed from latest Hall period	Fast response, more noise

When using automatic mode, the weight between fast and precise estimation is dynamically calculated based on:

- Absolute speed (lower speeds favor precise estimation)
- Deviation between the two estimates (larger deviation favors fast estimation)

Angle Correction

The angle_correct parameter allows adjustment of the estimated angle to compensate for:

- Hall sensor mounting offset
- Motor phase alignment
- System-specific calibration

The correction value is added to the calculated angle in radians.

Speed Clamping at Low Speed

When the time elapsed since the last Hall signal transition exceeds the maximum_period count, the estimated speed is automatically set to zero. This prevents erroneous speed readings when the motor is stationary or rotating very slowly.

Integration with Motor Control Loop

The Motor Sensor Hall module is designed to work with the motor control inner loop:

1. Call RM_MOTOR_SENSOR_HALL_Open to initialize the module
2. Call RM_MOTOR_SENSOR_HALL_AngleSpeedInit to set up data exchange pointers
3. Call RM_MOTOR_SENSOR_HALL_AngleSpeedCalc periodically from the carrier interrupt to update angle and speed
4. Call RM_MOTOR_SENSOR_HALL_PositionSpeedGet to retrieve mechanical position and speed
5. Call RM_MOTOR_SENSOR_HALL_Close to finalize the module when done

Limitations

Developers should be aware of the following limitations when using the Motor Sensor Hall module:

- The module requires a minimum rotational speed for accurate speed estimation. At very low speeds, the estimation accuracy decreases due to the discrete nature of Hall sensor signals.
- The angular resolution is limited to 60 electrical degrees (π/3 rad) between Hall signal transitions. Interpolation is used between transitions, but accuracy depends on speed consistency.
- Direction detection requires at least one Hall signal transition. Initial direction after startup may be incorrect until the first transition occurs.
- The maximum_period should be set appropriately for the application's minimum expected speed to avoid premature zero-speed detection.
- Only the functions/types/macros exposed via rm_motor_sensor_hall.h and rm_motor_sesnor_api.h should be accessed by user code and that the contents of the other headers is subject to change.

Examples

Motor Sensor Hall Basic Example

This is a basic example of minimal use of the Motor Sensor Hall module in an application.

```
void rm_motor_sensor_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSOR_HALL_Open(&g_motor_sensor_hall_ctrl,
&g_motor_sensor_hall_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Reset the module variables. */
    err = RM_MOTOR_SENSOR_HALL_Reset(&g_motor_sensor_hall_ctrl);

 /* Close the module. */
    err = RM_MOTOR_SENSOR_HALL_Close(&g_motor_sensor_hall_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Motor Sensor Hall Advanced Example

This example demonstrates using data exchange pointers and angle/speed calculation in a control loop.

```
/* Pointers for angle and speed data exchange */
static float * gp_speed_el;
```

```
static float * gp_angle_el;
static motor_sensor_output_t * gp_sensor_output;
void rm_motor_sensor_hall_advanced_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Open the Motor Sensor Hall module */
    err = RM_MOTOR_SENSOR_HALL_Open(&g_motor_sensor_hall_ctrl,
&g_motor_sensor_hall_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Set up data exchange pointers with inner loop */
    motor_shared_inner_to_position_speed_t inner_data;
    inner_data.inner_control_period = 0.0001f; /* 100us control period */
    inner_data.outer_control_period = 0.001f; /* 1ms outer loop period */
    err = RM_MOTOR_SENSOR_HALL_AngleSpeedInit(&g_motor_sensor_hall_ctrl,
                                              &gp_speed_el,
                                              &gp_angle_el,
                                              &gp_sensor_output,
                                              (motor_sensor_input_inner_t *)
&inner_data);
    assert(FSP_SUCCESS == err);
 /* Main control loop - typically called from carrier interrupt */
 while (true)
    {
 /* Application work here. */
 /* Calculate angle and speed from Hall sensor signals */
 motor_sensor_input_inner_t inner_input;
 motor_sensor_input_outer_t outer_input;
       err = RM_MOTOR_SENSOR_HALL_AngleSpeedCalc(&g_motor_sensor_hall_ctrl,
&inner_input, &outer_input);
     assert(FSP_SUCCESS == err);
 /* Access estimated values through pointers */
 float current_speed_el = *gp_speed_el; /* Electrical speed [rad/s] */
 float current_angle_el = *gp_angle_el; /* Electrical angle [rad] */
```

```
 /* Use angle and speed for motor control... */
       (void) current_speed_el;
       (void) current_angle_el;
 /* Get mechanical position and speed */
 float mechanical_position;
 float mechanical_speed;
       err = RM_MOTOR_SENSOR_HALL_PositionSpeedGet(&g_motor_sensor_hall_ctrl,
&mechanical_position, &mechanical_speed);
      assert(FSP_SUCCESS == err);
 /* mechanical_speed is in [rad/s mech] */
 /* mechanical_position is in [rad mech] */
       (void) mechanical_position;
       (void) mechanical_speed;
    }
}
void rm_motor_sensor_hall_parameter_update_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Update parameters at runtime */
 motor_sensor_hall_extended_cfg_t new_ext_cfg = g_motor_sensor_hall_ext_cfg;
    new_ext_cfg.angle_correct = 0.1f; /* Adjust angle correction */
 motor_sensor_cfg_t new_cfg =
    {
       .p_context = NULL,
       .p_extend = &new_ext_cfg,
    };
    err = RM_MOTOR_SENSOR_HALL_ParameterUpdate(&g_motor_sensor_hall_ctrl, &new_cfg);
    assert(FSP_SUCCESS == err);
}
```

Motor Sensor Hall Parameter Update Example

This example demonstrates updating parameters at runtime.

```
void rm_motor_sensor_hall_parameter_update_example (void)
```

```
{
 fsp_err_t err = FSP_SUCCESS;
 /* Update parameters at runtime */
 motor_sensor_hall_extended_cfg_t new_ext_cfg = g_motor_sensor_hall_ext_cfg;
    new_ext_cfg.angle_correct = 0.1f; /* Adjust angle correction */
 motor_sensor_cfg_t new_cfg =
    {
       .p_context = NULL,
       .p_extend = &new_ext_cfg,
    };
    err = RM_MOTOR_SENSOR_HALL_ParameterUpdate(&g_motor_sensor_hall_ctrl, &new_cfg);
    assert(FSP_SUCCESS == err);
}
```

Data Structure Documentation

◆ motor_sensor_hall_extended_cfg_t

struct motor_sensor_hall_extended_cfg_t		
Extended configuration for hall sensor module		
Data Fields		
bsp_io_port_pin_t	port_hall_sensor_u	Hall U-signal input port.
bsp_io_port_pin_t	port_hall_sensor_v	Hall V-signal input port.
bsp_io_port_pin_t	port_hall_sensor_w	Hall W-signal input port.
uint8_t	hall_pattern[MOTOR_SENSOR_HALL_SPEED_COUNTS+1]	The order of hall signal pattern.

float	angle_correct	Coefficient to correct angle.
uint16_t	default_counts	Default counts for period of hall signal to reset.
uint16_t	maximum_period	Maximum counts of hall signal period.
float	speed_mix_deviation_threshold	Speed mixing deviation threshold.
float	speed_mix_switch_threshold	Speed mixing switching threshold in [rad/s], the weight of more precise speed estimation will increase very fast above this value.
uint8_t	speed_select	Speed output selection motor_sensor_hall_speed_select_t.

◆ motor_sensor_hall_instance_signals_ctrl_t

struct motor_sensor_hall_instance_signals_ctrl_t		
Signals for hall FOC		
Data Fields		
float	speed_el	Estimated electrical speed [rad/s].
float	angle_el	Estimated electrical angle [rad].
float	inner_control_period	Inner control cycle period [sec].
float	outer_control_period	Outer control cycle period [sec].
uint8_t	state_id_ref	State of Id reference control.
uint8_t	state_iq_ref	State of Iq reference control.
float	speed_ref_el_ctrl	Command electrical speed value [rad/s].
uint8_t	hall_signal	Current hall signal pattern.
uint8_t	last_hall_signal	Previous hall signal pattern.
motor_sensor_hall_direction_t	direction	Current rotation direction.
motor_sensor_hall_direction_t	last_direction	Previous rotation direction.
uint16_t	carrier_count	Carrier interrupt count.
uint16_t	hall_period[MOTOR_SENSOR_HALL_SPEED_COUNTS]	Array of carrier counts for 2PI calculation.
uint8_t	period_counter	Counter index for hall_period array.
float	calculated_angle_el	Calculated rotor electrical angle [rad].

float	calculated_angle_el_per_count	Angle increment per carrier count [rad].
float	calculated_speed_el	Calculated electrical speed [rad/s].
float	calculated_speed_el_last_pulse	Electrical speed from last pulse [rad/s].
float	calculated_speed_el_mvavg	Moving average electrical speed [rad/s].
float	weight	Weight of speed estimated by last pulse.
uint8_t	hall_signal_memory	Memorized hall signal at startup.
motor_sensor_hall_signal_status_t	hall_signal_status	Hall signal capture status.
uint8_t	hall_signal_count	Rotation counter.
float	pseudo_speed_rad	Pseudo speed for startup [rad/s].
float	add_pseudo_speed_rad	Step of pseudo speed to update [rad/s].
uint16_t	startup_carrier_count	Counter of carrier interrupt for startup.
uint8_t	startup_flag	Flag for startup sequence.

◆ motor_sensor_hall_instance_ctrl_t

struct motor_sensor_hall_instance_ctrl_t		
Hall sensor instane control block		
Data Fields		
uint32_t	open	module open flag
motor_sensor_hall_instance_signals_ctrl_t	signals	Signals and controls structure.
motor_shared_pos_speed_to_inner_t	to_inner	Structure of data to be sent to inner loop.
const motor_shared_inner_to_position_speed_t *	p_from_inner	pointer to data from inner loop
motor_sensor_cfg_t const *	p_cfg	Angle related configuration structure.

Enumeration Type Documentation

◆ motor_sensor_hall_direction_t

enum motor_sensor_hall_direction_t	
Motor rotation direction	
Enumerator	
MOTOR_SENSOR_HALL_DIRECTION_CW	Clockwise rotation direction.
MOTOR_SENSOR_HALL_DIRECTION_CCW	Counter-clockwise rotation direction.

◆ motor_sensor_hall_speed_select_t

enum motor_sensor_hall_speed_select_t	
Speed estimation post-process method definitions	
Enumerator	
MOTOR_SENSOR_HALL_SPEED_SELECT_AUTO	Use weighted average (weights depend on speed and difference)
MOTOR_SENSOR_HALL_SPEED_SELECT_MOVAVG	Use moving averaged speed as output.
MOTOR_SENSOR_HALL_SPEED_SELECT_LAST_PULSE	Use the latest speed as output.

◆ motor_sensor_hall_signal_status_t

enum motor_sensor_hall_signal_status_t	
Status for hall signal capture	
Enumerator	
MOTOR_SENSOR_HALL_SIGNAL_STATUS_INITIAL	Hall signal is not captured (Initial state)
MOTOR_SENSOR_HALL_SIGNAL_STATUS_CAPTURED	Hall signal is captured.

Function Documentation

◆ RM_MOTOR_SENSOR_HALL_Open()

fsp_err_t RM_MOTOR_SENSOR_HALL_Open (motor_sensor_ctrl_t *const *p_ctrl*, motor_sensor_cfg_t const *const *p_cfg*)

Opens and configures the Angle Estimation module. Implements motor_sensor_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_SENSOR_HALL_Open(&g_motor_sensor_hall_ctrl,
&g_motor_sensor_hall_cfg);
```

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSOR_HALL_Close()

fsp_err_t RM_MOTOR_SENSOR_HALL_Close (motor_sensor_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_sensor_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_SENSOR_HALL_Close(&g_motor_sensor_hall_ctrl);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_HALL_Reset()

fsp_err_t RM_MOTOR_SENSOR_HALL_Reset (motor_sensor_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_sensor_api_t::reset.

Example:

```
/* Reset the module variables. */
   err = RM_MOTOR_SENSOR_HALL_Reset(&g_motor_sensor_hall_ctrl);
   assert(FSP_SUCCESS == err);
```

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_HALL_AngleSpeedInit()

fsp_err_t RM_MOTOR_SENSOR_HALL_AngleSpeedInit (motor_sensor_ctrl_t *const *p_ctrl*, float ** *pp_speed*, float ** *pp_angle*, motor_sensor_data_exchange_t *const *p_out_extra_data*)

Sets output pointers for speed, angle, and extra data for the inner loop estimation.

This function assigns the addresses of the internal speed and angle variables to the provided pointers, and sets up the pointer to extra output data for the inner loop. Also copies control period values from the inner loop input data to the internal signal structure and stores a reference to the inner data.

Example:

```
/* Set up data exchange pointers with inner loop */
   motor_shared_inner_to_position_speed_t inner_data;
   inner_data.inner_control_period = 0.0001f; /* 100us control period */
   inner_data.outer_control_period = 0.001f; /* 1ms outer loop period */
   err = RM_MOTOR_SENSOR_HALL_AngleSpeedInit(&g_motor_sensor_hall_ctrl,
                                             &gp_speed_el,
                                             &gp_angle_el,
                                             &gp_sensor_output,
                                             (motor_sensor_input_inner_t *)
&inner_data);
   assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to the motor sensor control structure.
[out]	pp_speed	Address of pointer to store the speed variable address.
[out]	pp_angle	Address of pointer to store the angle variable address.
[out]	p_out_extra_data	Address of pointer to store extra output data address.

Return values

FSP_SUCCESS	Pointers set successfully.

◆ RM_MOTOR_SENSOR_HALL_AngleSpeedCalc()

fsp_err_t RM_MOTOR_SENSOR_HALL_AngleSpeedCalc (motor_sensor_ctrl_t *const *p_ctrl*, motor_sensor_input_inner_t *const *p_inner*, motor_sensor_input_outer_t *const *p_outer*)

Calculates angle and speed based on Hall sensor inputs.

This function reads Hall sensor signals, determines rotation direction, calculates speed and angle, and updates the relevant output pointers.

Example:

```
/* Calculate angle and speed from Hall sensor signals */
motor_sensor_input_inner_t inner_input;
motor_sensor_input_outer_t outer_input;
      err = RM_MOTOR_SENSOR_HALL_AngleSpeedCalc(&g_motor_sensor_hall_ctrl,
&inner_input, &outer_input);
     assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to motor angle control structure.
[in]	p_inner	Pointer to inner loop input data.
[in]	p_outer	Pointer to outer loop input data.

Return values

FSP_SUCCESS	Calculation performed successfully.
FSP_ERR_ASSERTION	Null pointer or invalid state detected.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSOR_HALL_PositionSpeedGet()

fsp_err_t RM_MOTOR_SENSOR_HALL_PositionSpeedGet (motor_sensor_ctrl_t *const *p_ctrl*, float *const *p_pos*, float *const *p_speed*)

Get mechanical position and speed from Hall sensor measurements.

This function retrieves the current mechanical rotational position and speed from the Hall sensor controller. The speed output is normalized to mechanical units [rad/s mech] by dividing the electrical speed by the number of pole pairs. The position output is currently set to zero and must be implemented.

Example:

```
/* Get mechanical position and speed */
float mechanical_position;
float mechanical_speed;
      err = RM_MOTOR_SENSOR_HALL_PositionSpeedGet(&g_motor_sensor_hall_ctrl,
&mechanical_position, &mechanical_speed);
     assert(FSP_SUCCESS == err);
```

Parameters

[in]	p_ctrl	Pointer to the Hall sensor instance control structure.
[out]	p_pos	Pointer to store the resulting mechanical position [rad mech].
[out]	p_speed	Pointer to store the resulting mechanical speed [rad/s mech].

Return values

FSP_SUCCESS	Always returns success.

Detailed Description

Usual control of a SPM (Surface Permanent Magnet) motor on RA MCUs. This module implements the Motor 120 degree control (rm_motor_120_degree).

Overview

The motor 120 degree control is used to control a motor rotation in an application. This module is implemented with using a SPM motor. User can start/stop motor rotation simply.

Features

The motor 120 degree module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows examples of target hardware of this Motor 120-degree Module.

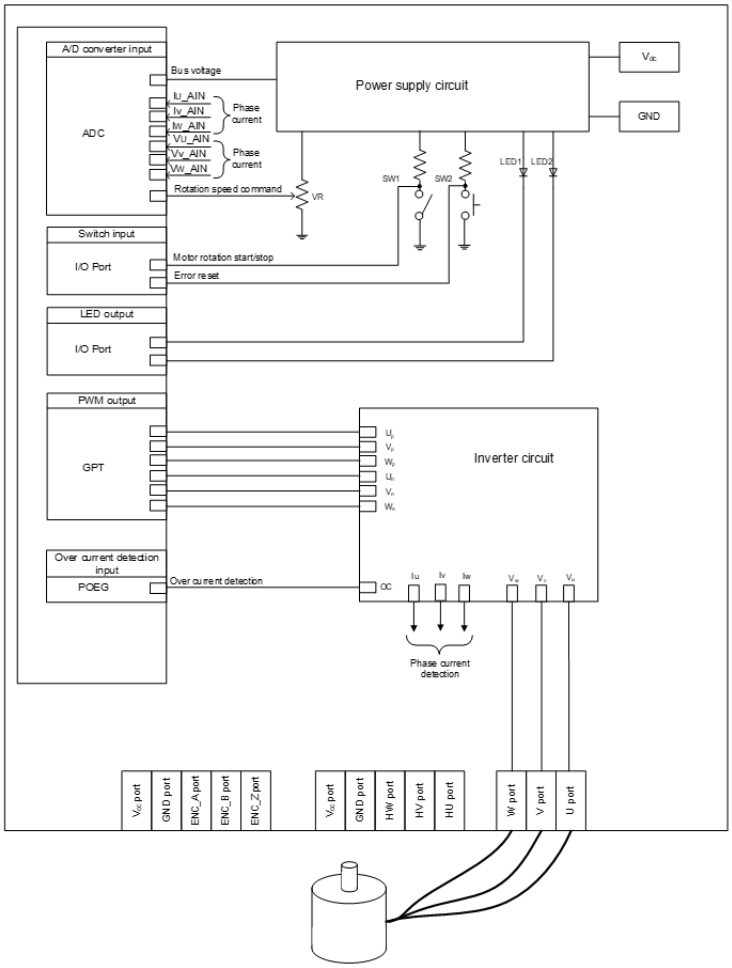

Figure 263: Example of target hardware of motor 120-degree sensorless

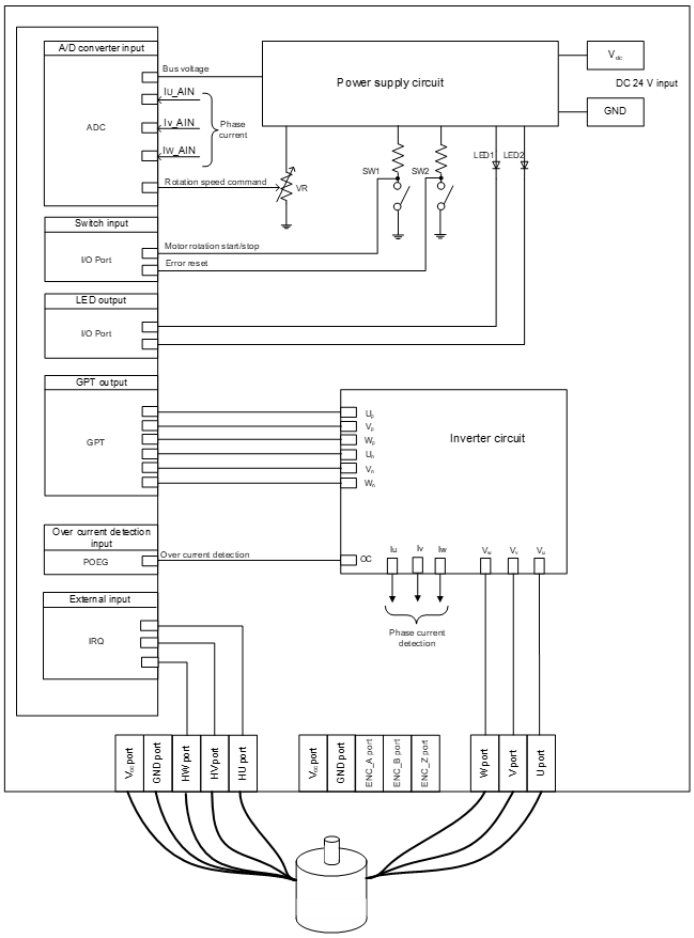

Figure 264: Example of target hardware of motor 120-degree with hall sensor

Modulation

The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 265: Modulation factor

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 266: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor 120-degree module.

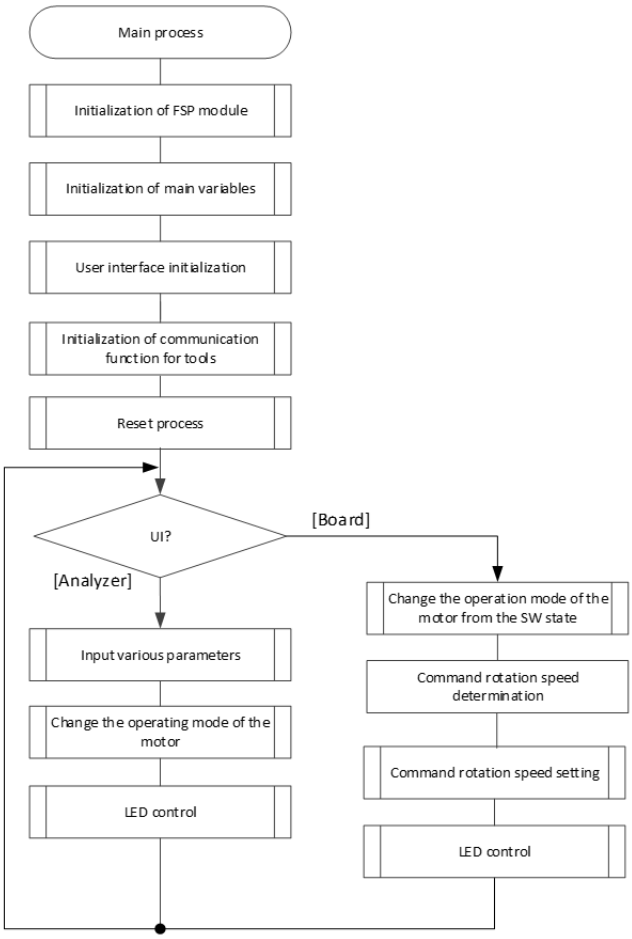

Figure 267: Main process

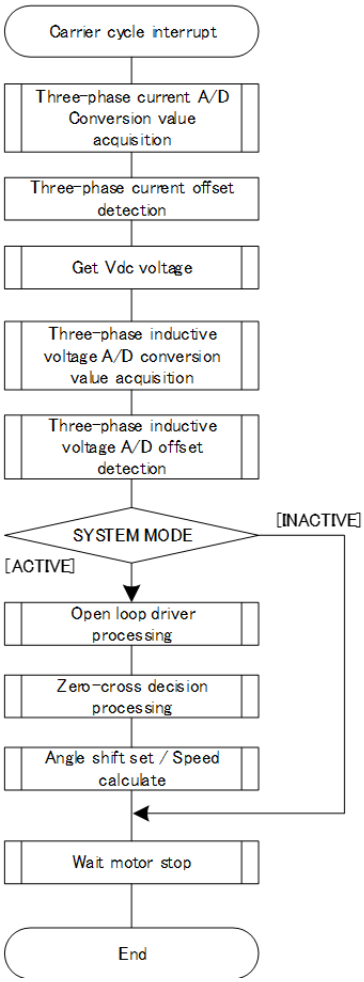

Figure 268: Current control process of 120-degree sensorless

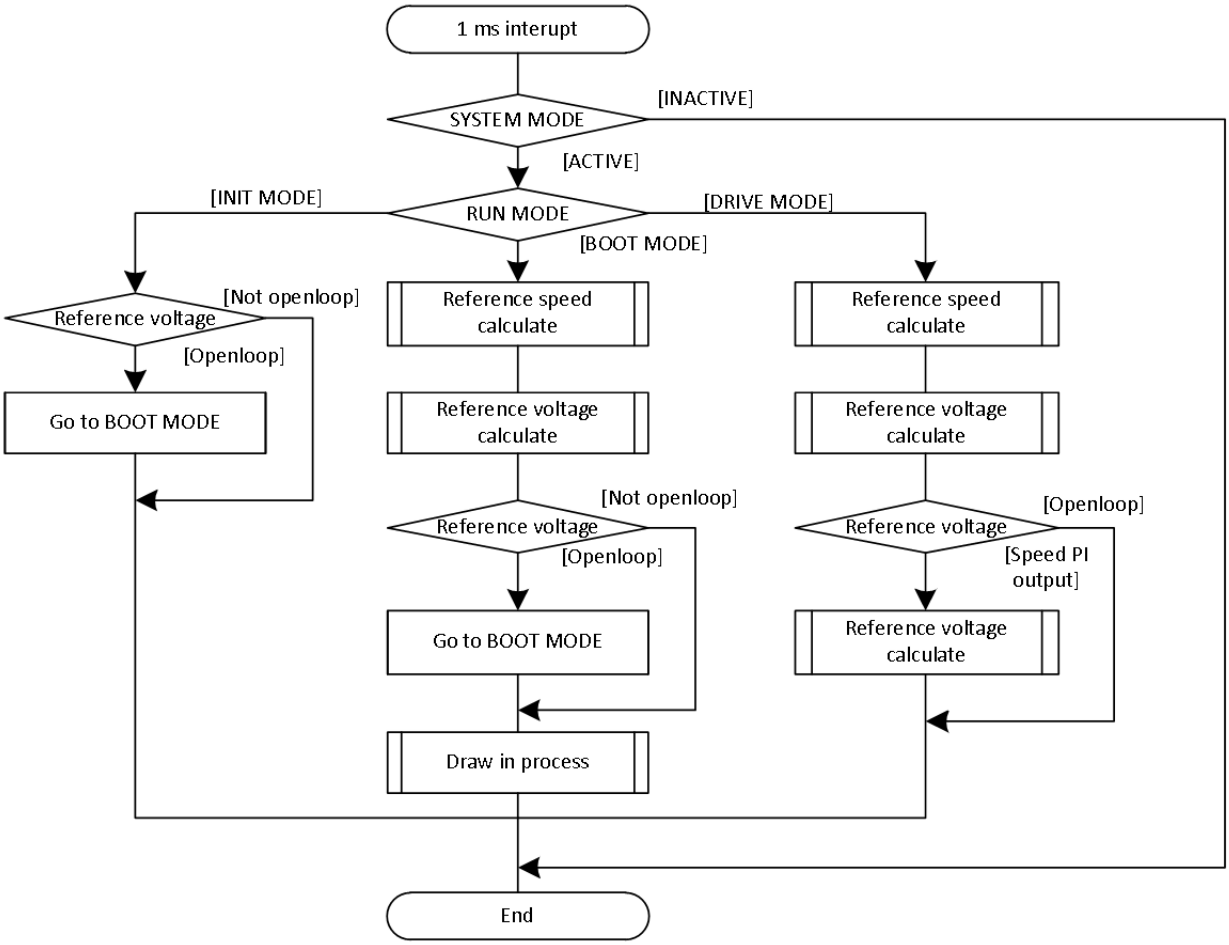

Figure 269: Speed control process of 120-degree sensorless

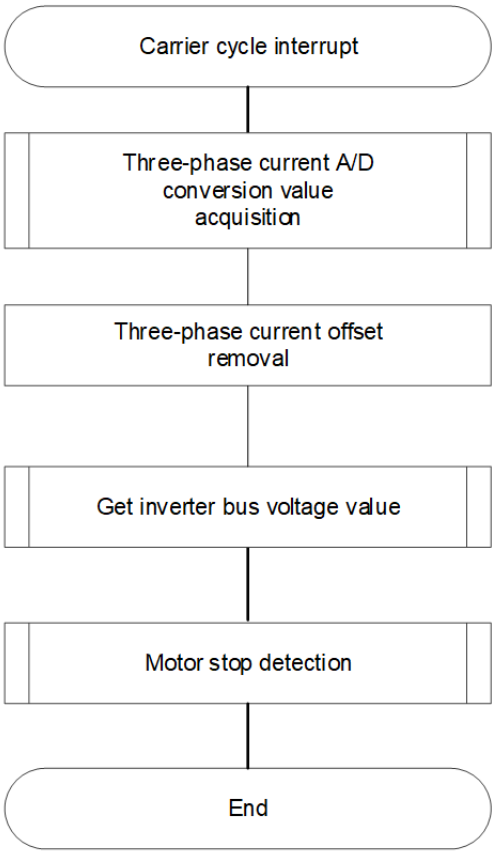

Figure 270: Current control process of 120-degree with hall sensor

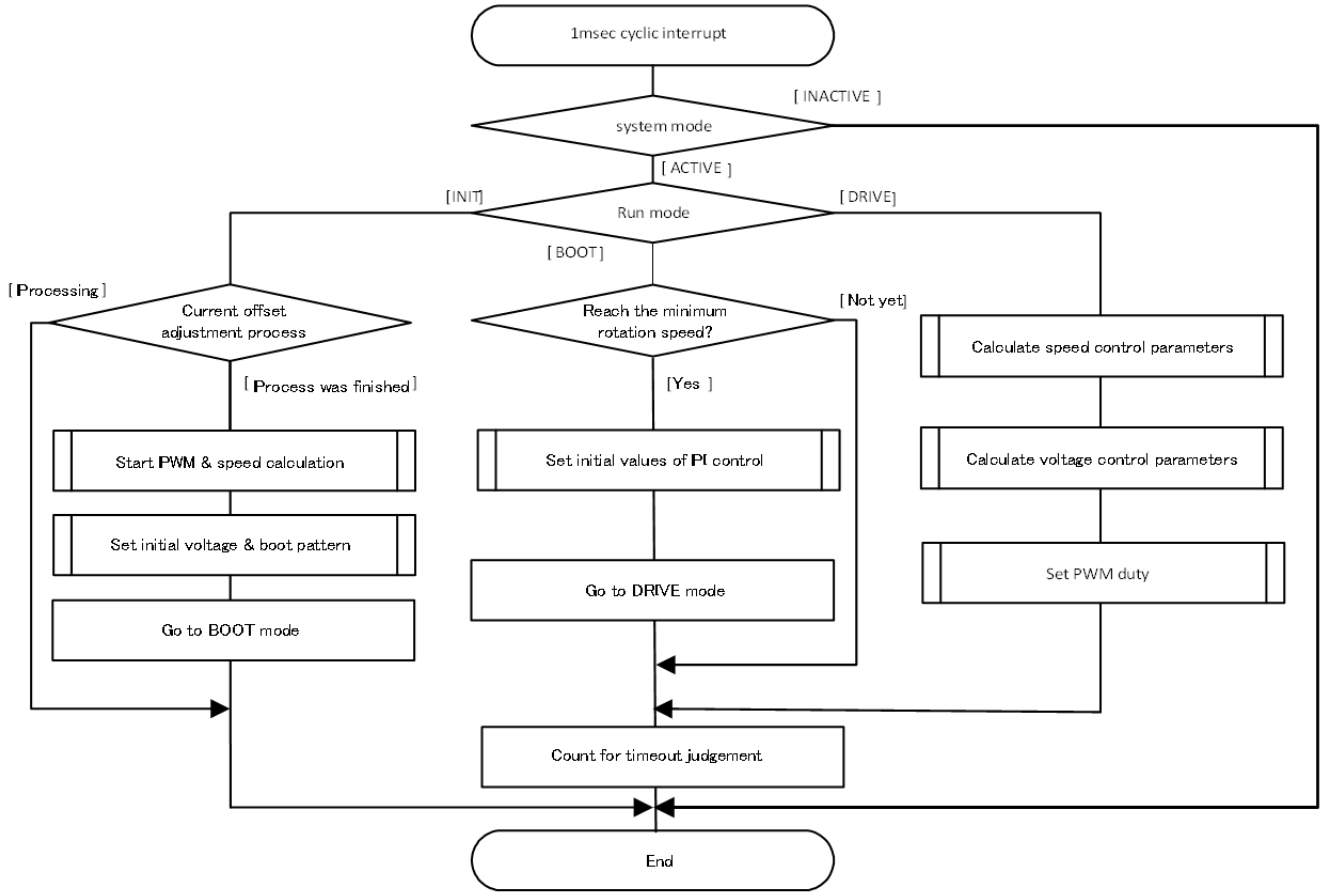

Figure 271: Speed control process of 120-degree with hall sensor

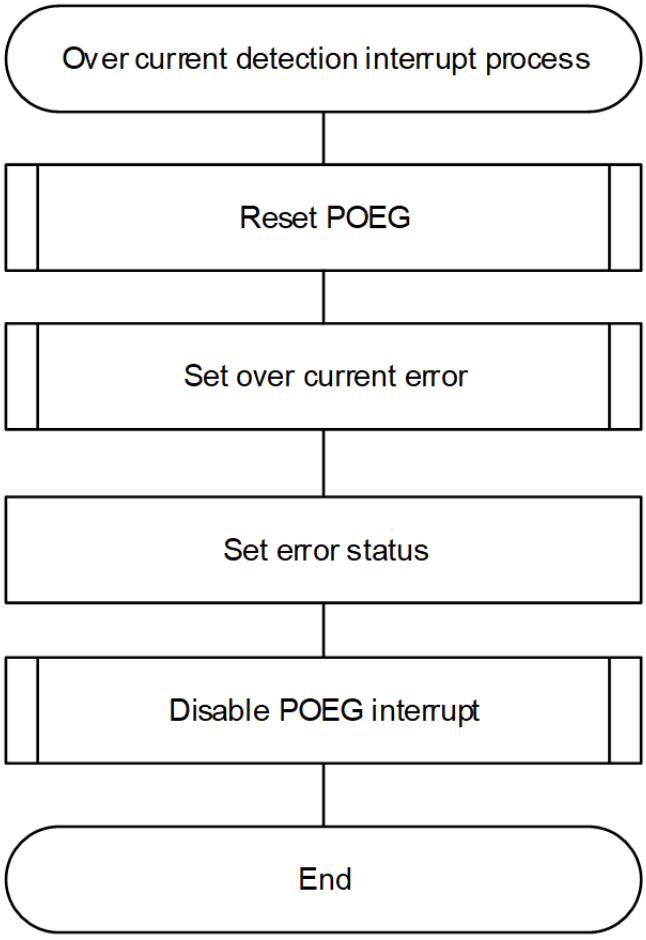

Figure 272: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_120_degree

The following build time configurations are defined in fsp_cfg/rm_motor_120_degree_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor 120 degree control (rm_motor_120_degree)

This module can be added to the Stacks tab via New Stack > Motor > Motor 120 degree control (rm_motor_120_degree).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_120_degree0	Module name.
Limit of over current (A)	Must be a valid value	4.0	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	14.0	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor 120 degree in an application.

```
void motor_120_degree_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
 /* Start motor rotation */
    (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
 /* Get current motor speed */
    (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
 /* Get wait stop flag */
    (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
 /* Check error */
    (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset the process. */
    (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
}
```

Data Structures

MOTOR_120_DEGREE_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_120_DEGREE_Open()

fsp_err_t RM_MOTOR_120_DEGREE_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the motor in register start mode. Implements motor_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_120_DEGREE_Open(g_motor_120_degree0.p_ctrl,
g_motor_120_degree0.p_cfg);
```

Return values

FSP_SUCCESS	Successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

Note

This function should only be called once as motor configuration registers can only be written to once so subsequent calls will have no effect.

◆ RM_MOTOR_120_DEGREE_Close()

fsp_err_t RM_MOTOR_120_DEGREE_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified motor control block. Implements motor_api_t::close.

Example:

```
/* Close the module. */
   (void) RM_MOTOR_120_DEGREE_Close(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Reset()

fsp_err_t RM_MOTOR_120_DEGREE_Reset (motor_ctrl_t *const *p_ctrl*)

Reset motor control block. Implements motor_api_t::reset.

Example:

```
/* Reset the process. */
   (void) RM_MOTOR_120_DEGREE_Reset(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Run()

fsp_err_t RM_MOTOR_120_DEGREE_Run (motor_ctrl_t *const *p_ctrl*)

Run motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_120_DEGREE_Run(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_Stop()

fsp_err_t RM_MOTOR_120_DEGREE_Stop (motor_ctrl_t *const *p_ctrl*)

Stop motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_120_DEGREE_Stop(g_motor_120_degree0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_ErrorSet()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
    (void) RM_MOTOR_120_DEGREE_ErrorSet(g_motor_120_degree0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully set error information.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_SpeedSet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_120_DEGREE_SpeedSet(g_motor_120_degree0.p_ctrl,
DEF_120_DEGREE_SPEED_REF);
```

Return values

FSP_SUCCESS	Successfully set speed reference.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_120_DEGREE_StatusGet()

fsp_err_t RM_MOTOR_120_DEGREE_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_120_DEGREE_StatusGet(g_motor_120_degree0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully got current control status.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_SpeedGet()

fsp_err_t RM_MOTOR_120_DEGREE_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_120_DEGREE_SpeedGet(g_motor_120_degree0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully got rotational speed.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_WaitStopFlagGet()

fsp_err_t RM_MOTOR_120_DEGREE_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag_wait_stop*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

```
/* Get wait stop flag */
   (void) RM_MOTOR_120_DEGREE_WaitStopFlagGet(g_motor_120_degree0.p_ctrl,
&smpl_wait_stop_flag);
```

Return values

FSP_SUCCESS	Successfully got wait stop flag.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_ErrorCheck()

fsp_err_t RM_MOTOR_120_DEGREE_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_120_DEGREE_ErrorCheck(g_motor_120_degree0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully error checke process.
FSP_ERR_ASSERTION	p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	Data received pointer is invalid.

Note

◆ RM_MOTOR_120_DEGREE_PositionSet()

fsp_err_t RM_MOTOR_120_DEGREE_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_120_DEGREE_AngleGet()

fsp_err_t RM_MOTOR_120_DEGREE_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Set position reference. Implements motor_api_t::angleGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_120_DEGREE_FunctionSelect()

fsp_err_t RM_MOTOR_120_DEGREE_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed estimation module is used to calculate rotor angle and rotational speed

in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application.

Features

The Motor Angle and Speed Estimation Module has below features.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_estimate_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Estimation (rm_motor_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Estimation (rm_motor_estimate).

Configuration	Options	Default	Description
Motor Parameter			
Pole pairs	Must be a valid positive integer.	2	Pole pairs
Motor Parameter > Resistance[ohm]	Must be a valid value	8.5F	Resistance
Motor Parameter > Inductance of d-axis[H]	Must be a valid value	0.0045F	Inductance of d-axis
Motor Parameter > Inductance of q-axis[H]	Must be a valid value	0.0045F	Inductance of q-axis
Motor Parameter > Permanent magnetic flux[Wb]	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia[kgm^2]	Must be a valid value	0.0000028F	Rotor inertia
Motor Parameter > Nominal current[Arms]	Must be a valid value	1.67	Nominal current
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Openloop damping	• Disable • Enable	Enable	Openloop damping functionally enable or

			disable
Natural frequency of BEMF observer	Must be a valid value	1000.0F	Natural frequency of BEMF observer
Damping ratio of BEMF observer	Must be a valid value	1.0F	Damping ratio of BEMF observer
Natural frequency of PLL Speed estimate loop	Must be a valid value	20.0F	Natural frequency of PLL Speed estimate loop
Damping ratio of PLL Speed estimate loop	Must be a valid value	1.0F	Damping ratio of PLL Speed estimate loop
Control period	Must be a valid value	0.00005F	Control period

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the Motor Angle and Speed Estimation:

Examples

Basic Example

This is a basic example of minimal use of the Motor Angle and Speed Estimation in an application.

```
void motor_estimate_basic_example (void)
{
 fsp_err_t             err = FSP_SUCCESS;
 motor_angle_current_t smpl_current:
 motor_angle_voltage_reference_t smpl_voltage;
 /* Initializes the module. */
    err = RM_MOTOR_ESTIMATE_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 while (true)
```

```
    {
 /* Application work here. */
 /* Set PI Control Flag before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_FlagPiCtrlSet(&g_mtr_angle0_ctrl, 1U);
       smpl_current.id = 1.0F;
       smpl_current.iq = 1.0F;
       smpl_voltage.vd = 10.0F;
       smpl_voltage.vq = 10.0F;
 /* Set Current and Speed data before get Angle/Speed and Estimated Component */
       (void) RM_MOTOR_ESTIMATE_CurrentSet(&g_mtr_angle0_ctrl, smpl_current,
smpl_voltage);
 /* Set Internal Speed Reference & damping speed data before get Angle/Speed and
Estimated Component */
       (void) RM_MOTOR_ESTIMATE_SpeedSet(&g_mtr_angle0_ctrl, 104.27F, 10.0F);
 /* Get Angle/Speed data */
       (void) RM_MOTOR_ESTIMATE_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
 /* Get Estimated Component */
       (void) RM_MOTOR_ESTIMATE_EstimatedComponentGet(&g_mtr_angle0_ctrl, &f_get_ed,
&f_get_eq);
    }
}
```

Function Documentation

◆ RM_MOTOR_ESTIMATE_Open()

fsp_err_t RM_MOTOR_ESTIMATE_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle Estimation module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_ESTIMATE_Close()

fsp_err_t RM_MOTOR_ESTIMATE_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_ESTIMATE_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_CurrentSet()

fsp_err_t RM_MOTOR_ESTIMATE_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_SpeedSet()

fsp_err_t RM_MOTOR_ESTIMATE_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_ESTIMATE_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_AngleSpeedGet()

fsp_err_t RM_MOTOR_ESTIMATE_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_EstimatedComponentGet()

fsp_err_t RM_MOTOR_ESTIMATE_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_SUCCESS	Successfully data gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_ESTIMATE_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_InternalCalculate()

fsp_err_t RM_MOTOR_ESTIMATE_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_AngleAdjust()

fsp_err_t RM_MOTOR_ESTIMATE_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_EncoderCyclic()

fsp_err_t RM_MOTOR_ESTIMATE_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_ESTIMATE_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_ESTIMATE_CyclicProcess()

fsp_err_t RM_MOTOR_ESTIMATE_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Perform induction cyclic process. Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_ESTIMATE_SensorDataSet()

fsp_err_t RM_MOTOR_ESTIMATE_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)

Set sensor data. Implements motor_angle_api_t::sensorDataSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with an encoder module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with an encoder module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_sense_encoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Support HALL sensor	• Support • Unsupport	Support	

Configurations for Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with encoder (rm_motor_sense_encoder).

Configuration	Options	Default	Description

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with an encoder: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with an encoder in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_ENCODER_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Initialize motor with the encoder */
       (void) RM_MOTOR_SENSE_ENCODER_AngleAdjust(&g_mtr_angle0_ctrl);
 /* Perform cyclic encoder process*/
       (void) RM_MOTOR_SENSE_ENCODER_CyclicProcess(&g_mtr_angle0_ctrl);
 /* Calculate information with encoder signal input */
       (void) RM_MOTOR_SENSE_ENCODER_InternalCalculate(&g_mtr_angle0_ctrl);
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_ENCODER_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
```

```
/* Get calculated component */
      (void) RM_MOTOR_SENSE_ENCODER_InfoGet(&g_mtr_angle0_ctrl, &temp_info);
   }
/* Reset the module */
   (void) RM_MOTOR_SENSE_ENCODER_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
   (void) RM_MOTOR_SENSE_ENCODER_Close(&g_mtr_angle0_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_SENSE_ENCODER_Open()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle Encoder module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	Angle Encoder module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSE_ENCODER_Close()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Encoder module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_Reset()

fsp_err_t RM_MOTOR_SENSE_ENCODER_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Encoder module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_ENCODER_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Perform cyclic process. Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_InfoGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_ENCODER_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed calculation with an encoder. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_ENCODER_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software currentSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software speedSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software flagPiCtrlSet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense encoder software estimatedComponentGet is not supported.

◆ RM_MOTOR_SENSE_ENCODER_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_ENCODER_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)

Set sensor data. Implements motor_angle_api_t::sensorDataSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with hall sensors module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with hall sensors module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_hall

The following build time configurations are defined in fsp_cfg/rm_motor_sense_hall_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with Hall sensors (rm_motor_sense_hall).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_angle0	Module name.
Hall sensor			
U phase input port	Manual Entry	BSP_IO_PORT_12_PIN_04	Hall sensor port U
V phase input port	Manual Entry	BSP_IO_PORT_12_PIN_05	Hall sensor port V
W phase input port	Manual Entry	BSP_IO_PORT_11_PIN_01	Hall sensor port W
sensor pattern #1	Must be a valid integer	1	Hall sensor pattern #1
sensor pattern #2	Must be a valid integer	5	Hall sensor pattern #2
sensor pattern #3	Must be a valid integer	4	Hall sensor pattern #3
sensor pattern #4	Must be a valid integer	6	Hall sensor pattern #4
sensor pattern #5	Must be a valid integer	2	Hall sensor pattern #5
sensor pattern #6	Must be a valid integer	3	Hall sensor pattern #6
Process Frequency (kHz)	Must be a valid value	20.0F	Frequency to perform the process.
Correction parameter	Must be a valid value	0.0F	Correction parameter

of rotor angle			of rotor angle
Default counts of carrier interrupt	Must be a valid non-negative value.	300U	Default counts of carrier interrupt during a period of Hall signal change
Maximum counts of one rotation	Must be a valid non-negative value.	500U	Maximum counts of carrier interrupt during one rotor rotation
Target value for pseudo speed (rad/s)	Must be a valid non-negative value.	100.0	Target value for pseudo speed (rad/s).
Target time until the pseudo speed update reaches (msec)	Must be a valid non-negative value.	300.0	Target time until the pseudo speed update reaches (msec).
Rotation counts to start speed estimation	Must be a valid integer	2	Rotation counts to start of speed estimation.
Carrier counts at startup	Must be a valid integer	400	Carrier counts to wait the start timing of pseudo speed update
Speed to judge start	Must be a valid non-negative value.	250.0	Speed to judge start PI calculation.

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with hall sensors: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with hall sensors in an application.

```
void motor_sense_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_HALL_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
```

```
 * This implementation is an example. */
// while (true)
   {
/* Application work here. */
/* Get angle/speed data */
      (void) RM_MOTOR_SENSE_HALL_AngleSpeedGet(&g_mtr_angle0_ctrl, &f_get_angle,
&f_get_speed, &f_get_phase_err);
   }
/* Reset the module */
   (void) RM_MOTOR_SENSE_HALL_Reset(&g_mtr_angle0_ctrl);
/* Close the module */
   (void) RM_MOTOR_SENSE_HALL_Close(&g_mtr_angle0_ctrl);
}
```

Data Structures

struct	motor_sense_hall_input_t
struct	motor_sense_hall_extended_cfg_t
struct	motor_sense_hall_instance_ctrl_t

Enumerations

enum	motor_sense_hall_direction_t
enum	motor_sense_hall_signal_status_t

Data Structure Documentation

◆ motor_sense_hall_input_t

struct motor_sense_hall_input_t		
This structure is provided to receive speed information.		
Data Fields		
float	f4_ref_speed_rad_ctrl	Speed Reference [rad/sec].

◆ motor_sense_hall_extended_cfg_t

struct motor_sense_hall_extended_cfg_t		
Optional Motor sense hall extension data structure.		
Data Fields		
bsp_io_port_pin_t	port_hall_sensor_u	Hall U-signal input port.

bsp_io_port_pin_t	port_hall_sensor_v	Hall V-signal input port.
bsp_io_port_pin_t	port_hall_sensor_w	Hall W-signal input port.
uint8_t	u1_hall_pattern[MOTOR_SENSE_HALL_SPEED_COUNTS+1]	The order of hall signal pattern.
float	f_pwm_carrier_freq	PWM carrier frequency (or Decimated frequency at decimation of current process)
float	f_angle_correct	Coefficient to correct angle.
uint8_t	u1_trigger_hall_signal_count	Rotation counts to wait the stability.
float	f4_target_pseudo_speed_rad	Target value for pseudo speed estimates [radian/second].
float	f4_reach_time_msec	Time until the pseudo speed estimate reaches the target value [msec].
uint16_t	u2_trigger_carrier_count	Estimated speed 0 until this trigger.
uint16_t	u2_default_counts	Default counts for period of hall signal to reset.
uint16_t	u2_maximum_period	Maximum counts of hall signal period.
uint8_t	u1_hall_polepairs	Hall pole pairs.
float	f4_start_speed_rad	Speed to judge start [radian/second].

◆ motor_sense_hall_instance_ctrl_t

struct motor_sense_hall_instance_ctrl_t		
SENSE_HALL control block. DO NOT INITIALIZE. Initialization occurs when motor_angle_api_t::open is called.		
Data Fields		
uint32_t	open	
uint8_t	u1_hall_signal	Hall signal pattern.
uint8_t	u1_last_hall_signal	Last hall signal pattern.
motor_sense_hall_direction_t	direction	Rotation direction.
motor_sense_hall_direction_t	last_direction	Last rotation direction.
uint16_t	u2_carrier_count	Carrier count.
uint16_t	u2_hall_period[MOTOR_SENSE_HALL_SPEED_COUNTS]	Array of carrier count to calculate 2PI.
uint8_t	u1_period_counter	Counter for above array.

float	f_angle	Rotor angle [radian].
float	f_angle_per_count	Angle per 1 count.
float	f_calculated_speed	Calculated speed [radian/second].
uint8_t	u1_hall_signal_memory	Memorized hall signal at startup.
motor_sense_hall_signal_status_t	hall_signal_status	Hall signal status.
uint8_t	u1_hall_signal_count	Rotation counter.
float	f4_pseudo_speed_rad	Pseudo speed used for startup [radian/second].
float	f4_add_pseudo_speed_rad	Step of pseudo speed to update [radian/second].
uint16_t	u2_startup_carrier_count	Counter of carrier interrupt for startup.
motor_sense_hall_input_t	st_input	Input parameter structure.
uint8_t	u1_startup_flag	Flag for startup.
motor_angle_cfg_t const *	p_cfg	

Enumeration Type Documentation

◆ motor_sense_hall_direction_t

enum motor_sense_hall_direction_t	
Enumerator	
MOTOR_SENSE_HALL_DIRECTION_CW	Rotation direction clockwise.
MOTOR_SENSE_HALL_DIRECTION_CCW	Rotation direction counter clockwise.

◆ motor_sense_hall_signal_status_t

enum motor_sense_hall_signal_status_t	
Enumerator	
MOTOR_SENSE_HALL_SIGNAL_STATUS_INITIAL	Hall signal isn't captured. (Initial)
MOTOR_SENSE_HALL_SIGNAL_STATUS_CAPTURED	Hall signal is captured.

Function Documentation

◆ RM_MOTOR_SENSE_HALL_Open()

fsp_err_t RM_MOTOR_SENSE_HALL_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the angle hall sensor module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	MTR_ANGL_EST successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_MOTOR_SENSE_HALL_Close()

fsp_err_t RM_MOTOR_SENSE_HALL_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle Estimation module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_Reset()

fsp_err_t RM_MOTOR_SENSE_HALL_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle Estimation module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_HALL_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_HALL_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_SUCCESS	Data get successfully.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_HALL_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is invalid.

◆ RM_MOTOR_SENSE_HALL_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_HALL_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_MOTOR_SENSE_HALL_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_HALL_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of Angle&Speed Estimation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_HALL_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_HALL_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)
Calculate internal parameters. Implements motor_angle_api_t::internalCalculate. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

◆ RM_MOTOR_SENSE_HALL_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_HALL_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)
Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

◆ RM_MOTOR_SENSE_HALL_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_HALL_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)
Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

◆ RM_MOTOR_SENSE_HALL_InfoGet()

fsp_err_t RM_MOTOR_SENSE_HALL_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)
Gets information of Encoder Angle Module. Implements motor_angle_api_t::infoGet. **Return values** FSP_ERR_UNSUPPORTED — Unsupported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor angle Interface.

Overview

The motor angle and speed calculation with induction sensor module is used to calculate rotor angle and rotational speed in an application. This module is designed to be used with the motor current module (rm_motor_current).

Features

The motor angle and speed calculation with induction sensor module has the features listed below.

- Calculate rotor angle [radian].
- Calculate rotational speed [radian/second].

Configuration

Build Time Configurations for rm_motor_sense_induction

The following build time configurations are defined in fsp_cfg/rm_motor_sense_induction_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor Angle and Speed Calculation with induction sensor (rm_motor_sense_induction).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_angle0	Module name.

Control type	• Speed • Position	Position	Select control Type
Frequency of current control (kHz)	Must be a valid non-negative value.	20.0	Frequency of current control
Decimation of Interrupt	Must be a valid integer.	1	Decimation of Interrupt
Counts to get signal	Must be a valid integer.	10	Counts to get analog input signal
Limit of signal error	Must be a valid integer.	100	Limit of signal error
Coefficient of speed LPF	Must be a valid value	0.07	Coefficient of speed LPF
A/D reference voltage	Must be a valid non-negative value.	3.3	Reference voltage of A/D converter
A/D conversion scale	Must be a valid non-negative value.	4095.0	Conversion scale of A/D converter
Openloop speed (rpm)	Must be a valid non-negative value.	6.0	Rotation speed at calibration openloop (rpm)
D-axis current at openloop (A)	Must be a valid non-negative value.	1.0	D-axis current at calibration openloop (A)
Angle adjustment times	Must be a valid integer.	512	Times to get signal at angle adjustment
Calibration enable	• Disable • Enable	Enable	Select enable/disable of signal calibration
Induction sensor pole pairs	Must be a valid integer.	4	Induction sensor pole pairs
Motor pole pairs	Must be a valid integer.	4	Motor pole pairs

Clock Configuration

Pin Configuration

Usage Notes

Limitations

Developers should be aware of the following limitations when using the motor angle and speed calculation with induction sensor: all configurations should be set as positive values.

Examples

Basic Example

This is a basic example of minimal use of the motor angle and speed calculation with induction sensor in an application.

```
void motor_sense_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SENSE_INDUCTION_Open(&g_mtr_angle0_ctrl, &g_mtr_angle_set0_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Initialize motor */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleAdjust(&g_mtr_angle0_ctrl);
 /* Perform cyclic process*/
       (void) RM_MOTOR_SENSE_INDUCTION_CyclicProcess(&g_mtr_angle0_ctrl);
 /* Calculate information with induction sensor signal input */
       (void) RM_MOTOR_SENSE_INDUCTION_InternalCalculate(&g_mtr_angle0_ctrl);
 /* Get angle/speed data */
       (void) RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet(&g_mtr_angle0_ctrl,
&f_get_angle, &f_get_speed, &f_get_phase_err);
    }
 /* Reset the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Reset(&g_mtr_angle0_ctrl);
 /* Close the module */
    (void) RM_MOTOR_SENSE_INDUCTION_Close(&g_mtr_angle0_ctrl);
}
```

Enumerations

enum	motor_sense_induction_loop_t
enum	motor_sense_induction_calibration_t
enum	motor_sense_induction_mode_t

Enumeration Type Documentation

◆ motor_sense_induction_loop_t

enum motor_sense_induction_loop_t	
Enumerator	
MOTOR_SENSE_INDUCTION_LOOP_SPEED	Speed control mode.
MOTOR_SENSE_INDUCTION_LOOP_POSITION	Position control mode.

◆ motor_sense_induction_calibration_t

enum motor_sense_induction_calibration_t	
Enumerator	
MOTOR_SENSE_INDUCTION_CALIBRATION_DISABLE	Disable calibration.
MOTOR_SENSE_INDUCTION_CALIBRATION_ENABLE	Enable calibration.

◆ motor_sense_induction_mode_t

enum motor_sense_induction_mode_t	
Enumerator	
MOTOR_SENSE_INDUCTION_MODE_INIT	Initialize mode (Start status)
MOTOR_SENSE_INDUCTION_MODE_BOOT	Boot mode (Angle adjustment status)
MOTOR_SENSE_INDUCTION_MODE_DRIVE	Drive mode (Normal work status)

Function Documentation

◆ RM_MOTOR_SENSE_INDUCTION_Open()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Open (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Opens and configures the Angle module. Implements motor_angle_api_t::open.

Return values

FSP_SUCCESS	Angle Induction module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SENSE_INDUCTION_Close()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Close (motor_angle_ctrl_t *const *p_ctrl*)

Disables specified Angle module. Implements motor_angle_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_Reset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_Reset (motor_angle_ctrl_t *const *p_ctrl*)

Reset variables of Angle module. Implements motor_angle_api_t::reset.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_InternalCalculate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InternalCalculate (motor_angle_ctrl_t *const *p_ctrl*)

Calculate internal parameters. Implements motor_angle_api_t::internalCalculate.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleSpeedGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_angle*, float *const *p_speed*, float *const *p_phase_err*)

Gets the current rotor's angle and rotation speed. Implements motor_angle_api_t::angleSpeedGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_AngleAdjust()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_AngleAdjust (motor_angle_ctrl_t *const *p_ctrl*)

Angle Adjustment Process. Implements motor_angle_api_t::angleAdjust.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_EncoderCyclic()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EncoderCyclic (motor_angle_ctrl_t *const *p_ctrl*)

Encoder Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::encoderCyclic.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software encoderCyclic is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_CyclicProcess()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CyclicProcess (motor_angle_ctrl_t *const *p_ctrl*)

Induction sensor Cyclic Process (Call in cyclic timer). Implements motor_angle_api_t::cyclicProcess.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_InfoGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_InfoGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_encoder_info_t *const *p_info*)

Gets information of Angle Module. Implements motor_angle_api_t::infoGet.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_CorrectReset()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CorrectReset (motor_angle_ctrl_t *const *p_ctrl*)

Reset to restart calibration Angle module.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_ErrorGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ErrorGet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_error_t *const *p_error*)

Gets the error information about induction correction.

Return values

FSP_SUCCESS	Successfully data calculated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_ParameterUpdate()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_ParameterUpdate (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_cfg_t const *const *p_cfg*)

Update the parameters of angle & speed calculation. Implements motor_angle_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_SensorDataSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SensorDataSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_ad_data_t *const *p_ad_data*)

Set A/D Converted Data. Implements motor_angle_api_t::sensorDataSet.

Return values

FSP_SUCCESS	Successfully data is update.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SENSE_INDUCTION_CurrentSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_CurrentSet (motor_angle_ctrl_t *const *p_ctrl*, motor_angle_current_t *const *p_st_current*, motor_angle_voltage_reference_t *const *p_st_voltage*)

Set d/q-axis Current Data & Voltage Reference. Implements motor_angle_api_t::currentSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software currentSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_SpeedSet (motor_angle_ctrl_t *const *p_ctrl*, float const *speed_ctrl*, float const *damp_speed*)

Set Speed Information. Implements motor_angle_api_t::speedSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software speedSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_FlagPiCtrlSet (motor_angle_ctrl_t *const *p_ctrl*, uint32_t const *flag_pi*)

Set the flag of PI Control runs. Implements motor_angle_api_t::flagPiCtrlSet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software flagPiCtrlSet is not supported.

◆ RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet()

fsp_err_t RM_MOTOR_SENSE_INDUCTION_EstimatedComponentGet (motor_angle_ctrl_t *const *p_ctrl*, float *const *p_ed*, float *const *p_eq*)

Gets estimated d/q-axis component. Implements motor_angle_api_t::estimatedComponentGet.

Return values

FSP_ERR_UNSUPPORTED	Motor sense induction software estimatedComponentGet is not supported.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor current Interface.

Overview

The motor current is used to control the electric current of motor rotation in an application. This module should be called cyclically after the A/D conversion of electric current of each phase in an application. This module calculates each phase voltage with input current reference, electric current and rotor angle.

Features

The Motor Current Module has below features.

- Calculate each phase(U/V/W) voltage.
- Decoupling Control.
- Voltage Error Compensation.

Configuration

Build Time Configurations for rm_motor_current

The following build time configurations are defined in fsp_cfg/rm_motor_current_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Current Controller (rm_motor_current)

This module can be added to the Stacks tab via New Stack > Motor > Motor Current Controller (rm_motor_current).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_current0	Module name.

Sensor type	• Sensorless • Encoder • Induction • Hall	Sensorless	Select sensor type
Shunt type	• 1 shunt • 2 shunt • 3 shunt	2 shunt	Select shunt type
Current control decimation	Must be a valid non-negative value.	0	Decimation of current control.
PWM carrier frequency (kHz)	Must be a valid value	20.0F	PWM carrier frequency.
Input voltage (V)	Must be a valid value	24.0F	Input voltage for limitation of current PI control.
Sample delay compensation	• Disable • Enable	Enable	Select enable/disable sample delay compensation.
Period magnification value	Must be a valid value	1.5	Period magnification value for sampling delay compensation.
Voltage error compensation	• Disable • Enable	Enable	Select enable/disable voltage error compensation.
Voltage error compensation table of voltage 1	Must be a valid value	0.672F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 2	Must be a valid value	0.945F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 3	Must be a valid value	1.054F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 4	Must be a valid value	1.109F	Voltage error compensation table of voltage.
Voltage error compensation table of voltage 5	Must be a valid value	1.192F	Voltage error compensation table of voltage.
Voltage error compensation table of current 1	Must be a valid value	0.013F	Voltage error compensation table of current.
Voltage error compensation table of current 2	Must be a valid value	0.049F	Voltage error compensation table of current.
Voltage error	Must be a valid value	0.080F	Voltage error

compensation table of current 3			compensation table of current.
Voltage error compensation table of current 4	Must be a valid value	0.184F	Voltage error compensation table of current.
Voltage error compensation table of current 5	Must be a valid value	0.751F	Voltage error compensation table of current.
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at A/D conversion finish interrupt.
Design Parameter			
Current PI loop omega (Hz)	Must be a valid value	300.0F	Current PI loop omega
Current PI loop zeta	Must be a valid value	1.0F	Current PI loop zeta
Motor Parameter			
Pole pairs	Must be a valid non-negative value.	2	Pole pairs
Resistance (ohm)	Must be a valid value	8.5F	Resistance
Inductance of d-axis (H)	Must be a valid value	0.0045F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid value	0.0045F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid value	0.0000028F	Rotor inertia

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the Period of Current Control with none-negative value.
- Set the Reference Voltage with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Current in an application.

```
void motor_current_basic_example (void)
{
 motor_current_input_current_t temp_input_current;
 motor_current_input_voltage_t temp_input_voltage;
 motor_current_get_voltage_t   temp_get_voltage;
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_CURRENT_Open(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Basically run this module at A/D conversion finish interrupt.
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Set current reference before get phase voltage */
       (void) RM_MOTOR_CURRENT_CurrentReferenceSet(g_test_motor_current.p_ctrl, 1.0F,
1.0F);
 /* Set speed and phase data before get phase voltage */
       (void) RM_MOTOR_CURRENT_SpeedPhaseSet(g_test_motor_current.p_ctrl, 104.72F,
1.0F);
       temp_input_current.iu    = 1.0F;
       temp_input_current.iv    = 1.0F;
       temp_input_current.iw    = 1.0F;
       temp_input_voltage.vdc    = 24.0F;
       temp_input_voltage.va_max = 24.0F;
 /* Set electric current and voltage before get phase voltage */
       (void) RM_MOTOR_CURRENT_CurrentSet(g_test_motor_current.p_ctrl,
temp_input_current, temp_input_voltage);
 /* Activate the process. */
```

```
      (void) RM_MOTOR_CURRENT_Run(g_test_motor_current.p_ctrl);
 /* Get d/q-axis current*/
      (void) RM_MOTOR_CURRENT_CurrentGet(g_test_motor_current.p_ctrl, &f_get_id,
&f_get_iq);
 /* Get the flag of PI control */
      (void) RM_MOTOR_CURRENT_PhaseVolageGet(g_test_motor_current.p_ctrl,
&temp_get_voltage);
 /* Get Output Parameter */
      (void) RM_MOTOR_CURRENT_ParameterGet(g_test_motor_current.p_ctrl,
&test_output);
      (void) RM_MOTOR_CURRENT_ParameterUpdate(g_test_motor_current.p_ctrl,
g_test_motor_current.p_cfg);
    }
 /* Reset the process. */
    (void) RM_MOTOR_CURRENT_Reset(g_test_motor_current.p_ctrl);
 /* Close the module. */
    (void) RM_MOTOR_CURRENT_Close(g_test_motor_current.p_ctrl);
}
```

Enumerations

enum	motor_current_shunt_type_t

Enumeration Type Documentation

◆ motor_current_shunt_type_t

enum motor_current_shunt_type_t	
Selection of shunt type	
Enumerator	
MOTOR_CURRENT_SHUNT_TYPE_1_SHUNT	Only use U phase current.
MOTOR_CURRENT_SHUNT_TYPE_2_SHUNT	Use U and W phase current.
MOTOR_CURRENT_SHUNT_TYPE_3_SHUNT	Use all phase current.

Function Documentation

◆ RM_MOTOR_CURRENT_Open()

fsp_err_t RM_MOTOR_CURRENT_Open (motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg*)

Opens and configures the Motor Current Module. Implements motor_current_api_t::open.

Return values

FSP_SUCCESS	Motor Current successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_CURRENT_Close()

fsp_err_t RM_MOTOR_CURRENT_Close (motor_current_ctrl_t *const *p_ctrl*)

Disables specified Motor Current Module. Implements motor_current_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_Reset()

fsp_err_t RM_MOTOR_CURRENT_Reset (motor_current_ctrl_t *const *p_ctrl*)

Reset variables of Motor Current Module. Implements motor_current_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_Run()

fsp_err_t RM_MOTOR_CURRENT_Run (motor_current_ctrl_t *const *p_ctrl*)

Run(Start) the Current Control. Implements motor_current_api_t::run.

Return values

FSP_SUCCESS	Successfully run.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_ParameterSet()

fsp_err_t RM_MOTOR_CURRENT_ParameterSet (motor_current_ctrl_t *const *p_ctrl*, motor_current_input_t const *const *p_st_input*)

Set (Input) Parameter Data. Implements motor_current_api_t::parameterSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input argument error.

◆ RM_MOTOR_CURRENT_CurrentReferenceSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentReferenceSet (motor_current_ctrl_t *const *p_ctrl*, float const *id_reference*, float const *iq_reference*)

Set Current Reference Data. Implements motor_current_api_t::currentReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_SpeedPhaseSet()

fsp_err_t RM_MOTOR_CURRENT_SpeedPhaseSet (motor_current_ctrl_t *const *p_ctrl*, float const *speed*, float const *phase*)

Set Current Speed & rotor phase Data. Implements motor_current_api_t::speedPhaseSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_CURRENT_CurrentSet()

fsp_err_t RM_MOTOR_CURRENT_CurrentSet (motor_current_ctrl_t *const *p_ctrl*, motor_current_input_current_t const *const *p_st_current*, motor_current_input_voltage_t const *const *p_st_voltage*)

Set d/q-axis Current & Voltage Data. Implements motor_current_api_t::currentSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_ParameterGet()

fsp_err_t RM_MOTOR_CURRENT_ParameterGet (motor_current_ctrl_t *const *p_ctrl*, motor_current_output_t *const *p_st_output*)

Get Output Parameters. Implements motor_current_api_t::parameterGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_CurrentGet()

fsp_err_t RM_MOTOR_CURRENT_CurrentGet (motor_current_ctrl_t *const *p_ctrl*, float *const *p_id*, float *const *p_iq*)

Get d/q-axis Current. Implements motor_current_api_t::currentGet.

Return values

FSP_SUCCESS	Successful data get.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_PhaseVoltageGet()

fsp_err_t RM_MOTOR_CURRENT_PhaseVoltageGet (motor_current_ctrl_t *const *p_ctrl*, motor_current_get_voltage_t *const *p_voltage*)

Gets the set phase voltage. Implements motor_current_api_t::phaseVoltageGet.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_CURRENT_ParameterUpdate()

fsp_err_t RM_MOTOR_CURRENT_ParameterUpdate (motor_current_ctrl_t *const *p_ctrl*, motor_current_cfg_t const *const *p_cfg*)

Update the parameters of Current Control. Implements motor_current_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_motor_current_encoder_cyclic()

void rm_motor_current_encoder_cyclic (motor_current_instance_t const * *p_ctrl*)
(end addtogroup MOTOR_CURRENT)

5.2.11.12 Motor Encoder Vector Control (rm_motor_encoder)

Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor Encoder Vector Control (rm_motor_encoder).

Overview

The motor encoder vector control is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor encoder module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Encoder Module.

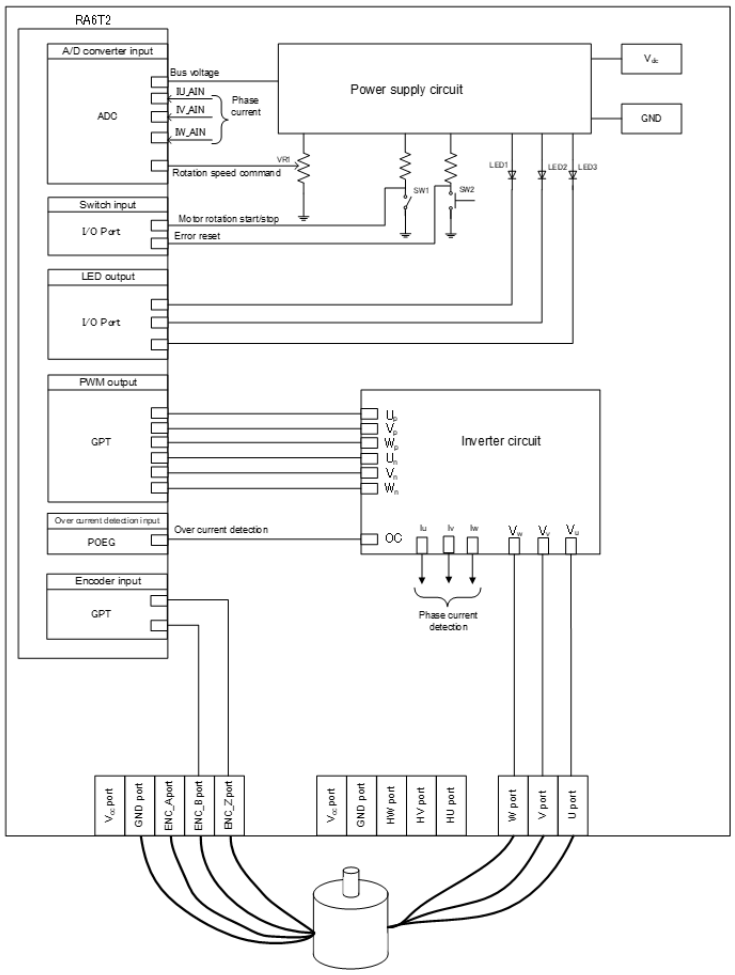

Figure 273: Example of target hardware of motor encoder module

Block Diagram

The below figure shows block diaram of encoder vector motor control.

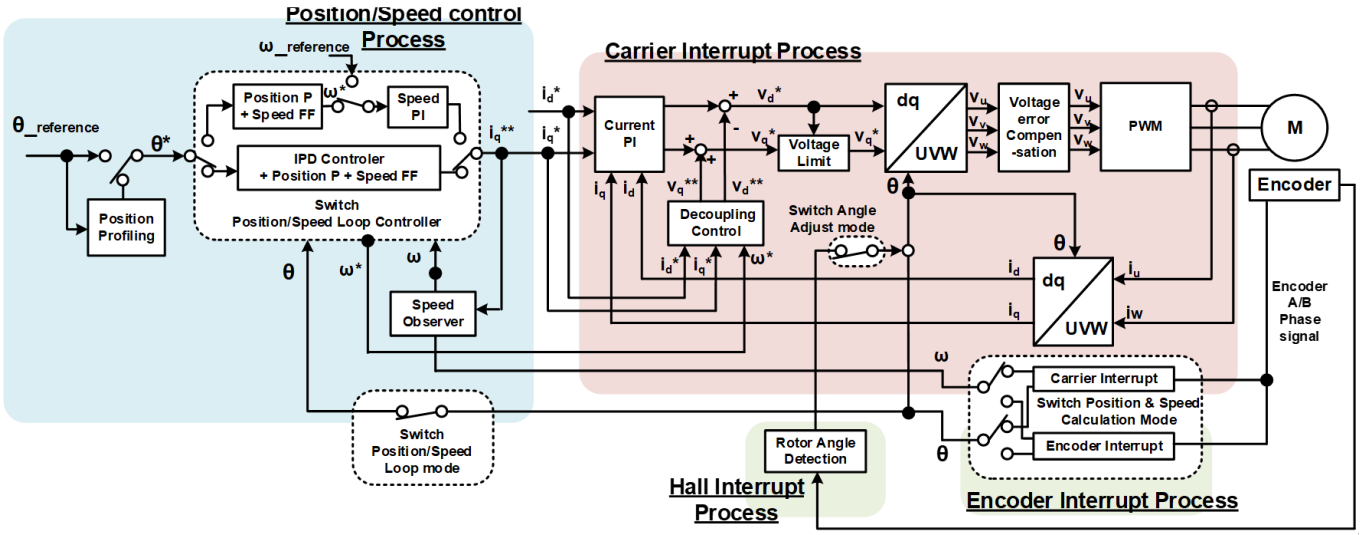

Figure 274: Block diagram of encoder vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 275: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 276: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 277: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor encoder module.

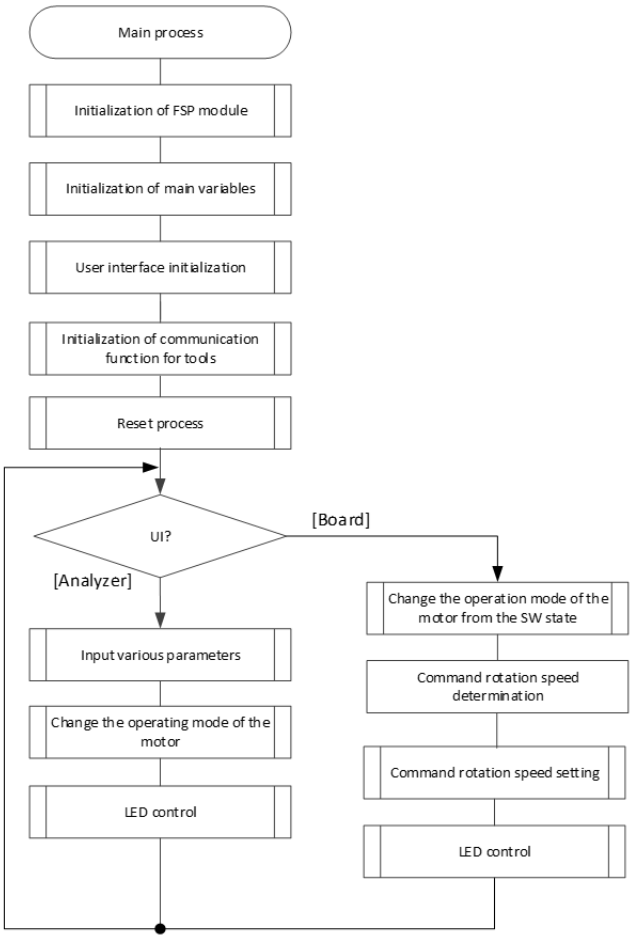

Figure 278: Main process

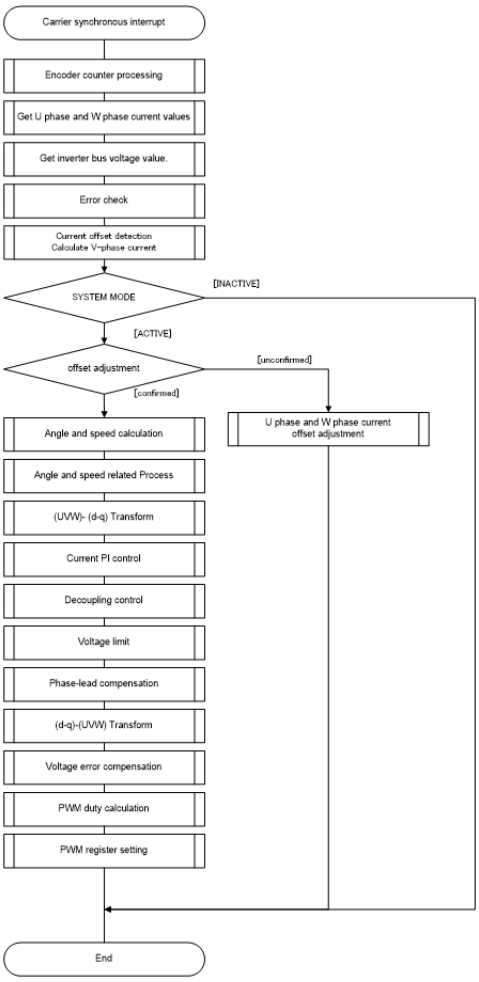

Figure 279: Current control process

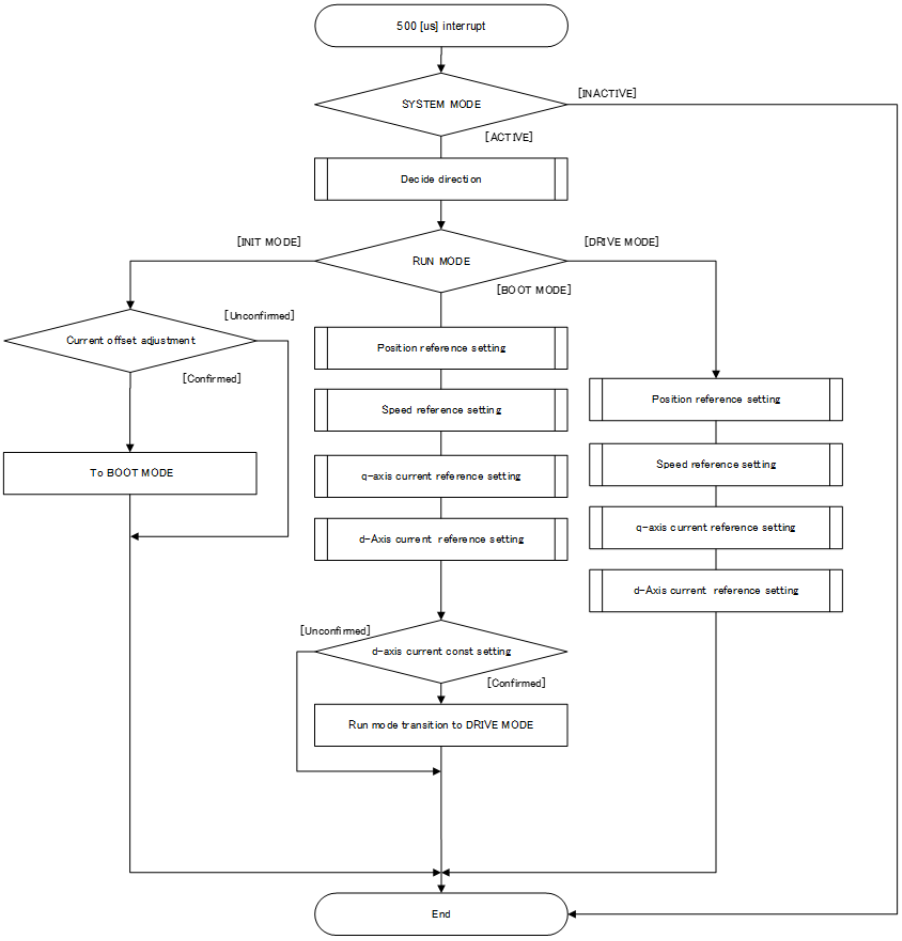

Figure 280: Speed control process

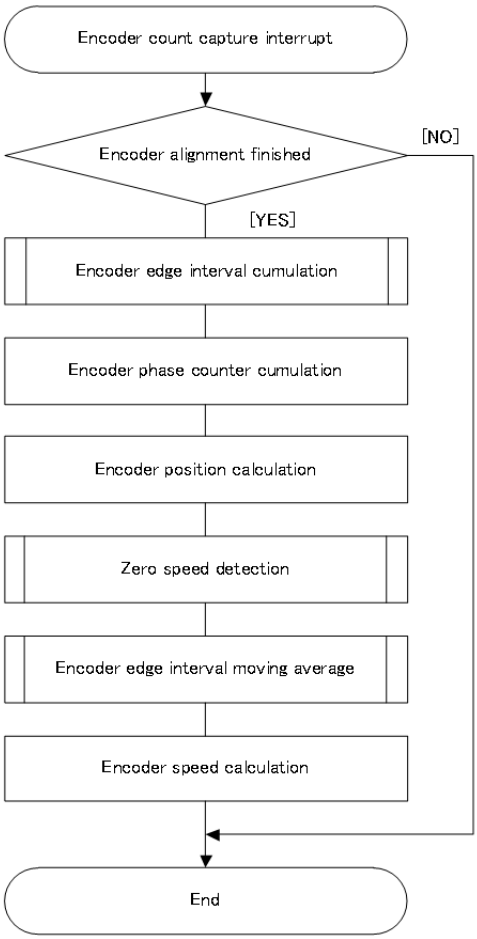

Figure 281: Encoder interrupt process

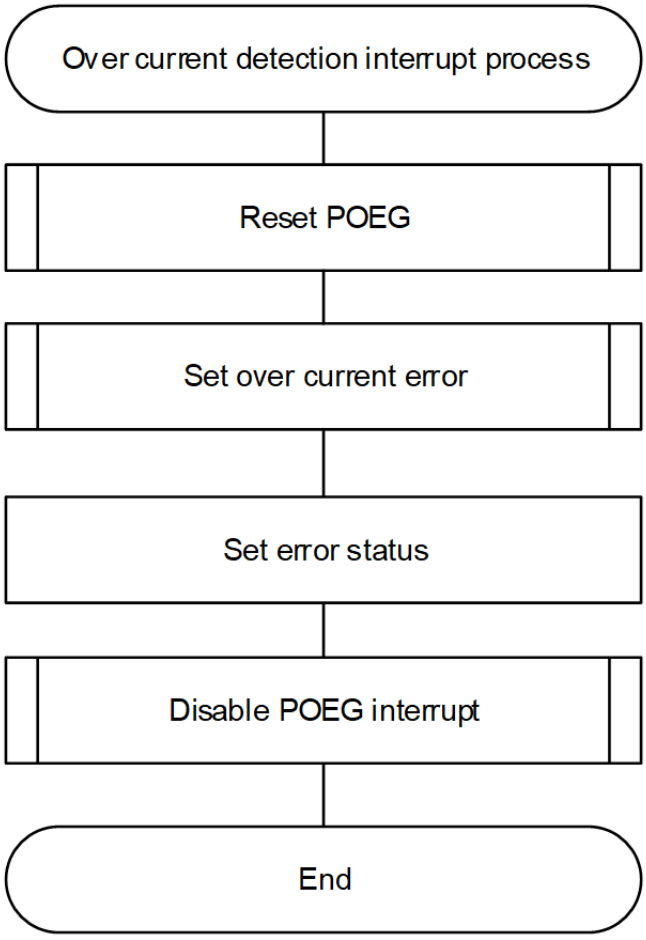

Figure 282: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_encoder

The following build time configurations are defined in fsp_cfg/rm_motor_encoder_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Encoder Vector Control (rm_motor_encoder)

This module can be added to the Stacks tab via New Stack > Motor > Motor Encoder Vector Control (rm_motor_encoder).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_encoder0	Module name.
Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	2100.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the motor encoder module in an application.

```
void motor_encoder_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
    handle_error(err);
```

```
 /* Set speed reference before motor run */
    (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
}
```

Enumerations

enum	motor_encoder_ctrl_t
enum	motor_encoder_ctrl_event_t

Enumeration Type Documentation

◆ motor_encoder_ctrl_t

enum motor_encoder_ctrl_t	
Enumerator	
MOTOR_ENCODER_CTRL_STOP	Stop mode.
MOTOR_ENCODER_CTRL_RUN	Run mode.
MOTOR_ENCODER_CTRL_ERROR	Error mode.

◆ motor_encoder_ctrl_event_t

enum motor_encoder_ctrl_event_t	
Enumerator	
MOTOR_ENCODER_CTRL_EVENT_STOP	Stop event.
MOTOR_ENCODER_CTRL_EVENT_RUN	Run event.
MOTOR_ENCODER_CTRL_EVENT_ERROR	Error event.
MOTOR_ENCODER_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_ENCODER_Open()

fsp_err_t RM_MOTOR_ENCODER_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_ENCODER_Open(g_motor_encoder0.p_ctrl, g_motor_encoder0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_ENCODER_Close()

fsp_err_t RM_MOTOR_ENCODER_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Encoder Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_ENCODER_Close(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Reset()

fsp_err_t RM_MOTOR_ENCODER_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Encoder Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_ENCODER_Reset(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Run()

fsp_err_t RM_MOTOR_ENCODER_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_ENCODER_Run(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_Stop()

fsp_err_t RM_MOTOR_ENCODER_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_Stop(g_motor_encoder0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_ErrorSet()

fsp_err_t RM_MOTOR_ENCODER_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_ENCODER_ErrorSet(g_motor_encoder0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_SpeedSet()

fsp_err_t RM_MOTOR_ENCODER_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_ENCODER_SpeedSet(g_motor_encoder0.p_ctrl,
RM_MOTOR_ENCODER_TEST_OVER_SPEED_LIMIT);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_ENCODER_PositionSet()

fsp_err_t RM_MOTOR_ENCODER_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_ENCODER_PositionSet(g_motor_encoder0.p_ctrl, &g_posref_sample1);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_StatusGet()

fsp_err_t RM_MOTOR_ENCODER_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_ENCODER_StatusGet(g_motor_encoder0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_AngleGet()

fsp_err_t RM_MOTOR_ENCODER_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_ENCODER_AngleGet(g_motor_encoder0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_SpeedGet()

fsp_err_t RM_MOTOR_ENCODER_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_ENCODER_SpeedGet(g_motor_encoder0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_ErrorCheck()

fsp_err_t RM_MOTOR_ENCODER_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_ENCODER_ErrorCheck(g_motor_encoder0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_ENCODER_WaitStopFlagGet()

fsp_err_t RM_MOTOR_ENCODER_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_ENCODER_FunctionSelect()

fsp_err_t RM_MOTOR_ENCODER_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_InertiaEstimateStart()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStart (motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_InertiaEstimateStop()

fsp_err_t RM_MOTOR_ENCODER_InertiaEstimateStop (motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStart()

fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStart (motor_ctrl_t *const *p_ctrl*)

Start return origin function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_ENCODER_ReturnOriginStop()

fsp_err_t RM_MOTOR_ENCODER_ReturnOriginStop (motor_ctrl_t *const *p_ctrl*)
Stop(Cancel) return origin function. **Return values** FSP_SUCCESS — Successfully resetted. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_MODE — Mode unmatch ***Note***

Detailed Description

Measurement and calculation process for the motor control on RA MCUs. This module implements the Motor Inertia Estimate Interface.

Overview

The motor inertia estimation module is used to measure and calculate rotor inertia in an application.

This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor Inertia Estimation Module has below features.

- Measurement process work automatically
- Calculate rotor inertia [kgm^2].

Configuration

Build Time Configurations for rm_motor_inertia_estimate

The following build time configurations are defined in fsp_cfg/rm_motor_inertia_estimate_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor inertia estimation (rm_motor_inertia_estimate)

This module can be added to the Stacks tab via New Stack > Motor > Motor inertia estimation (rm_motor_inertia_estimate).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_inertia_estimate0	Module name.
Moved position distance to measure (degree)	Must be set -360 to -10 or 10 to 360.	360	Moved position distance to measure inertia (degree)
Maximum speed (rpm)	Must be set over 60.	500	Maximum rotation speed (rpm)
Acceleration time	Must be a valid non-negative value.	0.3	Acceleration time
Motor inertia	Must be a valid non-negative value.	0.0000041	Motor inertia
Low threshold to judge speed	Must be set 0.1 to 0.5.	0.1	Low threshold to judge speed reached
High threshold to judge speed	Must be set 0.5 to 0.9, and greater than low threshold	0.9	High threshold to judge speed reached
Time to wait moving stability (sec)	Must be a valid non-negative value.	0.8	Time to wait moving stability
Cyclic period of current control (sec)	Must be a valid non-negative value.	0.00005	Cyclic period of current control (sec)

Cyclic period of speed control (sec)	Must be a valid non-negative value.	0.0005	Cyclic period of speed control (sec)
Motor pole pairs	Must be a valid non-negative value.	4	Motor pole pairs
Motor magnet flux (Wb)	Must be a valid non-negative value.	0.00623	Motor magnet flux (Wb)
Interval time	Must be a valid non-negative value.	400.0	Interval time. Please set same value as Position control

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Inertia Estimation in an application.

```
void motor_inertia_estimate_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */

Function Documentation

◆ RM_MOTOR_INERTIA_ESTIMATE_Open()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Open (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg*)

Opens and configures the motor inertia estimate module. Implements motor_inertia_estimate_api_t::open.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Open(&g_mtr_inertia_estimate0_ctrl,
&g_mtr_inertia_estimate0_cfg);
```

Return values

FSP_SUCCESS	Motor inertia estimate module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_INERTIA_ESTIMATE_Close()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Close (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Disables specified motor inertia estimate module. Implements motor_inertia_estimate_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Close(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Start()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Start (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Start inertia estimation. Implements motor_inertia_estimate_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Start(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Stop()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Stop (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Stop (Cancel) inertia estimation. Implements motor_inertia_estimate_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_INERTIA_ESTIMATE_Stop(&g_mtr_inertia_estimate0_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped (canceled).
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_Reset()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_Reset (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Reset variables of inertia estimate module. Implements motor_inertia_estimate_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_InfoGet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_InfoGet (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_info_t *const *p_info*)

Get information of inertia estimation. Implements motor_inertia_estimate_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_InfoGet(&g_mtr_inertia_estimate0_ctrl,
&temp_information);
```

Return values

FSP_SUCCESS	Successfully get data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Argument pointer is invalid.

◆ RM_MOTOR_INERTIA_ESTIMATE_DataSet()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_DataSet (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_set_data_t *const *p_set_data*)

Set necessary data to inertia estimation. Implements motor_inertia_estimate_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_INERTIA_ESTIMATE_DataSet(&g_mtr_inertia_estimate0_ctrl,
&temp_set_data);
```

Return values

FSP_SUCCESS	Successfully set data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_SpeedCyclic (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at speed control period. Implements motor_inertia_estimate_api_t::speedCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_CurrentCyclic (motor_inertia_estimate_ctrl_t *const *p_ctrl*)

Cyclic process of inertia estimation at current control period (called at A/D conversion finish interrupt). Implements motor_inertia_estimate_api_t::currentCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate()

fsp_err_t RM_MOTOR_INERTIA_ESTIMATE_ParameterUpdate (motor_inertia_estimate_ctrl_t *const *p_ctrl*, motor_inertia_estimate_cfg_t const *const *p_cfg*)

Update the parameters of inertia estimate. Implements motor_inertia_estimate_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor position Interface.

Overview

The motor position is used to control the position of motor rotor in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module calculates speed reference with inputted position reference and current rotational speed.

Features

The Motor Position Module has below features.

- Calculate speed reference.

Configuration

Build Time Configurations for rm_motor_position

The following build time configurations are defined in fsp_cfg/rm_motor_position_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Position Controller (rm_motor_position)

This module can be added to the Stacks tab via New Stack > Motor > Motor Position Controller (rm_motor_position).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_position0	Module name.
Position dead band	Must be a valid non-negative value.	1U	Ignored area of position control.
Position band limit	Must be a valid non-negative value.	3U	Ignored area of position control.
Speed feedforward ratio	Must be a valid value	0.8F	Speed feedforward ratio.
Encoder counts per one rotation	Must be a valid value	1200.0F	Encoder counts per one rotation.
Position omega	Must be a valid value	10.0F	Position control omega.
Period of speed control (sec)	Must be a valid value	0.0005F	Period of speed control.
IPD			
IPD LPF	• Disable • Enable	Disable	IPD LPF process enable or disable
Position Kp ratio	Must be a valid value	0.3F	Position Kp ratio.
Position feedforward	Must be a valid value	0.0F	Position feedforward

ratio			ratio.
Speed K ratio	Must be a valid value	2.0F	Speed K ratio
Error Limit #1	Must be a valid value	10.0F	Error limitation #1
Error limit #2	Must be a valid value	0.2F	Error limitation #2
LPF omega	Must be a valid value	500.0F	LPF omega.
LPF zeta	Must be a valid value	1.0F	LPF zeta.
Position Profiling			
Interval time	Must be a valid non-negative value.	400U	Interval time.
Accel time	Must be a valid value	0.3F	Accel time.
Maximum accel time (sec)	Must be a valid value	8117.96F	Maximum acceleration time (sec)
Acceleration maximum speed	Must be a valid value	2000.0F	Acceleration maximum speed.
Update step of timer	Must be a valid value	0.0005F	Update step of timer.
Motor Parameter			
Pole pair	Value must be non-negative	7	Pole pair
Resistance (ohm)	Must be a valid value	0.453F	Resistance
Inductance of d-axis (H)	Must be a valid value	0.0009447F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid value	0.0009447F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid value	0.006198F	Permanent magnetic flux
Motor Parameter > Motor inertia (kgm^2)	Must be a valid value	0.00000962F	Motor inertia

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with non-negative value.
- Set the limit of speed change step with non-negative value.
- Set the maximum speed with non-negative value.

Examples

Basic Example

This is a basic example of using the Motor Position module in an application.

```
void motor_position_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_POSITION_Open(g_motor_position0.p_ctrl, g_motor_position0.p_cfg);
    handle_error(err);
 /* Set working mode */
    RM_MOTOR_POSITION_ModeSet(g_motor_position0.p_ctrl,
MOTOR_POSITION_CTRL_MODE_STEP);
 /* Set position reference */
 RM_MOTOR_POSITION_PositionReferenceSet(g_motor_position0.p_ctrl, 180U);
 /* Basically run this module at cyclic interrupt (e.g. AGT timer).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Perform Position Control Process */
 RM_MOTOR_POSITION_PositionControl(g_motor_position0.p_ctrl);
 /* Perform Speed IPD Control Process */
 RM_MOTOR_POSITION_IpdSpeedPControl(g_motor_position0.p_ctrl, 0.0F, 0.0F,
&temp_iq_ref);
 /* Get Position */
 RM_MOTOR_POSITION_PositionGet(g_motor_position0.p_ctrl, &temp_position);
 /* Update parameters */
 RM_MOTOR_POSITION_ParameterUpdate(g_motor_position0.p_ctrl,
&g_motor_position0.p_cfg);
    }
 /* Reset Speed Control */
 RM_MOTOR_POSITION_Reset(g_motor_position0.p_ctrl);
 /* Close Speed Control */
```

```
 RM_MOTOR_POSITION_Close(g_motor_position0.p_ctrl);
}
```

Enumerations

Enumeration Type Documentation

◆ motor_position_ipd_lpf_t

enum motor_position_ipd_lpf_t

Enumerator	
MOTOR_POSITION_IPD_LPF_DISABLE	ipd control is disabled
MOTOR_POSITION_IPD_LPF_ENABLE	ipd control is enabled

Function Documentation

◆ RM_MOTOR_POSITION_Open()

fsp_err_t RM_MOTOR_POSITION_Open (motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg*)

Opens and configures the Motor Position Module. Implements motor_position_api_t::open.

Return values

FSP_SUCCESS	Motor Position Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Set parameter is invalid.

◆ RM_MOTOR_POSITION_Close()

fsp_err_t RM_MOTOR_POSITION_Close (motor_position_ctrl_t *const *p_ctrl*)

Disables specified Motor Position Module. Implements motor_position_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_Reset()

fsp_err_t RM_MOTOR_POSITION_Reset (motor_position_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Position Module. Implements motor_position_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionGet()

fsp_err_t RM_MOTOR_POSITION_PositionGet (motor_position_ctrl_t *const *p_ctrl*, int16_t *const *p_position*)

Get Rotor Position Data [degree]. Implements motor_position_api_t::positionGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_PositionSet()

fsp_err_t RM_MOTOR_POSITION_PositionSet (motor_position_ctrl_t *const *p_ctrl*, float const *position_rad*)

Set Position Data from Encoder [radian]. Implements motor_position_api_t::positionSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionReferenceSet()

fsp_err_t RM_MOTOR_POSITION_PositionReferenceSet (motor_position_ctrl_t *const *p_ctrl*, int16_t const *position_reference_deg*)

Set Position Reference Data [degree]. Implements motor_position_api_t::positionReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_ControlModeSet()

fsp_err_t RM_MOTOR_POSITION_ControlModeSet (motor_position_ctrl_t *const *p_ctrl*, motor_position_ctrl_mode_t const *mode*)

Set Position Control Mode. Implements motor_position_api_t::controlModeSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_PositionControl()

fsp_err_t RM_MOTOR_POSITION_PositionControl (motor_position_ctrl_t *const *p_ctrl*)

Calculates internal position reference.(Main process of Position Control) Implements motor_position_api_t::positionControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_POSITION_IpdSpeedPControl()

fsp_err_t RM_MOTOR_POSITION_IpdSpeedPControl (motor_position_ctrl_t *const *p_ctrl*, float const *ref_speed_rad*, float const *speed_rad*, float *const *p_iq_ref*)

Calculates the q-axis current reference by P control. Implements motor_position_api_t::ipdSpeedPControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferencePControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferencePControlGet (motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref*)

Get Speed Reference by P Control. Implements motor_position_api_t::speedReferencePControlGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferenceIpdControlGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceIpdControlGet (motor_position_ctrl_t *const *p_ctrl*, float const *max_speed_rad*, float *const *p_speed_ref*)

Get Speed Reference by IPD Control. Implements motor_position_api_t::speedReferenceIpdControlGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet()

fsp_err_t RM_MOTOR_POSITION_SpeedReferenceFeedforwardGet (motor_position_ctrl_t *const *p_ctrl*, float *const *p_speed_ref*)

Get Speed Reference by Feedforward. Implements motor_position_api_t::speedReferenceFeedforwardGet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_InfoGet()

fsp_err_t RM_MOTOR_POSITION_InfoGet (motor_position_ctrl_t *const *p_ctrl*, motor_position_info_t *const *p_info*)

Get position information.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_POSITION_ParameterUpdate()

fsp_err_t RM_MOTOR_POSITION_ParameterUpdate (motor_position_ctrl_t *const *p_ctrl*, motor_position_cfg_t const *const *p_cfg*)
Update the parameters of Position Control Calculation. Implements motor_position_api_t::parameterUpdate. **Return values** FSP_SUCCESS — Successfully data was updated. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_ARGUMENT — Configuration parameter error.

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Sensorless Vector Control (rm_motor_sensorless).

Overview

The motor sensorless vector control is used to control a motor rotation in an application. This module is implemented with using SPM motor. User can start/stop motor rotation simply.

Features

The Motor Sensorless Module has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Sensorless Module.

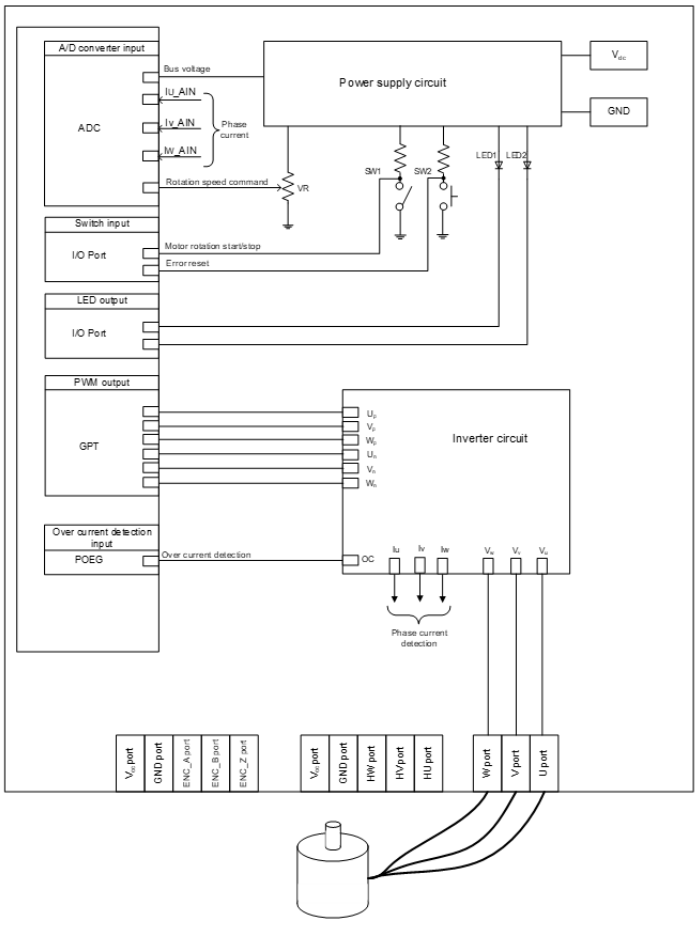

Figure 283: Example of target hardware of motor sensorless module

Block Diagram

The below figures show block diaram of sensorless vector motor control. The 1st shows as an open-loop state, 2nd as a PI feedback loop state.

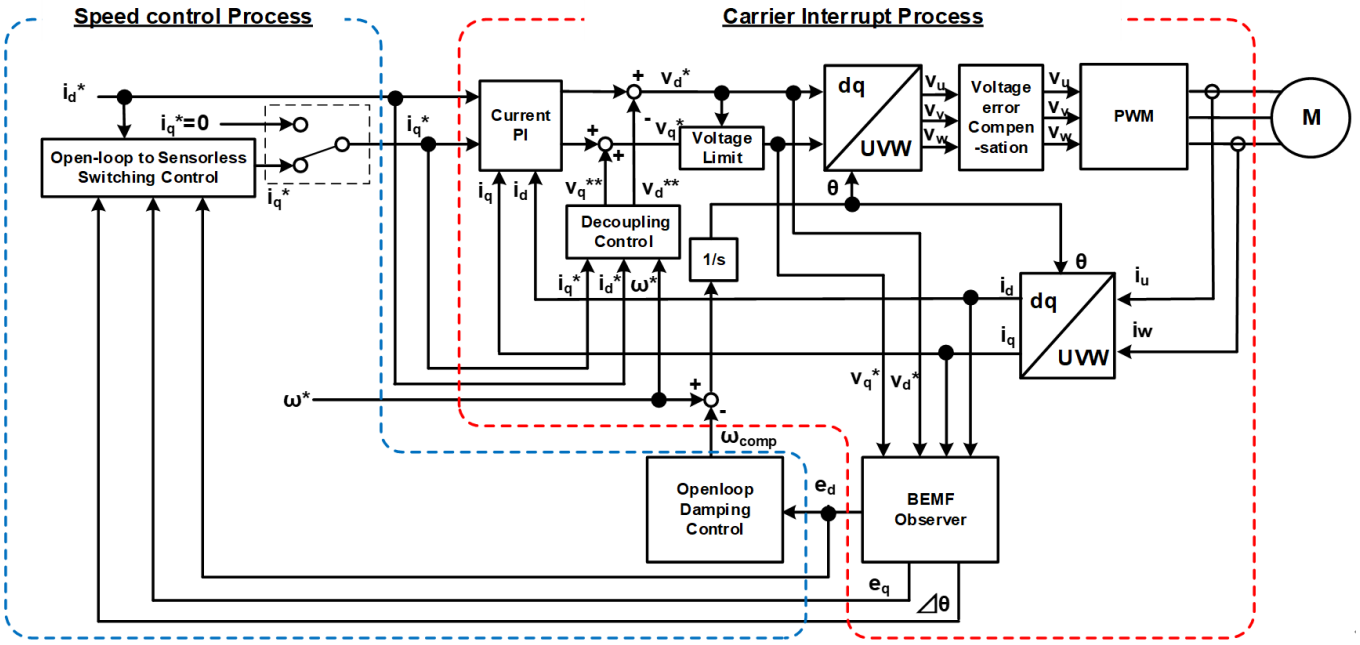

Figure 284: Block diagram of sensorless vector control (open-loop)

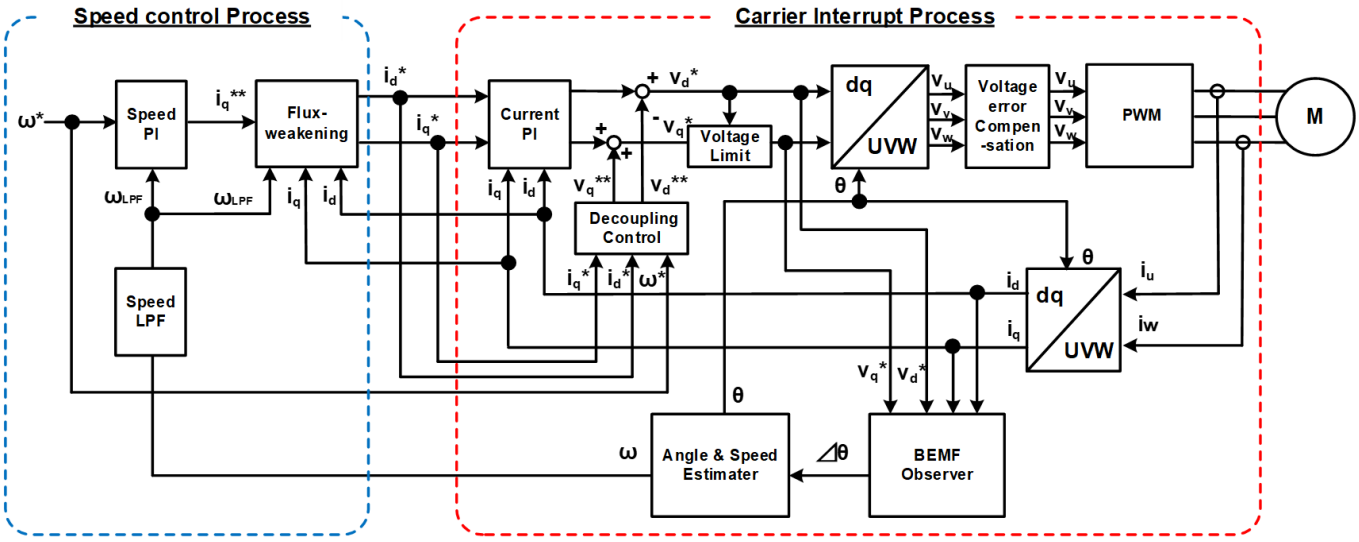

Figure 285: Block diagram of sensorless vector control (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 286: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 287: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 288: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor sensorless module.

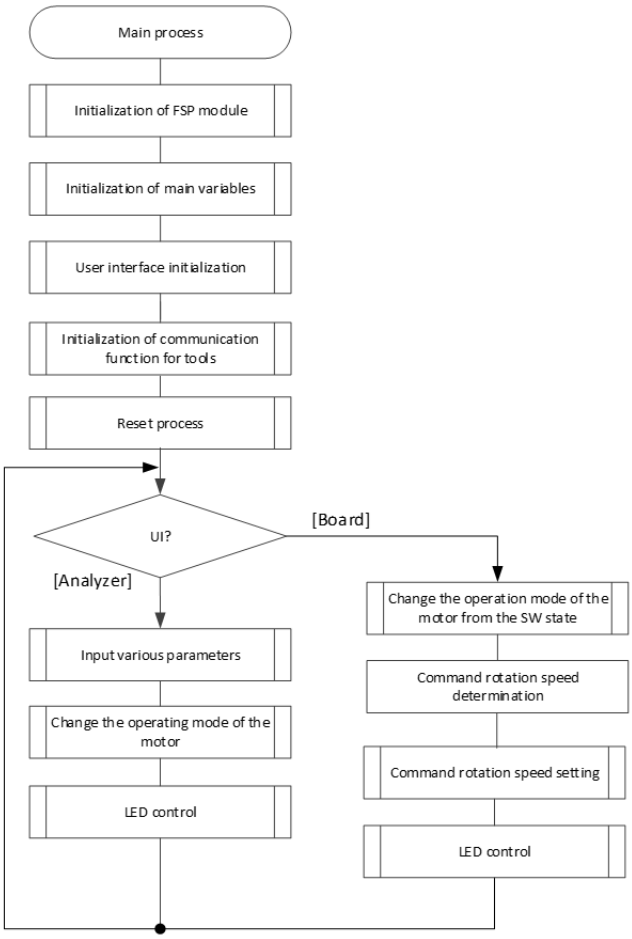

Figure 289: Main process

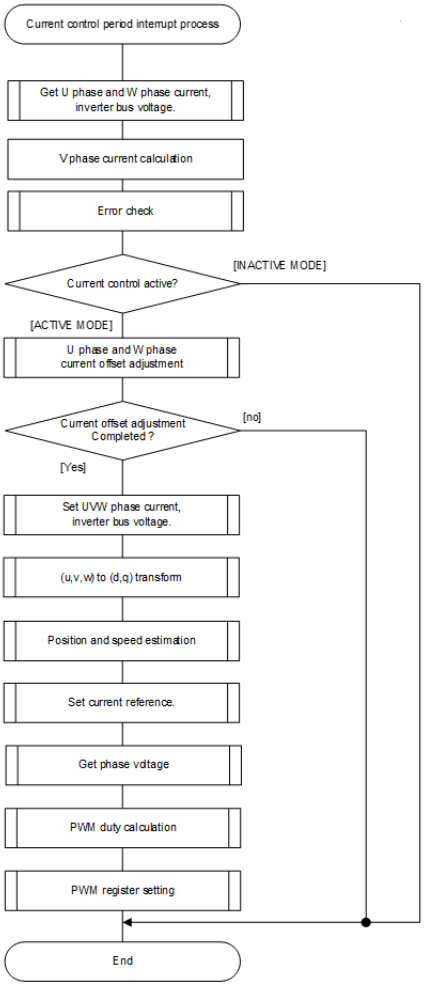

Figure 290: Current control process

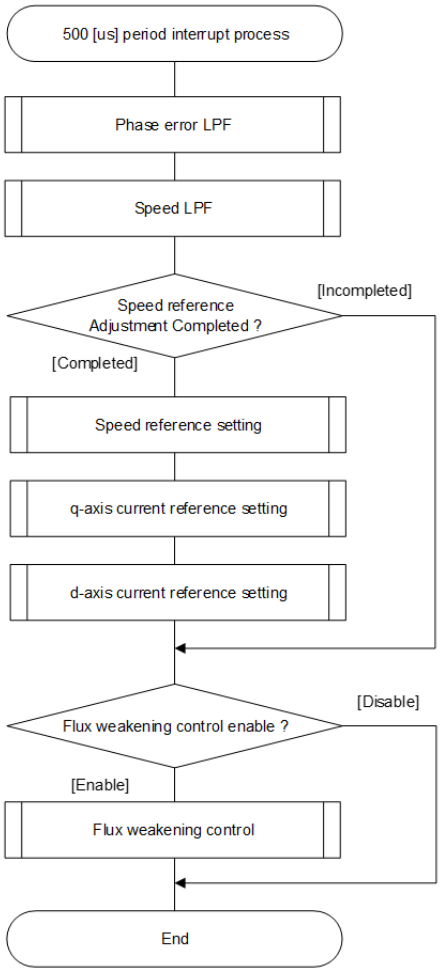

Figure 291: Speed control process

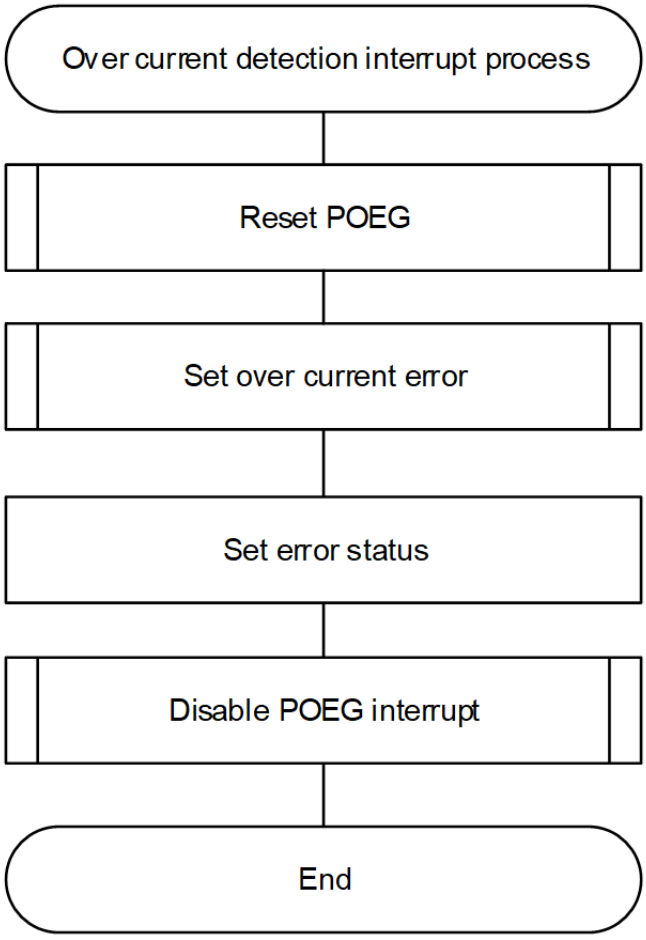

Figure 292: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_sensorless

The following build time configurations are defined in fsp_cfg/rm_motor_sensorless_cfg.h:

Configuration	Options	Default	Description
Parameter checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Sensorless Vector Control (rm_motor_sensorless)

This module can be added to the Stacks tab via New Stack > Motor > Motor Sensorless Vector Control (rm_motor_sensorless).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_sensorless0	Module name.
Limit of over current (A)	Must be a valid value	0.42F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	14.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the Motor Sensorless in an application.

```
void motor_sensorless_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
 /* Stop motor rotation */
    (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset Speed Control */
    (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_SENSORLESS_Open()

fsp_err_t RM_MOTOR_SENSORLESS_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_SENSORLESS_Open(g_motor_sensorless0.p_ctrl,
g_motor_sensorless0.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_SENSORLESS_Close()

fsp_err_t RM_MOTOR_SENSORLESS_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Sensorless Control block. Implements motor_api_t::close.

Example:

```
/* Close Speed Control */
   (void) RM_MOTOR_SENSORLESS_Close(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Reset()

fsp_err_t RM_MOTOR_SENSORLESS_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Sensorless Control block. Implements motor_api_t::reset.

Example:

```
/* Reset Speed Control */
   (void) RM_MOTOR_SENSORLESS_Reset(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Run()

fsp_err_t RM_MOTOR_SENSORLESS_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_SENSORLESS_Run(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_Stop()

fsp_err_t RM_MOTOR_SENSORLESS_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_Stop(g_motor_sensorless0.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_ErrorSet()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_SENSORLESS_ErrorSet(g_motor_sensorless0.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_SpeedSet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_SENSORLESS_SpeedSet(g_motor_sensorless0.p_ctrl,
DEF_SENSORLESS_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_SENSORLESS_StatusGet()

fsp_err_t RM_MOTOR_SENSORLESS_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_SENSORLESS_StatusGet(g_motor_sensorless0.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_AngleGet()

fsp_err_t RM_MOTOR_SENSORLESS_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_SENSORLESS_AngleGet(g_motor_sensorless0.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_SpeedGet()

fsp_err_t RM_MOTOR_SENSORLESS_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_SENSORLESS_SpeedGet(g_motor_sensorless0.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_ErrorCheck()

fsp_err_t RM_MOTOR_SENSORLESS_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_SENSORLESS_ErrorCheck(g_motor_sensorless0.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_SENSORLESS_PositionSet()

fsp_err_t RM_MOTOR_SENSORLESS_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_SENSORLESS_WaitStopFlagGet()

fsp_err_t RM_MOTOR_SENSORLESS_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_SENSORLESS_FunctionSelect()

fsp_err_t RM_MOTOR_SENSORLESS_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)
Select function. Implements motor_api_t::functionSelect. **Return values** FSP_ERR_UNSUPPORTED — Unsupported. ***Note***

5.2.11.16 Motor Speed Controller (rm_motor_speed)

Detailed Description

Calculation process for the motor control on RA MCUs. This module implements the Motor speed Interface.

Overview

The motor speed is used to control the speed of motor rotation in an application. This module should be called cyclically in an application (e.g. in cyclic timer interrupt). This module caliculates d/q-axis current reference with input speed reference, current rotational speed, and d/q-axis current.

Features

The motor speed module has below features.

- Calculate d/q-axis electric current reference.
- Flux weakening process at high speed rotation.
- Open loop damping control when using sensorless type.
- Low pass filter of input rotational speed.
- Speed observer function when using encoder type.

Configuration

Build Time Configurations for rm_motor_speed

The following build time configurations are defined in fsp_cfg/rm_motor_speed_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Position Support	• Enabled • Disabled	Disabled	Enable position algorithm support.

Configurations for Motor > Motor Speed Controller (rm_motor_speed)

This module can be added to the Stacks tab via New Stack > Motor > Motor Speed Controller (rm_motor_speed).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_speed0	Module name.
Speed control period (sec)	Must be a valid non-negative value	0.0005F	Period of speed control function.
Step of speed climbing (rpm)	Must be a valid non-negative value	0.5F	Step of speed change at start of open-loop.
Maximum rotational speed (rpm)	Must be a valid non-negative value.	2650.0F	Maximum rotational speed (Limit speed).
Speed LPF omega	Must be a valid non-negative value	10.0F	Design parameter for speed LPF.
Limit of q-axis current (A)	Must be a valid non-negative value	0.42F	Limit of q-axis current.
Step of speed feedback at open-loop	Must be a valid non-negative value	0.20F	Step of speed feedback at open-loop.
Natural frequency	Must be a valid non-negative value.	100.0F	Natural frequency for disturbance speed observer.
Open-loop damping	• Disable • Enable	Enable	Select enable/disable Open-loop damping control.
Flux weakening	• Disable • Enable	Disable	Select enable/disable flux weakening control.
Torque compensation for sensorless transition	• Disable • Enable	Enable	Select enable/disable torque compensation for sensorless

			transition.
Speed observer	• Disable • Enable	Enable	Select enable/disable Speed observer process.
Selection of speed observer	• Normal • Disturbance	Normal	Select speed observer type.
Control method	• PID • IPD	PID	Select the control method [PID or IPD].
Control type	• Sensoreless • Encoder • Induction • Hall	Sensoreless	
Open-Loop			
Step of d-axis current climbing	Must be a valid non-negative value	0.3F	Step of d-axis current climbing
Step of d-axis current descending	Must be a valid non-negative value	0.3F	Step of d-axis current descending
Step of q-axis current descending ratio	Must be a valid non-negative value	1.0F	Step of q-axis current descending ratio
Reference of d-axis current	Must be a valid non-negative value	0.3F	Reference of d-axis current
Threshold of speed control descending	Must be a valid value	600.0F	When rotational speed reaches this speed, d-axis current is controlled descending.
Threshold of speed control climbing	Must be a valid value	500.0F	Until rotational speed reaches this speed, d-axis current is controlled climbing.
Period between open-loop to BEMF (sec)	Must be a valid non-negative value	0.025F	Margin time between open-loop control changes to BEMF PI control.
Phase error(degree) to decide sensor-less switch timing	Must be a valid value	10.0F	Phase error(degree) to decide sensor-less switch timing.
Design parameter			
Speed PI loop omega	Must be a valid non-negative value	5.0F	Speed PI loop omega
Speed PI loop zeta	Must be a valid non-negative value	1.0F	Speed PI loop zeta
Estimated d-axis HPF omega	Must be a valid non-negative value	2.5F	HPF cutoff frequency for ed (Hz)
Open-loop damping	Must be a valid non-	1.0F	Damping ratio of open-

zeta	negative value		loop damping control
Cutoff frequency of phase error LPF	Must be a valid non-negative value	10.0F	Cutoff frequency of phase error LPF
Speed observer omega	Must be a valid non-negative value	200.0F	Speed observer loop omega
Speed observer zeta	Must be a valid non-negative value	1.0F	Speed observer loop zeta
Motor Parameter			
Pole pairs	Must be a valid integer.	2	Pole pairs
Resistance (ohm)	Must be a valid non-negative value	8.5F	Resistance
Inductance of d-axis (H)	Must be a valid non-negative value	0.0045F	Inductance of d-axis
Inductance of q-axis (H)	Must be a valid non-negative value	0.0045F	Inductance of q-axis
Permanent magnetic flux (Wb)	Must be a valid non-negative value	0.02159F	Permanent magnetic flux
Motor Parameter > Rotor inertia (kgm^2)	Must be a valid non-negative value	0.0000028F	Rotor inertia
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at timer interrupt.
Input data	Name must be a valid C symbol	NULL	Structure for Speed control Input. If you set this content, Speed Control function read these data automatically. (No need to use Set API.)
Output data	Name must be a valid C symbol	NULL	Structure for Speed control Output. If you set this content, Speed Control function write need data automatically. (No need to use Get API.)

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple calculation process.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

- Set the period of speed control with none-negative value.
- Set the limit of speed change step with none-negative value.
- Set the maximum speed with none-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor speed in an application.

```
void motor_speed_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_SPEED_Open(g_motor_speed0.p_ctrl, g_motor_speed0.p_cfg);
    handle_error(err);
 /* Set speed reference before get current reference */
    (void) RM_MOTOR_SPEED_SpeedReferenceSet(g_motor_speed0.p_ctrl, 104.72F);
 /* Set position reference before get current reference
  * (Basically Exclusive to SpeedReferenceSet. This is only sample,) */
    (void) RM_MOTOR_SPEED_PositionReferenceSet(g_motor_speed0.p_ctrl,
&g_posref_sample);
 /* Basically run this module at cyclic interrupt (e.g. AGT timer).
  * This implementation is an example. */
 // while (true)
    {
 /* Application work here. */
 /* Set input parameter data before get current reference */
       (void) RM_MOTOR_SPEED_ParameterSet(g_motor_speed0.p_ctrl,
&g_test_speed_input);
 /* Activate Speed Process */
       (void) RM_MOTOR_SPEED_Run(g_motor_speed0.p_ctrl);
 /* Perform Speed Control Process */
       (void) RM_MOTOR_SPEED_SpeedControl(g_motor_speed0.p_ctrl);
```

```
 /* Get output parameters */
       (void) RM_MOTOR_SPEED_ParameterGet(g_motor_speed0.p_ctrl,
&g_test_speed_output);
 //

 /* Update parameters */
       (void) RM_MOTOR_SPEED_ParameterUpdate(g_motor_speed0.p_ctrl,
&g_motor_speed0.p_cfg);
    }
 /* Reset Speed Control */
    (void) RM_MOTOR_SPEED_Reset(g_motor_speed0.p_ctrl);
 /* Close Speed Control */
    (void) RM_MOTOR_SPEED_Close(g_motor_speed0.p_ctrl);
}
```

Enumerations

enum	motor_speed_less_switch_t
enum	motor_speed_observer_switch_t
enum	motor_speed_observer_select_t
enum	motor_speed_ctrl_status_t

Enumeration Type Documentation

◆ motor_speed_control_type_t

enum motor_speed_control_type_t	
Enumerator	
MOTOR_SPEED_CONTROL_TYPE_SENSORLESS	Sensorless type.
MOTOR_SPEED_CONTROL_TYPE_ENCODER	Encoder type.
MOTOR_SPEED_CONTROL_TYPE_HALL	Hall type.
MOTOR_SPEED_CONTROL_TYPE_INDUCTION	Induction type.

◆ motor_speed_openloop_damping_t

enum motor_speed_openloop_damping_t	
Enumerator	
MOTOR_SPEED_OPENLOOP_DAMPING_DISABLE	Disable openloop damping.
MOTOR_SPEED_OPENLOOP_DAMPING_ENABLE	Enable openloop damping.

◆ motor_speed_flux_weaken_t

enum motor_speed_flux_weaken_t	
Enumerator	
MOTOR_SPEED_FLUX_WEAKEN_DISABLE	Disable flux-weakening control.
MOTOR_SPEED_FLUX_WEAKEN_ENABLE	Enable flux-weakening control.

◆ motor_speed_less_switch_t

enum motor_speed_less_switch_t	
Enumerator	
MOTOR_SPEED_LESS_SWITCH_DISABLE	Disable soft switching between open-loop mode and normal field oriented control mode.
MOTOR_SPEED_LESS_SWITCH_ENABLE	Enable soft switching between open-loop mode and normal field oriented control mode.

◆ motor_speed_observer_switch_t

enum motor_speed_observer_switch_t	
Enumerator	
MOTOR_SPEED_OBSERVER_SWITCH_DISABLE	Disable speed observer.
MOTOR_SPEED_OBSERVER_SWITCH_ENABLE	Enable speed observer.

◆ motor_speed_observer_select_t

enum motor_speed_observer_select_t	
Enumerator	
MOTOR_SPEED_OBSERVER_SELECT_NORMAL	Normal speed observer.
MOTOR_SPEED_OBSERVER_SELECT_DISTURBANCE	Disturbance speed observer.

◆ motor_speed_ctrl_status_t

enum motor_speed_ctrl_status_t	
Enumerator	
MOTOR_SPEED_CTRL_STATUS_INIT	Speed control status is INIT.
MOTOR_SPEED_CTRL_STATUS_BOOT	Speed control status is BOOT.
MOTOR_SPEED_CTRL_STATUS_RUN	Speed control status is RUN.

Function Documentation

◆ RM_MOTOR_SPEED_Open()

fsp_err_t RM_MOTOR_SPEED_Open (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg*)

Opens and configures the Motor Speed Module. Implements motor_speed_api_t::open.

Return values

FSP_SUCCESS	Motor Speed Module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

◆ RM_MOTOR_SPEED_Close()

fsp_err_t RM_MOTOR_SPEED_Close (motor_speed_ctrl_t *const *p_ctrl*)

Disables specified Motor Speed Module. Implements motor_speed_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_Reset()

fsp_err_t RM_MOTOR_SPEED_Reset (motor_speed_ctrl_t *const *p_ctrl*)

Reset the variables of Motor Speed Module. Implements motor_speed_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_Run()

fsp_err_t RM_MOTOR_SPEED_Run (motor_speed_ctrl_t *const *p_ctrl*)

Run(Start) the Motor Speed Control. Implements motor_speed_api_t::run.

Return values

FSP_SUCCESS	Successfully start.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_SpeedReferenceSet()

fsp_err_t RM_MOTOR_SPEED_SpeedReferenceSet (motor_speed_ctrl_t *const *p_ctrl*, float const *speed_reference_rpm*)

Set Speed Reference Data. Implements motor_speed_api_t::speedReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_PositionReferenceSet()

fsp_err_t RM_MOTOR_SPEED_PositionReferenceSet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position_data*)

Set Position Reference Data. Implements motor_speed_api_t::positionReferenceSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input structure pointer is NULL.

◆ RM_MOTOR_SPEED_ParameterSet()

fsp_err_t RM_MOTOR_SPEED_ParameterSet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_input_t const *const *p_st_input*)

Set Input parameters. Implements motor_speed_api_t::parameterSet.

Return values

FSP_SUCCESS	Successfully data is set.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_SPEED_SpeedControl()

fsp_err_t RM_MOTOR_SPEED_SpeedControl (motor_speed_ctrl_t *const *p_ctrl*)

Calculates the d/q-axis current reference.(Main process of Speed Control) Implements motor_speed_api_t::speedControl.

Return values

FSP_SUCCESS	Successful data calculation.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_SPEED_ParameterGet()

fsp_err_t RM_MOTOR_SPEED_ParameterGet (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_output_t *const *p_st_output*)

Get Speed Control Parameters. Implements motor_speed_api_t::parameterGet.

Return values

FSP_SUCCESS	Successfully the flag is gotten.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Output pointer is NULL.

◆ RM_MOTOR_SPEED_ParameterUpdate()

fsp_err_t RM_MOTOR_SPEED_ParameterUpdate (motor_speed_ctrl_t *const *p_ctrl*, motor_speed_cfg_t const *const *p_cfg*)
Update the parameters of Speed Control Calculation. Implements motor_speed_api_t::parameterUpdate. **Return values** FSP_SUCCESS — Successfully data was updated. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_ARGUMENT — Configuration parameter error.

Detailed Description

Usual control of a SPM motor on RA MCUs. This module implements the Motor Vector Control with hall sensors (rm_motor_hall).

Overview

The motor vector control with hall sensors is used to control a motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor vector control with hall sensors has below features.

- Start/Stop a motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Hall Module.

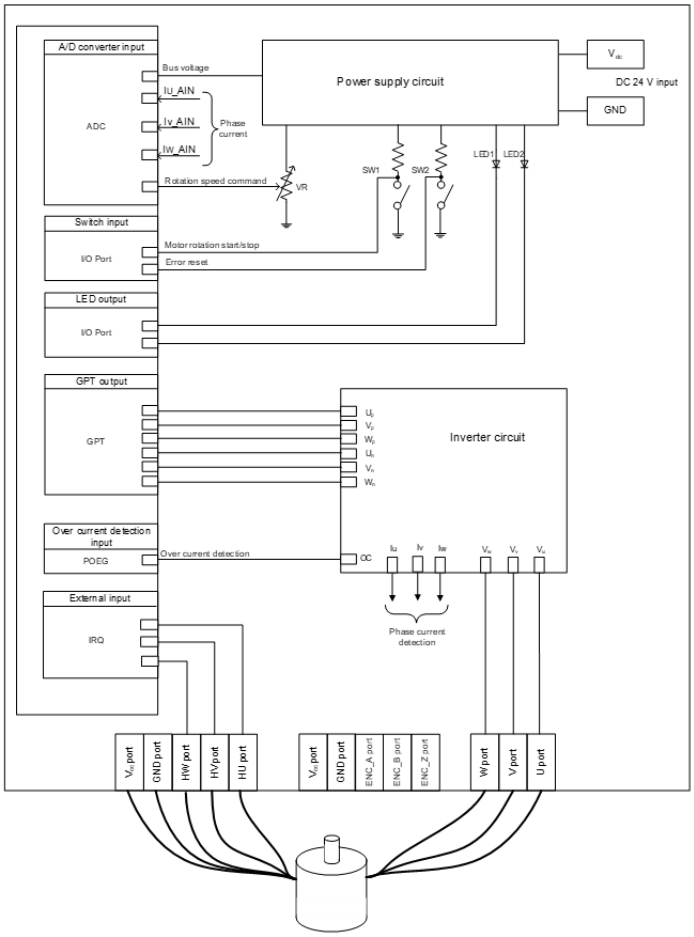

Figure 293: Example of target hardware of motor hall module

Block Diagram

The below figure shows block diaram of vector motor control with hall sensors.

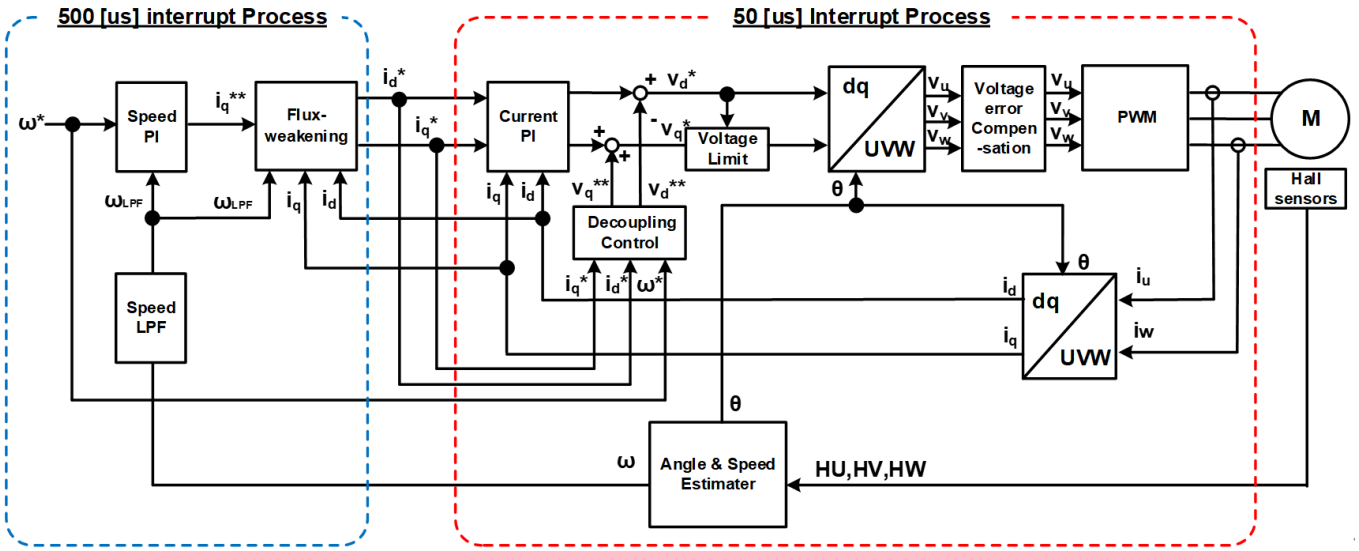

Figure 294: Block diagram of vector control with hall sensors

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 295: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2},\ V_{max} = max\{V_u, V_v, V_w\},\ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 296: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 297: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor hall module.

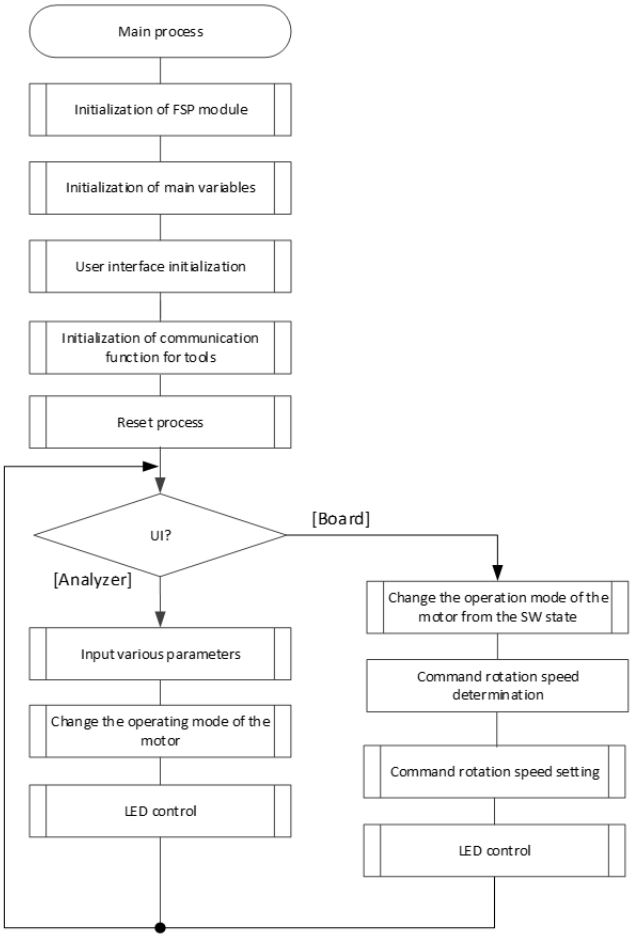

Figure 298: Main process

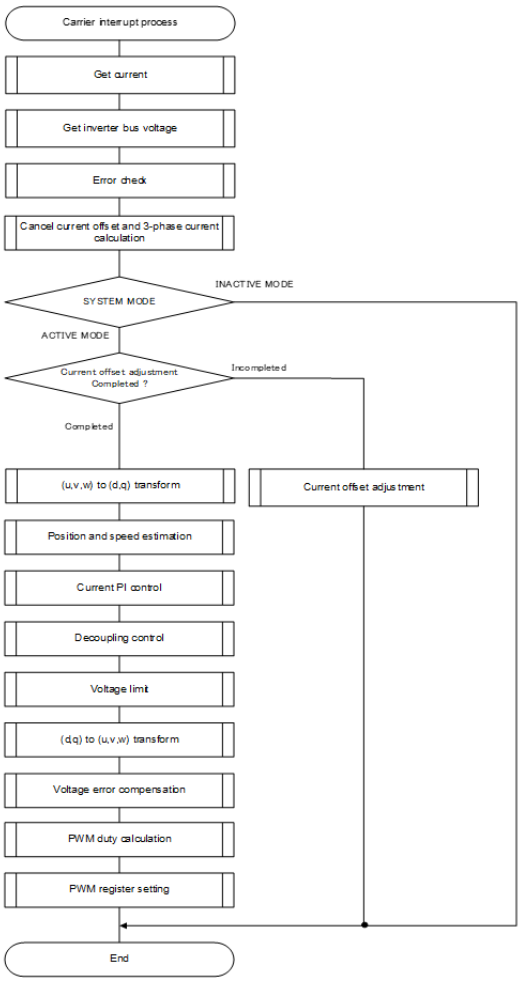

Figure 299: Current control process

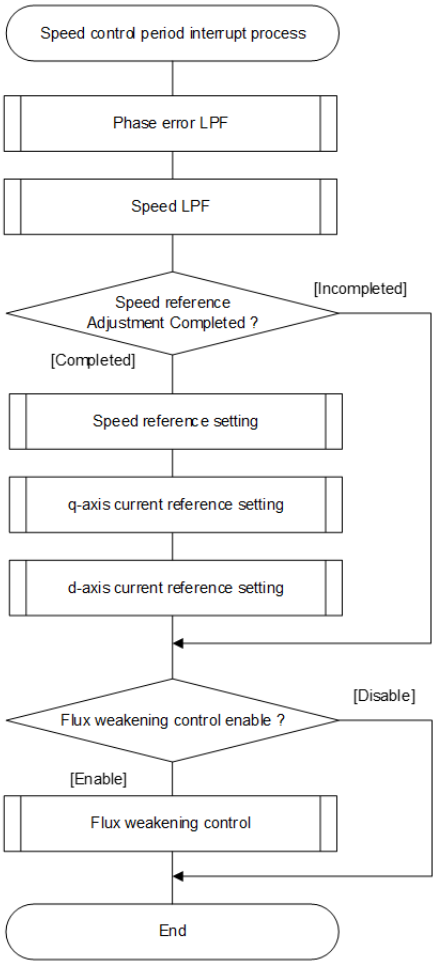

Figure 300: Speed control process

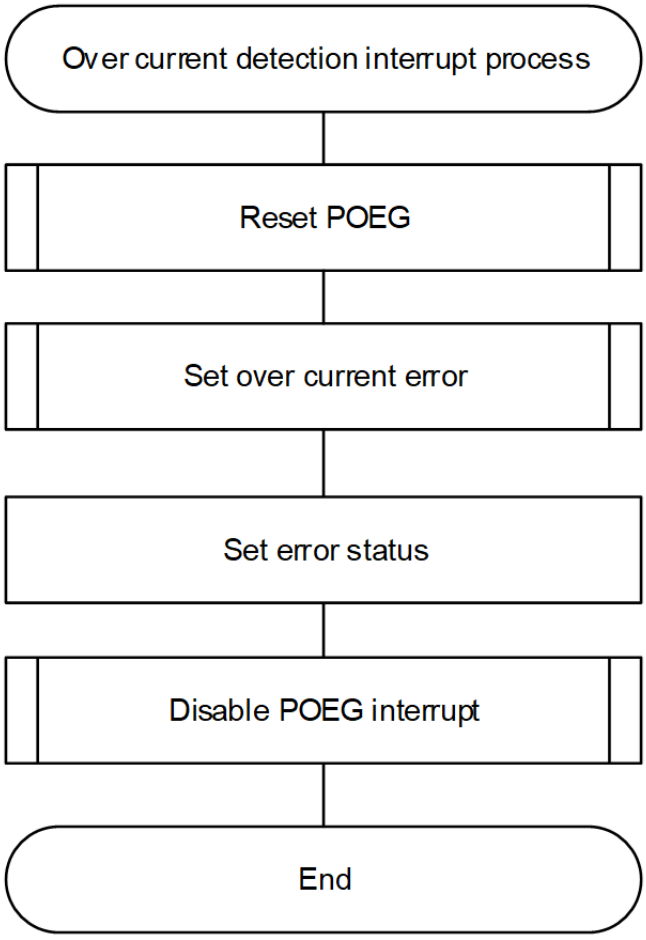

Figure 301: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_hall

The following build time configurations are defined in fsp_cfg/rm_motor_hall_cfg.h:

Configuration	Options	Default	Description
Parameter checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor Vector Control with hall sensors(rm_motor_hall)

This module can be added to the Stacks tab via New Stack > Motor > Motor Vector Control with hall sensors(rm_motor_hall).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_hall0	Module name.
Limit of over current (A)	Must be a valid value	0.42F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	14.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor vector control with hall sensors in an application.

```
void motor_hall_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
    assert(FSP_SUCCESS == err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
 /* Start motor rotation */
    (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor speed */
    (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
 /* When error is detected with extra Hardware */
    (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control (Clear error status) */
    (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
}
```

Function Documentation

◆ RM_MOTOR_HALL_Open()

fsp_err_t RM_MOTOR_HALL_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR HALL in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_HALL_Open(g_motor_hall0_smpl.p_ctrl, g_motor_hall0_smpl.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR HALL successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_HALL_Close()

fsp_err_t RM_MOTOR_HALL_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Hall Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_HALL_Close(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Reset()

fsp_err_t RM_MOTOR_HALL_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Hall Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control (Clear error status) */
   (void) RM_MOTOR_HALL_Reset(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Run()

fsp_err_t RM_MOTOR_HALL_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_HALL_Run(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_Stop()

fsp_err_t RM_MOTOR_HALL_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_HALL_Stop(g_motor_hall0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_ErrorSet()

fsp_err_t RM_MOTOR_HALL_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* When error is detected with extra Hardware */
   (void) RM_MOTOR_HALL_ErrorSet(g_motor_hall0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_SpeedSet()

fsp_err_t RM_MOTOR_HALL_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_HALL_SpeedSet(g_motor_hall0_smpl.p_ctrl,
DEF_HALL_TEST_OVSPD_LIM);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_HALL_StatusGet()

fsp_err_t RM_MOTOR_HALL_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_HALL_StatusGet(g_motor_hall0_smpl.p_ctrl, &smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_AngleGet()

fsp_err_t RM_MOTOR_HALL_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_HALL_AngleGet(g_motor_hall0_smpl.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_SpeedGet()

fsp_err_t RM_MOTOR_HALL_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor speed */
   (void) RM_MOTOR_HALL_SpeedGet(g_motor_hall0_smpl.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_ErrorCheck()

fsp_err_t RM_MOTOR_HALL_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_HALL_ErrorCheck(g_motor_hall0_smpl.p_ctrl, &smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_HALL_PositionSet()

fsp_err_t RM_MOTOR_HALL_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference. Implements motor_api_t::positionSet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_HALL_WaitStopFlagGet()

fsp_err_t RM_MOTOR_HALL_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_HALL_FunctionSelect()

fsp_err_t RM_MOTOR_HALL_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)
Select function. Implements motor_api_t::functionSelect. **Return values** FSP_ERR_UNSUPPORTED — Unsupported. ***Note***

5.2.11.18 Motor return origin (rm_motor_return_origin)

Modules » Motor

Functions

fsp_err_t	RM_MOTOR_RETURN_ORIGIN_Open (motor_return_origin_ctrl_t *const p_ctrl, motor_return_origin_cfg_t const *const p_cfg) Opens and configures the motor return origin module. Implements motor_return_origin_api_t::open. More...

Detailed Description

Search origin position process for the motor control on RA MCUs. This module implements the Motor Return Origin Function Interface.

Overview

The motor return origin module is used to search origin position in an application. This module should be used with Renesas Motor Workbench (RMW) basically.

Features

The Motor return origin module has below features.

- Search origin position automatically.

Configuration

Build Time Configurations for rm_motor_return_origin

The following build time configurations are defined in fsp_cfg/rm_motor_return_origin_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor return origin function (rm_motor_return_origin)

This module can be added to the Stacks tab via New Stack > Motor > Motor return origin function (rm_motor_return_origin).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_motor_return_origin0	Module name.
Using mode	Search by pushing	Search by pushing	Select using mode
Search speed (rpm)	Must be a valid non-negative value.	10.0	Speed to search origin position (rpm)
Acceleration of speed (rpm/sec)	Must be set 1 to 10000.	10000.0	Acceleration of rotation speed at return moving (rpm/sec)
Cyclic period of speed control (sec)	Must be a valid non-negative value.	0.0005	Cyclic period of speed control (sec)
Maximum current (A)	Must be a valid non-negative value.	1.8	Maximum current (A). Please set to match used motor.
Percentage of current to judge pushing (%)	Must be a valid non-negative value.	30.0	Perentage of current to judge pushing (%)
Pushing time (sec)	Must be a valid non-negative value.	1.0	Time to push the stopper (sec)
Degree to judge none stopper	Must be set -360 to 360.	360.0	When the motor runs over this value, it is judged impossible to search the stopper.
Degree to return	Must be a valid non-negative value.	3.0	Degree to return from the stopper (degree)
Mechanical gear ratio	Must be a valid non-negative value.	1.0	Mechanical gear ratio

Clock Configuration

This module doesn't depend on clock setting.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the Motor Return origin in an application.

```
void motor_return_origin_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
    assert(FSP_SUCCESS == err);
 /* Start process. */
    err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
    temp_set_data.f_iq             = 1.0F;
    temp_set_data.f_position_degree = 180.0F;
 /* Set data to the module. */
    err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
 /* Get information from the module. */
    err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
 /* Stop process. */
    err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
 /* Close the module. */
    err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
}
```

Data Structures

struct	motor_return_origin_extended_cfg_t
struct	motor_return_origin_pushing_t
struct	motor_return_origin_instance_ctrl_t

Data Structure Documentation

◆ motor_return_origin_extended_cfg_t

struct motor_return_origin_extended_cfg_t		
Extended configurations for return origin function		
Data Fields		
float	f_search_speed_rpm	Speed to search origin position [rpm].
float	f_return_accel_rpm	Acceleration speed when return [rpm/s].
float	f_speed_ctrl_period	Period of speed control [sec].
float	f_maximum_current	Maximum current [A].
float	f_current_limit_percent_push	Percentage of current at pushing.
float	f_pushing_time	Keep pushing time [sec].
float	f_over_degree	Angle to judge search impossible [degree].
float	f_return_degree	Return angle from pushing position [degree].
float	f_mechanical_gear_ratio	Mechanical gear ratio.

◆ motor_return_origin_pushing_t

struct motor_return_origin_pushing_t		
Variables for rerutn origin with pushing		
Data Fields		
uint32_t	u4_time_counter	Counter of speed cyclic (to judge the time)
float	f_sum_position	Summary of position data.
uint32_t	u4_sum_counter	Counter of summary.
float	f_move_amount	Movement amount [degree].
float	f_judge_iq	q-axis current to judge pushing
float	f_pushing_counts	Counts to measure pushing time.

◆ motor_return_origin_instance_ctrl_t

struct motor_return_origin_instance_ctrl_t
Return origin function instance control block
Data Fields

uint32_t	open	Used to determine if the module is configured.
motor_return_origin_start_flag_t	start_flag	start/stop flag
motor_return_origin_state_t	state	State number of return origin process.
int8_t	s1_direction	Moving direction.
float	f_angle_degree_on_edge	Rotor angle on the edge [degree].
float	f_current_speed	Current speed.
float	f_origin_position_angle_degree	Searched origin position [degree].
float	f_search_speed	Speed to search origin position [rad / sampling time].
float	f_accel_speed	Speed acceleration.
float	f_position_reference_degree	Position reference [degree].
motor_return_origin_pushing_t	st_pushing	Variables for pushing.
motor_return_origin_set_data_t	receive_data	Received data from speed(position) & current.
motor_return_origin_cfg_t const *	p_cfg	Pointer of configuration structure.

Function Documentation

◆ RM_MOTOR_RETURN_ORIGIN_Open()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Open (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg*)

Opens and configures the motor return origin module. Implements motor_return_origin_api_t::open .

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Open(&g_mtr_return_origin0_ctrl,
&g_mtr_return_origin0_cfg);
```

Return values

FSP_SUCCESS	Motor return origin module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_Close()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Close (motor_return_origin_ctrl_t *const *p_ctrl*)

Disables specified motor return origin module. Implements motor_return_origin_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MOTOR_RETURN_ORIGIN_Close(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Start()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Start (motor_return_origin_ctrl_t *const *p_ctrl*)

Start return origin function. Implements motor_return_origin_api_t::start.

Example:

```
/* Start process. */
   err = RM_MOTOR_RETURN_ORIGIN_Start(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Stop()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Stop (motor_return_origin_ctrl_t *const *p_ctrl*)

Stop (Cancel) return origin function. Implements motor_return_origin_api_t::stop.

Example:

```
/* Stop process. */
   err = RM_MOTOR_RETURN_ORIGIN_Stop(&g_mtr_return_origin0_ctrl);
```

Return values

FSP_SUCCESS	Successfully stopped (canceled).
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_Reset()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_Reset (motor_return_origin_ctrl_t *const *p_ctrl*)

Reset variables of return origin module. Implements motor_return_origin_api_t::reset.

Return values

FSP_SUCCESS	Successfully reset.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_InfoGet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_InfoGet (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_info_t *const *p_info*)

Get information of return origin. Implements motor_return_origin_api_t::infoGet.

Example:

```
/* Get information from the module. */
   err = RM_MOTOR_RETURN_ORIGIN_InfoGet(&g_mtr_return_origin0_ctrl, &temp_info);
```

Return values

FSP_SUCCESS	Successfully get data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_DataSet()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_DataSet (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_set_data_t *const *p_set_data*)

Set necessary data to return origin function. Implements motor_return_origin_api_t::dataSet.

Example:

```
/* Set data to the module. */
   err = RM_MOTOR_RETURN_ORIGIN_DataSet(&g_mtr_return_origin0_ctrl, &temp_set_data);
```

Return values

FSP_SUCCESS	Successfully set data.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

◆ RM_MOTOR_RETURN_ORIGIN_SpeedCyclic()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_SpeedCyclic (motor_return_origin_ctrl_t *const *p_ctrl*)

Cyclic process of return origin function at speed control period. (Called at timer interrupt.) Implements motor_return_origin_api_t::speedCyclic.

Return values

FSP_SUCCESS	Successfully perform the process.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MOTOR_RETURN_ORIGIN_ParameterUpdate()

fsp_err_t RM_MOTOR_RETURN_ORIGIN_ParameterUpdate (motor_return_origin_ctrl_t *const *p_ctrl*, motor_return_origin_cfg_t const *const *p_cfg*)

Update the parameters of return origin function. Implements motor_return_origin_api_t::parameterUpdate.

Return values

FSP_SUCCESS	Successfully data was updated.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter error.

Detailed Description

Control a SPM motor on RA MCUs. This module implements the Motor vector control with induction sensor (rm_motor_induction).

Overview

The motor vector control with induction sensor is used to control motor rotation in an application. This module is meant to be used with Surface Permanent Magnet (SPM) motors and allows applications to start or stop motor rotation easily.

Features

The motor induction module has below features.

- Start/stop motor rotation
- Error detection (over current, over speed, over voltage, low voltage)

Target Hardware

The below figure shows an example of target hardware of this Motor Induction Module.

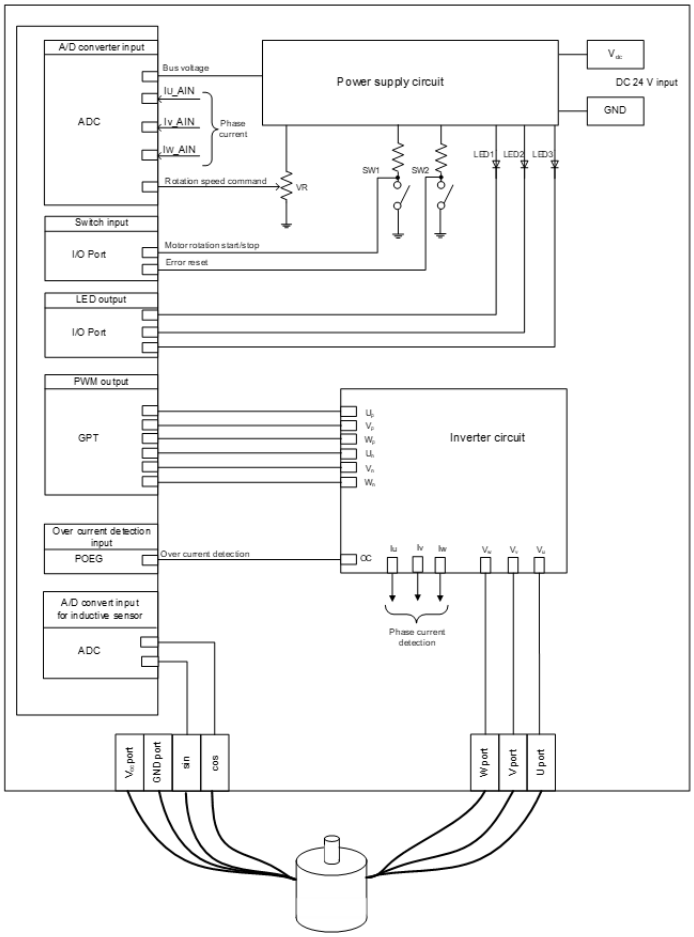

Figure 302: Example of target hardware of motor induction module

Block Diagram

The below figures show block diaram of vector motor control with using induction sensor.

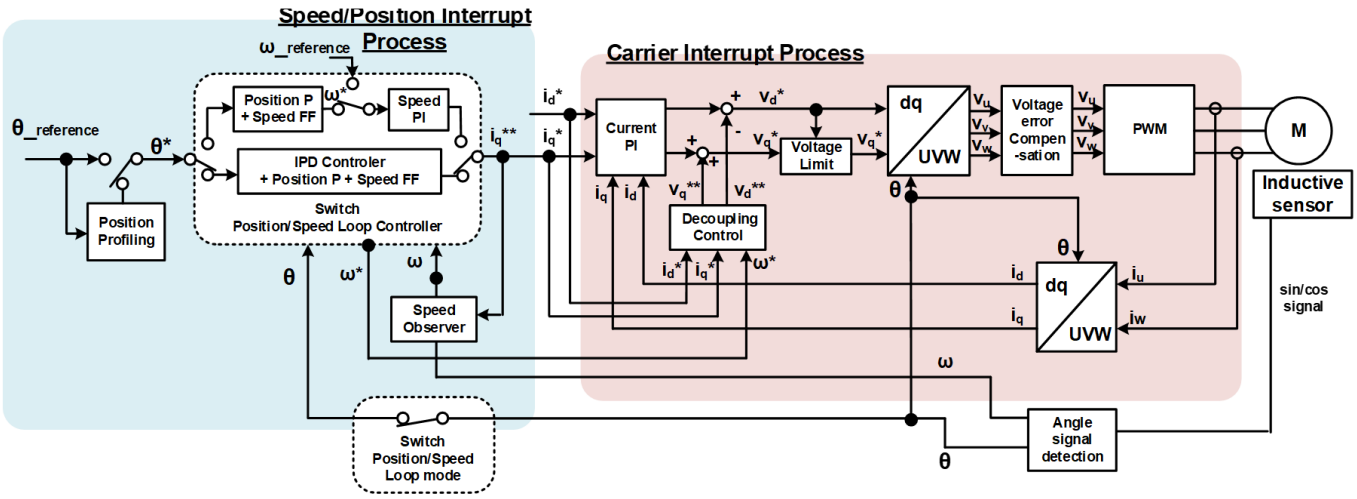

Figure 303: Block diagram of vector control with using induction sensor (PI feedback loop)

Modulation

- Sine wave modulation The modulation factor "m" is defined as follows.

$$m = \frac{V}{E}$$

m : Modulation ratio V : Reference voltage E : Inverter input voltage

Figure 304: Modulation factor

- Space vector modulation In vector control of a permanent magnet synchronous motor, generally, the desired voltage command value of each phase is generated sinusoidally. However, if the generated value is used as-is for the modulation wave for PWM generation, voltage utilization as applied to the motor (in terms of line voltage) is limited to a maximum of 86.7 percents with respect to inverter bus voltage. As such, as shown in the following expression, the average of the maximum and minimum values is calculated for the voltage command value of each phase, and the value obtained by subtracting the average from the voltage command value of each phase is used as the modulation wave. As a result, the maximum amplitude of the modulation wave is multiplied by (square root 3)/2, while voltage utilization becomes 100 percents and line voltage is unchanged.

$$\begin{pmatrix} V_u' \\ V_v' \\ V_w' \end{pmatrix} = \begin{pmatrix} V_u \\ V_v \\ V_w \end{pmatrix} + \Delta V \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix}$$

$$\because \Delta V = -\frac{V_{max}+V_{min}}{2} \ , \ V_{max} = max\{V_u, V_v, V_w\} \ , \ V_{min} = min\{V_u, V_v, V_w\}$$

V_u, V_v, V_w: Command values of U-, V-, and W-phases

V_u', V_v', V_w': Command values of U-, V-, and W-phases for PWM generation (modulation wave)

Figure 305: Space vector modulation

State transition

The below figure shows a state transition diagram. Internal state is managed by "SYSTEM MODE".

		MODE		
		STOP	RUN	ERROR
EVENT	STOP	STOP	STOP	ERROR
	RUN	RUN	RUN	ERROR
	ERROR	ERROR	ERROR	ERROR
	RESET	STOP	RUN	STOP

Figure 306: State transition diagram

(1) SYSTEM MODE "SYSTEM MODE" indicates the operating states of the system. The state transits on occurrence of each event (EVENT). "SYSTEM MODE" has 3 states that are motor drive stop (INACTIVE), motor drive (ACTIVE), and abnormal condition (ERROR).

(2) EVENT When "EVENT" occurs in each "SYSTEM MODE", "SYSTEM MODE" changes as shown the table in above figure, according to that "EVENT". The occurrence factors of each event are shown below.

EVENT name	Occurrence factor
STOP	by user operation
RUN	by user operation
ERROR	when the system detects an error
RESET	by user operation

Flowchart

The below figures show flowcharts of motor induction module.

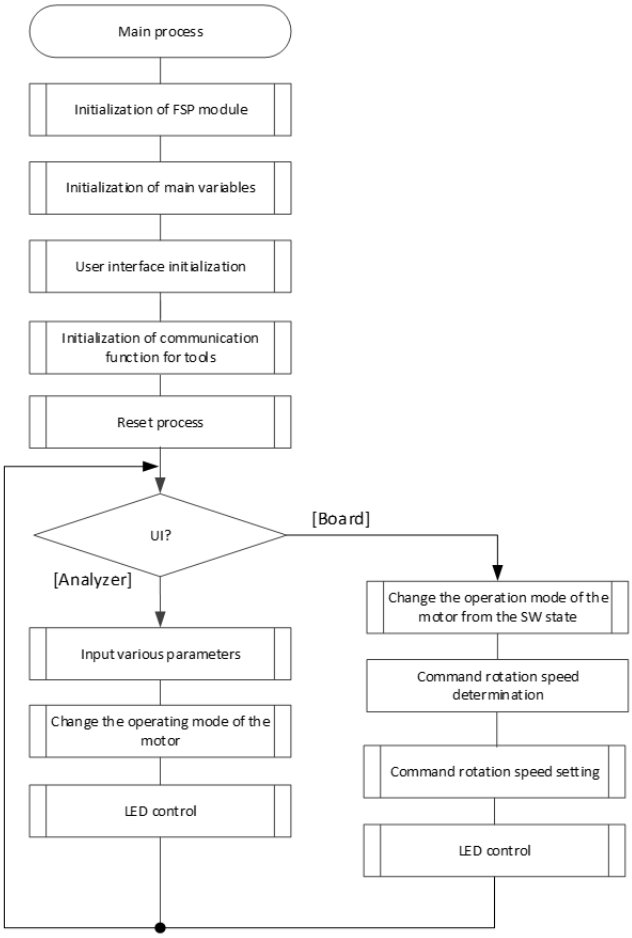

Figure 307: Main process

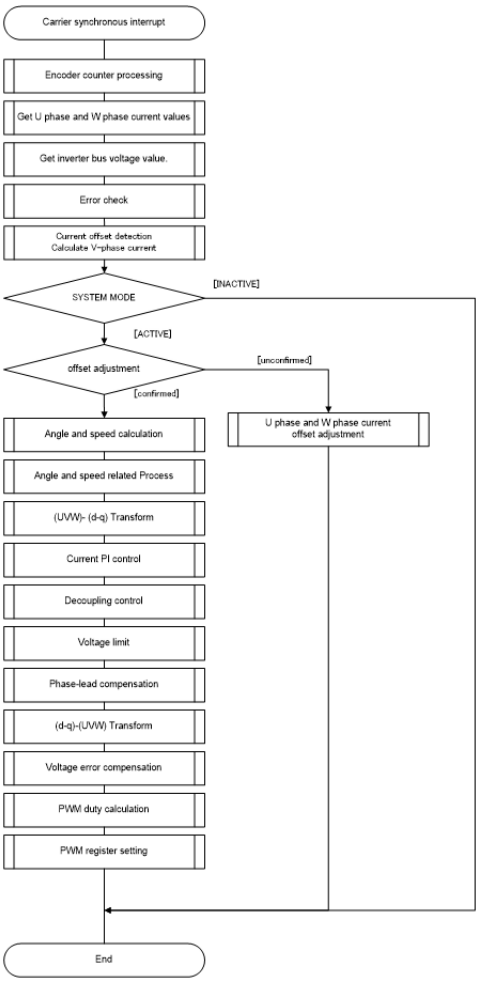

Figure 308: Current control process

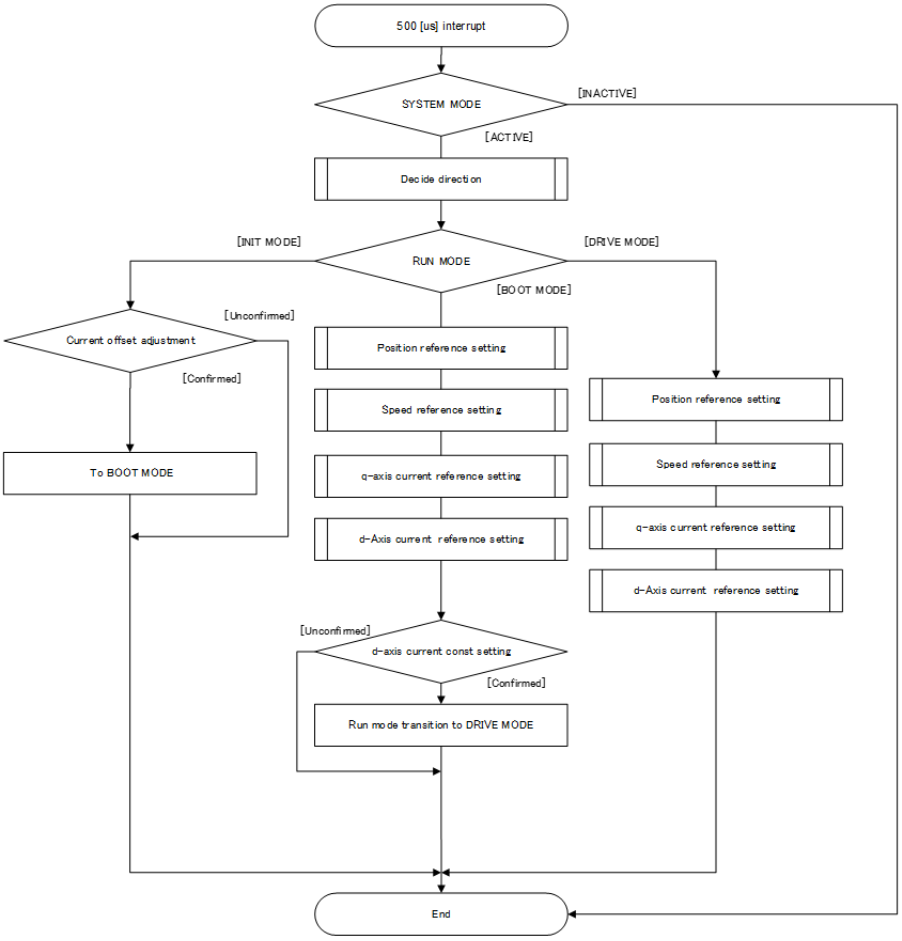

Figure 309: Speed control process

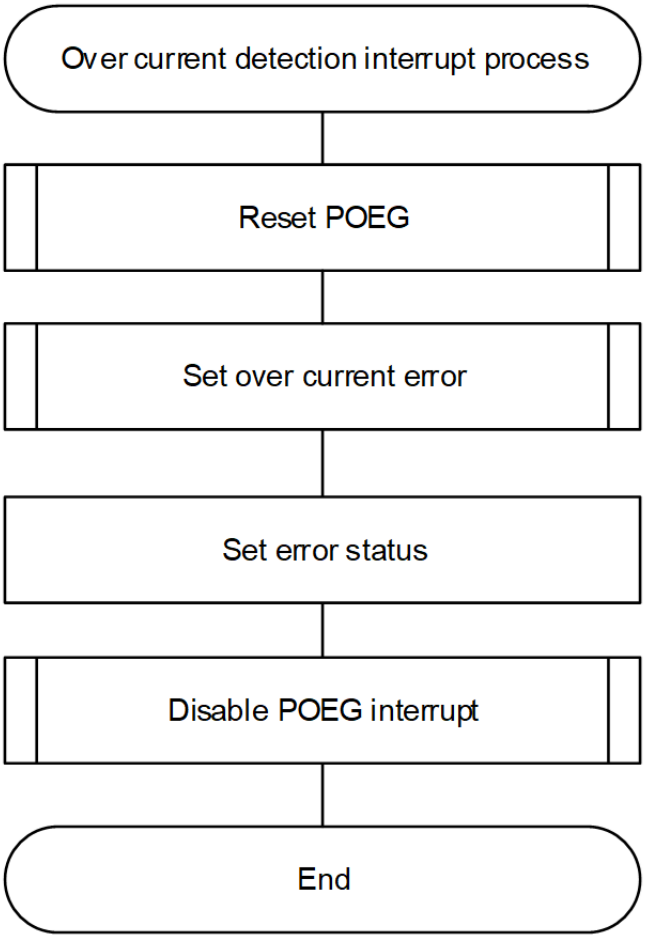

Figure 310: Over current detection interrupt process

Configuration

Build Time Configurations for rm_motor_induction

The following build time configurations are defined in fsp_cfg/rm_motor_induction_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Motor > Motor vector control with induction sensor (rm_motor_induction)

This module can be added to the Stacks tab via New Stack > Motor > Motor vector control with induction sensor (rm_motor_induction).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_motor_induction0	Module name.
Limit of over current (A)	Must be a valid value	2.0F	Limit of over current.(Detection threshold)
Limit of over voltage (V)	Must be a valid value	28.0F	Limit of over voltage.(Detection threshold)
Limit of over speed (rpm)	Must be a valid value	3000.0F	Limit of over speed.(Detection threshold)
Limit of low voltage (V)	Must be a valid value	18.0F	Limit of low voltage.(Detection threshold)
Interrupts			
Callback	Name must be a valid C symbol	NULL	A user callback function. If this callback function is provided, it is called at speed control cyclic interrupt.

Clock Configuration

This module doesn't depend on clock setting, because this module is a simple status transition process.

Pin Configuration

This module does not use I/O pins. Please set used pins on configuration of each hardware modules.

Usage Notes

Limitations

- Set the limit of electric current with non-negative value.
- Set the limit of input voltage with non-negative value.
- Set the limit of rotational speed with non-negative value.

Examples

Basic Example

This is a basic example of minimal use of the motor induction module in an application.

```
void motor_induction_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module. */
```

```
    err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
    handle_error(err);
 /* Set speed reference before motor run */
    (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
 /* Set position reference before motor run */
    (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
 /* Start motor rotation */
    (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
 /* Get current status */
    (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
 /* Get current rotor angle */
    (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
 /* Get current motor rotational speed */
    (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
 /* Check error */
    (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
 /* Stop motor rotation */
    (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
 /* If need, set extra error status */
    (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
 /* Reset motor control */
    (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
 /* Close motor control */
    (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
}
```

Enumerations

enum	motor_induction_ctrl_t

enum	motor_induction_ctrl_event_t

Enumeration Type Documentation

◆ motor_induction_ctrl_t

enum motor_induction_ctrl_t	
Enumerator	
MOTOR_INDUCTION_CTRL_STOP	Stop mode.
MOTOR_INDUCTION_CTRL_RUN	Run mode.
MOTOR_INDUCTION_CTRL_ERROR	Error mode.

◆ motor_induction_ctrl_event_t

enum motor_induction_ctrl_event_t	
Enumerator	
MOTOR_INDUCTION_CTRL_EVENT_STOP	Stop event.
MOTOR_INDUCTION_CTRL_EVENT_RUN	Run event.
MOTOR_INDUCTION_CTRL_EVENT_ERROR	Error event.
MOTOR_INDUCTION_CTRL_EVENT_RESET	Reset event.

Function Documentation

◆ RM_MOTOR_INDUCTION_Open()

fsp_err_t RM_MOTOR_INDUCTION_Open (motor_ctrl_t *const *p_ctrl*, motor_cfg_t const *const *p_cfg*)

Configure the MOTOR in register start mode. Implements motor_api_t::open.

This function should only be called once as MOTOR configuration registers can only be written to once so subsequent calls will have no effect.

Example:

```
/* Initializes the module. */
   err = RM_MOTOR_INDUCTION_Open(g_motor_induction0_smpl.p_ctrl,
g_motor_induction0_smpl.p_cfg);
```

Return values

FSP_SUCCESS	MOTOR successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Note

◆ RM_MOTOR_INDUCTION_Close()

fsp_err_t RM_MOTOR_INDUCTION_Close (motor_ctrl_t *const *p_ctrl*)

Disables specified Motor Induction Control block. Implements motor_api_t::close.

Example:

```
/* Close motor control */
   (void) RM_MOTOR_INDUCTION_Close(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Reset()

fsp_err_t RM_MOTOR_INDUCTION_Reset (motor_ctrl_t *const *p_ctrl*)

Reset Motor Induction Control block. Implements motor_api_t::reset.

Example:

```
/* Reset motor control */
   (void) RM_MOTOR_INDUCTION_Reset(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Run()

fsp_err_t RM_MOTOR_INDUCTION_Run (motor_ctrl_t *const *p_ctrl*)

Run Motor (Start motor rotation). Implements motor_api_t::run.

Example:

```
/* Start motor rotation */
   (void) RM_MOTOR_INDUCTION_Run(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_Stop()

fsp_err_t RM_MOTOR_INDUCTION_Stop (motor_ctrl_t *const *p_ctrl*)

Stop Motor (Stop motor rotation). Implements motor_api_t::stop.

Example:

```
/* Stop motor rotation */
   (void) RM_MOTOR_INDUCTION_Stop(g_motor_induction0_smpl.p_ctrl);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_ErrorSet()

fsp_err_t RM_MOTOR_INDUCTION_ErrorSet (motor_ctrl_t *const *p_ctrl*, motor_error_t const *error*)

Set error information. Implements motor_api_t::errorSet.

Example:

```
/* If need, set extra error status */
   (void) RM_MOTOR_INDUCTION_ErrorSet(g_motor_induction0_smpl.p_ctrl,
MOTOR_ERROR_OVER_CURRENT_HW);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_SpeedSet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedSet (motor_ctrl_t *const *p_ctrl*, float const *speed_rpm*)

Set speed reference[rpm]. Implements motor_api_t::speedSet.

Example:

```
/* Set speed reference before motor run */
   (void) RM_MOTOR_INDUCTION_SpeedSet(g_motor_induction0_smpl.p_ctrl,
RM_MOTOR_INDUCTION_TEST_OVER_SPEED_LIMIT);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.

Note

◆ RM_MOTOR_INDUCTION_PositionSet()

fsp_err_t RM_MOTOR_INDUCTION_PositionSet (motor_ctrl_t *const *p_ctrl*, motor_speed_position_data_t const *const *p_position*)

Set position reference[degree]. Implements motor_api_t::positionSet.

Example:

```
/* Set position reference before motor run */
   (void) RM_MOTOR_INDUCTION_PositionSet(g_motor_induction0_smpl.p_ctrl,
&g_posref_sample1);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data set pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_StatusGet()

fsp_err_t RM_MOTOR_INDUCTION_StatusGet (motor_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*)

Get current control status. Implements motor_api_t::statusGet.

Example:

```
/* Get current status */
   (void) RM_MOTOR_INDUCTION_StatusGet(g_motor_induction0_smpl.p_ctrl,
&smpl_status);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_AngleGet()

fsp_err_t RM_MOTOR_INDUCTION_AngleGet (motor_ctrl_t *const *p_ctrl*, float *const *p_angle_rad*)

Get current rotor angle. Implements motor_api_t::angleGet.

Example:

```
/* Get current rotor angle */
   (void) RM_MOTOR_INDUCTION_AngleGet(g_motor_induction0_smpl.p_ctrl, &smpl_angle);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_SpeedGet()

fsp_err_t RM_MOTOR_INDUCTION_SpeedGet (motor_ctrl_t *const *p_ctrl*, float *const *p_speed_rpm*)

Get rotational speed. Implements motor_api_t::speedGet.

Example:

```
/* Get current motor rotational speed */
   (void) RM_MOTOR_INDUCTION_SpeedGet(g_motor_induction0_smpl.p_ctrl, &smpl_speed);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_ErrorCheck()

fsp_err_t RM_MOTOR_INDUCTION_ErrorCheck (motor_ctrl_t *const *p_ctrl*, uint16_t *const *p_error*)

Check the occurunce of Error. Implements motor_api_t::errorCheck.

Example:

```
/* Check error */
   (void) RM_MOTOR_INDUCTION_ErrorCheck(g_motor_induction0_smpl.p_ctrl,
&smpl_error);
```

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Data received pointer is invalid..

Note

◆ RM_MOTOR_INDUCTION_WaitStopFlagGet()

fsp_err_t RM_MOTOR_INDUCTION_WaitStopFlagGet (motor_ctrl_t *const *p_ctrl*, motor_wait_stop_flag_t *const *p_flag*)

Get wait stop flag. Implements motor_api_t::waitStopFlagGet.

Example:

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Note

◆ RM_MOTOR_INDUCTION_FunctionSelect()

fsp_err_t RM_MOTOR_INDUCTION_FunctionSelect (motor_ctrl_t *const *p_ctrl*, motor_function_select_t const *function*)

Select using function. Implements motor_api_t::functionSelect.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_InertiaEstimateStart()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStart (motor_ctrl_t *const *p_ctrl*)

Start inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_InertiaEstimateStop()

fsp_err_t RM_MOTOR_INDUCTION_InertiaEstimateStop (motor_ctrl_t *const *p_ctrl*)

Stop(Cancel) inertia estimation function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStart()

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStart (motor_ctrl_t *const *p_ctrl*)

Start return origin function.

Return values

FSP_SUCCESS	Successfully resetted.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Mode unmatch

Note

◆ RM_MOTOR_INDUCTION_ReturnOriginStop()

fsp_err_t RM_MOTOR_INDUCTION_ReturnOriginStop (motor_ctrl_t *const *p_ctrl*)
Stop(Cancel) return origin function. **Return values** FSP_SUCCESS — Successfully resetted. FSP_ERR_ASSERTION — Null pointer. FSP_ERR_NOT_OPEN — Module is not open. FSP_ERR_INVALID_MODE — Mode unmatch ***Note***

5.2.12 Networking

Modules

Detailed Description

Networking Modules.

Modules

	AWS Cellular Interface on GM (rm_cellular_gm_aws) Middleware implementing the AWS Cellular API for GM cellular modems.
	AWS MQTT This module provides the AWS MQTT integration documentation.
	AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot) AWS OTA PAL layer implementation for downloading firmware updates.
	AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs) PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

	AWS coreHTTP This module provides the AWS coreHTTP library.
	Azure Embedded Wireless Framework GM Port (rm_azure_ewf_gm)
	BLE Abstraction (rm_ble_abs) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	BLE Driver (r_ble_balance) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Driver (r_ble_compact) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Driver (r_ble_extended) Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.
	BLE Mesh Network Modules BLE Mesh Network Modules.
	Cellular Comm Interface on UART (rm_cellular_comm_uart_aws) Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.
	DA16XXX Transport Layer (rm_at_transport_da16xxx_uart) Transport layer implementation for linking DA16XXX Drivers with Communications layer.
	EtherCAT SSC Port (rm_ethercat_ssc_port) Middleware for EtherCAT Slave Stack Code (SSC) on RA microprocessors. This module implements the EtherCAT SSC Interface.

	Ethercat (r_ethercat_phy) The Ethercat PHY module (r_ethercat_phy) provides an API for standard Ethercat PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.
	Ethernet (r_ether) Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.
	Ethernet (r_ether_phy) The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.
	Ethernet (r_rmac) Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.
	Ethernet (r_rmac_phy) The RMAC PHY module (r_rmac_phy) provides an API for standard Ethernet PHY communications applications that use the RMAC peripheral. It implements the Ethernet PHY Interface.
	Ethernet Generic PTP Timer (r_gptp) Driver for the Ethernet peripheral on RA MCUs. This module implements the GPTP Interface.
	FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp) Middleware for using TCP on RA MCUs.
	GTL BLE Abstraction (rm_ble_abs_gtl) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	Layer3 Ethernet Switch (r_layer3_switch) The LAYER3 SWITCH module (r_layer3_switch) provides an API for standard Ethernet communications applications that use the ESWM peripheral. It implements the Ethernet Switch Interface.

	NFC Reader Driver on PTX (rm_nfc_reader_ptx) NFC Reader driver implementation using the PTX NFC module on RA MCUs.
	NetX Duo Ethernet Driver (rm_netxduo_ether)
	NetX Duo WiFi Driver (rm_netxduo_wifi)
	On Chip HTTP Client on DA16XXX (rm_http_onchip_da16xxx) HTTP client implementation using the DA16XXX WiFi module on RA MCUs.
	On Chip MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx) MQTT client implementation using the DA16XXX WiFi module on RA MCUs.
	PTP (r_ptp) Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.
	SPP BLE Abstraction (rm_ble_abs_spp) Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface.
	Socket Communication Device (rm_comms_socket) Middleware to implement a generic communications interface over LWIP. This module implements the Communications Middleware Interface.
	WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx) Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.
	WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex) Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.
	gPTP Baremetal Porting Layer (rm_gptp_sys_baremetal)

	gPTP Ethernet Switch Module(rm_gptp_eswm)
	gPTP FreeRTOS Porting Layer (rm_gptp_sys_freertos)
	lwIP Baremetal Porting Layer (rm_lwip_sys_baremetal)
	lwIP Ethernet Driver (rm_lwip_ether)
	lwIP FreeRTOS Porting Layer (rm_lwip_sys_freertos)
	lwIP HTTP Server This module provides the lwIP HTTP Server integration documentation.
	lwIP Iperf This module provides the lwIP Iperf integration documentation.
	lwIP MQTT This module provides the lwIP MQTT integration documentation.
	lwIP NETBIOSNS This module implements the lwIP NETBIOSNS integration documentation.
	lwIP SMTP This module provides the lwIP SMTP integration documentation.
	lwIP SNTP This module provides the lwIP SNTP integration documentation.

5.2.12.1 AWS Cellular Interface on GM (rm_cellular_gm_aws)

Modules » Networking

Middleware implementing the AWS Cellular API for GM cellular modems.

Overview

See AWS documentation for how the Cellular API works: https://www.freertos.org/Documentation/api-ref/cellular/index.html

Features

The following GM modems are supported by this port:

- GM02S (https://sequans.com/products/monarch-2-gm02s/)

Please see the data sheets for hardware configuration for modems.

All APIs are supported by the GM port with the exception of the following RAT APIs:

- Cellular_SetRatPriority
- Cellular_GetRatPriority

The following URCs are supported by the GM port:

- CEREG (Cellular_RegisterUrcNetworkRegistrationEventCallback)
- SYSSTART (Cellular_RegisterModemEventCallback)
- SHUTDOWN (Cellular_RegisterModemEventCallback)
- SQNSRING (Cellular_SocketRegisterDataReadyCallback)

Support for other GM URCs can be possibly added by request in future releases.

Limitations

- This module does not handle module reset pins. The user should manually configure any reset pins in order to reset the module.
- The GM can only be used in buffer reception mode, not transparent mode. When calling Cellular_SocketConnect only CELLULAR_ACCESSMODE_BUFFER is supported.
- The AWS Cellular APIs don't currently allow the local port to be set for UDP. It can be set by modifying the localPort field in CellularSocketHandle_t after calling Cellular_CreateSocket but before calling Cellular_SocketConnect.

Configuration

AWS Cellular Interface

Build Time Configurations for source

The following build time configurations are defined in aws/cellular_interface/cellular_config.h:

Configuration	Options	Default	Description
Mobile Country Code Max Size	Value must be a positive integer	3	Mobile country code max size.
Mobile Network Node Max Size	Value must be a positive integer	3	Mobile network code max size.
Integrated Circuit Card Identity Max Size	Value must be a positive integer	20	Integrated circuit card identity max size.

International Mobile Subscriber Identity Max Size	Value must be a positive integer	15	International Mobile Subscriber Identity max size.
Firmware Version Max Size	Value must be a positive integer	32	Cellular module firmware version max size.
Hardware Version Max Size	Value must be a positive integer	12	Cellular module hardware version max size.
Serial Number Max Size	Value must be a positive integer	12	Cellular module serial number max size.
International Mobile Equipment Identity Max Size	Value must be a positive integer	15	International Mobile Equipment Identity number max size.
Registered Network operator Name Max Size	Value must be a positive integer	32	Registered network operator name max size.
Access Point Name Max Size	Value must be a positive integer	64	Access point name max size.
Packet Data Network Username Max Size	Value must be a positive integer	32	Packet data network username max size.
Packet Data Network Password Max Size	Value must be a positive integer	32	Packet data network password max size.
Data Network IP Address Max Size	Value must be a positive integer	40	Cellular data network IP address max size.
AT Command Max Size	Value must be a positive integer	200	Cellular AT command max size.
Max Number of Sockets	Value must be a positive integer	6	Cellular module number of socket max size.
Manufacturer ID Max Size	Value must be a positive integer	20	Cellular module manufacturer ID max size.
Model ID Max Size	Value must be a positive integer	10	Model ID max size.
EDRX List Max Size	Value must be a positive integer	4	EDRX list max size.
PDN Context ID Min Value	Value must be a positive integer	1	PDN context ID min value.
PDN Context ID Max Value	Value must be a positive integer	16	PDN context ID max value.
RAT Priority Count	Value must be a positive integer	3	RAT (radio access technology) priority count.

Socket Max Send Data Length (bytes)	Value must be in the range 1 - 1500	1460	Socket max send data length.
Socket Max Receive Data Length (bytes)	Value must be in the range 1 - 1500	1500	Socket max receive data length.
GetHostByName Support	• Enabled (default) • Disabled	Enabled (default)	Enables/disable GetHostByName.
Comm Interface Send Timeout (ms)	Value must be a positive integer	1000	Cellular comm interface receive timeout in ms.
Comm Interface Receive Timeout (ms)	Value must be a positive integer	50	Cellular comm interface receive timeout in ms.
Static Allocation Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated context.
Comm Interface Static Allocation Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated context for comm interface.
Default RAT	• GSM • WCDMA • EDGE • HSDPA • HSUPA • HSDPAHSUPA • LTE • CATM1 • NBIOT	CATM1	Default Radio Access Technology.
GSM Support	• Enabled • Disabled (default)	Disabled (default)	This should be disabled when a modem doesn't support GSM or the AT+CGREG command.
Static Socket Context	• Enabled • Disabled (default)	Disabled (default)	Use statically allocated socket.
AT Command Timeout (ms)	Value must be a positive integer	5000	Cellular common AT command timeout.
AT Command Raw Timeout (ms)	Value must be a positive integer	5000	Cellular AT command raw timeout.
AT Command Response prefix length	Value must be a positive integer	5000	Cellular AT command response prefix string length.

GM Cellular Interface Port

Configurations for Networking > AWS Cellular Interface on GM (rm_cellular_gm_aws)

This module can be added to the Stacks tab via New Stack > Networking > AWS Cellular Interface on

GM (rm_cellular_gm_aws).

Configuration	Options	Default	Description
Module Reset Pin (Port Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control port for the GM module. This property is only used in devassist.
Module Reset Pin (Pin Number)	Refer to the RA Configuration tool for available options.	00	Specify the reset control pin for the GM module. This property is only used in devassist.

Examples

Basic Example

```
void rm_cellular_gm_aws_basic_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
    CellularSimCardStatus_t sim_card_status;
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Get the SIM card status */
    err = Cellular_GetSimCardStatus(cellular_handle, &sim_card_status);
    assert(CELLULAR_SUCCESS == err);
    assert(CELLULAR_SIM_CARD_INSERTED == sim_card_status.simCardState);
}
```

Socket Example

```
#define SOCKET_EXAMPLE_BUFFER_SIZE (256)
#define SOCKET_EXAMPLE_TIMEOUT (UINT32_MAX)
#define SOCKET_EXAMPLE_IP ("255.255.255.255")
#define SOCKET_EXAMPLE_PORT (80)
uint32_t g_recv_event_count = 0;
void socket_example_data_ready_callback (CellularSocketHandle_t socketHandle, void *
```

```
pCallbackContext)
{
 FSP_PARAMETER_NOT_USED(socketHandle);
 FSP_PARAMETER_NOT_USED(pCallbackContext);
    g_recv_event_count++;
}
void rm_cellular_gm_aws_socket_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
 char                  * p_data          = "hello_world";
 char                   recv_buffer[SOCKET_EXAMPLE_BUFFER_SIZE] = "\0";
    uint32_t               sent_data_length    = 0;
    uint32_t               received_data_length = 0;
    uint32_t               timeout_ms          = SOCKET_EXAMPLE_TIMEOUT;
    CellularSocketHandle_t socket_handle;
    CellularSocketAddress_t socket_address =
    {
       .ipAddress =
      {
            CELLULAR_IP_ADDRESS_V4,
            SOCKET_EXAMPLE_IP
       },
       .port      = SOCKET_EXAMPLE_PORT
    };
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Create a TCP socket */
    err = Cellular_CreateSocket(cellular_handle,
                                1,
                                CELLULAR_SOCKET_DOMAIN_AF_INET,
                                CELLULAR_SOCKET_TYPE_STREAM,
                                CELLULAR_SOCKET_PROTOCOL_TCP,
```

```
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
 /* Register the data ready callback */
    err = Cellular_SocketRegisterDataReadyCallback(cellular_handle,
                                                   socket_handle,
                                                   socket_example_data_ready_callback
,
                                                   NULL);
    assert(CELLULAR_SUCCESS == err);
    g_recv_event_count = 0;
 /* Connect the TCP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
 /* Send data over the socket */
    err = Cellular_SocketSend(cellular_handle, socket_handle, (uint8_t *) p_data,
strlen(p_data), &sent_data_length);
    assert(CELLULAR_SUCCESS == err);
    assert(strlen(p_data) == sent_data_length);
 /* Wait for data ready callback */
    timeout_ms = SOCKET_EXAMPLE_TIMEOUT;
 while (timeout_ms > 0)
    {
 if (g_recv_event_count > 0)
     {
 break;
      }
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
       timeout_ms--;
    }
    assert(0 != timeout_ms);
 /* Receive data back */
    err = Cellular_SocketRecv(cellular_handle,
                              socket_handle,
```

```
                              (uint8_t *) recv_buffer,
                              SOCKET_EXAMPLE_BUFFER_SIZE,
                              &received_data_length);
    assert(CELLULAR_SUCCESS == err);
 /* Close the socket */
    err = Cellular_SocketClose(cellular_handle, socket_handle);
    assert(CELLULAR_SUCCESS == err);
}
```

Setting UDP local port

```
#define UDP_EXAMPLE_IP ("255.255.255.255")
#define UDP_EXAMPLE_REMOTE_PORT (80)
#define UDP_EXAMPLE_LOCAL_PORT (5000)
void rm_cellular_gm_aws_udp_local_port_set_example (void)
{
    CellularHandle_t       cellular_handle = NULL;
    CellularSocketHandle_t socket_handle   = NULL;
    CellularSocketAddress_t socket_address =
    {
       .ipAddress =
      {
            CELLULAR_IP_ADDRESS_V4,
            UDP_EXAMPLE_IP
       },
       .port      = UDP_EXAMPLE_REMOTE_PORT
    };
 /* Initialize Cellular Modem. */
    CellularError_t err = Cellular_Init(&cellular_handle,
&g_cellular_comm_interface_on_uart);
    assert(CELLULAR_SUCCESS == err);
 /* Create a UDP socket */
    err = Cellular_CreateSocket(cellular_handle,
                              1,
                              CELLULAR_SOCKET_DOMAIN_AF_INET,
```

```
                                CELLULAR_SOCKET_TYPE_DGRAM,
                                CELLULAR_SOCKET_PROTOCOL_UDP,
                                &socket_handle);
    assert(CELLULAR_SUCCESS == err);
 /* Set the local port */
    socket_handle->localPort = UDP_EXAMPLE_LOCAL_PORT;
 /* Connect the UDP socket */
    err = Cellular_SocketConnect(cellular_handle, socket_handle,
CELLULAR_ACCESSMODE_BUFFER, &socket_address);
    assert(CELLULAR_SUCCESS == err);
}
```

5.2.12.2 AWS MQTT

Modules » Networking

This module provides the AWS MQTT integration documentation.

Overview

The AWS MQTT library can connect to either AWS or a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: coreMQTT.

Features

- MQTT connections over TLS to an AWS IoT Endpoint or Mosquitto server

Configuration

Memory Usage

The AWS CoreMQTT library relies heavily on dynamic memory allocation for thread/task creation as well as other uses. Depending on the configuration it may be required to provide as much as 110k heap. To decrease this it is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreMQTT library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreMQTT APIs. See the example for more information.
- Not all MQTT servers support maintaining a TLS session after a MQTT disconnect. TLS_FreeRTOS_Disconnect and TLS_FreeRTOS_Connect should be called to establish a new TLS session before attempting to reconnect with CoreMQTT APIs if the server does not support TLS session resumption.

Limitations

- aws_clientcredential.h and aws_clientcredential_keys.h need to be added manually.
- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

Connection example using MbedTLS/PKCS11 Transport Interface

```

5.2.12.3 AWS OTA PAL on MCUBoot (rm_aws_ota_pal_mcuboot)

Modules » Networking

AWS OTA PAL layer implementation for downloading firmware updates.

Overview

This module provides the hardware port layer for the AWS IoT Over-the-air Update Library. Refer to the AWS OTA documentation: https://docs.aws.amazon.com/freertos/latest/userguide/integrate-ota-agent.html.

Configuration

Build Time Configurations for rm_aws_ota_pal_mcuboot

The following build time configurations are defined in fsp_cfg/rm_aws_ota_pal_mcuboot_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Filepath to Slot ID Callback Function	Must be a valid C symbol	NULL	Callback function for determining which Slot ID the image should be downloaded to.
OTA code signing signature algorithm	sig-sha256-ecdsa	sig-sha256-ecdsa	Code signing algorithm used by AWS to sign the downloaded image.

Configurations for Storage > AWS OTA PAL (rm_aws_ota_pal_mcuboot)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_aws_ota_pal_mcuboot0	Module name.

Common AWS Configuration

Build Time Configurations for source

The following build time configurations are defined in aws/ota_config.h:

Configuration	Options	Default	Description
Version			
Major	Value must be a non-	0	Major Version number

	negative integer		used when updating.
Minor	Value must be a non-negative integer	0	Minor Version number used when updating.
Build	Value must be a non-negative integer	1	Build Version number used when updating.
Custom ota_config.h	Manual Entry		Add a path to your custom ota_config.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Log2 File Block Size	Value must be a non-negative integer	11	Log base 2 of the size of the file data block message (excluding the header). e.g. 11: 2^11 = 2048bytes
Self Test Response Wait (ms)	Value must be a non-negative integer	16000	Milliseconds to wait for the self test phase to succeed before we force reset.
File Request Wait (ms)	Value must be a non-negative integer	10000	Milliseconds to wait before requesting data blocks from the OTA service if nothing is happening.
Max Thingname Length	Value must be a non-negative integer	64	The maximum allowed length of the thing name used by the OTA agent.
Max Num Blocks Request	Value must be a non-negative integer	1	The maximum number of data blocks requested from OTA streaming service.
Max Num Request Momentum	Value must be a non-negative integer	32	The maximum number of requests allowed to send without a response before we abort.
Ota Update Status Frequency	Value must be a non-negative integer	64	How frequently the device will report its OTA progress to the cloud.
Max Num OTA Data Buffers	Value must be a non-negative integer	1	The number of data buffers reserved by the OTA agent.

Allow Downgrade	• Allowed • Disallowed	Disallowed	Flag to enable booting into updates that have an identical or lower version than the current version.
Ota Firmware Update File Type ID	Value must be a non-negative integer	0	The file type id received in the job document.
Enabled Control Protocol	OTA Control Over MQTT	OTA Control Over MQTT	The protocol selected for OTA control operations.
Enabled Data Protcols	• OTA Data Over MQTT • OTA Data Over HTTP • OTA Data Over MQTT and HTTP	OTA Data Over MQTT	The protocol selected for OTA data operations.
OTA Primary Data Protocol	• OTA Data Over MQTT • OTA Data Over HTTP	OTA Data Over MQTT	The preferred protocol selected for OTA data operations.
OTA Events Polling Timeout (ms)	Value must be a non-negative integer	1000	The polling timeout (milliseconds) to receive messages from event queue.

Usage Notes

The current implementation utilizes MCUboot Port (rm_mcuboot_port) for switching images.

Limitations

- Currently only the only supported signature method is sig-sha256-ecdsa.

5.2.12.4 AWS PKCS11 PAL on LittleFS (rm_aws_pkcs11_pal_littlefs)

Modules » Networking

PKCS#11 PAL LittleFS layer implementation for use by FreeRTOS TLS.

Overview

Note

The PKCS#11 PAL LittleFS Interface does not provide any interfaces to the user. Consult the AWS documentation for more info: https://docs.aws.amazon.com/freertos/latest/portingguide/afr-porting-pkcs.html.

Configuration

There is no user configuration for this module

Usage Notes

The current implementation utilizes LittleFS on Flash (rm_littlefs_flash) for storage.

Limitations

- Credential access is not limited in any way.

5.2.12.5 AWS coreHTTP

Modules » Networking

This module provides the AWS coreHTTP library.

Overview

The AWS coreHTTP library can be used to send HTTP and HTTPS requests. The documentation for the library can be found at the following link: coreHTTP.

Features

- Secure and Non-secure HTTP requests
- Mutually authenticated connections

Configuration

Memory Usage

The AWS coreHTTP stack relies on dynamic memory allocation for thread/task creation as well as other uses. It is recommended to tweak the thread stack configuration values based on usage. Notable values are:

FreeRTOS Thread

- General|Minimal Stack Size
- Memory Allocation|Total Heap Size

FreeRTOS Plus TCP

- Stack size in words (not bytes)

Usage Notes

- A transport interface is required to use the CoreHTTP library (https://www.freertos.org/network-interface.html).
- For FSP, a transport interface over MbedTLS is provided. This transport interface can connect to RA ethernet, WiFi, and cellular modules via sockets wrappers for each module.
- TLS_FreeRTOS_Connect should be used before calling any CoreHTTP APIs. See the example for more information.

Limitations

- MbedTLS must be initialized and key provisioning must be done before starting a secure connection.

Examples

HTTPS GET request

```

```

5.2.12.6 Azure Embedded Wireless Framework GM Port (rm_azure_ewf_gm)

Modules » Networking

Note

The Azure Embedded Wireless Framework is still in beta and not all APIs may be fully implemented yet.

Overview

This documentation is for the GMxxx ports of the Azure Embedded Wireless Framework.

- For more information on the framework see the documentation: https://azure.github.io/embedded-wireless-framework/html/index.html.
    - There are also various examples available for the RA6M4_EK: https://github.com/Azure/embedded-wireless-framework/tree/main/examples/EK-RA6M4.
- For more GM02S hardware information including pin and baud rate info please see the GM02S page: https://sequans.com/products/monarch-2-gm02s/.

Features

- Various APIs to control/access GMxxx modem features via AT commands.
- Raw AT command APIs
- IPv4 sockets using TCP/UDP
- The EWF framework is usable standalone with bare metal and ThreadX.
- The framework can also be used with NetX when coupled with a EWF NetX middleware layer.

Limitations

The following are the limitations of the Azure EWF Library:

- DTC is not supported. The lower level interface using R_UART relies on processing data one byte at a time via the interrupt callback and UART_EVENT_RX_CHAR.
- Server mode sockets should be supported but have not been fully tested due to APN limitations.
- There are potential issues when using the default (-Os) optimization or above with AC6. All files under embedded_wireless_framework should be set to compile with no optimization (-O0) when using AC6.
- nx_ip_status_check does not currently work for the EWF middleware.
- When using socket send functions (ewf_adapter_tcp_send and ewf_adapter_udp_send) the GM port is limited to sending only 1460 bytes at a time. Data sent using these functions should be broken into 1460 byte chunks or less.
    - When using NetX the packet size for the driver packet pool should be set to 1460 bytes or less. Using larger packet sizes will work but the NetX Middleware Driver will potentially break up the packets inefficiently.

Unsupported NetX Duo Features

These features are handled directly on the GMxxx hardware or are not supported yet in the EWF library. NetX APIs for these features should not be used:

- IPv6 functionality (the EWF library doesn't yet support IPv6)
- ARP is handled directly by the cellular modem
- DHCP is handled directly by the cellular modem.

Configuration

The GM02S port for the Embedded Wireless Framework can be added to the Stacks tab via New Stack > Networking > Azure EWF Adapter on GM02S.

Build Time Configurations for Common

The following build time configurations are defined in fsp_cfg/azure/ewf/ewf.config.h:

Configuration	Options	Default	Description
Parameter Checking	• Enabled • Disabled	Enabled	This enables checking of function parameters. When this is disabled, parameter checking code is not present and the footprint is reduced

Enable Logging	• Enabled • Disabled	Disabled	This enables logging and the compilation of debug code. When disabled, logging and debug code is not present and the footprint is reduced.
Verbose Logging	• Enabled • Disabled	Disabled	This enables verbose logging. Verbose logging will only work if a EWF Log Function is set and logging is enabled.
EWF Log Function	Manual Entry	printf(__VA_ARGS__)	Function the library uses for standard log messages when logging is enabled.
EWF Log Error Function	Manual Entry	printf(__VA_ARGS__)	Function the library uses for error log messages when logging is enabled.

Usage Notes

The basic setup for the library is as follows:

Note

The message allocator (EWF_ALLOCATOR_THREADX_STATIC_DECLARE) should be at least 1500 bytes for GM

1. Declare an allocator, interface, and adapter using appropriate macros (EWF_ALLOCATOR_THREADX_STATIC_DECLARE/EWF_ALLOCATOR_MEMORY_POOL_STATIC_DECLARE/EWF_ALLOCATOR_C_HEAP_STATIC_DECLARE, EWF_INTERFACE_RA_UART_STATIC_DECLARE, EWF_ADAPTER_RENESAS_GM02S_STATIC_DECLARE).
2. Start the adapter with ewf_adapter_start.
3. Setup modem service if necessary with functions from ewf_adapter_api_modem.h and other included api_modem_* files.
4. Set functionality with ewf_adapter_modem_functionality_set.
5. Wait for network registration (can use ewf_adapter_modem_network_registration_check to wait).
6. Do a service activate to set desired PDP context with ewf_adapter_modem_packet_service_activate. This should be called regardless of whether context is already activated as it sets an internal library context number for functions like ewf_adapter_get_ipv4_address.
7. Call other network functions as needed from desired headers (i.e. TCP functions are in ewf_adapter_api_tcp.h).

When using NetX Duo the following must be done:

- Before creating an IP instance make sure that the modem adapter is started and connected to a network.
- After creating an IP instance the adapter pointer has to be stored manually to the IP

instance: g_ip.nx_ip_interface->nx_interface_additional_link_info = adapter_ptr;.
- After creating an IP instance the gateway address should be set to the IP of the modem in order to satisfy NetX Duo's internal routing algorithms (packets are actually routed by the modem hardware): nx_ip_gateway_address_set(&g_ip, RM_NETXDUO_TESTS_IP_ADDR);.

Examples

Basic TCP Socket Example

Note

The user should choose the relevant EWF_ALLOCATOR and EWF_ADAPTER macros from this example to use based on the hardware and RTOS being used

```
#define EWF_LOG_BUFFER_SIZE (256)
#define EWF_MODEM_NETWORK_WAIT_TIME_SECONDS (30)
#define EWF_HTTP_GET_SERVER "www.microsoft.com"
#define EWF_HTTP_GET "GET / HTTP/1.1\r\nHost:www.microsoft.com\r\n\r\n"
#define EWF_HTTP_PORT (80)
ewf_allocator * message_allocator_ptr = NULL;
ewf_interface * interface_ptr         = NULL;
ewf_adapter   * adapter_ptr          = NULL;
char ewf_log_buffer[EWF_LOG_BUFFER_SIZE];
void rm_azure_ewf_gm_example ()
{

Detailed Description

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

The Bluetooth Low Energy (BLE) Abstraction module supports the following features:

- following GAP Role support
  - Central: The device that sends a connection request to the Peripheral device.
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Observer : The device that scans for advertising.
  - Broadcaster : The device that sends advertising.
- LE 2M PHY
  - BLE communication is supported on the 2 Msym/s PHY.
- LE Coded PHY -Supports BLE communication on the Coded PHY. This enables communication over longer distances than 1M PHY and 2M PHY.
- LE Advertising Extensions
  - Up to four independent adverts can be executed simultaneously.
  - The size of Advertising Data/Scan Response Data has been expanded to a maximum of 1650 bytes.
  - Periodic Advertising is available.
- LE Channel Selection Algorithm #2
  - With the hopping channel selection algorithm added in Version 5.0, the machine that selects the channel It is possible.
- High Duty Cycle Non-Connectable Advertising
  - The ability to support non-connectable advertising with a minimum interval of up

to 20 msec.
- LE Secure Connections
  - Elliptic curve Diffie-Hellman key sharing (ECDH) for pairing with passive eavesdropping support.
- Link Layer privacy
  - This feature avoids being tracked by other BLE devices by periodically changing the Bluetooth device address.
- Link Layer Extended Scanner Filter policies
  - Scan Filter support for Resolvable private addresses.
- LE Data Packet Length Extension
  - This function expands the packet size of BLE data communications. It is possible to scale up to 251 bytes.
- LE L2CAP Connection Oriented Channel Support
  - The ability to support communication using the L2CAP credit based flow control channel.
- Low Duty Cycle Directed Advertising
  - The ability to support the advertising of the Low Duty Cycle for reconnecting to a known device.
- LE Link Layer Topology
  - It supports both Master and Slave roles and can operate as Master when connected to one remote device and as Slave when connected to another remote device.
- LE Ping
  - This function checks whether the link is maintained or not by requesting the transmission of packets containing MIC after link encryption.

BLE Library Configuration

There are three types of BLE Protocol Stacks, and the functions provided are different depending on the type of BLE Protocol Stack you select.

BLE library feature	Extended	Balance	Compact
GAP Role	Central Peripheral Observer Broadcaster	Central Peripheral Observer Broadcaster	Peripheral Broadcaster
LE 2M PHY	Yes	Yes	No
LE Coded PHY	Yes	Yes	No
LE Advertising Extensions	Yes	No	No
LE Channel Selection Algorithm #2	Yes	Yes	No
High Duty Cycle Non-Connectable Advertising	Yes	Yes	Yes
LE Secure Connections	Yes	Yes	Yes
Link Layer privacy	Yes	Yes	Yes
Link Layer Extended Scanner Filter policies	Yes	Yes	No
LE Data Packet Length	Yes	Yes	Yes

Extension			
LE L2CAP Connection Oriented Channel Support	Yes	No	No
Low Duty Cycle Directed Advertising	Yes	Yes	Yes
LE Link Layer Topology	Yes	Yes	No
LE Ping	Yes	Yes	Yes
32-bit UUID Support in LE	Yes	Yes	Yes

Target Devices

The BLE Abstraction module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_abs

The following build time configurations are defined in fsp_cfg/rm_ble_abs_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of connections	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Maximum number of connections.
Maximum connection data length	Value must be an integer between 27 and 251, and lower than the value defined in ble module.	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650, and lower than the value defined in ble module.	1650	Maximum advertising data length.

Maximum advertising set number	Value must be an integer between 1 and 4, and lower than the value defined in ble module.	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2, and lower than the value defined in ble module.	2	Maximum periodic sync set number.
Store Security Data	• Disable • Enable	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7, and lower than the value defined in ble module.	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Number of remote device bonding information.
Connection Event Start Notify	• Disable • Enable	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	• Disable • Enable	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	• Disable • Enable	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	• Disable • Enable	Disable	Set Advertising event close notify enable/disable.
Scanning Event Start Notify	• Disable • Enable	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	• Disable • Enable	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	• Disable • Enable	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	• Disable • Enable	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start	• Disable	Disable	Set RF_DEEP_SLEEP

Notify	• Enable		start notify enable/disable.
RF Deep Sleep Wakeup Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15, and lower than the value defined in ble module.	6	Load capacitance adjustment.
DC-DC converter	• Disable • Enable	Disable	Set DC-DC converter for RF part.
Slow Clock Source	• Use RF_LOCO • Use External 32.768kHz	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	• P109 • P205	P109	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	• MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz	MCU CLKOUT frequency 32.768kHz	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500, and lower than the value defined in ble module.	250	When BLE_ABS_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	• max +0dBm • max +4dBm	max +4dBm	Set transmission power maximum value.
Transmission Power Default Value	• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm)	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(BLE_ABS_CFG_RF_DEF_TX_POW).

		• Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20 dBm(Transmission Power Maximum Value = +4dBm)	
CLKOUT_RF Output	• No output • 4MHz output • 2MHz output • 1MHz output	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	• Disable • Enable	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000, and lower than the value defined in ble module.	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255, and lower than the value defined in ble module.	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7, and lower than the value defined in ble module.	-1	Device specific data block on E2 Data Flash.
MTU Size Configured	Value must be an integer between 23 and 247, and lower than the value defined in ble module.	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10, and lower than the value defined in ble module.	10	The maximum number of timer slot.

Configurations for Networking > BLE Abstraction (rm_ble_abs)

This module can be added to the Stacks tab via New Stack > Networking > BLE Abstraction (rm_ble_abs).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ble_abs0	Module name.
Gap callback	Name must be a valid C symbol	gap_cb	A user callback function must be provided if the BLE_ABS is configured to generate a GAP. If QE is used, set to NULL.
Vendor specific callback	Name must be a valid C symbol	vs_cb	A user callback function must be provided if the BLE_ABS is configured to generate a Vendor Specific. If QE is used, set to NULL.
GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	Set GATT server callback parameter. If QE is used, set to NULL.
GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.
GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to NULL.
GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.
Security			
Pairing parameters	Name must be a valid C symbol	gs_abs_pairing_param	Set pairing parameters.
IO capabilities of local device.	• BLE_GAP_IOCAP_DISPLAY_ONLY • BLE_GAP_IOCAP_DISPLAY_YESNO • BLE_GAP_IOCAP_KEYBOARD_ONLY • BLE_GAP_IOCAP_NOINPUT_NOOUTPUT • BLE_GAP_IOCAP_KEYBOARD_DI	BLE_GAP_IOCAP_NOINPUT_NOOUTPUT	Select IO capabilities of local device.

	SPLAY		
MITM protection policy.	• BLE_GAP_SEC_MITM_BEST_EFFORT • BLE_GAP_SEC_MITM_STRICT	BLE_GAP_SEC_MITM_BEST_EFFORT	Select MITM protection policy.
Determine whether to accept only Secure Connections or not.	• BLE_GAP_SC_BEST_EFFORT • BLE_GAP_SC_STRICT	BLE_GAP_SC_BEST_EFFORT	Select determine whether to accept only Secure Connections or not.
Type of keys to be distributed from local device.	• BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY		Select type of keys to be distributed from local device.
Type of keys which local device requests a remote device to distribute.	• BLE_GAP_KEY_DIST_ENCKEY • BLE_GAP_KEY_DIST_IDKEY • BLE_GAP_KEY_DIST_SIGNKEY		Set type of keys which local device requests a remote device to distribute.
Maximum LTK size.	Valid range is 7 - 16	16	Set Maximum LTK size.
Interrupts			
Callback provided when an ISR occurs	Name must be a valid C symbol	NULL	Callback provided when BLE ABS ISR occurs

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Stack Size Configuration

Note

When you use BLE on RTOS environment, make sure that thread stack size must be 0x1000 or more which call R_BLE_Execute.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Examples

BLE_ABS Basic Example

This is a basic example of minimal use of the BLE_ABS in an application.

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)
#define BLE_ABS_EVENT_FLAG_ADV_OFF (0x01 << 3)
#define BLE_ABS_EVENT_FLAG_DISCONN_IND (0x01 << 4)
#define BLE_ABS_EVENT_FLAG_RSLV_LIST_CONF_COMP (0x01 << 5)
#define BLE_ABS_EXAMPLE_SHORTENED_LOCAL_NAME 'E', 'x', 'a', 'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_COMPLETE_LOCAL_NAME 'T', 'E', 'S', 'T', '_', 'E', 'x', 'a',
'm', 'p', 'l', 'e'
#define BLE_ABS_EXAMPLE_SLOW_ADVERTISING_INTERVAL (0x00000640)
void ble_abs_peripheral_example (void)
{
 fsp_err_t         err    = FSP_SUCCESS;
 volatile uint32_t timeout = UINT16_MAX * UINT8_MAX * 8;

struct	ble_abs_instance_ctrl_t

Typedefs

typedef void(*	ble_abs_timer_cb_t) (uint32_t timer_hdl)

Enumerations

enum	e_ble_timer_type_t

Data Structure Documentation

◆ abs_advertising_parameter_t

struct abs_advertising_parameter_t		
advertising set parameters structure		
Data Fields		
union abs_advertising_parameter_t	advertising_parameter	Advertising parameters.
uint32_t	advertising_status	Advertising status.
ble_device_address_t	remote_device_address	Remote device address for direct advertising.

◆ abs_scan_parameter_t

struct abs_scan_parameter_t		
scan parameters structure		
Data Fields		
ble_abs_scan_parameter_t	scan_parameter	Scan parameters.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_1M	1M phy parameters for scan.
ble_abs_scan_phy_parameter_t	scan_phy_parameter_coded	Coded phy parameters for scan. */.
uint32_t	scan_status	

◆ ble_abs_instance_ctrl_t

struct ble_abs_instance_ctrl_t		
BLE ABS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_ABS_Open() is called.		
Data Fields		
uint32_t	open	Indicates whether the open() API has been successfully called.
void *	p_context	Placeholder for user data. Passed to the user callback in ble_abs_callback_args_t.
ble_gap_application_callback_t	abs_gap_callback	GAP callback function.
ble_vendor_specific_application_callback_t	abs_vendor_specific_callback	Vendor specific callback function.
ble_abs_delete_bond_application_callback_t	abs_delete_bond_callback	Delete bond information callback function.
uint32_t	connection_timer_handle	Cancel a request for connection timer.
uint32_t	advertising_timer_handle	Advertising timer for legacy advertising.
uint32_t	scan_timer_handle	Scan interval timer.
abs_advertising_parameter_t	advertising_sets[BLE_MAX_NO_OF_ADV_SETS_SUPPORTED]	Advertising set information.
abs_scan_parameter_t	abs_scan	Scan information.
st_ble_dev_addr_t	loc_bd_addr	Local device address.
uint8_t	privacy_mode	Privacy mode.
uint32_t	set_privacy_status	Local privacy status.
ble_abs_timer_t	timer[BLE_ABS_CFG_TIMER_NUMBER_OF_SLOT]	

uint8_t	local_irk[BLE_GAP_IRK_SIZE]	
ble_abs_identity_address_info_t	identity_address_info	
uint32_t	current_timeout_ms	Current timeout.
uint32_t	elapsed_timeout_ms	Elapsed timeout.
ble_abs_cfg_t const *	p_cfg	Pointer to the BLE ABS configuration block.

Typedef Documentation

◆ ble_abs_timer_cb_t

typedef void(* ble_abs_timer_cb_t) (uint32_t timer_hdl)
The timer callback invoked when the timer expired.

Enumeration Type Documentation

◆ e_ble_timer_type_t

enum e_ble_timer_type_t	
The timer type.	
Enumerator	
BLE_TIMER_ONE_SHOT	One shot timer type
BLE_TIMER_PERIODIC	Periodic timer type

Function Documentation

◆ RM_BLE_ABS_Open()

fsp_err_t RM_BLE_ABS_Open (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_cfg_t const *const *p_cfg*)

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.

FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.
FSP_ERR_INVALID_MODE	Invalid mode during open call

Host stack is initialized with this function. Before using All the R_BLE APIs, it's necessary to call this function. A callback functions are registered with this function. In order to receive the GAP, GATT, Vendor specific event, it's necessary to register a callback function. The result of this API call is notified in BLE_GAP_EVENT_STACK_ON event. Implements ble_abs_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_ABS_Open(&g_ble_abs0_ctrl, &g_ble_abs0_cfg);
```

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_INVALID_CHANNEL	The channel number is invalid.
FSP_ERR_ALREADY_OPEN	Requested channel is already open in a different configuration.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ RM_BLE_ABS_Close()

fsp_err_t RM_BLE_ABS_Close (ble_abs_ctrl_t *const *p_ctrl*)

Close the BLE channel. Implements ble_abs_api_t::close.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

Example:

```
/* Close BLE driver */
   err = RM_BLE_ABS_Close(&g_ble_abs0_ctrl);
```

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_Reset()

fsp_err_t RM_BLE_ABS_Reset (ble_abs_ctrl_t *const *p_ctrl*, ble_event_cb_t *init_callback*)

This function is not implemented. To perform this function call R_BLE_Close followed by R_BLE_Open. Implements ble_abs_api_t::reset.

Return values

FSP_ERR_UNSUPPORTED	Function is not supported

BLE is reset with this function. The process is carried out in the following order. R_BLE_Close() -> R_BLE_GAP_Terminate() -> R_BLE_Open() -> R_BLE_SetEvent(). The init_cb callback initializes the others (Host Stack, timer, etc...). Implements ble_abs_api_t::reset.

Return values

FSP_SUCCESS	Channel closed successfully.
FSP_ERR_ASSERTION	Null pointer presented.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_StartLegacyAdvertising()

fsp_err_t RM_BLE_ABS_StartLegacyAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_legacy_advertising_parameter_t const *const *p_advertising_parameter*)

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
    err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.

FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

Start Legacy Advertising after setting advertising parameters, advertising data and scan response data. The legacy advertising uses the advertising set whose advertising handle is 0. The advertising type is connectable and scannable(ADV_IND). The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startLegacyAdvertising

Example:

```
/* Start advertising. */
   err = RM_BLE_ABS_StartLegacyAdvertising(&g_ble_abs0_ctrl,
&legacy_advertising_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

◆ RM_BLE_ABS_StartExtendedAdvertising()

fsp_err_t RM_BLE_ABS_StartExtendedAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_extend_advertising_parameter_t const *const *p_advertising_parameter*)

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Extended Advertising after setting advertising parameters, advertising data. The extended advertising uses the advertising set whose advertising handle is 1. The advertising type is connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Implements ble_abs_api_t::startExtendedAdvertising

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

◆ RM_BLE_ABS_StartNonConnectableAdvertising()

fsp_err_t RM_BLE_ABS_StartNonConnectableAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_non_connectable_advertising_parameter_t const *const *p_advertising_parameter*)

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Feature not yet supported.

Start Non-Connectable Advertising after setting advertising parameters, advertising data. The non-connectable advertising uses the advertising set whose advertising handle is 2. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startNonConnectableAdvertising.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_STATE	Host stack hasn't been initialized.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.

◆ RM_BLE_ABS_StartPeriodicAdvertising()

fsp_err_t RM_BLE_ABS_StartPeriodicAdvertising (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_periodic_advertising_parameter_t const *const *p_advertising_parameter*)

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Subordinate modules do not support this feature.

Start Periodic Advertising after setting advertising parameters, periodic advertising parameters, advertising data and periodic advertising data. The periodic advertising uses the advertising set whose advertising handle is 3. The advertising type is non-connectable and non-scannable. The address type of local device is Public Identity Address or RPA(If the resolving list contains no matching entry, use the public address.). Scan request event(BLE_GAP_EVENT_SCAN_REQ_RECV) is not notified. Secondary Advertising Max Skip is 0. Implements ble_abs_api_t::startPeriodicAdvertising

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_advertising_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The advertising parameter is out of range.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_StartScanning()

fsp_err_t RM_BLE_ABS_StartScanning (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_scan_parameter_t const *const *p_scan_parameter*)

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_UNSUPPORTED	Function is not supported

Start scanning after setting scan parameters. The scanner address type is Public Identity Address. Fast scan is followed by slow scan. The end of fast scan or slow scan is notified with BLE_GAP_EVENT_SCAN_TO event. If fast_period is 0, only slow scan is carried out. If scan_period is 0, slow scan continues. Implements ble_abs_api_t::startScanning.

Example:

```
/* Start scanning. */
   err = RM_BLE_ABS_StartScanning(&g_ble_abs0_ctrl, &scan_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_scan_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The scan parameter is out of range.
FSP_ERR_IN_USE	This API is called in scanning.
FSP_ERR_BLE_ABS_NOT_FOUND	Usable timer slot not found.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_CreateConnection()

fsp_err_t RM_BLE_ABS_CreateConnection (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_connection_parameter_t const *const *p_connection_parameter*)

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */

   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Request create connection. The initiator address type is Public Identity Address. The scan interval is 60ms and the scan window is 30ms in case of 1M PHY or 2M PHY. The scan interval is 180ms and the scan window is 90ms in case of coded PHY. The Minimum CE Length and the Maximum CE Length are 0xFFFF. When the request for a connection has been received by the Controller, BLE_GAP_EVENT_CREATE_CONN_COMP event is notified. When a link has beens established, BLE_GAP_EVENT_CONN_IND event is notified. Implements ble_abs_api_t::createConnection.

Example:

```
/* Create connection with remote device. */
   err = RM_BLE_ABS_CreateConnection(&g_ble_abs0_ctrl, &g_connection_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_POINTER	p_connection_parameter is specified as NULL.
FSP_ERR_INVALID_ARGUMENT	The create connection parameter is out of range.
FSP_ERR_IN_USE	This API is called while creating a link by previous API call.
FSP_ERR_BLE_ABS_NOT_FOUND	Couldn't find a valid timer.
FSP_ERR_UNSUPPORTED	This feature is not supported in this configuration.

◆ RM_BLE_ABS_SetLocalPrivacy()

fsp_err_t RM_BLE_ABS_SetLocalPrivacy (ble_abs_ctrl_t *const *p_ctrl*, uint8_t const *const *p_lc_irk*, uint8_t *privacy_mode*)

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

Return values

FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.
FSP_ERR_UNSUPPORTED	Function is not supported

Generate a IRK, add it to the resolving list, set privacy mode and enable RPA function. Register vendor specific callback function, if IRK is generated by this function. After configuring local device privacy, BLE_GAP_ADDR_RPA_ID_PUBLIC is specified as own device address in theadvertising/scan/create connection API. Implements ble_abs_api_t::setLocalPrivacy

Example:

```
/* Set local privacy. */
   err = RM_BLE_ABS_SetLocalPrivacy(&g_ble_abs0_ctrl, p_local_irk, privacy_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl is specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The privacy_mode parameter is out of range.

◆ RM_BLE_ABS_StartAuthentication()

fsp_err_t RM_BLE_ABS_StartAuthentication (ble_abs_ctrl_t *const *p_ctrl*, uint16_t *connection_handle*)

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_UNSUPPORTED	Function is not supported

Start pairing or encryption. If pairing has been done, start encryption. The pairing parameters are configured by RM_BLE_ABS_Open() or R_BLE_GAP_SetPairingParams(). If the pairing parameters are configure by RM_BLE_ABS_Open(),

- bonding policy is that bonding information is stored.
- Key press notification is not supported. Implements ble_abs_api_t::startAuthentication.

Example:

```
/* Start authentication with remote device. */
   err = RM_BLE_ABS_StartAuthentication(&g_ble_abs0_ctrl, g_connection_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	p_instance_ctrl or connection_handle are specified as NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_ARGUMENT	The connection handle parameter is out of range.

◆ RM_BLE_ABS_DeleteBondInformation()

fsp_err_t RM_BLE_ABS_DeleteBondInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_abs_bond_information_parameter_t const *const *p_bond_information_parameter*)

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation was successful
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.

FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

Delete bonding information from BLE stack and storage. Implements ble_abs_api_t::deleteBondInformation.

Example:

```
/* Delete bonding information. */
   err = RM_BLE_ABS_DeleteBondInformation(&g_ble_abs0_ctrl,
&g_bond_information_parameter);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_bond_information_parameter is NULL.
FSP_ERR_NOT_OPEN	Control block not open.

◆ RM_BLE_ABS_ImportKeyInformation()

fsp_err_t RM_BLE_ABS_ImportKeyInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk*)

Import key information to BLE stack and storage. Implements ble_abs_api_t::importKeyInformation.

Example:

```
/* Import local key information. */
   err = RM_BLE_ABS_ImportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_INVALID_HW_CONDITION	Failure to access internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

◆ RM_BLE_ABS_ExportKeyInformation()

fsp_err_t RM_BLE_ABS_ExportKeyInformation (ble_abs_ctrl_t *const *p_ctrl*, ble_device_address_t * *p_local_identity_address*, uint8_t * *p_local_irk*, uint8_t * *p_local_csrk*)

Export key information to BLE stack and storage. Implements ble_abs_api_t::exportKeyInformation.

Example:

```
/* Export local key information. */
   err = RM_BLE_ABS_ExportKeyInformation(&g_ble_abs0_ctrl, &local_identity_address,
local_irk, local_csrk);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_local_identity_address, p_local_irk or p_local_csrk is NULL.
FSP_ERR_NOT_OPEN	Control block not open.
FSP_ERR_BUFFER_EMPTY	Dynamic memory allocation failed.
FSP_ERR_OUT_OF_MEMORY	Failure to access internal storage.
FSP_ERR_NOT_INITIALIZED	Not initialized internal storage.
FSP_ERR_UNSUPPORTED	Not supported in this configuration.

5.2.12.8 BLE Driver (r_ble_balance)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Balance configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.

    - Add an event in the BLE protocol stack internal queue.
- GAP
    - Initialization of the Host stack.
    - Start/Stop Advertising.
    - Start/Stop Scan.
    - Connect/Disconnect a link.
    - Initiate/Respond a pairing request.
- GATT Common
    - Get MTU size.
- GATT Server
    - Initialization of GATT Server.
    - Notification/Indication.
- GATT Client
    - Discovery services, characteristics.
    - Read/Write characteristic.
- Vendor Specific
    - DTM.
    - Set/Get transmit power.
    - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	**Supported**	Supported
GAP API	Supported	***1 Limited**	*1 *2 Limited
GATT Common API	Supported	**Supported**	Supported
GATT Client API	Supported	**Supported**	Supported
GATT Client API	Supported	**Supported**	Supported
L2CAP API	Supported	**Not Supported**	Not supported
Vendor Specific API	*3 Limited	***3 Limited**	*3 Limited

Note

1. *This configuration dose not support LE Advertising Extensions functionality APIs.*
2. *This configuration dose not support Central and Observer functionality APIs.*
3. *This configuration dose not support vender specific firmware update functionality APIs.*

Supported Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Supported Devices

Device Group	Devices
RA4	RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

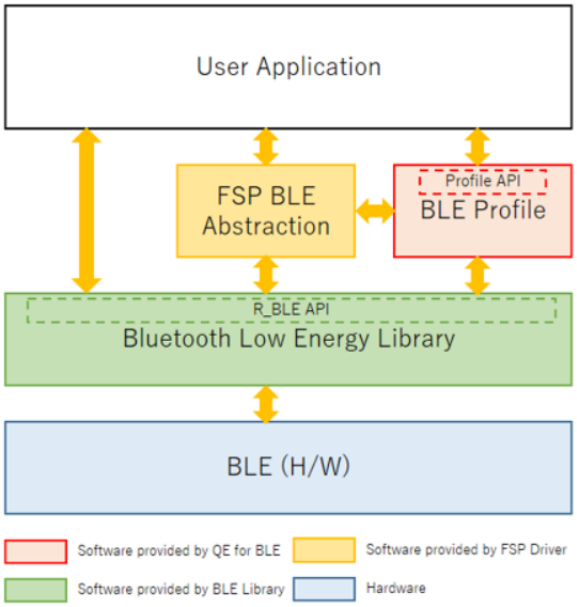

Figure 311: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

It takes around 250msec to initialize BLE protocol stack.
R_BLE_Open API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not support LE Advertising Extensions functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.
- This configuration dose not support L2CAP functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.
- This configuration dose not support vender specific firmware update functionality APIs.
Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.9 BLE Driver (r_ble_compact)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Compact configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising.
  - Initiate/Respond a pairing request.
- GATT Common

    - Get MTU size.
- GATT Server
    - Initialization of GATT Server.
    - Notification/Indication.
- GATT Client
    - Discovery services, characteristics.
    - Read/Write characteristic.
- Vendor Specific
    - DTM.
    - Set/Get transmit power.
    - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	Supported	Supported	**Supported**
GATT Common API	Supported	*1 Limited	***1 *2 Limited**
GATT Common API	Supported	Supported	**Supported**
GATT Server API	Supported	Supported	**Supported**
GATT Client API	Supported	Supported	**Supported**
L2CAP API	Supported	Not supported	**Not supported**
Vendor Specific API	*3 Limited	*3 Limited	***3 Limited**

Note

1. *This configuration dose not support LE Advertising Extensions functionality APIs.*
2. *This configuration dose not support Central and Observer functionality APIs.*
3. *This configuration dose not support vender specific firmware update functionality APIs.*

Supported Devices

The Renesas BLE Library supports the following devices.

- RA4W1

Supported Devices

Device Group	Devices
RA4	RA4W1

Configuration

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more

The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Figure shows the software structure of the BLE FSP module.

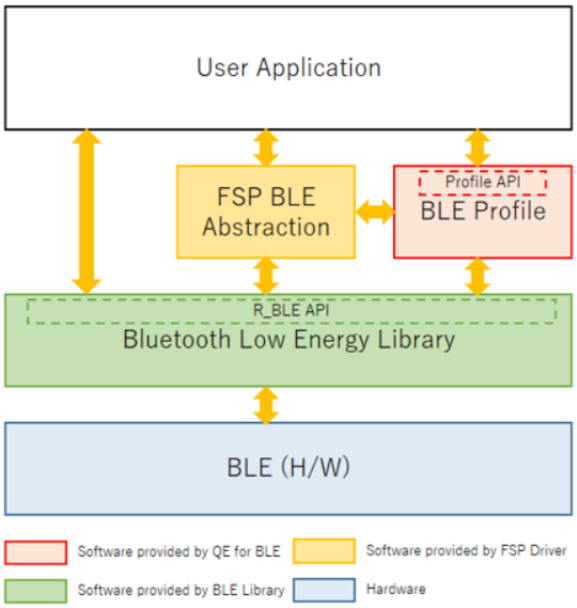

Figure 312: BLE software structure

The BLE FSP module consists of the BLE library.
The BLE Application uses the BLE functions via the R_BLE API provided by the BLE Library.
The QE for BLE generates the source codes (BLE base skeleton program) as a base for the BLE Application and the BLE Profile codes including the Profile API.

Initialize the BLE protocol stack

Note

It takes around 250msec to initialize BLE protocol stack.
R_BLE_Open API will be occupied MCU resources during the initialization.

Limitations

Developers should be aware of the following limitations when using the ble:

Note

- This configuration dose not supports LE Advertising Extensions functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.
- This configuration dose not supports Central and Observer functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) or BLE Driver (r_ble_balance)

configuration.
- This configuration dose not supports L2CAP functionality APIs.
If those functionalities need your system, select BLE Driver (r_ble_extended) configuration.
- This configuration dose not supports vender specific firmware update functionality APIs.
Those APIs are only supported by SPP BLE Abstraction (rm_ble_abs_spp) module.

Limitations on FreeRTOS environment

Developers should be aware of the following limitations when using the ble on FreeRTOS environment: When use deep sleep, sleep mode or standby mode, there is following two wake up option from RF module.

- Using Semaphore
- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.10 BLE Driver (r_ble_extended)

Modules » Networking

Driver for the Radio peripheral on RA MCUs. This module implements the BLE Interface.

Overview

The Bluetooth Low Energy (BLE) library in Extended configuration (r_ble) provides an API to control the Radio peripheral. This module is configured via the QE for BLE. QE for BLE provides standard services defined by standardization organization and custom services defined by user. Bluetooth LE Profile API Document User's Manual describes the APIs for standard services.

Features

- Common
  - Open/Close the BLE protocol stack.
  - Execute the BLE job.
  - Add an event in the BLE protocol stack internal queue.
- GAP
  - Initialization of the Host stack.
  - Start/Stop Advertising (Support LE Advertising Extensions).
  - Start/Stop Scan.
  - Connect/Disconnect a link.
  - Initiate/Respond a pairing request.
- GATT Common
  - Get MTU size.
- GATT Server
  - Initialization of GATT Server.
  - Notification/Indication.

- GATT Client
  - Discovery services, characteristics.
  - Read/Write characteristic.
- L2CAP
  - Credit-based flow control transaction.
- Vendor Specific
  - DTM.
  - Set/Get transmit power.
  - Set/Get BD_ADDR.

Supported functions

The supported functions are listed in the table below. Choose the configuration that best suits the functions that target system requires.

BLE library feature	Extended	Balance	Compact
Common API	**Supported**	Supported	Supported
GAP API	**Supported**	*1 Limited	*1 *2 Limited
GATT Common API	**Supported**	Supported	Supported

- Using Event Groups

Note

Event Groups is processing as a delay handler by timer task.
Therefore, if blocked by interrupts or if the timer task is blocked by another high-priority task, the existing connection will be broken.

5.2.12.11 BLE Mesh Network Modules

Modules » Networking

Detailed Description

BLE Mesh Network Modules.

Modules

BLE Mesh Network (rm_ble_mesh)
BLE Mesh Network Access (rm_ble_mesh_access)
BLE Mesh Network Bearer (rm_ble_mesh_bearer)
BLE Mesh Network Bearer Platform (rm_mesh_bearer_platform)
BLE Mesh Network Config Client (rm_mesh_config_clt)
BLE Mesh Network Config Server (rm_mesh_config_srv)
BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)
BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)
BLE Mesh Network Generic Battery Server (rm_mesh_generic_battery_srv)
BLE Mesh Network Generic Client Property Server (rm_mesh_generic_client_prop_srv)
BLE Mesh Network Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

	BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)
	BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)
	BLE Mesh Network Generic Level Server (rm_mesh_generic_level_srv)
	BLE Mesh Network Generic Location Client (rm_mesh_generic_loc_clt)
	BLE Mesh Network Generic Location Server (rm_mesh_generic_loc_srv)
	BLE Mesh Network Generic Manufacturer Property Server (rm_mesh_generic_mfr_prop_srv)
	BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt)
	BLE Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)
	BLE Mesh Network Generic Power Level Client (rm_mesh_generic_pl_clt)
	BLE Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv)
	BLE Mesh Network Generic Power On Off Client (rm_mesh_generic_poo_clt)
	BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)
	BLE Mesh Network Generic Property Client (rm_mesh_generic_prop_clt)
	BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)
	BLE Mesh Network Health Client (rm_mesh_health_clt)
	BLE Mesh Network Health Server (rm_mesh_health_srv)
	BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt)
	BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv)
	BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

	BLE Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv)
	BLE Mesh Network Light Lightness Client (rm_mesh_light_lightness_clt)
	BLE Mesh Network Light Lightness Server (rm_mesh_light_lightness_srv)
	BLE Mesh Network Light Location Client (rm_mesh_light_lc_clt)
	BLE Mesh Network Light Location Server (rm_mesh_light_lc_srv)
	BLE Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt)
	BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv)
	BLE Mesh Network Lower Trans (rm_ble_mesh_lower_trans)
	BLE Mesh Network Network (rm_ble_mesh_network)
	BLE Mesh Network Provision (rm_ble_mesh_provision)
	BLE Mesh Network Scene Client (rm_mesh_scene_clt)
	BLE Mesh Network Scene Server (rm_mesh_scene_srv)
	BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt)
	BLE Mesh Network Scheduler Server (rm_mesh_scheduler_srv)
	BLE Mesh Network Sensor Client (rm_mesh_sensor_clt)
	BLE Mesh Network Sensor Server (rm_mesh_sensor_srv)
	BLE Mesh Network Time Client (rm_mesh_time_clt)
	BLE Mesh Network Time Server (rm_mesh_time_srv)
	BLE Mesh Network Upper Trans (rm_ble_mesh_upper_trans)

fsp_err_t	RM_BLE_MESH_ConvertTransitionTimeFromMs (rm_ble_mesh_ctrl_t *const p_ctrl, uint32_t transition_time_in_ms, uint8_t *const p_transition_time)
fsp_err_t	RM_BLE_MESH_ConvertTransitionTimeToMs (rm_ble_mesh_ctrl_t *const p_ctrl, uint8_t transition_time, uint32_t *const p_transition_time_in_ms)

Detailed Description

Overview

Bluetooth Mesh defines a managed-flood-based mesh network. Any device in the network can send a message at any time as long as there is a sufficient density of devices that are listening and relaying messages. See sample application document and start up guide for information on how to create a BLE MESH application.

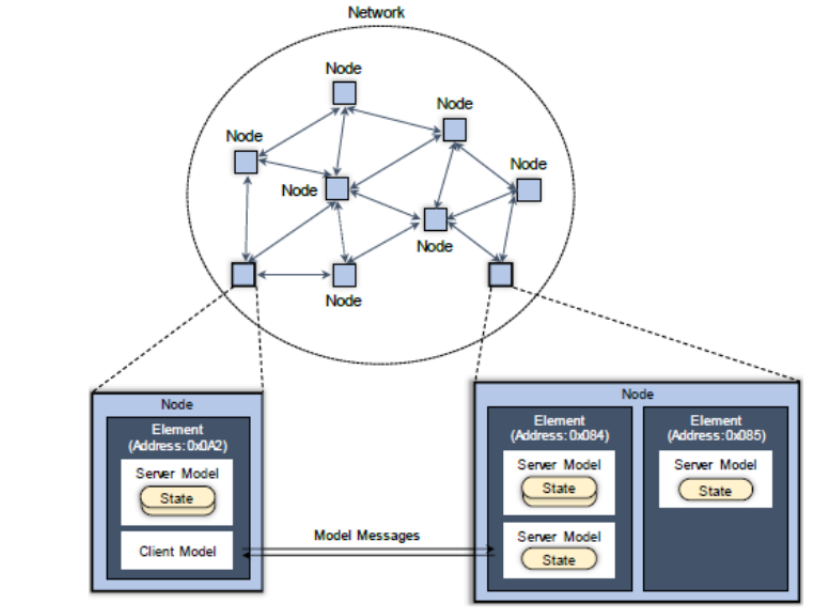

Figure 314: Overview Of Bletooth Mesh

Features

The BLE Mesh middleware has the following features:

- Supports one-to-one and one-to-many message transmission
- Supports relay messages to other nodes
- Supports secure message transmission against the following attack
  - Wiretap attack
  - Man-in-the-middle attack
  - Replay attack
  - Trash-can attack
  - Brute Force Key attack
- Supports following optional features
  - Supports Relay feature
  - Supports Proxy feature
  - Supports Friend feature
  - Supports Low Power feature

Target Devices

The BLE Mesh Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking. Valid settings include.

Configurations for Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh (rm_ble_mesh).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Bearer			
Network Interface Number	Invalid Network Interface Number	2	Network interfaces number.
Provisioning Interface Number	Invalid Provisioning Interface Number	2	Provisioning interfaces number.
Provisioning			
Unprovisioned Device Beacon Timeout in Milliseconds	Invalid Unprovisioned Device Beacon Timeout in Milliseconds	200	Unprovisioned device beacon timeout in milliseconds.
Network			
Network Cache Size	Invalid Network Cache Size	10	Network cache size.
Network Sequence Number Cache Size	Invalid Network Sequence Number Cache Size	32	Network sequence number cache size.
Maximum Number of Subnet	Invalid Maximum Number of Subnets	4	Maximum number of subnets
Maximum Number of Device Key	Invalid Maximum Number of Device Keys	4	Maximum number of device keys.
Proxy Filter List Size	Invalid Proxy Filter List Size	2	Maximum number of addresses present in each proxy filter list.
Network Sequence Number Block Size	Invalid Network Sequence Number Block Size	2048	The distance between the network sequence numbers, for every persistent storage write.

Network Transmit Count for Network Packets	Invalid Network Transmit Count for Network Packets	1	Network transmit count for network packets.
Network Interval Steps for Network Packets	Invalid Network Interval Steps for Network Packets	4	Network interval steps for network packets.
Network Transmit Count for Relayed Packets	Invalid Network Transmit Count for Relayed Packets	0	Network transmit count for relayed packets.
Network Interval Steps for Relayed Packets	Invalid Network Interval Steps for Relayed Packets	9	Network interval steps for relayed packets.
Proxy ADV Network ID Timeout for Each Subnet in Milliseconds.	Invalid Proxy ADV Network ID Timeout	100	Proxy ADV network ID timeout for each subnet in milliseconds.
Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	Invalid Proxy ADV Node Identity Timeout for Each Subnet in Milliseconds	300	Proxy ADV node identity timeout for each subnet in milliseconds.
Proxy ADV Node Identity Overall Time Period in Seconds	Invalid Proxy ADV Node Identity Overall Time Period in Seconds	60	Proxy ADV node identity overall time period in seconds.
Maximum Number of Queued Messages for Transmission	Invalid Maximum Number of Queued Messages for Transmission	64	Maximum number of queued messages for transmission.
Transport			
Maximum Number of LPN	Invalid Maximum Number of LPNs	1	Maximum number of LPNs.
Replay Protection Cache Size	Invalid Replay Protection Cache Size	10	Replay protection cache size.
Reassembled Cache Size	Invalid Reassembled Cache Size	8	Reassembled cach size.
Friend Poll Retry Count	Invalid Friend Poll Retry Count	10	Friend poll retry count.
Maximum Number of Segmentation and Reassembly Context	Invalid Maximum Number of Segmentation and Reassembly Context	8	Number of segmentation and reassembly contexts.
Lower Transport Segment Transmission Timeout in Milliseconds	Invalid Lower Transport Segment Transmission Timeout in Milliseconds	300	Lower transport segment transmission timeout in milliseconds.
Lower Transport Segment Re-Transmission Count	Invalid Lower Transport Segment Re-Transmission Count	2	Lower transport segment re-transmission count.

Lower Transport Acknowledgement Timeout in Milliseconds	Invalid Lower Transport Acknowledgement Timeout in Milliseconds	200	Lower transport acknowledgement timeout in milliseconds.
Lower Transport Incomplete Timeout in Seconds	Invalid Lower Transport Incomplete Timeout in Seconds	20	Lower transport incomplete timeout in seconds.
Friendship Receive Window	Invalid Friendship Receive Window	100	Friendship receive window.
Maximum Number of Friend Message Queue	Invalid Maximum Number of Friend Messages Queue	15	Maximum number of messages that the friend is capabale to queue for a single Low Power Node.
Maximum Number of Friend Subscription List	Invalid Maximum Number of Friend Subscription List	8	Maximum number of subscription addresses that the friend is capable to store for a single Low Power Node.
Friend Clear Confirmation Timeout in Milliseconds	Invalid Friend Clear Confirmation Timeout in Milliseconds	1000	Friend clear confirmation timeout in milliseconds.
Friend Clear Retry Count	Invalid Friend Clear Retry Count	5	Friend clear retry count.
Friendship Retry Timeout in Milliseconds	Invalid Friendship Retry Timeout in Milliseconds	1200	Friendship retry timeout in milliseconds.
Access			
Maximum Number of Element	Invalid Maximum Number of Element	4	Maximum number of elements.
Maximum Number of Model	Invalid Maximum Number of Model	60	Maximum number of models.
Maximum Number of Application	Invalid Maximum Number of Application	8	Maximum number of applications (keys) the device can store information about.
Maximum Number of Virtual Address	Invalid Maximum Number of Virtual Address	8	Maximum number of virtual addresses the device can store information about.
Maximum Number of Non-Virtual Address	Invalid Maximum Number of Non-Virtual Address	8	Maximum number of non-virtual addresses the device can store information about.
Maximum Number of Transition Timers	Invalid Maximum Number of Transition Timers	5	Maximum number of transition timers.

Maximum Number of Periodic Step Timers	Invalid Maximum Number of Periodic Step Timers	5	Maximum number of periodic step timers.
Foundation			
Config Server Secure Network Beacon Interval	Invalid Config Server Secure Network Beacon Interval	10	Config server secure network beacon interval.
Maximum Number of Health Server Instance	Invalid Maximum Number of Health Server Instance	2	Maximum number of health server instances.
Model			
Maximum Number of Light Lightness Controller Server Instance	Invalid Maximum Number of Light Lightness Controller Server Instance	1	Maximum number of light lightness controller server instances.
ID			
Company ID	Invalid Company ID	0x0036	Company ID.
Product ID	Invalid Product ID	0x0001	Product ID.
Vendor ID	Invalid Vendor ID	0x0100	Vendor ID.
Platform			
Platform > Storage			
Block Number	Invalid Block Number	5	Block number.
Platform > Memory Pool			
Memory Pool Size	Invalid Memory Pool Size	0x4000	Memory pool size.
Platform > Logging			
Packet Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the packet_bitfield mask.
Module Info Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the module information bitfield mask.
Generic Log Bitfield	• Network • Lower Trans • Upper Trans • Access		Specifies if this is included in the generic log bitfield mask.
function	Name Must Be a Valid C Symbol	NULL	

Clock Configuration

Note

System clock (ICLK): 8 MHz or more
Peripheral module clock A (PCLKA): 8MHz or more
The BLE Protocol Stack is optimized for ICLK and PCLKA frequencies of 32 MHz.
It is recommended that the clock be set so that the ICLK and PCLKA frequencies are 32MHz in order to get the best performance from the BLE.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Mesh System Architecture

Purpose of each layer is,

Model layer

Model is a standardized typical functionality so that nodes perform operations in accordance with application scenario.

Foundation Model layer

Foundation Models are models to configure and manage operations of elements.

Access layer

The access layer defines how higher layer applications can use the upper transport layer.

Upper transport layer

The upper transport layer encrypts, decrypts, and authenticates application data and is designed to provide confidentiality of access messages.

Lower transport layer

The lower transport layer defines how upper transport layer messages are segmented and reassembled into multiple Lower Transport PDUs to deliver large upper transport layer messages to other nodes.

Network layer

The network layer defines how transport messages are addressed towards one or more elements.

Bearer layer

The bearer layer defines how network messages are transported between nodes.

Device Life Cycle

The device not joined in the mesh network is an Unprovisioned Device and the device joined in the mesh network is called a Node.

- Unprovisioned Device
  Unprovisioned device cannot send or receive mesh messages. However, it will advertise its presence to the provisioner. By the provisioner, Unprovisioned Devices are invited to join the mesh network and become nodes(Provisioning).
- Node
  Nodes can send and receive mesh messages. It is managed by the configuration client through the mesh network, which configures how the nodes communicate. The configuration client can also remove a Node from the mesh network, which will return the node to an Unprovisioned Device.

To communicate with other nodes by using Models, each node needs Configuration. By Configuration process, information required for Model operation such as Application Keys, Publish Address, Subscription Address is configured. Following shows a typical lifecycle of a node.

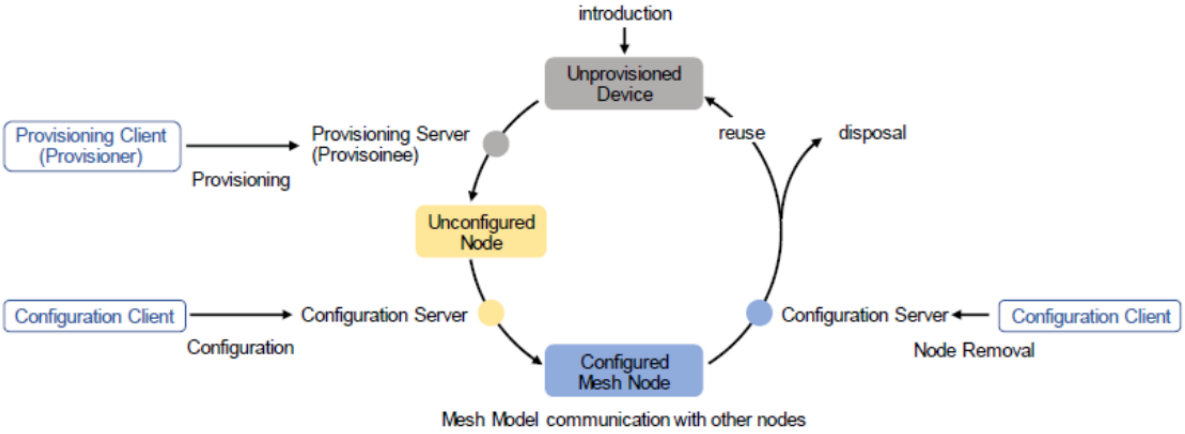

Figure 315: Device Life Cycle Image

Newly introduced device is provisioned by Provisioner and joins a network. Furthermore, this device is configured by Configuration Client and becomes to be able to communicate with other nodes with Mesh Model. Generally, Configuration Client is a smart phone or other mobile computing device. Configuration Client removes a node from a network by sending Config Node Reset message. Besides, Configuration Client updates encryption keys used in the network, and the removed node becomes unable to communicate with other nodes.

Examples

BLE_MESH Basic Example

This is a basic example of minimal use of the BLE_MESH in an application.

Data Structures

struct	rm_ble_mesh_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_instance_ctrl_t

struct rm_ble_mesh_instance_ctrl_t
RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

Function Documentation

◆ RM_BLE_MESH_Open()

fsp_err_t RM_BLE_MESH_Open (rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_cfg_t const *const *p_cfg*)

Open ble mesh middleware. API to initialize Mesh Stack. This is the first API that the application should call before any other API. This function initializes all the internal stack modules and data structures.

Implements rm_ble_mesh_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_Open(&g_ble_mesh0_ctrl, &g_ble_mesh0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_Close()

fsp_err_t RM_BLE_MESH_Close (rm_ble_mesh_ctrl_t *const *p_ctrl*)

Close ble mesh middleware. API to turn off Bluetooth Hardware. This API should be called after RM_BLE_MESH_Open.

Implements rm_ble_mesh_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_Close(&g_ble_mesh0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_StartTransitionTimer()

fsp_err_t RM_BLE_MESH_StartTransitionTimer (rm_ble_mesh_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_state_transition_t const *const *p_transition*, uint16_t *const *p_transition_time_handle*)

To start transition timer. API to start a transition timer.

Implements rm_ble_mesh_api_t::startTransitionTimer.

Example:

```
/* Start transition timer. */
   err = RM_BLE_MESH_StartTransitionTimer(&g_ble_mesh0_ctrl, &transition,
&transition_time_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

◆ RM_BLE_MESH_StopTransitionTimer()

fsp_err_t RM_BLE_MESH_StopTransitionTimer (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*)

To stop transition timer. API to stop a transition timer.

Implements rm_ble_mesh_api_t::stopTransitionTimer.

Example:

```
/* Stop transition timer. */
   err = RM_BLE_MESH_StopTransitionTimer(&g_ble_mesh0_ctrl, transition_time_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_GetRemainingTransitionTime()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTime (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint8_t *const *p_remaining_transition_time*)

To get remaining Transition Time. API to get remaining Transition Time.

Implements rm_ble_mesh_api_t::getRemainingTransitionTime.

Example:

```
/* Get remaining transition time. */
   err = RM_BLE_MESH_GetRemainingTransitionTime(&g_ble_mesh0_ctrl,
transition_time_handle, &remaining_transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_GetRemainingTransitionTimeWithOffset()

fsp_err_t RM_BLE_MESH_GetRemainingTransitionTimeWithOffset (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint16_t *transition_time_handle*, uint32_t *offset_in_ms*, uint8_t *const *p_remaining_transition_time*)

To get remaining Transition Time, with offset. API to get remaining Transition Time with offset in ms.

Implements rm_ble_mesh_api_t::getRemainingTransitionTimeWithOffset.

Example:

```
/* Get remaining transition time with offset. */
   err = RM_BLE_MESH_GetRemainingTransitionTimeWithOffset(&g_ble_mesh0_ctrl,
                                                          transition_time_handle,
                                                          offset_in_ms,

&remaining_transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remaining_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ConvertTransitionTimeFromMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeFromMs (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint32_t *transition_time_in_ms*, uint8_t *const *p_transition_time*)

To convert transition time from millisecond. API to convert transition timer in millisecond to Generic Default Transition Time state format.

Implements rm_ble_mesh_api_t::convertTransitionTimeFromMs.

Example:

```
/* Convert transition time from milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeFromMs(&g_ble_mesh0_ctrl,
transition_time_in_ms, &transition_time);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ConvertTransitionTimeToMs()

fsp_err_t RM_BLE_MESH_ConvertTransitionTimeToMs (rm_ble_mesh_ctrl_t *const *p_ctrl*, uint8_t *transition_time*, uint32_t *const *p_transition_time_in_ms*)

To convert transition time to millisecond. API to convert Generic Default Transition Time state format to required transition time value in miliseconds.

Implements rm_ble_mesh_api_t::convertTransitionTimeToMs.

Example:

```
/* Convert transition time to milliseconds. */
   err = RM_BLE_MESH_ConvertTransitionTimeToMs(&g_ble_mesh0_ctrl, transition_time,
&transition_time_in_ms);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transition_time_in_ms is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

fsp_err_t	RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress (rm_ble_mesh_access_ctrl_t *const p_ctrl, rm_ble_mesh_network_address_t addr)
fsp_err_t	RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode (rm_ble_mesh_access_ctrl_t *const p_ctrl, rm_ble_mesh_access_iv_update_test_mode_t mode)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Access module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_access

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_access_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Access (rm_ble_mesh_access).

Configuration	Options	Default	Description

General

Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_access0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Location Descriptor	Invalid Descriptor	0	Location descriptor.
Element Number	Invalid Descriptor	0	Element number to register the model.

Data Structures

struct	rm_ble_mesh_access_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_access_instance_ctrl_t

struct rm_ble_mesh_access_instance_ctrl_t
RM_BLE_MESH_ACCESS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_ACCESS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_ACCESS_Open()

fsp_err_t RM_BLE_MESH_ACCESS_Open (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_cfg_t const *const *p_cfg*)

Open access middleware. This routine creates a new node in the device. This can be used by the application to create extra nodes if required in addition to the default primary node. And this routine registers an element that can be populated with the models information to a specific node in the device identified by the node id.

Implements rm_ble_mesh_access_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_ACCESS_Open(&g_ble_mesh_access0_ctrl, &g_ble_mesh_access0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Close()

fsp_err_t RM_BLE_MESH_ACCESS_Close (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_access_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_Close(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_RegisterModel()

fsp_err_t RM_BLE_MESH_ACCESS_RegisterModel (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_t const *const *p_model*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

Register a model with the access layer. This routine registers a model associated with an element with the access layer.

Implements rm_ble_mesh_access_api_t::registerModel.

Example:

```
/* Register a model with the access layer. */
   err = RM_BLE_MESH_ACCESS_RegisterModel(&g_ble_mesh_access0_ctrl, &model,
&model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_model and p_model_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *elem_addr*, rm_ble_mesh_access_element_handle_t *const *p_handle*)

Get element handle. This routine searches for the element handle associated with specific element address.

Implements rm_ble_mesh_access_api_t::getElementHandle.

Example:

```
/* Get element handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandle(&g_ble_mesh_access0_ctrl, elem_addr,
&elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_element_handle_t *const *p_elem_handle*)

Get element handle for a given model handle. This routine searches for the element handle associated with specific model handle.

Implements rm_ble_mesh_access_api_t::getElementHandleForModelHandle.

Example:

```
/* Get element handle for a given model handle. */
   err = RM_BLE_MESH_ACCESS_GetElementHandleForModelHandle(&g_ble_mesh_access0_ctrl,
model_handle, &elem_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_elem_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetModelHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_element_handle_t *elem_handle*, rm_ble_mesh_access_model_id_t *model_id*, rm_ble_mesh_access_model_handle_t *const *p_handle*)

Get model handle. This routine searches for the model handle associated with specific model ID.

Implements rm_ble_mesh_access_api_t::getModelHandle.

Example:

```
/* Get model handle. */
   err = RM_BLE_MESH_ACCESS_GetModelHandle(&g_ble_mesh_access0_ctrl, elem_handle,
model_id, &model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Publish()

fsp_err_t RM_BLE_MESH_ACCESS_Publish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint8_t *reliable*)

API to publish access layer message. This routine publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::publish.

Example:

```
/* Publish access layer message. */
   err = RM_BLE_MESH_ACCESS_Publish(&g_ble_mesh_access0_ctrl, &model_handle,
&publish_message, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReliablePublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReliablePublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t const *const *p_handle*, rm_ble_mesh_access_req_msg_raw_t const *const *p_publish_message*, uint32_t *rsp_opcode*)

API to reliably publish Access layer message. This routine reliably publishes Access Layer message to the publish address associated with the model.

Implements rm_ble_mesh_access_api_t::reliablePublish.

Example:

```
/* Reliably publish access layer message. */
   err = RM_BLE_MESH_ACCESS_ReliablePublish(&g_ble_mesh_access0_ctrl, &model_handle,
&req_msg_raw, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle and p_publish_message are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_Reply()

fsp_err_t RM_BLE_MESH_ACCESS_Reply (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, uint8_t *ttl*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*)

API to reply to Access Layer message. This routine replies to Access Layer message.

Implements rm_ble_mesh_access_api_t::reply.

Example:

```
/* Reply to access layer message. */
   err = RM_BLE_MESH_ACCESS_Reply(&g_ble_mesh_access0_ctrl, &req_msg_context, ttl,
&req_msg_raw);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_ReplyAndPublish()

fsp_err_t RM_BLE_MESH_ACCESS_ReplyAndPublish (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_req_msg_context_t const *const *p_req_msg_context*, rm_ble_mesh_access_req_msg_raw_t const *const *p_req_msg_raw*, rm_ble_mesh_access_publish_setting_t const *const *p_publish_setting*)

API to reply to Access Layer message and optionally also to publish. This routine replies to Access Layer message and also publish if requested by application.

Implements rm_ble_mesh_access_api_t::replyAndPublish.

Example:

```
/* Reply to access layer message. */
   err =
RM_BLE_MESH_ACCESS_ReplyAndPublish(&g_ble_mesh_access0_ctrl, &req_msg_context,
&req_msg_raw, &publish_setting);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_req_msg_context and p_req_msg_raw are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_ACCESS_SendPdu()

fsp_err_t RM_BLE_MESH_ACCESS_SendPdu (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_pdu_t const *const *p_pdu*, uint8_t *reliable*)

API to send access PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_access_api_t::sendPdu.

Example:

```
/* Send Access PDUs. */
   err = RM_BLE_MESH_ACCESS_SendPdu(&g_ble_mesh_access0_ctrl, &pdu, reliable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetCompositionData()

fsp_err_t RM_BLE_MESH_ACCESS_GetCompositionData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_buffer_t *const *p_buffer*)

Get composition data.

Implements rm_ble_mesh_access_api_t::getCompositionData.

Example:

```
/* Get composition data. */
   err = RM_BLE_MESH_ACCESS_GetCompositionData(&g_ble_mesh_access0_ctrl, &buffer);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_buffer is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_Reset()

fsp_err_t RM_BLE_MESH_ACCESS_Reset (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To reset a node. This routine resets a node (other than a Provisioner) and removes it from the network.

Implements rm_ble_mesh_access_api_t::reset.

Example:

```
/* Reset a node. */
   err = RM_BLE_MESH_ACCESS_Reset(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetElementCount()

fsp_err_t RM_BLE_MESH_ACCESS_GetElementCount (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_count*)

To get the number of elements in local node. This routine retrieves the number of elements in local node.

Implements rm_ble_mesh_access_api_t::getElementCount.

Example:

```
/* Get the number of elements in local node. */
   err = RM_BLE_MESH_ACCESS_GetElementCount(&g_ble_mesh_access0_ctrl, &count);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_count is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To set primary unicast address. This routine sets primary unicast address.

Implements rm_ble_mesh_access_api_t::setPrimaryUnicastAddress.

Example:

```
/* Set primary unicast address. */
   err = RM_BLE_MESH_ACCESS_SetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress()

fsp_err_t RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *const *p_addr*)

To get primary unicast address. This routine gets primary unicast address.

Implements rm_ble_mesh_access_api_t::getPrimaryUnicastAddress.

Example:

```
/* Get primary unicast address. */
   err = RM_BLE_MESH_ACCESS_GetPrimaryUnicastAddress(&g_ble_mesh_access0_ctrl,
&addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_SetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ttl*)

To set default TTL. This routine sets default TTL.

Implements rm_ble_mesh_access_api_t::setDefaultTtl.

Example:

```
/* Set default TTL. */
   err = RM_BLE_MESH_ACCESS_SetDefaultTtl(&g_ble_mesh_access0_ctrl, ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetDefaultTtl()

fsp_err_t RM_BLE_MESH_ACCESS_GetDefaultTtl (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_ttl*)

To get default TTL. This routine gets default TTL.

Implements rm_ble_mesh_access_api_t::getDefaultTtl.

Example:

```
/* Get default TTL. */
   err = RM_BLE_MESH_ACCESS_GetDefaultTtl(&g_ble_mesh_access0_ctrl, &ttl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_ttl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_SetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *iv_index*, uint8_t *iv_update_flag*)

To set IV Index. This routine sets IV Index.

Implements rm_ble_mesh_access_api_t::setIvIndex.

Example:

```
/* Set IV Index. */
   err = RM_BLE_MESH_ACCESS_SetIvIndex(&g_ble_mesh_access0_ctrl, iv_index,
iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_IN_USE	Resource is busy.

◆ RM_BLE_MESH_ACCESS_GetIvIndex()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndex (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint32_t *const *p_iv_index*, uint8_t *const *p_iv_update_flag*)

To get IV Index. This routine gets IV Index.

Implements rm_ble_mesh_access_api_t::getIvIndex.

Example:

```
/* Get IV Index. */
   err = RM_BLE_MESH_ACCESS_GetIvIndex(&g_ble_mesh_access0_ctrl, &iv_index,
&iv_update_flag);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index and p_iv_update_flag are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetIvIndexByIvi()

fsp_err_t RM_BLE_MESH_ACCESS_GetIvIndexByIvi (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *ivi*, uint32_t *const *p_iv_index*)

To get IV Index by IVI. This routine gets IV Index based on the IVI in the received packet.

Implements rm_ble_mesh_access_api_t::getIvIndexByIvi.

Example:

```
/* Get IV Index by IVI. */
   err = RM_BLE_MESH_ACCESS_GetIvIndexByIvi(&g_ble_mesh_access0_ctrl, ivi,
&iv_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_iv_index is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_SetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *enable*, uint8_t *feature*)

To enable/disable a feature. This routine enables/disables a feature field.

Implements rm_ble_mesh_access_api_t::setFeaturesField.

Example:

```
/* Enable/Disable a feature. */
   err = RM_BLE_MESH_ACCESS_SetFeaturesField(&g_ble_mesh_access0_ctrl, enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeaturesField()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeaturesField (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_enable*, uint8_t *feature*)

To get state of a feature. This routine gets the state of a feature field.

Implements rm_ble_mesh_access_api_t::getFeaturesField.

Example:

```
/* Get state of a feature. */
   err = RM_BLE_MESH_ACCESS_GetFeaturesField(&g_ble_mesh_access0_ctrl, &enable,
features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_enable is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFeatures()

fsp_err_t RM_BLE_MESH_ACCESS_GetFeatures (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_features*)

To get state of all features. This routine gets the state of all features.

Implements rm_ble_mesh_access_api_t::getFeatures.

Example:

```
/* Get state of all features. */
   err = RM_BLE_MESH_ACCESS_GetFeatures(&g_ble_mesh_access0_ctrl, &features);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_features is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_GetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *const *p_friend_role*)

To get friendship role of the node. This routine gets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::getFriendshipRole.

Example:

```
/* Get friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_GetFriendshipRole(&g_ble_mesh_access0_ctrl,
&friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_friend_role is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_SetFriendshipRole()

fsp_err_t RM_BLE_MESH_ACCESS_SetFriendshipRole (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *friend_role*)

To set friendship role of the node. This routine sets the current friendship role of the node.

Implements rm_ble_mesh_access_api_t::setFriendshipRole.

Example:

```
/* Set friendship role of the node. */
   err = RM_BLE_MESH_ACCESS_SetFriendshipRole(&g_ble_mesh_access0_ctrl,
friend_role);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_dev_key*, rm_ble_mesh_network_address_t *uaddr*, uint8_t *num_elements*)

To add Device Key. This routine adds Device Key entry, along with corresponding Primary Device Address and Number of elements.

Implements rm_ble_mesh_access_api_t::addDeviceKey.

Example:

```
/* Add Device Key. */
   err = RM_BLE_MESH_ACCESS_AddDeviceKey(&g_ble_mesh_access0_ctrl, &dev_key, uaddr,
num_elements);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OVERFLOW	Device key table is full.

◆ RM_BLE_MESH_ACCESS_GetDeviceKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *dev_key_index*, uint8_t **const *p_dev_key*)

To get Device Key. This routine gets Device Key entry.

Implements rm_ble_mesh_access_api_t::getDeviceKey.

Example:

```
/* Get Device Key. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKey(&g_ble_mesh_access0_ctrl, dev_key_index,
p_dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys()

fsp_err_t RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys (rm_ble_mesh_access_ctrl_t *const *p_ctrl*)

To remove all Device Keys. This routine removes all Device Keys from table.

Implements rm_ble_mesh_access_api_t::removeAllDeviceKeys.

Example:

```
/* Remove all Device Keys. */
   err = RM_BLE_MESH_ACCESS_RemoveAllDeviceKeys(&g_ble_mesh_access0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetProvisionedDeviceList()

fsp_err_t RM_BLE_MESH_ACCESS_GetProvisionedDeviceList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_provisioned_device_entry_t const *const *p_prov_dev_list*, uint16_t *const *p_num_entries*)

To get list of Provisioned Device List. This routine returns list of Provisioned Devices from the Device Key Table.

Implements rm_ble_mesh_access_api_t::getProvisionedDeviceList.

Example:

```
/* Get list of provisioned device list. */
   err = RM_BLE_MESH_ACCESS_GetProvisionedDeviceList(&g_ble_mesh_access0_ctrl,
&prov_dev_list, &num_entries);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_dev_list and p_num_entries are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetDeviceKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetDeviceKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *prim_elem_uaddr*, rm_ble_mesh_access_device_key_handle_t *const *p_handle*)

To get device key handle. This routine returns Device Key Handle for a given Primary Element Address entry in Device Key Table.

Implements rm_ble_mesh_access_api_t::getDeviceKeyHandle.

Example:

```
/* Get Device Key handle. */
   err = RM_BLE_MESH_ACCESS_GetDeviceKeyHandle(&g_ble_mesh_access0_ctrl,
prim_elem_uaddr, &handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_appkey_handle_t *appkey_handle*, uint8_t **const *p_app_key*, uint8_t *const *p_aid*)

To get AppKey. This routine gets AppKey along with AID entry.

Implements rm_ble_mesh_access_api_t::getAppKey.

Example:

```
/* Get AppKey. */
   err = RM_BLE_MESH_ACCESS_GetAppKey(&g_ble_mesh_access0_ctrl, appkey_handle,
p_app_key, &aid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key and p_aid are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddUpdateNetkey()

fsp_err_t RM_BLE_MESH_ACCESS_AddUpdateNetkey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, uint32_t *opcode*, uint8_t const *const *p_net_key*)

To add/update NetKey. This routine adds/updates NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addUpdateNetkey.

Example:

```
/* Add/Update NetKey. */
   err = RM_BLE_MESH_ACCESS_AddUpdateNetkey(&g_ble_mesh_access0_ctrl, netkey_index,
opcode, &net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_AddFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_AddFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*, rm_ble_mesh_access_friend_security_credential_info_t *info*)

To add Security Credential of a LPN or the Friend. This routine adds NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::addFriendSecurityCredential.

Example:

```
/* Add security credential of a LPN or the friend. */
   err =
RM_BLE_MESH_ACCESS_AddFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index, info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *friend_index*)

To delete the Security Credential of a LPN or the Friend. This routine deletes NID, privacy and encryption keys associated with a friendship.

Implements rm_ble_mesh_access_api_t::deleteFriendSecurityCredential.

Example:

```
/* Delete the security credential of a LPN or the Friend. */
   err = RM_BLE_MESH_ACCESS_DeleteFriendSecurityCredential(&g_ble_mesh_access0_ctrl,
subnet_handle, friend_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_FindSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *netkey_index*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*)

To find a Subnet associated with the NetKey. This routine finds a Subnet based on the NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::findSubnet.

Example:

```
/* Find a subnet associated with the NetKey. */
   err = RM_BLE_MESH_ACCESS_FindSubnet(&g_ble_mesh_access0_ctrl, netkey_index,
&subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_FindMasterSubnet()

fsp_err_t RM_BLE_MESH_ACCESS_FindMasterSubnet (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *friend_subnet_handle*, rm_ble_mesh_network_subnet_handle_t *const* *p_master_subnet_handle*)

To find the Master Subnet associated with the friend security credential, identified by Friend Subnet Handle. This routine finds the Master Subnet based on the friend security credential, identified by Friend Subnet Handle.

Implements rm_ble_mesh_access_api_t::findMasterSubnet.

Example:

```
/* Close the module. */
   err =
RM_BLE_MESH_ACCESS_FindMasterSubnet(&g_ble_mesh_access0_ctrl, friend_subnet_handle,
&master_subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_master_subnet_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_DeleteNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To delete NetKey. This routine deletes a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteNetKey.

Example:

```
/* Delete NetKey. */
   err = RM_BLE_MESH_ACCESS_DeleteNetKey(&g_ble_mesh_access0_ctrl, subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetNetKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_net_key*)

To get NetKey. This routine fetches a NetKey entry. Each NetKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getNetKey.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_ACCESS_GetNetKey(&g_ble_mesh_access0_ctrl, subnet_handle,
&net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_net_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetNetKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetNetKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_netkey_count*, uint16_t *const *p_netkey_index_list*)

To get list of all known NetKeys. This routine returns a list of known NetKey Indices.

Implements rm_ble_mesh_access_api_t::getNetKeyIndexList.

Example:

```
/* Get list of all known NetKeys. */
   err = RM_BLE_MESH_ACCESS_GetNetKeyIndexList(&g_ble_mesh_access0_ctrl,
&netkey_count, &netkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_netkey_count and p_netkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_LookUpNid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *nid*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for NID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNid.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t const *const *p_network_id*, rm_ble_mesh_network_subnet_handle_t *const *p_subnet_handle*, rm_ble_mesh_access_associated_keys_t *const *p_key_set*)

To search for Network ID. This routine searches for matching Network ID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpNetworkId.

Example:

```
/* Search for NID. */
   err = RM_BLE_MESH_ACCESS_LookUpNid(&g_ble_mesh_access0_ctrl, nid, &subnet_handle,
&key_set);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id, p_subnet_handle and p_key_set are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_LookUpAid()

fsp_err_t RM_BLE_MESH_ACCESS_LookUpAid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *aid*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*, uint8_t *const *p_app_key*)

To search for AID. This routine searches for matching NID in subnet table.

Implements rm_ble_mesh_access_api_t::lookUpAid.

Example:

```
/* Search for AID. */
   err = RM_BLE_MESH_ACCESS_LookUpAid(&g_ble_mesh_access0_ctrl, aid, &appkey_handle,
&app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle and p_app_key are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_SetProvisioningData()

fsp_err_t RM_BLE_MESH_ACCESS_SetProvisioningData (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_data_t const *const *p_prov_data*)

Set Provisioning Data. This routine configures the provisioning data with Access Layer.

Implements rm_ble_mesh_access_api_t::setProvisioningData.

Example:

```
/* Set provisioning data. */
   err = RM_BLE_MESH_ACCESS_SetProvisioningData(&g_ble_mesh_access0_ctrl,
&prov_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_prov_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNid()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNid (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_nid*)

To get NID associated with a subnet. This routine fetches the NID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNid.

Example:

```
/* Get NID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNid(&g_ble_mesh_access0_ctrl, subnet_handle,
&nid);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_nid is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_privacy_key*)

To get Privacy Key associated with a subnet. This routine fetches the Privacy Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetPrivacyKey.

Example:

```
/* Get Privacy Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetPrivacyKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &privacy_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_privacy_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetNetworkId()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetNetworkId (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_network_id*)

To get Network ID associated with a subnet. This routine fetches the Network ID associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetNetworkId.

Example:

```
/* Get Network ID associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetNetworkId(&g_ble_mesh_access0_ctrl,
subnet_handle, &network_id);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_network_id is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetBeaconKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetBeaconKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_beacon_key*)

To get Beacon Key associated with a subnet. This routine fetches the Beacon Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetBeaconKey.

Example:

```
/* Get Beacon Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetBeaconKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &beacon_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_beacon_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetIdentityKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetIdentityKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_identity_key*)

To get Identity Key associated with a subnet. This routine fetches the Identity Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetIdentityKey.

Example:

```
/* Get Identity Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetIdentityKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &identity_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_identity_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey()

fsp_err_t RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *handle*, uint8_t *const *p_encrypt_key*)

To get Encryption Key associated with a subnet. This routine fetches the Encryption Key associated with a subnet.

Implements rm_ble_mesh_access_api_t::getSubnetEncryptionKey.

Example:

```
/* Get Encryption Key associated with a subnet. */
   err = RM_BLE_MESH_ACCESS_GetSubnetEncryptionKey(&g_ble_mesh_access0_ctrl,
subnet_handle, &encrypt_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_encrypt_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_GetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To get Node Identity. This routine gets Node Identity State of a node

Implements rm_ble_mesh_access_api_t::getNodeIdentity.

Example:

```
/* Get node identity. */
   err = RM_BLE_MESH_ACCESS_GetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetNodeIdentity()

fsp_err_t RM_BLE_MESH_ACCESS_SetNodeIdentity (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_id_state*)

To set Node Identity. This routine sets Node Identity State of a node.

Implements rm_ble_mesh_access_api_t::setNodeIdentity.

Example:

```
/* Set node identity. */
   err = RM_BLE_MESH_ACCESS_SetNodeIdentity(&g_ble_mesh_access0_ctrl, subnet_handle,
&id_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_id_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_GetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *const *p_key_refresh_state*)

To get Key Refresh Phase. This routine gets Key Refresh Phase State of a node

Implements rm_ble_mesh_access_api_t::getKeyRefreshPhase.

Example:

```
/* Get key refresh phase. */
   err = RM_BLE_MESH_ACCESS_GetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetKeyRefreshPhase()

fsp_err_t RM_BLE_MESH_ACCESS_SetKeyRefreshPhase (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t const *const *p_key_refresh_state*)

To set Key Refresh Phase. This routine sets Key Refresh Phase State of a node.

Implements rm_ble_mesh_access_api_t::setKeyRefreshPhase.

Example:

```
/* Set key refresh phase. */
   err = RM_BLE_MESH_ACCESS_SetKeyRefreshPhase(&g_ble_mesh_access0_ctrl,
subnet_handle, &key_refresh_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key_refresh_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_SetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *tx_state*)

To set Network/Relay Transmit state. This routine sets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::setTransmitState.

Example:

```
/* Set network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_SetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_GetTransmitState()

fsp_err_t RM_BLE_MESH_ACCESS_GetTransmitState (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint8_t *tx_state_type*, uint8_t *const *p_tx_state*)

To get Network/Relay Transmit state. This routine gets Network/Relay Transmit state.

Implements rm_ble_mesh_access_api_t::getTransmitState.

Example:

```
/* Get network/relay transmit state. */
   err = RM_BLE_MESH_ACCESS_GetTransmitState(&g_ble_mesh_access0_ctrl,
tx_state_type, &tx_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_tx_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_AddAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_AddAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To add AppKey. This routine adds AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::addAppKey.

Example:

```
/* Add AppKey. */
   err = RM_BLE_MESH_ACCESS_AddAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_UpdateAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UpdateAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To update AppKey. This routine updates AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::updateAppKey.

Example:

```
/* Update AppKey. */
   err = RM_BLE_MESH_ACCESS_UpdateAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*)

To delete AppKey. This routine deletes AppKey entry. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::deleteAppKey.

Example:

```
/* Delete AppKey. */
   err = RM_BLE_MESH_ACCESS_DeleteAppKey(&g_ble_mesh_access0_ctrl, subnet_handle,
appkey_index, &app_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_app_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetAppKeyHandle()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyHandle (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *appkey_index*, uint8_t const *const *p_app_key*, rm_ble_mesh_network_appkey_handle_t *const *p_appkey_handle*)

To get AppKey Handle for a given AppKey Index. This routine gets AppKey Handle for a given AppKey Index. Each AppKey is associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyHandle.

Example:

```
/* Get AppKey handle for a given AppKey index. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyHandle(&g_ble_mesh_access0_ctrl,
                                            subnet_handle,
                                            appkey_index,
                                            &app_key,
                                            &appkey_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAppKeyIndexList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAppKeyIndexList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all known AppKeys. This routine returns a list of known AppKey Indices associated with a subnet.

Implements rm_ble_mesh_access_api_t::getAppKeyIndexList.

Example:

```
/* Get list of all known AppKeys. */
   err = RM_BLE_MESH_ACCESS_GetAppKeyIndexList(&g_ble_mesh_access0_ctrl,
                                               subnet_handle,
                                                &appkey_count,
                                                &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_BindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_BindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To bind a model with an AppKey. This routine binds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::bindModelWithAppKey.

Example:

```
/* Bind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_BindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_UnbindModelWithAppKey()

fsp_err_t RM_BLE_MESH_ACCESS_UnbindModelWithAppKey (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *appkey_index*)

To unbind a model with an AppKey. This routine unbinds a model with an AppKey.

Implements rm_ble_mesh_access_api_t::unbindModelWithAppKey.

Example:

```
/* Unbind a model with an AppKey. */
   err = RM_BLE_MESH_ACCESS_UnbindModelWithAppKey(&g_ble_mesh_access0_ctrl,
model_handle, appkey_index);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelAppKeyList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelAppKeyList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_appkey_count*, uint16_t *const *p_appkey_index_list*)

To get list of all AppKeys associated with a model. This routine returns a list of known AppKey Indices associated with a model.

Implements rm_ble_mesh_access_api_t::getModelAppKeyList.

Example:

```
/* Get list of all AppKeys associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelAppKeyList(&g_ble_mesh_access0_ctrl,
                                               model_handle,
                                               &appkey_count,
                                               &appkey_index_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_appkey_count and p_appkey_index_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To set Publication information associated with a model. This routine sets Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublication.

Example:

```
/* Set publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_SetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor()

fsp_err_t RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint8_t *period_divisor*)

To set Publication Fast Period Divisor information associated with a model. This routine sets Publication Fast Period Divisor information associated with a model.

Implements rm_ble_mesh_access_api_t::setModelPublicationPeriodDivisor.

Example:

```
/* Set publication fast period divisor information associated with a model. */
   err =
RM_BLE_MESH_ACCESS_SetModelPublicationPeriodDivisor(&g_ble_mesh_access0_ctrl,
model_handle, period_divisor);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_GetModelPublication()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelPublication (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_publish_info_t *const *p_publish_info*)

To get Publication information associated with a model. This routine returns Publication information associated with a model.

Implements rm_ble_mesh_access_api_t::getModelPublication.

Example:

```
/* Get publication information associated with a model. */
   err = RM_BLE_MESH_ACCESS_GetModelPublication(&g_ble_mesh_access0_ctrl,
model_handle, &publish_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_publish_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_AddModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_AddModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To add an address to a model subscription list. This routine adds an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::addModelSubscription.

Example:

```
/* Add an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_AddModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_DeleteModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, rm_ble_mesh_access_address_t const *const *p_sub_addr*)

To delete an address to a model subscription list. This routine deletes an address to a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteModelSubscription.

Example:

```
/* Delete an address to a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle, &sub_addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_DeleteAllModelSubscription()

fsp_err_t RM_BLE_MESH_ACCESS_DeleteAllModelSubscription (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*)

To discard a model subscription list. This routine discards a subscription list of a model.

Implements rm_ble_mesh_access_api_t::deleteAllModelSubscription.

Example:

```
/* Discard a model subscription list. */
   err = RM_BLE_MESH_ACCESS_DeleteAllModelSubscription(&g_ble_mesh_access0_ctrl,
model_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *model_handle*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of a model. This routine returns a list of subscription addresses of a model.

Implements rm_ble_mesh_access_api_t::getModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of a model. */
   err = RM_BLE_MESH_ACCESS_GetModelSubscriptionList(&g_ble_mesh_access0_ctrl,
                                                     model_handle,
                                                         &sub_addr_count,
                                                         &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList()

fsp_err_t RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, uint16_t *const *p_sub_addr_count*, uint16_t *const *p_sub_addr_list*)

To get list of subscription addresses of all the models. This routine returns a consolidated list of subscription addresses of all the models.

Implements rm_ble_mesh_access_api_t::getAllModelSubscriptionList.

Example:

```
/* Get list of subscription addresses of all the models. */
   err = RM_BLE_MESH_ACCESS_GetAllModelSubscriptionList(&g_ble_mesh_access0_ctrl,
&sub_addr_count, &sub_addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_sub_addr_count and p_sub_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_ACCESS_IsValidElementAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidElementAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid element address to receive a packet. This routine checks if destination address in a received packet matches with any of the known element address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidElementAddress.

Example:

```
/* Check if valid element address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidElementAddress(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed()

fsp_err_t RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if Fixed Group Address in receive packet to be processed. This routine checks if destination address in a received packet as a Fixed Group Address to be processed.

Implements rm_ble_mesh_access_api_t::isFixedGroupAddressToBeProcessed.

Example:

```
/* Check if fixed group address in receive packet to be processed. */
   err =
RM_BLE_MESH_ACCESS_IsFixedGroupAddressToBeProcessed(&g_ble_mesh_access0_ctrl, addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress()

fsp_err_t RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*)

To check if valid subscription address to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of local or friend device.

Implements rm_ble_mesh_access_api_t::isValidSubscriptionAddress.

Example:

```
/* Check if valid subscription address to receive a packet. */
   err = RM_BLE_MESH_ACCESS_IsValidSubscriptionAddress(&g_ble_mesh_access0_ctrl,
addr);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode()

fsp_err_t RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode (rm_ble_mesh_access_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_iv_update_test_mode_t *mode*)

To set the IV Update Test Mode feature. This routine is used to set the IV Update Test Mode flag.

Implements rm_ble_mesh_access_api_t::enableIvUpdateTestMode.

Example:

```
/* Set the IV update test mode feature. */
   err = RM_BLE_MESH_ACCESS_EnableIvUpdateTestMode(&g_ble_mesh_access0_ctrl, mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_bearer

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_bearer_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer (rm_ble_mesh_bearer).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_bearer0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.

Data Structures

struct	rm_ble_mesh_bearer_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_bearer_instance_ctrl_t

struct rm_ble_mesh_bearer_instance_ctrl_t
RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

Function Documentation

◆ RM_BLE_MESH_BEARER_Open()

fsp_err_t RM_BLE_MESH_BEARER_Open (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_cfg_t const *const *p_cfg*)

Open bearer middleware.

Implements rm_ble_mesh_bearer_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Open(&g_ble_mesh_bearer0_ctrl, &g_ble_mesh_bearer0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.

◆ RM_BLE_MESH_BEARER_Close()

fsp_err_t RM_BLE_MESH_BEARER_Close (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Close bearer middleware. Implements rm_ble_mesh_bearer_api_t::close.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_BEARER_Close(&g_ble_mesh_bearer0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_RegisterInterface()

fsp_err_t RM_BLE_MESH_BEARER_RegisterInterface (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_ntf_callback_result_t(*)(rm_ble_mesh_bearer_ntf_callback_args_t *p_args) *p_callback*)

Register interface with Bearer Layer. This routine registers interface with the Bearer Layer. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerInterface.

Example:

```
/* Register Bearer interface. */
   err = RM_BLE_MESH_BEARER_RegisterInterface(&g_ble_mesh_bearer0_ctrl, brr_type,
rm_ble_mesh_bearer_ntf_callback);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_BEARER_RegisterBeaconHandler()

fsp_err_t RM_BLE_MESH_BEARER_RegisterBeaconHandler (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_beacon_type_t *bcon_type*, void(*)(rm_ble_mesh_bearer_beacon_callback_args_t *p_args) *p_handler*)

Register beacon interface with Bearer Layer. This routine registers interface with the Bearer Layer to process Beacons. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::registerBeaconHandler.

Example:

```
/* Register beacon handler. */
   err = RM_BLE_MESH_BEARER_RegisterBeaconHandler(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON,
                                                  rm_ble_mesh_bearer_beacon_callback
);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_AddBearer()

fsp_err_t RM_BLE_MESH_BEARER_AddBearer (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_info_t const *const *p_brr_info*, rm_ble_mesh_bearer_handle_t *const *p_brr_handle*)

Add a bearer to Bearer Layer. This routine adds a bearer that is setup by the application for use by the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::addBearer.

Example:

```
/* Add Bearer. */
   err = RM_BLE_MESH_BEARER_AddBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_info, &brr_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_info and p_brr_handle are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_RemoveBearer()

fsp_err_t RM_BLE_MESH_BEARER_RemoveBearer (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle*)

Remove a bearer from Bearer Layer. This routine removes a bearer from the Mesh Stack. Bearer Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_bearer_api_t::removeBearer.

Example:

```
/* Remove Bearer. */
   err = RM_BLE_MESH_BEARER_RemoveBearer(&g_ble_mesh_bearer0_ctrl,
RM_BLE_MESH_BEARER_TYPE_BCON, &brr_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_ObserveBeacon()

fsp_err_t RM_BLE_MESH_BEARER_ObserveBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *bcon_type*, uint8_t *enable*)

Observe on/off for the beacon type. This routine sends enables/disables the observation procedure for the given beacon type.

Implements rm_ble_mesh_bearer_api_t::observeBeacon.

Example:

```
/* Observe beacon. */
   err = RM_BLE_MESH_BEARER_ObserveBeacon(&g_ble_mesh_bearer0_ctrl, bcon_type,
enable);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_dev_uuid*, uint16_t *oob_info*, rm_ble_mesh_buffer_t const *const *p_uri*)

API to send unprovisioned device beacon. This routine sends Unprovisioned Device Beacon.

Implements rm_ble_mesh_bearer_api_t::bcastUnprovisionedBeacon.

Example:

```
/* Broadcast unprovisioned beacon. */
   err = RM_BLE_MESH_BEARER_BcastUnprovisionedBeacon(&g_ble_mesh_bearer0_ctrl, type,
&dev_uuid, oob_info, &uri);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_dev_uuid and p_uri are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_BroadcastBeacon()

fsp_err_t RM_BLE_MESH_BEARER_BroadcastBeacon (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_packet*, uint16_t *length*)

API to broadcast a beacon. This routine sends the beacon of given type on Adv and GATT bearers.

Implements rm_ble_mesh_bearer_api_t::broadcastBeacon.

Example:

```
/* Broadcast beacon. */
   err = RM_BLE_MESH_BEARER_BroadcastBeacon(&g_ble_mesh_bearer0_ctrl, type, &packet,
length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_packet is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_StartProxyAdv()

fsp_err_t RM_BLE_MESH_BEARER_StartProxyAdv (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *type*, uint8_t const *const *p_data*, uint16_t *datalen*)

API to send proxy device ADV. This routine sends Proxy Device ADV.

Implements rm_ble_mesh_bearer_api_t::startProxyAdv.

Example:

```
/* Start proxy advertising. */
   err = RM_BLE_MESH_BEARER_StartProxyAdv(&g_ble_mesh_bearer0_ctrl, type, &data,
length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_BEARER_SendPdu()

fsp_err_t RM_BLE_MESH_BEARER_SendPdu (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, rm_ble_mesh_bearer_handle_t const *const *p_brr_handle*, rm_ble_mesh_bearer_type_t *brr_type*, rm_ble_mesh_buffer_t const *const *p_buffer*)

Send a bearer PDU. This routine sends a PDU from the Mesh stack to over the bearer indicated by the bearer handle.

Implements rm_ble_mesh_bearer_api_t::sendPdu.

Example:

```
/* Send common Bearer PDUs. */
   err = RM_BLE_MESH_BEARER_SendPdu(&g_ble_mesh_bearer0_ctrl, &brr_handle,
RM_BLE_MESH_BEARER_TYPE_BCON, &buffer);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_brr_handle and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_BEARER_GetPacketRssi()

fsp_err_t RM_BLE_MESH_BEARER_GetPacketRssi (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t * *p_rssi_value*)

Get the RSSI of current received packet being processed. This routine returns the RSSI value of the received packet in its context when called from the Mesh stack.

Implements rm_ble_mesh_bearer_api_t::getPacketRssi.

Example:

```
/* Get the RSSI of current received packet being processed. */
   err = RM_BLE_MESH_BEARER_GetPacketRssi(&g_ble_mesh_bearer0_ctrl, &rssi_value);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_rssi_value is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_Sleep()

fsp_err_t RM_BLE_MESH_BEARER_Sleep (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*)

Put the bearer to sleep. This routine requests the underlying bearer interface to sleep. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::sleep.

Example:

```
/* Put the bearer to sleep. */
   err = RM_BLE_MESH_BEARER_Sleep(&g_ble_mesh_bearer0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_BEARER_Wakeup()

fsp_err_t RM_BLE_MESH_BEARER_Wakeup (rm_ble_mesh_bearer_ctrl_t *const *p_ctrl*, uint8_t *mode*)

Wakeup the bearer. This routine requests the underlying bearer interface to wakeup. Default bearer interface is that of advertising bearer.

Implements rm_ble_mesh_bearer_api_t::wakeup.

Example:

```
/* Wakeup the bearer. */
   err = RM_BLE_MESH_BEARER_Wakeup(&g_ble_mesh_bearer0_ctrl, mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Bearer Platform module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_bearer_platform

The following build time configurations are defined in fsp_cfg/rm_mesh_bearer_platform_cfg.h:

Configuration	Options	Default	Description
Debug Public Address	Must be a valid device address	FF:FF:FF:50:90:74	Public Address of firmware initial value.
Debug Random Address	Must be a valid device address	FF:FF:FF:FF:FF:FF	Random Address of firmware initial value.
Maximum number of	Value must be an	7	Maximum number of

connections	integer between 1 and 7, and lower than the value defined in ble module.		connections.
Maximum connection data length	Value must be an integer between 27 and 251, and lower than the value defined in ble module.	251	Maximum connection data length.
Maximum advertising data length	Value must be an integer between 31 and 1650, and lower than the value defined in ble module.	1650	Maximum advertising data length.
Maximum advertising set number	Value must be an integer between 1 and 4, and lower than the value defined in ble module.	4	Maximum advertising set number.
Maximum periodic sync set number.	Value must be an integer between 1 and 2, and lower than the value defined in ble module.	2	Maximum periodic sync set number.
Store Security Data	• Disable • Enable	Disable	Store Security Data in DataFlash.
Data Flash Block for Security Data	Value must be an integer between 0 and 7, and lower than the value defined in ble module.	0	Data Flash Block for Security Data Management.
Remote Device Bonding Number	Value must be an integer between 1 and 7, and lower than the value defined in ble module.	7	Number of remote device bonding information.
Connection Event Start Notify	• Disable • Enable	Disable	Set Connection event start notify enable/disable.
Connection Event Close Notify	• Disable • Enable	Disable	Set Connection event close notify enable/disable.
Advertising Event Start Notify	• Disable • Enable	Disable	Set Advertising event start notify enable/disable.
Advertising Event Close Notify	• Disable • Enable	Disable	Set Advertising event close notify enable/disable.

Scanning Event Start Notify	• Disable • Enable	Disable	Set Scanning event start notify enable/disable.
Scanning Event Close Notify	• Disable • Enable	Disable	Set Scanning event close notify enable/disable.
Initiating Event Start Notify	• Disable • Enable	Disable	Set Initiating event start notify enable/disable.
Initiating Event Close Notify	• Disable • Enable	Disable	Set Initiating event close notify enable/disable.
RF Deep Sleep Start Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP start notify enable/disable.
RF Deep Sleep Wakeup Notify	• Disable • Enable	Disable	Set RF_DEEP_SLEEP wakeup notify enable/disable.
Bluetooth dedicated clock	Value must be an integer between 0 and 15, and lower than the value defined in ble module.	6	Load capacitance adjustment.
DC-DC converter	• Disable • Enable	Disable	Set DC-DC converter for RF part.
Slow Clock Source	• Use RF_LOCO • Use External 32.768kHz	Use RF_LOCO	Set slow clock source for RF part.
MCU CLKOUT Port	• P109 • P205	P109	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, Set port of MCU CLKOUT.
MCU CLKOUT Frequency Output	• MCU CLKOUT frequency 32.768kHz • MCU CLKOUT frequency 16.384kHz	MCU CLKOUT frequency 32.768kHz	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set frequency output from CLKOUT of MCU part.
Sleep Clock Accuracy(SCA)	Value must be an integer between 0 and 500, and lower than the value defined in ble module.	250	When MESH_BEARER_PLATFORM_CFG_RF_EXTERNAL_32K_ENABLE = 1, set Sleep Clock Accuracy(SCA) for RF slow clock.
Transmission Power Maximum Value	• max +0dBm • max +4dBm	max +4dBm	Set transmission power maximum value.

Transmission Power Default Value	• High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm) • Mid 0dBm(Transmission Power Maximum Value = +0dBm) / 0dBm(Transmission Power Maximum Value = +4dBm) • Low -18dBm(Transmission Power Maximum Value = +0dBm) / -20dBm(Transmission Power Maximum Value = +4dBm)	High 0dBm(Transmission Power Maximum Value = +0dBm) / +4dBm(Transmission Power Maximum Value = +4dBm)	Set default transmit power. Default transmit power is dependent on the configuration of Maximum transmission power(MESH_BEARER_PLATFORM_CFG_RF_MAX_TX_POW).
CLKOUT_RF Output	• No output • 4MHz output • 2MHz output • 1MHz output	No output	Set CLKOUT_RF output setting.
RF_DEEP_SLEEP Transition	• Disable • Enable	Enable	Set RF_DEEP_SLEEP transition.
MCU Main Clock Frequency	Value must be an integer between 1000 and 20000, and lower than the value defined in ble module.	8000	Set MCU Main Clock Frequency (kHz). Set clock source according to your board environment. HOCO: don't care. / Main Clock: 1000 to 20000 kHz / PLL Circuit: 4000 to 12500 kHz
Code Flash(ROM) Device Data Block	Value must be an integer between -1 and 255, and lower than the value defined in ble module.	255	Device specific data block on Code Flash (ROM).
Device Specific Data Flash Block	Value must be an integer between -1 and 7, and lower than the value defined in ble module.	-1	Device specific data block on E2 Data Flash.

MTU Size Configured	Value must be an integer between 23 and 247, and lower than the value defined in ble module.	247	MTU Size configured by GATT MTU exchange procedure.
Timer Slot Maximum Number	Value must be an integer between 1 and 10, and lower than the value defined in ble module.	10	The maximum number of timer slot.

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Bearer Platform (rm_mesh_bearer_platform).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_mesh_bearer_platform0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Device Address Type	Invalid Device Address Type	0	Select device address type (public : 0, random : 1).
GATT Server Callback Number	Invalid Callback Number	1	Number of GATT server callback.
GATT Client Callback Number	Invalid Callback Number	1	Number of GATT client callback.
Vender Specific Callback	Name Must Be a Valid C Symbol.	NULL	Vendor specific callback function name.

Data Structures

struct	rm_mesh_bearer_platform_instance_ctrl_t
struct	rm_mesh_bearer_platform_extended_cfg_t

Typedefs

typedef void(*	rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr) Callback function for GATT interface event. More...

Enumerations

enum	rm_mesh_bearer_platform_interface_event_t

Data Structure Documentation

◆ rm_mesh_bearer_platform_instance_ctrl_t

struct rm_mesh_bearer_platform_instance_ctrl_t

RM_BLE_MESH_BEARER private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_BEARER_Open() is called.

◆ rm_mesh_bearer_platform_extended_cfg_t

struct rm_mesh_bearer_platform_extended_cfg_t

Bearer port extension for renesas BLE stack.

Typedef Documentation

◆ rm_mesh_bearer_platform_gatt_iface_cb_t

typedef void(* rm_mesh_bearer_platform_gatt_iface_cb_t) (uint8_t event_name, uint8_t event_param, uint16_t conn_hdl, st_ble_dev_addr_t *peer_addr)

Callback function for GATT interface event.

Parameters

event_name	The event defined by rm_mesh_bearer_platform_interface_event_t
event_param	The mode of GATT connection rm_mesh_bearer_platform_gatt_mode_t
conn_hdl	The connection handle
peer_addr	Pointer to the connected device address

Enumeration Type Documentation

◆ rm_mesh_bearer_platform_interface_event_t

enum rm_mesh_bearer_platform_interface_event_t	
GATT Interface Events	
Enumerator	
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_UP	The event GATT Bearer BLE Link Layer connected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DOWN	The event GATT Bearer BLE Link Layer disconnected
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_ENABLE	The event GATT Bearer service enabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_DISABLE	The event GATT Bearer service disabled for communication
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_NOT_FOUND	The event discovery process is not completed
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_SCAN	The event that connectable device having Mesh GATT Service is found
RM_MESH_BEARER_PLATFORM_INTERFACE_EVENT_CANCEL	The Event GATT/BLE link layer connection creation is canceled

Function Documentation

◆ RM_MESH_BEARER_PLATFORM_Open()

fsp_err_t RM_MESH_BEARER_PLATFORM_Open (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_cfg_t const *const *p_cfg*)

Open Bearer Platform middleware. Initialize underlying BLE Protocol Stack to use as a Mesh Bearer. API to initialize underlying BLE Protocol Stack to use as a Mesh Bearer. Completion of the initialization is notified by the callback function.

Implements rm_mesh_bearer_platform_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_BEARER_PLATFORM_Open(&g_mesh_bearer_platform0_ctrl,
&g_mesh_bearer_platform0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_BEARER_PLATFORM_Close()

fsp_err_t RM_MESH_BEARER_PLATFORM_Close (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Close Bearer Platform middleware. Terminate BLE stack.

Implements rm_mesh_bearer_platform_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_BEARER_PLATFORM_Close(&g_mesh_bearer_platform0_ctrl);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Setup()

fsp_err_t RM_MESH_BEARER_PLATFORM_Setup (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*)

Register ADV bearer with Mesh stack and start scan. API to register ADV bearer with Mesh stack. After registering, this routine starts Scan.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_CallbackSet()

fsp_err_t RM_MESH_BEARER_PLATFORM_CallbackSet (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_iface_cb_t *callback*)

Register callback function to receive GATT interface events. API to register callback function to receive GATT interface events.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	callback	Callback function.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Set GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_GetGattMode()

fsp_err_t RM_MESH_BEARER_PLATFORM_GetGattMode (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_gatt_mode_t * *p_mode*)

Get current GATT Bearer mode.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	p_mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_mode is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_SetScanResponseData()

fsp_err_t RM_MESH_BEARER_PLATFORM_SetScanResponseData (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_data*, uint8_t *len*)

Set scan response data in connectable and scannable undirected advertising event. API to Set Scan Response Data in Connectable and scannable undirected Advertising event. Scan Response Data can be used for indicating additional information such as << Complete Local Name>>.

Implements rm_mesh_bearer_platform_api_t::setScanResponseData.

Example:

```
 /* Set scan response data in connectable and scannable undirected advertising
event.. */
    err = RM_MESH_BEARER_PLATFORM_SetScanResponseData(&g_mesh_bearer_platform0_ctrl,
&data, length);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ScanGattBearer()

fsp_err_t RM_MESH_BEARER_PLATFORM_ScanGattBearer (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Manage reporting connectable device having Mesh GATT service. API to manage reporting connectable device having Mesh GATT service.

Parameters

[in]	p_ctrl	rm_mesh_bearer_platform control block.
[in]	state	Notification configuration flag; enable if RM_MESH_BEARER_PLATFORM_STATE_ENABLE, or disable if RM_MESH_BEARER_PLATFORM_STATE_DISABLE.
[in]	mode	GATT interface mode, either RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION or RM_MESH_BEARER_PLATFORM_GATT_MODE_PROXY.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_BEARER_PLATFORM_Connect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Connect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint8_t * *p_remote_address*, uint8_t *address_type*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Request to create connection. API to request to Create Connection. Completion of the establishing a connection is notified by RM_BLE_MESH_BEARER_IFACE_UP. After establishing a connection, RM_MESH_BEARER_PLATFORM_DiscoverService() is invoked automatically.

Implements rm_mesh_bearer_platform_api_t::connect.

Example:

```
/* Request to create connection. */
   err = RM_MESH_BEARER_PLATFORM_Connect(&g_mesh_bearer_platform0_ctrl,
                                         &remote_address,
                                         bearer_address_type,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_remote_address is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_DiscoverService()

fsp_err_t RM_MESH_BEARER_PLATFORM_DiscoverService (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Start service discovery for Mesh GATT service. API to start Service Discovery for Mesh GATT Service. If Mesh GATT Service specified by the "mode" argument, this routine enables Notification of the Mesh GATT Service by invoking RM_MESH_BEARER_PLATFORM_ConfigureNotification().

Implements rm_mesh_bearer_platform_api_t::discoverService.

Example:

```
/* Start service discovery for Mesh GATT service. */
   err = RM_MESH_BEARER_PLATFORM_DiscoverService(&g_mesh_bearer_platform0_ctrl,
                                                 handle,
RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_ConfigureNotification()

fsp_err_t RM_MESH_BEARER_PLATFORM_ConfigureNotification (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*, rm_mesh_bearer_platform_state_t *state*, rm_mesh_bearer_platform_gatt_mode_t *mode*)

Configure GATT notification of Mesh GATT service. API to configure GATT Notification of Mesh GATT Service.

Implements rm_mesh_bearer_platform_api_t::configureNotification.

Example:

```
/* Configure GATT notification of Mesh GATT service. */
   err =
RM_MESH_BEARER_PLATFORM_ConfigureNotification(&g_mesh_bearer_platform0_ctrl,
                                              handle,
 RM_MESH_BEARER_PLATFORM_STATE_ENABLE,
 RM_MESH_BEARER_PLATFORM_GATT_MODE_PROVISION);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_MESH_BEARER_PLATFORM_Disconnect()

fsp_err_t RM_MESH_BEARER_PLATFORM_Disconnect (rm_mesh_bearer_platform_ctrl_t *const *p_ctrl*, uint16_t *handle*)

Terminate Connection. API to terminate connection.

Implements rm_mesh_bearer_platform_api_t::disconnect.

Example:

```
/* Terminate Connection. */
   err = RM_MESH_BEARER_PLATFORM_Disconnect(&g_mesh_bearer_platform0_ctrl, handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_config_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Client (rm_mesh_config_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_clt0	Module name.

Data Structures

struct	rm_mesh_config_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_clt_instance_ctrl_t

struct rm_mesh_config_clt_instance_ctrl_t
BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_CLT_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_CLT_Open()

fsp_err_t RM_MESH_CONFIG_CLT_Open (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_config_client_cfg_t const *const *p_cfg*)

Open Configuration Client middleware. This is to initialize Configuration Client model and to register with Access layer.

Implements rm_ble_mesh_config_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_CLT_Open(&g_mesh_config_clt0_ctrl, &g_mesh_config_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_CLT_Close()

fsp_err_t RM_MESH_CONFIG_CLT_Close (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Close Configuration Client middleware.

Implements rm_ble_mesh_config_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_CLT_Close(&g_mesh_config_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_CLT_SetServer()

fsp_err_t RM_MESH_CONFIG_CLT_SetServer (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *server_addr*, uint8_t * *p_dev_key*)

This is to sets the information about server which is to be configured.

Implements rm_ble_mesh_config_client_api_t::setServer.

Example:

```
/* Sets the information about server which is to be configured. */
   err = RM_MESH_CONFIG_CLT_SetServer(&g_mesh_config_clt0_ctrl, server_addr,
&dev_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.

◆ RM_MESH_CONFIG_CLT_SendReliablePdu()

fsp_err_t RM_MESH_CONFIG_CLT_SendReliablePdu (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_config_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_CONFIG_CLT_SendReliablePdu(&g_mesh_config_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconGet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Beacon Get is an acknowledged message used to get the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_BeaconSet()

fsp_err_t RM_MESH_CONFIG_CLT_BeaconSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Beacon Set is an acknowledged message used to set the current Secure Network Beacon state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_beacon_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_CompositionDataGet()

fsp_err_t RM_MESH_CONFIG_CLT_CompositionDataGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Composition Data Get is an acknowledged message used to read one page of the Composition Data.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_composition_data_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlGet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

Config Default TTL Get is an acknowledged message used to get the current Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_DefaultTtlSet()

fsp_err_t RM_MESH_CONFIG_CLT_DefaultTtlSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Default TTL Set is an acknowledged message used to set the Default TTL state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_default_ttl_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxyGet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config GATT Proxy Get is an acknowledged message used to get the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_GattProxySet()

fsp_err_t RM_MESH_CONFIG_CLT_GattProxySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config GATT Proxy Set is an acknowledged message used to set the GATT Proxy state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_gatt_proxy_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelayGet()

fsp_err_t RM_MESH_CONFIG_CLT_RelayGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Relay Get is an acknowledged message used to get the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_RelaySet()

fsp_err_t RM_MESH_CONFIG_CLT_RelaySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Relay Set is an acknowledged message used to set the current Relay and Relay Retransmit states of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_relay_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Get is an acknowledged message used to get the publish address and parameters of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet()

fsp_err_t RM_MESH_CONFIG_CLT_ModelPublicationVaddrSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Publication Set is an acknowledged message used to set the Model Publication state of an outgoing message that originates from a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_publication_virtual_address_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Add is an acknowledged message used to add an address to a Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete is an acknowledged message used to delete a subscription address from the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionVaddrOverwrite (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Overwrite is an acknowledged message used to discard the Subscription List and add an address to the cleared Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_virtual_address_overwrite_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll()

fsp_err_t RM_MESH_CONFIG_CLT_ModelSubscriptionDeleteAll (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model Subscription Delete All is an acknowledged message used to discard the Subscription List of a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_subscription_delete_all_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for SIG Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model Subscription Get is an acknowledged message used to get the list of subscription addresses of a model within the element. This message is only for Vendor Models.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_subscription_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Add is an acknowledged message used to add a NetKey to a NetKey List on a node. The added NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Update is an acknowledged message used to update a NetKey on a node. The updated NetKey is then used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config NetKey Delete is an acknowledged message used to delete a NetKey on a NetKey List from a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_netkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config NetKey Get is an acknowledged message used to report all NetKeys known to the node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyAdd()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyAdd (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Add is an acknowledged message used to add an AppKey to the AppKey List on a node and bind it to the NetKey identified by NetKeyIndex. The added AppKey can be used by the node only as a pair with the specified NetKey. The AppKey is used to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_add_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyUpdate()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyUpdate (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Update is an acknowledged message used to update an AppKey value on the AppKey List on a node. The updated AppKey is used by the node to authenticate and decrypt messages it receives, as well as authenticate and encrypt messages it sends, as defined by the Key Refresh procedure.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_update_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyDelete()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyDelete (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config AppKey Delete is an acknowledged message used to delete an AppKey from the AppKey List on a node

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_delete_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_AppkeyGet()

fsp_err_t RM_MESH_CONFIG_CLT_AppkeyGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The AppKey Get is an acknowledged message used to report all AppKeys bound to the NetKey.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_appkey_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentityGet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentityGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Get is an acknowledged message used to get the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeIdentitySet()

fsp_err_t RM_MESH_CONFIG_CLT_NodeIdentitySet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Node Identity Set is an acknowledged message used to set the current Node Identity state for a subnet.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_node_id_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppBind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppBind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Bind is an acknowledged message used to bind an AppKey to a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_bind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_ModelAppUnbind()

fsp_err_t RM_MESH_CONFIG_CLT_ModelAppUnbind (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Model App Unbind is an acknowledged message used to remove the binding between an AppKey and a model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_model_app_unbind_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_SigModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_SigModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config SIG Model App Get is an acknowledged message used to request report of all AppKeys bound to the SIG Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_sig_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_VendorModelAppGet()

fsp_err_t RM_MESH_CONFIG_CLT_VendorModelAppGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Vendor Model App Get is an acknowledged message used to request report of all AppKeys bound to the Vendor Model.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_vendor_model_app_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NodeReset()

fsp_err_t RM_MESH_CONFIG_CLT_NodeReset (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Node Reset is an acknowledged message used to reset a node (other than a Provisioner) and remove it from the network.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendGet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Friend Get is an acknowledged message used to get the current Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_FriendSet()

fsp_err_t RM_MESH_CONFIG_CLT_FriendSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Friend Set is an acknowledged message used to set the Friend state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_friend_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Get is an acknowledged message used to get the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet()

fsp_err_t RM_MESH_CONFIG_CLT_KeyrefreshPhaseSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Key Refresh Phase Set is an acknowledged message used to set the current Key Refresh Phase state of the identified network key.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_key_refresh_phase_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Publication Get is an acknowledged message used to get the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatPublicationSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatPublicationSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Publication state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_publication_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Heartbeat Subscription Get is an acknowledged message used to get the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet()

fsp_err_t RM_MESH_CONFIG_CLT_HeartbeatSubscriptionSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Heartbeat Publication Set is an acknowledged message used to set the current Heartbeat Subscription state of an element.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_heartbeat_subscription_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_LpnPolltimeoutGet()

fsp_err_t RM_MESH_CONFIG_CLT_LpnPolltimeoutGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Low Power Node PollTimeout Get is an acknowledged message used to get the current value of PollTimeout timer of the Low Power node within a Friend node. The message is sent to a Friend node that has claimed to be handling messages by sending ACKs On Behalf Of (OBO) the indicated Low Power node. This message should only be sent to a node that has the Friend feature supported and enabled.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_low_power_node_polling_timeout_get_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitGet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitGet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*)

The Config Network Transmit Get is an acknowledged message used to get the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_CONFIG_CLT_NetworkTransmitSet()

fsp_err_t RM_MESH_CONFIG_CLT_NetworkTransmitSet (rm_ble_mesh_config_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Config Network Transmit Set is an acknowledged message used to set the current Network Transmit state of a node.

Parameters

[in]	p_ctrl	rm_mesh_config_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_config_clt_network_transmit_set_parameter_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Config Server (rm_mesh_config_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Config Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_config_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_config_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Config Server (rm_mesh_config_srv).

Configuration	Options	Default	Description
Interrupts			
Callback	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh config client ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_config_srv0	Module name.

Data Structures

struct	rm_mesh_config_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_config_srv_instance_ctrl_t

struct rm_mesh_config_srv_instance_ctrl_t

BLE mesh config instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_CONFIG_SRV_Open() is called.

Function Documentation

◆ RM_MESH_CONFIG_SRV_Open()

fsp_err_t RM_MESH_CONFIG_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize configuration server model. This is to initialize configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_CONFIG_SRV_Open(&g_mesh_config_srv0_ctrl, &g_mesh_config_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_CONFIG_SRV_Close()

fsp_err_t RM_MESH_CONFIG_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate configuration server model. This is to terminate configuration server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_CONFIG_SRV_Close(&g_mesh_config_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_CONFIG_SRV_StateUpdate()

fsp_err_t RM_MESH_CONFIG_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_CONFIG_SRV_StateUpdate(&g_mesh_config_srv0_ctrl, &state);
```

Return values

FSP_ERR_UNSUPPORTED	This function is unsupported.

BLE Mesh Network Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Admin Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_admin_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_admin_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Admin Property Server (rm_mesh_generic_admin_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic admin property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_admin_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_admin_prop_srv_info_t

struct	rm_mesh_generic_admin_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_admin_prop_srv_info_t

struct rm_mesh_generic_admin_prop_srv_info_t		
Generic Admin Property is a state representing a device property of an element that can be read or written		
Data Fields		
uint16_t	property_id	Admin Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	Admin User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	Admin Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_admin_prop_srv_instance_ctrl_t

struct rm_mesh_generic_admin_prop_srv_instance_ctrl_t
BLE mesh generic admin prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ADMIN_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Admin_Property Server model. This is to initialize Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_Open(&g_mesh_generic_admin_prop_srv0_ctrl,
&g_mesh_generic_admin_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Admin_Property Server model. This is to terminate Generic_Admin_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ADMIN_PROP_SRV_Close(&g_mesh_generic_admin_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_ADMIN_PROP_SRV_StateUpdate(&g_mesh_generic_admin_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Battery Client (rm_mesh_generic_battery_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Close

	(rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Client (rm_mesh_generic_battery_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_clt0	Module name.

Data Structures

struct	rm_mesh_generic_battery_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_clt_instance_ctrl_t

struct rm_mesh_generic_battery_clt_instance_ctrl_t
BLE mesh generic battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_CLT_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Battery Client middleware. This is to initialize Generic_Battery Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Open(&g_mesh_generic_battery_clt0_ctrl,
&g_mesh_generic_battery_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Battery Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_CLT_Close(&g_mesh_generic_battery_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Battery client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic battery client model. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_GetModelHandle(&g_mesh_generic_battery_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_BATTERY_CLT_SendReliablePdu(&g_mesh_generic_battery_clt0_ctrl,
                                            req_opcode,
                                            p_parameter,
                                            rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_BATTERY_CLT_Get()

fsp_err_t RM_MESH_GENERIC_BATTERY_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Battery Get message is an acknowledged message used to get the Generic Battery state of an element. The response to the Generic Battery Get message is a Generic Battery Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_battery_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Battery Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_battery_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_battery_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Battery Server (rm_mesh_generic_battery_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic battery server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_battery_srv0	Module name.

Data Structures

struct	rm_mesh_generic_battery_srv_info_t
struct	rm_mesh_generic_battery_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_battery_srv_info_t

struct rm_mesh_generic_battery_srv_info_t

Generic Battery state is a set of four values representing the state of a battery

Data Fields		
uint8_t	generic_battery_level	Generic Battery Level state is a value ranging from 0 percent through 100 percent
uint32_t	generic_battery_time_to_discharge	Generic Battery Time to Discharge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint32_t	generic_battery_time_to_charge	Generic Battery Time to Charge state is a 24-bit unsigned value ranging from 0 through 0xFFFFFF
uint8_t	generic_battery_flags	Generic Battery Flags state is a concatenation of four 2-bit bit fields: Presence, Indicator, Charging, and Serviceability

◆ rm_mesh_generic_battery_srv_instance_ctrl_t

struct rm_mesh_generic_battery_srv_instance_ctrl_t
BLE mesh generic_battery instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_BATTERY_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_BATTERY_SRV_Open()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Battery Server model. This is to initialize Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Open(&g_mesh_generic_battery_srv0_ctrl,
&g_mesh_generic_battery_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_BATTERY_SRV_Close()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Battery Server model. This is to terminate Generic_Battery Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_BATTERY_SRV_Close(&g_mesh_generic_battery_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_BATTERY_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_BATTERY_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Client Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_client_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_client_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Client Property Server (rm_mesh_generic_client_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic client property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_client_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_client_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_generic_client_prop_srv_instance_ctrl_t**

struct rm_mesh_generic_client_prop_srv_instance_ctrl_t
BLE mesh generic client prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_CLIENT_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Client_Property Server model. This is to initialize Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_CLIENT_PROP_SRV_Open(&g_mesh_generic_client_prop_srv0_ctrl,
                                              &g_mesh_generic_client_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Client_Property Server model. This is to terminate Generic_Client_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_Close(&g_mesh_generic_client_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_CLIENT_PROP_SRV_StateUpdate(&g_mesh_generic_client_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Client (rm_mesh_generic_dtt_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time

			client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_clt0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_clt_instance_ctrl_t

struct rm_mesh_generic_dtt_clt_instance_ctrl_t
BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_CLT_Open()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic Default Transition Time Client middleware. This is to initialize Generic_Default_Transition_Time Client model and to register with Access layer.
Implements rm_ble_mesh_model_client_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_GENERIC_DTT_CLT_Open(&g_mesh_generic_dtt_clt0_ctrl, &g_mesh_generic_dtt_clt0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Close()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic Default Transition Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_CLT_Close(&g_mesh_generic_dtt_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Default_Transition_Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic default transition time client model. */
   err = RM_MESH_GENERIC_DTT_CLT_GetModelHandle(&g_mesh_generic_dtt_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_DTT_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_DTT_CLT_SendReliablePdu(&g_mesh_generic_dtt_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Get()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Default Transition Time Get is an acknowledged message used to get the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Get message is a Generic Default Transition Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_Set()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set is an acknowledged message used to set the Generic Default Transition Time state of an element. The response to the Generic Default Transition Time Set message is a Generic Default Transition Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_DTT_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Default Transition Time Set Unacknowledged is an unacknowledged message used to set the Generic Default Transition Time state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_clt control block.
[in]	p_parameter	Pointer to transition time.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_DTT_SRV_GetTime

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_mesh_generic_dtt_srv_transtion_time_info_t *const p_info)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Default Transition Time Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_dtt_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_dtt_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Default Transition Time Server (rm_mesh_generic_dtt_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Tmeout Occurs	Name must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic default transition time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_dtt_srv0	Module name.

Data Structures

struct	rm_mesh_generic_dtt_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_dtt_srv_instance_ctrl_t

struct rm_mesh_generic_dtt_srv_instance_ctrl_t
BLE mesh generic dtt instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_DTT_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_DTT_SRV_Open()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Default_Transition_Time Server model. This is to initialize Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Open(&g_mesh_generic_dtt_srv0_ctrl,
&g_mesh_generic_dtt_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_DTT_SRV_Close()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Default_Transition_Time Server model. This is to terminate Generic_Default_Transition_Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_DTT_SRV_Close(&g_mesh_generic_dtt_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_DTT_SRV_GetTime()

fsp_err_t RM_MESH_GENERIC_DTT_SRV_GetTime (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_generic_dtt_srv_transtion_time_info_t *const *p_info*)

API to get default transition time. This is to get default transition time.

Parameters

[in]	p_ctrl	rm_mesh_generic_dtt_srv control block.
[in]	p_info	rm_mesh_generic_dtt_srv status information.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.

BLE Mesh Network Generic Level Client (rm_mesh_generic_level_clt)

fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Client (rm_mesh_generic_level_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_clt0	Module name.

Data Structures

struct	rm_mesh_generic_level_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_clt_instance_ctrl_t

struct rm_mesh_generic_level_clt_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Level Client middleware. This is to initialize Generic_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Open(&g_mesh_generic_level_clt0_ctrl,
&g_mesh_generic_level_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_CLT_Close(&g_mesh_generic_level_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Level client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle().

Example:

```
/* Get the handle of generic level client model. */
   err = RM_MESH_GENERIC_LEVEL_CLT_GetModelHandle(&g_mesh_generic_level_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_LEVEL_CLT_SendReliablePdu(&g_mesh_generic_level_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Get()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Level Get is an acknowledged message used to get the Generic Level state of an element. The response to the Generic Level Get message is a Generic Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_Set()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set is an acknowledged message used to set the Generic Level state of an element to a new absolute value. The response to the Generic Level Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Level Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element to a new absolute value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set is an acknowledged message used to set the Generic Level state of an element by a relative value. The message is transactional, it supports changing the state by a cumulative value with a sequence of messages that are part of a transaction. The response to the Generic Delta Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_DeltaSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Delta Set Unacknowledged is an unacknowledged message used to set the Generic Level state of an element by a relative value.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSet()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set is an acknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed. The response to the Generic Move Set message is a Generic Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LEVEL_CLT_MoveSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Move Set Unacknowledged is an unacknowledged message used to start a process of changing the Generic Level state of an element with a defined transition speed.

Parameters

[in]	p_ctrl	rm_mesh_generic_level_clt control block.
[in]	p_parameter	Pointer to Generic Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Target Devices

The BLE Mesh Network Generic Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_level_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_level_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Level Server (rm_mesh_generic_level_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided Shen Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_level_srv0	Module name.

Data Structures

struct	rm_mesh_generic_level_srv_info_t
struct	rm_mesh_generic_level_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_level_srv_info_t

struct rm_mesh_generic_level_srv_info_t		
Generic Level state is a 16-bit signed integer (2-s complement) representing the state of an element		
Data Fields		
uint16_t	level	Generic Level
uint32_t	delta_level	Delta Level
uint16_t	move_level	Move Level
uint8_t	tid	
uint8_t	transition_time	
uint8_t	delay	
uint16_t	target_level	Target Level

◆ rm_mesh_generic_level_srv_instance_ctrl_t

struct rm_mesh_generic_level_srv_instance_ctrl_t
BLE mesh generic level instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LEVEL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LEVEL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Level Server model. This is to initialize Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Open(&g_mesh_generic_level_srv0_ctrl,
&g_mesh_generic_level_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LEVEL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Level Server model. This is to terminate Generic_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LEVEL_SRV_Close(&g_mesh_generic_level_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LEVEL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LEVEL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_BATTERY_SRV_StateUpdate(&g_mesh_generic_battery_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_loc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_loc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic

Location Client (rm_mesh_generic_loc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Location Client (rm_mesh_generic_loc_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic location client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_loc_clt0	Module name.

Data Structures

struct	rm_mesh_generic_loc_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_loc_clt_instance_ctrl_t

struct rm_mesh_generic_loc_clt_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_CLT_Open()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Location Client middleware. This is to initialize Generic_Location Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Open(&g_mesh_generic_loc_clt0_ctrl,
&g_mesh_generic_loc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_CLT_Close()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Location Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_CLT_Close(&g_mesh_generic_loc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Location client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic_location client model. */
   err = RM_MESH_GENERIC_LOC_CLT_GetModelHandle(&g_mesh_generic_loc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_LOC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands */
   err = RM_MESH_GENERIC_LOC_CLT_SendReliablePdu(&g_mesh_generic_loc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Global Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Global Get message is a Generic Location Global Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Global Set message is a Generic Location Global Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationGlobalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Global Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Global Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalGet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Location Local Get message is an acknowledged message used to get the selected fields of the Generic Location state of an element. The response to the Generic Location Local Get message is a Generic Location Local Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSet()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set is an acknowledged message used to set the selected fields of the Generic Location state of an element. The response to the Generic Location Local Set message is a Generic Location Local Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_LOC_CLT_LocationLocalSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Location Local Set Unacknowledged is an unacknowledged message used to set the selected fields of the Generic Location state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_clt control block.
[in]	p_parameter	Pointer to Generic Location Local Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

struct	rm_mesh_generic_loc_srv_local_info_t

struct	rm_mesh_generic_loc_srv_state_info_t
struct	rm_mesh_generic_loc_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_loc_srv_global_info_t

struct rm_mesh_generic_loc_srv_global_info_t		
Generic Global Location state defines location information of an element		
Data Fields		
uint32_t	global_latitude	Global Coordinates (Latitude)
uint32_t	global_longitude	Global Coordinates (Longitude)
uint16_t	global_altitude	Global Altitude

◆ rm_mesh_generic_loc_srv_local_info_t

struct rm_mesh_generic_loc_srv_local_info_t		
Generic Local Location state defines location information of an element		
Data Fields		
uint16_t	local_north	Local Coordinates (North)
uint16_t	local_east	Local Coordinates (East)
uint16_t	local_altitude	Local Altitude
uint8_t	floor_number	Floor Number
uint16_t	uncertainty	Uncertainty

◆ rm_mesh_generic_loc_srv_state_info_t

struct rm_mesh_generic_loc_srv_state_info_t		
Generic Location state is a composite state that includes a Generic Location Global state and a Generic Location Local state		
Data Fields		
rm_mesh_generic_loc_srv_global_info_t	global_location	Global Location
rm_mesh_generic_loc_srv_local_info_t	local_location	Local Location

◆ rm_mesh_generic_loc_srv_instance_ctrl_t

struct rm_mesh_generic_loc_srv_instance_ctrl_t
BLE mesh generic loc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_LOC_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_LOC_SRV_Open()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Location Server model and to initialize Generic_Location_Setup Server model. This is to initialize Generic_Location Server model and to register with Access layer. And this is to initialize Generic_Location_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Open(&g_mesh_generic_loc_srv0_ctrl,
&g_mesh_generic_loc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_LOC_SRV_Close()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Location Server model. This is to terminate Generic_Location Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_LOC_SRV_Close(&g_mesh_generic_loc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_LOC_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_LOC_SRV_StateUpdate(&g_mesh_generic_loc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_LOC_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_loc_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Data Structure Documentation

◆ rm_mesh_generic_mfr_prop_srv_info_t

struct rm_mesh_generic_mfr_prop_srv_info_t		
Generic Manufacturer Property is a state representing a device property of an element that is programmed by a manufacturer and can be read		
Data Fields		
uint16_t	property_id	Manufacturer Property ID field is a 2-octet Assigned Number value that references a device property
uint8_t	user_access	Manufacturer User Access field is an enumeration indicating whether or not the device property can be read as a Generic User Property
uint8_t *	property_value	Manufacturer Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_mfr_prop_srv_instance_ctrl_t

struct rm_mesh_generic_mfr_prop_srv_instance_ctrl_t
BLE mesh generic mfr prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_MFR_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Manufacturer_Property Server model. This is to initialize Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Open(&g_mesh_generic_mfr_prop_srv0_ctrl,
&g_mesh_generic_mfr_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Manufacturer_Property Server model. This is to terminate Generic_Manufacturer_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_MFR_PROP_SRV_Close(&g_mesh_generic_mfr_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_MFR_PROP_SRV_StateUpdate(&g_mesh_generic_mfr_prop_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic On Off Client (rm_mesh_generic_on_off_clt)

Modules » Networking » BLE Mesh Network Modules

fsp_err_t	RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Client (rm_mesh_generic_on_off_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off client ISR occurs

Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_clt0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_clt_instance_ctrl_t

struct rm_mesh_generic_on_off_clt_instance_ctrl_t

BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_CLT_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Onoff Client middleware. This is to initialize Generic_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Open(&g_mesh_generic_on_off_clt0_ctrl,
&g_mesh_generic_on_off_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_Close(&g_mesh_generic_on_off_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic on_off client model. */
   err = RM_MESH_GENERIC_ON_OFF_CLT_GetModelHandle(&g_mesh_generic_on_off_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_GENERIC_ON_OFF_CLT_SendReliablePdu(&g_mesh_generic_on_off_clt0_ctrl,
                                           req_opcode,
                                           p_parameter,
                                           rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Get()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Generic OnOff Get is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_Set()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an acknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_ON_OFF_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic OnOff Set is an unacknowledged message used to get the Generic OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_on_off_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_generic_on_off_set_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic On Off Server (rm_mesh_generic_on_off_srv)

	(rm_ble_mesh_model_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_on_off_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_on_off_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic On Off Server (rm_mesh_generic_on_off_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server ISR occurs
Callback Provided When an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_on_off_srv0	Module name.

Data Structures

struct	rm_mesh_generic_on_off_srv_info_t
struct	rm_mesh_generic_on_off_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_on_off_srv_info_t

struct rm_mesh_generic_on_off_srv_info_t		
Generic OnOff state is a Boolean value that represents the state of an element		
Data Fields		
uint8_t	onoff	Generic On/Off
uint8_t	target_onoff	Target On/Off - Used in response path
uint8_t	last_onoff	Last On/Off
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_on_off_srv_instance_ctrl_t

struct rm_mesh_generic_on_off_srv_instance_ctrl_t
BLE mesh generic on off instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_ON_OFF_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_ON_OFF_SRV_Open()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Onoff Server model. This is to initialize Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Open(&g_mesh_generic_on_off_srv0_ctrl,
&g_mesh_generic_on_off_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_ON_OFF_SRV_Close()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Onoff Server model. This is to terminate Generic_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_Close(&g_mesh_generic_on_off_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_ON_OFF_SRV_StateUpdate(&g_mesh_generic_on_off_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power Level Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Client (rm_mesh_generic_pl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided When Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_clt0	Module name.

Data Structures

struct	rm_mesh_generic_pl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_pl_clt_instance_ctrl_t

struct rm_mesh_generic_pl_clt_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Level Client middleware. This is to initialize Generic_Power_Level Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_CLT_Open(&g_mesh_generic_pl_clt0_ctrl,
&g_mesh_generic_pl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Level Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_CLT_Close(&g_mesh_generic_pl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Level client model. Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power level client model. */
   err = RM_MESH_GENERIC_PL_CLT_GetModelHandle(&g_mesh_generic_pl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_PL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands. Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PL_CLT_SendReliablePdu(&g_mesh_generic_pl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Level Get message is an acknowledged message used to get the Generic Power Actual state of an element. The response to the Generic Power Level Get message is a Generic Power Level Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set is an acknowledged message used to set the Generic Power Actual state of an element. The response to the Generic Power Level Set message is a Generic Power Level Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LevelSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Level Set Unacknowledged is an unacknowledged message used to set the Generic Power Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Level Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_LastGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Last Get is an acknowledged message used to get the Generic Power Last state of an element. The response to a Generic Power Last Get message is a Generic Power Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Default Get is an acknowledged message used to get the Generic Power Default state of an element. The response to a Generic Power Default Get message is a Generic Power Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set is an acknowledged message used to set the Generic Power Default state of an element. The response to the Generic Power Default Set message is a Generic Power Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Default Set Unacknowledged is an unacknowledged message used to set the Generic Power Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeGet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Power Range Get is an acknowledged message used to get the Generic Power Range state of an element. The response to the Generic Power Range Get message is a Generic Power Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSet()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set is an acknowledged message used to set the Generic Power Range state of an element. The response to the Generic Power Range Set message is a Generic Power Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Power Range Set Unacknowledged is an unacknowledged message used to set the Generic Power Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_clt control block.
[in]	p_parameter	Pointer to Generic Power Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Power Level Server (rm_mesh_generic_pl_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_PL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_PL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power Level Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_pl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_pl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power Level Server (rm_mesh_generic_pl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power level server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_pl_srv0	Module name.

Data Structures

struct	rm_mesh_generic_pl_srv_actual_state_info_t
struct	rm_mesh_generic_pl_srv_last_state_info_t

struct	rm_mesh_generic_pl_srv_default_state_info_t
struct	rm_mesh_generic_pl_srv_range_state_info_t
struct	rm_mesh_generic_pl_srv_state_info_t
struct	rm_mesh_generic_pl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_pl_srv_actual_state_info_t

struct rm_mesh_generic_pl_srv_actual_state_info_t		
Generic Power Actual state determines the linear percentage of the maximum power level of an element, representing a range from 0 percent through 100 percent		
Data Fields		
uint16_t	power_actual	Generic Power Actual
uint8_t	tid	
uint16_t	power_target	Generic Power Target - Used only in response path
uint8_t	transition_time	Transition Time - Used in request path Used as Remaining Time in response path
uint8_t	delay	
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_generic_pl_srv_last_state_info_t

struct rm_mesh_generic_pl_srv_last_state_info_t		
Generic Power Last state is a 16-bit value representing a percentage ranging from (1/65535) percent to 100 percent		
Data Fields		
uint16_t	power_last	Generic Power Last

◆ rm_mesh_generic_pl_srv_default_state_info_t

struct rm_mesh_generic_pl_srv_default_state_info_t		
Generic Power Default state is a 16-bit value ranging from 0 through 65535		
Data Fields		
uint16_t	power_default	Generic Power Default

◆ rm_mesh_generic_pl_srv_range_state_info_t

struct rm_mesh_generic_pl_srv_range_state_info_t

Generic Power Range state determines the minimum and maximum power levels of an element relative to the maximum power level an element can output		
Data Fields		
uint16_t	power_range_min	Generic Power Range - Minimum
uint16_t	power_range_max	Generic Power Range - Maximum
uint8_t	status	Status - Used only in the response path

◆ rm_mesh_generic_pl_srv_state_info_t

struct rm_mesh_generic_pl_srv_state_info_t		
Generic Power Level state is a composite state that includes a Generic Power Actual state, a Generic Power Last state, a Generic Power Default state, and a Generic Power Range state		
Data Fields		
rm_mesh_generic_pl_srv_actual_state_info_t	generic_power_actual	Generic Power Actual
rm_mesh_generic_pl_srv_last_state_info_t	generic_power_last	Generic Power Last
rm_mesh_generic_pl_srv_default_state_info_t	generic_power_default	Generic Power Default
rm_mesh_generic_pl_srv_range_state_info_t	generic_power_range	Generic Power Range

◆ rm_mesh_generic_pl_srv_instance_ctrl_t

struct rm_mesh_generic_pl_srv_instance_ctrl_t
BLE mesh generic pl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PL_SRV_Open()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Level Server model and to initialize Generic_Power_Level_Setup Server model. This is to initialize Generic_Power_Level Server model and to register with Access layer. And this is to initialize Generic_Power_Level_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PL_SRV_Open(&g_mesh_generic_pl_srv0_ctrl,
&g_mesh_generic_pl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PL_SRV_Close()

fsp_err_t RM_MESH_GENERIC_PL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Level Server model. This is to terminate Generic_Power_Level Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PL_SRV_Close(&g_mesh_generic_pl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PL_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_PL_SRV_StateUpdate(&g_mesh_generic_pl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_PL_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_pl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power On Off Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Client (rm_mesh_generic_poo_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off client ISR occurs

Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_clt0	Module name.

Data Structures

struct	rm_mesh_generic_poo_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_clt_instance_ctrl_t

struct rm_mesh_generic_poo_clt_instance_ctrl_t

BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_CLT_Open()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Power_Onoff Client middleware. This is to initialize Generic_Power_Onoff Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_CLT_Open(&g_mesh_generic_poo_clt0_ctrl,
&g_mesh_generic_poo_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_POO_CLT_Close()

fsp_err_t RM_MESH_GENERIC_POO_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Power_Onoff Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_CLT_Close(&g_mesh_generic_poo_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_POO_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Power_Onoff client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic power on off client model. */
   err = RM_MESH_GENERIC_POO_CLT_GetModelHandle(&g_mesh_generic_poo_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_POO_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_POO_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_POO_CLT_SendReliablePdu(&g_mesh_generic_poo_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupGet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic OnPowerUp Get is an acknowledged message used to get the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Get message is a Generic OnPowerUp Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSet()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set is an acknowledged message used to set the Generic OnPowerUp state of an element. The response to the Generic OnPowerUp Set message is a Generic OnPowerUp Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_POO_CLT_OnpowerupSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic OnPowerUp Set Unacknowledged is an unacknowledged message used to set the Generic OnPowerUp state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_clt control block.
[in]	p_parameter	Pointer to Generic OnPowerUp Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Power On Off Server (rm_mesh_generic_poo_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)
fsp_err_t	RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Power On Off Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_poo_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_poo_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Power On Off Server (rm_mesh_generic_poo_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic power on off server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_poo_srv0	Module name.

Data Structures

struct	rm_mesh_generic_poo_srv_on_power_up_state_info_t
struct	rm_mesh_generic_poo_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_poo_srv_on_power_up_state_info_t

struct rm_mesh_generic_poo_srv_on_power_up_state_info_t		
Generic OnPowerUp state is an enumeration representing the behavior of an element when powered up		
Data Fields		
uint8_t	onpowerup	Generic OnPowerUp

◆ rm_mesh_generic_poo_srv_instance_ctrl_t

struct rm_mesh_generic_poo_srv_instance_ctrl_t
BLE mesh generic poo instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_POO_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_POO_SRV_Open()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_Power_Onoff Server model and to initialize Generic_Power_Onoff_Setup Server model. This is to initialize Generic_Power_Onoff Server model and to register with Access layer. And this is to initialize Generic_Power_Onoff_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_POO_SRV_Open(&g_mesh_generic_poo_srv0_ctrl,
&g_mesh_generic_poo_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_POO_SRV_Close()

fsp_err_t RM_MESH_GENERIC_POO_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_Power_Onoff Server model. This is to terminate Generic_Power_Onoff Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_POO_SRV_Close(&g_mesh_generic_poo_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_POO_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_GENERIC_POO_SRV_StateUpdate(&g_mesh_generic_poo_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_GENERIC_POO_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_generic_poo_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic Property Client (rm_mesh_generic_prop_clt)

fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowle

	dged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic Property Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_prop_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_prop_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic Property Client (rm_mesh_generic_prop_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic property client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_prop_clt0	Module name.

Data Structures

struct	rm_mesh_generic_prop_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_generic_prop_clt_instance_ctrl_t**

struct rm_mesh_generic_prop_clt_instance_ctrl_t

BLE mesh generic prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_PROP_CLT_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_PROP_CLT_Open()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Generic_Property Client middleware. This is to initialize Generic_Property Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Open(&g_mesh_generic_prop_clt0_ctrl,
&g_mesh_generic_prop_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_PROP_CLT_Close()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Generic_Property Client middleware. Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_PROP_CLT_Close(&g_mesh_generic_prop_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_PROP_CLT_GetModelHandle()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Generic_Property client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of generic property client model. */
   err = RM_MESH_GENERIC_PROP_CLT_GetModelHandle(&g_mesh_generic_prop_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_GENERIC_PROP_CLT_SendReliablePdu()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_GENERIC_PROP_CLT_SendReliablePdu(&g_mesh_generic_prop_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic User Properties Get is an acknowledged message used to get the list of Generic User Property states of an element. The response to the Generic User Properties Get message is a Generic User Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Get is an acknowledged message used to get the Generic User Property state of an element. The response to the Generic User Property Get message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set is an acknowledged message used to set the Generic User Property state of an element. The response to the Generic User Property Set message is a Generic User Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_UserPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic User Property Set Unacknowledged is an unacknowledged message used to set the Generic User Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic User Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Admin Properties Get is an acknowledged message used to get the list of Generic Admin Property states of an element. The response to the Generic Admin Properties Get message is a Generic Admin Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Get is an acknowledged message used to get the Generic Admin Property state of an element. The response to the Generic Admin Property Get message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set is an acknowledged message used to set the Generic Admin Property state of an element. The response to the Generic Admin Property Set message is a Generic Admin Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_AdminPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Admin Property Set Unacknowledged is an unacknowledged message used to set the Generic Admin Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Admin Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertiesGet (
rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Generic Manufacturer Properties Get is an acknowledged message used to get the list of Generic Manufacturer Property states of an element. The response to the Generic Manufacturer Properties Get message is a Generic Manufacturer Properties Status message. The message has no parameters.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Get is an acknowledged message used to get the Generic Manufacturer Property state of an element. The response to the Generic Manufacturer Property Get message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Manufacturer Property Set is an acknowledged message used to set the Generic Manufacturer Property User Access state of an element. The response to the Generic Manufacturer Property Set message is a Generic Manufacturer Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ManufacturerPropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Generic Manufacturer Property Set Unacknowledged is an unacknowledged message used to set the Generic Manufacturer Property User Access state of an element.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Manufacturer Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet()

fsp_err_t RM_MESH_GENERIC_PROP_CLT_ClientPropertiesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Generic Client Properties Get is an acknowledged message used to get the list of Generic Client Property states of an element. The response to the Generic Client Properties Get message is a Generic Client Properties Status message.

Parameters

[in]	p_ctrl	rm_mesh_generic_prop_clt control block.
[in]	p_parameter	Pointer to Generic Client Properties Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Generic User Property Server (rm_mesh_generic_user_prop_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Generic User Property Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_generic_user_prop_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_generic_user_prop_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Generic User Property Server (rm_mesh_generic_user_prop_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh generic user property server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_generic_user_prop_srv0	Module name.

Data Structures

struct	rm_mesh_generic_user_prop_srv_info_t
struct	rm_mesh_generic_user_prop_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_generic_user_prop_srv_info_t

struct rm_mesh_generic_user_prop_srv_info_t		
Generic User Property is a state representing a device property of an element		
Data Fields		
uint16_t	property_id	User Property ID field is a 2-octet Assigned Number value referencing a device property
uint8_t	user_access	User Access field is an enumeration indicating whether the device property can be read or written as a Generic User Property
uint8_t *	property_value	User Property Value field is a conditional field
uint16_t	property_value_len	

◆ rm_mesh_generic_user_prop_srv_instance_ctrl_t

struct rm_mesh_generic_user_prop_srv_instance_ctrl_t
BLE mesh generic user prop instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_GENERIC_USER_PROP_SRV_Open() is called.

Function Documentation

◆ RM_MESH_GENERIC_USER_PROP_SRV_Open()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Generic_User_Property Server model. This is to initialize Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Open(&g_mesh_generic_user_prop_srv0_ctrl,
&g_mesh_generic_user_prop_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_GENERIC_USER_PROP_SRV_Close()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Generic_User_Property Server model. This is to terminate Generic_User_Property Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_GENERIC_USER_PROP_SRV_Close(&g_mesh_generic_user_prop_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate()

fsp_err_t RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err =
RM_MESH_GENERIC_USER_PROP_SRV_StateUpdate(&g_mesh_generic_user_prop_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Health Client (rm_mesh_health_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_health_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Client (rm_mesh_health_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_clt0	Module name.

Data Structures

struct	rm_mesh_health_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_clt_instance_ctrl_t

struct rm_mesh_health_clt_instance_ctrl_t
BLE mesh health client instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_CLIENT_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_CLIENT_Open()

fsp_err_t RM_MESH_HEALTH_CLIENT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Health Client middleware. This is to initialize Health Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_CLIENT_Open(&g_mesh_health_clt0_ctrl,
&g_mesh_health_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_HEALTH_CLIENT_Close()

fsp_err_t RM_MESH_HEALTH_CLIENT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Health Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_CLIENT_Close(&g_mesh_health_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_CLIENT_GetModelHandle()

fsp_err_t RM_MESH_HEALTH_CLIENT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of health client model. */
   err = RM_MESH_HEALTH_CLIENT_GetModelHandle(&g_mesh_health_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_HEALTH_CLIENT_SendReliablePdu()

fsp_err_t RM_MESH_HEALTH_CLIENT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to set the handle of Health client model.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_HEALTH_CLIENT_SendReliablePdu(&g_mesh_health_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Get is an acknowledged message used to get the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClearUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear Unacknowledged is an unacknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultClear()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultClear (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Clear is an acknowledged message used to clear the current Registered Fault state identified by Company ID of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_get_clear_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTest()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTest (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test is an acknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_FaultTestUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Fault Test Unacknowledged is an unacknowledged message used to invoke a self-test procedure of an element. The procedure is implementation specific and may result in changing the Health Fault state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_fault_test_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Period Get is an acknowledged message used to get the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set Unacknowledged is an unacknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_PeriodSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_PeriodSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Period Set is an acknowledged message used to set the current Health Period state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_period_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionGet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Health Attention Get is an acknowledged message used to get the current Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSet()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set is an acknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged()

fsp_err_t RM_MESH_HEALTH_CLIENT_AttentionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Health Attention Set Unacknowledged is an unacknowledged message used to set the Attention Timer state of an element.

Parameters

[in]	p_ctrl	rm_mesh_health_clt control block.
[in]	p_parameter	Pointer to the structure populated as in rm_mesh_health_clt_attention_info_t.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Health Server (rm_mesh_health_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, rm_ble_mesh_health_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, const rm_ble_mesh_access_model_handle_t *const model_handle, uint8_t test_id, uint16_t company_id, uint8_t fault_code)
fsp_err_t	RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const p_ctrl, uint8_t *status, uint16_t length)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Health Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_health_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_health_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Health Server (rm_mesh_health_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh health server ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_health_srv0	Module name.
Company ID	Invalid Company Id	0	Select company id.
Number of Self Tests	Invalid Number of Self Tests	0	Select number of self tests.
Self Tests	Name Must Be a Valid C Symbol	NULL	Self test

Data Structures

struct	rm_mesh_health_server_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_health_server_instance_ctrl_t

struct rm_mesh_health_server_instance_ctrl_t
BLE mesh health server instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_HEALTH_SERVER_Open() is called.

Function Documentation

◆ RM_MESH_HEALTH_SERVER_Open()

fsp_err_t RM_MESH_HEALTH_SERVER_Open (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_health_server_cfg_t const *const *p_cfg*)

API to initialize Health Server model. This is to initialize Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_HEALTH_SERVER_Open(&g_mesh_health_srv0_ctrl,
&g_mesh_health_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_HEALTH_SERVER_Close()

fsp_err_t RM_MESH_HEALTH_SERVER_Close (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*)

API to terminate Health Server model. This is to terminate Health Server model and to register with Access layer.

Implements rm_ble_mesh_health_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_HEALTH_SERVER_Close(&g_mesh_health_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_HEALTH_SERVER_ReportFault()

fsp_err_t RM_MESH_HEALTH_SERVER_ReportFault (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, const rm_ble_mesh_access_model_handle_t *const *model_handle*, uint8_t *test_id*, uint16_t *company_id*, uint8_t *fault_code*)

API to report self-test fault. This is to report fault observed during self-test procedure.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	model_handle	Model Handle identifying the Health Server model instance.
[in]	test_id	Identifier of the self-test.
[in]	company_id	Company Identifier.
[in]	fault_code	Fault value indicating the error.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_HEALTH_SERVER_PublishCurrentStatus()

fsp_err_t RM_MESH_HEALTH_SERVER_PublishCurrentStatus (rm_ble_mesh_health_server_ctrl_t *const *p_ctrl*, uint8_t * *status*, uint16_t *length*)

API to publish current status.

Parameters

[in]	p_ctrl	rm_mesh_health_srv control block.
[in]	status	Current status.
[in]	length	Length of status.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Control Client (rm_mesh_light_ctl_clt)

fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Control Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Client (rm_mesh_light_ctl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_clt0	Module name.

Data Structures

struct	rm_mesh_light_ctl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_clt_instance_ctrl_t

struct rm_mesh_light_ctl_clt_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Ctl Client middleware. This is to initialize Light_Ctl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Open(&g_mesh_light_ctl_clt0_ctrl,
&g_mesh_light_ctl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Ctl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_CLT_Close(&g_mesh_light_ctl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Ctl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light ctl client model. */
   err = RM_MESH_LIGHT_CTL_CLT_GetModelHandle(&g_mesh_light_ctl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_CTL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_CTL_CLT_SendReliablePdu(&g_mesh_light_ctl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Get is an acknowledged message used to get the Light CTL state of an element. The response to the Light CTL Get message is a Light CTL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set is an acknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Set Unacknowledged is an unacknowledged message used to set the Light CTL Lightness state, Light CTL Temperature state, and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Temperature Get is an acknowledged message used to get the Light CTL Temperature state of an element. The response to the Light CTL Temperature Get message is a Light CTL Temperature Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set is an acknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element. The response to the Light CTL Temperature Set message is a Light CTL Temperature Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Temperature Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature state and the Light CTL Delta UV state of an element

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light CTL Default Get is an acknowledged message used to get the Light CTL Temperature Default and Light CTL Delta UV Default states of an element. The response to the Light CTL Default Get message is a Light CTL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set is an acknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element. The response to the Light CTL Set message is a Light CTL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light CTL Default Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Default state and the Light CTL Delta UV Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light CTL Temperature Range Get is an acknowledged message used to get the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set Unacknowledged is an unacknowledged message used to set the Light CTL Temperature Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_CTL_CLT_TemperatureRangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light CTL Temperature Range Set is an acknowledged message used to set the Light CTL Temperature Range state of an element. The response to the Light CTL Temperature Range Get message is a Light CTL Temperature Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_clt control block.
[in]	p_parameter	Pointer to Light CTL Temperature Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Control Server (rm_mesh_light_ctl_srv)

Modules » Networking » BLE Mesh Network Modules

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Control Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_ctl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_ctl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Control Server (rm_mesh_light_ctl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light control server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_ctl_srv0	Module name.

Data Structures

struct	rm_mesh_light_ctl_srv_info_t

struct	rm_mesh_light_ctl_srv_default_info_t
struct	rm_mesh_light_ctl_srv_temperature_info_t
struct	rm_mesh_light_ctl_srv_temperature_range_info_t
struct	rm_mesh_light_ctl_srv_extended_cfg_t
struct	rm_mesh_light_ctl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_ctl_srv_info_t

struct rm_mesh_light_ctl_srv_info_t		
Light CTL state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	target_ctl_lightness	Target Light CTL Lightness - Used in response path
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Terget Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_ctl_srv_default_info_t

struct rm_mesh_light_ctl_srv_default_info_t		
Light CTL Default state is a composite state that includes the Light CTL Lightness, the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_lightness	Light CTL Lightness
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	ctl_delta_uv	Light CTL Delta UV

◆ rm_mesh_light_ctl_srv_temperature_info_t

struct rm_mesh_light_ctl_srv_temperature_info_t		
Light CTL Temperature state is a composite state that includes the Light CTL Temperature and the Light CTL Delta UV states		
Data Fields		
uint16_t	ctl_temperature	Light CTL Temperature
uint16_t	target_ctl_temperature	Target Light CTL Temperature - Used in response path
uint16_t	ctl_delta_uv	Light CTL Delta UV
uint16_t	target_ctl_delta_uv	Target Light CTL Delta UV - Used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ rm_mesh_light_ctl_srv_temperature_range_info_t

struct rm_mesh_light_ctl_srv_temperature_range_info_t		
Light CTL Temperature Range state determines the minimum and maximum color temperatures of tunable white light an element is capable of emitting		
Data Fields		
uint16_t	ctl_temperature_range_min	CTL Temperature Range Min
uint16_t	ctl_temperature_range_max	CTL Temperature Range Max
uint8_t	status	Status - Used in response path

◆ rm_mesh_light_ctl_srv_extended_cfg_t

struct rm_mesh_light_ctl_srv_extended_cfg_t		
BLE mesh light ctl extension for BLE mesh light ctl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_temperature_access_instance	Pointer to access instance for temperature model.

◆ rm_mesh_light_ctl_srv_instance_ctrl_t

struct rm_mesh_light_ctl_srv_instance_ctrl_t
BLE mesh light ctl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_CTL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_CTL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Ctl Server model and to initialize Light_Ctl_Temperature Server model. This is to initialize Light_Ctl Server model and to register with Access layer. And this is to initialize Light_Ctl_Temperature Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Open(&g_mesh_light_ctl_srv0_ctrl,
&g_mesh_light_ctl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_CTL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Ctl Server model. This is to terminate Light_Ctl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_CTL_SRV_Close(&g_mesh_light_ctl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_CTL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_CTL_SRV_StateUpdate(&g_mesh_light_ctl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_CTL_SRV_TemperatureServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_ctl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Hsl Client (rm_mesh_light_hsl_clt)

fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Client (rm_mesh_light_hsl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_clt0	Module name.

Data Structures

struct	rm_mesh_light_hsl_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_clt_instance_ctrl_t

struct rm_mesh_light_hsl_clt_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Hsl Client middleware. This is to initialize Light_Hsl Client model and to register with Access layer.
 	
Implements rm_ble_mesh_model_client_api_t::open.
 	
Example:
`/* Open the module. */`
`err = RM_MESH_LIGHT_HSL_CLT_Open(&g_mesh_light_hsl_clt0_ctrl, &g_mesh_light_hsl_clt0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Hsl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_CLT_Close(&g_mesh_light_hsl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Hsl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light hsl client model. */
   err = RM_MESH_LIGHT_HSL_CLT_GetModelHandle(&g_mesh_light_hsl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_HSL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_HSL_CLT_SendReliablePdu(&g_mesh_light_hsl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Get is an acknowledged message used to get the Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Get message is a Light HSL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set Unacknowledged is an unacknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Set is an acknowledged message used to set the Light HSL Lightness state, Light HSL Hue state, and the Light HSL Saturation state of an element. The response to the Light HSL Set message is a Light HSL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Target Get is an acknowledged message used to get the target Light HSL Lightness, Light HSL Hue, and Light HSL Saturation states of an element. The response to the Light HSL Target Get message is a Light HSL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light HSL Default Get is an acknowledged message used to get the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Get message is a Light HSL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set is an acknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element. The response to the Light HSL Default Set message is a Light HSL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light HSL Hue Default, and Light HSL Saturation Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Range Get is an acknowledged message used to get the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Get message is a Light HSL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set is an acknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element. The response to the Light HSL Range Set message is a Light HSL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light HSL Range Set Unacknowledged is an unacknowledged message used to set the Light HSL Hue Range and Light HSL Saturation Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Hue Get is an acknowledged message used to get the Light HSL Hue state of an element. The response to the Light HSL Hue Get message is a Light HSL Hue Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set is an acknowledged message used to set the target Light HSL Hue state of an element. The response to the Light HSL Hue Set message is a Light HSL Hue Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_HueSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Hue Set Unacknowledged is an unacknowledged message used to set the target Light HSL Hue state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Hue Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationGet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light HSL Saturation Get is an acknowledged message used to get the Light HSL Saturation state of an element. The response to the Light HSL Saturation Get message is a Light HSL Saturation Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSet()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set is an acknowledged message used to set the target Light HSL Saturation state of an element. The response to the Light HSL Saturation Set message is a Light HSL Saturation Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_HSL_CLT_SaturationSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light HSL Saturation Set Unacknowledged is an unacknowledged message used to set the target Light HSL Saturation state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_clt control block.
[in]	p_parameter	Pointer to Light HSL Saturation Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Hsl Server (rm_mesh_light_hsl_srv)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Hsl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_hsl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_hsl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light HSL Server (rm_mesh_light_hsl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light HSL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_hsl_srv0	Module name.

Data Structures

struct	rm_mesh_light_hsl_srv_info_t

struct	rm_mesh_light_hsl_srv_target_info_t
struct	rm_mesh_light_hsl_srv_default_info_t
struct	rm_mesh_light_hsl_srv_hue_info_t
struct	rm_mesh_light_hsl_srv_saturation_info_t
struct	rm_mesh_light_hsl_srv_range_info_t
struct	rm_mesh_light_hsl_srv_extended_cfg_t
struct	rm_mesh_light_hsl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_hsl_srv_info_t

struct rm_mesh_light_hsl_srv_info_t

Light HSL state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states

Data Fields

uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_hsl_lightness	Target Perceived lightness - used in the response path
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	target_hsl_hue	Target hue - used in the response path
uint16_t	hsl_saturation	The saturation of a color light
uint16_t	target_hsl_saturation	Target saturation - used in the response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_hsl_srv_target_info_t

struct rm_mesh_light_hsl_srv_target_info_t

Light HSL Target state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_default_info_t

struct rm_mesh_light_hsl_srv_default_info_t		
Light HSL Default state is a composite state that includes the Light HSL Lighness, the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hsl_lightness	The perceived lightness of a light emitted by the element
uint16_t	hsl_hue	The 16-bit value representing the hue
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_hue_info_t

struct rm_mesh_light_hsl_srv_hue_info_t		
Light HSL Hue		
Data Fields		
uint16_t	hsl_hue	The 16-bit value representing the hue

◆ rm_mesh_light_hsl_srv_saturation_info_t

struct rm_mesh_light_hsl_srv_saturation_info_t		
Light HSL Saturation		
Data Fields		
uint16_t	hsl_saturation	The saturation of a color light

◆ rm_mesh_light_hsl_srv_range_info_t

struct rm_mesh_light_hsl_srv_range_info_t		
Light HSL Range state is a composite state that includes Minimum and Maximum of the Light HSL Hue and the Light HSL Saturation states		
Data Fields		
uint16_t	hue_range_min	The value of the Hue Range Min field of the Light HSL Hue

		Range state
uint16_t	hue_range_max	The value of the Hue Range Max field of the Light HSL Hue Range state
uint16_t	saturation_range_min	The value of the Saturation Range Min field of the Light HSL Saturation Range state
uint16_t	saturation_range_max	The value of the Saturation Range Max field of the Light HSL Saturation Range state
uint8_t	status	Status - Used only in response path

◆ rm_mesh_light_hsl_srv_extended_cfg_t

struct rm_mesh_light_hsl_srv_extended_cfg_t		
BLE mesh light hsl extension for BLE mesh light hsl.		
Data Fields		
rm_ble_mesh_access_instance_t const *	p_hue_access_instance	Pointer to access instance for hue model.
rm_ble_mesh_access_instance_t const *	p_saturation_access_instance	Pointer to access instance for saturation model.

◆ rm_mesh_light_hsl_srv_instance_ctrl_t

struct rm_mesh_light_hsl_srv_instance_ctrl_t
BLE mesh light hsl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_HSL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_HSL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Hsl Server/Light_Hsl_Hue Server/Light_Hsl_Saturation Server model.

1. This is to initialize Light_Hsl Server model and to register with Access layer.
2. This is to initialize Light_Hsl_Hue Server model and to register with Access layer.
3. This is to initialize Light_Hsl_Saturation Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Open(&g_mesh_light_hsl_srv0_ctrl,
&g_mesh_light_hsl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_HSL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Hsl Server model. This is to terminate Light_Hsl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_HSL_SRV_Close(&g_mesh_light_hsl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_HSL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_HSL_SRV_StateUpdate(&g_mesh_light_hsl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_HueServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_HSL_SRV_SaturationServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_hsl_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Lightness Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Client (rm_mesh_light_lightness_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_clt0	Module name.

Data Structures

struct	rm_mesh_light_lightness_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lightness_clt_instance_ctrl_t

struct rm_mesh_light_lightness_clt_instance_ctrl_t
BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lightness Client middleware. This is to initialize Light_Lightness Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Open(&g_mesh_light_lightness_clt0_ctrl,
&g_mesh_light_lightness_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lightness Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_CLT_Close(&g_mesh_light_lightness_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lightness client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lightness client model. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_GetModelHandle(&g_mesh_light_lightness_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err =
RM_MESH_LIGHT_LIGHTNESS_CLT_SendReliablePdu(&g_mesh_light_lightness_clt0_ctrl,
                                                        req_opcode,
                                                        p_parameter,
                                                        rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Get()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Get is an acknowledged message used to get the Light Lightness Actual state of an element. The response to the Light Lightness Get message is a Light Lightn

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_Set()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set is an acknowledged message used to set the Light Lightness Actual state of an element. The response to the Light Lightness Set message is a Light Lightness Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Set Unacknowledged is an unacknowledged message used to set the Light Lightness Actual state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Linear Get is an acknowledged message used to get the Light Lightness Linear state of an element. The response to the Light Lightness Linear Get message is a Light Lightness Linear Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set is an acknowledged message used to set the Light Lightness Linear state of an element. The response to the Light Lightness Linear Set message is a Light Lightness Linear Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LinearSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Linear Set Unacknowledged is an unacknowledged message used to set the Light Lightness Linear state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Linear Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_LastGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Last Get is an acknowledged message used to get the Light Lightness Last state of an element. The response to the Light Lightness Last Get message is a Light Lightness Last Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light Lightness Default Get is an acknowledged message used to get the Light Lightness Default state of an element. The response to the Light Lightness Default Get message is a Light Lightness Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set is an acknowledged message used to set the Light Lightness Default state of an element. The response to the Light Lightness Default Set message is a Light Lightness Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light Lightness Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light Lightness Range Get is an acknowledged message used to get the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set is an acknowledged message used to set the Light Lightness Range state of an element. The response to the Light Lightness Range Get message is a Light Lightness Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light Lightness Range Set Unacknowledged is an unacknowledged message used to set the Light Lightness Range state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_clt control block.
[in]	p_parameter	Pointer to Light Lightness Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Lightness Server (rm_mesh_light_lightness_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_model_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const p_ctrl)

fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)
fsp_err_t	RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Lightness Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lightness_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lightness_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Server (rm_mesh_light_lightness_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Server (rm_mesh_light_lightness_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lightness_srv0	Module name.

Data Structures

struct	rm_mesh_light_lightness_srv_linear_info_t
struct	rm_mesh_light_lightness_srv_actual_info_t

struct	rm_mesh_light_lightness_srv_last_info_t
struct	rm_mesh_light_lightness_srv_default_info_t
struct	rm_mesh_light_lightness_srv_range_info_t
struct	rm_mesh_light_lightness_srv_info_t
struct	rm_mesh_light_lightness_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lightness_srv_linear_info_t

struct rm_mesh_light_lightness_srv_linear_info_t		
Light Lightness Linear state represents the lightness of a light on a linear scale		
Data Fields		
uint16_t	lightness_linear	Light Lightness Linear
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path

◆ rm_mesh_light_lightness_srv_actual_info_t

struct rm_mesh_light_lightness_srv_actual_info_t		
Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_actual	Light Lightness Actual
uint16_t	lightness_target	Light Lightness Target - Used in response path.
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_lightness_srv_last_info_t

struct rm_mesh_light_lightness_srv_last_info_t		
Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale		
Data Fields		
uint16_t	lightness_last	Light Lightness Last

◆ rm_mesh_light_lightness_srv_default_info_t

struct rm_mesh_light_lightness_srv_default_info_t		
Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state		
Data Fields		
uint16_t	lightness_default	Light Lightness Default

◆ rm_mesh_light_lightness_srv_range_info_t

struct rm_mesh_light_lightness_srv_range_info_t		
Light Lightness Range state determines the minimum and maximum lightness of an element		
Data Fields		
uint16_t	lightness_range_min	Light Lightness Range Min
uint16_t	lightness_range_max	Light Lightness Range Max

◆ rm_mesh_light_lightness_srv_info_t

struct rm_mesh_light_lightness_srv_info_t		
Light Lightness state is a composite state that includes the Light Lightness Linear, the Light Lightness Actual, the Light Lightness Last, and the Light Lightness Default states		
Data Fields		
rm_mesh_light_lightness_srv_linear_info_t	light_lightness_linear	Light Lightness Linear state represents the lightness of a light on a linear scale
rm_mesh_light_lightness_srv_actual_info_t	light_lightness_actual	Light Lightness Actual state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_last_info_t	light_lightness_last	Light Lightness Last state represents the lightness of a light on a perceptually uniform lightness scale
rm_mesh_light_lightness_srv_default_info_t	light_lightness_default	Light Lightness Default state is a value ranging from 0x0000 to 0xFFFF, representing a default lightness level for the Light Lightness Actual state

rm_mesh_light_lightness_srv_range_info_t	light_lightness_range	Light Lightness Range state.
uint8_t	range_status	Status field used only for the Range Status

◆ rm_mesh_light_lightness_srv_instance_ctrl_t

struct rm_mesh_light_lightness_srv_instance_ctrl_t
BLE mesh light lightness instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LIGHTNESS_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Lightness Server model and to initialize Light_Lightness_Setup Server model. This is to initialize Light_Lightness Server model and to register with Access layer. And this is to initialize Light_Lightness_Setup Server model and to register with Access layer. Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Open(&g_mesh_light_lightness_srv0_ctrl,
&g_mesh_light_lightness_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lightness Server model. This is to terminate Light_Lightness Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_Close(&g_mesh_light_lightness_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LIGHTNESS_SRV_StateUpdate(&g_mesh_light_lightness_srv0_ctrl,
&state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_LIGHT_LIGHTNESS_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_light_lightness_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Location Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_lc_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_lc_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light Lightness Controller Client (rm_mesh_light_lc_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light lightness controller client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_lc_clt0	Module name.

Data Structures

struct	rm_mesh_light_lc_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_lc_clt_instance_ctrl_t

struct rm_mesh_light_lc_clt_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_LC_CLT_Open()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Lc Client middleware. This is to initialize Light_Lc Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_CLT_Open(&g_mesh_light_lc_clt0_ctrl,
&g_mesh_light_lc_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_CLT_Close()

fsp_err_t RM_MESH_LIGHT_LC_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Lc Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_CLT_Close(&g_mesh_light_lc_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_LC_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Lc client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light lc client model. */
   err = RM_MESH_LIGHT_LC_CLT_GetModelHandle(&g_mesh_light_lc_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_LC_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_LC_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_LC_CLT_SendReliablePdu(&g_mesh_light_lc_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Mode Get is an acknowledged message used to get the Light LC Mode state of an element. The response to the Light LC Mode Get message is a Light LC Mode Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set is an acknowledged message used to set the Light LC Mode state of an element. The response to the Light LC Mode Set message is a Light LC Mode Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_ModeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Mode Set Unacknowledged is an unacknowledged message used to set the Light LC Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Mode Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC OM Get is an acknowledged message used to get the Light LC Occupancy Mode state of an element. The response to the Light LC OM Get message is a Light LC OM Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set is an acknowledged message used to set the Light LC Occupancy Mode state of an element. The response to the Light LC OM Set message is a Light LC OM Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_OmSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC OM Set Unacknowledged is an unacknowledged message used to set the Light LC Occupancy Mode state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC OM Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light LC Light OnOff Get is an acknowledged message used to get the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Get message is a Light LC Light OnOff Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set is an acknowledged message used to set the Light LC Light OnOff state of an element. The response to the Light LC Light OnOff Set message is a Light LC Light OnOff Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_LightOnOffSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Light OnOff Set Unacknowledged is an unacknowledged message used to set the Light LC Light OnOff state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Light OnOff Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertyGet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertyGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light LC Property Get is an acknowledged message used to get the Light LC Property state of an element. The response to the Light LC Property Get message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySet()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set is an acknowledged message used to set the Light LC Property state of an element. The response to the Light LC Property Set message is a Light LC Property Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_LC_CLT_PropertySetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light LC Property Set Unacknowledged is an unacknowledged message used to set the Light LC Property state of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_lc_clt control block.
[in]	p_parameter	Pointer to Light LC Property Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

rm_ble_mesh_access_model_handle_t *	p_handle	Access model handle.
rm_ble_mesh_light_lc_srv_event_t	event_type	Application events defined for Light LC Server Model.
uint8_t *	p_event_data	Event data.
uint16_t	event_data_length	Event data length.

◆ **rm_mesh_light_lc_srv_instance_ctrl_t**

struct rm_mesh_light_lc_srv_instance_ctrl_t
BLE mesh light lc instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_LC_SRV_Open() is called.

Enumeration Type Documentation

◆ rm_ble_mesh_light_lc_srv_event_t

enum rm_ble_mesh_light_lc_srv_event_t	
Light LC light event	
Enumerator	
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_OFF	Light LC Server Event Off.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_STANDBY	Light LC Server Event Standby.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_ON	Light LC Server Event Fade On.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_RUN	Light LC Server Event Run.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE	Light LC Server Event Fade.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_PROLONG	Light LC Server Event Prolong.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_AUTO	Light LC Server Event Standby Auto.
RM_MESH_LIGHT_LC_SRV_LIGHT_EVENT_FADE_STANDBY_MANUAL	Light LC Server Event Standby Manual.

◆ rm_ble_mesh_light_lc_srv_state_t

enum rm_ble_mesh_light_lc_srv_state_t	
Light LC state	
Enumerator	
RM_MESH_LIGHT_LC_SRV_STATE_OFF	Light LC Server State Off.
RM_MESH_LIGHT_LC_SRV_STATE_STANDBY	Light LC Server State Standby.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_ON	Light LC Server State Fade On.
RM_MESH_LIGHT_LC_SRV_STATE_RUN	Light LC Server State Run.
RM_MESH_LIGHT_LC_SRV_STATE_FADE	Light LC Server State Fade.
RM_MESH_LIGHT_LC_SRV_STATE_PROLONG	Light LC Server State Prolong.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_AUTO	Light LC Server State Standby Auto.
RM_MESH_LIGHT_LC_SRV_STATE_FADE_STANDBY_MANUAL	Light LC Server State Standby Manual.

◆ rm_mesh_light_lc_srv_light_state_t

enum rm_mesh_light_lc_srv_light_state_t	
Light LC light state	
Enumerator	
RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_OFF	Light state Off.
RM_MESH_LIGHT_LC_SRV_LIGHT_STATE_ON	Light state ON.

Function Documentation

◆ RM_MESH_LIGHT_LC_SRV_Open()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Lc Server model. This is to initialize Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_LC_SRV_Open(&g_mesh_light_lc_srv0_ctrl,
&g_mesh_light_lc_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_LC_SRV_Close()

fsp_err_t RM_MESH_LIGHT_LC_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Lc Server model. This is to terminate Light_Lc Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_LC_SRV_Close(&g_mesh_light_lc_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_LC_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_LC_SRV_StateUpdate(&g_mesh_light_lc_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_LC_SRV_SetTimeProperty()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetTimeProperty (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_device_property_t *property*, uint32_t *time_in_ms*)

API to set Light LC Sever Specific Time Properties. This is to update the Light LC Module with any Light Control Time Properties values. Typically these LC Time properties will be needed to be updated or informed to the Light LC Module during Power-Up, Scene Recall/Restore related scenario or when ever the Local application desires to enforce an update in these device properties values. Currently this interface handles only Time related Device Properties of Light LC Module like:
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_OCCUPANCY_DELAY
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_RUN_ON
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_PROLONG
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_AUTO
RM_BLE_MESH_MODEL_SERVER_DEVICE_PROPERTY_LIGHT_CONTROL_TIME_FADE_STANDBY_MANUAL

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	property	LC Server Device Property ID
[in]	time_in_ms	Related Device Property Value time in milliseconds

Example:

```
/* Set Light LC Sever Specific Time Properties. */
   err = RM_MESH_LIGHT_LC_SRV_SetTimeProperty(&g_mesh_light_lc_srv0_ctrl, property, time_in_ms);
```

Return values

FSP_SUCCESS	Set the Light Control Time Properties values successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_LIGHT_LC_SRV_SetScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_SetScenario (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t const *const *p_scenario*)

API to locally trigger the Light LC Server state machine from the application. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application could trigger the Light LC Server from any desired LC State.

Example:

```
/* Trigger to Recall/Restore the scenario. */
   err = RM_MESH_LIGHT_LC_SRV_SetScenario(&g_mesh_light_lc_srv0_ctrl, &scenario);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_scenario	Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present

Return values

FSP_SUCCESS	Updated scenario successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_scenario is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_MESH_LIGHT_LC_SRV_GetCurrentScenario()

fsp_err_t RM_MESH_LIGHT_LC_SRV_GetCurrentScenario (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_scenario_t *const *p_scenario*)

API to fetch the Light LC Server state machine related information from the Light LC Server Module. This typically is used in Power-Up or Scene Recall/Restore Scenario where the Application uses this to fetch and persistently store the Light LC State related details.

Example:

```
/* Fetch the current scenario. */
   err = RM_MESH_LIGHT_LC_SRV_GetCurrentScenario(&g_mesh_light_lc_srv0_ctrl,
&scenario);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_scenario	Pointer to rm_mesh_light_lc_srv_scenario_t where Light LC Server State Informations are present

Return values

FSP_SUCCESS	Fetch information successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_scenario is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_ReportOccupancy()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportOccupancy (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to report any occupancy to Light LC Server Model.

Example:

```
/* Reports any occupancy. */
   err = RM_MESH_LIGHT_LC_SRV_ReportOccupancy(&g_mesh_light_lc_srv0_ctrl);
```

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_LC_SRV_ReportLightOnOff()

fsp_err_t RM_MESH_LIGHT_LC_SRV_ReportLightOnOff (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_mesh_light_lc_srv_light_state_t *state*)

API to report any Light ON or OFF to Light LC Server Model. There could be many triggering factors to this Light related ON/OFF events from the upper layer. This API could be used for the following scenarios

1. Manual/Physical trigger of Light ON/OFF
2. State Binding with Generic ON/OFF
3. Trigger of Light ON/OFF due to Ambient Light Sensor values

Example:

```
/* Reports any Light ON or OFF. */
   err = RM_MESH_LIGHT_LC_SRV_ReportLightOnOff(&g_mesh_light_lc_srv0_ctrl, state);
```

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	state	Desired state value of Light LC ONOFF.

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

BLE Mesh Network Light Xyl Client (rm_mesh_light_xyl_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Xyl Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Client (rm_mesh_light_xyl_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_clt0	Module name.

Data Structures

struct	rm_mesh_light_xyl_clt_instance_ctrl_t

Data Structure Documentation

◆ **rm_mesh_light_xyl_clt_instance_ctrl_t**

struct rm_mesh_light_xyl_clt_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_CLT_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_CLT_Open()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Light_Xyl Client middleware. This is to initialize Light_Xyl Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Open(&g_mesh_light_xyl_clt0_ctrl,
&g_mesh_light_xyl_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Close()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Light_Xyl Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_CLT_Close(&g_mesh_light_xyl_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_CLT_GetModelHandle()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Light_Xyl client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of light xyl client model. */
   err = RM_MESH_LIGHT_XYL_CLT_GetModelHandle(&g_mesh_light_xyl_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_LIGHT_XYL_CLT_SendReliablePdu()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_LIGHT_XYL_CLT_SendReliablePdu(&g_mesh_light_xyl_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Get()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Get is an acknowledged message used to get the Light xyL Lightness, Light xyL x, and Light xyL y states of an element. Upon receiving a Light xyL Get message, the element shall respond with a Light xyL Status message. The response to the Light xyL Get message is a Light xyL Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_Set()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set is an acknowledged message used to set the Light xyL Lightness, Light xyL x state, and the Light xyL y states of an element. The response to the Light xyL Set message is a Light xyL Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_SetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

The Light xyL Set Unacknowledged is an unacknowledged message used to set the Light xyL Lightness, Light xyL x, and the Light xyL y states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_TargetGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_TargetGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Target Get is an acknowledged message used to get the target Light xyL Lightness, Light xyL x, and Light xyL y states of an element. The response to the Light xyL Target Get message is a Light xyL Target Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Light xyL Default Get is an acknowledged message used to get the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Get message is a Light xyL Default Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set is an acknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element. The response to the Light xyL Default Set message is a Light xyL Default Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_DefaultSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Default Set Unacknowledged is an unacknowledged message used to set the Light Lightness Default, the Light xyL x Default, and Light xyL y Default states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light HSL Default Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeGet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

The Light xyL Range Get is an acknowledged message used to get the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Get message is a Light xyL Range Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSet()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set is an acknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element. The response to the Light xyL Range Set message is a Light xyL Range Status message.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged()

fsp_err_t RM_MESH_LIGHT_XYL_CLT_RangeSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Light xyL Range Set Unacknowledged is an unacknowledged message used to set the Light xyL x Range and Light xyL y Range states of an element.

Parameters

[in]	p_ctrl	rm_mesh_light_xyl_clt control block.
[in]	p_parameter	Pointer to Light xyL Range Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Light Xyl Server (rm_mesh_light_xyl_srv)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Light Xyl Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_light_xyl_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_light_xyl_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Light XYL Server (rm_mesh_light_xyl_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh light XYL server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_srv0	Module name.

Data Structures

struct	rm_mesh_light_xyl_srv_info_t
struct	rm_mesh_light_xyl_srv_target_info_t
struct	rm_mesh_light_xyl_srv_default_info_t
struct	rm_mesh_light_xyl_srv_range_info_t

struct	rm_mesh_light_xyl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_xyl_srv_info_t

struct rm_mesh_light_xyl_srv_info_t

Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_xyl_lightness	Target perceived lightness - used in response path
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	target_xyl_x	Target x coordinate - used in response path
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light
uint16_t	target_xyl_y	Target y coordinate - used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_xyl_srv_target_info_t

struct rm_mesh_light_xyl_srv_target_info_t

Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing

		the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_default_info_t

struct rm_mesh_light_xyl_srv_default_info_t		
Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_range_info_t

struct rm_mesh_light_xyl_srv_range_info_t		
Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element		
Data Fields		
uint16_t	xyl_x_range_min	The minimum value of a Light xyL x state of an element
uint16_t	xyl_x_range_max	The maximum value of a Light xyL x state of an element
uint16_t	xyl_y_range_min	The minimum value of a Light xyL y state of an element
uint16_t	xyl_y_range_max	The maximum value of a Light xyL y state of an element
uint8_t	status	Status - Used in the response path

◆ rm_mesh_light_xyl_srv_instance_ctrl_t

struct rm_mesh_light_xyl_srv_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Lower Trans (rm_ble_mesh_lower_trans)

fsp_err_t	RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits (rm_ble_mesh_lower_trans_ctrl_t *const p_ctrl)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Lower Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_lower_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the

			hardware.
Notification Enable	• Enabled • Disabled	Disabled	Whether to enable the notification or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_lower_trans_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_lower_trans_instance_ctrl_t

struct rm_ble_mesh_lower_trans_instance_ctrl_t
RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_LOWER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_LOWER_TRANS_Open()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_cfg_t const *const *p_cfg*)

Register Inerface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_lower_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl,
&g_ble_mesh_lower_trans0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_Close()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Lower Transport Layer. Implements rm_ble_mesh_lower_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_SendPdu()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_transmit_setting_t const *const *p_transmit_setting*, rm_ble_mesh_buffer_t const *const *p_buffer*, rm_ble_mesh_lower_trans_reliable_t *reliable*)

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_lower_trans_api_t::sendPdu.

Example:

```
/* Send transport PDUs. */
   err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                         &transmit_setting,
                                         &buffer,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transmit_setting and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts. */
   err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
   err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_lower_trans_api_t::reinitReplayCache.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
   err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
   err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_network

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_network_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_network0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Ignore Netcache Wrapping	• Processed • Dropped	Dropped	Ignore netcache wrapping.
RX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the RX callback event or

			not.
TX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the TX callback event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_network_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_network_instance_ctrl_t

struct rm_ble_mesh_network_instance_ctrl_t

RM_BLE_MESH_NETWORK private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_NETWORK_Open() is called.

Function Documentation

◆ RM_BLE_MESH_NETWORK_Open()

fsp_err_t RM_BLE_MESH_NETWORK_Open (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_cfg_t const *const *p_cfg*)

Register Inerface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements rm_ble_mesh_network_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_NETWORK_Close()

fsp_err_t RM_BLE_MESH_NETWORK_Close (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Unregister Inerface with Network Layer. Implements rm_ble_mesh_network_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()

fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements rm_ble_mesh_network_api_t::broadcastSecureBeacon.

Example:

```
/* Send secure network beacon. */
   err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_network_header_t const *const *p_header*, rm_ble_mesh_buffer_t const *const *p_buffer*)

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements rm_ble_mesh_network_api_t::sendPduOnInterface.

Example:

```
/* Send network PDUs on selected network interfaces. */
   err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info, p_header and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_GetAddressType()

fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_network_address_type_t *const *p_type*)

To get address type. This routine is to get address type for a given address.

Implements rm_ble_mesh_network_api_t::getAddressType.

Example:

```
/* Get address type. */
   err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_type is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_FetchProxyState()

fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_gatt_proxy_state_t *const *p_proxy_state*)

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NEgTWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements rm_ble_mesh_network_api_t::fetchProxyState.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
   err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_proxy_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_filter_type_t *type*)

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements rm_ble_mesh_network_api_t::setProxyFilter.

Example:

```
/* Set proxy server's filter type. */
   err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_config_opcode_t *opcode*, rm_ble_mesh_network_proxy_address_list_t *const *p_addr_list*)

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements rm_ble_mesh_network_api_t::configProxyFilter.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
   err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info and p_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, rm_ble_mesh_network_gatt_proxy_adv_mode_t *proxy_adv_mode*)

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::startProxyServerAdv.

Example:

```
/* Start connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::stopProxyServerAdv.

Example:

```
/* Stop connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, uint32_t *const *p_seq_num*)

To allocate sequence number. This function is used to allocate Sequence Number.

Implements rm_ble_mesh_network_api_t::allocateSeqNumber.

Example:

```
/* Allocate sequence number. */
   err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t *const *p_seq_num_state*)

To get current sequence number state. This function is used to get current Sequence Number state.

Implements rm_ble_mesh_network_api_t::getSeqNumberState.

Example:

```
/* Get current sequence number state. */
   err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t const *const *p_seq_num_state*)

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements rm_ble_mesh_network_api_t::setSeqNumberState.

Example:

```
/* Set current sequence number state. */
   err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ResetNetCache()

fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_network_api_t::resetNetCache.

Example:

```
/* Reinitialize all Network Layer cache entries. */
   err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

BLE Mesh Network Provision (rm_ble_mesh_provision)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_BLE_MESH_PROVISION_Open (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_cfg_t const *const p_cfg)
fsp_err_t	RM_BLE_MESH_PROVISION_Close (rm_ble_mesh_provision_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLE_MESH_PROVISION_Setup (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_role_t role, rm_ble_mesh_provision_device_info_t info, uint16_t timeout)
fsp_err_t	RM_BLE_MESH_PROVISION_Bind (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_device_info_t info, uint8_t attention, rm_ble_mesh_provision_handle_t *const p_handle)
fsp_err_t	RM_BLE_MESH_PROVISION_SendPdu (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_provision_pdu_type_t type, rm_ble_mesh_buffer_t pdu_data)
fsp_err_t	RM_BLE_MESH_PROVISION_SetAuthVal (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_buffer_t auth_value)

fsp_err_t	RM_BLE_MESH_PROVISION_Abort (rm_ble_mesh_provision_ctrl_t *const p_ctrl, rm_ble_mesh_provision_handle_t const *const p_handle, rm_ble_mesh_provision_link_close_reason_t reason)

fsp_err_t	RM_BLE_MESH_PROVISION_SetOobAuthInfo (rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t const *const p_auth_info, uint8_t size)
fsp_err_t	RM_BLE_MESH_PROVISION_GenerateEcdhKey (rm_ble_mesh_provision_ctrl_t *const p_ctrl, uint8_t *const p_public_key)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Provision module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_provision0	Module name.
Provision Capabilities			
Number of Elements	Invalid Number of Elements	1	Provision capabilities number of elements.
Supported Algorithms	Invalid Supported Algorithms	0	Provision capabilities supported algorithms.
Public Key Type	Invalid Public Key Type	0	Provision capabilities public key type.
Static OOB Type	Invalid Static OOB Type	0	Provision capabilities static OOB type.
Output OOB Action	Invalid Output OOB Action	0	Provision capabilities output OOB action.
Output OOB Size	Invalid Output OOB Size	0	Provision capabilities output OOB size.
Input OOB Action	Invalid Input OOB Action	0	Provision capabilities input OOB action.
Input OOB Size	Invalid Input OOB Size	0	Provision capabilities iutput OOB size.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Provision Callback	Name Must Be a Valid C Symbol.	NULL	Provision callback function name.

Data Structures

struct	rm_ble_mesh_provision_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_provision_instance_ctrl_t

struct rm_ble_mesh_provision_instance_ctrl_t
RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_PROVISION_Open() is called.

Function Documentation

◆ RM_BLE_MESH_PROVISION_Open()

fsp_err_t RM_BLE_MESH_PROVISION_Open (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_cfg_t const *const *p_cfg*)

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements rm_ble_mesh_provision_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Close()

fsp_err_t RM_BLE_MESH_PROVISION_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_provision_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Setup()

fsp_err_t RM_BLE_MESH_PROVISION_Setup (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_role_t *role*, rm_ble_mesh_provision_device_info_t *info*, uint16_t *timeout*)

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements rm_ble_mesh_provision_api_t::setup.

Example:

```
/* Setup the device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter info->p_device is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Bind()

fsp_err_t RM_BLE_MESH_PROVISION_Bind (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_device_info_t *info*, uint8_t *attention*, rm_ble_mesh_provision_handle_t *const *p_handle*)

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements rm_ble_mesh_provision_api_t::bind.

Example:

```
/* Bind to the peer device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_SendPdu()

fsp_err_t RM_BLE_MESH_PROVISION_SendPdu (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_provision_pdu_type_t *type*, rm_ble_mesh_buffer_t *pdu_data*)

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements rm_ble_mesh_provision_api_t::sendPdu.

Example:

```
/* Send provisioning PDUs to the peer. */
   err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_UNSUPPORTED	The pdu type is not supported.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetAuthVal()

fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_buffer_t *auth_value*)

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY event with the respective OOB Action and Size.

Implements rm_ble_mesh_provision_api_t::setAuthVal.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};;

/* Set the display authval. */

   err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_Abort()

fsp_err_t RM_BLE_MESH_PROVISION_Abort (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*,
rm_ble_mesh_provision_handle_t const *const *p_handle*,
rm_ble_mesh_provision_link_close_reason_t *reason*)

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements rm_ble_mesh_provision_api_t::abort.

Example:

```
/* Abort the provisioning procedure. */
   err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::getLocalPublicKey.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_public_key*)

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::setLocalPublicKey.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_key*)

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements rm_ble_mesh_provision_api_t::generateRandomizedNumber.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
   err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key*, uint8_t *size*)

Utility API to set device out of band public key for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobPublicKey.

Example:

```
/* Set device out of band public key. */
   err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 64.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_auth_info*, uint8_t *size*)

Utility API to set device out of band authentication information for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobAuthInfo.

Example:

```
/* Set device out of band authentication information. */
   err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_auth_info is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 16.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to generate ECDH public key to be used for provisioning.

Implements rm_ble_mesh_provision_api_t::generateEcdhKey.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

fsp_err_t	RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_clt0	Module name.

Data Structures

struct	rm_mesh_scene_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

struct rm_mesh_scene_clt_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

fsp_err_t RM_MESH_SCENE_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_CLT_Close()

fsp_err_t RM_MESH_SCENE_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scene Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Get()

fsp_err_t RM_MESH_SCENE_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Recall()

fsp_err_t RM_MESH_SCENE_CLT_Recall (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RegisterGet()

fsp_err_t RM_MESH_SCENE_CLT_RegisterGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Store()

fsp_err_t RM_MESH_SCENE_CLT_Store (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Delete()

fsp_err_t RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
