Name	Name Must Be a Valid C Symbol	g_rm_mesh_light_xyl_srv0	Module name.

Data Structures

struct	rm_mesh_light_xyl_srv_info_t
struct	rm_mesh_light_xyl_srv_target_info_t
struct	rm_mesh_light_xyl_srv_default_info_t
struct	rm_mesh_light_xyl_srv_range_info_t

struct	rm_mesh_light_xyl_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_light_xyl_srv_info_t

struct rm_mesh_light_xyl_srv_info_t

Light xyL state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	target_xyl_lightness	Target perceived lightness - used in response path
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	target_xyl_x	Target x coordinate - used in response path
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light
uint16_t	target_xyl_y	Target y coordinate - used in response path
uint8_t	tid	TID - Used in request path
uint8_t	transition_time	Transition Time - Used in request path. Used as remaining time in response path.
uint8_t	delay	Delay - Used in request path
uint16_t	transition_time_handle	Transition Timer Handle

◆ rm_mesh_light_xyl_srv_target_info_t

struct rm_mesh_light_xyl_srv_target_info_t

Light xyL target state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states

Data Fields

uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing

		the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_default_info_t

struct rm_mesh_light_xyl_srv_default_info_t		
Light xyL default state is a composite state that includes the xyL Lightness, the Light xyL x and the Light xyL y states		
Data Fields		
uint16_t	xyl_lightness	The perceived lightness of a light emitted by the element
uint16_t	xyl_x	The 16-bit value representing the x coordinate of a CIE1931 color light
uint16_t	xyl_y	The 16-bit value representing the y coordinate of a CIE1931 color light

◆ rm_mesh_light_xyl_srv_range_info_t

struct rm_mesh_light_xyl_srv_range_info_t		
Light xyL Range state determines the minimum and maximum values of the Light xyL x and syL y state of an element		
Data Fields		
uint16_t	xyl_x_range_min	The minimum value of a Light xyL x state of an element
uint16_t	xyl_x_range_max	The maximum value of a Light xyL x state of an element
uint16_t	xyl_y_range_min	The minimum value of a Light xyL y state of an element
uint16_t	xyl_y_range_max	The maximum value of a Light xyL y state of an element
uint8_t	status	Status - Used in the response path

◆ rm_mesh_light_xyl_srv_instance_ctrl_t

struct rm_mesh_light_xyl_srv_instance_ctrl_t
BLE mesh light xyl instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_LIGHT_XYL_SRV_Open() is called.

Function Documentation

◆ RM_MESH_LIGHT_XYL_SRV_Open()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Light_Xyl Server model. This is to initialize Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Open(&g_mesh_light_xyl_srv0_ctrl,
&g_mesh_light_xyl_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_LIGHT_XYL_SRV_Close()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Light_Xyl Server model. This is to terminate Light_Xyl Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_LIGHT_XYL_SRV_Close(&g_mesh_light_xyl_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_LIGHT_XYL_SRV_StateUpdate()

fsp_err_t RM_MESH_LIGHT_XYL_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_LIGHT_XYL_SRV_StateUpdate(&g_mesh_light_xyl_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Lower Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_lower_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_lower_trans_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Lower Trans (rm_ble_mesh_lower_trans).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_lower_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the

			hardware.
Notification Enable	• Enabled • Disabled	Disabled	Whether to enable the notification or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_lower_trans_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_lower_trans_instance_ctrl_t

struct rm_ble_mesh_lower_trans_instance_ctrl_t
RM_BLE_MESH_LOWER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_LOWER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_LOWER_TRANS_Open()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Open (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_cfg_t const *const *p_cfg*)

Register Inerface with Lower Transport Layer. This routine registers interface with the Lower Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.
Implements rm_ble_mesh_lower_trans_api_t::open.
Example:
`/* Open the module. */`
`err = RM_BLE_MESH_LOWER_TRANS_Open(&g_ble_mesh_lower_trans0_ctrl, &g_ble_mesh_lower_trans0_cfg);`

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_Close()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Lower Transport Layer. Implements rm_ble_mesh_lower_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_LOWER_TRANS_Close(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_LOWER_TRANS_SendPdu()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_SendPdu (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_lower_trans_transmit_setting_t const *const *p_transmit_setting*, rm_ble_mesh_buffer_t const *const *p_buffer*, rm_ble_mesh_lower_trans_reliable_t *reliable*)

API to send transport PDUs. This routine sends transport PDUs to peer device.

Implements rm_ble_mesh_lower_trans_api_t::sendPdu.

Example:

```
/* Send transport PDUs. */
   err = RM_BLE_MESH_LOWER_TRANS_SendPdu(&g_ble_mesh_lower_trans0_ctrl,
                                         &transmit_setting,
                                         &buffer,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_transmit_setting and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To clear all segmentation and reassembly contexts. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts. */
   err = RM_BLE_MESH_LOWER_TRANS_ClearSarContexts(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

To clear all segmentation and reassembly contexts for a given subnet. This routine clears all segmentation and reassembly contexts.

Implements rm_ble_mesh_lower_trans_api_t::clearSubnetSarContexts.

Example:

```
/* Clear all segmentation and reassembly contexts for a given subnet. */
   err =
RM_BLE_MESH_LOWER_TRANS_ClearSubnetSarContexts(&g_ble_mesh_lower_trans0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To reinitialize all Lower Transport replay cache entries. This routine clears and reinitializes all Transport Replay Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_lower_trans_api_t::reinitReplayCache.

Example:

```
/* Reinitialize all Lower Transport replay cache Entries. */
   err = RM_BLE_MESH_LOWER_TRANS_ReinitReplayCache(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits()

fsp_err_t RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits (rm_ble_mesh_lower_trans_ctrl_t *const *p_ctrl*)

To trigger any LTRN pending transmissions. Trigger pending transmits is an interface to check for pending segments in the tx queue and schedule for transmission, which is mainly used by the LPN operation.

Implements rm_ble_mesh_lower_trans_api_t::triggerPendingTransmits.

Example:

```
/* Trigger any Lower Transport pending transmissions. */
   err =
RM_BLE_MESH_LOWER_TRANS_TriggerPendingTransmits(&g_ble_mesh_lower_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Network module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_network

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_network_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Network (rm_ble_mesh_network).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_network0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Ignore Netcache Wrapping	• Processed • Dropped	Dropped	Ignore netcache wrapping.
RX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the RX callback event or

			not.
TX Callback Event Enable	• Enabled • Disabled	Disabled	Whether to enable the TX callback event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_network_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_network_instance_ctrl_t

struct rm_ble_mesh_network_instance_ctrl_t

RM_BLE_MESH_NETWORK private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_NETWORK_Open() is called.

Function Documentation

◆ RM_BLE_MESH_NETWORK_Open()

fsp_err_t RM_BLE_MESH_NETWORK_Open (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_cfg_t const *const *p_cfg*)

Register Inerface with Network Layer. This routine registers interface with the Network Layer. Network Layer supports only one upper layer, hence this routine shall be called once.

Implements rm_ble_mesh_network_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_NETWORK_Open(&g_ble_mesh_network0_ctrl,
&g_ble_mesh_network0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_NETWORK_Close()

fsp_err_t RM_BLE_MESH_NETWORK_Close (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Unregister Inerface with Network Layer. Implements rm_ble_mesh_network_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_NETWORK_Close(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_BroadcastSecureBeacon()

fsp_err_t RM_BLE_MESH_NETWORK_BroadcastSecureBeacon (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*)

API to send Secure Network Beacon. This routine sends Secure Network Beacon for the given subnet handle.

Implements rm_ble_mesh_network_api_t::broadcastSecureBeacon.

Example:

```
/* Send secure network beacon. */
   err = RM_BLE_MESH_NETWORK_BroadcastSecureBeacon(&g_ble_mesh_network0_ctrl,
subnet_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_NETWORK_SendPduOnInterface()

fsp_err_t RM_BLE_MESH_NETWORK_SendPduOnInterface (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_network_header_t const *const *p_header*, rm_ble_mesh_buffer_t const *const *p_buffer*)

Extension API to send Network PDUs on selected network interfaces. This routine sends NETWORK PDUs on all or selected Network Interfaces.

Implements rm_ble_mesh_network_api_t::sendPduOnInterface.

Example:

```
/* Send network PDUs on selected network interfaces. */
   err = RM_BLE_MESH_NETWORK_SendPduOnInterface(&g_ble_mesh_network0_ctrl,
&route_info, &header, &buffer);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info, p_header and p_buffer are NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_GetAddressType()

fsp_err_t RM_BLE_MESH_NETWORK_GetAddressType (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_network_address_type_t *const *p_type*)

To get address type. This routine is to get address type for a given address.

Implements rm_ble_mesh_network_api_t::getAddressType.

Example:

```
/* Get address type. */
   err = RM_BLE_MESH_NETWORK_GetAddressType(&g_ble_mesh_network0_ctrl, addr, &type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_type is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_FetchProxyState()

fsp_err_t RM_BLE_MESH_NETWORK_FetchProxyState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_gatt_proxy_state_t *const *p_proxy_state*)

Check if the proxy module is ready to handle proxy messages/events. This routine returns the current state of the Proxy. The valid states of proxy are:

1. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_NULL - If no callback registered by Upper Layers
2. RM_BLE_MESH_NEgTWORK_GATT_PROXY_STATE_READY - If callback registered and Proxy not connected
3. RM_BLE_MESH_NETWORK_GATT_PROXY_STATE_CONNECTED - if callback registered and Proxy connected

Implements rm_ble_mesh_network_api_t::fetchProxyState.

Example:

```
/* Check if the proxy module is ready to handle proxy messages/events. */
   err = RM_BLE_MESH_NETWORK_FetchProxyState(&g_ble_mesh_network0_ctrl,
&proxy_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_proxy_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_SetProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_filter_type_t *type*)

Set proxy server's filter type. This function is used by the Proxy Client to set the filter type on the Proxy Server.

Implements rm_ble_mesh_network_api_t::setProxyFilter.

Example:

```
/* Set proxy server's filter type. */
   err = RM_BLE_MESH_NETWORK_SetProxyFilter(&g_ble_mesh_network0_ctrl, &route_info,
filter_type);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ConfigProxyFilter()

fsp_err_t RM_BLE_MESH_NETWORK_ConfigProxyFilter (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_route_info_t const *const *p_route_info*, rm_ble_mesh_proxy_config_opcode_t *opcode*, rm_ble_mesh_network_proxy_address_list_t *const *p_addr_list*)

Add or Delete/Remove addresses to/from proxy filter list. This function is used by the Proxy Client to add/delete Addresses to/from the Proxy Server's filter List.

Implements rm_ble_mesh_network_api_t::configProxyFilter.

Example:

```
/* Add or delete/remove addresses to/from proxy filter list. */
   err = RM_BLE_MESH_NETWORK_ConfigProxyFilter(&g_ble_mesh_network0_ctrl,
&route_info, opcode, &addr_list);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_route_info and p_addr_list are NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_StartProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StartProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, rm_ble_mesh_network_gatt_proxy_adv_mode_t *proxy_adv_mode*)

Start connectable advertisements for a proxy server. This function is used by the Proxy Server to start Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::startProxyServerAdv.

Example:

```
/* Start connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StartProxyServerAdv(&g_ble_mesh_network0_ctrl,
subnet_handle, proxy_adv_mode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_NETWORK_StopProxyServerAdv()

fsp_err_t RM_BLE_MESH_NETWORK_StopProxyServerAdv (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

Stop connectable advertisements for a proxy server. This function is used by the Proxy Server to stop Connectable Undirected Advertisements.

Implements rm_ble_mesh_network_api_t::stopProxyServerAdv.

Example:

```
/* Stop connectable advertisements for a proxy server. */
   err = RM_BLE_MESH_NETWORK_StopProxyServerAdv(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_AllocateSeqNumber()

fsp_err_t RM_BLE_MESH_NETWORK_AllocateSeqNumber (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, uint32_t *const *p_seq_num*)

To allocate sequence number. This function is used to allocate Sequence Number.

Implements rm_ble_mesh_network_api_t::allocateSeqNumber.

Example:

```
/* Allocate sequence number. */
   err = RM_BLE_MESH_NETWORK_AllocateSeqNumber(&g_ble_mesh_network0_ctrl, &seq_num);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_GetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_GetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t *const *p_seq_num_state*)

To get current sequence number state. This function is used to get current Sequence Number state.

Implements rm_ble_mesh_network_api_t::getSeqNumberState.

Example:

```
/* Get current sequence number state. */
   err = RM_BLE_MESH_NETWORK_GetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_SetSeqNumberState()

fsp_err_t RM_BLE_MESH_NETWORK_SetSeqNumberState (rm_ble_mesh_network_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_seq_number_state_t const *const *p_seq_num_state*)

To set current sequence number state. This function is used to get current Sequence Number state, which acquiring lock. Used from persistent storage.

Implements rm_ble_mesh_network_api_t::setSeqNumberState.

Example:

```
/* Set current sequence number state. */
   err = RM_BLE_MESH_NETWORK_SetSeqNumberState(&g_ble_mesh_network0_ctrl,
&seq_num_state);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_seq_num_state is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_NETWORK_ResetNetCache()

fsp_err_t RM_BLE_MESH_NETWORK_ResetNetCache (rm_ble_mesh_network_ctrl_t *const *p_ctrl*)

To reinitialize all Network Layer cache entries. This routine clears and reinitializes all Network Cache Entries. This needs to be invoked by the upper layer when the Network moves to a newer IV Index (Normal State) and the Sequence numbers are reset.

Implements rm_ble_mesh_network_api_t::resetNetCache.

Example:

```
/* Reinitialize all Network Layer cache entries. */
   err = RM_BLE_MESH_NETWORK_ResetNetCache(&g_ble_mesh_network0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

BLE Mesh Network Provision (rm_ble_mesh_provision)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Provision module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_provision

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_provision_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Provision (rm_ble_mesh_provision).

Configuration	Options	Default	Description
General			
Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_provision0	Module name.
Provision Capabilities			
Number of Elements	Invalid Number of Elements	1	Provision capabilities number of elements.
Supported Algorithms	Invalid Supported Algorithms	0	Provision capabilities supported algorithms.
Public Key Type	Invalid Public Key Type	0	Provision capabilities public key type.
Static OOB Type	Invalid Static OOB Type	0	Provision capabilities static OOB type.
Output OOB Action	Invalid Output OOB Action	0	Provision capabilities output OOB action.
Output OOB Size	Invalid Output OOB Size	0	Provision capabilities output OOB size.
Input OOB Action	Invalid Input OOB Action	0	Provision capabilities input OOB action.
Input OOB Size	Invalid Input OOB Size	0	Provision capabilities iutput OOB size.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Provision Callback	Name Must Be a Valid C Symbol.	NULL	Provision callback function name.

Data Structures

struct	rm_ble_mesh_provision_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_provision_instance_ctrl_t

struct rm_ble_mesh_provision_instance_ctrl_t
RM_BLE_MESH_PROVISION private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_PROVISION_Open() is called.

Function Documentation

◆ RM_BLE_MESH_PROVISION_Open()

fsp_err_t RM_BLE_MESH_PROVISION_Open (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_cfg_t const *const *p_cfg*)

Open access middleware. This function registers the provisioning capabilities of the application along with the application callback to notify events during the provisioning procedure.

Implements rm_ble_mesh_provision_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_PROVISION_Open(&g_ble_mesh_provision0_ctrl,
&g_ble_mesh_provision0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Close()

fsp_err_t RM_BLE_MESH_PROVISION_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Close access middleware. Implements rm_ble_mesh_provision_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_PROVISION_Close(&g_ble_mesh_provision0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Setup()

fsp_err_t RM_BLE_MESH_PROVISION_Setup (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_role_t *role*, rm_ble_mesh_provision_device_info_t *info*, uint16_t *timeout*)

Setup the device for provisioning. This function configures the device to get in a provisionable state by specifying the role, bearer and creating a context.

Implements rm_ble_mesh_provision_api_t::setup.

Example:

```
/* Setup the device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Setup(&g_ble_mesh_provision0_ctrl, role, info,
timeout);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter info->p_device is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_Bind()

fsp_err_t RM_BLE_MESH_PROVISION_Bind (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_device_info_t *info*, uint8_t *attention*, rm_ble_mesh_provision_handle_t *const *p_handle*)

Bind to the peer device for provisioning. This function establishes a provisioning link with the peer device and exchanges the capabilities for provisioning.

Implements rm_ble_mesh_provision_api_t::bind.

Example:

```
/* Bind to the peer device for provisioning. */
   err = RM_BLE_MESH_PROVISION_Bind(&g_ble_mesh_provision0_ctrl, info, attention,
&provision_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_SendPdu()

fsp_err_t RM_BLE_MESH_PROVISION_SendPdu (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_provision_pdu_type_t *type*, rm_ble_mesh_buffer_t *pdu_data*)

Send provisioning PDUs to the peer. This function is used by the provisioning application to send the provisioning PDUs to the peer device during the procedure.

Implements rm_ble_mesh_provision_api_t::sendPdu.

Example:

```
/* Send provisioning PDUs to the peer. */
   err = RM_BLE_MESH_PROVISION_SendPdu(&g_ble_mesh_provision0_ctrl,
&provision_handle, type, pdu_data);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_UNSUPPORTED	The pdu type is not supported.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetAuthVal()

fsp_err_t RM_BLE_MESH_PROVISION_SetAuthVal (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, rm_ble_mesh_provision_handle_t const *const *p_handle*, rm_ble_mesh_buffer_t *auth_value*)

Set the display authval. This function shall be used by the provisioning application to set the authval being displayed to the user on receiving RM_BLE_MESH_PROVISION_EVENT_TYPE_OOB_DISPLAY event with the respective OOB Action and Size.

Implements rm_ble_mesh_provision_api_t::setAuthVal.

Example:

```
rm_ble_mesh_buffer_t auth_value = {.payload = NULL, .length = 0};;

/* Set the display authval. */

   err = RM_BLE_MESH_PROVISION_SetAuthVal(&g_ble_mesh_provision0_ctrl,
&provision_handle, auth_value);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_Abort()

fsp_err_t RM_BLE_MESH_PROVISION_Abort (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*,
rm_ble_mesh_provision_handle_t const *const *p_handle*,
rm_ble_mesh_provision_link_close_reason_t *reason*)

Abort the provisioning procedure. This API can be used by the application to abort the ongoing provisioning procedure. This routine closes the provisioning link with the reason as specified.

Implements rm_ble_mesh_provision_api_t::abort.

Example:

```
/* Abort the provisioning procedure. */
   err = RM_BLE_MESH_PROVISION_Abort(&g_ble_mesh_provision0_ctrl, &provision_handle,
reason);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_PROVISION_GetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_GetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to get current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::getLocalPublicKey.

Example:

```
/* Get current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_SetLocalPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetLocalPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_public_key*)

Utility API to set current ECDH public key to be used for provisioning. This API can be used by the application to fetch the current ECDH P256 Public Key which is to be used for the Provisioning Procedure.

Implements rm_ble_mesh_provision_api_t::setLocalPublicKey.

Example:

```
/* Set current ECDH Public Key to be used for Provisioning. */
   err = RM_BLE_MESH_PROVISION_SetLocalPublicKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_PROVISION_GenerateRandomizedNumber()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateRandomizedNumber (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_key*)

Utility API to generate 128bits (16 bytes) randomized number to be used for provisioning. The randomized number can be used for UUID, Net Key and Application Key.

Implements rm_ble_mesh_provision_api_t::generateRandomizedNumber.

Example:

```
/* Generate 128bits (16 bytes) randomized number. */
   err = RM_BLE_MESH_PROVISION_GenerateRandomizedNumber(&g_ble_mesh_provision0_ctrl,
p_net_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobPublicKey()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobPublicKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key*, uint8_t *size*)

Utility API to set device out of band public key for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobPublicKey.

Example:

```
/* Set device out of band public key. */
   err = RM_BLE_MESH_PROVISION_SetOobPublicKey(&g_ble_mesh_provision0_ctrl,
p_public_key, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_key is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 64.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_SetOobAuthInfo()

fsp_err_t RM_BLE_MESH_PROVISION_SetOobAuthInfo (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t const *const *p_auth_info*, uint8_t *size*)

Utility API to set device out of band authentication information for provisioning.

Implements rm_ble_mesh_provision_api_t::setOobAuthInfo.

Example:

```
/* Set device out of band authentication information. */
   err = RM_BLE_MESH_PROVISION_SetOobAuthInfo(&g_ble_mesh_provision0_ctrl,
p_auth_info, size);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_auth_info is NULL.
FSP_ERR_INVALID_ARGUMENT	The parameter size is more than 16.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_PROVISION_GenerateEcdhKey()

fsp_err_t RM_BLE_MESH_PROVISION_GenerateEcdhKey (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*, uint8_t *const *p_public_key*)

Utility API to generate ECDH public key to be used for provisioning.

Implements rm_ble_mesh_provision_api_t::generateEcdhKey.

Example:

```
/* Generate ECDH Public Key for Provisioning. */
   err = RM_BLE_MESH_PROVISION_GenerateEcdhKey(&g_ble_mesh_provision0_ctrl,
&public_key);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_public_key is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Client (rm_mesh_scene_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_clt0	Module name.

Data Structures

struct	rm_mesh_scene_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_clt_instance_ctrl_t

struct rm_mesh_scene_clt_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_CLT_Open()

fsp_err_t RM_MESH_SCENE_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

open Scene Client middleware. This is to initialize Scene Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCENE_CLT_Open(&g_mesh_scene_clt0_ctrl, &g_mesh_scene_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_CLT_Close()

fsp_err_t RM_MESH_SCENE_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scene Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_CLT_Close(&g_mesh_scene_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCENE_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scene client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scene client model. */
   err = RM_MESH_SCENE_CLT_GetModelHandle(&g_mesh_scene_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SCENE_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCENE_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCENE_CLT_SendReliablePdu(&g_mesh_scene_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Get()

fsp_err_t RM_MESH_SCENE_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Get is an acknowledged message used to get the current status of a currently active scene of an element. The response to the Scene Get message is a Scene Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Recall()

fsp_err_t RM_MESH_SCENE_CLT_Recall (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall is an acknowledged message that is used to recall the current state of an element from a previously stored scene. The response to the Scene Recall message is a Scene Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RecallUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_RecallUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Recall Unacknowledged is an unacknowledged message used to recall the current state of an element from a previously stored Scene.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Recall message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_RegisterGet()

fsp_err_t RM_MESH_SCENE_CLT_RegisterGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scene Register Get is an acknowledged message used to get the current status of the Scene Register of an element. The response to the Scene Register Get message is a Scene Register Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Store()

fsp_err_t RM_MESH_SCENE_CLT_Store (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store is an acknowledged message used to store the current state of an element as a Scene, which can be recalled later. The response to the Scene Store message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_StoreUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_StoreUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Store Unacknowledged is an unacknowledged message used to store the current state of an element as a Scene, which can be recalled later.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Store message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_Delete()

fsp_err_t RM_MESH_SCENE_CLT_Delete (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete is an acknowledged message used to delete a Scene from the Scene Register state of an element. The response to the Scene Delete message is a Scene Register Status message.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCENE_CLT_DeleteUnacknowledged()

fsp_err_t RM_MESH_SCENE_CLT_DeleteUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scene Delete Unacknowledged is an unacknowledged message used to delete a scene from the Scene Register state of an element.

Parameters

[in]	p_ctrl	rm_mesh_scene_clt control block.
[in]	p_parameter	Pointer to Scene Delete parameter.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Scene Server (rm_mesh_scene_srv)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl, rm_ble_mesh_scene_server_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCENE_SRV_StateUpdate

	(rm_ble_mesh_scene_server_ctrl_t *const p_ctrl, rm_ble_mesh_access_server_state_t const *const p_state)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scene Server module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scene_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scene_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scene Server (rm_mesh_scene_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scene server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scene_srv0	Module name.
Model Handle	Invalid Model Handle	0	Select model handle.
Setup Server Handle	Invalid Setup Server Handle	0	Select setup server handle.

Data Structures

struct	rm_mesh_scene_srv_number_info_t
struct	rm_mesh_scene_srv_status_info_t

struct	rm_mesh_scene_srv_register_status_info_t
struct	rm_mesh_scene_srv_ext_tid_and_transition_info_t
struct	rm_mesh_scene_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scene_srv_number_info_t

struct rm_mesh_scene_srv_number_info_t

The state to identify a scene

Data Fields

uint16_t	number	The number to identify a scene

◆ rm_mesh_scene_srv_status_info_t

struct rm_mesh_scene_srv_status_info_t

The current status of a currently active scene

Data Fields

uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t	target_scene	Scene Number of a target scene.
uint8_t	remaining_time	

◆ rm_mesh_scene_srv_register_status_info_t

struct rm_mesh_scene_srv_register_status_info_t

The current status of scene register

Data Fields

uint8_t	status_code	Status Code
uint16_t	current_scene	Scene Number of a current scene.
uint16_t *	scenes	A list of scenes stored within an element
uint16_t	scenes_count	

◆ rm_mesh_scene_srv_ext_tid_and_transition_info_t

struct rm_mesh_scene_srv_ext_tid_and_transition_info_t

TID and Transition is a structure which contains Transaction ID (TID) as mandatory field. Other two fields, Transition Time and Delay are optional.

TID field is a transaction identifier indicating whether the message is a new message or a retransmission of a previously sent message.

If present, the Transition Time field identifies the time that an element will take to transition to the target state from the present state.

The Delay field shall be present when the Transition Time field is present. It identifies the message execution delay, representing a time interval between receiving the message by a model and executing the associated model behaviors.

◆ rm_mesh_scene_srv_instance_ctrl_t

struct rm_mesh_scene_srv_instance_ctrl_t
BLE mesh scene instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCENE_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCENE_SRV_Open()

fsp_err_t RM_MESH_SCENE_SRV_Open (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_scene_server_cfg_t const *const *p_cfg*)

API to initialize Scene Server model. This is to initialize Scene Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCENE_SRV_Open(&g_mesh_scene_srv0_ctrl, &g_mesh_scene_srv0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCENE_SRV_Close()

fsp_err_t RM_MESH_SCENE_SRV_Close (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*)

API to terminate Scene Server model. This is to terminate Scene Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCENE_SRV_Close(&g_mesh_scene_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCENE_SRV_StateUpdate()

fsp_err_t RM_MESH_SCENE_SRV_StateUpdate (rm_ble_mesh_scene_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCENE_SRV_StateUpdate(&g_mesh_scene_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

BLE Mesh Network Scheduler Client (rm_mesh_scheduler_clt)

Modules » Networking » BLE Mesh Network Modules

Functions

fsp_err_t	RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, rm_ble_mesh_model_client_cfg_t const *const p_cfg)
fsp_err_t	RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const p_ctrl,

	rm_ble_mesh_access_model_handle_t *const p_model_handle)
fsp_err_t	RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, uint32_t req_opcode, void const *const p_parameter, uint32_t rsp_opcode)
fsp_err_t	RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)
fsp_err_t	RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Scheduler Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Client (rm_mesh_scheduler_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler

			client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_clt0	Module name.

Data Structures

struct	rm_mesh_scheduler_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_clt_instance_ctrl_t

struct rm_mesh_scheduler_clt_instance_ctrl_t

BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_CLT_Open()

fsp_err_t RM_MESH_SCHEDULER_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Scheduler Client middleware. This is to initialize Scheduler Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SCHEDULER_CLT_Open(&g_mesh_scheduler_clt0_ctrl,
&g_mesh_scheduler_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCHEDULER_CLT_Close()

fsp_err_t RM_MESH_SCHEDULER_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Scheduler Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_CLT_Close(&g_mesh_scheduler_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_CLT_GetModelHandle()

fsp_err_t RM_MESH_SCHEDULER_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Scheduler client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of scheduler client model. */
   err = RM_MESH_SCHEDULER_CLT_GetModelHandle(&g_mesh_scheduler_clt0_ctrl,
&model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SCHEDULER_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SCHEDULER_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SCHEDULER_CLT_SendReliablePdu(&g_mesh_scheduler_clt0_ctrl,
req_opcode, p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_Get()

fsp_err_t RM_MESH_SCHEDULER_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Scheduler Get is an acknowledged message used to get the current Schedule Register state of an element. The response to the Scheduler Get message is a Scheduler Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionGet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Get is an acknowledged message used to report the action defined by the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Get message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSet()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set is an acknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field. The response to the Scheduler Action Set message is a Scheduler Action Status message.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged()

fsp_err_t RM_MESH_SCHEDULER_CLT_ActionSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Scheduler Action Set Unacknowledged is an unacknowledged message used to set the entry of the Schedule Register state of an element, identified by the Index field.

Parameters

[in]	p_ctrl	rm_mesh_scheduler_clt control block.
[in]	p_parameter	Pointer to Scheduler Action Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_scheduler_srv

The following build time configurations are defined in fsp_cfg/rm_mesh_scheduler_srv_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Scheduler Server (rm_mesh_scheduler_srv).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server ISR occurs
Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh scheduler server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_scheduler_srv0	Module name.

Data Structures

struct	rm_mesh_scheduler_srv_schedules_info_t
struct	rm_mesh_scheduler_srv_entry_index_info_t
struct	rm_mesh_scheduler_srv_entry_info_t
struct	rm_mesh_scheduler_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_scheduler_srv_schedules_info_t

struct rm_mesh_scheduler_srv_schedules_info_t		
The current Schedule Register state of an element.		
Data Fields		
uint16_t	schedules	Bit field indicating defined Actions in the Schedule Register

◆ rm_mesh_scheduler_srv_entry_index_info_t

struct rm_mesh_scheduler_srv_entry_index_info_t		
The entry index of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry

◆ rm_mesh_scheduler_srv_entry_info_t

struct rm_mesh_scheduler_srv_entry_info_t		
The entry of the Schedule Register state		
Data Fields		
uint8_t	index	Index of the Schedule Register entry
uint8_t	year	Scheduled year for the action
uint16_t	month	Scheduled month for the action
uint8_t	day	Scheduled day of the month for the action
uint8_t	hour	Scheduled hour for the action
uint8_t	minute	Scheduled minute for the action
uint8_t	second	Scheduled second for the action
uint8_t	dayofweek	Schedule days of the week for the action
uint8_t	action	Action to be performed at the scheduled time
uint8_t	transition_time	Transition time for this action
uint16_t	scene_number	Scene number to be used for some actions

◆ rm_mesh_scheduler_srv_instance_ctrl_t

struct rm_mesh_scheduler_srv_instance_ctrl_t
BLE mesh scheduler instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SCHEDULER_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SCHEDULER_SRV_Open()

fsp_err_t RM_MESH_SCHEDULER_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Scheduler Server model. This is to initialize Scheduler Server model and to register with Access layer.
Implements rm_ble_mesh_model_server_api_t::open.
Example:
`/* Open the module. */`
`err = RM_MESH_SCHEDULER_SRV_Open(&g_mesh_scheduler_srv0_ctrl, &g_mesh_scheduler_srv0_cfg);`

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SCHEDULER_SRV_Close()

fsp_err_t RM_MESH_SCHEDULER_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Scheduler Server model. This is to terminate Scheduler Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SCHEDULER_SRV_Close(&g_mesh_scheduler_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SCHEDULER_SRV_StateUpdate()

fsp_err_t RM_MESH_SCHEDULER_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SCHEDULER_SRV_StateUpdate(&g_mesh_scheduler_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Sensor Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_sensor_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_sensor_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Sensor Client (rm_mesh_sensor_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh sensor client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_sensor_clt0	Module name.

Data Structures

struct	rm_mesh_sensor_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_sensor_clt_instance_ctrl_t

struct rm_mesh_sensor_clt_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_CLT_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_CLT_Open()

fsp_err_t RM_MESH_SENSOR_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Sensor Client middleware. This is to initialize Sensor Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_CLT_Open(&g_mesh_sensor_clt0_ctrl, &g_mesh_sensor_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_CLT_Close()

fsp_err_t RM_MESH_SENSOR_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Sensor Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_CLT_Close(&g_mesh_sensor_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_CLT_GetModelHandle()

fsp_err_t RM_MESH_SENSOR_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Sensor client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of sensor client model. */
   err = RM_MESH_SENSOR_CLT_GetModelHandle(&g_mesh_sensor_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_SENSOR_CLT_SendReliablePdu()

fsp_err_t RM_MESH_SENSOR_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_SENSOR_CLT_SendReliablePdu(&g_mesh_sensor_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_DescriptorGet()

fsp_err_t RM_MESH_SENSOR_CLT_DescriptorGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Descriptor Get is an acknowledged message used to get the Sensor Descriptor state of all sensors within an element. The response to a Sensor Descriptor Get message is a Sensor Descriptor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Descriptor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_Get()

fsp_err_t RM_MESH_SENSOR_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Get is an acknowledged message used to get the Sensor Data state. The response to the Sensor Get message is a Sensor Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_ColumnGet()

fsp_err_t RM_MESH_SENSOR_CLT_ColumnGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Column Get is an acknowledged message used to get the Sensor Series Column state. The response to the Sensor Column Get message is a Sensor Column Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Column Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SeriesGet()

fsp_err_t RM_MESH_SENSOR_CLT_SeriesGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Series Get is an acknowledged message used to get a sequence of the Sensor Series Column states. The response to the Sensor Series Get message is a Sensor Series Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Series Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceGet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Get is an acknowledged message used to get the Sensor Cadence state of an element. The response to the Sensor Cadence Get message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSet()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set is an acknowledged message used to set the Sensor Cadence state of an element. The response to the Sensor Cadence Set message is a Sensor Cadence Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_CadenceSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Cadence Set Unacknowledged is an unacknowledged message used to set the Sensor Cadence state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Cadence Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingsGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingsGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Settings Get is an acknowledged message used to get the list of Sensor Setting states of an element. The response to the Sensor Settings Get message is a Sensor Settings Status message

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingGet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Get is an acknowledged message used to get the Sensor Setting state of an element. The response to the Sensor Setting Get message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Get message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSet()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set is an acknowledged message used to set the Sensor Setting state of an element. The response to the Sensor Setting Set message is a Sensor Setting Status message.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_CLT_SettingSetUnacknowledged()

fsp_err_t RM_MESH_SENSOR_CLT_SettingSetUnacknowledged (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Sensor Setting Set Unacknowledged is an unacknowledged message used to set the Sensor Setting state of an element.

Parameters

[in]	p_ctrl	rm_mesh_sensor_clt control block.
[in]	p_parameter	Pointer to Sensor Settings Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Data Structure Documentation

◆ rm_mesh_sensor_srv_descriptor_info_t

struct rm_mesh_sensor_srv_descriptor_info_t

Sensor Descriptor state represents the attributes describing the sensor data

Data Fields

uint16_t	sensor_property_id	Sensor Property ID field is a 2-octet value referencing a device property that describes the meaning and the format of data reported by a sensor
uint16_t	sensor_positive_tolerance	Sensor Positive Tolerance field is a 12-bit value representing the magnitude of a possible positive error associated with the measurements that the sensor is reporting
uint16_t	sensor_negative_tolerance	Sensor Negative Tolerance field is a 12-bit value representing the magnitude of a possible negative error associated with the measurements that the sensor is reporting
uint8_t	sensor_sampling_function	Sensor Sampling Function field specifies the averaging operation or type of sampling function applied to the measured value
uint8_t	sensor_measurement_period	Sensor Measurement Period field specifies a uint8 value n that represents the averaging time span, accumulation time, or measurement period in seconds over which the measurement is taken
uint8_t	sensor_update_interval	measurement reported by a sensor is internally refreshed at

		the frequency indicated in the Sensor Update Interval field
uint8_t	status	Status - used in response to indicate if other fields to be included

◆ rm_mesh_sensor_srv_settings_info_t

struct rm_mesh_sensor_srv_settings_info_t		
Sensor Settings state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t *	setting_property_ids	Property ID of a setting within a sensor
uint16_t	setting_property_ids_count	

◆ rm_mesh_sensor_srv_setting_info_t

struct rm_mesh_sensor_srv_setting_info_t		
Sensor Setting state controls parameters of a sensor		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint16_t	sensor_setting_property_id	Property ID of a setting within a sensor
uint8_t	sensor_setting_access	Read/Write access rights for the setting
uint8_t *	sensor_setting_raw	Raw value of a setting within a sensor
uint16_t	sensor_setting_raw_len	
uint8_t	status	

◆ rm_mesh_sensor_srv_cadence_info_t

struct rm_mesh_sensor_srv_cadence_info_t		
Sensor Cadence state controls the cadence of sensor reports		
Data Fields		
uint16_t	sensor_property_id	Property ID of a sensor
uint8_t	fast_cadence_period_divisor	Divisor for the Publish Period
uint8_t	status_trigger_type	Defines the unit and format of the Status Trigger Delta fields
uint8_t *	status_trigger_delta_down	Delta down value that triggers a status message
uint16_t	status_trigger_delta_down_len	

uint8_t *	status_trigger_delta_up	Delta up value that triggers a status message
uint16_t	status_trigger_delta_up_len	
uint8_t	status_min_interval	Minimum interval between two consecutive Status messages APPLICATION NOTE: The Current Sensor Server Model implementation does not inherently check for the time interval between two consecutive status messages. The application layer which manages the data for the Sensor Server Model holds the responsibility for interleaving consecutive status messages with the configured Minimum time interval for statuses.
uint8_t *	fast_cadence_low	Low value for the fast cadence range
uint16_t	fast_cadence_low_len	
uint8_t *	fast_cadence_high	High value for the fast cadence range
uint16_t	fast_cadence_high_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_data_info_t

struct rm_mesh_sensor_srv_data_info_t		
The Sensor Data state is a sequence of one or more pairs of Sensor Property ID and Raw Value fields, with each Raw Value field size and representation defined by the characteristics referenced by the Sensor Property ID		
Data Fields		
uint16_t	property_id_1	ID of the 1st device property of the sensor
uint8_t *	raw_value_1	Raw Value field with a size and representation defined by the 1st device property
uint16_t	raw_value_1_len	
uint16_t	property_id_2	ID of the 2nd device property of the sensor
uint8_t *	raw_value_2	Raw Value field with a size and representation defined by the 2nd device property
uint16_t	raw_value_2_len	

uint16_t	property_id_n	ID of the nth device property of the sensor
uint8_t *	raw_value_n	Raw Value field with a size and representation defined by the nth device property
uint16_t	raw_value_n_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_series_column_info_t

struct rm_mesh_sensor_srv_series_column_info_t		
Values measured by sensors may be organized as arrays (and represented as series of columns, such as histograms		
Data Fields		
uint16_t	sensor_property_id	Property describing the data series of the sensor
uint8_t *	sensor_raw_value_x	Raw value representing the left corner of a column on the X axis
uint16_t	sensor_raw_value_x_len	
uint8_t *	sensor_column_width	Raw value representing the width of the column
uint16_t	sensor_column_width_len	
uint8_t *	sensor_raw_value_y	Raw value representing the height of the column on the Y axis
uint16_t	sensor_raw_value_y_len	
uint8_t	status	Status - used in response path

◆ rm_mesh_sensor_srv_instance_ctrl_t

struct rm_mesh_sensor_srv_instance_ctrl_t
BLE mesh sensor instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_SENSOR_SRV_Open() is called.

Function Documentation

◆ RM_MESH_SENSOR_SRV_Open()

fsp_err_t RM_MESH_SENSOR_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Sensor Server model and to initialize Sensor_Setup Server model. This is to initialize Sensor Server model and to register with Access layer. And this is to initialize Sensor_Setup Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_SENSOR_SRV_Open(&g_mesh_sensor_srv0_ctrl, &g_mesh_sensor_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_SENSOR_SRV_Close()

fsp_err_t RM_MESH_SENSOR_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Sensor Server model. This is to terminate Sensor Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_SENSOR_SRV_Close(&g_mesh_sensor_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_SENSOR_SRV_StateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_SENSOR_SRV_StateUpdate(&g_mesh_sensor_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_SENSOR_SRV_SetupServerStateUpdate()

fsp_err_t RM_MESH_SENSOR_SRV_SetupServerStateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Parameters

[in]	p_ctrl	rm_mesh_sensor_srv control block.
[in]	p_state	To send reply for a request or to inform change in state.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

fsp_err_t	RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl)
fsp_err_t	RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const p_ctrl, void const *const p_parameter)

Detailed Description

Overview

Target Devices

The BLE Mesh Network Time Client module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_mesh_time_clt

The following build time configurations are defined in fsp_cfg/rm_mesh_time_clt_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Model Time Client (rm_mesh_time_clt).

Configuration	Options	Default	Description
Interrupts			
Callback Provided when Timeout Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time client ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_clt0	Module name.

Data Structures

struct	rm_mesh_time_clt_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_time_clt_instance_ctrl_t

struct rm_mesh_time_clt_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_CLT_Open() is called.

Function Documentation

◆ RM_MESH_TIME_CLT_Open()

fsp_err_t RM_MESH_TIME_CLT_Open (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_client_cfg_t const *const *p_cfg*)

Open Time Client middleware. This is to initialize Time Client model and to register with Access layer.

Implements rm_ble_mesh_model_client_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_CLT_Open(&g_mesh_time_clt0_ctrl, &g_mesh_time_clt0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_CLT_Close()

fsp_err_t RM_MESH_TIME_CLT_Close (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Close Time Client middleware.

Implements rm_ble_mesh_model_client_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_CLT_Close(&g_mesh_time_clt0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_CLT_GetModelHandle()

fsp_err_t RM_MESH_TIME_CLT_GetModelHandle (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_model_handle_t *const *p_model_handle*)

This is to get the handle of Time client model.

Implements rm_ble_mesh_model_client_api_t::getModelHandle.

Example:

```
/* Get the handle of time client model. */
   err = RM_MESH_TIME_CLT_GetModelHandle(&g_mesh_time_clt0_ctrl, &model_handle);
```

Return values

FSP_SUCCESS	Got model handle successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_POINTER	The parameter p_model_handle is NULL.

◆ RM_MESH_TIME_CLT_SendReliablePdu()

fsp_err_t RM_MESH_TIME_CLT_SendReliablePdu (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, uint32_t *req_opcode*, void const *const *p_parameter*, uint32_t *rsp_opcode*)

This is to initialize sending acknowledged commands.

Implements rm_ble_mesh_model_client_api_t::sendReliablePdu.

Example:

```
/* Initialize sending acknowledged commands. */
   err = RM_MESH_TIME_CLT_SendReliablePdu(&g_mesh_time_clt0_ctrl, req_opcode,
p_parameter, rsp_opcode);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Get()

fsp_err_t RM_MESH_TIME_CLT_Get (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Get is a message used to get the Time state of neighbor nodes. The response to the Time Get message is a Time Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_Set()

fsp_err_t RM_MESH_TIME_CLT_Set (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Set is an acknowledged message used to set the Time state of an element. The response to the Time Set message is a Time Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneGet()

fsp_err_t RM_MESH_TIME_CLT_ZoneGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Zone Get is an acknowledged message used to get the Time Zone Offset Current state, the Time Zone Offset New state , and the TAI of Zone Change state. The response to the Time Zone Get message is a Time Zone Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_ZoneSet()

fsp_err_t RM_MESH_TIME_CLT_ZoneSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Zone Set is an acknowledged message used to set the Time Zone Offset New state and the TAI of Zone Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Zone Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaGet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

TAI-UTC Delta Get is an acknowledged message used to get the TAI-UTC Delta Current state, the TAI-UTC Delta New state, and the TAI of Delta Change state. The response to the TAI-UTC Delta Get message is a TAI-UTC Delta Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_TaiUtcDeltaSet()

fsp_err_t RM_MESH_TIME_CLT_TaiUtcDeltaSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

TAI-UTC Delta Set is an acknowledged message used to set the TAI-UTC Delta New state and the TAI of Delta Change state.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to TAI-UTC Delta Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleGet()

fsp_err_t RM_MESH_TIME_CLT_RoleGet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*)

Time Role Get is an acknowledged message used to get the Time Role state of an element. The response to the Time Role Get message is a Time Role Status message. There are no parameters for this message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

◆ RM_MESH_TIME_CLT_RoleSet()

fsp_err_t RM_MESH_TIME_CLT_RoleSet (rm_ble_mesh_model_client_ctrl_t *const *p_ctrl*, void const *const *p_parameter*)

Time Role Set is an acknowledged message used to set the Time Role state of an element. The response to the Time Role Set message is a Time Role Status message.

Parameters

[in]	p_ctrl	rm_mesh_time_clt control block.
[in]	p_parameter	Pointer to Time Role Set message.

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_INVALID_POINTER	The parameter p_parameter is NULL.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Callback Provided when an Timeout ISR Occurs	Name Must Be a Valid C Symbol	NULL	Callback provided when mesh time server timeout ISR occurs
Name	Name Must Be a Valid C Symbol	g_rm_mesh_time_srv0	Module name.

Data Structures

struct	rm_mesh_time_srv_info_t
struct	rm_mesh_time_srv_zone_info_t
struct	rm_mesh_time_srv_tai_utc_delta_info_t
struct	rm_mesh_time_srv_role_info_t
struct	rm_mesh_time_srv_instance_ctrl_t

Data Structure Documentation

◆ rm_mesh_time_srv_info_t

struct rm_mesh_time_srv_info_t		
Mesh defines times based on International Atomic Time (TAI). The base representation of times is the number of seconds after 00:00:00 TAI on 2000-01-01 (that is, 1999-12-31T23:59:28 UTC)		
Data Fields		
uint8_t	tai_seconds[5]	Current TAI time in seconds since the epoch.
uint8_t	subsecond	The sub-second time in units of 1/256s.
uint8_t	uncertainty	Estimated uncertainty in 10-millisecond steps.
uint8_t	time_authority	0 = No Time Authority. The element does not have a trusted OOB source of time, such as GPS or NTP. 1 = Time Authority. The element has a trusted OOB source of time, such as GPS or NTP or a battery-backed, properly initialized RTC.
uint16_t	tai_utc_delta	Current difference between TAI and UTC in seconds
uint8_t	time_zone_offset	The local time zone offset in 15-minute increments

◆ rm_mesh_time_srv_zone_info_t

struct rm_mesh_time_srv_zone_info_t		
Time Zone		
Data Fields		
uint8_t	time_zone_offset_current	Current local time zone offset. Meaningful only in 'Time Zone Status' response.
uint8_t	time_zone_offset_new	Upcoming local time zone offset.
uint8_t	tai_of_zone_change[5]	Absolute TAI time when the Time Zone Offset will change from Current to New.

◆ rm_mesh_time_srv_tai_utc_delta_info_t

struct rm_mesh_time_srv_tai_utc_delta_info_t
TAI-UTC Delta

Data Fields		
uint16_t	tai_utc_delta_current	Current difference between TAI and UTC in seconds. Meaningful only in 'TAI-UTC Delta Status' response.
uint16_t	tai_utc_delta_new	Upcoming difference between TAI and UTC in seconds.
uint8_t	padding	Always 0b0. Other values are Prohibited.
uint8_t	tai_of_delta_change[5]	TAI Seconds time of the upcoming TAI-UTC Delta change

◆ rm_mesh_time_srv_role_info_t

struct rm_mesh_time_srv_role_info_t		
The Time Role state of an element		
Data Fields		
uint8_t	role	Time Role

◆ rm_mesh_time_srv_instance_ctrl_t

struct rm_mesh_time_srv_instance_ctrl_t
BLE mesh time instance control block. DO NOT INITIALIZE. Initialization occurs when RM_MESH_TIME_SRV_Open() is called.

Function Documentation

◆ RM_MESH_TIME_SRV_Open()

fsp_err_t RM_MESH_TIME_SRV_Open (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_model_server_cfg_t const *const *p_cfg*)

API to initialize Time Server model. This is to initialize Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::open.

Example:

```
/* Open the module. */
   err = RM_MESH_TIME_SRV_Open(&g_mesh_time_srv0_ctrl, &g_mesh_time_srv0_cfg);
```

Return values

FSP_SUCCESS	Model opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Model is already open.
FSP_ERR_NOT_FOUND	The number of models has exceeded the limit.
FSP_ERR_ABORTED	Model initialization is failed.

◆ RM_MESH_TIME_SRV_Close()

fsp_err_t RM_MESH_TIME_SRV_Close (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*)

API to terminate Time Server model. This is to terminate Time Server model and to register with Access layer.

Implements rm_ble_mesh_model_server_api_t::close.

Example:

```
/* Close the module. */
   err = RM_MESH_TIME_SRV_Close(&g_mesh_time_srv0_ctrl);
```

Return values

FSP_SUCCESS	Model successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Model is not open.

◆ RM_MESH_TIME_SRV_StateUpdate()

fsp_err_t RM_MESH_TIME_SRV_StateUpdate (rm_ble_mesh_model_server_ctrl_t *const *p_ctrl*, rm_ble_mesh_access_server_state_t const *const *p_state*)

API to send reply or to update state change. This is to send reply for a request or to inform change in state.

Implements rm_ble_mesh_model_server_api_t::stateUpdate.

Example:

```
/* Update server status. */
   err = RM_MESH_TIME_SRV_StateUpdate(&g_mesh_time_srv0_ctrl, &state);
```

Return values

FSP_SUCCESS	Updated server status successfully.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_state is NULL.
FSP_ERR_NOT_OPEN	Model is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_APPROXIMATION	Lower layer is invalid state.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_ADDRESS	Invalid source address.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_ABORTED	Operation is failed.

Detailed Description

Overview

Target Devices

The BLE Mesh Network Upper Trans module supports the following devices.

- RA4W1

Configuration

Build Time Configurations for rm_ble_mesh_upper_trans

The following build time configurations are defined in fsp_cfg/rm_ble_mesh_upper_trans_cfg.h:

Configuration	Options	Default	Description

Configurations for Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans)

This module can be added to the Stacks tab via New Stack > Networking > BLE Mesh Network modules > BLE Mesh Upper Trans (rm_ble_mesh_upper_trans).

Configuration	Options	Default	Description
General			

Name	Name Must Be a Valid C Symbol	g_rm_ble_mesh_upper_trans0	Module name.
Channel Number	Invalid Channel Number	0	Select channel corresponding to the channel number of the hardware.
Control Message Event Enable	• Enabled • Disabled	Disabled	Whether to enable the control message event or not.
Access Message Event Enable	• Enabled • Disabled	Disabled	Whether to enable the access message event or not.
Callback	Name Must Be a Valid C Symbol	NULL	Callback function name.

Data Structures

struct	rm_ble_mesh_upper_trans_instance_ctrl_t

Data Structure Documentation

◆ rm_ble_mesh_upper_trans_instance_ctrl_t

struct rm_ble_mesh_upper_trans_instance_ctrl_t
RM_BLE_MESH_UPPER_TRANS private control block. DO NOT MODIFY. Initialization occurs when RM_BLE_MESH_UPPER_TRANS_Open() is called.

Function Documentation

◆ RM_BLE_MESH_UPPER_TRANS_Open()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Open (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_cfg_t const *const *p_cfg*)

Register Inerface with Transport Layer. This routine registers interface with the Transport Layer. Transport Layer supports single Application, hence this rouine shall be called once.

Implements rm_ble_mesh_upper_trans_api_t::open.

Example:

```
/* Open the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Open(&g_ble_mesh_upper_trans0_ctrl,
&g_ble_mesh_upper_trans0_cfg);
```

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.

◆ RM_BLE_MESH_UPPER_TRANS_Close()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_Close (rm_ble_mesh_provision_ctrl_t *const *p_ctrl*)

Unregister Inerface with Transport Layer. Implements rm_ble_mesh_upper_trans_api_t::close.

Example:

```
/* Close the module. */
   err = RM_BLE_MESH_UPPER_TRANS_Close(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Module successfully closed.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_UPPER_TRANS_SendAccessPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendAccessPdu (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_access_layer_pdu_t const *const *p_access_layer_pdu*, rm_ble_mesh_lower_trans_reliable_t *reliable*)

API to send Access Layer PDUs. This routine sends Access Layer PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendAccessPdu.

Example:

```
/* Send Access Layer PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendAccessPdu(&g_ble_mesh_upper_trans0_ctrl,
                                               &access_layer_pdu,
RM_BLE_MESH_LOWER_TRANS_RELIABLE_ENABLE);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_access_layer_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_SendControlPdu()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SendControlPdu (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_pdu_t const *const *p_control_pdu*)

API to send transport Control PDUs. This routine sends transport Control PDUs to peer device.

Implements rm_ble_mesh_upper_trans_api_t::sendControlPdu.

Example:

```
/* Send Upper Transport control PDUs. */
   err = RM_BLE_MESH_UPPER_TRANS_SendControlPdu(&g_ble_mesh_upper_trans0_ctrl,
&control_pdu);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_control_pdu is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friendship_setting_t const *const *p_setting*)

API to setup Friendship. This routine is used by the device acting as a low power node to setup a friendship procedure to any available friend nodes.

Implements rm_ble_mesh_upper_trans_api_t::lpnSetupFriendship.

Example:

```
/* Setup friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnSetupFriendship(&g_ble_mesh_upper_trans0_ctrl,
&setting);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_setting is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Lower layer is invalid state.

◆ RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

API to terminate friendship. This routine is used by the device acting as a low power node terminate friendship with an active Friend node.

Implements rm_ble_mesh_upper_trans_api_t::lpnClearFriendship.

Example:

```
/* Terminate friendship. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnClearFriendship(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_control_opcode_t *action*, uint16_t const *const *p_addr_list*, uint16_t *count*)

API to manage friend subscription list. This routine is used by the device acting as a low power node add/remove addresses to/from the friends subscription list.

Implements rm_ble_mesh_upper_trans_api_t::lpnManageSubscription.

Example:

```
/* Manage friend subscription list. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnManageSubscription(&g_ble_mesh_upper_trans0_ctrl,
 RM_BLE_MESH_UPPER_TRANS_CONTROL_OPCODE_FRIEND_POLL,
                                                &addr_list,
                                                count);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_addr_list is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.

◆ RM_BLE_MESH_UPPER_TRANS_LpnPoll()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnPoll (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To trigger Friend Poll from application. This routine enables the application to trigger a Friend Poll even before the expiry of an active poll period configured during the friendship establishment. The poll peroid will get reset at this point.

Implements rm_ble_mesh_upper_trans_api_t::lpnPoll.

Example:

```
/* Trigger friend poll from application. */
   err = RM_BLE_MESH_UPPER_TRANS_LpnPoll(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle*)

To check if address matches with any of the LPN. This routine checks if destination address in a received packet matches with any of the known element address of LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnElementAddress.

Example:

```
/* Check if address matches with any of the LPN. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnElementAddress(&g_ble_mesh_upper_trans0_ctrl, addr,
&lpn_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *addr*, rm_ble_mesh_lower_trans_lpn_handle_t *const *p_lpn_handle*)

To check if valid subscription address of an LPN to receive a packet. This routine checks if destination address in a received packet matches with any of the known subscription address of an LPN.

Implements rm_ble_mesh_upper_trans_api_t::isValidLpnSubscriptionAddress.

Example:

```
/* Check if valid subscription address of an LPN to receive a packet. */
   err =
RM_BLE_MESH_UPPER_TRANS_IsValidLpnSubscriptionAddress(&g_ble_mesh_upper_trans0_ctrl,
addr, &lpn_handle);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_lpn_handle is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_FOUND	Input parameter is not found.

◆ RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_address_t *lpn_addr*, uint32_t *const *p_poll_timeout*)

To get Poll Timeout of an LPN. This routine checks if LPN address is valid and then returns Poll Timeout configured for the LPN.

Implements rm_ble_mesh_upper_trans_api_t::getLpnPolltimeout.

Example:

```
/* Get poll timeout of an LPN. */
   err = RM_BLE_MESH_UPPER_TRANS_GetLpnPolltimeout(&g_ble_mesh_upper_trans0_ctrl,
addr, &poll_timeout);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_poll_timeout is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_friend_role_t *role*, uint16_t *lpn_index*, rm_ble_mesh_upper_trans_friendship_info_t *const *p_node*)

To get the LPN node information. This routine fetches the node information of the LPN element at the given index

Implements rm_ble_mesh_upper_trans_api_t::getFriendshipInfo.

Example:

```
/* Get the LPN node information. */
   err = RM_BLE_MESH_UPPER_TRANS_GetFriendshipInfo(&g_ble_mesh_upper_trans0_ctrl,
RM_BLE_MESH_UPPER_TRANS_FRIEND_ROLE_FRIEND,
                                                   lpn_index,
                                                   &node);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_node is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_network_subnet_handle_t *subnet_handle*, uint8_t *flag*, uint32_t *ivindex*)

To add the security update information. This routine updates the security state of the network to all the active LPN elements. This will be forwarded to the elements when it polls for the next packet available.

Implements rm_ble_mesh_upper_trans_api_t::lpnRegisterSecurityUpdate.

Example:

```
/* Add the security update information. */
   err =
RM_BLE_MESH_UPPER_TRANS_LpnRegisterSecurityUpdate(&g_ble_mesh_upper_trans0_ctrl,
subnet_handle, flag, ivindex);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_ClearAllLpn()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_ClearAllLpn (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*)

To clear information related to all LPNs. This routine clears information related to all LPNs.

Implements rm_ble_mesh_upper_trans_api_t::clearAllLpn.

Example:

```
/* Clear information related to all LPNs. */
   err = RM_BLE_MESH_UPPER_TRANS_ClearAllLpn(&g_ble_mesh_upper_trans0_ctrl);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info*)

To set the Heartbeat publication data. This routine configures the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatPublication.

Example:

```
 /* Set the heartbeat publication data. */
    err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_publication_info_t *const *p_info*)

To get the Heartbeat publication data. This routine retrieves the Heartbeat publication information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatPublication.

Example:

```
/* Get the heartbeat publication data. */
   err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatPublication(&g_ble_mesh_upper_trans0_ctrl,
&ut_hp_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info*)

To set the Heartbeat subscription data. This routine configures the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::setHeartbeatSubscription.

Example:

```
/* Set the heartbeat subscription data. */
   err =
RM_BLE_MESH_UPPER_TRANS_SetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ADDRESS	Invalid source address.

◆ RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription (
rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*,
rm_ble_mesh_upper_trans_heartbeat_subscription_info_t *const *p_info*)

To get the Heartbeat subscription data. This routine retrieves the Heartbeat subscription information

Implements rm_ble_mesh_upper_trans_api_t::getHeartbeatSubscription.

Example:

```
/* Get the heartbeat subscription data. */
   err =
RM_BLE_MESH_UPPER_TRANS_GetHeartbeatSubscription(&g_ble_mesh_upper_trans0_ctrl,
&ut_hs_info);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_INVALID_POINTER	The parameter p_info is NULL.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat()

fsp_err_t RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat (rm_ble_mesh_upper_trans_ctrl_t *const *p_ctrl*, uint8_t *change_in_feature_bit*)

To trigger Heartbeat send on change in feature. This routine triggers the Heartbeat send on change in state of supported features.

Implements rm_ble_mesh_upper_trans_api_t::triggerHeartbeat.

Example:

```
/* Trigger heartbeat send on change in feature. */
   err = RM_BLE_MESH_UPPER_TRANS_TriggerHeartbeat(&g_ble_mesh_upper_trans0_ctrl,
change_in_feature_bit);
```

Return values

FSP_SUCCESS	Operation succeeded.
FSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input parameter is invalid.
FSP_ERR_OUT_OF_MEMORY	Memory allocation is failed.
FSP_ERR_OVERFLOW	TX queue is full.
FSP_ERR_UNDERFLOW	TX queue is empty.
FSP_ERR_NOT_FOUND	Input parameter is not found.
FSP_ERR_INVALID_POINTER	The internal parameter is NULL.

5.2.12.12 Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Modules » Networking

Detailed Description

Middleware implementing the AWS Cellular Comm Interface for the FSP UART API.

Overview

See AWS documentation for how the Cellular Comm Interface works: https://www.freertos.org/Documentation/api-ref/cellular/cellular_porting.html#cellular_porting_comm_if

Configuration

Note

Using DTC with UART is recommended to reduce the number of interrupts in the system.

Build Time Configurations for rm_cellular_comm_uart_aws

The following build time configurations are defined in fsp_cfg/middleware/rm_cellular_comm_uart_aws_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	Selects if code for parameter checking is to be included in the build.
Receive Buffer	Size should be greater than zero	256	Temporary buffer for received bytes. When read function is called reamaining bytes will be read directly into buffer specified by read function argument.
Receive Transfer Size	Size should be greater than zero	512	The comm interface will break down UART reads into smaller read requests based on this number. For instance if this is set to 512 bytes then the interface will request 512 bytes at a time until the

requested length is met or timeout. This is helpful for making use of DTC without having a long timeout period. AWS Cellular Interface Common->Comm Interface Receive Timeout is the timeout used for individual reads and should set accordingly based on this setting.

Configurations for Networking > Cellular Comm Interface on UART (rm_cellular_comm_uart_aws)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_cellular_comm_uart0	Module name.

Function Documentation

◆ RM_CELLULAR_COMM_UART_AWS_Open()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Open (rm_cellular_comm_uart_aws_instance_ctrl_t * *p_instance_ctrl*, CellularCommInterfaceReceiveCallback_t *receive_callback*, void * *pUserData*)

Implements open for CellularCommInterface_t

Parameters

[in]	receive_callback	Callback to call upon receiving data
[in]	pUserData	Pointer to user data to be passed through callback
[in]	p_instance_ctrl	Pointer to a rm_cellular_comm_uart_aws_instance_ctrl_t

Return values

IOT_COMM_INTERFACE_SUCCESS	Open succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Send()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Send (CellularCommInterfaceHandle_t *commInterfaceHandle*, const uint8_t * *pData*, uint32_t *dataLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataSentLength*)

Implements send for CellularCommInterface_t. This function will block the calling thread until data is sent.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pData	Pointer to data to send
[in]	dataLength	Length of data to send
[in]	timeoutMilliseconds	Timeout in MS to wait for data to send
[in]	pDataSentLength	Actual length of data sent

Return values

IOT_COMM_INTERFACE_SUCCESS	Send succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure
IOT_COMM_INTERFACE_TIMEOUT	Send operation timed out

◆ RM_CELLULAR_COMM_UART_AWS_Receive()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Receive (CellularCommInterfaceHandle_t *commInterfaceHandle*, uint8_t * *pBuffer*, uint32_t *bufferLength*, uint32_t *timeoutMilliseconds*, uint32_t * *pDataReceivedLength*)

Implements receive for CellularCommInterface_t. This function will block the calling thread until data is received.

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open
[in]	pBuffer	Pointer to buffer to receive to
[in]	bufferLength	Length of buffer
[in]	timeoutMilliseconds	Timeout in MS to wait for data reception
[in]	pDataReceivedLength	Actual length of data received

Return values

IOT_COMM_INTERFACE_SUCCESS	Receieve succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure
IOT_COMM_INTERFACE_DRIVER_ERROR	Lower level failure

◆ RM_CELLULAR_COMM_UART_AWS_Close()

CellularCommInterfaceError_t RM_CELLULAR_COMM_UART_AWS_Close (CellularCommInterfaceHandle_t *commInterfaceHandle*)

Implements close for CellularCommInterface_t

Parameters

[in]	commInterfaceHandle	CellularCommInterfaceHandle_t assigned in open

Return values

IOT_COMM_INTERFACE_SUCCESS	Close succeeded
IOT_COMM_INTERFACE_BAD_PARAMETER	Bad parameter was passed in
IOT_COMM_INTERFACE_FAILURE	General failure

◆ comm_uart_aws_callback()

void comm_uart_aws_callback (uart_callback_args_t * *p_args*)
Callback for UART driver **Parameters** [in] p_args — Arguments from UART RX/TX callback

5.2.12.13 DA16XXX Transport Layer (rm_at_transport_da16xxx_uart)

Modules » Networking

Functions

void	rm_at_transport_da16xxx_uart_callback (uart_callback_args_t *p_args)

fsp_err_t	rm_at_transport_da16xxx_uartClose (at_transport_da16xxx_ctrl_t *const p_ctrl)

Detailed Description

Transport layer implementation for linking DA16XXX Drivers with Communications layer.

Overview

This Transport Layer provides an abstraction interface between the DA16XXX driver and communications layers. Currently, the module supports only UART, but will support SPI in future.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

- Configuring internal send/receive buffers.
- Providing thread-safe access to the communications interface (mutex) when sending AT commands.
- Implementing AT command send function based on user communication option (UART or SPI (future)). This function must be able to check the module response.
- Implement a receive function based on user communication option (UART or SPI (future)). Handles income data from the communications interface and stacks it on an internal buffer.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Configuration

Build Time Configurations for rm_at_transport_da16xxx_uart

The following build time configurations are defined in fsp_cfg/rm_at_transport_da16xxx_uart_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Interrupt Configuration

Refer to UART (r_sci_uart).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart).

Usage Notes

- This module is not designed to be used directly, users will access this module via the DA16XXX driver

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Data Structures

struct	at_transport_da16xxx_extended_cfg_t
struct	at_transport_da16xxx_instance_ctrl_t

Data Structure Documentation

◆ at_transport_da16xxx_extended_cfg_t

struct at_transport_da16xxx_extended_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uart_instance_t *	uart_instances[AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.

◆ at_transport_da16xxx_instance_ctrl_t

struct at_transport_da16xxx_instance_ctrl_t	
AT_TRANSPORT_DA16XXX private control block. DO NOT MODIFY.	
Data Fields	
at_transport_da16xxx_cfg_t const *	p_cfg
	Pointer to initial configurations.

uint32_t	num_uarts
	number of UARTS currently used for communication with module
uint32_t	curr_cmd_port
	Current UART instance index for AT commands.
uint32_t	open
	Flag to indicate if transport instance has been initialized.
uint8_t	cmd_rx_queue_buf [AT_TRANSPORT_DA16XXX_CFG_CMD_RX_BUF_SIZE]
	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl
	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct
	Structure to hold stream buffer info.
SemaphoreHandle_t	tx_sem
	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem
	Receive binary semaphore handle.
SemaphoreHandle_t	uart_tei_sem [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]
	UART transmission end binary semaphore.

uart_instance_t *	uart_instance_objects [AT_TRANSPORT_DA16XXX_CFG_MAX_NUMBER_UART_PORTS]
	UART instance object.
const bsp_io_port_pin_t	reset_pin
	Reset pin used for module.
bool(*	p_callback)(at_transport_da16xxx_callback_args_t *p_args)
	Pointer to callback function.
void *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ rm_at_transport_da16xxx_uart_callback()

void rm_at_transport_da16xxx_uart_callback (uart_callback_args_t * *p_args*)

UART Callback routine.

Parameters

[in]	p_args	Pointer to uart callback structure.

◆ rm_at_transport_da16xxx_uartOpen()

fsp_err_t rm_at_transport_da16xxx_uartOpen (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_DA16XXX Middleware module.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	WIFI_DA16XXX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_OUT_OF_MEMORY	There is no more heap memory available.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed.

◆ rm_at_transport_da16xxx_uart_atCommandSendThreadSafe()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSendThreadSafe (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd*)

Send an AT command with testing for return response.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_at_cmd	Pointer to AT command data structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

◆ rm_at_transport_da16xxx_uart_atCommandSend()

fsp_err_t rm_at_transport_da16xxx_uart_atCommandSend (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_data_t * *p_at_cmd*)

Send and receive an AT command with testing for return. Thread-Safe

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_at_cmd	Pointer to Transport layer instance data structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Assertion error occurred.

◆ rm_at_transport_da16xxx_uart_giveMutex()

fsp_err_t rm_at_transport_da16xxx_uart_giveMutex (at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag*)

Give the mutex for the send basic call.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	mutex_flag	Flags for the mutex.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred giving the mutex.

◆ rm_at_transport_da16xxx_uart_takeMutex()

fsp_err_t rm_at_transport_da16xxx_uart_takeMutex (at_transport_da16xxx_ctrl_t *const *p_ctrl*, uint32_t *mutex_flag*)

Take the mutex for the send basic call.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	mutex_flag	Flags for the mutex.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred taking the mutex.

◆ rm_at_transport_da16xxx_uart_bufferRecv()

size_t rm_at_transport_da16xxx_uart_bufferRecv (at_transport_da16xxx_ctrl_t *const *p_ctrl*, const char * *p_data*, uint32_t *length*, uint32_t *rx_timeout*)

Receive data from stream buffer.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.
[in]	p_data	Pointer to data.
[in]	length	Data length.
[in]	rx_timeout	Timeout for receiving data on the buffer.

Return values

Number	of bytes pulled from Streambuffer
FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_INVALID_DATA	Accuracy of data is not guaranteed

◆ rm_at_transport_da16xxx_statusGet()

fsp_err_t rm_at_transport_da16xxx_statusGet (at_transport_da16xxx_ctrl_t *const *p_ctrl*, at_transport_da16xxx_status_t * *p_status*)

Gets the status of the configured DA16xxx transport.

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.

◆ rm_at_transport_da16xxx_uartClose()

fsp_err_t rm_at_transport_da16xxx_uartClose (at_transport_da16xxx_ctrl_t *const *p_ctrl*)

Closes the AT Transport DA16XXX Middleware module.

Parameters

[in]	p_ctrl	Pointer to Transport layer instance control structure.

Return values

FSP_SUCCESS	WIFI_DA16XXX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The Transport layer instance is not open.

5.2.12.14 EtherCAT SSC Port (rm_ethercat_ssc_port)

Modules » Networking

Functions

fsp_err_t RM_ETHERCAT_SSC_PORT_Open (ethercat_ssc_port_ctrl_t *const p_ctrl, ethercat_ssc_port_cfg_t const *const p_cfg)

EtherCAT Slave Controller is initialized with this function. This function includes PHY initialization and ESC EEPROM loading. Afterwards, EtherCAT communication begins. Also EtherCAT interrupts are permitted if the interrupts are used. In order to receive the EtherCAT, EtherCAT Sync0, EtherCAT Sync1 interrupt event, it's necessary to register a callback function. Implements ethercat_ssc_port_api_t::open. More...

fsp_err_t	RM_ETHERCAT_SSC_PORT_Close (ethercat_ssc_port_ctrl_t *const p_ctrl)

Detailed Description

Middleware for EtherCAT Slave Stack Code (SSC) on RA microprocessors. This module implements the EtherCAT SSC Interface.

Overview

This module provides the hardware port layer for EtherCAT Slave Stack Code. The control target is the EtherCAT Slave Controller (ESC). This module uses the EtherCAT slave stack code generated by the SSC tools provided by Beckhoff Automation GmbH. Users must register as a member of the EtherCAT Technology Group (ETG) to obtain SSC
tools.:
https://www.ethercat.org/en/downloads/downloads_01DCC32A10294F2EA866F7E46FB0285F.htm
After initializing this module, refer to the SSC API reference to use the EtherCAT slave stack. The hardware access layer API referenced from the stack are also implemented. Please include renesashw.h in the stack source file which has hardware access.

Features

The EtherCAT SSC port module supports the following features:

- Number of EtherCAT ports: 2
- Interrupts: EtherCAT interrupt, Sync0 interrupt, Sync1 interrupt
- Hardware access layer specified by SSC (including timer)
- Initialize ESC and PHY to enable EtherCAT communication

Configuration

Build Time Configurations for rm_ethercat_ssc_port

The following build time configurations are defined in fsp_cfg/rm_ethercat_ssc_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Phy Link Polarity0	• Active High • Active Low	Active Low	Set the signal porality of CAT0_LINKSTA pin.
Phy Link Polarity1	• Active High • Active Low	Active High	Set the signal porality of CAT1_LINKSTA pin.

Configurations for Networking > EtherCAT SSC Port (rm_ethercat_ssc_port)

This module can be added to the Stacks tab via New Stack > Networking > EtherCAT SSC Port (rm_ethercat_ssc_port).

Configuration	Options	Default	Description

PHY			
Reset Signal Hold Time (ms)	Specify a value between 0x1 and 0xFFFFFFFF.	1	Time to keep the PHY reset signal low.
Reset Wait Time (us)	Specify a value between 0x1 and 0xFFFFFFFF.	15000	Wait time to access the PHY register after the PHY reset signal is released.
Offset Address	Specify a value between 0x0 and 0xFF.	0	The offset address of PHY in case of using the EtherCAT.
Delay Time of TX Signal			
Port 0	• 0 ns • 10 ns • 20 ns • 30 ns	0 ns	Set the amount of delay time for TX signal of the Port 0
Port 1	• 0 ns • 10 ns • 20 ns • 30 ns	0 ns	Set the amount of delay time for TX signal of the Port 1
Interrupts			
EtherCAT Interrupt Priority	MCU Specific Options		Select the EtherCAT interrupt priority.
EtherCAT SYNC0 Interrupt Priority	MCU Specific Options		Select the EtherCAT SYNC0 interrupt priority.
EtherCAT SYNC1 Interrupt Priority	MCU Specific Options		Select the EtherCAT SYNC1 interrupt priority.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs
Name	Name must be a valid C symbol	g_ethercat_ssc_port0	Module name.
EEPROM Size	• Under 32Kbits • Over 32Kbits	Under 32Kbits	Specify whether to use Normal or Inverted.

Clock Configuration

The ESC uses the ESCCLK which is generated by the clock generation circuit and the ESCCLK divided by 4 as CLK100 and CLK25 of the ESC IP Core, respectively.

Set the registers in the clock generation circuit so that the frequency of the ESCCLK becomes 100 MHz. Also, set the registers that the frequency of the ETHPHYCLK signal which is used as the operating clock of a PHY-LSI becomes 25 MHz.

Pin Configuration

The RM_ETHERCAT_SSC_PORT module is used for configuring pins.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the RM_ETHERCAT_SSC_PORT:

- Port configuration is EtherCAT port only.

ETHERCAT SSC Port Basic Example

This is a basic example of minimal use of the ETHERCAT SSC Port in an application.

```
void ethercat_ssc_port_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
 /* Initializes the module before using the EtherCAT Slave Stack. */
 /* The instance of EtherCAT SSC Port instance can be accessed as
gp_ether_cat_ssc_port */
    err = RM_ETHERCAT_SSC_PORT_Open(gp_ethercat_ssc_port->p_ctrl,
gp_ethercat_ssc_port->p_cfg);
 /* Handle any errors. This function should be defined by the user. */
    handle_error(err);
 /* Close the module after using the EtherCAT Slave Stack. */
 RM_ETHERCAT_SSC_PORT_Close(gp_ethercat_ssc_port->p_ctrl);
}
/* Example callback called when EtherCAT interrupt. */
void ethercat_ssc_port_callback (ethercat_ssc_port_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case ETHERCAT_SSC_PORT_EVENT_ESC_CAT_INTERRUPT:
      {
/* ESC CAT Interrupt application */
 break;
       }
 case ETHERCAT_SSC_PORT_EVENT_ESC_SYNC0_INTERRUPT:
      {
```

```
/* ESC SYNC0 Interrupt application */
 break;
       }
 case ETHERCAT_SSC_PORT_EVENT_ESC_SYNC1_INTERRUPT:
      {
/* ESC SYNC1 Interrupt application */
 break;
       }
 default:
      {
 /* Do Nothing! */
       }
    }
}
```

Data Structures

Function Documentation

◆ RM_ETHERCAT_SSC_PORT_Open()

fsp_err_t RM_ETHERCAT_SSC_PORT_Open (ethercat_ssc_port_ctrl_t *const *p_ctrl*, ethercat_ssc_port_cfg_t const *const *p_cfg*)

EtherCAT Slave Controller is initialized with this function. This function includes PHY initialization and ESC EEPROM loading. Afterwards, EtherCAT communication begins. Also EtherCAT interrupts are permitted if the interrupts are used. In order to receive the EtherCAT, EtherCAT Sync0, EtherCAT Sync1 interrupt event, it's necessary to register a callback function. Implements ethercat_ssc_port_api_t::open.

Return values

FSP_SUCCESS	Opened successfully
FSP_ERR_ASSERTION	A required input pointer is NULL
FSP_ERR_ALREADY_OPEN	Control block has already been opened
FSP_ERR_INVALID_ARGUMENT	Irq number lower then 0.
FSP_ERR_INVALID_HW_CONDITION	ESC EEPROM loading error
FSP_ERR_TIMEOUT	ESC EEPROM loading timeout error

◆ RM_ETHERCAT_SSC_PORT_Close()

fsp_err_t RM_ETHERCAT_SSC_PORT_Close (ethercat_ssc_port_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ethercat_ssc_port_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to the control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

Detailed Description

The Ethercat PHY module (r_ethercat_phy) provides an API for standard Ethercat PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY

Interface.

Overview

The Ethercat PHY module is used to setup and manage an external Ethercat PHY device for use with the on-chip Ethercat Slave Controller (ESC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethercat PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Supported Devices

Device Group	Devices
RA8	RA8T2

Configuration

Build Time Configurations for r_ethercat_phy

The following build time configurations are defined in fsp_cfg/r_ethercat_phy_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ICS1894 Target	• Disabled • Enabled	Disabled	Select whether to use ICS1894 Phy LSI or not.
User Own Target	• Disabled • Enabled	Disabled	Select whether to use User own Phy LSI or not.

Configurations for Networking > Ethernet (r_ethercat_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ethercat_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ethercat_phy0	Module name.
Channel	• 0 • 1	0	Select the Ethernet controller channel

			number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	MII	module.driver.ether_phy.mii_type.rmii	Specify to use MII.
PHY-LSI Type	• Kit Component • DEFAULT • ICS1894 • User own PHY	Kit Component	Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board.
Target Init Function	Name must be a valid C symbol	NULL	Set the initial function of the PHY-LSI, When using your own PHY-LSI.
Target Link Partner Ability Get Function	Name must be a valid C symbol	NULL	Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI.
MII Register Access Wait-time	Specify a value between 0x1 and 0x7FFFFFFF.	8	Specify the bit timing for MII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.
Flow Control	• Disable • Enable	Disable	Select whether to enable or disable flow control.

Usage Notes

Note

See the example below for details on how to initialize the Ethercat PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO

pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type		MII and RMII management frame							
	Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ethercat_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - ICS1894

Examples

ETHERCAT PHY Basic Example

This is a basic example of minimal use of the ETHERCAT PHY in an application.

```
void ethercat_phy_basic_example (void)

```

```
{
 fsp_err_t err = FSP_SUCCESS;
    g_ethercat_phy0_ctrl.open   = 0U;
    g_ethercat_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_ETHERCAT_PHY_Open(&g_ethercat_phy0_ctrl, &g_ethercat_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_ETHERCAT_PHY_StartAutoNegotiate(&g_ethercat_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_ETHERCAT_PHY_LinkStatusGet(&g_ethercat_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
    err = R_ETHERCAT_PHY_LinkPartnerAbilityGet(&g_ethercat_phy0_ctrl,
                                               &g_ethercat_phy0_line_speed_duplex,
                                               &g_ethercat_phy0_local_pause,
                                               &g_ethercat_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
    err = R_ETHERCAT_PHY_LinkStatusGet(&g_ethercat_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	ethercat_phy_instance_ctrl_t
struct	ethercat_phy_extended_cfg_t

Enumerations

enum	ethercat_phy_interface_status_t

Data Structure Documentation

◆ ethercat_phy_instance_ctrl_t

struct ethercat_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg	Pointer to initial configurations.
uint32_t	local_advertise	Capabilities bitmap for local advertising.
ethercat_phy_interface_status_t	interface_status	Initialized status of ETHER PHY interface.

◆ ethercat_phy_extended_cfg_t

struct ethercat_phy_extended_cfg_t	
ETHERCAT PHY extended configuration.	
Data Fields	
void(*	p_target_init)(ethercat_phy_instance_ctrl_t *p_instance_ctrl)
	Pointer to callback that is called to initialize the target.
bool(*	p_target_link_partner_ability_get)(ethercat_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex)
	Pointer to callback that is called to get the link partner ability.

Enumeration Type Documentation

◆ ethercat_phy_interface_status_t

enum ethercat_phy_interface_status_t	
Initialization state for read/write	
Enumerator	
ETHERCAT_PHY_INTERFACE_STATUS_UNINITIALIZED	ETHER PHY interface is uninitialized.
ETHERCAT_PHY_INTERFACE_STATUS_INITIALIZED	ETHER PHY interface is initialized.

Function Documentation

◆ R_ETHERCAT_PHY_Open()

fsp_err_t R_ETHERCAT_PHY_Open (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Resets Ethercat PHY device. Implements ether_phy_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.

◆ R_ETHERCAT_PHY_Close()

fsp_err_t R_ETHERCAT_PHY_Close (ether_phy_ctrl_t *const *p_ctrl*)

Close Ethercat PHY device. Implements ether_phy_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHERCAT_PHY_StartAutoNegotiate()

fsp_err_t R_ETHERCAT_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

Return values

FSP_SUCCESS	ETHERCAT_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_ARGUMENT	Register address is incorrect
FSP_ERR_INVALID_MODE	Command is invalid.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHERCAT_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHERCAT_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause*)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

Return values

FSP_SUCCESS	ETHERCAT_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_INVALID_MODE	Command is invalid.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHERCAT_PHY_LinkStatusGet()

fsp_err_t R_ETHERCAT_PHY_LinkStatusGet (ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

Return values

FSP_SUCCESS	ETHERCAT_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_INVALID_MODE	Command is invalid.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHERCAT_PHY_ChipInit()

fsp_err_t R_ETHERCAT_PHY_ChipInit (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Initialize Ethercat PHY device. Implements ether_phy_api_t::chipInit.

Return values

FSP_SUCCESS	PHY device initialized successfully.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block or configuration structure is NULL.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ R_ETHERCAT_PHY_Read()

fsp_err_t R_ETHERCAT_PHY_Read (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data*)

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

Return values

FSP_SUCCESS	ETHERCAT_PHY successfully read data.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_INVALID_ARGUMENT	Address is not a valid size
FSP_ERR_INVALID_MODE	Command is invalid.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHERCAT_PHY_Write()

fsp_err_t R_ETHERCAT_PHY_Write (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data*)

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

Return values

FSP_SUCCESS	ETHERCAT_PHY successfully write data.
FSP_ERR_ASSERTION	Pointer to ETHERCAT_PHY control block is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size
FSP_ERR_INVALID_MODE	Command is invalid.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

5.2.12.16 Ethernet (r_ether)

Modules » Networking

Functions

fsp_err_t	R_ETHER_Open (ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg) After ETHERC, EDMAC and PHY-LSI are reset in software, an auto

	negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open. More...
fsp_err_t	R_ETHER_Close (ether_ctrl_t *const p_ctrl) Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close. More...
fsp_err_t	R_ETHER_BufferRelease (ether_ctrl_t *const p_ctrl) Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease. More...
fsp_err_t	R_ETHER_RxBufferUpdate (ether_ctrl_t *const p_ctrl, void *const p_buffer) Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate. More...
fsp_err_t	R_ETHER_LinkProcess (ether_ctrl_t *const p_ctrl) The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess. More...
fsp_err_t	R_ETHER_WakeOnLANEnable (ether_ctrl_t *const p_ctrl) The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable. More...
fsp_err_t	R_ETHER_Read (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes) Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read. More...
fsp_err_t	R_ETHER_Write (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length) Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write. More...

fsp_err_t	R_ETHER_TxStatusGet (ether_ctrl_t *const p_ctrl, void *const p_buffer_address)
fsp_err_t	R_ETHER_CallbackSet (ether_ctrl_t *const p_api_ctrl, void(*p_callback)(ether_callback_args_t *), void *const p_context, ether_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

Overview

This module performs Ethernet frame transmission and reception using an Ethernet controller and an Ethernet DMA controller.

Features

The Ethernet module supports the following features:

- Transmit/receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Magic packet detection mode support
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support

Supported Devices

Device Group	Devices
RA6	RA6E1, RA6M2, RA6M3, RA6M4, RA6M5
RA8	RA8D1, RA8E1, RA8M1, RA8T1

Configuration

Build Time Configurations for r_ether

The following build time configurations are defined in fsp_cfg/r_ether_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
ET0_LINKSTA Pin Status Flag	• Fall -> Rise • Rise -> Fall	Fall -> Rise	Specify the polarity of the link signal output

			by the PHY-LSI. When 0 is specified, link-up and link-down correspond respectively to the fall and rise of the LINKSTA signal. When 1 is specified, link-up and link-down correspond respectively to the rise and fall of the LINKSTA signal.
Link Signal Change Flag	• Unused • Used	Unused	Use LINKSTA signal for detect link status changes 0 = unused (use PHY-LSI status register) 1 = use (use LINKSTA signal)
Read Buffer Size Checking	• Enabled • Disabled	Disabled	If selected, read buffer size is checked.

Configurations for Networking > Ethernet (r_ether)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ether0	Module name.
Channel	0	0	Select the ether channel number.
MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
Zero-copy Mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
Flow control functionality	• Disable • Enable	Disable	Enable or disable flow control.
Filters			
Multicast Mode	• Disable • Enable	Enable	Enable or disable multicast frame reception.
Promiscuous Mode	• Disable • Enable	Disable	Enable this option to receive packets addressed to other NICs.
Broadcast filter	Must be a valid non-	0	Limit of the number of

	negative integer with maximum configurable value of 65535.		broadcast frames received continuously
Buffers			
Number of TX buffer	Must be an integer from 1 to 8	1	Number of transmit buffers
Number of RX buffer	Must be an integer from 1 to 8	1	Number of receive buffers
Allocate RX buffer	• Disable • Enable	Enable	Allocates the RX buffer when generating the configuration structure
Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Padding size	• Disable • 1 Byte • 2 Bytes • 3 Bytes	Disable	The padding size that is automatically inserted into the received packets
Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
Interrupts			
EESR event	Refer to the RA Configuration tool for available options.	• RFOF • RDE • FR • TFUF • TDE • TC	Select event list for each bit of EESR.
ECSR event	• ICD • MPD • LCHNG • PSRTO • BFR		Select event list for each bit of ECSR.
Interrupt priority	MCU Specific Options		Select the EDMAC interrupt priority.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

Interrupt Configuration

The first R_ETHER_Open function call sets EINT interrupts. The user could provide callback function which would be invoked when EINT interrupt handler has been completed. The callback arguments will contain information about a channel number, the ETHERC and EDMAC status, the event code, and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The clock for this module is derived from the following peripheral clock for each MCU group:

MCU Group	Peripheral Clock
RA4E2	PCLKA
RA4T1	PCLKA
RA6E1	PCLKA
RA6E2	PCLKA
RA6M2	PCLKA
RA6M3	PCLKA
RA6M4	PCLKA
RA6M5	PCLKA
RA6T3	PCLKA

Note

1. *When using ETHERC, the PCLKA frequency is in the range 12.5 MHz <= PCLKA <= 120 MHz.*
2. *When using ETHERC, PCLKA = ICLK.*

Pin Configuration

To use the Ethernet module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_ETHER_Open function.

Usage Notes

Ethernet Frame Format

The Ethernet module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

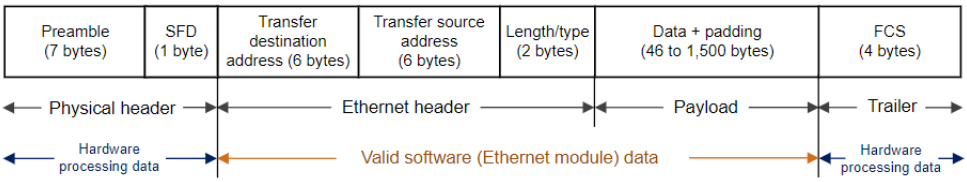

Figure 321: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

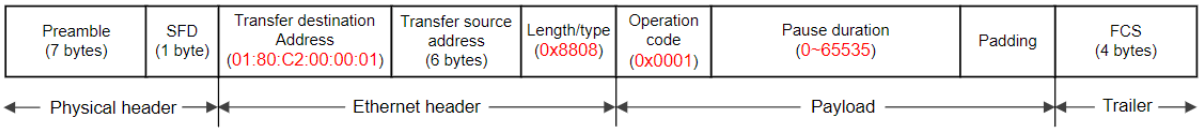

Figure 322: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

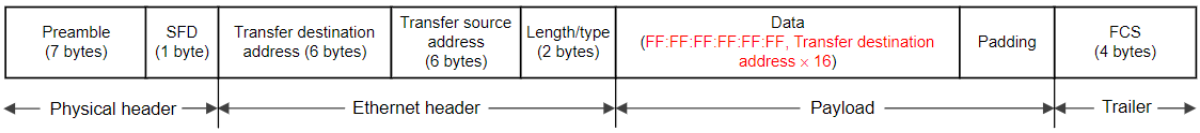

Figure 323: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Limitations

Memory alignment limitation for Ethernet buffer

The Ethernet Driver has several alignment constraints:

- 16-byte alignment for the descriptor
- 32-byte aligned read buffer for R_ETHER_RxBufferUpdate when zero copy mode is enabled

Functional limitations in TrustZone Security Extensions

The Ethernet Driver has several security constraints:

MCU	Has Security Extension	Support Flat project	Support TrustZone project	
			Secure	Non-Secure
RA6M2	-	x	-	-
RA6M3	-	x	-	-

RA6M4	- *1	x	-	x
RA6M5	- *1	x	-	x
RA8M1	x	x	x	x

Note

1. ETHERC/EDMAC is always Non-secure peripheral in this MCU.

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

```

Data Structure Documentation

◆ ether_instance_descriptor_t

struct ether_instance_descriptor_t
EDMAC descriptor as defined in the hardware manual. Structure must be packed at 1 byte.

◆ ether_extended_cfg_t

struct ether_extended_cfg_t		
ETHER extension configures the buffer descriptor for ETHER.		
Data Fields		
ether_instance_descriptor_t *	p_rx_descriptors	Receive descriptor buffer pool.
ether_instance_descriptor_t *	p_tx_descriptors	Transmit descriptor buffer pool.
uint32_t	eesr_event_filter	Filter for EESR related event.
uint8_t	ecsr_event_filter	Filter for ECSR related event.

◆ ether_instance_ctrl_t

struct ether_instance_ctrl_t	
ETHER control block. DO NOT INITIALIZE. Initialization occurs when ether_api_t::open is called.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
ether_cfg_t const *	p_ether_cfg
	Pointer to initial configurations.
ether_instance_descriptor_t *	p_rx_descriptor
	Pointer to the currently referenced transmit descriptor.
ether_instance_descriptor_t *	p_tx_descriptor
	Pointer to the currently referenced receive descriptor.
void *	p_reg_etherc
	Base register of ethernet controller for this channel.
void *	p_reg_edmac
	Base register of EDMA controller for this channel.

ether_previous_link_status_t	previous_link_status
	Previous link status.
ether_link_change_t	link_change
	status of link change
ether_magic_packet_t	magic_packet
	status of magic packet detection
ether_link_establish_status_t	link_establish_status
	Current Link status.

Enumeration Type Documentation

◆ ether_previous_link_status_t

enum ether_previous_link_status_t	
Enumerator	
ETHER_PREVIOUS_LINK_STATUS_DOWN	Previous link status is down.
ETHER_PREVIOUS_LINK_STATUS_UP	Previous link status is up.
ETHER_PREVIOUS_LINK_STATUS_DOWN	Previous link status is down.
ETHER_PREVIOUS_LINK_STATUS_UP	Previous link status is up.

◆ ether_link_change_t

enum ether_link_change_t	
Enumerator	
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.
ETHER_LINK_CHANGE_NO_CHANGE	Link status is no change.
ETHER_LINK_CHANGE_LINK_DOWN	Link status changes to down.
ETHER_LINK_CHANGE_LINK_UP	Link status changes to up.

◆ ether_magic_packet_t

enum ether_magic_packet_t	
Enumerator	
ETHER_MAGIC_PACKET_NOT_DETECTED	Magic packet is not detected.
ETHER_MAGIC_PACKET_DETECTED	Magic packet is detected.

◆ ether_link_establish_status_t

enum ether_link_establish_status_t	
Enumerator	
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.
ETHER_LINK_ESTABLISH_STATUS_DOWN	Link establish status is down.
ETHER_LINK_ESTABLISH_STATUS_UP	Link establish status is up.

◆ ether_eesr_event_mask_t

enum ether_eesr_event_mask_t
Event mask for EESR register

Enumerator	
ETHER_EESR_EVENT_MASK_CERF	CERF event.
ETHER_EESR_EVENT_MASK_PRE	PRE event.
ETHER_EESR_EVENT_MASK_RTSF	RTSF event.
ETHER_EESR_EVENT_MASK_RTLF	RTLF event.
ETHER_EESR_EVENT_MASK_RRF	PRF event.
ETHER_EESR_EVENT_MASK_RMAF	RMAF event.
ETHER_EESR_EVENT_MASK_TRO	TRO event.
ETHER_EESR_EVENT_MASK_CD	CD event.
ETHER_EESR_EVENT_MASK_DLC	DLC event.
ETHER_EESR_EVENT_MASK_CND	CND event.
ETHER_EESR_EVENT_MASK_RFOF	RFOF event.
ETHER_EESR_EVENT_MASK_RDE	RDE event.
ETHER_EESR_EVENT_MASK_FR	FR event.
ETHER_EESR_EVENT_MASK_TFUF	TFUF event.
ETHER_EESR_EVENT_MASK_TDE	TDE event.
ETHER_EESR_EVENT_MASK_TC	TC event.
ETHER_EESR_EVENT_MASK_ECI	ECI event.
ETHER_EESR_EVENT_MASK_ADE	ADE event.
ETHER_EESR_EVENT_MASK_RFCOF	RFCOF event.
ETHER_EESR_EVENT_MASK_RABT	RABT event.
ETHER_EESR_EVENT_MASK_TABT	TABT event.
ETHER_EESR_EVENT_MASK_TWB	TWB event.

◆ ether_ecsr_event_mask_t

enum ether_ecsr_event_mask_t	
Event mask for ECSR register	
Enumerator	
ETHER_ECSR_EVENT_MASK_ICD	ICD event.
ETHER_ECSR_EVENT_MASK_MPD	MPD event.
ETHER_ECSR_EVENT_MASK_LCHNG	LCHNG event.
ETHER_ECSR_EVENT_MASK_PSRTO	PSRTO event.
ETHER_ECSR_EVENT_MASK_BFR	BFR event.

Function Documentation

◆ R_ETHER_Open()

fsp_err_t R_ETHER_Open (ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg*)

After ETHERC, EDMAC and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to extend config structure or MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Close()

fsp_err_t R_ETHER_Close (ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_BufferRelease()

fsp_err_t R_ETHER_BufferRelease (ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the circular receive buffer list. Implements ether_api_t::bufferRelease.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.

◆ R_ETHER_RxBufferUpdate()

fsp_err_t R_ETHER_RxBufferUpdate (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*)

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_ETHER_RECEIVE_BUFFER_ACTIVE	All descriptor is active.

◆ R_ETHER_LinkProcess()

fsp_err_t R_ETHER_LinkProcess (ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ R_ETHER_WakeOnLANEnable()

fsp_err_t R_ETHER_WakeOnLANEnable (ether_ctrl_t *const *p_ctrl*)

The setting of ETHERC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_ETHER_Read()

fsp_err_t R_ETHER_Read (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes*)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_SIZE	The buffer size is smaller than ether_cfg_t::ether_buffer_size.

◆ R_ETHER_Write()

fsp_err_t R_ETHER_Write (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length*)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_MAGIC_PACKET_MODE	As a Magic Packet is being detected, transmission and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.

◆ R_ETHER_TxStatusGet()

fsp_err_t R_ETHER_TxStatusGet (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address*)

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

Return values

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

◆ R_ETHER_CallbackSet()

fsp_err_t R_ETHER_CallbackSet (ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

fsp_err_t	R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const p_ctrl) Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet. More...
fsp_err_t	R_ETHER_PHY_ChipInit (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg) Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit. More...
fsp_err_t	R_ETHER_PHY_Read (ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t *const p_data) Read data from register of PHY-LSI . Implements ether_phy_api_t::read. More...
fsp_err_t	R_ETHER_PHY_Write (ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t data) Write data to register of PHY-LSI . Implements ether_phy_api_t::write. More...

Detailed Description

The Ethernet PHY module (r_ether_phy) provides an API for standard Ethernet PHY communications applications that use the ETHERC peripheral. It implements the Ethernet PHY Interface.

Overview

The Ethernet PHY module is used to setup and manage an external Ethernet PHY device for use with the on-chip Ethernet Controller (ETHERC) peripheral. It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

Features

The Ethernet PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support

Supported Devices

Device Group	Devices
RA6	RA6E1, RA6M2, RA6M3, RA6M4, RA6M5

RA8	RA8D1, RA8E1, RA8M1, RA8T1

Configuration

Build Time Configurations for r_ether_phy

The following build time configurations are defined in fsp_cfg/r_ether_phy_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
KSZ8091RNB Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8091RNB PHY-LSI or not.
KSZ8041 Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8041 PHY-LSI or not.
DP83620 Target	• Disabled • Enabled	Disabled	Select whether to use DP83620 PHY-LSI or not.
ICS1894 Target	• Disabled • Enabled	Disabled	Select whether to use ICS1894 PHY-LSI or not.
User Own Target	• Disabled • Enabled	Disabled	Select whether to use User own PHY-LSI or not.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Automatic PHY-LSI Initialization	• Enabled • Disabled	Enabled	Select whether to initialize the Ethernet PHY-LSI in the open function.

Configurations for Networking > Ethernet (r_ether_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_ether_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_ether_phy0	Module name.
Channel	• 0 • 1	0	Select the Ethernet controller channel number.
PHY-LSI Address	Specify a value between 0 and 31.	0	Specify the address of the PHY-LSI used.
Default PHY-LSI port	0	0	Specify the default port for PHY-LSI configuration.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	• MII • RMII	RMII	Specify whether to use MII or RMII.
PHY-LSI type	• Kit Component • DEFAULT • KSZ8091RNB • KSZ8041 • DP83620 • ICS1894 • User own PHY	Kit Component	Select the Phy LSI target. Selecting 'Kit Component' will automatically choose the correct option when using a Renesas development board.
Port Custom Init Function	Name must be a valid C symbol	NULL	Set the initial function of the PHY-LSI, When using your own PHY-LSI.
Port Custom Link Partner Ability Get Function	Name must be a valid C symbol	NULL	Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI.
MII/RMII Register Access Wait-time	Specify a value between 0x1 and 0x7FFFFFFF.	8	Specify the bit timing for MII/RMII register accesses during PHY initialization. This value should be adjusted experimentally based on the PHY-LSI used.

Flow Control	• Disable • Enable	Disable	Select whether to enable or disable flow control.

Usage Notes

Note

See the example below for details on how to initialize the Ethernet PHY module.

Accessing the MII and RMII Registers

Use the PIR register to access the MII and RMII registers in the PHY-LSI. Serial data in the MII and RMII management frame format is transmitted and received through the ET0_MDC and ET0_MDIO pins controlled by software.

MII and RMII management frame format

The below table lists the MII and RMII management frame formats.

Access type	MII and RMII management frame							
	Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDD DDDDD DDDDD D	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDD DDDDD DDDDD D	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_ether_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
  - KSZ8091RNB
  - KSZ8041
  - DP83620
  - ICS1894

Examples

ETHER PHY Basic Example

This is a basic example of minimal use of the ETHER PHY in an application.

```
void ether_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_ether_phy0_ctrl.open   = 0U;
    g_ether_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_ETHER_PHY_Open(&g_ether_phy0_ctrl, &g_ether_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_ETHER_PHY_StartAutoNegotiate(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
    err = R_ETHER_PHY_LinkPartnerAbilityGet(&g_ether_phy0_ctrl,
                                            &g_ether_phy0_line_speed_duplex,
                                            &g_ether_phy0_local_pause,
                                            &g_ether_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
```

```
    err = R_ETHER_PHY_LinkStatusGet(&g_ether_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	ether_phy_instance_ctrl_t
struct	ether_phy_extended_cfg_t

Enumerations

enum	ether_phy_interface_status_t

Data Structure Documentation

◆ ether_phy_instance_ctrl_t

struct ether_phy_instance_ctrl_t		
ETHER PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.		
Data Fields		
uint32_t	open	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg	Pointer to initial configurations.
volatile uint32_t *	p_reg_pir	Pointer to ETHERC peripheral registers.
uint32_t	local_advertise	Capabilities bitmap for local advertising.
ether_phy_interface_status_t	interface_status	Initialized status of ETHER PHY interface.

◆ ether_phy_extended_cfg_t

struct ether_phy_extended_cfg_t	
ETHER PHY extended configuration.	
Data Fields	
void(*	p_target_init)(ether_phy_instance_ctrl_t *p_instance_ctrl)
	Pointer to callback that is called to initialize the target.
bool(*	p_target_link_partner_ability_get)(ether_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex)
	Pointer to callback that is called to get the link partner ability.

ether_phy_lsi_cfg_t const *	p_phy_lsi_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS]
	Pointer list of PHY LSI configurations.
uint8_t	default_phy_lsi_cfg_index
	Index of the default PHY LSI condiguration.

Enumeration Type Documentation

◆ ether_phy_interface_status_t

enum ether_phy_interface_status_t	
Initialization state for read/write	
Enumerator	
ETHER_PHY_INTERFACE_STATUS_UNINITIALIZED	ETHER PHY interface is uninitialized.
ETHER_PHY_INTERFACE_STATUS_INITIALIZED	ETHER PHY interface is initialized.

Function Documentation

◆ R_ETHER_PHY_Open()

fsp_err_t R_ETHER_PHY_Open (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.
FSP_ERR_INVALID_ARGUMENT	Register address is incorrect
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized.

◆ R_ETHER_PHY_Close()

fsp_err_t R_ETHER_PHY_Close (ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_ETHER_PHY_StartAutoNegotiate()

fsp_err_t R_ETHER_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

Return values

FSP_SUCCESS	ETHER_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_ARGUMENT	Register address is incorrect
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_LinkPartnerAbilityGet()

fsp_err_t R_ETHER_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause*)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_LinkStatusGet()

fsp_err_t R_ETHER_PHY_LinkStatusGet (ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

Return values

FSP_SUCCESS	ETHER_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_INVALID_ARGUMENT	Status register address is incorrect
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_ChipInit()

fsp_err_t R_ETHER_PHY_ChipInit (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit.

Return values

FSP_SUCCESS	PHY device initialized successfully.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block or configuration structure is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.

◆ R_ETHER_PHY_Read()

fsp_err_t R_ETHER_PHY_Read (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data*)

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

Return values

FSP_SUCCESS	ETHER_PHY successfully read data.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_INVALID_ARGUMENT	Address is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

◆ R_ETHER_PHY_Write()

fsp_err_t R_ETHER_PHY_Write (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data*)

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

Return values

FSP_SUCCESS	ETHER_PHY successfully write data.
FSP_ERR_ASSERTION	Pointer to ETHER_PHY control block is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized

5.2.12.18 Ethernet (r_rmac)

Modules » Networking

Functions

fsp_err_t	R_RMAC_Open (ether_ctrl_t *const p_ctrl, ether_cfg_t const *const p_cfg) After RMAC, Switch and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open. More...
fsp_err_t	R_RMAC_Close (ether_ctrl_t *const p_ctrl) Disables interrupts. Removes power and releases hardware lock.

	Implements ether_api_t::close. More...
fsp_err_t	R_RMAC_BufferRelease (ether_ctrl_t *const p_ctrl) Move to the next buffer in the receive buffer list. Implements ether_api_t::bufferRelease. More...
fsp_err_t	R_RMAC_RxBufferUpdate (ether_ctrl_t *const p_ctrl, void *const p_buffer) Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate. More...
fsp_err_t	R_RMAC_LinkProcess (ether_ctrl_t *const p_ctrl) The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess. More...
fsp_err_t	R_RMAC_WakeOnLANEnable (ether_ctrl_t *const p_ctrl) The setting of RMAC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable. More...
fsp_err_t	R_RMAC_Read (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t *const length_bytes) Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read. More...
fsp_err_t	R_RMAC_Write (ether_ctrl_t *const p_ctrl, void *const p_buffer, uint32_t const frame_length) Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write. More...
fsp_err_t	R_RMAC_TxStatusGet (ether_ctrl_t *const p_ctrl, void *const p_buffer_address)
fsp_err_t	R_RMAC_CallbackSet (ether_ctrl_t *const p_api_ctrl, void(*p_callback)(ether_callback_args_t *), void *const p_context,

	ether_callback_args_t *const p_callback_memory)
fsp_err_t	R_RMAC_SetWriteConfig (ether_ctrl_t *const p_ctrl, rmac_write_cfg_t *const p_write_cfg) Set configuration for tx frame. This API must call before ether_api_t::write. More...
fsp_err_t	R_RMAC_GetTxTimestamp (ether_ctrl_t *const p_ctrl, rmac_timestamp_t *const p_timestamp) Get timestamp of transmitted frame. This API must call after ether_api_t::write. More...
fsp_err_t	R_RMAC_GetRxTimestamp (ether_ctrl_t *const p_ctrl, rmac_timestamp_t *const p_timestamp) Get timestamp of received frame. This API must call before ether_api_t::read. More...

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the Ethernet Interface.

Overview

This module transmits and receives Ethernet (IEEE 802.3) frames. This module provides single MAC layer interface.

The following figure shows which IPs are used by the r_rmac module.

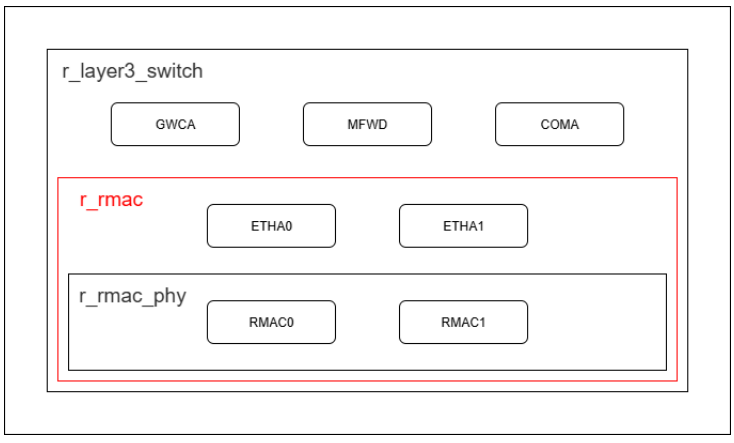

Figure 324: ESWM block diagram

Features

The RMAC module supports the following features:

- Transmit/Receive processing
- Optional zero-copy buffering
- Callback function with returned event code
- Auto negotiation support
- Flow control support
- Multicast filtering support
- Broadcast filtering support
- Promiscuous mode support
- Get the frame transmission and reception times
- Port based forwarding function for transmission/reception
- Descriptor format selection when transmitting

Supported Devices

Device Group	Devices
RA8	RA8D2, RA8M2, RA8P1, RA8T2

Configuration

Build Time Configurations for r_rmac

The following build time configurations are defined in fsp_cfg/r_rmac_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Read Buffer Size Checking	• Enabled • Disabled	Disabled	If selected code for buffer size checking is included in the build.

Configurations for Networking > Ethernet MAC (r_rmac)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet MAC (r_rmac). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ether0	Module name.
Channel	Must be an integer greater than or equal to 0.	0	Write the ether channel number.
Zero-copy Mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
Flow control functionality	• Disable • Enable	Disable	Enable or disable flow control.

MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of this channel.
Filters			
Multicast Mode	• Disable • Enable	Enable	Enable or disable multicast frame reception.
Promiscuous Mode	• Disable • Enable	Disable	Enable this option to receive packets addressed to other NICs.
Broadcast filter	Must be a valid non-negative integer with maximum configurable value of 65535.	0	Limit of the number of broadcast frames received continuously
Buffers			
Padding size	Disable	Disable	The padding size that is automatically inserted into the received packets
Padding offset	Must be less than 64 bytes.	0	The offset into a receive buffer to insert padding bytes.
TX queue length	Value must be an integer	3	Number of buffers per TX queue.
RX queue length	Value must be an integer	3	Number of buffers per RX queue.
TX queue num	Value must be an integer	2	TX queue num
RX queue num	Value must be an integer	2	RX queue num
Number of TX buffer	Value must be an integer	12	Number of transmit buffers
Number of RX buffer	Value must be an integer	12	Number of receive buffers
Buffer size	Must be at least 1514 which is the maximum Ethernet frame size.	1514	Size of Ethernet buffer
Allocate RX buffer	• Disable • Enable	Enable	Allocates the RX buffer when generating the configuration structure
Number of node num	Value must be an integer	24	Number of receive buffers
Interrupts			
Magic packet interrupt	MCU Specific Options		Select the magic

priority			packet detection interrupt priority.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs
Timestamp			
TS queue length	Value must be an integer	8	Timestamp queue length.
Forwarding			
Transmission descriptor format	• Transmission ethernet descriptor • Transmission direct descriptor	Transmission direct descriptor	The transmission direct descriptor could be used, for example, for non-routable protocol forwarding (network control) or for CPU-CPU communication and the transmission ethernet descriptor could be used for all normal ethernet transmissions.
Port based forwarding for reception	• Enabled • Disabled	Disabled	Port based forwarding function forwards all frames from a port to other ones when receiving.
Link			
Link monitored ports	MCU Specific Options		Select ports to be monitored for link up detection.
Link Detection	• Default port (same as Channel) • All monitored ports • Any monitored port	Default port (same as Channel)	Condition for detecting link up status of monitored ports.

Interrupt Configuration

The first R_RMAC_Open function call sets GWDI interrupts. The user could provide callback function which would be invoked when GWDI interrupt handler has been completed. The callback arguments will contain information about a channel number, the event code and a pointer to the user defined context.

Callback Configuration

The user could provide callback function which would be invoked when either a magic packet or a link signal change is detected. When the callback function is called, a variable in which the channel

number for which the detection occurred and a constant shown in Table 2.4 are stored is passed as an argument. If the value of this argument is to be used outside the callback function, its value should be copied into, for example, a global variable.

Clock Configuration

The ESWM peripheral uses ICLK, PCLKA, ESWCLK and ESWPHYCLK as clocks. These clocks must be set to frequencies within the ranges shown in the following table.

PHY speed [Mbps]	ICLK [MHz]	PCLKA [MHz]	ESWCLK [MHz]	ESWPHYCLK [MHz]
10/100	50 to 250	up to 125	50 to 250	Not required
1000	150 to 250	up to 125	150 to 250	500

Note

1. Clock restrictions are as follow: ICLK × 1.5 => ESWCLK, ESWCLK > PCLKA and ICLK > PCLKA.
2. When using a products in the HLQFP176 package, set ESWCLK to 125 MHz or less.

Pin Configuration

To use the RMAC module, input/output signals of the peripheral function have to be allocated to pins with the multi-function pin controller (MPC). Please perform the pin setting before calling the R_RMAC_Open function.

Usage Notes

Ethernet Frame Format

The RMAC module supports the Ethernet II/IEEE 802.3 frame format.

Frame Format for Data Transmission and Reception

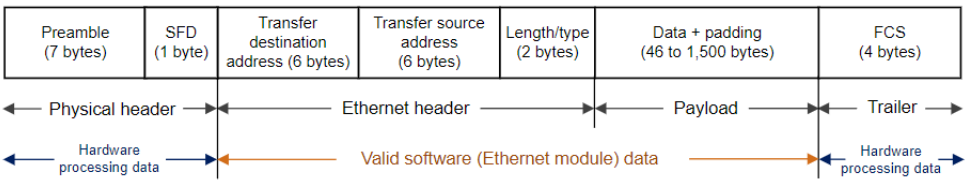

Figure 325: Frame Format Image

The preamble and SFD signal the start of an Ethernet frame. The FCS contains the CRC of the Ethernet frame and is calculated on the transmitting side. When data is received the CRC value of the frame is calculated in hardware, and the Ethernet frame is discarded if the values do not match. When the hardware determines that the data is normal, the valid range of receive data is: (transmission destination address) + (transmission source address) + (length/type) + (data).

PAUSE Frame Format

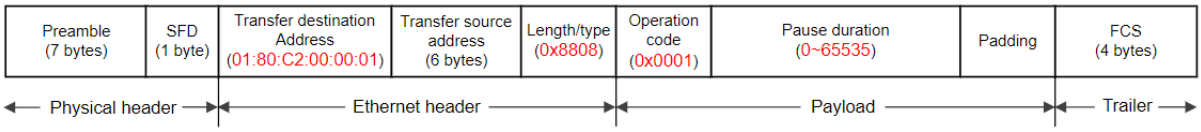

Figure 326: Pause Frame Format Image

The transmission destination address is specified as 01:80:C2:00:00:01 (a multicast address reserved for PAUSE frames). At the start of the payload the length/type is specified as 0x8808 and the operation code as 0x0001. The pause duration in the payload is specified by the value of the automatic PAUSE (AP) bits in the automatic PAUSE frame setting register (APR), or the manual PAUSE time setting (MP) bits in the manual PAUSE frame setting register (MPR).

Magic Packet Frame Format

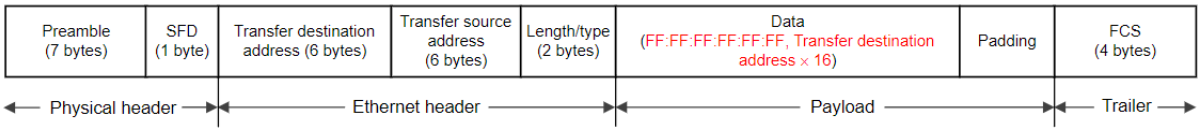

Figure 327: Magic Packet Frame Format Image

In a Magic Packet, the value FF:FF:FF:FF:FF:FF followed by the transmission destination address repeated 16 times is inserted somewhere in the Ethernet frame data.

Examples

ETHER Basic Example

This is a basic example of minimal use of the ETHER in an application.

Note

In this example zero-copy mode is disabled and there are no restrictions on buffer alignment.

```
#define RMAC_EXAMPLE_MAXIMUM_ETHERNET_FRAME_SIZE (1514)
#define RMAC_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)

    assert(FSP_SUCCESS == err);
 /* Disable transmission and receive function and close the rmac instance. */
 R_RMAC_Close(&g_ether0_ctrl);
}
```

Function Documentation

◆ R_RMAC_Open()

fsp_err_t R_RMAC_Open (ether_ctrl_t *const *p_ctrl*, ether_cfg_t const *const *p_cfg*)

After RMAC, Switch and PHY-LSI are reset in software, an auto negotiation of PHY-LSI is begun. Afterwards, the link signal change interrupt is permitted. Implements ether_api_t::open.

Initializes the ether module and applies configurations. Implements ether_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to extend config structure or MAC address is NULL.
FSP_ERR_INVALID_ARGUMENT	Interrupt is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_RMAC_Close()

fsp_err_t R_RMAC_Close (ether_ctrl_t *const *p_ctrl*)

Disables interrupts. Removes power and releases hardware lock. Implements ether_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_RMAC_BufferRelease()

fsp_err_t R_RMAC_BufferRelease (ether_ctrl_t *const *p_ctrl*)

Move to the next buffer in the receive buffer list. Implements ether_api_t::bufferRelease.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block or internal buffers is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_BUFFER_EMPTY	There is no available internal RX buffer.

◆ R_RMAC_RxBufferUpdate()

fsp_err_t R_RMAC_RxBufferUpdate (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*)

Change the buffer pointer of the current rx buffer descriptor. Implements ether_api_t::rxBufferUpdate.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	The pointer of buffer is NULL or not aligned on a 32-bit boundary.
FSP_ERR_INVALID_MODE	Driver is configured to non zero copy mode.
FSP_ERR_BUFFER_EMPTY	There is no available internal RX buffer.

◆ R_RMAC_LinkProcess()

fsp_err_t R_RMAC_LinkProcess (ether_ctrl_t *const *p_ctrl*)

The Link up processing, the Link down processing, and the magic packet detection processing are executed. Implements ether_api_t::linkProcess.

Return values

FSP_SUCCESS	Link is up.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Link is down.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	When reopening the PHY interface initialization of the PHY-LSI failed.
FSP_ERR_ALREADY_OPEN	When reopening the PHY interface it was already opened.
FSP_ERR_INVALID_CHANNEL	When reopening the PHY interface an invalid channel was passed.
FSP_ERR_INVALID_POINTER	When reopening the PHY interface the MAC address pointer was NULL.
FSP_ERR_INVALID_ARGUMENT	When reopening the PHY interface the interrupt was not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of the PHY-LSI failed.

◆ R_RMAC_WakeOnLANEnable()

fsp_err_t R_RMAC_WakeOnLANEnable (ether_ctrl_t *const *p_ctrl*)

The setting of RMAC is changed from normal sending and receiving mode to magic packet detection mode. Implements ether_api_t::wakeOnLANEnable.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_PHY_ERROR_LINK	Initialization of PHY-LSI failed.

◆ R_RMAC_Read()

fsp_err_t R_RMAC_Read (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t *const *length_bytes*)

Receive Ethernet frame. Receives data to the location specified by the pointer to the receive buffer. In zero copy mode, the address of the receive buffer is returned. In non zero copy mode, the received data in the internal buffer is copied to the pointer passed by the argument. Implements ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_NO_DATA	There is no data in receive buffer.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_FILTERING	Multicast Frame filter is enable, and Multicast Address Frame is received.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_BUFFER_EMPTY	There is no available internal RX buffer.
FSP_ERR_INVALID_SIZE	The buffer size is smaller than ether_cfg_t::ether_buffer_size.

◆ R_RMAC_Write()

fsp_err_t R_RMAC_Write (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer*, uint32_t const *frame_length*)

Transmit Ethernet frame. Transmits data from the location specified by the pointer to the transmit buffer, with the data size equal to the specified frame length. In the non zero copy mode, transmits data after being copied to the internal buffer. Implements ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_ETHER_ERROR_LINK	Auto-negotiation is not completed, and reception is not enabled.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	Transmit buffer is not empty.
FSP_ERR_INVALID_POINTER	Value of the pointer is NULL.
FSP_ERR_INVALID_ARGUMENT	Value of the send frame size is out of range.
FSP_ERR_BUFFER_EMPTY	There is no available internal TX buffer.

◆ R_RMAC_TxStatusGet()

fsp_err_t R_RMAC_TxStatusGet (ether_ctrl_t *const *p_ctrl*, void *const *p_buffer_address*)

Provides status of Ethernet driver in the user provided pointer. Implements ether_api_t::txStatusGet.

Return values

FSP_SUCCESS	Transmit buffer address is stored in provided p_buffer_address.
FSP_ERR_ASSERTION	Pointer to ETHER control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	p_status is NULL.
FSP_ERR_NOT_FOUND	Transmit buffer address has been overwritten in transmit descriptor.

◆ R_RMAC_CallbackSet()

fsp_err_t R_RMAC_CallbackSet (ether_ctrl_t *const *p_api_ctrl*, void(*)(ether_callback_args_t *) *p_callback*, void *const *p_context*, ether_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_RMAC_SetWriteConfig()

fsp_err_t R_RMAC_SetWriteConfig (ether_ctrl_t *const *p_ctrl*, rmac_write_cfg_t *const *p_write_cfg*)

Set configuration for tx frame. This API must call before ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_RMAC_GetTxTimestamp()

fsp_err_t R_RMAC_GetTxTimestamp (ether_ctrl_t *const *p_ctrl*, rmac_timestamp_t *const *p_timestamp*)

Get timestamp of transmitted frame. This API must call after ether_api_t::write.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_RMAC_GetRxTimestamp()

fsp_err_t R_RMAC_GetRxTimestamp (ether_ctrl_t *const *p_ctrl*, rmac_timestamp_t *const *p_timestamp*)

Get timestamp of received frame. This API must call before ether_api_t::read.

Return values

FSP_SUCCESS	Processing completed successfully.
FSP_ERR_ASSERTION	A pointer argument is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

5.2.12.19 Ethernet (r_rmac_phy)

Modules » Networking

Functions

fsp_err_t R_RMAC_PHY_Open (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg)

Resets Ethernet PHY device. Implements ether_phy_api_t::open. More...

fsp_err_t R_RMAC_PHY_Close (ether_phy_ctrl_t *const p_ctrl)

Close Ethernet PHY device. Implements ether_phy_api_t::close. More...

fsp_err_t R_RMAC_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const p_ctrl)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate. More...

fsp_err_t R_RMAC_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const p_ctrl, uint32_t *const p_line_speed_duplex, uint32_t *const p_local_pause, uint32_t *const p_partner_pause)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet. More...

fsp_err_t R_RMAC_PHY_LinkStatusGet (ether_phy_ctrl_t *const p_ctrl)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet. More...

fsp_err_t	R_RMAC_PHY_ChipInit (ether_phy_ctrl_t *const p_ctrl, ether_phy_cfg_t const *const p_cfg) Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit. More...
fsp_err_t	R_RMAC_PHY_Read (ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t *const p_data) Read data from register of PHY-LSI . Implements ether_phy_api_t::read. More...
fsp_err_t	R_RMAC_PHY_Write (ether_phy_ctrl_t *const p_ctrl, uint32_t reg_addr, uint32_t data) Write data to register of PHY-LSI . Implements ether_phy_api_t::write. More...
fsp_err_t	R_RMAC_PHY_ChipSelect (ether_phy_ctrl_t *const p_ctrl, uint8_t port) Update the target PHY LSI of this driver. More...
fsp_err_t	R_RMAC_PHY_CallbackSet (ether_phy_ctrl_t *const p_ctrl, void(*p_callback)(ether_phy_callback_args_t *), void *const p_context, ether_phy_callback_args_t *const p_callback_memory)

Detailed Description

The RMAC PHY module (r_rmac_phy) provides an API for standard Ethernet PHY communications applications that use the RMAC peripheral. It implements the Ethernet PHY Interface.

Overview

The RMAC PHY module is used to setup and manage an external Ethernet PHY device. r_rmac_phy use the on-chip MAC layer peripheral(RMAC), which is part of Ethernet Switch Module(ESWM). It performs auto-negotiation to determine the optimal connection parameters between link partners. Once initialized the connection between the external PHY and the onboard controller is automatically managed in hardware.

The following figure shows which IPs are used by the r_rmac_phy module.

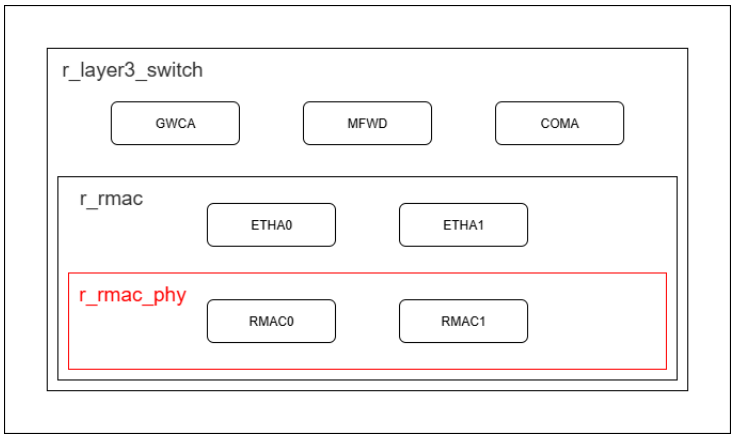

Figure 328: ESWM block diagram

Features

The RMAC PHY module supports the following features:

- Auto negotiation support
- Flow control support
- Link status check support
- Gigabit Ethernet support

Following features are not supported:

- Extensions to management frame format defined in IEEE802.3 clause 45

Supported Devices

Device Group	Devices
RA8	RA8D2, RA8M2, RA8P1, RA8T2

Configuration

Build Time Configurations for r_rmac_phy

The following build time configurations are defined in fsp_cfg/r_rmac_phy_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
KSZ8091RNB Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8091RNB PHY-LSI or not.
KSZ8041 Target	• Disabled • Enabled	Disabled	Select whether to use KSZ8041 PHY-LSI or not.

DP83620 Target	• Disabled • Enabled	Disabled	Select whether to use DP83620 PHY-LSI or not.
ICS1894 Target	• Disabled • Enabled	Disabled	Select whether to use ICS1894 PHY-LSI or not.
GPY111 Target	• Disabled • Enabled	Disabled	Select whether to use GPY111 PHY-LSI or not.
VSC8541 Target	• Disabled • Enabled	Disabled	Select whether to use VSC8541 Phy LSI or not.
User Own Target	• Disabled • Enabled	Disabled	Select whether to use User own Phy LSI or not.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.
Reference Clock	• Default • Enabled • Disabled	Default	Select whether to use the RMII reference clock. Selecting 'Default' will automatically choose the correct option when using a Renesas development board.

Configurations for Networking > Ethernet (r_rmac_phy)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet (r_rmac_phy). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupts			
Context	Name must be a valid C symbol	NULL	Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs
ETHA0 status interrupt priority	MCU Specific Options		Select the ETHA0 status interrupt priority.

ETHA1 status interrupt priority	MCU Specific Options		Select the ETHA1 status interrupt priority.
Name	Name must be a valid C symbol	g_rmac_phy0	Module name.
Channel	• 0 • 1	0	Select the Ethernet controller channel number.
Default PHY-LSI port	• 0 • 1	0	Specify the default port for PHY-LSI configuration.
PHY-LSI Reset Completion Timeout	Specify a value between 0x1 and 0xFFFFFFFF.	0x00020000	Specify the number of times to read the PHY-LSI control register while waiting for reset completion. This value should be adjusted experimentally based on the PHY-LSI used.
Select MII type	• MII • RMII • GMII • RGMII	RMII	Specify whether to use MII or RMII.
Port Custom Init Function	Name must be a valid C symbol	NULL	Set the initial function of the PHY-LSI, When using your own PHY-LSI.
Port Custom Link Partner Ability Get Function	Name must be a valid C symbol	NULL	Set the link partner ability get function of the PHY-LSI, When using your own PHY-LSI.
Flow Control	• Disable • Enable	Disable	Select whether to enable or disable flow control.
Management frame format	Clause 22 frame format	Clause 22 frame format	Select the management frame format used to access the PHY-LSI.
MDC clock rate (Hz)	Value must be a non-negative number	2500000	Specify the MDC clock frequency
MDIO hold timing adjustment	Value must be a non-negative integer less than 8	0	Specify the clock cycle for hold timing.
MDIO capture timing adjustment	Value must be a non-negative integer less than 8	0	Specify the clock cycle for capture timing.

Frame preemption	• Disable • Enable	Disable	Select whether to enable or disable frame preemption feature.
Verify frame interval	Value must be a non-negative integer less than 128	10	Interval for sending verify frame [ms].

Usage Notes

Accessing the Registers in PHY-LSI

Use the RMAC peripheral to access the registers in the PHY-LSI. Management frame is transmitted and received through the ETn_MDC and ETn_MDIO pins controlled by hardware.

This HW supports two management frame format.

- Normal management frame format defined in Clause 22 of IEEE802.3 (Describe "MDIO" in this document)
- Extension management frame format defined in Clause 45 of IEEE802.3 (Describe "eMDIO" in this document)

Management frame format of MDIO (Clause 22)

The below table lists the management frame formats of MDIO.

Access type	MII and RMII management frame							
	Item	PRE	ST	OP	PHYAD	REGAD	TA	DATA	IDLE
	Number of bits	32	2	2	5	5	2	16	1
Read		1...1	01	10	00001	RRRRR	Z0	DDDDDDDDDDDDDDDD	Z
Write		1...1	01	01	00001	RRRRR	10	DDDDDDDDDDDDDDDD	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 01b.
- OP (operation code): Send 10b for read or 01b for write.
- PHYAD (PHY address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits. When the PHY-LSI address is 1, send 00001b.
- REGAD (register address): One register is selected from up to 32 registers in the PHY-LSI. When the register address is 1, send 00001b.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.

Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Management frame format of eMDIO (Clause 45)

The below table lists the management frame formats of eMDIO(Clause 45).

Access type	MII and RMII management frame							
Item	PRE	ST	OP	PRTAD	DEVAD	TA	DATA	IDLE
Number of bits	32	2	2	5	5	2	16	1
Address	1...1	00	00	PPPPP	EEEEE	10	AAAAAAAAAAAAAAAA	Z
Write	1...1	00	01	PPPPP	EEEEE	10	DDDDDDDDDDDDDDDD	Z
Read	1...1	00	11	PPPPP	EEEEE	Z0	DDDDDDDDDDDDDDDD	Z
Read Increment	1...1	00	10	PPPPP	EEEEE	Z0	DDDDDDDDDDDDDDDD	Z

Note

- PRE (preamble): Send 32 consecutive 1s.
- ST (start of frame): Send 00b.
- OP (operation code): Send 00b for register address, 10b for read operation, 11b for write operation, or 10b for post-read-increment-address operation.
- PRTAD (port address): Up to 32 PHY-LSIs can be connected to one MAC. PHY-LSIs are selected with these 5 bits port address. When the port address is 1, send 00001b.
- DEVAD (device address): Up to 32 MDIO Manageable Devices(MMD) are contained in a PHY-LSI. MMD are selected with these 5 bits device address.
- TA (turnaround): Use 2-bit turnaround time to avoid contention between the register address and data during a read operation.
Send 10b during a write operation. Release the bus for 1 bit during a read operation (Z is output).
(This is indicated as Z0 because 0 is output from the PHY-LSI on the next clock cycle.)
- DATA (data): 16-bit data. Sequentially send or receive starting from the MSB.
- IDLE (IDLE condition): Wait time before inputting the next MII or RMII management format. Release the bus during a write
operation (Z is output). No control is required, because a bus was already released during a read operation.

Limitations

- The r_rmac_phy module may need to be customized for PHY devices other than the ones currently supported. Use the existing code as a starting point for creating a custom implementation. Supported PHY devices are as follows.
    - KSZ8091RNB
    - KSZ8041
    - DP83620
    - ICS1894
    - GPY111
    - VSC8541

Examples

RMAC PHY Basic Example

This is a basic example of minimal use of the RMAC PHY in an application.

```
void rmac_phy_basic_example (void)
{
 fsp_err_t err = FSP_SUCCESS;
    g_rmac_phy0_ctrl.open   = 0U;
    g_rmac_phy0_cfg.channel = 0;
 /* Initializes the module. */
    err = R_RMAC_PHY_Open(&g_rmac_phy0_ctrl, &g_rmac_phy0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Start auto negotiation. */
    err = R_RMAC_PHY_StartAutoNegotiate(&g_rmac_phy0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Polling until link is established. */
 while (FSP_SUCCESS != R_RMAC_PHY_LinkStatusGet(&g_rmac_phy0_ctrl))
    {
 /* Do nothing */
    }
 /* Get link partner ability from phy interface. */
    err = R_RMAC_PHY_LinkPartnerAbilityGet(&g_rmac_phy0_ctrl,
                                           &g_rmac_phy0_line_speed_duplex,
                                           &g_rmac_phy0_local_pause,
                                           &g_rmac_phy0_partner_pause);
    assert(FSP_SUCCESS == err);
 /* Check current link status. */
```

```
    err = R_RMAC_PHY_LinkStatusGet(&g_rmac_phy0_ctrl);
    assert(FSP_SUCCESS == err);
}
```

Data Structures

enum	rmac_phy_frame_format_t

Data Structure Documentation

◆ rmac_phy_instance_ctrl_t

struct rmac_phy_instance_ctrl_t	
RMAC PHY control block. DO NOT INITIALIZE. Initialization occurs when ether_phy_api_t::open is called.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
ether_phy_cfg_t const *	p_ether_phy_cfg
	Pointer to initial configurations.
R_RMAC0_Type *	p_reg_rmac
	Pointer to RMAC peripheral registers.
uint32_t	local_advertise
	Capabilities bitmap for local advertising.
rmac_phy_interface_status_t	interface_status

	Initialized status of ETHER PHY interface.
uint8_t	phy_lsi_cfg_index
	Index of the PHY LSI that is currently the target of operation.
void(*	p_callback)(ether_phy_callback_args_t *p_args)
	Callback provided when an ISR occurs.

◆ rmac_phy_extended_cfg_t

struct rmac_phy_extended_cfg_t	
RMAC PHY extended configuration.	
Data Fields	
void(*	p_target_init)(rmac_phy_instance_ctrl_t *p_instance_ctrl)
	Pointer to callback that is called to initialize the target.
bool(*	p_target_link_partner_ability_get)(rmac_phy_instance_ctrl_t *p_instance_ctrl, uint32_t line_speed_duplex)
	Pointer to callback that is called to get the link partner ability.
rmac_phy_frame_format_t	frame_format
	Whether the management frame format is MDIO or eMDIO.
uint32_t	mdc_clock_rate
	MDC frequency division.
uint8_t	mdio_hold_time
	MDIO hold time adjustment.
uint8_t	mdio_capture_time

	MDIO capture time adjustment.
ether_phy_lsi_cfg_t const *	p_phy_lsi_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS]
	Pointer list of PHY LSI configurations.
uint8_t	default_phy_lsi_cfg_index
	Index of the default PHY LSI condiguration.
uint32_t	frame_preemption_verification_interval
	Interval for sending verify frame [ms].
IRQn_Type	easi_irq [BSP_FEATURE_ETHER_NUM_CHANNELS]
	EASI interrupt number.
uint32_t	easi_ipl [BSP_FEATURE_ETHER_NUM_CHANNELS]
	EASI interrupt priority.
void(*	p_callback)(ether_phy_callback_args_t *p_args)
	Callback provided when an ISR occurs.
void *	p_context
	Placeholder for user data.

Enumeration Type Documentation

◆ rmac_phy_interface_status_t

enum rmac_phy_interface_status_t	
Initialization state for read/write	
Enumerator	
RMAC_PHY_INTERFACE_STATUS_UNINITIALIZED	ETHER PHY interface is uninitialized.
RMAC_PHY_INTERFACE_STATUS_INITIALIZED	ETHER PHY interface is initialized.

◆ rmac_phy_frame_format_t

enum rmac_phy_frame_format_t	
Enumerator	
RMAC_PHY_FRAME_FORMAT_MDIO	Normal management frame format defined in clause 22.
RMAC_PHY_FRAME_FORMAT_EMDIO	Extension management frame format defined in clause 45.

Function Documentation

◆ R_RMAC_PHY_Open()

fsp_err_t R_RMAC_PHY_Open (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Resets Ethernet PHY device. Implements ether_phy_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_CHANNEL	Invalid channel number is given.
FSP_ERR_INVALID_POINTER	Pointer to p_cfg is NULL.
FSP_ERR_INVALID_MODE	Function is called when not in CONFIG mode.

◆ R_RMAC_PHY_Close()

fsp_err_t R_RMAC_PHY_Close (ether_phy_ctrl_t *const *p_ctrl*)

Close Ethernet PHY device. Implements ether_phy_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_INVALID_MODE	Function is called when not in DISABLE mode.

◆ R_RMAC_PHY_StartAutoNegotiate()

fsp_err_t R_RMAC_PHY_StartAutoNegotiate (ether_phy_ctrl_t *const *p_ctrl*)

Starts auto-negotiate. Implements ether_phy_api_t::startAutoNegotiate.

Return values

FSP_SUCCESS	RMAC_PHY successfully starts auto-negotiate.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_LinkPartnerAbilityGet()

fsp_err_t R_RMAC_PHY_LinkPartnerAbilityGet (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *const *p_line_speed_duplex*, uint32_t *const *p_local_pause*, uint32_t *const *p_partner_pause*)

Reports the other side's physical capability. Implements ether_phy_api_t::linkPartnerAbilityGet.

Return values

FSP_SUCCESS	RMAC_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_ETHER_PHY_NOT_READY	The auto-negotiation isn't completed
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_LinkStatusGet()

fsp_err_t R_RMAC_PHY_LinkStatusGet (ether_phy_ctrl_t *const *p_ctrl*)

Returns the status of the physical link. Implements ether_phy_api_t::linkStatusGet.

Return values

FSP_SUCCESS	RMAC_PHY successfully get link partner ability.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened
FSP_ERR_ETHER_PHY_ERROR_LINK	PHY-LSI is not link up.
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_ChipInit()

fsp_err_t R_RMAC_PHY_ChipInit (ether_phy_ctrl_t *const *p_ctrl*, ether_phy_cfg_t const *const *p_cfg*)

Initialize Ethernet PHY device. Implements ether_phy_api_t::chipInit.

Return values

FSP_SUCCESS	PHY device initialized successfully.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_TIMEOUT	PHY-LSI Reset wait timeout.
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_Read()

fsp_err_t R_RMAC_PHY_Read (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *const *p_data*)

Read data from register of PHY-LSI . Implements ether_phy_api_t::read.

Return values

FSP_SUCCESS	RMAC_PHY successfully read data.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_INVALID_POINTER	Pointer to read buffer is NULL.
FSP_ERR_INVALID_ARGUMENT	Address is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_Write()

fsp_err_t R_RMAC_PHY_Write (ether_phy_ctrl_t *const *p_ctrl*, uint32_t *reg_addr*, uint32_t *data*)

Write data to register of PHY-LSI . Implements ether_phy_api_t::write.

Return values

FSP_SUCCESS	RMAC_PHY successfully write data.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block is NULL.
FSP_ERR_INVALID_ARGUMENT	Address or data is not a valid size
FSP_ERR_NOT_INITIALIZED	The control block has not been initialized
FSP_ERR_INVALID_MODE	Function is called when not in OPERATION mode.

◆ R_RMAC_PHY_ChipSelect()

fsp_err_t R_RMAC_PHY_ChipSelect (ether_phy_ctrl_t *const *p_ctrl*, uint8_t *port*)

Update the target PHY LSI of this driver.

Return values

FSP_SUCCESS	PHY device initialized successfully.
FSP_ERR_ASSERTION	Pointer to RMAC_PHY control block or configuration structure is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Invalid PHY LSI is selected.

◆ R_RMAC_PHY_CallbackSet()

fsp_err_t R_RMAC_PHY_CallbackSet (ether_phy_ctrl_t *const *p_ctrl*, void(*)(ether_phy_callback_args_t *) *p_callback*, void *const *p_context*, ether_phy_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements ether_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

5.2.12.20 Ethernet Generic PTP Timer (r_gptp)

Modules » Networking

Functions

fsp_err_t	R_GPTP_Open (gptp_ctrl_t *const p_ctrl, gptp_cfg_t const *const p_cfg)
fsp_err_t	R_GPTP_Close (gptp_ctrl_t *const p_ctrl)
fsp_err_t	R_GPTP_TimerCfg (gptp_ctrl_t *const p_ctrl, uint8_t timer, gptp_timer_cfg_t const *const p_timer_cfg)
fsp_err_t	R_GPTP_Start (gptp_ctrl_t *const p_ctrl, uint8_t timer)
fsp_err_t	R_GPTP_Stop (gptp_ctrl_t *const p_ctrl, uint8_t timer)

fsp_err_t	R_GPTP_TimerOffsetSet (gptp_ctrl_t *const p_ctrl, uint8_t timer, int64_t offset)
fsp_err_t	R_GPTP_TimerRateSet (gptp_ctrl_t *const p_ctrl, uint8_t timer, uint32_t rate)
fsp_err_t	R_GPTP_PulseGeneratorSet (gptp_ctrl_t *const p_ctrl, uint8_t timer, gptp_pulse_generator_t *p_pulse)

fsp_err_t	R_GPTP_CallbackSet (gptp_ctrl_t *const p_ctrl, void(*p_callback)(gptp_callback_args_t *), void *const p_context, gptp_callback_args_t *const p_callback_memory)

Detailed Description

Driver for the Ethernet peripheral on RA MCUs. This module implements the GPTP Interface.

Overview

Ethernet Generic PTP timer (GPTP) enables accurate synchronization of the clock in the control system.

This module supports two GPTP timer.

Features

The GPTP module has the following features:

- Supports start and stop gPTP timer.
- Supports set timer offset.
- Supports set timer rate.
- Supports set pulse generator.

Supported Devices

Device Group	Devices
RA8	RA8D2, RA8M2, RA8P1, RA8T2

Configuration

Build Time Configurations for r_gptp

The following build time configurations are defined in fsp_cfg/r_gptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > Ethernet Generic PTP Timer (r_gptp)

This module can be added to the Stacks tab via New Stack > Networking > Ethernet Generic PTP Timer (r_gptp). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_gptp0	Module name.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs

Clock Configuration

The GPTP clock is based on the ESWCLK frequency. You can set the PTPTIVCt (t = 0 or 1) register to timer increment value according to ESWCLK frequency.

Usage Notes

Examples

This is a basic example of minimal use of the GPTP in an application.

```
void gptp_basic_example (void)
{
 fsp_err_t       err       = FSP_SUCCESS;
    uint8_t          timer    = GPTP_EXAMPLE_TIMER_NUMBER;
 gptp_timer_cfg_t timer_cfg = {.clock_period = GPTP_EXAMPLE_CLOCK_PERIOD};
    int64_t          offset    = GPTP_EXAMPLE_OFFSET;
    uint32_t         rate      = GPTP_EXAMPLE_RATE;
 gptp_timer_value_t timer_value =
    {
       .time_sec_upper = 0,
       .time_sec_lower = 0,
       .time_nsec      = 0,
    };
 gptp_pulsed_output_cfg_t pulsed_output_cfg0 =
    {
       .pulse_num       = 0,
       .start_sec_upper = 0,
       .start_sec_lower = 0,
       .start_ns         = 0,
       .wide             = 0,
       .period_sec_upper = 0,
       .period_sec_lower = 0,
       .period_ns       = 0,
```

```
   };
gptp_pulsed_output_cfg_t pulsed_output_cfg1 =
   {
      .pulse_num       = 1,
      .start_sec_upper = 0,
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
gptp_pulsed_output_cfg_t pulsed_output_cfg2 =
   {
      .pulse_num       = 2,
      .start_sec_upper = 0,
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
gptp_pulsed_output_cfg_t pulsed_output_cfg3 =
   {
      .pulse_num       = 3,
      .start_sec_upper = 0,
      .start_sec_lower = 0,
      .start_ns         = 0,
      .wide             = 0,
      .period_sec_upper = 0,
      .period_sec_lower = 0,
      .period_ns       = 0,
   };
```

```
gptp_pulse_generator_t pulse_generator =
   {
      .p_pulsed_output_cfg_list =
     {&pulsed_output_cfg0, &pulsed_output_cfg1, &pulsed_output_cfg2,
&pulsed_output_cfg3},
   };
/* Open the gptp instance with initial configuration. */
   err = R_GPTP_Open(&g_gptp0_ctrl, &g_gptp0_cfg);
/* Handle any errors. This function should be defined by the user. */
   assert(FSP_SUCCESS == err);
/* Set configuration of gptp timer. */
   err = R_GPTP_TimerCfg(&g_gptp0_ctrl, timer, &timer_cfg);
   assert(FSP_SUCCESS == err);
/* Start gptp timer. */
   err = R_GPTP_Start(&g_gptp0_ctrl, timer);
   assert(FSP_SUCCESS == err);
/* Get value of gptp timer. */
   err = R_GPTP_TimerValueGet(&g_gptp0_ctrl, timer, &timer_value);
   assert(FSP_SUCCESS == err);
/* Set offset of gptp timer. */
   err = R_GPTP_TimerOffsetSet(&g_gptp0_ctrl, timer, offset);
   assert(FSP_SUCCESS == err);
/* Set rate of gptp timer. */

Data Structures

struct	gptp_pulsed_output_cfg_t
struct	gptp_pulse_generator_t
struct	gptp_instance_ctrl_t

Data Structure Documentation

◆ gptp_pulsed_output_cfg_t

struct gptp_pulsed_output_cfg_t		
Pulsed output configuration.		
Data Fields		
uint8_t	pulse_num	Pulse generator number.
uint16_t	start_sec_upper	Pulse start second(upper 16 bit).
uint32_t	start_sec_lower	Pulse start second(lower 32 bit).
uint32_t	start_ns	Pulse start nanosecond.
uint16_t	wide	Pulse width.
uint16_t	period_sec_upper	Pulse period second(upper 16 bit).
uint32_t	period_sec_lower	Pulse period second(lower 32 bit).
uint32_t	period_ns	Pulse period nanosecond.

◆ gptp_pulse_generator_t

struct gptp_pulse_generator_t		
Pulse generator.		
Data Fields		
gptp_pulsed_output_cfg_t *	p_pulsed_output_cfg_list[BSP_FEATURE_ESWM_GPTP_PULSE_GENERATOR_NUM]	List of pointer to pulsed output configuration.

◆ gptp_instance_ctrl_t

struct gptp_instance_ctrl_t
GPTP control block. DO NOT INITIALIZE. Initialization occurs when gptp_api_t::open is called.
Data Fields

uint32_t	open
	Indicates whether the open() API has been successfully called.
gptp_cfg_t const *	p_cfg
	Pointer to initial configurations.
R_GPTP_Type *	p_reg_gptp
	Pointer to GPTP timer register.
void(*	p_callback)(gptp_callback_args_t *)
	Pointer to callback that is called.
gptp_callback_args_t *	p_callback_memory
	Pointer to non-secure memory that can be used to pass arguments to a callback in non-secure memory.
void const *	p_context
	Pointer to context to be passed into callback function.

Function Documentation

◆ R_GPTP_Open()

fsp_err_t R_GPTP_Open (gptp_ctrl_t *const *p_ctrl*, gptp_cfg_t const *const *p_cfg*)

Initializes the gptp module and applies configurations.

Return values

FSP_SUCCESS	Module opened successfully.
FSP_ERR_ASSERTION	Pointer to GPTP control block or configuration structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.

◆ R_GPTP_Close()

fsp_err_t R_GPTP_Close (gptp_ctrl_t *const *p_ctrl*)

Close the gptp module.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Pointer to GPTP control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened

◆ R_GPTP_TimerCfg()

fsp_err_t R_GPTP_TimerCfg (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_timer_cfg_t const *const *p_timer_cfg*)

Configures the gptp timer parameters.

Return values

FSP_SUCCESS	Command successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Invalid timer id.
FSP_ERR_INVALID_POINTER	Invalid poiter to the timer cfg.

◆ R_GPTP_Start()

fsp_err_t R_GPTP_Start (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*)

Starts gptp timer.

Return values

FSP_SUCCESS	Timer started..
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Invalid timer id.

◆ R_GPTP_Stop()

fsp_err_t R_GPTP_Stop (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*)

Stops gptp timer.

Return values

FSP_SUCCESS	Timer stopped.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Invalid timer id.

◆ R_GPTP_TimerValueGet()

fsp_err_t R_GPTP_TimerValueGet (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_timer_value_t *const *p_timer_value*)

Gets the current time value to the timer with the specified gptp timer number.

Return values

FSP_SUCCESS	Sec upper, sec lower, and nano sec srored in p_timestamp.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ R_GPTP_TimerOffsetSet()

fsp_err_t R_GPTP_TimerOffsetSet (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, int64_t *offset*)

Sets the offset correction for the specified gptp timer number.

Return values

FSP_SUCCESS	Time offset set successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ R_GPTP_TimerRateSet()

fsp_err_t R_GPTP_TimerRateSet (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, uint32_t *rate*)

Sets clock rate correction for the specified timer.

Return values

FSP_SUCCESS	Time rate set successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ R_GPTP_PulseGeneratorSet()

fsp_err_t R_GPTP_PulseGeneratorSet (gptp_ctrl_t *const *p_ctrl*, uint8_t *timer*, gptp_pulse_generator_t * *p_pulse*)

Sets pulse generator.

Return values

FSP_SUCCESS	Pulse generator set successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to arguments are NULL.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameter.

◆ **R_GPTP_CallbackSet()**

fsp_err_t R_GPTP_CallbackSet (gptp_ctrl_t *const *p_ctrl*, void(*)(gptp_callback_args_t *) *p_callback*, void *const *p_context*, gptp_callback_args_t *const *p_callback_memory*)
Updates the user callback with the option to provide memory for the callback argument structure. Implements gptp_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

5.2.12.21 FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)

Modules » Networking

Middleware for using TCP on RA MCUs.

Overview

FreeRTOS Plus TCP is a TCP stack created for use with FreeRTOS.

This module provides the NetworkInterface required to use FreeRTOS Plus TCP with the Ethernet (r_ether) driver or the Ethernet (r_rmac) driver.

Please refer to the FreeRTOS Plus TCP documentation for further details.

Configuration

Build Time Configurations for FreeRTOS_Plus_TCP

The following build time configurations are defined in aws/FreeRTOSIPConfig.h:

Configuration	Options	Default	Description
Print debug messages	• Disable • Enable	Disable	If ipconfigHAS_DEBUG_PRINTF is set to 1 then FreeRTOS_debug_printf should be defined to the function used to print out the debugging

			messages.
Backward Compatible Mode	• No • Yes	Yes	Run the code in backward compatible mode
Enable IPV6	• Disable • Enable	Disable	Stack supports handling IPv6 packets (including handling IPv6 header, ND, RA, and so on) when enabled
Print info messages	• Disable • Enable	Disable	Set to 1 to print out non debugging messages, for example the output of the FreeRTOS_netstat() command, and ping replies. If ipconfigHAS_PRINTF is set to 1 then FreeRTOS_printf should be set to the function used to print out the messages.
Byte order of the target MCU	pdFREERTOS_LITTLE_ENDIAN	pdFREERTOS_LITTLE_ENDIAN	Define the byte order of the target MCU
IP/TCP/UDP checksums	• Disable • Enable	Enable	If the network card/driver includes checksum offloading (IP/TCP/UDP checksums) then set ipconfigDRIVER_INCLUDED_RX_IP_CHECKSUM to 1 to prevent the software stack repeating the checksum calculations.
Receive Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_recv() will block for. The timeouts can be set per socket, using setsockopt().
Send Block Time	Value must be a non-negative integer	10000	Amount of time FreeRTOS_send() will block for. The timeouts can be set per socket, using setsockopt().
DNS caching	• Disable • Enable	Enable	DNS caching
DNS Request Attempts	Value must be an	2	When a cache is

	integer		present, ipconfigDNS_REQUEST_ATTEMPTS can be kept low and also DNS may use small timeouts.
IP stack task priority	Only symbols, numbers and arithmetic operators are valid.	configMAX_PRIORITIES - 2	Set the priority of the task that executes the IP stack.
Stack size in words (not bytes)	Only symbols, numbers and arithmetic operators are valid.	configMINIMAL_STACK_SIZE * 5	The size, in words (not bytes), of the stack allocated to the FreeRTOS+TCP stack.
Network Events call vApplicationIPNetworkEventHook	• Disable • Enable	Enable	vApplicationIPNetworkEventHook is called when the network connects or disconnects.
Max UDP send block time	Only symbols, numbers and arithmetic operators are valid.	15000 / portTICK_PERIOD_MS	Max UDP send block time
Use DHCP	• Disable • Enable	Enable	If ipconfigUSE_DHCP is 1 then FreeRTOS+TCP will attempt to retrieve an IP address, netmask, DNS server address and gateway address from a DHCP server.
DHCP Register Hostname	• Disable • Enable	Enable	Register hostname when using DHCP
DHCP Uses Unicast	• Disable • Enable	Enable	DHCP uses unicast.
DHCP callback function	• Disable • Enable	Disable	Provide an implementation of the DHCP callback function (xApplicationDHCPHook)
Interval between transmissions	Only symbols, numbers and arithmetic operators are valid.	120000 / portTICK_PERIOD_MS	When ipconfigUSE_DHCP is set to 1, DHCP requests will be sent out at increasing time intervals until either a reply is received from a DHCP server and accepted, or the interval between transmissions reaches ipconfigMAXIMUM_DISC

			OVER_TX_PERIOD.
ARP Cache Entries	Value must be an integer	6	The maximum number of entries that can exist in the ARP table at any one time
ARP Request Retransmissions	Value must be an integer	5	ARP requests that do not result in an ARP response will be re-transmitted a maximum of ipconfigMAX_ARP_RETRANSMISSIONS times before the ARP request is aborted.
Maximum time before ARP table entry becomes stale	Value must be an integer	150	The maximum time between an entry in the ARP table being created or refreshed and the entry being removed because it is stale
Use string for IP Address	• Disable • Enable	Enable	Take an IP in decimal dot format (for example, "192.168.0.1") as its parameter FreeRTOS_inet_addr_quick() takes an IP address as four separate numerical octets (for example, 192, 168, 0, 1) as its parameters
Total number of available network buffers	Value must be an integer	10	Define the total number of network buffer that are available to the IP stack
Set the maximum number of events	Only symbols, numbers and arithmetic operators are valid.	ipconfigNUM_NETWORK_BUFFER_DESCRIPTORS + 5	Set the maximum number of events that can be queued for processing at any one time. The event queue must be a minimum of 5 greater than the total number of network buffers
Enable FreeRTOS_sendto() without calling Bind	• Enable • Disable	Disable	Set to 1 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the IP stack automatically binding

			the socket to a port number from the range socketAUTO_PORT_ALLOCATION_START_NUMBER to 0xffff. If ipconfigALLOW_SOCKET_SEND_WITHOUT_BIND is set to 0 then calling FreeRTOS_sendto() on a socket that has not yet been bound will result in the send operation being aborted.
TTL values for UDP packets	Value must be an integer	128	Define the Time To Live (TTL) values used in outgoing UDP packets
TTL values for TCP packets	Value must be an integer	128	Defines the Time To Live (TTL) values used in outgoing TCP packets
Use TCP and all its features	• Disable • Enable	Enable	Use TCP and all its features
Let TCP use windowing mechanism	• Disable • Enable	Disable	Let TCP use windowing mechanism
Maximum number of bytes the payload of a network frame can contain	Value must be an integer	1500	Maximum number of bytes the payload of a network frame can contain
Basic DNS client or resolver	• Disable • Enable	Enable	Set ipconfigUSE_DNS to 1 to include a basic DNS client/resolver. DNS is used through the FreeRTOS_gethostbyname() API function.
Reply to incoming ICMP echo (ping) requests	• Disable • Enable	Enable	If ipconfigREPLY_TO_INCOMING_PINGS is set to 1 then the IP stack will generate replies to incoming ICMP echo (ping) requests.
FreeRTOS_SendPingRequest() is available	• Disable • Enable	Disable	If ipconfigSUPPORT_OUTGOING_PINGS is set to 1 then the FreeRTOS_SendPingRequest() API function is available.
FreeRTOS_select() (and associated) API function is available	• Disable • Enable	Disable	If ipconfigSUPPORT_SELECT_FUNCTION is set to 1 then the

			FreeRTOS_select() (and associated) API function is available
Filter out non Ethernet II frames.	• Disable • Enable	Enable	If ipconfigFILTER_OUT_NON_ETHERNET_II_FRAMES is set to 1 then Ethernet frames that are not in Ethernet II format will be dropped. This option is included for potential future IP stack developments
Responsibility of the Ethernet interface to filter out packets	• Disable • Enable	Disable	If ipconfigETHERNET_DRIVER_FILTERS_FRAME_TYPES is set to 1 then it is the responsibility of the Ethernet interface to filter out packets that are of no interest.
Access 32-bit fields in the IP packets	Value must be an integer	2	To access 32-bit fields in the IP packets with 32-bit memory instructions, all packets will be stored 32-bit-aligned, plus 16-bits. This has to do with the contents of the IP-packets: all 32-bit fields are 32-bit-aligned, plus 16-bit
Size of the pool of TCP window descriptors	Value must be an integer	240	Define the size of the pool of TCP window descriptors
Size of Rx buffer for TCP sockets	Value must be an integer	3000	Define the size of Rx buffer for TCP sockets
Size of Tx buffer for TCP sockets	Value must be an integer	3000	Define the size of Tx buffer for TCP sockets
TCP keep-alive	• Disable • Enable	Enable	TCP keep-alive is available or not
TCP keep-alive interval	Value must be an integer	120	TCP keep-alive interval in second
The socket semaphore to unblock the MQTT task (USER_SEMAPHORE)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (WAKE_CALLBACK)	• Disable • Enable	Enable	The socket semaphore is used to unblock the MQTT task

The socket semaphore to unblock the MQTT task (USE_CALLBACKS)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (TX_DRIVER)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
The socket semaphore to unblock the MQTT task (RX_DRIVER)	• Disable • Enable	Disable	The socket semaphore is used to unblock the MQTT task
Possible optimisation for expert users	• Disable • Enable	Disable	Possible optimisation for expert users - requires network driver support. It is is useful when there is high network traffic. If non-zero value then instead of passing received packets into the IP task one at a time the network interface can chain received packets together and pass them into the IP task in one go. If set to 0 then only one buffer will be sent at a time.

Configurations for Networking > FreeRTOS+TCP Wrapper to ethernet driver (rm_freertos_plus_tcp)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_freertos_plus_tcp0	Module name.
RX Handler Task Stack Size	Only symbols, numbers and arithmetic operators are valid.	configMINIMAL_STACK_SIZE	Stack size of RX handler task.
RX Handler Task Priority	Only symbols, numbers and arithmetic operators are valid.	configMAX_PRIORITIES - 1	Priority of RX handler task. A higher priority ensures timely processing of network traffic or callbacks.
Check Link Status Task Stack Size	Only symbols, numbers and arithmetic operators are valid.	configMINIMAL_STACK_SIZE	Stack size of Check link status task.
Check Link Status Task Priority	Only symbols, numbers and arithmetic operators are valid.	configMAX_PRIORITIES - 1	Priority of Check link status task. A low priority is recommended as this is an periodic task.

Link check interval	Only symbols, numbers and arithmetic operators are valid.	1000	Interval for checking link status of the ethernet instance of the network interface. Low period will consume more processing time

Usage Notes

In order to use the NetworkInterface implementation provided by Renesas for RA devices:

1/ **In case of Common|Backward Compatible Mode =="NO" (FreeRTOS+TCP 4.0.0 onward)**

Note

This mode use IP_Init_Multi to initialize the TCP/IP stack.
Before calling this function, at least 1 interface and 1 end-point must have been added to the TCP/IP stack.

2/ **In case of Common|Backward Compatible Mode =="YES" (FreeRTOS+TCP 4.0.0 backward)**

Note

This mode use IP_Init to initialize stack.
Only support 1 interface.
Only one instance of the middle port layer should be generated.

- Some of the stack initialisation APIs have been deprecated as of FreeRTOS V4.0.0 onwards. Please refer to FreeRTOS+TCP Networking Tutorial: Initializing the TCP/IP Stack for the new APIs supporting IPv6, Multiple Endpoints and Multiple interfaces. To use the deprecated APIs please set it to "Yes" for the stack property "Common|Backward Compatible Mode".

Note

The MAC address passed to FreeRTOS_FillEndPoint must match the MAC address configured in the r_ether instance.
g_ether_instance must have vEtherISRCallback configured as the callback.
The xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber functions should be implemented in systems using FreeRTOS Plus TCP without Secure Sockets.
The weak implementations provided of xApplicationGetRandomNumber and ulApplicationGetNextSequenceNumber rely on rand() as implemented by the respective compiler's math library and may require heap allocation to support re-entrant usage. If these implementations are to be used, srand() must be seeded with a truly random value in the application in order to ensure randomness. This should be done using psa_generate_random() from the mbedtls stack. The weak implementations can also be instead overridden with a user-implementation that uses psa_generate_random().
To connect to a server using an IP address the macro ipconfigINCLUDE_FULL_INET_ADDR must be set to 1.

Limitations

- Zero-copy is not currently supported by the NetworkInterface.

5.2.12.22 GTL BLE Abstraction (rm_ble_abs_gtl)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics DA14531 and DA14535 Bluetooth® Low Energy 5 Modules. The rm_ble_abs_gtl driver interfaces with the DA14531/DA14535 module over UART.

Features

The Bluetooth® Low Energy Abstraction module with GTL supports the following features:

- Common functionality
  - Boot from host or DA14531/DA14535 flash.
  - Use 1-wire (default) or 2-wire UART for booting.
  - Open/Close the BLE protocol stack.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
  - Central: The device that initiates a connection with a peripheral.
  - All roles: The device may act as a central and peripheral the same time.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
  - Scan
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notifications and Indications.
  - Read/Write of GATT Profile from host.
  - Optionally the application and not the device may handle the attributes (Read Indication).
- Gatt Client functionality
  - Discover Peripheral Services/Characteristics.
  - Read/Write Peripheral Characteristics.
  - Receive Notifications and Indications.
- Security functionality (DA14531/DA14535)
  - Supporting Legacy Pairing.
  - Initiate security request procedure from Peripheral as well.
  - Support Secure connections.
  - Support security for both roles (Central - Peripheral).
  - Store bonding data to flash using vee_flash generic module.
  - Enable security from configurator.

    - Store bonding data to flash using vee_flash generic module.
    - Enable security from configurator.
    - Delete all bonding data.
    - Delete bonding data with specific BD address.
    - Read and Write BD address to storage.
    - Add crypto libs to encode bonding data in flash. (TinyCrypt module must be added)
- DA1453x Sleep support
    - Three sleep modes are supported with UART HW flow control.

Configuration

Pin Configuration

Pins used by the BLE driver to control the DA14531/DA14535 module:

- Reset Pin : Active low reset line for DA14531/DA14535 module.
- UART Interface : RX/TX/RTS Pins. The PMOD DA1453x modules require manually setting CTS GPIO as input. PMOD2_SS should be Input and PMOD2_CLK Output Low.

Usage Notes

Getting Started Guide

The below guide walks users through building a fully working solution that allows booting from the host via 1-wire UART in order to run a BLE application from the RA MCU using the GTL interface.

https://lpccs-docs.renesas.com/DA1453x-FSP_BLE_Framework/UM-B-172/index.html

Addresses

- A public BD address the address pre-programmed into the DA14531/DA14535 and will be used as default.
- A random BD address can be set by calling the R_BLE_VS_SetBdAddr function before the R_BLE_GAP_Init function is called.
- A public BD address can be set by calling the R_BLE_GTL_VS_SetPublicBdAddress() after R_BLE_GAP_Init function is called.

Heap Requirements

Ensure the BSP heap size is set to at least 2K bytes.

When using FreeRTOS ensure the heap 4 size is set to a minimum of 2K bytes.

Module Firmware Compatibility

This middleware module is compatible with GTL binary version 6.0.23.1451 and later. You must ensure that the DA14531/DA14535 Module (or PMOD) you are using contains this version (or later) firmware or that you use the boot from host feature and have the host MCU load the binary into the DA14531/DA14535. Note that DA14531 and DA14535 are not firmware compatible even though the GTL API is the same.

Instructions detailing how to upgrade the firmware in a DA14531 Module can be found here:

https://lpccs-docs.renesas.com/US159-DA14531EVZ_Firmware_Upgrade/index.html

The GTL binary file can be downloaded using the tool described in the above instructions, or by using the following link:

https://www.renesas.com/us/en/document/swo/fsp-gtl-binary-us159-da14531evz-pmod-programming?r=1564826

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Following a power on reset, the R_BLE_VS_GetRand function always returns the same number. Subsequent calls to this function produce random numbers.

Up to 3 concurrent connections are supported.

For DA1453x Sleep mode CTSRTS0 (EK-RA6M4) should be set to P413. Flow Control CTS/RTS Selection should be set to Hardware CTS. If RA is required to wake-up from DA453x P413 and P414 should be shorted and P414 should be set to interrupt mode. R_BLE_GTL_VS_SetSleepMode() is not unsupported, R_BLE_GTL_VS_SetSleepModeExt should be called directly instead.

For bonded devices Client Characteristic Configuration (CCC) values are not saved to flash memory. They are kept to RAM as long as reset does not take place. If the user wishes to save the CCC values to non-volatile memory, he should handle it from the application layer by marking them as Read Indicated (RI, please find the description bellow).

The CCC values are not kept per connection, the value of a CCC is the value of the last modification by a GATT Client. If the user wishes to keep CCC values per connection, he should handle it from the application layer by marking them as Read Indicated (RI, please find the description bellow).

Maximum bonded devices are limited to seven (7). Application must delete an entry before bonding with a new device. Saving bond data is supported with devices that use HP_Flash and boards RA6M4_EK, RA6M5_EK, RA4M3_EK, RA4M2_EK.

Role switching between Central and Peripheral is not supported after the devices have been bonded.

Out Of Band (OOB) paring is not supported.

GAP operations cannot overlap, e.g. you cannot initiate two connections concurrently

The boot from host feature currently supports 1-wire and 2-wire UART operation. If using a 1-wire boot from host the UART RX and TX pins on the host RA MCU must be tied together using a 1K ohm resistor in order to boot the DA14531/DA14535 - this resistor can remain in place after the boot operation has been completed. Boot from host using 2-wire UART is not supported when using a DA14531MOD module because not all the required pins are exposed. Boot from host using 2-wire UART is supported when a DA14535PMOD with SmartBoot (UM-B-171) is already flashed in DA14535. In this case the same pins used for GTL communication are also used for 2-wire boot.

The RI feature of attributes (values are not stored in DA1453x database) is controlled from the flag Enable Characteristic Value Read Callback of QE Tool. In case of a write request the local data base is automatically updated. The app will be notified by an BLE_GATTS_OP_PEER_XXX_WRITE_REQ. In case of a read request and Value Read Callback is enabled (read indication) the local data base is not automatically accessed to get the value. The user is responsible to provide the reply value from gatts_cb by using R_BLE_GTL_GATTS_ReadCfm after a BLE_GATTS_EVENT_DB_ACCESS_IND with

BLE_GATTS_OP_PEER_XXX_READ_REQ. The Client Characteristic Configuration (CCC) values are always treated as RI values. If the attribute is CCC and it is not marked as read_notify, then r_ble_gtl automatically handles it by using a cached value.

Service and characteristic write callback functions, are not generated by the QE Tool. Thus, R_BLE_GTL_GATTC_WRITE_REQ_IND always confirms with R_BLE_GTL_GAP_ERR_NO_ERROR. No value check is provided for incorrect value/range etc

Bonding data encryption requires TinyCrypt module to be added from configuration.

SPI comm interface:

- Booting DA14531 from RA6 is not supported yet. Need to burn the code on DA14531 flash before use.
- After GAPM_RESET_CMD, DA14531 needs 1.1sec to respond to GAPM_CMP_EVT. This delay is under investigation.
- This module was tested with RA6M5 & M4 Evaluation Kits
- Setup SCI->SCI0 pins according to your HW (RXD0, TXD0, SCK0 not CTSRTS0) and Operation mode-> Simple SPI.
- Set DREADY irq, channel and pin form stack (g_external_irq0).
- Set from stack "Boot from host disabled" & "Disable sleep"

R_BLE_GTL_GAP_StartScan supports only :

- Passive Scan (R_BLE_GTL_GAPM_OP_SCAN_PASSIVE)
- General Discovery Mode (R_BLE_GTL_GAP_GEN_DISCOVERY)
- No White Listing (R_BLE_GTL_SCAN_ALLOW_ADV_ALL)
- Static own address (R_BLE_GTL_GAPM_STATIC_ADDR)
- Slow Scan input
- 1M Phy
- Timeout of 7.7 Seconds restricted by DA145xx ROM.

R_BLE_GTL_GAP_CreateConn supports only :

- Static own address (R_BLE_GTL_GAPM_STATIC_ADDR)
- Automatic connection operation (R_BLE_GTL_GAPM_OP_CONNECTION_AUTO)

Currently supported rm_ble_abs_gtl interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising
- RM_BLE_ABS_CreateConnection
- RM_BLE_ABS_StartScanning

Currently supported r_ble_api interface functions:

- R_BLE_Open
- R_BLE_Close
- R_BLE_Execute
- R_BLE_IsTaskFree
- R_BLE_GetVersion
- R_BLE_GAP_Init
- R_BLE_GAP_Terminate
- R_BLE_GAP_UpdConn

- R_BLE_GAP_SetDataLen
- R_BLE_GAP_Disconnect
- R_BLE_GAP_ConfWhiteList
- R_BLE_GAP_GetVerInfo
- R_BLE_GAP_ReadRssi
- R_BLE_GAP_ReadChMap
- R_BLE_GAP_SetAdvParam
- R_BLE_GAP_SetAdvSresData
- R_BLE_GAP_StartAdv
- R_BLE_GAP_StopAdv
- R_BLE_GAP_GetRemainAdvBufSize
- R_BLE_GAP_GetRemDevInfo
- R_BLE_GAP_CreateConn
- R_BLE_GAP_CancelCreateConn
- R_BLE_GAP_StartScan
- R_BLE_GAP_StopScan
- R_BLE_GATTS_SetDbInst
- R_BLE_GATT_GetMtu
- R_BLE_GATTS_RegisterCb
- R_BLE_GATTS_DeregisterCb
- R_BLE_GATTS_Notification
- R_BLE_GATTS_Indication
- R_BLE_GATTS_GetAttr
- R_BLE_GATTS_SetAttr
- R_BLE_GATTC_DiscAllPrimServ
- R_BLE_GATTC_DiscPrimServ
- R_BLE_GATTC_DiscCharByUuid
- R_BLE_GATTC_DiscIncServ
- R_BLE_GATTC_DiscAllChar
- R_BLE_GATTC_DiscAllCharDesc
- R_BLE_GATTC_RegisterCb
- R_BLE_GATTC_DeregisterCb
- R_BLE_GATTC_ReqExMtu
- R_BLE_GATTC_ReadChar
- R_BLE_GATTC_ReadCharUsingUuid
- R_BLE_GATTC_ReadLongChar
- R_BLE_GATTC_ReadMultiChar
- R_BLE_GATTC_WriteCharWithoutRsp
- R_BLE_GATTC_WriteChar
- R_BLE_GATTC_WriteLongChar
- R_BLE_GATTC_ReliableWrites
- R_BLE_GATTC_ExecWrite
- R_BLE_VS_Init
- R_BLE_VS_GetBdAddr
- R_BLE_VS_SetBdAddr
- R_BLE_VS_GetRand
- R_BLE_VS_SetTxPower
- R_BLE_VS_GetTxPower
- R_BLE_GAP_SetPairingParams
- R_BLE_GAP_ReplyPairing
- R_BLE_GAP_ReplyLtkReq
- R_BLE_GAP_ReplyExKeyInfoReq
- R_BLE_GAP_StartPairing
- R_BLE_GAP_ReplyNumComp
- R_BLE_GAP_ReplyPasskeyEntry

- R_BLE_GAP_StartEnc
- R_BLE_GAP_GetDevSecInfo

Currently supported callback events:

- BLE_GAP_EVENT_STACK_ON
- BLE_GAP_EVENT_STACK_OFF
- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_DATA_LEN_CHG
- BLE_GAP_EVENT_CONN_PARAM_UPD_COMP
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GAP_EVENT_ADV_REPT_IND
- BLE_GAP_EVENT_SET_DATA_LEN_COMP
- BLE_GAP_EVENT_LOC_VER_INFO
- BLE_GAP_EVENT_RSSI_RD_COMP
- BLE_GAP_EVENT_CH_MAP_RD_COMP
- BLE_GAP_EVENT_GET_REM_DEV_INFO
- BLE_GAP_EVENT_CONN_CANCEL_COMP
- BLE_GAP_EVENT_CONN_PARAM_UPD_REQ
- BLE_GATTS_EVENT_WRITE_RSP_COMP
- BLE_GATTS_EVENT_HDL_VAL_CNF
- BLE_GATTS_EVENT_DB_ACCESS_IND
- BLE_GATTC_EVENT_EX_MTU_RSP
- BLE_GATTC_EVENT_PRIM_SERV_16_DISC_IND
- BLE_GATTC_EVENT_PRIM_SERV_128_DISC_IND
- BLE_GATTC_EVENT_ALL_PRIM_SERV_DISC_COMP
- BLE_GATTC_EVENT_CHAR_READ_BY_UUID_RSP
- BLE_GATTC_EVENT_CHAR_READ_RSP
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTC_EVENT_CHAR_WRITE_RSP
- BLE_GATTC_EVENT_CHAR_WRITE_WITHOUT_RSP
- BLE_GATTC_EVENT_CHAR_DISC_COMP
- BLE_GATTC_EVENT_CHAR_128_DISC_IND
- BLE_GATTC_EVENT_HDL_VAL_IND
- BLE_GATTC_EVENT_HDL_VAL_NTF
- BLE_GATTC_EVENT_EXECUTE_WRITE_COMP
- BLE_GATTC_EVENT_ATT_INFO_REQ_IND
- BLE_GATTC_EVENT_HDL_VAL_SVC_CHNG
- BLE_GAP_EVENT_EX_KEY_REQ
- BLE_GAP_EVENT_PASSKEY_ENTRY_REQ
- BLE_GAP_EVENT_PEER_KEY_INFO
- BLE_GAP_EVENT_PAIRING_COMP
- BLE_GAP_EVENT_LTK_REQ
- BLE_GAP_EVENT_ENC_CHG
- BLE_GAP_EVENT_LTK_RSP_COMP

Examples

BLE_ABS_GTL Basic Example

This is a basic example of minimal use of the BLE_ABS_GTL in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
      {
            g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
       }
 case BLE_GAP_EVENT_ADV_ON:
      {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
            g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
            g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
       }
 case BLE_GAP_EVENT_ADV_OFF:
      {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_ADV_OFF;
 break;
       }
 case BLE_GAP_EVENT_CONN_IND:
      {
            g_ble_event_flag |= BLE_ABS_EVENT_FLAG_CONN_IND;
 break;
       }
      {
 /* Do nothing. */
 break;
```

```
        }
 default:
 break;
    }
}
```

```
#define BLE_ABS_EVENT_FLAG_STACK_ON (0x01 << 0)
#define BLE_ABS_EVENT_FLAG_CONN_IND (0x01 << 1)
#define BLE_ABS_EVENT_FLAG_ADV_ON (0x01 << 2)

Detailed Description

The LAYER3 SWITCH module (r_layer3_switch) provides an API for standard Ethernet communications applications that use the ESWM peripheral. It implements the Ethernet Switch Interface.

Overview

This module performs Ethernet frame transmission and reception using Ethernet Switch Module.

The following figure shows which IPs are used by the r_layer3_switch module.

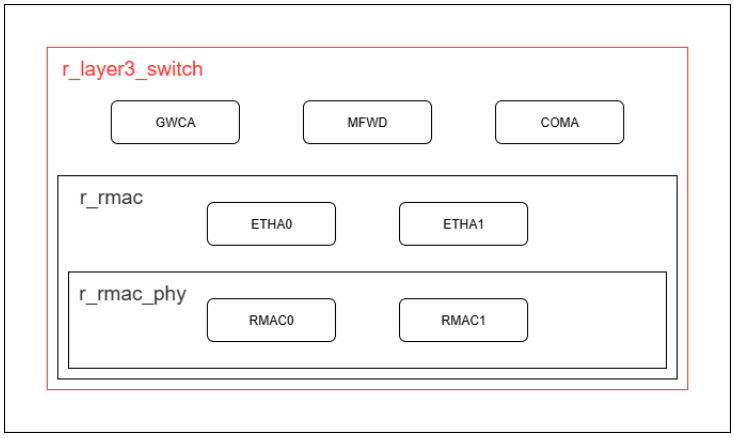

Figure 329: ESWM block diagram

Features

The layer3 switch module supports the following features:

- Transmit/receive data using a descriptor.
- Timestamp feature
- Optional callback function when transmit/receive complete or an error occurs
- Port based Forwarding [MFWD]
- Direct Forwarding [MFWD]
- L2/L3 Forwarding [MFWD/GWCA]
- L2/L3 Update [MFWD]

- Frame Replication and Elimination for Reliability (FRER) feature [MFWD]
- Per Stream Filtering and Policing (PSFP) feature [MFWD]

Supported Devices

Device Group	Devices
RA8	RA8D2, RA8M2, RA8P1, RA8T2

Configuration

Build Time Configurations for r_layer3_switch

The following build time configurations are defined in fsp_cfg/r_layer3_switch_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Available queue num	Value must be an integer between 1 and 64	4	available queue num.
gPTP enable	• Enabled • Disabled	Enabled	Select whether or not to use gPTP function.
Time Aware Shaper	• Enabled • Disabled	Disabled	Select whether or not to use the Time Aware Shaper function.

Configurations for Networking > Switch (r_layer3_switch)

This module can be added to the Stacks tab via New Stack > Networking > Switch (r_layer3_switch). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Interrupts			
Interrupt priority	MCU Specific Options		Select the layer3_switch interrupt priority.
ETHA0 error interrupt priority	MCU Specific Options		Select the layer3_switch etha0 interrupt priority.
ETHA1 error interrupt priority	MCU Specific Options		Select the layer3_switch etha1 interrupt priority.
Ports			
Ports > Port 0			

Ports > Port 0 > IPV queue depth

Queue 0	Value must be an integer more than 1	64	queue0 dept of port 0.
Queue 1	Value must be an integer more than 1	64	queue1 dept of port 0.
Queue 2	Value must be an integer more than 1	64	queue2 dept of port 0.
Queue 3	Value must be an integer more than 1	64	queue3 dept of port 0.
Queue 4	Value must be an integer more than 1	64	queue4 dept of port 0.
Queue 5	Value must be an integer more than 1	64	queue5 dept of port 0.
Queue 6	Value must be an integer more than 1	64	queue6 dept of port 0.
Queue 7	Value must be an integer more than 1	64	queue7 dept of port 0.
Forwarding	MCU Specific Options		Destination ports for port 0 forwarding
IPV queues for preemptable frames	• Queue 0 • Queue 1 • Queue 2 • Queue 3 • Queue 4 • Queue 5 • Queue 6 • Queue 7		Select IPV queues that send preemptable frames from port 0.
Minimum fragment size of preemptable frames	• 64 bytes • 128 bytes • 192 bytes • 256 bytes	64 bytes	Select minimum fragment size of preemptable frames that send from port 0.
MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of port 0.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs for port0.
Context	Name must be a valid C symbol	NULL	Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t for port0.
GPTP timer number	• Timer 0 • Timer 1	Timer 0	GPTP timer number of port 0.

Ports > Port 1

Ports > Port 1 > IPV queue depth

Queue 0	Value must be an integer more than 1	64	queue0 dept of port 1.
Queue 1	Value must be an integer more than 1	64	queue1 dept of port 1.
Queue 2	Value must be an integer more than 1	64	queue2 dept of port 1.
Queue 3	Value must be an integer more than 1	64	queue3 dept of port 1.
Queue 4	Value must be an integer more than 1	64	queue4 dept of port 1.
Queue 5	Value must be an integer more than 1	64	queue5 dept of port 1.
Queue 6	Value must be an integer more than 1	64	queue6 dept of port 1.
Queue 7	Value must be an integer more than 1	64	queue7 dept of port 1.
Forwarding	MCU Specific Options		Destination ports for port 1 forwarding
IPV queues for preemptable frames	• Queue 0 • Queue 1 • Queue 2 • Queue 3 • Queue 4 • Queue 5 • Queue 6 • Queue 7		Select IPV queues that send preemptable frames from port 1.
Minimum fragment size of preemptable frames	• 64 bytes • 128 bytes • 192 bytes • 256 bytes	64 bytes	Select minimum fragment size of preemptable frames that send from port 1.
MAC address	Must be a valid MAC address	00:11:22:33:44:55	MAC address of port 1.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs for port1.
Context	Name must be a valid C symbol	NULL	Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t for port1.
GPTP timer number	• Timer 0 • Timer 1	Timer 1	GPTP timer number of port 1.

Ports > CPU

Forwarding	• Port 0 • Port 1		Destination ports for CPU forwarding
CBS			
CBS > Port 0 Band width (%)			
Queue 0	Value must be an integer between 0 and 100	0	queue0 Band width of port 0.
Queue 1	Value must be an integer between 0 and 100	0	queue1 Band width of port 0.
Queue 2	Value must be an integer between 0 and 100	0	queue2 Band width of port 0.
Queue 3	Value must be an integer between 0 and 100	0	queue3 Band width of port 0.
Queue 4	Value must be an integer between 0 and 100	0	queue4 Band width of port 0.
Queue 5	Value must be an integer between 0 and 100	0	queue5 Band width of port 0.
Queue 6	Value must be an integer between 0 and 100	0	queue6 Band width of port 0.
Queue 7	Value must be an integer between 0 and 100	0	queue7 Band width of port 0.
CBS > Port 1 Band width (%)			
Queue 0	Value must be an integer between 0 and 100	0	queue0 Band width of port 1.
Queue 1	Value must be an integer between 0 and 100	0	queue1 Band width of port 1.
Queue 2	Value must be an integer between 0 and 100	0	queue2 Band width of port 1.
Queue 3	Value must be an integer between 0 and 100	0	queue3 Band width of port 1.
Queue 4	Value must be an integer between 0 and 100	0	queue4 Band width of port 1.

Queue 5	Value must be an integer between 0 and 100	0	queue5 Band width of port 1.
Queue 6	Value must be an integer between 0 and 100	0	queue6 Band width of port 1.
Queue 7	Value must be an integer between 0 and 100	0	queue7 Band width of port 1.
CBS > Port 0 Maximum burst frame number			
Queue 0	Value must be an integer between 0 and 255	0	queue0 maximum burst frame number of port 0.
Queue 1	Value must be an integer between 0 and 255	0	queue1 maximum burst frame number of port 0.
Queue 2	Value must be an integer between 0 and 255	0	queue2 maximum burst frame number of port 0.
Queue 3	Value must be an integer between 0 and 255	0	queue3 maximum burst frame number of port 0.
Queue 4	Value must be an integer between 0 and 255	0	queue4 maximum burst frame number of port 0.
Queue 5	Value must be an integer between 0 and 255	0	queue5 maximum burst frame number of port 0.
Queue 6	Value must be an integer between 0 and 255	0	queue6 maximum burst frame number of port 0.
Queue 7	Value must be an integer between 0 and 255	0	queue7 maximum burst frame number of port 0.
CBS > Port 1 Maximum burst frame number			
Queue 0	Value must be an integer between 0 and 255	0	queue0 maximum burst frame number of port 0.
Queue 1	Value must be an integer between 0 and 255	0	queue1 maximum burst frame number of port 0.
Queue 2	Value must be an integer between 0 and 255	0	queue2 maximum burst frame number of port 0.
Queue 3	Value must be an	0	queue3 maximum

	integer between 0 and 255		burst frame number of port 0.
Queue 4	Value must be an integer between 0 and 255	0	queue4 maximum burst frame number of port 0.
Queue 5	Value must be an integer between 0 and 255	0	queue5 maximum burst frame number of port 0.
Queue 6	Value must be an integer between 0 and 255	0	queue6 maximum burst frame number of port 0.
Queue 7	Value must be an integer between 0 and 255	0	queue7 maximum burst frame number of port 0.
Name	Name must be a valid C symbol	g_layer3_switch0	Module name.
Channel	0	0	Select the layer3 switch controller channel number.
Context	Name must be a valid C symbol	NULL	Placeholder for user data. Passed to the user callback in ether_switch_callback_args_t.
Callback	Name must be a valid C symbol	NULL	Callback provided when an ISR occurs
Number of Layer 3 routing entries	Value must be an integer between 1 and 256	10	Maximum number of Layer 3 routing entries.

Usage Notes

Time-Sensitive Network (TSN)

Credit Based Shaper [802.1Qav]

Credit Based Shaper (CBS) is a standard defined in IEEE 802.1Qav that limits the throughput of Ethernet traffic. The figure below illustrates the operation of CBS when the bandwidth is set to 40Mbps. When the transmission throughput exceeds the bandwidth configured by CBS, frame transmission is restricted. The restricted frames are buffered in the queue and transmitted with delay.

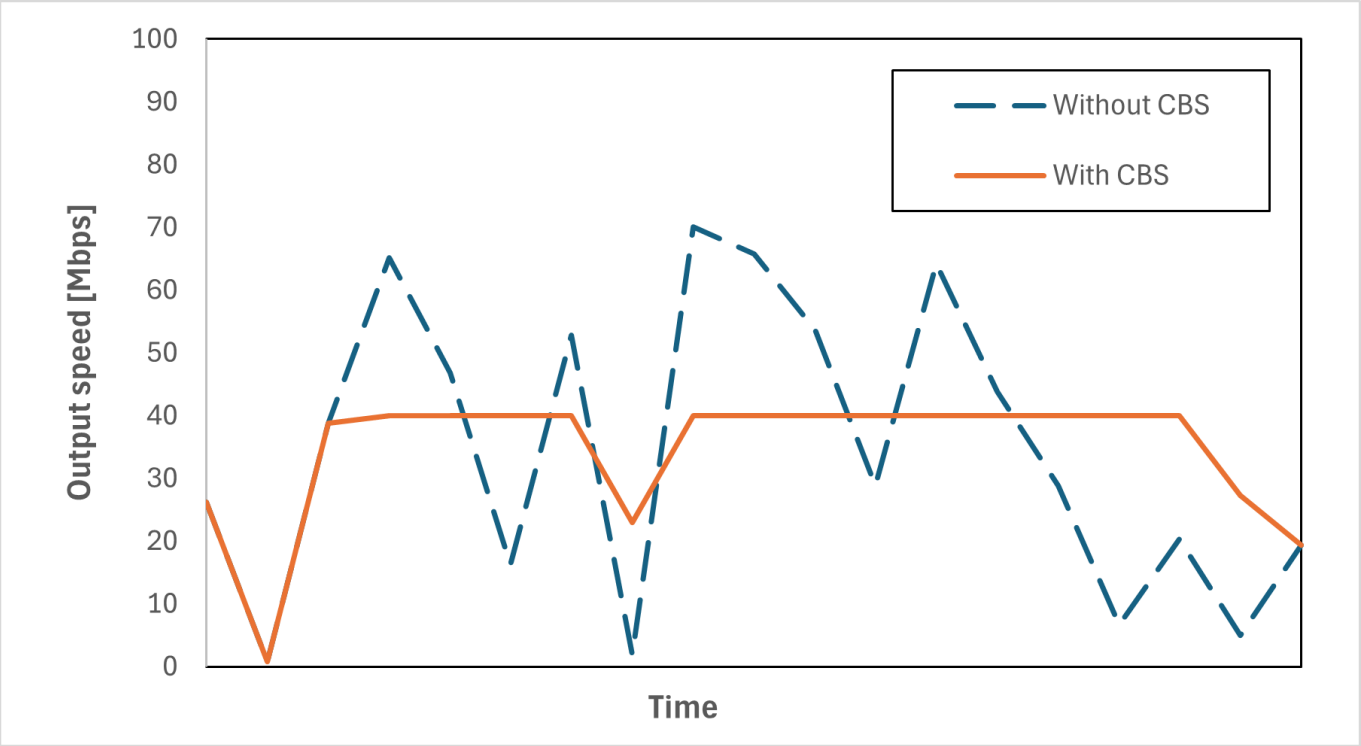

Figure 330: CBS operation image

In the r_layer3_switch module, CBS bandwidth can be configured for each Internal Priority Value (IPV) queue per transmission port. There are 8 IPV queues available for each port. On transmission ports where CBS is enabled, the throughput is limited to the configured bandwidth. CBS can be configured through stack properties or the ConfigurePort() API.

Note

The maximum number of frames that can be buffered by CBS is limited to the depth of each IPV queue. If many frames are buffered in high-priority queues, the common memory pool may be depleted, potentially limiting transmission from other queues.

Time-Aware Shaper [802.1Qbv]

Time-Aware Shaper (TAS) is a standard defined in IEEE 802.1Qbv that limits Ethernet traffic by controlling the time window when frames are transmitted. TAS controls transmission by changing gate states. Frames are transmitted while the gate is opened and when the gate is closed, frames cannot be transmitted and are delayed until the next open state. By opening each gate at different timings, it is possible to prevent frames of specific priorities from monopolizing the bandwidth. The figure below illustrates the operation of TAS. In this image, the gate cycle time is set to 10ms, Gate 0 is opened for 2.5 ms and closed for 7.5 ms, Gate 1 is closed for 1.0 + 5.0 ms and open for 4.0 ms.

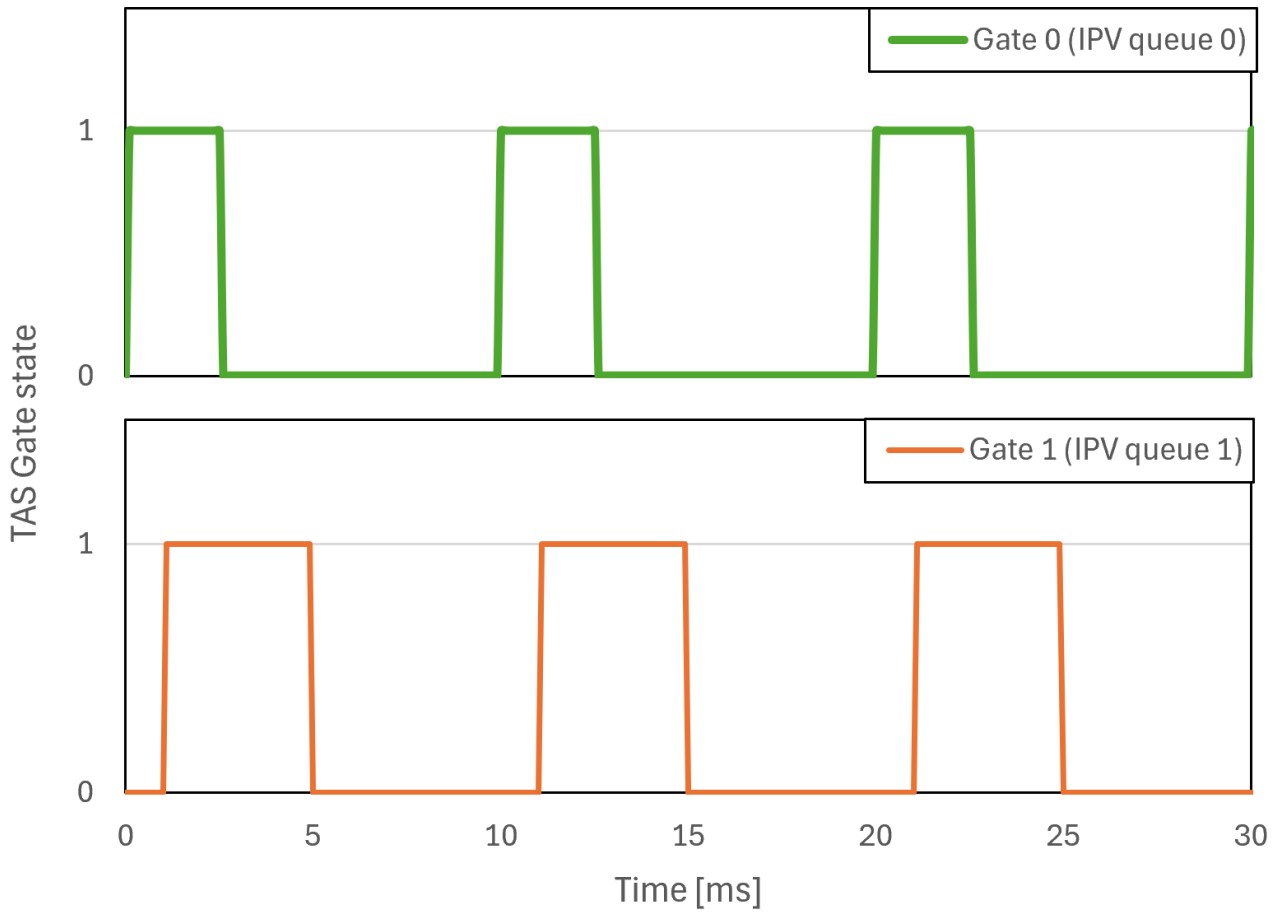

Figure 331: TAS operation image

In the r_layer3_switch module, TAS gates can be configured for each IPV queue of the transmission ports. Each gate learns entries that represent windows. An entry contains the window time and state. TAS feature is configured using the ConfigureTAS() API, and enabled using the EnableTAS() API.

Note

This TAS feature uses the gPTP timer.

Frame preemption [802.3br, 802.1Qbu]

Frame preemption is a standard defined in IEEE 802.3br and 802.1Qbu. This standard allows preempting low-priority frames to send high-priority frames.

Verification process

Frame preemption needs to verify the frame preemption capability of the link partner. The figure below shows the verification process. Verify frames have special preambles, so these frames are rejected on devices which do not support frame preemption.

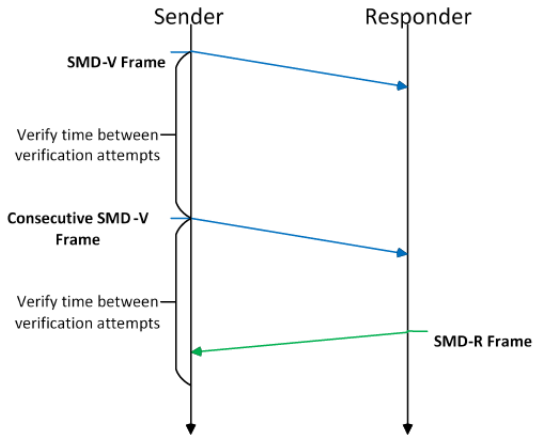

Figure 332: Frame preemption verification

In the r_layer3_switch module, the verification process is performed when the r_rmac_phy module links up and frame preemption is enabled in the configuration.

Preemption

The figure below shows the behavior of frame preemption. The low-priority frame (preemptable frame) is separated into several fragments, and they can be transferred in the intervals between high-priority frames (express frames). As a result, the negative influence on the throughput of high-priority frames is prevented.

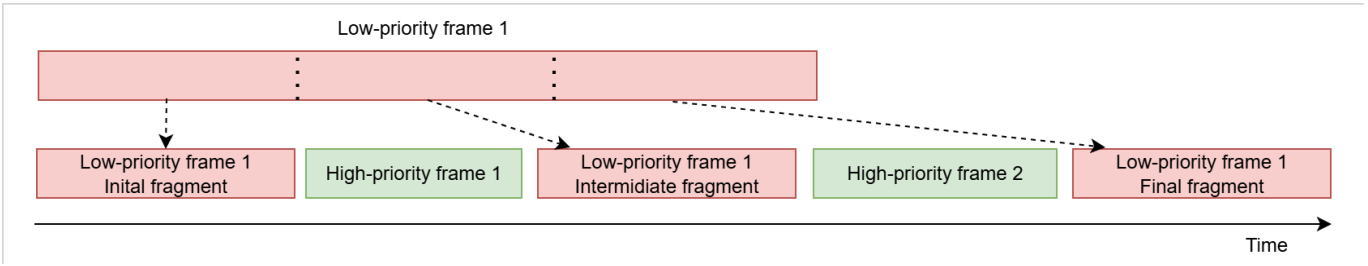

Figure 333: Frame preemption behavior

In the r_layer3_switch module, each IPV queue can be configured to send either preemptable frames or express frames. ESWM IP automatically assembles separated frames when receiving them.

Note

Sending preemptable frames is enabled when the verification process succeeds.

Per Stream Filtering and Policing (PSFP) [802.1Qci]

Per Stream Filtering and Policing (PSFP) feature is a standard defined in IEEE 802.1Qci that supports MSDU and Meter filters.

MAC Service Data Unit (MSDU) Filter

MAC Service Data Unit (MSDU)filter filters packets when Ethernet frame size (payload) is more than a

threshold.

Meter Filter

Meter filter filters packets when information rate is more than a threshold.

The filtered packets are sent to green or yellow bucket by Meter filter configuration.

Normal Mode and Throttle Mode

MSDU and Meter filters support normal mode and throttle mode.

In normal mode, the driver does not send packets filtered MSDU or Meter filter. Also, error status flag becomes 1 when the packet is more than a threshold.

In throttle mode, the driver keeps not to send all packets when error status flag is 1. User can clear error status flag using PsfpClearErrorStatus() API.

Limitations

Developers should be aware of the following limitations when using the r_layer3_switch:

- CBS feature supports only 100 Mbps and 1 Gbps link speeds.
- PSFP feature supports only Meter filter and MSDU filter. PSFP stream gates are not supported.

Examples

Basic Example

This is a basic example of transmission use of the LAYER3 SWITCH.

```
#define LAYER3_SWITCH_EXAMPLE_DESCRIPTOR_POOL_SIZE (8)
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE (1514)
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE_UPPER ((uint8_t)
((LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE & \
  0xFF00) >> 8))
#define LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE_LOWER ((uint8_t)
LAYER3_SWITCH_EXAMPLE_MAXIMUM_FRAME_SIZE & \
  0x00FF)
#define LAYER3_SWITCH_EXAMPLE_TRANSMIT_ETHERNET_FRAME_SIZE (60)
#define LAYER3_SWITCH_EXAMPLE_SOURCE_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79, 0x01
#define LAYER3_SWITCH_EXAMPLE_DESTINATION_MAC_ADDRESS 0x74, 0x90, 0x50, 0x00, 0x79,
0x02
#define LAYER3_SWITCH_EXAMPLE_FRAME_TYPE 0x00, 0x2E
#define LAYER3_SWITCH_EXAMPLE_PAYLOAD 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00,
```

Data Structure Documentation

◆ layer3_switch_basic_descriptor_t

struct layer3_switch_basic_descriptor_t
GWCA descriptor.

◆ layer3_switch_descriptor_t

struct layer3_switch_descriptor_t
GWCA extended descriptor.

◆ layer3_switch_ts_reception_process_descriptor_t

struct layer3_switch_ts_reception_process_descriptor_t
GWCA TS reception process descriptor.

◆ layer3_switch_psfp_msdu_filter_cfg_t

struct layer3_switch_psfp_msdu_filter_cfg_t		
Configuration of PSFP MSDU filter.		
Data Fields		
uint32_t	msdu_filter_id	PSFP MSDU filter ID.
uint32_t	maximum_frame_size	Maximum frame size is rejected by PSFP MSDU filter.
layer3_switch_msdu_filter_mode_t	mode	PSFP MSDU filter mode.

◆ layer3_switch_psfp_msdu_filter_info_t

struct layer3_switch_psfp_msdu_filter_info_t		
Information of PSFP MSDU filter.		
Data Fields		
uint32_t	msdu_filter_hw_id	
layer3_switch_psfp_filter_status_t	status	PSFP MSDU filter ID for hardware.
layer3_switch_psfp_msdu_filter_cfg_t *	p_psfp_msdu_filter_cfg	Status of PSFP MSDU filter. Pointer to configuration of PSFP MSDU filter.

◆ layer3_switch_psfp_meter_filter_cfg_t

struct layer3_switch_psfp_meter_filter_cfg_t		
Configuration of PSFP Meter filter for user.		
Data Fields		
uint32_t	meter_filter_id	PSFP Meter filter ID.
uint32_t	cbs	Maximum number of tokens (in bytes) contained in green bucket.
uint32_t	cir	Used to increment green tokens when green bucket is not full.
uint32_t	ebs	Maximum number of tokens (in bytes) contained in yellow bucket.
uint32_t	eir	Used to increment yellow tokens when yellow bucket is not full.
layer3_switch_meter_filter_mode_t	mode	Meter filter mode.
layer3_switch_meter_filter_drop_red_frame_t	drop_red_frame	Drop or not red frame by Meter filter.
layer3_switch_meter_filter_coupling_status_t	coupling_enable	When green bucket is full, CIR tokens are 0:lost, 1:added the yellow bucket.
layer3_switch_meter_filter_dei_handling_policy_t	dei_handling_policy	DEI handling policy for determining a frame color.
layer3_switch_meter_filter_pcp_handling_policy_t	pcp_handling_policy	PCP handling policy for determining a frame color.

◆ layer3_switch_psfp_meter_filter_info_t

struct layer3_switch_psfp_meter_filter_info_t		
Information of PSFP Meter filter.		
Data Fields		
uint32_t	meter_filter_hw_id	
layer3_switch_psfp_filter_status_t	status	PSFP Meter filter ID for hardware.
layer3_switch_psfp_meter_filter_cfg_t *	p_psfp_meter_filter_cfg	Status of PSFP Meter filter. Pointer to configuration of PSFP Meter filter.

◆ layer3_switch_psfp_error_status_bitmask_t

struct layer3_switch_psfp_error_status_bitmask_t

Bitmasks for clearing error status of throttle mode.		
Data Fields		
uint32_t	msdu_filter_bitmask	Bitmask for clearing error status bit of PSFP MSDU filter.
uint32_t	meter_filter_bitmask	Bitmask for clearing error status bit of PSFP Meter filter.

◆ layer3_switch_frer_cfg_t

struct layer3_switch_frer_cfg_t		
Configuration of FRER feature.		
Data Fields		
uint32_t	sys_clock	Timeout check time.
uint32_t	timeout_enable	Timeout check valid.
uint32_t	check_period	Microsecond prescaler used to creates an internal clock for aging at 1 MHz to derive the timeout 1 kHz clock.

◆ layer3_switch_frer_entry_t

struct layer3_switch_frer_entry_t		
FRER table entry.		
Data Fields		
uint32_t	take_no_sequence	Reject frames without R-TAG.
uint32_t	sequence_history_len	Sequence history length.
uint32_t	set_recovery_remaining_tick	Time in tick before timeout.

◆ layer3_switch_frer_entry_cfg_t

struct layer3_switch_frer_entry_cfg_t		
Configuration of FRER entry (individual and sequence recovery).		
Data Fields		
layer3_switch_frer_entry_t	individual_recovery	FRER table entry for individual recovery.
layer3_switch_frer_entry_t *	p_sequence_recovery	Pointer to FRER entry(sequence recovery) information referenced by FRERN in this FRER entry(individual recovery).
uint32_t	sequence_recovery_id	

◆ layer3_switch_frer_sequence_recovery_status_t

struct layer3_switch_frer_sequence_recovery_status_t		
Status of FRER sequence recovery table.		
Data Fields		
bool	learned	Flags whether the FRER entry(sequence recovery) related to this entry has been learned.
uint32_t	frer_entry_index	Real FRER table index of the FRER entry(sequence recovery) related to this entry.

◆ layer3_switch_descriptor_queue_cfg_t

struct layer3_switch_descriptor_queue_cfg_t		
Configuration of a descriptor queue.		
Data Fields		
layer3_switch_descriptor_format_t	descriptor_format	Enable or disable extended descriptors.
layer3_switch_queue_type_t	type	Reception queue or transmission queue.
layer3_switch_write_back_mode_t	write_back_mode	Configure write-back to descriptor fields.
layer3_switch_descriptor_t *	p_descriptor_array	Descriptor array that use to create queue.
layer3_switch_ts_reception_process_descriptor_t *	p_ts_descriptor_array	TS descriptor array that use to create queue.
layer3_switch_rx_timestamp_storage_t	rx_timestamp_storage	Configure RX timestamp storage.
uint32_t	array_length	Length of descriptor array. This length includes terminate descriptor at the end.
uint32_t	ports	Bitmap of ports that use this queue.

◆ layer3_switch_cbs_cfg_t

struct layer3_switch_cbs_cfg_t		
Configuration of Credit Based Shaper.		
Data Fields		
uint8_t	band_width_list[8]	CBS band width [%] of each queue.
uint8_t	max_burst_num_list[8]	Maximum burst frame number of each queue.

◆ layer3_switch_port_cfg_t

struct layer3_switch_port_cfg_t	
Configuration of each Ethernet port.	
Data Fields	
uint8_t *	p_mac_address
	Pointer to MAC address.
bool	forwarding_to_cpu_enable
	Enable or disable reception on CPU.
layer3_switch_cbs_cfg_t *	p_cbs_cfg
	Pointer to CBS configuration.
void(*	p_callback)(ether_switch_callback_args_t *p_args)
	Callback provided when an ISR occurs.
ether_switch_callback_args_t *	p_callback_memory
	Pointer to optional callback argument memory.
void *	p_context
	Pointer to context to be passed into callback function.

◆ layer3_switch_descriptor_queue_status_t

struct layer3_switch_descriptor_queue_status_t		
Status of a descriptor queue.		
Data Fields		
uint32_t	head	Index at the head of the queue. This used for GetDescriptor API.
uint32_t	tail	Index at the tail of the queue. This used for SetDescriptor API.

bool	created	This queue is already created.
layer3_switch_descriptor_queue_cfg_t const *	p_queue_cfg	Configuration of this queue.
bool	rx_available	Indicates whether the queue is available for reception.

◆ layer3_switch_ipv6_filter_address_offset_t

struct layer3_switch_ipv6_filter_address_offset_t		
IP address offset for creating IPv6 filter of Layer3 forwarding.		
Data Fields		
uint8_t	offset	Offset of IPv6 address.
layer3_switch_ip_address_direction_t	direction	Select source or destination.

◆ layer3_switch_l3_stream_filter_cfg_t

struct layer3_switch_l3_stream_filter_cfg_t		
Configuration of stream filter in Layer3 forwarding.		
Data Fields		
uint16_t	filter_field_bitmask	Bitmask of which feilds is enabled in stream filter. Use layer3_switch_l3_filter_bitmask_t.
layer3_switch_ipv6_filter_address_offset_t	ipv6_address0	Offset of IPv6 address 0.
layer3_switch_ipv6_filter_address_offset_t	ipv6_address1	Offset of IPv6 address 1.

◆ layer3_switch_frame_vlan_tag_t

struct layer3_switch_frame_vlan_tag_t		
VLAN tag structure.		
Data Fields		
uint16_t	pcp: 3	Priority Code Point (3 bit).
uint16_t	dei: 1	Drop Eligible Indicator (1 bit).
uint16_t	id: 12	VLAN ID (12 bit).

◆ layer3_switch_frame_filter_t

struct layer3_switch_frame_filter_t
Frame filter of a MAC/VLAN/Layer3 forwarding entry. Set values for members required for filtering.
Data Fields

layer3_switch_table_entry_type_t	entry_type	Type of this entry. Select MAC, VLAN or Layer3.
uint8_t *	p_destination_mac_address	Destination MAC address.
uint8_t *	p_source_mac_address	Source MAC address.
layer3_switch_frame_vlan_tag_t	vlan_c_tag	VLAN C-TAG.
layer3_switch_frame_vlan_tag_t	vlan_s_tag	VLAN S-TAG.
layer3_switch_ip_version_t	ip_version	IP version. Select IPv4, IPv6, or not IP packet.
uint8_t	protocol	IP protocol.
uint8_t *	p_source_ip_address	Source IP address.
uint8_t *	p_destination_ip_address	Destination IP address.
uint16_t	layer4_source_port	TCP/UDP source port.
uint16_t	layer4_destination_port	TCP/UDP destination port.

◆ layer3_switch_l3_filter_t

struct layer3_switch_l3_filter_t		
Store filter information of Layer3 forwarding entry.		
Data Fields		
layer3_switch_frame_filter_t	frame	Target frame format that used to Layer3 forwarding.

◆ layer3_switch_l3_update_config_t

struct layer3_switch_l3_update_config_t		
Configuration of a L2/L3 update feature for output frames.		
Data Fields		
uint32_t	enable_destination_ports	Destination ports that this update config is enabled.
uint32_t	update_field_bitmask	Bit mask of which fields will be updated. Use layer3_switch_l3_update_bitmask_t.
uint8_t *	p_mac_destination_address	MAC Destination Address.
layer3_switch_frame_vlan_tag_t	vlan_c_tag	VLAN C-tag.
layer3_switch_frame_vlan_tag_t	vlan_s_tag	VLAN S-tag.
layer3_switch_forwarding_r_tag_t	r_tag_update_mode	R-TAG update setting.
bool	sequence_number_generation_enable	Flags whether sequence number generation (FRER) is enabled for this entry.

◆ layer3_switch_table_entry_cfg_t

struct layer3_switch_table_entry_cfg_t		
Table entry configuration of MAC/VLAN/Layer3 forwarding.		
Data Fields		
bool	entry_enable	Enable or disable entry. If this field is false, entry will be removed.
bool	security_enable	Entry is secure or not.
layer3_switch_psfp_msdu_filter_cfg_t *	p_psfp_msdu_filter_cfg	
layer3_switch_psfp_meter_filter_cfg_t *	p_psfp_meter_filter_cfg	Pointer to configuration of PSFP MDSU filter. Pointer to configuration of PSFP Meter filter.
layer3_switch_frer_entry_cfg_t *	p_frer_entry_cfg	Configuration of the FRER entry(individual recovery) for this L3 entry (set to NULL : FRER is not valid in this L3 entry).
uint32_t	destination_ports	Destination ports of forwarding.
uint32_t	source_ports	Source ports that enable forwarding of incoming frame.
uint32_t	destination_queue_index	Destination queue. This fields is only used when a destination port is CPU.
uint32_t	internal_priority_update_enable	Enable to update internal priority.
uint32_t	internal_priority_update_value	Internal priority when updating is enabled.
union layer3_switch_table_entry_cfg_t	__unnamed__	

◆ layer3_switch_table_entry_t

struct layer3_switch_table_entry_t		
Table entry of MAC/VLAN/Layer3 forwarding.		
Data Fields		
layer3_switch_frame_filter_t	target_frame	Target frame of forwarding by this entry.
layer3_switch_table_entry_cfg_t	entry_cfg	Configuration of this entry.

◆ layer3_switch_forwarding_port_cfg_t

struct layer3_switch_forwarding_port_cfg_t		
Configuration of forwarding feature for each port.		
Data Fields		
bool	mac_table_enable	Enable MAC table and forwarding feature.
layer3_switch_mac_address_search_t	mac_address_search	Select which MAC address or addresses are used to search the MAC table for forwarding.
bool	mac_reject_unknown	Reject frame with unknown MAC address.
bool	mac_hardware_learning_enable	Enable hardware learning and migration.
bool	vlan_table_enable	Enable VLAN table and forwarding feature.
bool	vlan_reject_unknown	Reject frame with unknown VLAN ID.
layer3_switch_vlan_ingress_mode_t	vlan_ingress_mode	Select Tag-based VLAN or Port-based VLAN for incoming frame.
layer3_switch_vlan_egress_mode_t	vlan_egress_mode	Tagging/untagging mode for outgoing frame.
layer3_switch_frame_vlan_tag_t	vlan_s_tag	S-TAG of this port. When egress mode is hardware SC-TAG, add this to outgoing frame.
layer3_switch_frame_vlan_tag_t	vlan_c_tag	C-TAG of this port. When egress mode is hardware C-TAG, add this to outgoing frame.
bool	layer3_table_enable	Enable Layer3 table and forwarding feature.
bool	layer3_reject_unknown	Reject frame that not found in Layer3 table.
bool	layer3_ipv4_filter_enable	Enable IPv4 stream filter.
bool	layer3_ipv6_filter_enable	Enable IPv6 stream filter.
bool	layer3_l2_filter_enable	Enable L2 stream filter.

◆ layer3_switch_table_t

struct layer3_switch_table_t		
Forwarding table containing MAC/VLAN/Layer3 forwarding entries.		
Data Fields		
layer3_switch_table_entry_t *	p_mac_entry_list	List of MAC entries.
uint32_t	mac_list_length	Length of the MAC entry list.

layer3_switch_table_entry_t *	p_vlan_entry_list	List of VLAN entries.
uint32_t	vlan_list_length	Length of the VLAN entry list.
layer3_switch_table_entry_t *	p_l3_entry_list	List of Layer3 entries.
uint32_t	l3_list_length	Length of the Layer3 entry list.

◆ layer3_switch_table_cfg_t

struct layer3_switch_table_cfg_t		
Configuration of the forwarding table.		
Data Fields		
layer3_switch_table_t *	p_table	Pointer to forwarding table.
layer3_switch_forwarding_port_cfg_t	port_cfg_list[BSP_FEATURE_ETHER_NUM_CHANNELS+1]	Forwarding configuration of each port.
uint32_t	unsecure_entry_maximum_num	Maximum number of unsecure entries.
bool	mac_entry_aging_enable	Enable aging feature of MAC table.
uint32_t	mac_entry_aging_time_sec	Time[s] to delete an entry by aging.
layer3_switch_vlan_mode_t	vlan_mode	VLAN mode options: NO VLAN, C-TAG, or SC-TAG.
layer3_switch_l3_stream_filter_cfg_t	l3_stream_filter_cfg	Configuration of stream filter in Layer3 forwarding.
layer3_switch_frer_cfg_t	frer_cfg	Configuration of FRER feature.

◆ layer3_switch_extended_cfg_t

struct layer3_switch_extended_cfg_t		
ESWM extension configures each Ethernet port and forwarding feature.		
Data Fields		
ether_phy_instance_t const *	p_ether_phy_instances[BSP_FEATURE_ETHER_NUM_CHANNELS]	List of pointers to ETHER_PHY instance.
gptp_instance_t const *	p_gptp_instance	Pointer to a gPTP instance.
uint32_t	fowarding_target_port_masks[BSP_FEATURE_ETHER_NUM_CHANNELS+1]	List of ports to which incoming frames are forwarded.
uint8_t *	p_mac_addresses[BSP_FEATURE_ETHER_NUM_CHANNELS]	
uint32_t	ipv_queue_depth_list[BSP_FEATURE_ETHER_NUM_CHANNELS][BSP_FEATURE_ESWM_ETHA_IPV_QUEUE_NUM]	List of IPV queue depth for each port.

uint32_t	ipv_queue_preemptable_bitmask[BSP_FEATURE_ETHER_NUM_CHANNELS]	Bitmask of IPV queues that contain preemptable frames.
layer3_switch_preemptable_frame_fragment_size_t	frame_preemption_fragment_size[BSP_FEATURE_ETHER_NUM_CHANNELS]	Minimum fragment size of preemptable frame.
layer3_switch_l3_filter_t *	l3_filter_list	Filter list of layer3 routing.
uint32_t	l3_filter_list_length	Length of Layer3 filter list.
layer3_switch_port_cfg_t *	p_port_cfg_list[BSP_FEATURE_ETHER_NUM_CHANNELS]	Configuration for each port.
IRQn_Type	etha_error_irq_port_0	ETHA error interrupt number for port 0.
IRQn_Type	etha_error_irq_port_1	ETHA error interrupt number for port 1.
uint8_t	etha_error_ipl_port_0	ETHA error interrupt priority for port 0.
uint8_t	etha_error_ipl_port_1	ETHA error interrupt priority for port 1.
uint8_t	gptp_timer_numbers[BSP_FEATURE_ESWM_GPTP_TIMER_NUM]	List of timer numbers for transmission/reception timestamp.

◆ layer3_switch_instance_ctrl_t

struct layer3_switch_instance_ctrl_t	
LAYER3_SWITCH control block. DO NOT INITIALIZE. Initialization occurs when ether_switch_api_t::open is called.	
Data Fields	
uint32_t	open
	Used to determine if the channel is configured.
ether_switch_cfg_t const *	p_cfg
	Pointer to initial configurations.
R_GWCA0_Type *	p_gwca_reg
	Pointer to GWCA register.
uint32_t	allocated_descriptor_queue_index

	Index of the descriptor pool.
layer3_switch_basic_descriptor_t	p_descriptor_queue_list [LAYER3_SWITCH_CFG_AVAILABLE_QUEUE_NUM]
	Descriptor queue lists used by hardware.
layer3_switch_descriptor_queue_status_t	p_queues_status [LAYER3_SWITCH_CFG_AVAILABLE_QUEUE_NUM]
	Status of each descriptor queues.
layer3_switch_port_cfg_t	p_port_cfg_list [BSP_FEATURE_ETHER_NUM_CHANNELS]
	Configuration for each port.
layer3_switch_table_status_t	table_status
	Forwarding table is initialized or not.
uint32_t	l3_entry_count
	Counts of valid LAYER3 entry.
uint8_t	l3_routing_number
	Routing number for L2/L3 update feature.
uint8_t	l3_remapping_number
	Remapping number for L2/L3 update feature.
layer3_switch_ts_descriptor_queue_status_t	ts_descriptor_queue_status_list [BSP_FEATURE_ESWM_TS_DESCRIPTOR_QUEUE_MAX_NUM]
	Status of TS reception descriptor queues.

layer3_switch_psfp_msdu_filter_info_t	psfp_msdu_filter_info_list [BSP_FEATURE_ESWM_PSFP_MSDU_FILTER_MAX_NUM]
	List of information of PSFP MSDU filter.
layer3_switch_psfp_meter_filter_info_t	psfp_meter_filter_info_list [BSP_FEATURE_ESWM_PSFP_METER_FILTER_SINGLE_BUCKET_METERS_MAX_NUM]
	List of information of PSFP Meter filter.
uint32_t	valid_frer_entry_num
	Number of valid FRER entry.
layer3_switch_frer_sequence_recovery_status_t	frer_sequence_recovery_status [BSP_FEATURE_ESWM_FRER_TABLE_SIZE]
	Status of table for each FRER sequence recovery entry.
uint32_t	used_frer_sequence_generator_num
	Number of the sequence number generator.
bool	frame_preemption_available [BSP_FEATURE_ETHER_NUM_CHANNELS]
	Status of the frame preemption verification.
ether_switch_link_status_bitmaps_t	link_status_bitmaps
	Current Link status.
void(*	p_callback)(ether_switch_callback_args_t *p_args)
	Callback provided when an ISR occurs.
ether_switch_callback_args_t *	p_callback_memory

	Pointer to optional callback argument memory.
void *	p_context
	Pointer to context to be passed into callback function.

◆ layer3_switch_tas_entry_t

struct layer3_switch_tas_entry_t		
Configuration of the gate operation.		
Data Fields		
layer3_switch_tas_gate_state_t	state	Gate state.
uint32_t	time	Time associated with the entry gate state [nsec].

◆ layer3_switch_tas_gate_cfg_t

struct layer3_switch_tas_gate_cfg_t		
Configuration of the gate.		
Data Fields		
layer3_switch_tas_gate_state_t	initial_gate_state	Initial gate state when the cycle starts.
uint8_t	tas_entry_num	Number of TAS entries included in this gate.
layer3_switch_tas_entry_t *	p_tas_entry_list	List of TAS entries included in this gate.

◆ layer3_switch_tas_cfg_t

struct layer3_switch_tas_cfg_t		
Configuration of the TAS.		
Data Fields		
uint8_t	gptp_timer_number	gPTP timer number.
uint32_t	cycle_time_start_high	Upper 32 bits of TAS cycle start time [nsec].
uint32_t	cycle_time_start_low	Lower 32 bits of TAS cycle start time [nsec].
uint32_t	cycle_time	TAS cycle time [nsec].
layer3_switch_tas_gate_cfg_t	gate_cfg_list[8]	List of TAS gate configurations.

◆ layer3_switch_target_port_bitmaps_t

struct layer3_switch_target_port_bitmaps_t		
Target port bitmaps.		
Data Fields		
uint32_t	ports[((BSP_FEATURE_ETHER_NUM_CHANNELS - 1)/32)+1]	List of target ports bitmap.

Enumeration Type Documentation

◆ layer3_switch_descriptor_type_t

enum layer3_switch_descriptor_type_t	
GWCA descriptor type.	
Enumerator	
LAYER3_SWITCH_DESCRIPTOR_TYPE_LINKFIX	Linkfix. Control element pointing to next descriptor in chain.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_IS	Frame Empty Incremental Start.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_IC	Frame Empty Incremental Continue.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_ND	Frame Empty No Data Storage.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY	Frame Empty.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_START	Frame Empty Start.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_MID	Frame Empty Mid.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEMPTY_END	Frame Empty End.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FSINGLE	Frame Single.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FSTART	Frame Start.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FMID	Frame Mid.
LAYER3_SWITCH_DESCRIPTOR_TYPE_FEND	Frame End.
LAYER3_SWITCH_DESCRIPTOR_TYPE_LEMPTY	Link Empty.
LAYER3_SWITCH_DESCRIPTOR_TYPE_EEMPTY	EOS Empty.
LAYER3_SWITCH_DESCRIPTOR_TYPE_LINK	Link.
LAYER3_SWITCH_DESCRIPTOR_TYPE_EOS	End of Set.

◆ layer3_switch_port_bitmask_t

enum layer3_switch_port_bitmask_t	
Bitmasks for each port.	
Enumerator	
LAYER3_SWITCH_PORT_BITMASK_PORT0	Port 0.
LAYER3_SWITCH_PORT_BITMASK_PORT1	Port 1.
LAYER3_SWITCH_PORT_BITMASK_PORT2	Port 2.

◆ layer3_switch_queue_type_t

enum layer3_switch_queue_type_t	
Descriptor queue type.	
Enumerator	
LAYER3_SWITCH_QUEUE_TYPE_RX	Reception queue.
LAYER3_SWITCH_QUEUE_TYPE_TX	Transmission queue.

◆ layer3_switch_descriptor_format_t

enum layer3_switch_descriptor_format_t	
Descriptor format type.	
Enumerator	
LAYER3_SWITCH_DISCRIPTOR_FORMTAT_BASIC	Using basic descriptor.
LAYER3_SWITCH_DISCRIPTOR_FORMTAT_EXTENDED	Using extended descriptor with additional fields.
LAYER3_SWITCH_DISCRIPTOR_FORMTAT_TX_TIMESTAMP	Using TX timestamp descriptor.

◆ layer3_switch_write_back_mode_t

enum layer3_switch_write_back_mode_t	
Write back mode.	
Enumerator	
LAYER3_SWITCH_WRITE_BACK_MODE_FULL	All fields are updated by hardware.
LAYER3_SWITCH_WRITE_BACK_MODE_DISABLE	No fields are updated by hardware.
LAYER3_SWITCH_WRITE_BACK_MODE_KEEP_DT	Fields exclude DT are updated by hardware.

◆ layer3_switch_ip_version_t

enum layer3_switch_ip_version_t	
IP version options.	
Enumerator	
LAYER3_SWITCH_IP_VERSION_NONE	Not IP packet.
LAYER3_SWITCH_IP_VERSION_IPV4	IPv4 packet.
LAYER3_SWITCH_IP_VERSION_IPV6	IPv6 packet.

◆ layer3_switch_ip_address_direction_t

enum layer3_switch_ip_address_direction_t	
Direction of IP address.	
Enumerator	
LAYER3_SWITCH_IP_ADDRESS_DIRECTION_SOURCE	Use IP source address in stream ID.
LAYER3_SWITCH_IP_ADDRESS_DIRECTION_DESTINATION	Use IP destination address in stream ID.

◆ layer3_switch_magic_packet_detection_t

enum layer3_switch_magic_packet_detection_t	
Magic packet detection options.	
Enumerator	
LAYER3_SWITCH_MAGIC_PACKET_DETECTION_ENABLE	Enable magic packet detection.
LAYER3_SWITCH_MAGIC_PACKET_DETECTION_DISABLE	Disable magic packet detection.

◆ layer3_switch_mac_address_search_t

enum layer3_switch_mac_address_search_t	
MAC addresses used to search the MAC table for forwarding.	
Enumerator	
LAYER3_SWITCH_MAC_ADDRESS_SEARCH_DESTINATION	Use the destination MAC address only.
LAYER3_SWITCH_MAC_ADDRESS_SEARCH_SOURCE	Use the source MAC address only.
LAYER3_SWITCH_MAC_ADDRESS_SEARCH_SOURCE_AND_DESTINATION	Use both destination and source MAC addresses.

◆ layer3_switch_vlan_mode_t

enum layer3_switch_vlan_mode_t	
VLAN detection mode.	
Enumerator	
LAYER3_SWITCH_VLAN_MODE_NO_VLAN	Not use VLAN feature.
LAYER3_SWITCH_VLAN_MODE_C_TAG	Detect and use VLAN C-TAG.
LAYER3_SWITCH_VLAN_MODE_SC_TAG	Detect and use VLAN SC-TAG.

◆ layer3_switch_vlan_ingress_mode_t

enum layer3_switch_vlan_ingress_mode_t	
VLAN ingress mode determines whether the switch operates with tagged VLAN or port-based VLAN.	
Enumerator	
LAYER3_SWITCH_VLAN_INGRESS_MODE_TAG_BASED	Use VLAN ID of the incoming frame.
LAYER3_SWITCH_VLAN_INGRESS_MODE_PORT_BASED	Use VLAN ID of the incoming port.

◆ layer3_switch_vlan_egress_mode_t

enum layer3_switch_vlan_egress_mode_t	
VLAN egress mode determines the VLAN tag that is added to output frames.	
Enumerator	
LAYER3_SWITCH_VLAN_EGRESS_MODE_NO_VLAN	Frame always outgoing without VLAN TAG.
LAYER3_SWITCH_VLAN_EGRESS_MODE_C_TAG	Frame outgoing with C-TAG of incoming frame.
LAYER3_SWITCH_VLAN_EGRESS_MODE_HW_C_TAG	Frame always outgoing with C-TAG of output port.
LAYER3_SWITCH_VLAN_EGRESS_MODE_SC_TAG	Frame always outgoing with SC-TAG of incoming frame.
LAYER3_SWITCH_VLAN_EGRESS_MODE_HW_SC_TAG	Frame always outgoing with SC-TAG of output port.

◆ layer3_switch_ip_protocol_t

enum layer3_switch_ip_protocol_t	
IP protocols type.	
Enumerator	
LAYER3_SWITCH_IP_PROTOCOL_TCP	IP protocol is TCP.
LAYER3_SWITCH_IP_PROTOCOL_UDP	IP protocol is UDP.

◆ layer3_switch_forwarding_r_tag_t

enum layer3_switch_forwarding_r_tag_t	
R-TAG filed update options.	
Enumerator	
LAYER3_SWITCH_FORWARDING_R_TAG_UPDATE	Incoming frame with R-TAG will be updated with new R-TAG.
LAYER3_SWITCH_FORWARDING_R_TAG_ALWAYS_ADD	ALl incoming frame will be added new R-TAG.
LAYER3_SWITCH_FORWARDING_R_TAG_ALWAYS_ELIMINATE	ALl incoming frame will be removed R-TAG.

◆ layer3_switch_l3_filter_bitmask_t

enum layer3_switch_l3_filter_bitmask_t	
Frame filters options for layer3 forwarding.	
Enumerator	
LAYER3_SWITCH_L3_FILTER_BITMASK_MAC_DESTINATION	Enable MAC destination address.
LAYER3_SWITCH_L3_FILTER_BITMASK_MAC_SOURCE	Enable MAC source address.
LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_ID	Enable VLAN ID of S-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_PCP	Enable PCP of S-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_STAG_DEI	Enable DEI of S-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_ID	Enable VLAN ID of C-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_PCP	Enable PCP of C-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_CTAG_DEI	Enable DEI of C-TAG.
LAYER3_SWITCH_L3_FILTER_BITMASK_IP_SOURCE_ADDRESS	Enable IP source address.
LAYER3_SWITCH_L3_FILTER_BITMASK_IP_DESTINATION_ADDRESS	Enable IP destination address.
LAYER3_SWITCH_L3_FILTER_BITMASK_PROTOCOL	Enable IP protocol.
LAYER3_SWITCH_L3_FILTER_BITMASK_IP_SOURCE_PORT	Enable layer4 source port.
LAYER3_SWITCH_L3_FILTER_BITMASK_IP_DESTINATION_PORT	Enable layer4 destination port.

◆ layer3_switch_l3_update_bitmask_t

enum layer3_switch_l3_update_bitmask_t	
Enable L2/L3 update feature.	
Enumerator	
LAYER3_SWITCH_L3_UPDATE_BITMASK_TTL	Update TTL.
LAYER3_SWITCH_L3_UPDATE_BITMASK_MAC_DESTINATION	Update MAC destination address.
LAYER3_SWITCH_L3_UPDATE_BITMASK_MAC_SOURCE	Update MAC source address.
LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_ID	Update VLAN ID of C-TAG.
LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_PCP	Update PCP of C-TAG.
LAYER3_SWITCH_L3_UPDATE_BITMASK_CTAG_DEI	Update DEI of C-TAG.
LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_ID	Update VLAN ID of C-TAG.
LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_PCP	Update PCP of C-TAG.
LAYER3_SWITCH_L3_UPDATE_BITMASK_STAG_DEI	Update DEI of C-TAG.

◆ layer3_switch_table_entry_type_t

enum layer3_switch_table_entry_type_t	
Table entry type for forwarding feature.	
Enumerator	
LAYER3_SWITCH_TABLE_ENTRY_TYPE_EMPTY	Entry is not initialized yet.
LAYER3_SWITCH_TABLE_ENTRY_TYPE_MAC	Entry of MAC table.
LAYER3_SWITCH_TABLE_ENTRY_TYPE_VLAN	Entry of VLAN table.
LAYER3_SWITCH_TABLE_ENTRY_TYPE_LAYER3	Entry of Layer3 table.

◆ layer3_switch_table_status_t

enum layer3_switch_table_status_t	
Table status for forwarding feature.	
Enumerator	
LAYER3_SWITCH_TABLE_STATUS_UNINITIALIZED	Forwarding table is uninitialized.
LAYER3_SWITCH_TABLE_STATUS_INITIALIZED	Forwarding table is initialized.

◆ layer3_switch_tas_gate_state_t

enum layer3_switch_tas_gate_state_t	
TAS gate state.	
Enumerator	
LAYER3_SWITCH_TAS_GATE_STATE_CLOSE	Gate is closed.
LAYER3_SWITCH_TAS_GATE_STATE_OPEN	Gate is opened.

◆ layer3_switch_rx_timestamp_storage_t

enum layer3_switch_rx_timestamp_storage_t	
Enable or disable rx timestamp storage.	
Enumerator	
LAYER3_SWITCH_RX_TIMESTAMP_STORAGE_DISABLE	Timestamp is not added in the descriptor.
LAYER3_SWITCH_RX_TIMESTAMP_STORAGE_ENABLE	Timestamp is added in the descriptor.

◆ layer3_switch_ts_descriptor_queue_status_t

enum layer3_switch_ts_descriptor_queue_status_t	
Used or not timestamp descriptor queue.	
Enumerator	
LAYER3_SWITCH_TS_DESCRIPTOR_QUEUE_STATUS_UNUSED	TS descriptor queue is unused.
LAYER3_SWITCH_TS_DESCRIPTOR_QUEUE_STATUS_USED	TS descriptor queue is used.

◆ layer3_switch_preemptable_frame_fragment_size_t

enum layer3_switch_preemptable_frame_fragment_size_t	
Fragment size of preemptable frame.	
Enumerator	
LAYER3_SWITCH_PREEMPTABLE_FRAME_FRAGMENT_SIZE_64BYTE	Minimum fragment size is 64 byte.
LAYER3_SWITCH_PREEMPTABLE_FRAME_FRAGMENT_SIZE_128BYTE	Minimum fragment size is 64 byte.
LAYER3_SWITCH_PREEMPTABLE_FRAME_FRAGMENT_SIZE_192BYTE	Minimum fragment size is 64 byte.
LAYER3_SWITCH_PREEMPTABLE_FRAME_FRAGMENT_SIZE_256BYTE	Minimum fragment size is 64 byte.

◆ layer3_switch_psfp_filter_status_t

enum layer3_switch_psfp_filter_status_t	
Used or not PSFP MSDU filter.	
Enumerator	
LAYER3_SWITCH_PSFP_FILTER_STATUS_UNUSED	PSFP filter is unused.
LAYER3_SWITCH_PSFP_FILTER_STATUS_USED	PSFP filter is used.

◆ layer3_switch_msdu_filter_mode_t

enum layer3_switch_msdu_filter_mode_t	
PSFP MSDU filter mode.	
Enumerator	
LAYER3_SWITCH_MSDU_FILTER_NORMAL_MODE	Filtering occurs if LDESCR.TPL[GWCA] is greater than FWPMPCi.MSDUV.
LAYER3_SWITCH_MSDU_FILTER_THROTTLE_MODE	Filtering occurs if LDESCR.TPL[GWCA] is greater than FWPMPCi.MSDUV. Frames with FWEIS2.PMFS[i] set are also filtered.

◆ layer3_switch_meter_filter_mode_t

enum layer3_switch_meter_filter_mode_t	
PSFP Meter filter mode.	
Enumerator	
LAYER3_SWITCH_METER_FILTER_NORMAL_MODE	Any frame linked to Meter filter i thanks to L3 table received when not enough token is available will be red.
LAYER3_SWITCH_METER_FILTER_THROTTLE_MODE	Any frame linked to Meter filter i thanks to L3 table received when not enough token is available or when FWEIS5.PMRFSi is set will be red.

◆ layer3_switch_meter_filter_coupling_status_t

enum layer3_switch_meter_filter_coupling_status_t	
Enable or disable copling flag.	
Enumerator	
LAYER3_SWITCH_METER_FILTER_COUPLING_STATUS_DISABLE	When green bucket is full, CIR tokens are lost.
LAYER3_SWITCH_METER_FILTER_COUPLING_STATUS_ENABLE	When green bucket is full, CIR tokens are added to the yellow bucket.

◆ layer3_switch_meter_filter_drop_red_frame_t

enum layer3_switch_meter_filter_drop_red_frame_t	
Drop or not red frames.	
Enumerator	
LAYER3_SWITCH_METER_FILTER_NOT_DROP_RED_FRAME	Red frames are not dropped by Meter filter.
LAYER3_SWITCH_METER_FILTER_DROP_RED_FRAME	Red frames are dropped by Meter filter.

◆ layer3_switch_meter_filter_dei_handling_policy_t

enum layer3_switch_meter_filter_dei_handling_policy_t	
DEI handling policy for determining a frame color.	
Enumerator	
LAYER3_SWITCH_METER_FILTER_DEI_HANDLING_POLICY_IGNORE	Ignore the DEI of the VLAN TAG, and the frame color is determined only by the PCP value.
LAYER3_SWITCH_METER_FILTER_DEI_HANDLING_POLICY_YELLOW	When the DEI of the VLAN TAG is 1, treat it as a yellow frame.

◆ layer3_switch_meter_filter_pcp_handling_policy_t

enum layer3_switch_meter_filter_pcp_handling_policy_t	
PCP handling policy for determining a frame color.	
Enumerator	
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_GREEN_ALL	Treat all frames as green, regardless of the PCP.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_1	Treat a frame as yellow when the PCP is less than 1.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_2	Treat a frame as yellow when the PCP is less than 2.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_3	Treat a frame as yellow when the PCP is less than 3.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_4	Treat a frame as yellow when the PCP is less than 4.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_5	Treat a frame as yellow when the PCP is less than 5.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_6	Treat a frame as yellow when the PCP is less than 6.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_BELOW_7	Treat a frame as yellow when the PCP is less than 7.
LAYER3_SWITCH_METER_FILTER_PCP_HANDLING_POLICY_YELLOW_ALL	Treat all frames as yellow, regardless of the PCP.

Function Documentation

◆ R_LAYER3_SWITCH_Open()

fsp_err_t R_LAYER3_SWITCH_Open (ether_switch_ctrl_t *const *p_ctrl*, ether_switch_cfg_t const *const *p_cfg*)

Initializes the switch module and applies configurations. Implements ether_switch_api_t::open.

Return values

FSP_SUCCESS	Channel opened successfully.
FSP_ERR_ASSERTION	Pointer to control block, config structure or extended config structure is NULL.
FSP_ERR_ALREADY_OPEN	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
FSP_ERR_ETHER_ERROR_PHY_COMMUNICATION	Initialization of PHY-LSI failed.
FSP_ERR_INVALID_ARGUMENT	Invalid configuration value.

◆ R_LAYER3_SWITCH_Close()

fsp_err_t R_LAYER3_SWITCH_Close (ether_switch_ctrl_t *const *p_ctrl*)

Disables interrupts and stop module. Implements ether_switch_api_t::close.

Return values

FSP_SUCCESS	Channel successfully closed.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	Control block is not open.

◆ R_LAYER3_SWITCH_CreateDescriptorQueue()

fsp_err_t R_LAYER3_SWITCH_CreateDescriptorQueue (ether_switch_ctrl_t *const *p_ctrl*, uint32_t *const *p_queue_index*, const layer3_switch_descriptor_queue_cfg_t *const *p_queue_cfg*)

Create a new descriptor queue and set it to LINKFIX table. This function must be called before calling R_LAYER3_SWITCH_SetDescriptor and R_LAYER3_SWITCH_GetDescriptor.

Return values

FSP_SUCCESS	Descriptor created successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	Control block is not open.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_OUT_OF_MEMORY	Descriptor queue list is depleted.
FSP_ERR_OVERFLOW	TS descriptor queue is used.

◆ R_LAYER3_SWITCH_SetDescriptor()

fsp_err_t R_LAYER3_SWITCH_SetDescriptor (ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index*, layer3_switch_descriptor_t const *const *p_descriptor*)

Set descriptor data to a target descriptor.

Return values

FSP_SUCCESS	Descriptor set successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	Control block is not open.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_INVALID_ARGUMENT	Queue index is invalid.
FSP_ERR_NOT_INITIALIZED	This descriptor queue is not created.
FSP_ERR_IN_USE	Target descriptor is now running.
FSP_ERR_OVERFLOW	Descriptor queue is full.

◆ R_LAYER3_SWITCH_GetDescriptor()

fsp_err_t R_LAYER3_SWITCH_GetDescriptor (ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index*, layer3_switch_descriptor_t *const *p_descriptor*)

Get descriptor data from a target descriptor.

Return values

FSP_SUCCESS	Descriptor got successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	Control block is not open.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_INVALID_ARGUMENT	Queue index is invalid.
FSP_ERR_NOT_INITIALIZED	This descriptor queue is not created or target descriptor is not set.
FSP_ERR_IN_USE	Target descriptor is now running.

◆ R_LAYER3_SWITCH_StartDescriptorQueue()

fsp_err_t R_LAYER3_SWITCH_StartDescriptorQueue (ether_switch_ctrl_t *const *p_ctrl*, uint32_t *queue_index*)

Reload and enable a descriptor queue. In a TX descriptor queue, the queue start transmission. In a RX descriptor queue, the queue start reception.

Return values

FSP_SUCCESS	Descriptor queue started successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	Control block is not open.
FSP_ERR_INVALID_ARGUMENT	Queue index is invalid.
FSP_ERR_NOT_INITIALIZED	Target descriptor queue is not created.
FSP_ERR_IN_USE	Target descriptor queue is already running.
FSP_ERR_INVALID_DATA	Target TX queue have no data.

◆ R_LAYER3_SWITCH_CallbackSet()

fsp_err_t R_LAYER3_SWITCH_CallbackSet (ether_switch_ctrl_t *const *p_ctrl*, void(*)(ether_switch_callback_args_t *) *p_callback*, void *const *p_context*, ether_switch_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ R_LAYER3_SWITCH_ConfigurePort()

fsp_err_t R_LAYER3_SWITCH_ConfigurePort (ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port*, layer3_switch_port_cfg_t * *p_port_cfg*)

Configure Ethernet port features, including callback function for each port.

Return values

FSP_SUCCESS	Port configured successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_INVALID_ARGUMENT	Port number is invalid.

◆ R_LAYER3_SWITCH_AddTableEntry()

fsp_err_t R_LAYER3_SWITCH_AddTableEntry (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_frame_filter_t const *const *p_target_frame*, layer3_switch_table_entry_cfg_t const *const *p_entry_cfg*)

Add or update an entry of the forwarding table.

Return values

FSP_SUCCESS	Successfully add/updated an entry into the table.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_OVERFLOW	The number of unsecure entries exceeded the configured value.
FSP_ERR_WRITE_FAILED	A hardware error occurred while learning the entry.
FSP_ERR_INVALID_ARGUMENT	Target frame or entry type is invalid.
FSP_ERR_INVALID_MODE	VLAN feature is disabled and a VLAN entry is passed.
FSP_ERR_BUFFER_EMPTY	PSFP MSDU or Meter filter ID is invalid.

◆ R_LAYER3_SWITCH_SearchTableEntry()

fsp_err_t R_LAYER3_SWITCH_SearchTableEntry (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_frame_filter_t const *const *p_target_frame*, layer3_switch_table_entry_cfg_t *const *p_entry_cfg*)

Search an entry from the forwarding table.

Return values

FSP_SUCCESS	The entry is found successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_NOT_FOUND	The entry is not found in the table.
FSP_ERR_INVALID_ARGUMENT	Target frame or entry type is invalid.
FSP_ERR_INVALID_MODE	VLAN feature is disabled and a VLAN entry is passed.

◆ R_LAYER3_SWITCH_ConfigureTable()

fsp_err_t R_LAYER3_SWITCH_ConfigureTable (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_table_cfg_t const *const *p_table_cfg*)

Configure and initialize an forwarding table.

Return values

FSP_SUCCESS	Table configured successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_WRITE_FAILED	Failed to add entries.

◆ R_LAYER3_SWITCH_GetTable()

fsp_err_t R_LAYER3_SWITCH_GetTable (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_table_t *const *p_table*)

Get a pointer to the forwarding table.

Return values

FSP_SUCCESS	Table got successfully.
FSP_ERR_ASSERTION	Pointer to control block is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_INVALID_MODE	VLAN feature is disabled and a VLAN entry list is passed.

◆ R_LAYER3_SWITCH_ConfigureTAS()

fsp_err_t R_LAYER3_SWITCH_ConfigureTAS (ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port*, layer3_switch_tas_cfg_t * *p_tas_cfg*)

Configure Time Aware Shaper feature.

Return values

FSP_SUCCESS	TAS configure successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.
FSP_ERR_INVALID_ARGUMENT	Port number is invalid.
FSP_ERR_UNSUPPORTED	TAS feature is not enabled in the configuration.

◆ R_LAYER3_SWITCH_EnableTAS()

fsp_err_t R_LAYER3_SWITCH_EnableTAS (ether_switch_ctrl_t *const *p_ctrl*, uint8_t *port*)

Enable Time Aware Shaper feature.

Return values

FSP_SUCCESS	TAS enabled successfully.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_ARGUMENT	Port number is invalid.
FSP_ERR_UNSUPPORTED	TAS feature is not enabled in the configuration.

◆ R_LAYER3_SWITCH_PsfpClearErrorStatus()

fsp_err_t R_LAYER3_SWITCH_PsfpClearErrorStatus (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_psfp_error_status_bitmask_t *bitmasks*)

Clear error status bit of throttle mode.

Return values

FSP_SUCCESS	Status bit cleared successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_LAYER3_SWITCH_LinkStatusCheck()

fsp_err_t R_LAYER3_SWITCH_LinkStatusCheck (ether_switch_ctrl_t *const *p_ctrl*, layer3_switch_target_port_bitmaps_t * *p_port_bitmaps*, ether_switch_link_status_bitmaps_t * *p_link_status_bitmaps*)

Check the link status of multiple ports.

Return values

FSP_SUCCESS	Status bit cleared successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_INVALID_POINTER	Pointer to a argument is NULL.

Detailed Description

NFC Reader driver implementation using the PTX NFC module on RA MCUs.

Overview

This middleware module supplies an implementation for the NFC IoT Reader on the PTX module. The NFC functionalities are provided via a modular NFC Soft Controller (NCS) architecture, and this FSP module will include the NSC (aka NFC SDK). Functionality is provided in a split-stack architecture, where time-critical operations are running on the on-chip MCU, and the rest of the NFC logic is in the host controller to carry out applications such as IoT reader. The driver may also be adapted to further support next-generation PTX devices in future (which have not yet been released).

The NFC Reader module supports the following modules:

- PTX105R (https://www.renesas.com/en/products/wireless-connectivity/nfc/ptx105r-mid-power-multi-protocol-nfc-forum-compliant-reader)

Features

The NFC Reader PTX driver supplies these features:

- Initializes the IOTRD (IoT Reader) API and NSC stack
- Initializes the PTX chip
- Discovers cards according to NFC Forum
- Selects a specific card in case multiple cards/protocols were discovered
- Retrieves card details like technical/activation parameters
- Exchanges RF data and bitstreams
- Stops RF communication
- NDEF add-on API for exchanging data using the NDEF (NFC Data Exchange Format) standard
- Native-Tag add-on API for implementing the Application Protocol Data Units (APDU) over ISO-DEP
- Discovery support for "Low-Power-Card-Detection"
- Optionally puts the PTX chip into and wake up from stand-by mode

Future support is considered for the following features:

- Optionally updates RF and System configuration parameters at runtime
- Controls various GPIO pins of the PTX chip
- Plus several add-on features for additional operations and testing

Configuration

Build Time Configurations for rm_nfc_reader_ptx

The following build time configurations are defined in fsp_cfg/rm_nfc_reader_ptx_cfg.h:

Configuration	Options	Default	Description
Add-on			
NDEF Support	• Disabled	Disabled	Includes the APIs

	• Enabled		provided by the NDEF Add-on.
Native Tag Support	• Disabled • Enabled	Disabled	Includes the APIs provided by the Native-Tag Add-on.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
NFC NDEF Work Buffer Size	Must be an integer greater than 0	64	Size in bytes of the NFC NDEF work buffer used for internally exchanging data with a tag. Must be an integer greater than 0.

Configurations for Networking > NFC IoT Reader on PTX (rm_nfc_reader_ptx)

This module can be added to the Stacks tab via New Stack > Networking > NFC IoT Reader on PTX (rm_nfc_reader_ptx).

Configuration	Options	Default	Description
NFC Poll Type			
Type-A	• Disabled • Enabled	Enabled	Select to discover NFC Type-A tags
Type-B	• Disabled • Enabled	Enabled	Select to discover NFC Type-B tags
Type-V	• Disabled • Enabled	Enabled	Select to discover NFC Type-V tags
Type-F	• Disabled • Enabled	Enabled	Select to discover NFC Type-F tags
Temperature Sensor			
Calibrate Sensor	• Disabled • Enabled	Enabled	Enable/Disable on-board temperature sensor calibration. Must be executed once per chip (lifetime), it is not needed after.
Shutdown Temperature (°C)	Must be an integer greater than 0 and less than 223	100	Set the expected thermal shutdown threshold value (Celsius).
Ambient Temperature (°C)	Must be an integer greater than 0 and less than 85	25	Set the ambient temperature value at which calibration takes place (Celsius).
Name	Name must be a valid	g_nfc_reader_ptx0	Module name.

	C symbol		
Set Polling Mode	Must be an integer greater than or equal to 0 and less than 256	0	Set polling mode, where 0 is Regular Polling, 1 is Low-power Card Detection (LPCD), and 2-255 is LPCD with every n-th cycle as Regular Polling
NFC Interrupt Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the interrupt port/pin used by the NFC chip to signal for SPI communications.
NFC Interrupt Pin	Refer to the RA Configuration tool for available options.	module.driver.nfc_reader_ptx.pin_control_pin.PIN_DISABLE	Specify the interrupt port/pin used by the NFC chip to signal for SPI communications.
Device Limit	Must be an integer greater than 0 and less than 50	5	Select the max number of tags to discover.
Idle Time	Must be an integer greater than 0 and less than 65535	100	Select idle time between polling cycles (ms).

Note: This module provides the basic configurations in the FSP Configurator required to discover, activate, and exchange data with an NFC tag. The user can then copy these configurations to a new structure if they want to connect to a new tag type/make changes to the configurations dynamically.

Interrupt Configuration

Refer to SPI (r_sci_spi). R_SCI_SPI_Open() is called by this module

Clock Configuration

Refer to SPI (r_sci_spi).

Pin Configuration

Refer to SPI (r_sci_spi). R_SCI_SPI_Open() is called by this module

Usage Notes

- For all information on the PTX NFC IoT Reader, including data types, APIs, the SDK, etc., refer to the PTX105R documentation on the webpage above.
- This module includes the NFC SDK which must be stored and compiled on the host RA MCU. The NFC IoT Reader claims that code size is roughly 39K B Code Flash (53 KB with the reference application) and 3-4 KB of Stack memory for the reference application. Consider this when looking at the device and the user application.
- This module also requires a minimal amount of heap allocation (256 bytes). Be sure to allocate some heap size in the FSP Configurator BSP tab.
- The NFC SDK provided with this module contains platform-specific and device-specific code related to using the FSP on RA devices. For other devices, the Platform API (ptxPLAT) must

be implemented/ported.
- When selecting the NFC tag protocol (Type-A, Type-B, Type-V, and Type-F), ensure that at least one type is selected.
- For data exchange, the user must provide transmission/receive buffers with the exact data packet for the intended tag type. For information on commands, responses, and parameters, definitions can be found in the NFC Specification.
- The NFC SDK contains a default RF waveform configuration file (ptxNSC_RfConfigVal.c) which is compatible with the PTX105RQC Pmod board. For custom boards, this configuration file will need to be generated with the GUI tool available on the module webpage.
- The NFC chip provides an external interrupt pin which links to the ptxPLAT_GPIO_IsrCallback callback function. The same pin is also used during SPI communications for the NFC chip to signal it is ready and must be implemented in the FSP Configurator. The port/pin chosen for the interrupt pin should be the same for the NFC module properties and the External IRQ properties.

Limitations

- The module will only support SPI for the first release, with other protocols (I2C, UART) planned for future releases.
- The PTX105RQC Pmod board only supports SPI, so consider the evaluation kit (PTX105REK) for other interfaces.
- The NFC chip reset pin (labeled as SEN pin) isn't supported in the FSP currently, and it does not have a pinout on the PTX105RQC Pmod board.

Examples

Basic Example

This is a basic example of minimal use of the NFC IoT Reader module in an application.

```
void nfc_basic_example (void)
{
 fsp_err_t                err       = FSP_SUCCESS;
    ptxIotRdInt_Demo_State_t demo_state = IoTRd_DemoState_WaitForActivation;
    err = RM_NFC_READER_PTX_Open(&g_rm_nfc_reader_ptx_instance,
&g_nfc_reader_ptx_cfg);
    assert(FSP_SUCCESS == err);
    err = RM_NFC_READER_PTX_DiscoveryStart(&g_rm_nfc_reader_ptx_instance);
    assert(FSP_SUCCESS == err);
    ptxIoTRd_CardRegistry_t * card_registry = NULL;
    err = RM_NFC_READER_PTX_CardRegistryGet(&g_rm_nfc_reader_ptx_instance,
&card_registry);
    assert(FSP_SUCCESS == err);
 /* T2T Protocol Example => READ BLOCK 0 */
 const uint8_t PROT_T2T_EXAMPLE[] = {0x30, 0x00};
```

```
    nfc_send_buf.tx_length = sizeof(PROT_T2T_EXAMPLE);
    memcpy(&nfc_tx_buf[0], &PROT_T2T_EXAMPLE[0], nfc_send_buf.tx_length);
 while (1)

◆ nfc_reader_ptx_data_info_t

struct nfc_reader_ptx_data_info_t		
NFC data exchange packet parameters		
Data Fields		
uint8_t *	p_tx_buf	Pointer to buffer holding data to send.
uint32_t	tx_length	Length of data to send.
uint8_t *	p_rx_buf	Pointer to buffer for data to receive.
uint32_t	rx_length	Length of data to receive.

◆ nfc_reader_ptx_cfg_t

struct nfc_reader_ptx_cfg_t		
NFC Configuration		
Data Fields		
bool	poll_type_a	Flag to indicate enabling discovery for Type-A tags.
bool	poll_type_b	Flag to indicate enabling discovery for Type-B tags.
bool	poll_type_f	Flag to indicate enabling discovery for Type-F tags.
bool	poll_type_v	Flag to indicate enabling discovery for Type-V tags.
uint8_t	device_limit	Defines the maximum number of devices that can be connected at once.
uint8_t	discover_mode	Set polling mode, where 0 = Regular Polling, 1 = Low-Power Card Detection (LPCD), 2-255 = LPCD with every n-th Cycle Regular Polling.
uint32_t	idle_time_ms	RF-Discovery Loop. Idle time between polling cycles in milliseconds.
uint8_t	temp_sensor_calibrate	Flag to enable/disable temperature sensor calibration.
uint8_t	temp_sensor_shutdown	Expected thermal shutdown threshold value.
uint8_t	temp_sensor_ambient	Ambient temperature at which temperature sensor calibration takes place.
const bsp_io_port_pin_t	interrupt_pin	Interrupt pin for NFC chip to signal for communication.
ptxIoTRd_t *	iot_reader_context	Instance of the NFC SDK IoT Reader main structure.
rm_comms_instance_t *	p_comms_instance_ctrl	Pointer to the NFC module's Comms instance.
ioport_instance_t *	p_gpio_context	Pointer to the NFC module's GPIO instance.
external_irq_instance_t *	p_irq_context	Pointer to the NFC module's SPI external interrupt instance.
timer_instance_t *	p_timer_context	Pointer to the NFC module's sleep timer instance.

timer_instance_t *	p_app_timer	Pointer to the NFC module's Transparent Data Channel (TDC) timer instance.
ptxNDEF_t *	p_ndef_context	Pointer to the optional NDEF API context.

◆ nfc_reader_ptx_instance_ctrl_t

struct nfc_reader_ptx_instance_ctrl_t		
NFC_READER_PTX private control block. DO NOT MODIFY.		
Data Fields		
uint8_t	ndef_work_buf[NFC_READER_PTX_NDEF_WORK_BUF_SIZE]	Buffer for NDEF internal data exchange.
uint32_t	open	Flag to indicate if NFC has been opened.
uint32_t	ndef_open	Flag to indicate if NFC NDEF has been initialized.
uint32_t	native_tag_open	Flag to indicate if NFC Native-Tag has been initialized.
nfc_reader_ptx_state_t	state_flag	Flag to track Idle/discovered/activated.
nfc_reader_ptx_cfg_t const *	p_cfg	Pointer to p_cfg for NFC.

Enumeration Type Documentation

◆ nfc_reader_ptx_native_tag_type_t

enum nfc_reader_ptx_native_tag_type_t	
NFC Native-tag Tag Type Flag	
Enumerator	
NFC_READER_PTX_NATIVE_TAG_TYPE_NONE	No tag was selected for Native-Tag add-on APIs.
NFC_READER_PTX_NATIVE_TAG_TYPE_T2T	Type 2 tag bit mask for Native-Tag add-on APIs.
NFC_READER_PTX_NATIVE_TAG_TYPE_T3T	Type 3 tag bit mask for Native-Tag add-on APIs.
NFC_READER_PTX_NATIVE_TAG_TYPE_T4T	Type 4 tag bit mask for Native-Tag add-on APIs.
NFC_READER_PTX_NATIVE_TAG_TYPE_T5T	Type 5 tag bit mask for Native-Tag add-on APIs.

◆ nfc_reader_ptx_ndef_read_write_t

enum nfc_reader_ptx_ndef_read_write_t	
NFC NDEF data exchange flags	
Enumerator	
NFC_READER_PTX_NDEF_WRITE	Write flag for NDEF data exchange.
NFC_READER_PTX_NDEF_READ	Read flag for NDEF data exchange.

◆ nfc_reader_ptx_power_mode_t

enum nfc_reader_ptx_power_mode_t	
NFC power mode flags	
Enumerator	
NFC_READER_PTX_ACTIVE_MODE	Active mode (default), all features enabled.
NFC_READER_PTX_STANDBY_MODE	Stand-by mode, most features disabled for low power.

◆ nfc_reader_ptx_state_t

enum nfc_reader_ptx_state_t	
NFC state machine status	
Enumerator	
NFC_READER_PTX_IDLE	Idle state before starting discovery.
NFC_READER_PTX_POLLING	Polling state for discovering tags.
NFC_READER_PTX_DISCOVERED	Discovered state for tags that were found.
NFC_READER_PTX_ACTIVATED	Activated state for activating a discovered tag.

◆ nfc_reader_ptx_return_state_t

enum nfc_reader_ptx_return_state_t	
NFC de-activation return state	
Enumerator	
NFC_READER_PTX_RETURN_IDLE	Rf-Deactivation Type 0 - Turn off RF-field.
NFC_READER_PTX_RETURN_DISCOVER	Rf-Deactivation Type 1 - Restart RF-Discovery.
NFC_READER_PTX_RETURN_SLEEP	Rf-Deactivation Type 2 - Put remote device to sleep.
NFC_READER_PTX_RETURN_SLEEP_NON_BLOCKING	Rf-Deactivation Type 3 - Put remote device to sleep (non-blocking)
NFC_READER_PTX_RETURN_NO_RF_RESET	Rf-Deactivation Type 4 - Common RF Deactivate but no Field Reset.
NFC_READER_PTX_RETURN_IDLE_PROTOCOL	Rf-Deactivation Type 5 - Use protocol-specific Deactivation, IDLE afterwards.
NFC_READER_PTX_RETURN_DISCOVER_PROTOCOL	Rf-Deactivation Type 6 - Use protocol-specific Deactivation, RF-Discovery started afterwards.

Function Documentation

◆ RM_NFC_READER_PTX_Open()

fsp_err_t RM_NFC_READER_PTX_Open (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_cfg_t const *const *p_cfg*)

Initializes the NFC IoT Reader.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_cfg	Pointer to NFC IoT Reader configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_ALREADY_OPEN	Module is already opened.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.

◆ RM_NFC_READER_PTX_DiscoveryStart()

fsp_err_t RM_NFC_READER_PTX_DiscoveryStart (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Initiates discovery of NFC tags.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the idle state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.

◆ RM_NFC_READER_PTX_StatusGet()

fsp_err_t RM_NFC_READER_PTX_StatusGet (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_StatusType_t *status_type*, uint8_t *const *p_status*)

Gets the status information on the provided status identifier (system, discovery, etc.). Used during polling to confirm a card was discovered.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	status_type	Status identifier for target info.
[in]	p_status	Pointer to location to store NFC chip status flag.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the polling state.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.

◆ RM_NFC_READER_PTX_CardRegistryGet()

fsp_err_t RM_NFC_READER_PTX_CardRegistryGet (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_CardRegistry_t ** *pp_card_registry*)

Gets the internal card registry.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	pp_card_registry	Pointer to card registry for discovered cards.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.

◆ RM_NFC_READER_PTX_CardActivate()

fsp_err_t RM_NFC_READER_PTX_CardActivate (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, ptxIoTRd_CardParams_t *const *p_card_params*, ptxIoTRd_CardProtocol_t *protocol*)

Gets the details of the discovered card and connects to it. Not required if only a single tag was discovered.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_card_params	Parameters of the card to be activated.
[in]	protocol	The NFC protocol of the card to be activated.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the discovered/selection state.

◆ RM_NFC_READER_PTX_DataExchange()

fsp_err_t RM_NFC_READER_PTX_DataExchange (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Sends and receives data to/from the activated card.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.

◆ RM_NFC_READER_PTX_ReaderDeactivation()

fsp_err_t RM_NFC_READER_PTX_ReaderDeactivation (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_return_state_t *return_state*)

Deactivates the activated card to return to the desired state (idle, discovery, etc.).

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	return_state	Expectation for end state of NFC state machine.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.

◆ RM_NFC_READER_PTX_PowerModeSet()

fsp_err_t RM_NFC_READER_PTX_PowerModeSet (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_power_mode_t *power_mode*)

Puts the device into either Active (all features) or Stand-by mode (most features off), to cut down energy consumption. RF communication is not possible from Stand-by mode, and Wake-up is possible only via communication interface. This function is only available exclusively before starting discovery.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	power_mode	Flag to indicate if setting to Active or Stand-by mode.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the idle/polling state.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.

◆ RM_NFC_READER_PTX_NDEF_Init()

fsp_err_t RM_NFC_READER_PTX_NDEF_Init (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Initializes the optional NDEF API add-on. Must be done after NFC stack is initialized.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_ALREADY_OPEN	NDEF API add-on was already initialized.
FSP_ERR_UNSUPPORTED	NDEF API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_NDEF_DataExchange()

fsp_err_t RM_NFC_READER_PTX_NDEF_DataExchange (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, uint8_t * *p_ndef_message*, uint32_t *message_length*, nfc_reader_ptx_ndef_read_write_t *ndef_read_write_flag*)

Exchanges NDEF data with an NFC tag by reading from or writing to it.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_ndef_message	Pointer to the buffer to transmit or receive a message.
[in]	message_length	Length of the NDEF message buffer.
[in]	ndef_read_write_flag	Flag to control if the data exchange is a read or a write.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_NOT_INITIALIZED	NDEF add-on is not initialized yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_UNSUPPORTED	NDEF API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_NDEF_Lock()

fsp_err_t RM_NFC_READER_PTX_NDEF_Lock (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Locks an NFC tag to prevent writing to it, making it read-only.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_NOT_INITIALIZED	NDEF add-on is not initialized yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_UNSUPPORTED	NDEF API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_Native_Tag_Init()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Init (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_data_info_t *const *p_data_info*, uint8_t *tag_select*)

Initializes the optional Native-Tag API add-on. Must be done after NFC stack is initialized. For each tag type to be initialized, the tag type bit values must be set in the tag select parameter.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_data_info	Pointer to the NFC TX/RX data.
[in]	tag_select	User-provided bitmask of tags to be initialized.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_ALREADY_OPEN	Native-Tag API add-on was already initialized.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_Native_Tag_Read()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Read (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_native_tag_read_params_t *const *p_read_params*, nfc_reader_ptx_native_tag_type_t *tag_type*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Performs a read operation using the Native-Tag API add-on. Optional configurations must be set for the required tag type based on the command to be used.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_read_params	Pointer to optional parameter structure for read operation.
[in]	tag_type	The target tag type for the operation.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_INVALID_MODE	One of the available tag types was not selected.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_Native_Tag_Write()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Write (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_native_tag_write_params_t *const *p_write_params*, nfc_reader_ptx_native_tag_type_t *tag_type*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Performs a write operation using the Native-Tag API add-on.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_write_params	Pointer to optional parameter structure for write operation.
[in]	tag_type	The target tag type for the operation.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_INVALID_MODE	One of the available tag types was not selected.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on was not included in project configuration.

◆ RM_NFC_READER_PTX_Native_Tag_Select()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Select (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_native_tag_select_params_t *const *p_select_params*, nfc_reader_ptx_native_tag_type_t *tag_type*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Performs a Select operation using the Native-Tag API add-on, which is different for each tag type. For Type 2 tags, this selects a different sector (memory page). For Type 3 tags, they do not use a Select function (returns unsupported). For Type 4 tags, it selects a different File and/or Application on the tag. For Type 5 tags, this sets a tag as selected, allowing a reader to communicate with a specific tag without its UID.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_select_params	Pointer to optional parameter structure for select operation.
[in]	tag_type	The target tag type for the operation.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_INVALID_MODE	One of the available tag types was not selected.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on not enabled, or tag type not supported.

◆ RM_NFC_READER_PTX_Native_Tag_Lock()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Lock (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_native_tag_lock_params_t *const *p_lock_params*, nfc_reader_ptx_native_tag_type_t *tag_type*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Performs a Lock operation using the Native-Tag API add-on. This function is exclusive to Type 5 tags.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_lock_params	Pointer to optional parameter structure for lock operation.
[in]	tag_type	The target tag type for the operation.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_DATA	Problem with input parameters or data transmission.
FSP_ERR_INVALID_MODE	One of the available tag types was not selected.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on not enabled, or tag type not supported.

◆ RM_NFC_READER_PTX_Native_Tag_Sleep()

fsp_err_t RM_NFC_READER_PTX_Native_Tag_Sleep (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*, nfc_reader_ptx_native_tag_sleep_params_t *const *p_sleep_params*, nfc_reader_ptx_native_tag_type_t *tag_type*, nfc_reader_ptx_data_info_t *const *p_data_info*)

Performs a Sleep operation using the Native-Tag API add-on. This function is exclusive to Type 5 tags.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.
[in]	p_sleep_params	Pointer to optional parameter structure for sleep operation.
[in]	tag_type	The target tag type for the operation.
[in]	p_data_info	Pointer to the NFC TX/RX data.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Module is not opened yet.
FSP_ERR_INVALID_STATE	NFC module is not in the activated state.
FSP_ERR_INVALID_ARGUMENT	Invalid input parameters to the function.
FSP_ERR_UNSUPPORTED	Native-Tag API add-on not enabled, or tag type not supported.

◆ RM_NFC_READER_PTX_Close()

fsp_err_t RM_NFC_READER_PTX_Close (nfc_reader_ptx_instance_ctrl_t *const *p_ctrl*)

Closes the FSP NFC module and resets all variables.

Parameters

[in]	p_ctrl	Pointer to NFC IoT Reader control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Assertion error occurred.
FSP_ERR_NOT_OPEN	Close being called before the module is Open.

5.2.12.25 NetX Duo Ethernet Driver (rm_netxduo_ether)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the Ethernet Interface.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- Link status callback
- Configurable IP MTU

Configuration

Configurations for Networking > NetX Duo Ethernet Driver (rm_netxduo_ether)

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_netxduo_ether_0	Module name.

IP MTU	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Calculating the Packet Size for an IP instance

In order to ensure that there is enough space to store an entire Ethernet frame, the packet pool used for receiving packets must have a payload size that is 32 bytes larger than the configured ether_cfg_t::ether_buffer_size. The extra 32 bytes is needed in order to ensure that the allocated packets are properly aligned to 32 bytes.

ether_cfg_t::ether_buffer_size is calculated from the IP MTU using the following formula:

ceil((rm_netxduo_ether_cfg_t::mtu + Ethernet Header (14) + Padding Bytes (2)) / 32) * 32

Zero Copy Support

Zero copy support should only be disabled when a lower level ethernet driver doesn't support it. Disabling zero copy will negatively impact performance. When zero copy is disabled larger buffers will need to be allocated or link speed will need to be limited to counteract poor performance.

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo Ether Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_MSW (0)
#define NETXDUO_EXAMPLE_MAC_ADDRESS_LSW (0)
static NX_IP g_ip;
static NX_PACKET_POOL g_packet_pool;
static uint8_t g_ip_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
```

```
static uint8_t g_ip_arp_cache_memory[NETXDUO_EXAMPLE_ARP_CACHE_SIZE]
BSP_ALIGN_VARIABLE(4);
static void rm_netxduo_ether0 (NX_IP_DRIVER * driver_req_ptr)
{
 /* Pass the driver request and ethernet driver configuration to the NetX Duo Ether
Driver. */
    rm_netxduo_ether(driver_req_ptr, &g_netxduo_ether_instance);
}
void rm_netxduo_ether_example ()
{
    UINT status;
    nx_system_initialize();
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_ether driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool,
                          rm_netxduo_ether0,
                          &g_ip_stack_memory[0],
 sizeof(g_ip_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_arp_enable(&g_ip, g_ip_arp_cache_memory, sizeof
(g_ip_arp_cache_memory));
```

```
    assert(NX_SUCCESS == status);
    status = nx_tcp_enable(&g_ip);
    assert(NX_SUCCESS == status);
    status = nx_icmp_enable(&g_ip);
    assert(NX_SUCCESS == status);
}
```

Changing MAC address Example

This is an example of changing the MAC address after an IP instance has already been created.

```
void rm_netxduo_ether_change_mac_address_example ()
{
    ULONG driver_status;
    UINT status;
 /* Disable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_DISABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
 /* Update the MAC address. */
    status = nx_ip_interface_physical_address_set(&g_ip,
                                                  0,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_MSW,
                                                  NETXDUO_EXAMPLE_MAC_ADDRESS_LSW,
                                                  NX_TRUE);
    assert(NX_SUCCESS == status);
 /* Re-enable the link. */
    status = nx_ip_driver_interface_direct_command(&g_ip, NX_LINK_ENABLE, 0,
&driver_status);
    assert(NX_SUCCESS == status);
}
```

5.2.12.26 NetX Duo WiFi Driver (rm_netxduo_wifi)

Modules » Networking

Overview

This module provides a NetX Duo driver that is implemented using the rm_wifi_onchip_silex driver.

Please refer to the NetXDuo documentation for further details.

Features

- Packet Types Supported
  - TCP/IPv4
  - UDP
- Configurable IP MTU

Configuration

Build Time Configurations for rm_netxduo_wifi

The following build time configurations are defined in fsp_cfg/middleware/rm_netxduo_wifi_cfg.h:

Configuration	Options	Default	Description
IP MTU (bytes)	Value must be in the range [576, 1500] bytes.	1500	IP MTU

Usage Notes

Connecting to a Wireless Network

NetX Duo does not support connecting to a wireless network directly and instead the driver functions should be called directly to establish a connection.

- rm_wifi_onchip_silex_open() should be called to initialize the WiFi module driver.
- rm_wifi_onchip_silex_scan() should be used to scan for access points.
- rm_wifi_onchip_silex_connect() should be used before opening a NetX IP instance in order to connect it to a network.
- rm_wifi_onchip_silex_network_info_get() should be used after an access point connection has been established to get DHCP acquired IP address, subnet mask, and gateway.

Unsupported NetX Duo Features

These features are currently not supported due to lack of support in the rm_wifi_onchip_silex driver or in the WiFi module hardware/firmware:

- IPv6 functionality
- TCP/UDP server mode
- ARP is handled directly by the WiFi module
- DHCP is always enabled on module by the rm_wifi_onchip_silex driver, thus the software DHCP stack is unsupported.

- The source port will not be used when binding a TCP or UDP socket. Applications should set the source port to NX_ANY_PORT.
- Use of the NetX Duo FTP addon is not recommended as certain FTP functions will return a NX_NO_PACKET due to how SX-ULPGN firmware handles bundling packet data.

On Module Alternatives

Instead of using NetX Duo Software Addons the following features can be performed directly on the WiFi module by calling the appropriate function instead if desired:

- DNS: The user can preform a DNS lookup by calling rm_wifi_onchip_silex_dns_query().
- ICMP: The user can perform a ping by calling rm_wifi_onchip_silex_ping().
- SNTP: The WiFi module has multiple public APIs for time related functions:
  - RM_WIFI_ONCHIP_SILEX_EpochTimeGet()
  - RM_WIFI_ONCHIP_SILEX_LocalTimeGet()
  - RM_WIFI_ONCHIP_SILEX_SntpEnableSet()
  - RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()
  - RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

Examples

Basic Example

This is a basic example of minimal use of the NetX Duo WiFi Driver in an application.

```
#define NETXDUO_EXAMPLE_IP_STACK_SIZE (2048U)
#define NETXDUO_EXAMPLE_ARP_CACHE_SIZE (2048U)
#define NETXDUO_EXAMPLE_PACKET_SIZE (1568U)
#define NETXDUO_EXAMPLE_PACKET_NUM (100U)
#define NETXDUO_EXAMPLE_PACKET_POOL_SIZE ((sizeof(NX_PACKET) +
NETXDUO_EXAMPLE_PACKET_SIZE) * \
  NETXDUO_EXAMPLE_PACKET_NUM)
#define NETXDUO_EXAMPLE_SSID "ssidName"
#define NETXDUO_EXAMPLE_PASSWORD "password"
static NX_IP g_ip0;
static NX_PACKET_POOL g_packet_pool0;
static uint8_t g_ip0_stack_memory[NETXDUO_EXAMPLE_IP_STACK_SIZE]
BSP_ALIGN_VARIABLE(4);
static uint8_t g_packet_pool0_pool_memory[NETXDUO_EXAMPLE_PACKET_POOL_SIZE]
BSP_ALIGN_VARIABLE(4);
extern wifi_onchip_silex_cfg_t g_wifi_onchip_silex_cfg;
void rm_netxduo_wifi_example ()
{
```

```
    UINT      status;
 fsp_err_t err;
    nx_system_initialize();
 /* Open WiFi module */
    err = rm_wifi_onchip_silex_open(&g_wifi_onchip_silex_cfg);
    assert(FSP_SUCCESS == err);
 /* Connect to desired AP */
    err = rm_wifi_onchip_silex_connect(NETXDUO_EXAMPLE_SSID, eWiFiSecurityWPA2,
NETXDUO_EXAMPLE_PASSWORD);
    assert(FSP_SUCCESS == err);
 /* Create a packet pool for the IP instance. */
    status = nx_packet_pool_create(&g_packet_pool0,
 "Packet Pool",
                                   NETXDUO_EXAMPLE_PACKET_SIZE,
                                   &g_packet_pool0_pool_memory[0],
                                   NETXDUO_EXAMPLE_PACKET_POOL_SIZE);
    assert(NX_SUCCESS == status);
 /* Create an IP instance using the rm_netxduo_wifi driver and packet pool instance.
*/
    status = nx_ip_create(&g_ip0,
 "IP Instance",
                          IP_ADDRESS(192, 168, 1, 2),
                          IP_ADDRESS(255, 255, 255, 0),
                          &g_packet_pool0,
                          rm_netxduo_wifi,
                          &g_ip0_stack_memory[0],
 sizeof(g_ip0_stack_memory),
                          0);
    assert(NX_SUCCESS == status);
 /* Enable all modules that are required by the application. */
    status = nx_tcp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
    status = nx_udp_enable(&g_ip0);
    assert(NX_SUCCESS == status);
```

```
}
```

TLS Example

This is a basic example of connecting a TLS socket.

```
#define NETXDUO_EXAMPLE_CRYPTO_METADATA_BUFFER_SIZE (18000U)

                                                   g_trusted_ca_length,
                                    NX_NULL,
                                                   0,
                                    NX_NULL,
                                                   0,
                                                   NX_SECURE_X509_KEY_TYPE_NONE);
    assert(NX_SUCCESS == status);
 /* Add the initialized certificate as a trusted root certificate. */
    status = nx_secure_tls_trusted_certificate_add(&tls_session, &g_certificate);
    assert(NX_SUCCESS == status);
 /* Bind the socket to a port. */
    status = nx_tcp_client_socket_bind(p_socket, NETXDUO_EXAMPLE_PORT,
NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
 /* Connect TCP socket */
    status = nx_tcp_client_socket_connect(p_socket, NETXDUO_EXAMPLE_IP,
NETXDUO_EXAMPLE_SERVER_PORT, NX_WAIT_FOREVER);
```

```
    assert(NX_SUCCESS == status);
 /* Start the TLS Session using the connected TCP socket. This function will
  * ascertain from the TCP socket state that this is a TLS Client session. */
    status = nx_secure_tls_session_start(&tls_session, p_socket, NX_WAIT_FOREVER);
    assert(NX_SUCCESS == status);
}
```

UDP Example

This is a basic example of connecting a UDP socket.

```
#define NETXDUO_TESTS_SOCKET_TIMEOUT (3000)
#define NETXDUO_TESTS_UDP_TX_PORT (5000)
#define NETXDUO_TESTS_SERVER_IP (0xC0A80064)
void rm_netxduo_wifi_udp_example (void)
{
    NX_UDP_SOCKET udp_client_socket;
 /* IP Address of the remote socket. */
    NXD_ADDRESS g_ip_address = NETXDUO_TESTS_SERVER_IP;
 /* Create the socket. */
    nx_udp_socket_create(&g_ip, &udp_client_socket, "Socket 0", NX_IP_NORMAL,
NX_FRAGMENT_OKAY, 0, 5);
 /* Bind to the UDP port. */
    nx_udp_socket_bind(&udp_client_socket, NETXDUO_TESTS_UDP_TX_PORT,
TX_WAIT_FOREVER);
    NX_PACKET * p_nx_packet = NX_NULL;
 /* Allocate a packet for message data */
    nx_packet_allocate(&g_packet_pool0, &p_nx_packet, NX_UDP_PACKET,
NETXDUO_TESTS_SOCKET_TIMEOUT)
 /* Append message data to packet */
    nx_packet_data_append(&p_nx_packet, "Hello World", 12, &g_packet_pool0,
NX_WAIT_FOREVER);
 /* Send UDP message to server */
    nx_udp_socket_send(&udp_client_socket, &p_nx_packet, &g_ip_address,
NETXDUO_TESTS_UDP_TX_PORT);
```

```
    NX_PACKET * p_nx_packet_recv;
 /* Receive any response from UDP server */
    nx_udp_socket_receive(&udp_client_socket, &p_nx_packet_recv,
NETXDUO_TESTS_SOCKET_TIMEOUT);
 /* Unbind and delete the udp socket. */
    nx_udp_socket_unbind(&udp_client_socket);
    nx_udp_socket_delete(&udp_client_socket);
}
```

5.2.12.27 On Chip HTTP Client on DA16XXX (rm_http_onchip_da16xxx)

Modules » Networking

Functions

fsp_err_t	RM_HTTP_DA16XXX_Open (http_onchip_da16xxx_instance_ctrl_t *p_ctrl, http_onchip_da16xxx_cfg_t const *const p_cfg)

fsp_err_t	RM_HTTP_DA16XXX_Close (http_onchip_da16xxx_instance_ctrl_t *p_ctrl)

Detailed Description

HTTP client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the HTTP Client on the DA16XXX module, as well as the ability to start an HTTP server on the module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX HTTP module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

The HTTP Onchip da16xxx Middleware driver supplies these features:

- Supports sending a request header (GET, PUT, and POST) to an HTTP server and receiving a response header
- Supports unsecure and secure connection via TLS encryption
- Supports parsing of the response header and returning to the user
- Supports other optional configurations such as Server Name Indication (SNI) and ALPNs
- Supports starting a secure or unsecure HTTP server on the DA16XXX module

Configuration

Build Time Configurations for rm_http_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_http_onchip_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > HTTP Client/Server on DA16XXX (rm_http_onchip_da16xxx)

This module can be added to the Stacks tab via New Stack > Networking > HTTP Client/Server on DA16XXX (rm_http_onchip_da16xxx).

Configuration	Options	Default	Description
Certificates			
HTTP Certificates Header File	Must be a valid C symbol		Name of header file that will contain certificates (macros). User must create header file if this field is populated.
Root CA	Must be a valid C symbol	ROOT_CA	Links to user-defined macro of the same name for Root CA which user must define in application header.
Client Certificate	Must be a valid C symbol	CLIENT_CERT	Links to user-defined macro of the same name for client certificate which user must define in

			application header.
Private Key	Must be a valid C symbol	PRIVATE_KEY	Links to user-defined macro of the same name for private key which user must define in application header.
ALPN			
ALPN 1	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 2	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 3	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
Server Name Indication (SNI)	Manual Entry		
TLS Authentification Level	• 0 (None) • 1 (Optional) • 2 (Required)	0 (None)	Level of TLS authentication for HTTP requests.

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- When starting an HTTP server, the DA16XXX module will use the default HTTP test server

included in the SDK. The user will need to customize the SDK to provide their own desired server. Refer to guides on the DA16XXX module page for importing/modifying the SDK

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the HTTP module
- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an HTTP server with TLS (unless buffer size settings are altered manually)

Examples

Basic Example

This is a basic example of minimal use of HTTP Middleware in an application.

```
void http_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       http_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = WIFI_PWD,
       .ucSSID                     = WIFI_SSID,
       .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
       .ucSSIDLength            = sizeof(WIFI_SSID),
       .xSecurity               = eWiFiSecurityWPA2,
    };
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Initialize the HTTP Client connection */
```

```
    http_err = RM_HTTP_DA16XXX_Open(&g_rm_http_onchip_da16xxx_instance,
&g_http_onchip_da16xxx_cfg);
    assert(FSP_SUCCESS == http_err);
 /* Initialize the HTTP Client connection */
    http_err = RM_HTTP_DA16XXX_Send(&g_rm_http_onchip_da16xxx_instance, &test_req,
&user_buf);
    assert(FSP_SUCCESS == http_err);
 /* Close the HTTP Client module */
    http_err = RM_HTTP_DA16XXX_Close(&g_rm_http_onchip_da16xxx_instance);
    assert(FSP_SUCCESS == http_err);
}
```

Data Structures

struct	http_onchip_da16xxx_request_t
struct	http_onchip_da16xxx_buffer_t
struct	http_onchip_da16xxx_cfg_t
struct	http_onchip_da16xxx_instance_ctrl_t

Macros

#define	HTTP_ONCHIP_DA16XXX_MAX_ALPN Maximum number of ALPNs supported by DA16XXX.
#define	HTTP_ONCHIP_DA16XXX_MAX_SNI_LEN Maximum length of SNI supported by DA16XXX.
#define	HTTP_ONCHIP_DA16XXX_MAX_GET_LEN Maximum length of HTTP GET request.

Enumerations

enum	http_onchip_da16xxx_method_t
enum	http_onchip_da16xxx_tls_auth_t
enum	http_onchip_da16xxx_ssl_enable_t

Data Structure Documentation

◆ http_onchip_da16xxx_request_t

struct http_onchip_da16xxx_request_t		
HTTP Request Buffer		
Data Fields		
const char *	p_http_endpoint	Defines the URL to send HTTP requests to.
const char *	p_request_body	Pointer to optional buffer for body.
http_onchip_da16xxx_method_t	method	Request method to be used.
uint32_t	length	Length of optional body buffer.

◆ http_onchip_da16xxx_buffer_t

struct http_onchip_da16xxx_buffer_t		
HTTP User Buffers		
Data Fields		
char *	p_request_buffer	User HTTP request buffer.
uint32_t	req_length	Size of HTTP request buffer.
char *	p_response_buffer	User HTTP request buffer.
uint32_t	resp_length	Size of HTTP request buffer.

◆ http_onchip_da16xxx_cfg_t

struct http_onchip_da16xxx_cfg_t		
HTTP Configuration		
Data Fields		
at_transport_da16xxx_instance_t const *	p_transport_instance	
const char *	p_alpns[HTTP_ONCHIP_DA16XXX_MAX_ALPN]	Buffer for storing ALPN names.
uint8_t	alpn_count	ALPN Protocols count. Max value is 3.
const char *	p_sni_name	Pointer to Server Name Indication.
http_onchip_da16xxx_tls_auth_t	tls_level	Set TLS Authentication Level (0, 1, or 2)
const char *	p_root_ca	String representing a trusted

		server root certificate.
uint32_t	root_ca_size	Size associated with root CA Certificate.
const char *	p_client_cert	String representing a Client certificate.
uint32_t	client_cert_size	Size associated with Client certificate.
const char *	p_client_private_key	String representing Client Private Key.
uint32_t	private_key_size	Size associated with Client Private Key.

◆ http_onchip_da16xxx_instance_ctrl_t

struct http_onchip_da16xxx_instance_ctrl_t		
HTTP_ONCHIP_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if HTTP has been opened.
http_onchip_da16xxx_ssl_enable_t	enable	Flag to indicate if HTTP server is secure.
http_onchip_da16xxx_cfg_t const *	p_cfg	Pointer to p_cfg for HTTP.

Enumeration Type Documentation

◆ http_onchip_da16xxx_method_t

enum http_onchip_da16xxx_method_t	
HTTP Request Method	
Enumerator	
HTTP_ONCHIP_DA16XXX_GET	Value converted to "get" string.
HTTP_ONCHIP_DA16XXX_POST	Value converted to "post" string.
HTTP_ONCHIP_DA16XXX_PUT	Value converted to "put" string.

◆ http_onchip_da16xxx_tls_auth_t

enum http_onchip_da16xxx_tls_auth_t	
HTTP TLS Authentication Level	
Enumerator	
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_NONE	TLS verification is not used.
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_OPTIONAL	TLS verification is optional.
HTTP_ONCHIP_DA16XXX_TLS_VERIFY_REQUIRED	TLS verification is required.

◆ http_onchip_da16xxx_ssl_enable_t

enum http_onchip_da16xxx_ssl_enable_t	
HTTP SSL Enable	
Enumerator	
HTTP_ONCHIP_DA16XXX_SSL_DISABLE	SSL is disabled.
HTTP_ONCHIP_DA16XXX_SSL_ENABLE	SSL is enabled.

Function Documentation

◆ RM_HTTP_DA16XXX_Open()

fsp_err_t RM_HTTP_DA16XXX_Open (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_cfg_t const *const *p_cfg*)

Initialize the DA16XXX on-chip HTTP Client service.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.
[in]	p_cfg	Pointer to HTTP Client configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_INVALID_ARGUMENT	Data size is too large or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.

◆ RM_HTTP_DA16XXX_Send()

fsp_err_t RM_HTTP_DA16XXX_Send (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_request_t * *p_request*, http_onchip_da16xxx_buffer_t * *p_buffer*)

Send the HTTP request with the configured buffers.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.
[in]	p_request	Pointer to HTTP request control structure.
[in]	p_buffer	Pointer to HTTP user buffer struct for request and response.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	Data size is too large.
FSP_ERR_INVALID_DATA	Data was not received correctly.

◆ RM_HTTP_DA16XXX_Start()

fsp_err_t RM_HTTP_DA16XXX_Start (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, http_onchip_da16xxx_ssl_enable_t *enable*)

Start the HTTP server.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.
[in]	enable	Enum value to enable or disable SSL.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_INVALID_ARGUMENT	SSl enable is either null or incorrect.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ RM_HTTP_DA16XXX_Stop()

fsp_err_t RM_HTTP_DA16XXX_Stop (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Start the HTTP server.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.
FSP_ERR_INVALID_ARGUMENT	SSl enable is either null or incorrect.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ RM_HTTP_DA16XXX_Close()

fsp_err_t RM_HTTP_DA16XXX_Close (http_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX HTTP Client service.

Parameters

[in]	p_ctrl	Pointer to HTTP Client instance control structure.

Return values

FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	Parameter checking was unsuccessful.

Detailed Description

MQTT client implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the MQTT Client on the DA16XXX module. The network stack is run on the DA16XXX and this module inherits and extends the core functionality from the DA16XXX WiFi driver. The DA16XXX MQTT module only supports FreeRTOS currently (Microsoft Azure support expected in future release).

The DA16XXX module supports the following modules:

- DA16200
- DA16600

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Features

The MQTT Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to an MQTT broker via hostname, port, and user credentials
- Supports unsecure and secure connection via TLS encryption
- Supports the MQTT subscribe/publish model for multiple topics
- Supports other optional configurations such as MQTT v3.1.1, Quality-of-service (QoS) level, TLS cipher suites, and ALPNs

Configuration

Build Time Configurations for rm_mqtt_onchip_da16xxx

The following build time configurations are defined in fsp_cfg/rm_mqtt_onchip_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Size of MQTT RX buffer	Must be an integer greater than 0	512	Size in bytes of the MQTT buffer used for receiving subscribed data. Must be an integer greater than 0.
Size of MQTT TX buffer	Must be an integer greater than 200 and less than 2064	512	Size in bytes of the MQTT buffer used for sending commands and publishing data. Maximum publishing

length is 2063 bytes

Configurations for Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx)

This module can be added to the Stacks tab via New Stack > Networking > MQTT Client on DA16XXX (rm_mqtt_onchip_da16xxx).

Configuration	Options	Default	Description
Certificates			
MQTT Certificates Header File	Must be a valid C symbol		Name of header file that will contain certificates (macros). User must create header file if this field is populated.
Root CA	Must be a valid C symbol	ROOT_CA	Links to user-defined macro of the same name for Root CA which user must define in application header.
Client Certificate	Must be a valid C symbol	CLIENT_CERT	Links to user-defined macro of the same name for client certificate which user must define in application header.
Private Key	Must be a valid C symbol	PRIVATE_KEY	Links to user-defined macro of the same name for private key which user must define in application header.
ALPN			
ALPN 1	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 2	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
ALPN 3	Manual Entry		Select Application Layer Protocol Negotiations (ALPNs)
Interrupts			
Callback	Must be a valid C symbol	mqtt0_callback	A user callback function. This callback function must be provided. It is called from the MQTT Receive function to process

			subscribed MQTT messages.
Use MQTT protocol v3.1.1	• Disabled • Enabled	Enabled	
MQTT Receive Maximum Timeout (ms)	Timeout must be an integer greater than 0 and less than 65535	10	Timeout for the MQTT Receive function to check the buffer for incoming MQTT messages in milliseconds.
MQTT Transit Maximum Timeout (ms)	Timeout must be an integer greater than 0 and less than 65535	10	Timeout for publishing MQTT messages in milliseconds.
Clean Session	• Disabled • Enabled	Enabled	
Keep Alive (s)	Must be an integer greater than 0 and less than 65535	60	MQTT ping period to check if connection is still active.
Client Identifier	Manual Entry		
Host Name (or IP address)	Manual Entry		
MQTT Port	Must be an integer greater than 0 and less than 65535	8883	
MQTT User Name	Must be a valid C symbol		
MQTT Password	Must be a valid C symbol		
Last Will Topic	Manual Entry		Topic for MQTT Last Will message.
Last Will Message	Manual Entry		Payload for MQTT Last Will message.
Server Name Indication (SNI)	Manual Entry		
Last Will QoS	• 0 • 1 • 2	0	Quality-of-Service for MQTT Last Will message.
TLS Cipher Suites	Refer to the RA Configuration tool for available options.	0U	Select TLS Cipher Suites

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Note: This module provides the basic configurations in the FSP Configurator required to connect to an MQTT broker such as credential information (user, password, client key, etc.), publish/subscribe

topics, and optional configurations as required. The user can then copy these configurations to a new structure if they want to connect to a new endpoint/make changes to the configurations dynamically.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- This module is not a standalone module - ensure that the WiFi module APIs are invoked first to configure the DA16XXX module and connect to an Access Point before using the MQTT module where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB.
- When the user intends to use secure TLS in their application, they need to provide certificates (root certificate authority, client certificate, and private key) in a header file
- The user must provide certificate macro names in the FSP Configurator properties, as well as the name of the header file (to link the module, certificates, and header together)
- If the user provides these credentials in the Configurator, they must create a new header file in their /src/ folder with the same name as they provided in the Configurator properties. When the code is generated, a build error will occur if the header file is not created
- If only using username and password, these fields can be left blank (default), and a header file does not need to be created

Limitations

Refer to WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

- Ensure that DA16XXX SDK version v3.2.6 or later is being used, where the default buffer size for incoming TLS is 6KB and outgoing TLS is 4KB. Using earlier versions may result in failure to connect to an MQTT broker with TLS (unless buffer size settings are altered manually)
- For publish/subscribe topics, a separate QoS level cannot be set per topic - only one QoS level can be set which applies to all messages
- Currently the module only supports unsecured MQTT with username/password or secure MQTT/TLS with certificates (root CA, client certificate, and private key). The module does not accept username/password with certificates.

Examples

Basic Example

This is a basic example of minimal use of MQTT Middleware in an application.

```
void mqtt_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 fsp_err_t       mqtt_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = WIFI_PWD,
       .ucSSID                     = WIFI_SSID,
       .xPassword.xWPA.ucLength = sizeof(WIFI_PWD),
       .ucSSIDLength            = sizeof(WIFI_SSID),
       .xSecurity               = eWiFiSecurityWPA2,
    };
 /* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
 /* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
 /* Initialize the MQTT Client connection */
    mqtt_err = RM_MQTT_DA16XXX_Open(&g_rm_mqtt_onchip_da16xxx_instance,
&g_mqtt_onchip_da16xxx_cfg);
    assert(FSP_SUCCESS == mqtt_err);
 /* Subscribe to MQTT topics to be received */

Macros

#define	MQTT_ONCHIP_DA16XXX_MAX_ALPN Maximum number of ALPNs supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_MAX_SNI_LEN Maximum length of SNI supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_TLS_CIPHER_SUITE_MAX Maximum number of TLS cipher suites supported by DA16XXX.

#define	MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT Maximum number of TLS cipher suites supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_MAX_TOPIC_LEN Maximum total length for topics supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_MAX_PUBMSG_LEN Maximum total length for message supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_MAX_PUBTOPICMSG_LEN Maximum total length for message + topic supported by DA16XXX.
#define	MQTT_ONCHIP_DA16XXX_SUBTOPIC_MAX_CNT Maximum number of subscription topics allowed.

Enumerations

enum	mqtt_onchip_da16xxx_qos_t
enum	mqtt_onchip_da16xxx_tls_cipher_suites_t

Data Structure Documentation

◆ mqtt_onchip_da16xxx_sub_info_t

struct mqtt_onchip_da16xxx_sub_info_t		
MQTT SUBSCRIBE packet parameters		
Data Fields		
mqtt_onchip_da16xxx_qos_t	qos	Quality of Service for subscription.
const char *	p_topic_filter	Topic filter to subscribe to.
uint16_t	topic_filter_length	Length of subscription topic filter.

◆ mqtt_onchip_da16xxx_pub_info_t

struct mqtt_onchip_da16xxx_pub_info_t		
MQTT PUBLISH packet parameters		
Data Fields		
mqtt_onchip_da16xxx_qos_t	qos	Quality of Service for

		subscription.
const char *	p_topic_name	Topic name on which the message is published.
uint16_t	topic_name_Length	Length of topic name.
const char *	p_payload	Message payload.
uint32_t	payload_length	Message payload length.

◆ mqtt_onchip_da16xxx_callback_args_t

struct mqtt_onchip_da16xxx_callback_args_t		
MQTT Packet info structure to be passed to user callback		
Data Fields		
uint8_t *	p_data	Payload received from subscribed MQTT topic.
const char *	p_topic	Topic to which the message payload belongs to.
uint32_t	data_length	Length of the MQTT payload.
void *	p_context	Placeholder for user data.

◆ mqtt_onchip_da16xxx_cfg_t

struct mqtt_onchip_da16xxx_cfg_t	
MQTT Configuration	
Data Fields	
const uint8_t	use_mqtt_v311
	Flag to use MQTT v3.1.1.
const uint16_t	rx_timeout
	MQTT Rx timeout in milliseconds.
const uint16_t	tx_timeout
	MQTT Tx timeout in milliseconds.
void(*	p_callback)(mqtt_onchip_da16xxx_callback_args_t *p_args)
	Location of user callback.

void *	p_context
	Placeholder for user data. Passed to the user callback in mqtt_onchip_da16xxx_callback_args_t.
uint8_t	clean_session
	Whether to establish a new, clean session or resume a previous session.
uint8_t	alpn_count
	ALPN Protocols count. Max value is 3.
const char *	p_alpns [MQTT_ONCHIP_DA16XXX_MAX_ALPN]
	ALPN Protocols.
uint8_t	tls_cipher_count
	TLS Cipher suites count. Max value is 17.
uint16_t	keep_alive_seconds
	MQTT keep alive period.
const char *	p_client_identifier
	MQTT Client identifier. Must be unique per client.
uint16_t	client_identifier_length
	Length of the client identifier.
const char *	p_host_name
	MQTT endpoint host name.

uint16_t	mqtt_port
	MQTT Port number.
const char *	p_mqtt_user_name
	MQTT user name. Set to NULL if not used.
uint16_t	user_name_length
	Length of MQTT user name. Set to 0 if not used.
const char *	p_mqtt_password
	MQTT password. Set to NULL if not used.
uint16_t	password_length
	Length of MQTT password. Set to 0 if not used.
const char *	p_root_ca
	String representing a trusted server root certificate.
uint32_t	root_ca_size
	Size associated with root CA Certificate.
const char *	p_client_cert
	String representing a Client certificate.
uint32_t	client_cert_size
	Size associated with Client certificate.
const char *	p_client_private_key

	String representing Client Private Key.
uint32_t	private_key_size
	Size associated with Client Private Key.
const char *	p_will_topic
	String representing Will Topic.
const char *	p_will_msg
	String representing Will Message.
const char *	p_sni_name
	Server Name Indication.
mqtt_onchip_da16xxx_qos_t	will_qos_level
	Will Topic QoS level.
mqtt_onchip_da16xxx_tls_cipher_suites_t	p_tls_cipher_suites [MQTT_ONCHIP_DA16XXX_TLS_CIPHER_MAX_CNT]
	TLS Cipher suites supported.

◆ mqtt_onchip_da16xxx_instance_ctrl_t

struct mqtt_onchip_da16xxx_instance_ctrl_t		
MQTT_ONCHIP_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
uint8_t	cmd_tx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[MQTT_ONCHIP_DA16XXX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.

uint32_t	open	Flag to indicate if MQTT has been opened.
bool	is_mqtt_connected	Flag to track MQTT connection status.
mqtt_onchip_da16xxx_cfg_t const *	p_cfg	Pointer to p_cfg for MQTT.

Enumeration Type Documentation

◆ mqtt_onchip_da16xxx_qos_t

enum mqtt_onchip_da16xxx_qos_t	
MQTT Quality-of-service (QoS) levels	
Enumerator	
MQTT_ONCHIP_DA16XXX_QOS_0	Delivery at most once.
MQTT_ONCHIP_DA16XXX_QOS_1	Delivery at least once.
MQTT_ONCHIP_DA16XXX_QOS_2	Delivery exactly once.

◆ mqtt_onchip_da16xxx_tls_cipher_suites_t

enum mqtt_onchip_da16xxx_tls_cipher_suites_t	
MQTT TLS Cipher Suites	
Enumerator	
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA	TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA protocol.
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA	TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA protocol.
TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256	TLS_ECDHE_RSA_WITH_AES_128_CBC_SHA256 protocol.
TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384	TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384 protocol.
TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256	TLS_ECDHE_RSA_WITH_AES_128_GCM_SHA256 protocol.
TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384	TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384 protocol.
TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA	TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA protocol.
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA	TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA protocol.
TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256	TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256 protocol.
TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384	TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384 protocol.
TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256	TLS_ECDHE_ECDSA_WITH_AES_128_GCM_SHA256 protocol.
TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384	TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384 protocol.

Function Documentation

◆ RM_MQTT_DA16XXX_Open()

fsp_err_t RM_MQTT_DA16XXX_Open (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_cfg_t const *const *p_cfg*)

Initialize the DA16XXX on-chip MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_cfg	Pointer to MQTT Client configuration structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_cfg instance is NULL.
FSP_ERR_INVALID_ARGUMENT	Data size is too large or NULL.
FSP_ERR_ALREADY_OPEN	The instance has already been opened.

◆ RM_MQTT_DA16XXX_Disconnect()

fsp_err_t RM_MQTT_DA16XXX_Disconnect (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Disconnect from DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl instance is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.

◆ RM_MQTT_DA16XXX_Connect()

fsp_err_t RM_MQTT_DA16XXX_Connect (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, uint32_t *timeout_ms*)

Configure and connect the DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	timeout_ms	Timeout in milliseconds.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_IN_USE	The MQTT client is already connected.
FSP_ERR_INVALID_DATA	Response does not contain Connect status.

◆ RM_MQTT_DA16XXX_Publish()

fsp_err_t RM_MQTT_DA16XXX_Publish (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_pub_info_t *const *p_pub_info*)

Publish a message for a given MQTT topic.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_pub_info	MQTT Publish packet parameters.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_pub_info is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_Subscribe()

fsp_err_t RM_MQTT_DA16XXX_Subscribe (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info*, size_t *subscription_count*)

Subscribe to DA16XXX MQTT topics.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_sub_info	List of MQTT subscription info.
[in]	subscription_count	Number of topics to subscribe to.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_sub_info is NULL or subscription_count is 0.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_UnSubscribe()

fsp_err_t RM_MQTT_DA16XXX_UnSubscribe (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*, mqtt_onchip_da16xxx_sub_info_t *const *p_sub_info*)

Unsubscribe from DA16XXX MQTT topics.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.
[in]	p_sub_info	List of MQTT subscription info.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_ctrl, p_sub_info is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Data size is too large.

◆ RM_MQTT_DA16XXX_Receive()

fsp_err_t RM_MQTT_DA16XXX_Receive (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Receive data subscribed to on DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The p_ctrl, p_textstring, p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened or the client is not connected.
FSP_ERR_INVALID_DATA	Receive function did not receive valid publish data.

◆ RM_MQTT_DA16XXX_Close()

fsp_err_t RM_MQTT_DA16XXX_Close (mqtt_onchip_da16xxx_instance_ctrl_t * *p_ctrl*)

Close the DA16XXX MQTT Client service.

Parameters

[in]	p_ctrl	Pointer to MQTT Client instance control structure.

Return values

FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The p_ctrl, p_textstring, p_ip_addr is NULL.

Detailed Description

Driver for the PTP peripheral on RA MCUs. This module implements the PTP Interface.

Overview

PTP allows for multiple devices on a network to synchronize their clocks with very high precision. The PTP peripheral generates and processes PTP messages automatically. In slave mode, it also corrects the local time in order to adjust for any offset from the master clock time.

Features

- Ordinary clock
  - Master mode
  - Slave mode
- Peer-to-peer
- End-to-end
- Frame fromats
  - Ethernet II frames
  - IEEE802.3 + LLC + SNAP frames
  - IPv4 + UDP
- Clock correction modes
  - Mode 1: Add the offsetFromMaster value to the local time whenever it is updated.
  - Mode 2: Calculate a clock gradient and continuously adjust the local time in order to minimize the offsetFromMaster value.

Supported Devices

Device Group	Devices
RA6	RA6M3

Configuration

Build Time Configurations for r_ptp

The following build time configurations are defined in fsp_cfg/r_ptp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > PTP (r_ptp)

This module can be added to the Stacks tab via New Stack > Networking > PTP (r_ptp).

Configuration	Options	Default	Description
Clock Properties			
Priority 1	Value must in the range [0,255].	128	Priority1 field advertised in generated announce packets.
Class	Value must in the range [0,255].	248	Class field advertised in generated announce packets.
Accuracy	Value must in the range [0,255].	0xFE	Accuracy field advertised in generated announce packets.
Variance	Value must in the range [0,65535].	0xFFFF	Variance field advertised in generated announce packets.
Priority 2	Value must in the range [0,255].	128	Priority2 field advertised in generated announce packets.
Time Source	Value must in the range [0,255].	160	Time Source field advertised in generated announce packets.
Ethernet			
Multicast Filter MAC address	Must be a valid MAC address	01:1B:19:00:00:00	In Multicast Filtered mode, only multicast addresses that match this address are received by the ETHERC EDMAC.

Primary Destination MAC address	Must be a valid MAC address	01:1B:19:00:00:00	The destination MAC address for primary PTP messages.
PDelay Destination MAC address	Must be a valid MAC address	01:80:C2:00:00:0E	The destination MAC address for PDelay messages.
IP			
Primary Destination IP address	Must be a valid IP address	224.0.1.129	The destination IPv4 address for primary messages.
PDelay Destination IP address	Must be a valid IP address	224.0.0.107	The destination IPv4 address for PDelay messages.
Event Message TOS	Value must in the range [0,255].	0	The IP packet TOS for event messages.
General Message TOS	Value must in the range [0,255].	0	The IP packet TOS for general messages.
Primary Message TTL	Value must in the range [0,255].	1	The IP packet TTL for primary messages.
PDelay Message TTL	Value must in the range [0,255].	1	The IP packet TTL for p_delay messages.
Event Port	Value must in the range [0,65535].	319	The UDP port for event messages.
General Port	Value must in the range [0,65535].	320	The UDP port for general messages.
Synchronization Detection			
Threshold (Nanoseconds)	Value must be greater than 0.	1000000	The minimum offsetFromMaster value required in order to synchronize with the master clock.
Count	Value must in the range [0,15].	5	The number of times the calculated offsetFromMaster value must be less than the threshold in order to synchronize with the master clock.
Synchronization Lost Detection			
Threshold (Nanoseconds)	Value must be greater than 0.	10000000	The minimum offsetFromMaster value required in order to lose synchronization with the master clock.

Count	Value must in the range [0,15].	5	The number of times the calculated offsetFromMaster value must be greater than the threshold in order to lose synchronization with the master.
Interrupts			
Callback	Name must be a valid C symbol	ptp0_user_callback	Called when a STCA/SYNFP event occurs, a PTP message is received, or if a Pulse Timer event occurs.
MINT Interrupt priority	MCU Specific Options		Select the EPTPC MINT interrupt priority.
Pulse Timer Interrupt priority	MCU Specific Options		Select the EPTPC IPLS priority.
Name	Name must be a valid C symbol	g_ptp0	Module name.
Ethernet PHY Interface Type	• MII • RMII	RMII	The interface type used to communicate with the Ethernet PHY.
Frame Filter	• Extended Promiscuous Mode • Unicast and Multicast • Unicast and Multicast Filtered • Unicast	Unicast	Selects how packets are filtered based on their destination MAC address. Packets that pass the filter are transferred to the ETHERC EDMAC.
Frame Format	• Ethernet II • Ethernet II | IPv4 | UDP • IEEE802.3 | LLC | SNAP • IEEE802.3 | LLC | SNAP | IPv4 | UDP	Ethernet II	The format of the frames that encapsulate the PTP messages.
Clock Domain	Value must in the range [0,255].	0	The PTP clock will only respond to clocks in its domain.
Clock Domain Filter	• Enable • Disable	Enable	Filter out PTP messages from other clock domains.
Buffer Size	Value must in the range [64,1536].	1536	The maximum Ethernet packet size that can be transmitted or received

			by the application from the EDMAC.
Number of transmit buffers	Value must in the range [1,16].	4	The number of transmit buffers in the packet queue.
Number of receive buffers	Value must in the range [1,16].	4	The number of receive buffers in the packet queue.
Announce message interval.	MCU Specific Options		The period of time between generated announce messages.
Sync message interval.	MCU Specific Options		The period of time between generated sync messages.
Delay_req message interval.	MCU Specific Options		The period of time between generated delay_req messages.
Message timeout	Value must be greater than 0.	4000	The time in milliseconds needed to generate timeout events after not receiving a sync or delay_resp message.
Clock Source	• PCLKA / 1 • PCLKA / 2 • PCLKA / 3 • PCLKA / 4 • PCLKA / 5 • PCLKA / 6 • REF50CK0	PCLKA / 6	The STCA clock source must be 20Mhz, 25Mhz, 50Mhz, or 100Mhz. When REF50CK0 is selected, the STCA frequency is 25Mhz.
Clock Correction Mode	• Clock Correction Mode 1 • Clock Correction Mode 2	Clock Correction Mode 1	Clock correction mode 1 corrects the local clock using the current offsetFromMaster value. Clock correction mode 2 calculates a clock gradient in order to continuously correct the local clock.
Gradient Worst10 Interval	Value must in the range [0,255].	32	The number of sync messages to use when calculating the worst10 gradient values (Only applies to clock correction mode 2).

Clock Configuration

The STCA input clock can be the following clock sources:

- PCLKA / 1
- PCLKA / 2
- PCLKA / 3
- PCLKA / 4
- PCLKA / 5
- PCLKA / 6
- REF50CK0

The STCA input clock is restricted to the following frequencies:

- 20 Mhz
- 25 Mhz
- 50 Mhz
- 100 Mhz

When REF50CK0 is selected, the input clock frequency is 25 Mhz.

Pin Configuration

The PTP module requires the Ethernet (r_ether) instance in order to initialize the Ethernet PHY. This means that the ETHERC pins must be configured.

Usage Notes

PTP Port State

The current PTP port state determines which messages need to be generated and processed by the PTP peripheral. It is the application's responsibility to determine what the current state of the PTP port should be.

The following messages can be generated by the PTP peripheral:

- Announce
- Sync
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp

The following messages can be processed by the PTP peripheral:

- Sync
- Follow_up
- Delay_req
- Delay_resp
- PDelay_req
- PDelay_resp
- PDelay_resp_follow_up

The application must receive the following messages in order to determine the current state of its PTP port:

- Announce
- Management

- Signaling

The following messages can only be sent manually:

- Management
- Signaling

The PTP API defines the following states:

State	Generated Messages	Processed Messages	Received Messages
Disabled	N/A	N/A	N/A
Passive	N/A	N/A	Announce, Signaling, Management
E2E/P2P Slave	Delay_req/(PDelay_req, PDelay_resp)	Sync, Follow_up, Delay_resp/(PDelay_req, PDelay_resp)	Announce, Signaling, Management
E2E/P2P Master	Announce, Sync, Delay_resp/(PDelay_req, PDelay_resp)	delay_req/(PDelay_req, PDelay_resp)	Announce, Signaling, Management

Pulse Timers

Pulse Timers are configurable timers used to generate interrupts and ELC events. Each pulse timer has a configurable start time, pulse, and period. At the start of each timer period, a rising edge occurs. After the pulse time has elapsed, a falling edge occurs. ELC events and IRQs can be generated on rising and/or falling edges for each Pulse Timer. There are two types of interrupts generated by each Pulse Timer; MINT and IPLS.

ELC Events

Pulse timers may be configured to generate the following ELC events:

- EPTPC_TIMERn_RISE - Generated on the rising edge of pulse timer channel n[1].
- EPTPC_TIMERn_FALL - Generated on the falling edge of pulse timer channel n[1].

Note

1. n = [0,5] corresponds to the channel of the pulse timer.

MINT Interrupts

MINT IRQs are only generated on the rising edge of a Pulse Timer channel. The callback will provide the channel number of the pulse timer that caused the interrupt.

IPLS Interrupts

Each Pulse Timer channel can be configured as a source for generating IPLS IRQs. All of the pulse timers that are selected as IPLS sources are OR'd together and rising and falling edge IRQs can be generated from the resulting signal. Below is an example of a resulting signal from two IPLS sources. Unlike MINT interrupts, IPLS interrupts do not provide any information about which Pulse Timer caused the IRQ because the IRQs from all the Pulse Timers are OR'd together.

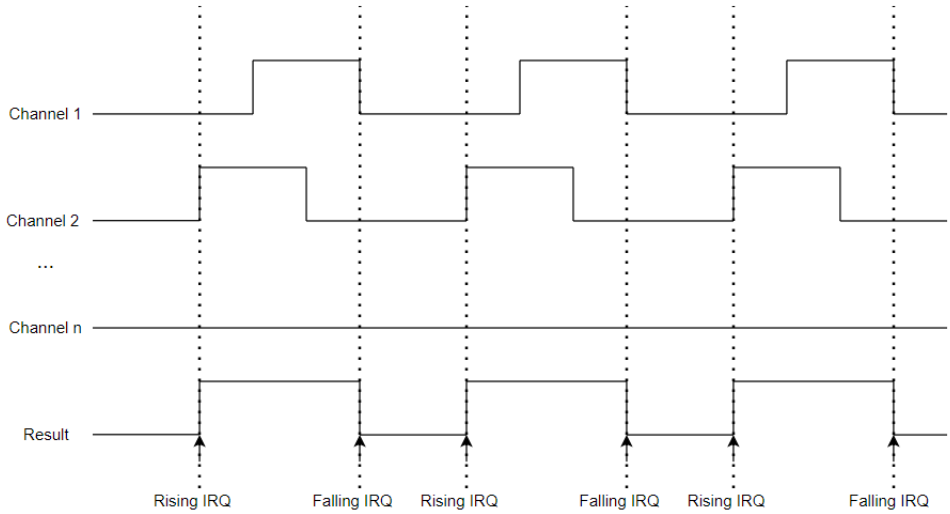

Figure 334: IPLS IRQ Generation

Ethernet Frame Filter

The PTP driver can filter Ethernet frames that are received by Ethernet (r_ether). There are four different filtering modes:

- Extended Promiscuous - All Ethernet frames are received by Ethernet (r_ether).
- Unicast and Multicast - All Unicast frames destined for the PTP and Multicast frames are received by Ethernet (r_ether).
- Unicast and Multicast Filtered - All Unicast frames destined for the PTP are received by Ethernet (r_ether). All multicast frames that match ptp_synfp_cfg_t::p_multicast_addr_filter are received by Ethernet (r_ether).
- Unicast - Only Unicast frames destined for the PTP are received by Ethernet (r_ether).

Limitations

Developers should be aware of the following limitations when using the PTP:

- PTP will not automatically initialize Ethernet (r_ether). This provides flexibility by allowing PTP to be used alongside 3rd party IP stacks (Eg. FreeRTOS+TCP Wrapper to r_ether (rm_freertos_plus_tcp)), however this means the application must execute the Ethernet (r_ether) link process in order to use PTP.
- The driver will not detect announce message timeouts. This functionality must be handled by the application.
- When IP + UDP frame format is selected, the driver will not automatically join the multicast group. This must be done by the application.
- In order to call PTP API functions from ISRs, the MINT and IPLS interrupt priorities must be configured to be lower than BSP_CFG_IRQ_MASK_LEVEL_FOR_CRITICAL_SECTION. This is to guarantee that PTP register accesses are atomic.
- When IEEE802.3 | LLC | SNAP | IP | UDP or IEEE802.3 | LLC | SNAP Frame Format is selected, the PTP peripheral sets the OUI field in the SNAP frame to the first 3 bytes of the **MAC address** configured in the Ethernet (r_ether) module's configuration property. In order for the PID field of SNAP to be interpreted as EtherType, the OUI field should be set to '0'.

Examples

Slave Mode

This is a basic example of minimal use of PTP in slave mode.

```
volatile bool g_first_announce_message_received = false;
volatile bool g_sync_acquired = false;
void slave_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_PASSIVE);
    assert(FSP_SUCCESS == err);
 /* Wait for the first announce message (This will provide the master clock ID). */
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (!g_first_announce_message_received && --timeout)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
    }
    assert(0U != timeout);
 /* When a master clock is found, change to the slave state to start synchronizing
```

```
 * the local clock to the master clock. */
   err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_SLAVE);
   assert(FSP_SUCCESS == err);
/* Wait for local clock to be synchronized with the master clock. */
   timeout = EXAMPLE_TIMEOUT;
while (!g_sync_acquired && --timeout)
   {
R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_SECONDS);
   }
   assert(0U != timeout);
/* The local clock is now synchronized with the grand master clock. */
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_slave_callback_example (ptp_callback_args_t * p_args)
{
switch (p_args->event)
   {
case PTP_EVENT_SYNC_ACQUIRED:
     {
/* The offsetFromMaster value is now within the configured threshold to be
 * synchronized with the master clock.
 */
           g_sync_acquired = true;
break;
     }
case PTP_EVENT_MESSAGE_RECEIVED:
     {
static ptp_message_t g_current_master_announce_message;
switch (p_args->p_message->header.message_type)
     {
case PTP_MESSAGE_TYPE_ANNOUNCE:
     {
                int8_t comparison = 0;
if (!g_first_announce_message_received)
```

```
     {
 /* If this is the first announce packet, immediately switch to this master clock. */
                       comparison = 1;
                       g_first_announce_message_received = true;
     }
 else
     {
 /*
  * Run the "Best Master Clock Algorithm" to determine if the clock defined in this
announce
  * packet is better than the current master clock.
  */
 fsp_err_t err = R_PTP_BestMasterClock(&g_current_master_announce_message,
                                                        p_args->p_message,
                                                        &comparison);
     assert(FSP_SUCCESS == err);
     }
 if (1 == comparison)
     {
 /* Save the message as the new master announce message. */
                       g_current_master_announce_message = *p_args->p_message;
 /* Set the master clock ID and sourcePortID in the PTP instance so that it
  * synchronizes with the new best master clock.
  */
 fsp_err_t err = R_PTP_MasterClockIdSet(&g_ptp_ctrl,
                                                          g_current_master_annou
nce_message.header.clock_id,
                                                        g_current_master_annou
nce_message.header.source_port_id);
     assert(FSP_SUCCESS == err);
     }
 break;
     }
 default:
```

```
     {
 break;
     }
     }
 break;
     }
 default:
     {
 break;
     }
   }
}
```

Master Mode

This is a basic example of minimal use of PTP in master mode.

```
#define PTP_EXAMPLE_CURRENT_UTC_OFFSET (37)
void master_mode_basic_example (void)
{
 /* The PTP Instance must be opened before R_ETHER is opened. */
 fsp_err_t err = R_PTP_Open(&g_ptp_ctrl, &g_ptp_cfg);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP MAC address. */
    err = R_PTP_MacAddrSet(&g_ptp_ctrl, g_ptp_mac_address);
    assert(FSP_SUCCESS == err);
 /* Configure the PTP Local Clock ID (Usually generated from MAC address). */
    err = R_PTP_LocalClockIdSet(&g_ptp_ctrl, g_ptp_clock_id);
    assert(FSP_SUCCESS == err);
 /* Get the current time from an external time source (Eg. RTC). */
 ptp_time_t current_time;
    get_current_time_example(&current_time);
 /* Set the PTP local time to the current time. */
    err = R_PTP_LocalClockValueSet(&g_ptp_ctrl, &current_time);
    assert(FSP_SUCCESS == err);
```

```
 /* Set the currentUtcOffset field in announce messages. */
    err = R_PTP_CurrentUtcOffsetSet(&g_ptp_ctrl, PTP_EXAMPLE_CURRENT_UTC_OFFSET);
    assert(FSP_SUCCESS == err);
 /* Set message flags in announce messages to indicate that the current UTC offset is
valid and that the PTP timescale is used. */
 ptp_message_flags_t flags;
    flags.value = 0;
    flags.value_b.currentUtcOffsetValid = 1;
    flags.value_b.ptpTimescale          = 1;
    err = R_PTP_MessageFlagsSet(&g_ptp_ctrl, PTP_MESSAGE_TYPE_ANNOUNCE, flags);
    assert(FSP_SUCCESS == err);
 /* Open the r_ether_api instance. */
    err = R_ETHER_Open(&g_ether_ctrl, &g_ether_cfg);
    assert(FSP_SUCCESS == err);
 /* Wait for the link to be established. */
 do
    {
       err = R_ETHER_LinkProcess(&g_ether_ctrl);
    } while (FSP_SUCCESS != err);
 /* Set the PTP instance to passive state and listen for announce message. */
    err = R_PTP_PortStateSet(&g_ptp_ctrl, PTP_PORT_STATE_E2E_MASTER);
    assert(FSP_SUCCESS == err);
 /*
  * The master clock is now operational and will automatically generate announce and
sync messages
  * as well as respond to delay_req messages.
  */
}
```

Send PTP Messages

This is a basic example of how to send PTP messages.

```
#define PTP_MANAGEMENT_ACTION_GET (0U)
#define PTP_TLV_TYPE_MANAGEMENT (1U)
```

```
#define PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION (1U)
static uint32_t g_transmit_complete = 0U;
void send_message_example (void)
{
 static ptp_message_t message;
 static uint8_t       p_tlv_data[6];
    memset(&message, 0, sizeof(ptp_message_t));
 /* Fill in the required fields for the message header (Note that appropriate fields
will be endian swapped). */
    message.header.message_type = PTP_MESSAGE_TYPE_MANAGEMENT;
    message.header.version      = 2;
 /* The message length is the total number of bytes in the PTP message (Including the
message header). */
    message.header.message_length = (uint16_t) (sizeof(ptp_message_header_t) +
 sizeof(ptp_message_management_t) +
 sizeof(p_tlv_data));
    memcpy(message.header.clock_id, g_ptp_clock_id, sizeof(g_ptp_clock_id));
    message.header.control_field = PTP_CTRL_FIELD_MANAGEMENT;
 /* Fill in the required fields for the management message. */
    memcpy(message.management.target_clock_id, g_target_clock_id, sizeof
(g_target_clock_id));
    message.management.target_port_id         = 1;
    message.management.starting_boundary_hops = 1;
    message.management.boundary_hops          = 1;
    message.management.action                = PTP_MANAGEMENT_ACTION_GET;
 /*
  * Fill in TLV data (Note that TLV data is big endian).
  *
  * Type (Management)
  */
    p_tlv_data[0] = 0;
    p_tlv_data[1] = PTP_TLV_TYPE_MANAGEMENT;
 /* Length */
    p_tlv_data[2] = 0;
```

```
    p_tlv_data[3] = 2;
 /* Management ID (Clock Description) */
    p_tlv_data[4] = 0;
    p_tlv_data[5] = PTP_TLV_MANAGEMENT_ID_CLOCK_DESCRIPTION;
 /* Send the message. */
 fsp_err_t err = R_PTP_MessageSend(&g_ptp_ctrl, &message, p_tlv_data, sizeof
(p_tlv_data));
    assert(FSP_SUCCESS == err);
    uint32_t timeout = EXAMPLE_TIMEOUT;
 while (0U == g_transmit_complete && --timeout)
    {
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MICROSECONDS);
    }
}
/* Callback called whenever a PTP event occurs. */
void g_ptp_send_message_callback_example (ptp_callback_args_t * p_args)
{
 switch (p_args->event)
    {
 case PTP_EVENT_MESSAGE_TRANSMIT_COMPLETE:
     {
           g_transmit_complete = 1U;
 break;
     }
 case PTP_EVENT_MESSAGE_RECEIVED:
     {
 switch (p_args->p_message->header.message_type)
     {
 case PTP_MESSAGE_TYPE_MANAGEMENT:
     {
 /* Handle the response message. */
 break;
     }
 default:
```

```
      {
 break;
      }
      }
      }
 default:
      {
 break;
      }
    }
}
```

Data Structures

struct	ptp_instance_ctrl_t

Data Structure Documentation

◆ ptp_instance_ctrl_t

struct ptp_instance_ctrl_t		
PTP instance control block.		
Data Fields		
uint32_t	open	Marks if the instance has been opened.
uint32_t	tx_buffer_write_index	Index into the descriptor list to write the next packet.
uint32_t	tx_buffer_complete_index	Index into the descriptor list of the last transmitted packet.
uint32_t	rx_buffer_index	Index into the descriptor of the last received packet.
uint32_t	tslatr	Keep track of whether tslatr was set.
ptp_cfg_t const *	p_cfg	Pointer to the configuration structure.

Function Documentation

◆ R_PTP_Open()

fsp_err_t R_PTP_Open (ptp_ctrl_t *const *p_ctrl*, ptp_cfg_t const *const *p_cfg*)

This function initializes PTP. Implements ptp_api_t::open.

This function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Configures the peripheral registers according to the configuration.
- Initialize the control structure for use in other PTP Interface functions.

Return values

FSP_SUCCESS	The instance has been successfully configured.
FSP_ERR_ALREADY_OPEN	Instance was already initialized.
FSP_ERR_NOT_OPEN	The EDMAC instance was not opened correctly.
FSP_ERR_ASSERTION	An invalid argument was given in the configuration structure.

◆ R_PTP_MacAddrSet()

fsp_err_t R_PTP_MacAddrSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr*)

This function sets the MAC address for the PTP instance. Implements ptp_api_t::macAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The MAC address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_IpAddrSet()

fsp_err_t R_PTP_IpAddrSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *ip_addr*)

This function sets the IP address for the PTP instance. Implements ptp_api_t::ipAddrSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.

Return values

FSP_SUCCESS	The IP address has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL.
FSP_ERR_INVALID_MODE	The configured ptp_synfp_cfg_t::frame_format is not configured to use IP packets, or the instance is not in the correct state.

◆ R_PTP_LocalClockIdSet()

fsp_err_t R_PTP_LocalClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*)

This function sets the local clock ID for the PTP instance. Implements ptp_api_t::localClockIdSet.

Note

This function may only be called while the PTP instance is in ptp_port_state_t::PTP_PORT_STATE_DISABLE.
Typically the clock ID is derived from the MAC address (E.g. {b1,b2,b3,0xFF,0xFE,b4,b5,b6}).

Return values

FSP_SUCCESS	The local clock ID has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL
FSP_ERR_INVALID_MODE	The instance is not in the correct state.

◆ R_PTP_MasterClockIdSet()

fsp_err_t R_PTP_MasterClockIdSet (ptp_ctrl_t *const *p_ctrl*, uint8_t const *const *p_clock_id*, uint16_t *port_id*)

This function sets the master clock ID and port ID that the local clock will synchronize with. Implements ptp_api_t::masterClockIdSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageFlagsSet()

fsp_err_t R_PTP_MessageFlagsSet (ptp_ctrl_t *const *p_ctrl*, ptp_message_type_t *message_type*, ptp_message_flags_t *flags*)

This function sets the flags field for the given message type. Implements ptp_api_t::messageFlagsSet.

Return values

FSP_SUCCESS	The master clock ID and port ID have been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_CurrentUtcOffsetSet()

fsp_err_t R_PTP_CurrentUtcOffsetSet (ptp_ctrl_t *const *p_ctrl*, uint16_t *offset*)

This function sets the currentUtcOffset value in announce messages. ptp_api_t::currentUtcOffsetSet .

Return values

FSP_SUCCESS	The currentUtcOffset has been updated.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PortStateSet()

fsp_err_t R_PTP_PortStateSet (ptp_ctrl_t *const *p_ctrl*, uint32_t *state*)

This function changes the current state of the PTP instance. Implements ptp_api_t::portStateSet.

Return values

FSP_SUCCESS	The instance will transition to the new state.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_MessageSend()

fsp_err_t R_PTP_MessageSend (ptp_ctrl_t *const *p_ctrl*, ptp_message_t const *const *p_message*, uint8_t const *const *p_tlv_data*, uint16_t *tlv_data_size*)

This function sends a PTP message. ptp_api_t::messageSend.

Return values

FSP_SUCCESS	The packet has been written to the transmit descriptor.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_ETHER_ERROR_TRANSMIT_BUFFER_FULL	There is no space for the packet in the transmit queue.

◆ R_PTP_LocalClockValueSet()

fsp_err_t R_PTP_LocalClockValueSet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t const *const *p_time*)

This function sets the local clock value. Implements ptp_api_t::localClockValueSet.

Return values

FSP_SUCCESS	The local clock value has been set.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_LocalClockValueGet()

fsp_err_t R_PTP_LocalClockValueGet (ptp_ctrl_t *const *p_ctrl*, ptp_time_t *const *p_time*)

This function gets the local clock value. Implements ptp_api_t::localClockValueGet.

Return values

FSP_SUCCESS	The local clock value has been written in p_time.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL

◆ R_PTP_PulseTimerCommonConfig()

fsp_err_t R_PTP_PulseTimerCommonConfig (ptp_ctrl_t *const *p_ctrl*, ptp_pulse_timer_common_cfg_t *const *p_timer_cfg*)

This function configures IPLS IRQ settings that are common to all pulse timer channels. Implements ptp_api_t::pulseTimerCommonConfig.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_PulseTimerEnable()

fsp_err_t R_PTP_PulseTimerEnable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*, ptp_pulse_timer_cfg_t *const *p_timer_cfg*)

This function enables a pulse timer channel. Implements ptp_api_t::pulseTimerEnable.

Return values

FSP_SUCCESS	The pulse timer has been enabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.
FSP_ERR_INVALID_ARGUMENT	The start time must be set to a value that is later than current time.

◆ R_PTP_PulseTimerDisable()

fsp_err_t R_PTP_PulseTimerDisable (ptp_ctrl_t *const *p_ctrl*, uint32_t *channel*)

This function disables a pulse timer channel. Implements ptp_api_t::pulseTimerDisable.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_Close()

fsp_err_t R_PTP_Close (ptp_ctrl_t *const *p_ctrl*)

Disable the PTP instance. Implements ptp_api_t::close.

Return values

FSP_SUCCESS	The pulse timer has been disabled.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	An argument was NULL or invalid.

◆ R_PTP_BestMasterClock()

fsp_err_t R_PTP_BestMasterClock (ptp_message_t const *const *p_announce1*, ptp_message_t const *const *p_announce2*, int8_t *const *p_comparison*)

This function compares two clocks to determine which one is the better master clock.

p_comparison:

- Set to -1 if p_announce1 defines the best master clock.
- Set to 1 if p_announce2 defines the best master clock.
- Set to 0 if p_announce1 and p_announce2 define the same clock.

Return values

FSP_SUCCESS	The valid result has been written to p_use_announce_clock.
FSP_ERR_ASSERTION	An argument was NULL.

5.2.12.30 SPP BLE Abstraction (rm_ble_abs_spp)

Modules » Networking

Middleware for the Bluetooth peripheral on RA MCUs. This module implements the BLE ABS Interface .

Overview

This module provides BLE GAP functionality that complies with the Bluetooth Core Specification version 5.0 specified by the Bluetooth SIG. This module is configured via the QE for BLE. QE for BLE provides standard and custom services defined by the user.

The module supports the Renesas Electronics RYZ012 Bluetooth® Low Energy 5 Module. The rm_ble_abs_spp driver interfaces with the RYZ012 module over UART or SPI.

Features

The Bluetooth Low Energy (BLE) Abstraction module with SPP supports the following features:

- Common functionality
  - Open/Close the BLE protocol stack.
  - Setting Transmit Power Level.
- The following GAP Role support
  - Peripheral: The device that accepts a connection request from Central and establishes a connection.
- GAP functionality
  - Initialize the Host stack.
  - Setting address.
  - Start/Stop Advertising.
  - Connect/Disconnect a link.
- GATT Common functionality
  - Get MTU Size.
- GATT Server functionality
  - Initialization of GATT Server.
  - Loading of Profile definition.
  - Notification of characteristics modification.
  - Read/Write of GATT Profile from host.
- Selectable Communication Interfaces
  - SPI Interface
  - UART Interface

Target Devices

The BLE Abstraction module supports the following devices.

- RA6 line of devices using the RYZ012 module
- RA4 Line of devices using the RYZ012 module

Configuration

Build Time Configurations for rm_ble_abs_spp

The following build time configurations are defined in fsp_cfg/rm_ble_abs_spp_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enable • Disable	Default (BSP)	Specify whether to include code for API parameter checking.
Reset Port	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin port for the MCU.
Reset Pin	Refer to the RA Configuration tool for available options.	10	Specify the module reset pin for the MCU.
UART/SPI Select Port (PB5)	Refer to the RA Configuration tool for available options.	03	Specify the module PB5 (UART/SPI select) port for the MCU.
UART/SPI Select Pin (PB5)	Refer to the RA Configuration tool for available options.	11	Specify the module PB5 (UART/SPI select) pin for the MCU.
SPI Software SSL Port	Refer to the RA Configuration tool for available options.	Disabled	Specify the port to use for controlling SSL using the ioport module.
SPI Software SSL Pin	Refer to the RA Configuration tool for available options.	Disabled	Specify the pin to use for controlling SSL using the ioport module.
Transmit Power Level (in dBm)	Refer to the RA Configuration tool for available options.	4.57	Specify the module transmit power in dBm.

Configurations for Networking > SPP BLE Abstraction (rm_ble_abs_spp)

This module can be added to the Stacks tab via New Stack > Networking > SPP BLE Abstraction (rm_ble_abs_spp).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_ble_abs0	Module name.
GAP callback	Name must be a valid C symbol	gap_cb	If QE is used, set to "gap_cb".
Vendor specific callback	Name must be a valid C symbol	vs_cb	If QE is used, set to "vs_cb".
GATT server callback parameter	Name must be a valid C symbol	gs_abs_gatts_cb_param	If QE is used, set to "gs _abs_gattc_cb_param".
GATT server callback number	Must be a valid number	2	The number of GATT Server callback functions.

GATT client callback parameter	Name must be a valid C symbol	gs_abs_gattc_cb_param	Set GATT client callback parameter. If QE is used, set to "gs_abs_gattc_cb_param".
GATT client callback number	Must be a valid number	2	The number of GATT Server callback functions.

Pin Configuration

Pins used by the BLE driver to control the RYZ012 module:

- Reset Pin : Active low reset line for RYZ012 module
- UART/SPI Select Pin : Allows selection between UART or SPI for module communication. UART is selected with output low and SPI with output high.
- UART Interface : RX/TX Pins
- SPI Interface : MOSI/MISO/SCK/SSL Pins
  - Data Ready Pin : When the SPI Interface is selected as the communication interface, the Data Ready pin is asserted in order to notify the MCU that there is data ready to be read.
  - Software SSL Pin : Can be optionally configured in order to drive the SSL Pin using software instead of hardware[1].

Note

1. The software SSL Pin is required when using the SPI (r_sci_spi) driver.
2. When using software SSL, the pin must be configured as "Output mode (Initial High)" in the pin configuration editor in addition to being configured in the "stacks" tab.

Usage Notes

Limitations

Developers should be aware of the following limitations when using the BLE_ABS:

Currently supported rm_ble_abs_spp interface functions:

- RM_BLE_ABS_Open
- RM_BLE_ABS_Close
- RM_BLE_ABS_StartLegacyAdvertising

Currently supported r_ble_spp_api interface functions:

- R_BLE_Open
- R_BLE_Close

Currently supported callback events:

- BLE_GAP_EVENT_CONN_IND
- BLE_GAP_EVENT_DISCONN_IND
- BLE_GAP_EVENT_ADV_ON
- BLE_GAP_EVENT_ADV_OFF
- BLE_GATTC_EVENT_CONN_IND
- BLE_GATTS_EVENT_CONN_IND
- BLE_GATTC_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_DISCONN_IND
- BLE_GATTS_EVENT_WRITE_RSP_COMP

Transmit Power

Specific Operational Use Conditions for RYZ012 BLE module:

Please consult the laws and regulations of the region(s) in which the device will be used to verify the information below before using this device.

North America (FCC) The module must not be operated at power levels above 10.0 dBm. Host devices that need higher output power may not be marketed without prior re-certification.

Europe (RED) The module must not be operated at power levels above 8.4 dBm. Host devices that need higher output power may not be marketed in regions covered by RED regulation without prior re-certification.

Japan (MIC) The module must be operated at power level 4.5 dBm. Host devices that need to change output power may not be marketed without prior re-certification.

The current default level used in the e² studio Configurator is 4.57 dBm for the transmit power level.

Examples

BLE_ABS_SPP Basic Example

This is a basic example of minimal use of the BLE_ABS_SPP in an application.

```
/* The callback is called when peripheral event occurs. */
void gap_peripheral_cb (uint16_t type, ble_status_t result, st_ble_evt_data_t *
p_data)
{
 FSP_PARAMETER_NOT_USED(result);
```

```
 FSP_PARAMETER_NOT_USED(p_data);
 switch (type)
    {
 case BLE_GAP_EVENT_STACK_ON:
      {
            g_ble_event_flag = g_ble_event_flag | BLE_ABS_EVENT_FLAG_STACK_ON;
 break;
       }
 case BLE_GAP_EVENT_ADV_ON:
      {
 st_ble_gap_adv_set_evt_t * p_gap_adv_set_evt_param = (st_ble_gap_adv_set_evt_t *)
p_data->p_param;
            g_advertising_handle = p_gap_adv_set_evt_param->adv_hdl;
            g_ble_event_flag    |= BLE_ABS_EVENT_FLAG_ADV_ON;
 break;
       }
 case BLE_GAP_EVENT_ADV_OFF:

Detailed Description

Middleware to implement a generic communications interface over LWIP. This module implements the Communications Middleware Interface.

Overview

The RM_COMMS_SOCKET module implements COMMS API for LWIP interface.

Features

The implementation of the LWIP communications interfacehas the following key features:

- Non-blocking API for bare metal
- Non-blocking and blocking API for RTOS
- Socket connection detection mode

Configuration

Build Time Configurations for rm_comms_socket

The following build time configurations are defined in fsp_cfg/rm_comms_socket_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Networking > Socket Communication Device (rm_comms_socket)

This module can be added to the Stacks tab via New Stack > Networking > Socket Communication Device (rm_comms_socket).

Configuration	Options	Default	Description
RTOS			
Recursive Write Mutex	• Do Not Use • Use	Use	Lock device for writing in using RTOS.
Recursive Read Mutex	• Do Not Use • Use	Use	Lock device for reading in using RTOS.
Mutex Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for recursive mutex operation in using RTOS.
Write Semaphore	• Do Not Use • Use	Use	Block writing in using RTOS.
Read Semaphore	• Do Not Use • Use	Use	Block reading in using RTOS.
Semaphore Timeout	Value must be a non-negative integer	0xFFFFFFFF	Timeout for semaphore operation in using RTOS.
Name	Name must be a valid C symbol	g_comms_socket0	Module name.
Socket type	TCP	TCP	
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided.
Server Port	Value must be a non-negative integer	9010	TCP port ranges from 1 to 63556

Usage Notes

Limitations

- If DHCP is enabled, user have to find board's IP address via DHCP server, mDNS, etc.
- UDP socket is not supported.
- RM_COMMS_SOCKET_WriteRead API is not implemented.

Examples

Basic Example

This is a basic example of minimal use of LWIP communications implementation in an application.

```
void rm_comms_socket_example () {
 /* This step: Initialize pin setting (of MCU device) */
 /* TODO code */
    rm_comms_socket_extended_cfg_t * p_extend = (rm_comms_socket_extended_cfg_t *)
g_comms_socket_port_cfg.p_extend;
 struct netif comms_socket_netif;
 /* Following code are lwIP setup process. */
    lwip_init();
 /* Initialize netif before open rm_comms_socket. */
    netif_add(&comms_socket_netif,
              RM_COMMS_SOCKET_EXAMPLE_IP_ADDR,
              RM_COMMS_SOCKET_EXAMPLE_NETMASK,
              RM_COMMS_SOCKET_EXAMPLE_GW,
              p_extend->p_lwip_ether,
 rm_lwip_ether_init,
              netif_input);
    netif_set_default(&comms_socket_netif);
    netif_set_up(&comms_socket_netif);
    netif_set_link_up(&comms_socket_netif);
 /* Init the rm_comms_socket */
 RM_COMMS_SOCKET_Open(&g_comms_socket_port_ctrl, &g_comms_socket_port_cfg);
 /* Waiting few milliseconds for socket ready to be used */
 R_BSP_SoftwareDelay(10, BSP_DELAY_UNITS_MILLISECONDS);
 /* Set callback function */
 RM_COMMS_SOCKET_CallbackSet(&g_comms_socket_port_ctrl, tcp_callback,
g_comms_socket_port_cfg.p_context);
```

```
 /* This step: Client start to creating the socket and send connect command to Server
(MCU device) */
 /* TODO code */
 /* Waiting for connection to be established. */
    LWIP_TEST_WAIT_TIMEOUT(true == connected, LWIP_TEST_MAXIMUM_WAITING_TIME);
 /* Tries 3 times loop to receive/send data from/to client */
 for (uint16_t tries = 1; tries < 3; tries++)

     {
           connected = true;
break;
     }
   }
}
```

Data Structures

struct	rm_comms_socket_instance_ctrl_t

Data Structure Documentation

◆ rm_comms_socket_instance_ctrl_t

struct rm_comms_socket_instance_ctrl_t	
Communications middleware control structure.	
Data Fields	
uint32_t	open
	Open flag.
rm_comms_cfg_t const *	p_cfg

	Middleware configuration.
rm_comms_socket_extended_cfg_t *	p_extend
	Pointer to device specific settings (lower level configuration structure)
void(*	p_callback)(rm_comms_callback_args_t *p_args)
	Pointer to callback that is called when a socket_event_t occurs.
void *	p_context
	Pointer to context passed into callback function.

Function Documentation

◆ RM_COMMS_SOCKET_Open()

fsp_err_t RM_COMMS_SOCKET_Open (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_cfg_t const *const *p_cfg*)

Opens and configures the SOCKET Comms module. Implements rm_comms_api_t::open.

Return values

FSP_SUCCESS	SOCKET Comms module successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ABORTED	Module is not successfully open.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_UNSUPPORTED	Socket type is not supported.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_Close()

fsp_err_t RM_COMMS_SOCKET_Close (rm_comms_ctrl_t *const *p_api_ctrl*)

Disables specified SOCKET Comms module. Implements rm_comms_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Socket type is not supported.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_CallbackSet()

fsp_err_t RM_COMMS_SOCKET_CallbackSet (rm_comms_ctrl_t *const *p_api_ctrl*, void(*)(rm_comms_callback_args_t *) *p_callback*, void *const *p_context*)

Updates the SOCKET Comms callback. Implements rm_comms_api_t::callbackSet.

Return values

FSP_SUCCESS	Successfully set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_COMMS_SOCKET_Read()

fsp_err_t RM_COMMS_SOCKET_Read (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the SOCKET bus. Implements rm_comms_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_ENABLED	Operation is disabled when there is no TCP connection.
FSP_ERR_NOT_OPEN	Module is not open.

Note

Do not call this API in Interrupt function when enabling mutex or semaphore

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_Write()

fsp_err_t RM_COMMS_SOCKET_Write (rm_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the SOCKET bus. Implements rm_comms_api_t::write.

Return values

FSP_SUCCESS	Successfully writing data .
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_WRITE_FAILED	No bytes were transferred.
FSP_ERR_NOT_ENABLED	Operation is disabled when there is no active TCP connection.
FSP_ERR_NOT_OPEN	Module is not open.

Note

Do not call this API in Interrupt function when enabling mutex or semaphore

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_COMMS_SOCKET_WriteRead()

fsp_err_t RM_COMMS_SOCKET_WriteRead (rm_comms_ctrl_t *const *p_api_ctrl*, rm_comms_write_read_params_t const *write_read_params*)

Performs simultaneous read and write. Implements rm_comms_api_t::writeRead..

Return values

FSP_SUCCESS	Transfer was started successfully.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Read bytes and write bytes are not the same.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

5.2.12.32 WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Modules » Networking

Functions

fsp_err_t	RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t *p_server_ip_addr)

fsp_err_t	RM_WIFI_DA16XXX_GenericAtSendRcv (char const *const at_string, char *const response_buffer, uint32_t length)

Detailed Description

Wifi and Socket implementation using the DA16XXX WiFi module on RA MCUs.

Overview

This Middleware module currently supplies an implementation for using the DA16XXX module in two different configurations.

The first is for the FreeRTOS WiFi interface, where the network stack is located on the MCU using a socket interface, and the DA16XXX Wi-Fi module provides a connection to the internet. This configuration requires FreeRTOS to be used.

The second configuration is for use with the DA16XXX on-chip MQTT and HTTP client modules, where the network stack is located on the DA16XXX module. In this configuration, this Middleware driver supports FreeRTOS as well as Baremetal (Microsoft Azure support expected in future release).

DA16XXX is a low power Wi-Fi networking SoC that delivers a dramatic breakthrough in battery life even for devices that are continuously connected to the Wi-Fi network. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the DA16XXX Web Site

The DA16XXX module supports the following modules:

- DA16200
- DA16600 (currently Wi-Fi features only)

Features

The WiFi Onchip da16xxx Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports TCP client sockets.
- Drive supports 1 UART for interfacing with the DA16XXX module.

Configuration

Build Time Configurations for rm_wifi_da16xxx

The following build time configurations are defined in fsp_cfg/rm_wifi_da16xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Enable DA16600 Support	• Enabled • Disabled	Disabled	Enabled if using the DA16600 module
Check Minimum SDK Version	• Disabled • Enabled	Enabled	Enable or disable comparing the current DA16XXX module's SDK version to the minimum required

Number of supported socket instances (not used with on-chip APIs)	1	1	Enable number of socket instances
Size of RX buffer for socket (not used with on-chip APIs)	Manual Entry	8192	
Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi DA16XXX Framework Driver (rm_wifi_da16xxx)

Configuration	Options	Default	Description
Country code in ISO 3166-1 alpha-2 standard	Manual Entry	US	
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone UTC Offset in Hours	Refer to the RA Configuration tool for available options.	0	Value in hours from 12 to -12

Note: It is suggested that when using the DA16XXX module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip DA16XXX Framework Driver (rm_wifi_da16xxx)

Usage Notes

- When the DA16XXX Wi-Fi configures the UART baud rate on the DA16XXX module based on the user settings in the UART driver configuration properties, the UART Baud rate settings will be stored in the NVM memory of the DA16XXX. After reboot, the DA16XXX comes up with the previously updated UART baud rate settings.
- When using the DA16600 Pmod module, make sure that the SDK has been updated to the latest version that supports AT commands. The default SDK that comes from the factory doesn't support the AT command interface, which will cause the WIFI_On() API to fail. This is not required for the DA16200 Pmod module.

Limitations

- WiFi AP connections do not currently support WEP security.
- The default UART baud rate supported by v3.2.1 Wi-Fi SDK is 115200 and v3.2.4 Wi-Fi SDK is 230400. User needs to explicitly configure the default UART baud settings in the UART driver configurator properties based on the version of Wi-Fi SDK used in their testing.
- This driver is configured to support the following baud rates only: 115200, 230400, 460800, and 921600. These values are defined by the uart_baud_rates[] array and UART_BAUD_MAX_CNT found in the transport layer files.
- In v3.2.1 Wi-Fi SDK, the daylight savings time setting is disabled by default. The user needs to mandatorily set the following parameters such as minutes = 0, daylight savings to disable when calling RM_WIFI_DA16XXX_SntpTimeZoneSet() API.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the da16xxx module firmware. The rm_wifi_da16xxx_connect() function will return an error if a comma is detected.
- Wi-Fi AP Scanning is currently limited to max of 10 Access Points.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
       .xPassword.xWPA.cPassphrase = "password",
       .ucSSID                     = "access_point_ssid",
```

```
        .xPassword.xWPA.ucLength = 8,
        .ucSSIDLength            = 17,
        .xSecurity               = eWiFiSecurityWPA2,
    };
    memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
    memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
    wifi_err = WIFI_On();
    assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
    wifi_err = WIFI_ConnectAP(&net_params);
    assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
    wifi_err = WIFI_GetIPInfo(&ipInfo);
    assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
    uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
    wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
    assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
    wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
    assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE (64)
/*
```

```
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                    = "access_point_ssid",
       .ucSSIDLength              = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                 = 0,
       .xSecurity                 = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_DA16XXX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
```

```
 /* Change the IP address of the server */
 RM_WIFI_DA16XXX_SntpServerIpAddressSet((uint8_t *) ip_address_sntp_server_valid);
 /* Change the timezone to PST with daylight saving enabled */
 RM_WIFI_DA16XXX_SntpTimeZoneSet(-8, 0, WIFI_DA16XXX_SNTP_DAYLIGHT_SAVINGS_DISABLE);
 /* Connect back to the access point */
 WIFI_ConnectAP(&net_params);
 /* Get the local time string in format [DayOfWeek Month DayOfMonth Year
Hour:Minute:Second] */
 RM_WIFI_DA16XXX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the Access Point and shutdown the WIFI module*/
 WIFI_Disconnect();
 WIFI_Off();
}
```

Data Structures

struct	wifi_da16xxx_cfg_t
struct	da16xxx_socket_t
struct	wifi_da16xxx_instance_ctrl_t

Enumerations

enum	wifi_da16xxx_sntp_enable_t
enum	da16xxx_socket_status_t

enum	da16xxx_recv_state
enum	wifi_da16xxx_sntp_daylight_savings_enable_t

Data Structure Documentation

◆ wifi_da16xxx_cfg_t

struct wifi_da16xxx_cfg_t		
User configuration structure, used in open function		
Data Fields		
at_transport_da16xxx_instance_t	p_transport_instance	

const *		
const uint32_t	num_sockets	Number of sockets to initialize.
const uint8_t *	country_code	Country code defined in ISO3166-1 alpha-2 standard.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_utc_offset_in_hours	Timezone offset in secs (-43200 - 43200)
void *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ da16xxx_socket_t

struct da16xxx_socket_t		
DA16XXX Wifi internal socket instance structure		
Data Fields		
uint8_t	remote_ipaddr[4]	Remote IP address.
int	remote_port	Remote Port.
int	socket_recv_data_len	Data length of incoming socket data.
int	socket_type	Socket type (TCP Server | TCP Client | UDP)
uint32_t	socket_status	Current socket status.
uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.
da16xxx_recv_state	socket_recv_state	Incoming Socket data header information.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_DA16XXX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.

◆ wifi_da16xxx_instance_ctrl_t

struct wifi_da16xxx_instance_ctrl_t

WIFI_DA16XXX private control block. DO NOT MODIFY.		
Data Fields		
wifi_da16xxx_cfg_t const *	p_wifi_da16xxx_cfg	Pointer to initial configurations.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_socket	Current Socket index for AT commands.
uint32_t	open	Flag to indicate if wifi instance has been initialized.
uint8_t	is_sntp_enabled	Flag to indicate Enable/Disable of SNTP Client.
uint8_t	cmd_tx_buff[WIFI_DA16XXX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_DA16XXX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.
uint8_t	curr_gateway[4]	Current GAteway of module.
da16xxx_socket_t	sockets[WIFI_DA16XXX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ wifi_da16xxx_sntp_enable_t

enum wifi_da16xxx_sntp_enable_t
DA16XXX WiFi module enable/disable for SNTP

◆ da16xxx_socket_status_t

enum da16xxx_socket_status_t
DA16XXX Wifi socket status types

◆ da16xxx_socket_rw

enum da16xxx_socket_rw
DA16XXX socket shutdown channels

◆ da16xxx_recv_state

enum da16xxx_recv_state
DA16XXX socket receive state

◆ wifi_da16xxx_sntp_daylight_savings_enable_t

enum wifi_da16xxx_sntp_daylight_savings_enable_t
DA16XXX WiFi module enable/disable for SNTP Daylight

Function Documentation

◆ RM_WIFI_DA16XXX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_DA16XXX_SntpServerIpAddressSet (uint8_t * *p_server_ip_addr*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_server_ip_addr	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_ASSERTION	The parameter p_server_ip_addr is NULL.

Update the SNTP Server IP Address

◆ RM_WIFI_DA16XXX_SntpEnableSet()

fsp_err_t RM_WIFI_DA16XXX_SntpEnableSet (wifi_da16xxx_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Flag to indicate enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_DA16XXX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_DA16XXX_SntpTimeZoneSet (int *utc_offset_in_hours*, uint32_t *minutes*, wifi_da16xxx_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	utc_offset_in_hours	Timezone in UTC offset in hours
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

◆ RM_WIFI_DA16XXX_LocalTimeGet()

fsp_err_t RM_WIFI_DA16XXX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: YYYY-MM-DD,HOUR:MIN:SECS

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_DA16XXX_GenericAtSendRcv()

fsp_err_t RM_WIFI_DA16XXX_GenericAtSendRcv (char const *const *at_string*, char *const *response_buffer*, uint32_t *length*)

Sends any AT command compatible with the DA16XXX module. Provide optional buffer to receive the response.

Parameters

[in]	at_string	Input AT command string from the user.
[in]	response_buffer	Optional buffer for receiving the response.
[in]	length	Size of optional buffer.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Input was not a valid AT command.

Send a generic AT command to the DA16XXX and optionally receive a response

5.2.12.33 WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

	minutes, wifi_onchip_silex_sntp_daylight_savings_enable_t daylightSavingsEnable)

Detailed Description

Wifi and Socket implementation using the Silex SX-ULPGN WiFi module on RA MCUs.

Overview

This Middleware module supplies an implementation for the FreeRTOS WiFi interface and AzureRTOS NetxDuo WiFi interface using the Silex SX-ULPGN module.

You can find specifics about the WiFi and Secure Socket interface APIs supported by this module at these web sites: Wifi API.

The SX-ULPGN is a low-power, compact IEEE 802.11b/g/n 2.4GHz 1x1 Wireless LAN module equipped with the Qualcomm® QCA4010 Wireless SOC. The module comes readily equipped with radio certification for Japan, North America and Europe. More information about this module can be found at the Silex Web Site

Features

The WiFi Onchip Silex Middleware driver supplies these features:

- Supports connect/disconnect to a b/g/n (2.4GHz) WiFi Access Point using Open, WPA, and WPA2 security. Encryption types can be either TKIP, or CCMP(AES).
- Supports retrieval of the module device MAC address.
- Once connected you can acquire the assigned module device IP.
- Supports a WiFi network scan capability to get a list of local Access Points.
- Supports a Ping function to test network connectivity.
- Supports a DNS Query call to retrieve the IPv4 address of a supplied URL.
- Supports both TCP and UDP client sockets.
- Drive supports 1 or 2 UARTs for interfacing with the SX-ULPGN module. The second UART is considered optional.

Configuration

Build Time Configurations for rm_wifi_onchip_silex

The following build time configurations are defined in fsp_cfg/rm_wifi_onchip_silex_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Number of supported socket instances	Refer to the RA Configuration tool for available options.	1	Enable number of socket instances
Size of RX buffer for socket	Manual Entry	4096	

Size of TX buffer for CMD Port	Manual Entry	1500	
Size of RX buffer for CMD Port	Manual Entry	3000	
Semaphore maximum timeout	Manual Entry	10000	
Number of retries for AT commands	Manual Entry	10	
Module Reset Port	Refer to the RA Configuration tool for available options.	06	Specify the module reset pin port for the MCU.
Module Reset Pin	Refer to the RA Configuration tool for available options.	03	Specify the module reset pin for the MCU.
Enable SNTP Client	• Enabled • Disabled	Disabled	Should the SNTP client of the module be enabled

Configurations for Networking > WiFi Onchip Silex Driver using UART (rm_wifi_onchip_silex)

Configuration	Options	Default	Description
SNTP server IPv4 address	Must be a valid IPv4 address	0.0.0.0	
SNTP Timezone Offset from UTC Hours	Must be between 12 and -12 hours	0	Value in hours from 12 to -12
SNTP Timezone Offset from UTC Minutes	Must be between 0 and 59 minutes	0	Value in minutes from 0 to 59
Use Daylight Savings Time	• Enabled • Disabled	Disabled	Specify if daytime savings should be used for local time calulation

Note: It is suggested that when using the Silex Module that DTC and FIFO are enabled in the UART configuration to facilitate a more reliable data transfer between module and MCU.

Note: If you wish to use flow control then you must enable flow control in the RA Configuration editor. This can be found in the UART setting. It is advantageous to use flow control all the time since it allows the hardware to gate the flow of data across the serial bus. Without hardware flow control for faster data rate you will most likely see an overflow condition between MCU and the module device.

Note: Higher baud rates are supported in the RA Configuration editor and should be changed in the first UART configuration. There is no need to change the second UART baud rate since it is only used as an AT command channel.

Note: It is a good idea to also enable the FIFO in the UART configuration settings if you plan to use higher baud rates.

Interrupt Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex).

Clock Configuration

Refer to UART (r_sci_uart).

Pin Configuration

Refer to UART (r_sci_uart). R_SCI_UART_Open() is called by WiFi Onchip Silex Driver using r_sci_uart (rm_wifi_onchip_silex)

Usage Notes

Limitations

- WiFi AP connections do not currently support WEP security.
- When operating with a single UART only single socket connections are possible. To support multiple sockets two UART channels must be connected to the module. When using the Renesas-provided SX-ULPGN PMOD board the second UART channel is on pins 9 and 10 of the PMOD header.
- Network connection parameters SSID and Passphrase for the Access Point can not contain any commas. This is a current limitation of the Silex module firmware. The rm_wifi_onchip_silex_connect() function will return an error if a comma is detected.
- When operating with a single UART and there is an active socket connection you cannot call WIFI_Scan(), WIFI_Ping(), WIFI_GetMAC(), or WIFI_GetIPInfo(). Calling one of these function will return an error code in this situation. These commands are blocked in the one UART case during an active socket connection because they could cause data loss. To avoid this limitation please configure the hardware to use both UARTs.
- The Silex WiFi modules SNTP support requires all configuration changes to made when the WiFi is disconnected from an Access Point. This is a limitation of the Silex module firmware. If changes to the default SNTP settings are required then the application will have to close the current AP connection, make the necessary SNTP changes, and then re-establish the original connection.

Examples

Basic Example

This is a basic example of minimal use of WiFi Middleware in an application.

```
void wifi_onchip_basic_example (void)
{
 WIFIReturnCode_t wifi_err;
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucChannel                  = 0,
```

```
      .xPassword.xWPA.cPassphrase = "password",
      .ucSSID                     = "access_point_ssid",
      .xPassword.xWPA.ucLength = 8,
      .ucSSIDLength            = 17,
      .xSecurity               = eWiFiSecurityWPA2,
   };
   memset(scan_data, 0, sizeof(WIFIScanResult_t) * MAX_WIFI_SCAN_RESULTS);
   memset(g_socket_recv_buffer, 0, sizeof(uint8_t) * SX_WIFI_SOCKET_RX_BUFFER_SIZE);
/* Open connection to the Wifi Module */
   wifi_err = WIFI_On();
   assert(eWiFiSuccess == wifi_err);
/* Connect to the Access Point */
   wifi_err = WIFI_ConnectAP(&net_params);
   assert(eWiFiSuccess == wifi_err);
/* Get address assigned by AP */
WIFIIPConfiguration_t ipInfo;
   wifi_err = WIFI_GetIPInfo(&ipInfo);
   assert(eWiFiSuccess == wifi_err);
/* Ping an address accessible on the network */
   uint8_t       ip_address[4] = {216, 58, 194, 174}; // NOLINT
const uint16_t ping_count    = 3;
const uint32_t intervalMS    = 100;
   wifi_err = WIFI_Ping(&ip_address[0], ping_count, intervalMS);
   assert(eWiFiSuccess == wifi_err);
/* Scan the local Wifi network for other APs */
   wifi_err = WIFI_Scan(&scan_data[0], MAX_WIFI_SCAN_RESULTS);
   assert(eWiFiSuccess == wifi_err);
/* Shutdown the WIFI */
WIFI_Off();
}
```

SNTP example

An example of using Simple Network Time Protocol (SNTP) on WiFi in an application.

```
#define RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE (64)
/*
 * Example of the use of SNTP with Wifi. Example gets the epoch time and local
 * system time strings. It is also demonstrated how the user will need to disconnect
 * from the access point to make changes to the SNTP configuration during runtime.
 *
 * Function assumes that the SNTP has been enabled and configured with proper
 * SNTP server address. For brevity error checking has not been implemented.
 *
 */
void wifi_onchip_sntp_example (void)
{
 /* Setup Access Point connection parameters */
 WIFINetworkParams_t net_params =
    {
       .ucSSID                   = "access_point_ssid",
       .ucSSIDLength             = 17,
       .xPassword.xWPA.cPassphrase = "password",
       .xPassword.xWPA.ucLength    = 8,
       .ucChannel                = 0,
       .xSecurity                = eWiFiSecurityWPA2
    };
    uint8_t local_time[RM_WIFI_ONCHIP_SILEX_TEMP_BUFFER_SIZE];
    time_t current_sys_time = 0;
 // SNTP IP address
    uint8_t ip_address_sntp_server_valid[4] = {216, 239, 35, 0}; // NOLINT : Static
IP address
    memset(local_time, 0, sizeof(local_time));
 /* Open connection to the Wifi Module */
 WIFI_On();
 /* Connect to the Access Point */
 WIFI_ConnectAP(&net_params);
 /* Get the Epoch time in seconds since Jan 1, 1970 UTC */
 RM_WIFI_ONCHIP_SILEX_EpochTimeGet(&current_sys_time);
```

```
 /* Get the local time string */
 RM_WIFI_ONCHIP_SILEX_LocalTimeGet((uint8_t *) local_time, sizeof(local_time));
 /* Disconnect from the access point to make changes to the SNTP configuration */
 WIFI_Disconnect();
 /* Change the IP address of the server */

Data Structure Documentation

◆ wifi_onchip_silex_cfg_t

struct wifi_onchip_silex_cfg_t		
User configuration structure, used in open function		
Data Fields		
const uint32_t	num_uarts	Number of UART interfaces to use.
const uint32_t	num_sockets	Number of sockets to initialize.
const bsp_io_port_pin_t	reset_pin	Reset pin used for module.
const uart_instance_t *	uart_instances[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	SCI UART instances.
const wifi_onchip_silex_sntp_enable_t	sntp_enabled	Enable/Disable the SNTP Client.
const uint8_t *	sntp_server_ip	The SNTP server IP address string.
const int32_t	sntp_timezone_offset_from_utc_hours	Timezone offset from UTC in (+/-) hours.
const uint32_t	sntp_timezone_offset_from_utc_minutes	Timezone offset from UTC in minutes.
const wifi_onchip_silex_sntp_daylight_savings_enable_t	sntp_timezone_use_daylight_savings	Enable/Disable use of daylight saving time.
void *	p_context	User defined context passed into callback function.
void const *	p_extend	Pointer to extended configuration by instance of interface.

◆ ulpgn_socket_t

struct ulpgn_socket_t		
Silex ULPGN Wifi internal socket instance structure		
Data Fields		
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
uint8_t	socket_recv_buff[WIFI_ONCHIP_SILEX_CFG_MAX_SOCKET_RX_SIZE]	Socket receive buffer used by byte queue.
uint32_t	socket_status	Current socket status.

uint32_t	socket_recv_error_count	Socket receive error count.
uint32_t	socket_create_flag	Flag to determine in socket has been created.
uint32_t	socket_read_write_flag	flag to determine if read and/or write channels are active.

◆ wifi_onchip_silex_instance_ctrl_t

struct wifi_onchip_silex_instance_ctrl_t		
WIFI_ONCHIP_SILEX private control block. DO NOT MODIFY.		
Data Fields		
uint32_t	open	Flag to indicate if wifi instance has been initialized.
wifi_onchip_silex_cfg_t const *	p_wifi_onchip_silex_cfg	Pointer to initial configurations.
bsp_io_port_pin_t	reset_pin	Wifi module reset pin.
uint32_t	num_uarts	number of UARTS currently used for communication with module
uint32_t	tx_data_size	Size of the data to send.
uint32_t	num_creatable_sockets	Number of simultaneous sockets supported.
uint32_t	curr_cmd_port	Current UART instance index for AT commands.
uint32_t	curr_data_port	Current UART instance index for data.
uint8_t	cmd_rx_queue_buf[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command port receive buffer used by byte queue // FreeRTOS.
StreamBufferHandle_t	socket_byteq_hdl	Socket stream buffer handle.
StaticStreamBuffer_t	socket_byteq_struct	Structure to hold stream buffer info.
volatile uint32_t	curr_socket_index	Currently active socket instance.
uint8_t	cmd_tx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_TX_BUF_SIZE]	Command send buffer.
uint8_t	cmd_rx_buff[WIFI_ONCHIP_SILEX_CFG_CMD_RX_BUF_SIZE]	Command receive buffer.
uint32_t	at_cmd_mode	Current command mode.
uint8_t	curr_ipaddr[4]	Current IP address of module.
uint8_t	curr_subnetmask[4]	Current Subnet Mask of module.

uint8_t	curr_gateway[4]	Current GAteway of module.
SemaphoreHandle_t	tx_sem	Transmit binary semaphore handle.
SemaphoreHandle_t	rx_sem	Receive binary semaphore handle.
uint8_t	last_data[WIFI_ONCHIP_SILEX_RETURN_TEXT_LENGTH]	Tailing buffer used for command parser.
uart_instance_t *	uart_instance_objects[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART instance objects.
SemaphoreHandle_t	uart_tei_sem[WIFI_ONCHIP_SILEX_CFG_MAX_NUMBER_UART_PORTS]	UART transmission end binary semaphore.
ulpgn_socket_t	sockets[WIFI_ONCHIP_SILEX_CFG_NUM_CREATEABLE_SOCKETS]	Internal socket instances.

Enumeration Type Documentation

◆ sx_ulpgn_socket_status_t

enum sx_ulpgn_socket_status_t
Silex ULPGN Wifi socket status types

◆ sx_ulpgn_socket_rw

enum sx_ulpgn_socket_rw
Silex socket shutdown channels

◆ wifi_onchip_silex_sntp_enable_t

enum wifi_onchip_silex_sntp_enable_t
Silex WiFi module enable/disable for SNTP

◆ wifi_onchip_silex_sntp_daylight_savings_enable_t

enum wifi_onchip_silex_sntp_daylight_savings_enable_t
Silex WiFi module enable/disable for SNTP

Function Documentation

◆ rm_wifi_onchip_silex_open()

fsp_err_t rm_wifi_onchip_silex_open (wifi_onchip_silex_cfg_t const *const *p_cfg*)

Opens and configures the WIFI_ONCHIP_SILEX Middleware module.

Parameters

[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX successfully configured.
FSP_ERR_ASSERTION	The parameter p_cfg or p_instance_ctrl is NULL.
FSP_ERR_OUT_OF_MEMORY	There is no more heap memory available.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ rm_wifi_onchip_silex_close()

fsp_err_t rm_wifi_onchip_silex_close ( )

Disables WIFI_ONCHIP_SILEX.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX closed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_disconnect()

fsp_err_t rm_wifi_onchip_silex_disconnect ( )

Disconnects from connected AP.

Return values

FSP_SUCCESS	WIFI_ONCHIP_SILEX disconnected successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

◆ rm_wifi_onchip_silex_socket_connected()

fsp_err_t rm_wifi_onchip_silex_socket_connected (fsp_err_t * *p_status*)

Check if a specific socket instance is connected.

Parameters

[out]	p_status	Pointer to integer holding the socket connection status.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_status is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

◆ rm_wifi_onchip_silex_network_info_get()

fsp_err_t rm_wifi_onchip_silex_network_info_get (uint32_t * *p_ip_addr*, uint32_t * *p_subnet_mask*, uint32_t * *p_gateway*)

Return the network information for the connection to the access point.

Parameters

[out]	p_ip_addr	Pointer to integer holding the IP address.
[out]	p_subnet_mask	Pointer to integer holding the subnet mask.
[out]	p_gateway	Pointer to integer holding the gateway.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	A parameter pointer is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_AP_NOT_CONNECTED	No connection to access point has happened.

◆ rm_wifi_onchip_silex_connect()

fsp_err_t rm_wifi_onchip_silex_connect (const char * *p_ssid*, WIFISecurity_t *security*, const char * *p_passphrase*)

Connects to the specified Wifi Access Point.

Parameters

[in]	p_ssid	Pointer to SSID of Wifi Access Point.
[in]	security	Security type to use for connection.
[in]	p_passphrase	Pointer to the passphrase to use for connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ssid or p_passphrase is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	No commas are accepted in the SSID or Passphrase.

◆ rm_wifi_onchip_silex_mac_addr_get()

fsp_err_t rm_wifi_onchip_silex_mac_addr_get (uint8_t * *p_macaddr*)

Get MAC address.

Parameters

[out]	p_macaddr	Pointer array to hold mac address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_macaddr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_scan()

fsp_err_t rm_wifi_onchip_silex_scan (WIFIScanResult_t * *p_results*, uint32_t *maxNetworks*)

Get the information about local Wifi Access Points.

Parameters

[out]	p_results	Pointer to a structure array holding scanned Access Points.
[in]	maxNetworks	Size of the structure array for holding APs.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_results or p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ping()

fsp_err_t rm_wifi_onchip_silex_ping (uint8_t * *p_ip_addr*, uint32_t *count*, uint32_t *interval_ms*)

Ping an IP address on the network.

Parameters

[in]	p_ip_addr	Pointer to IP address array.
[in]	count	Number of pings to attempt.
[in]	interval_ms	Interval between ping attempts.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_ip_addr_get()

fsp_err_t rm_wifi_onchip_silex_ip_addr_get (uint32_t * *p_ip_addr*)

Get the assigned module IP address.

Parameters

[out]	p_ip_addr	Pointer an array to hold the IP address.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The parameter p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_avail_socket_get()

fsp_err_t rm_wifi_onchip_silex_avail_socket_get (uint32_t * *p_socket_id*)

Get the next available socket ID.

Parameters

[out]	p_socket_id	Pointer to an integer to hold the socket ID.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_socket_id is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_WIFI_FAILED	Error occurred in the execution of this function

◆ rm_wifi_onchip_silex_socket_status_get()

fsp_err_t rm_wifi_onchip_silex_socket_status_get (uint32_t *socket_no*, uint32_t * *p_socket_status*)

Get the socket status.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_socket_status	Pointer to an integer to hold the socket status

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl or p_socket_status is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_shutdown()

int32_t rm_wifi_onchip_silex_tcp_shutdown (uint32_t *socket_no*, uint32_t *shutdown_channels*)

Shutdown portion of a socket

Parameters

[in]	socket_no	Socket ID number.
[in]	shutdown_channels	Specify if read or write channel is shutdown for socket

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_ASSERTION	The parameter p_instance_ctrl is NULL. The value of socket_no is greater than/equal num_creatable_sockets.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_socket_create()

fsp_err_t rm_wifi_onchip_silex_socket_create (uint32_t *socket_no*, uint32_t *type*, uint32_t *ipversion*)

Create a new socket instance.

Parameters

[in]	socket_no	Socket ID number.
[in]	type	Socket type.
[in]	ipversion	Socket IP type.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_tcp_connect()

fsp_err_t rm_wifi_onchip_silex_tcp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*)

Connect to a specific IP and Port using socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection.
[in]	port	Port number for socket connection.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_udp_connect()

fsp_err_t rm_wifi_onchip_silex_udp_connect (uint32_t *socket_no*, uint32_t *ipaddr*, uint32_t *port*, uint32_t *type*)

Connect to a specific IP and Port using UDP socket.

Parameters

[in]	socket_no	Socket ID number.
[in]	ipaddr	IP address for socket connection. 0 if type is server.
[in]	port	Port number for socket connection.
[in]	type	Type of UDP connection. Can be client or server.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_send()

int32_t rm_wifi_onchip_silex_send (uint32_t *socket_no*, const uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Send data over TCP to a server.

Parameters

[in]	socket_no	Socket ID number.
[in]	p_data	Pointer to data to send.
[in]	length	Length of data to send.
[in]	timeout_ms	Timeout to wait for transmit end event

Return values

FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.

◆ rm_wifi_onchip_silex_recv()

int32_t rm_wifi_onchip_silex_recv (uint32_t *socket_no*, uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Receive data over TCP from a server.

Parameters

[in]	socket_no	Socket ID number.
[out]	p_data	Pointer to data received from socket.
[in]	length	Length of data array used for receive.
[in]	timeout_ms	Timeout to wait for data to be received from socket.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_ASSERTION	The p_instance_ctrl or parameter p_data is NULL.

◆ rm_wifi_onchip_silex_socket_disconnect()

fsp_err_t rm_wifi_onchip_silex_socket_disconnect (uint32_t *socket_no*)

Disconnect a specific socket connection.

Parameters

[in]	socket_no	Socket ID to disconnect

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	Bad parameter value was passed into function.

◆ rm_wifi_onchip_silex_dns_query()

fsp_err_t rm_wifi_onchip_silex_dns_query (const char * *p_textstring*, uint8_t * *p_ip_addr*)

Initiate a DNS lookup for a given URL.

Parameters

[in]	p_textstring	Pointer to array holding URL to query from DNS.
[out]	p_ip_addr	Pointer to IP address returned from look up.

Return values

FSP_SUCCESS	Function completed successfully.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_ASSERTION	The p_instance_ctrl, p_textstring, p_ip_addr is NULL.
FSP_ERR_NOT_OPEN	The instance has not been opened.
FSP_ERR_INVALID_ARGUMENT	The URL passed in is to long.

◆ RM_WIFI_ONCHIP_SILEX_EpochTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_EpochTimeGet (time_t * *p_utc_time*)

This will retrieve time info from an NTP server at the address entered via an during configuration. If the server isn't set or the client isn't enabled, then it will return an error. The date/time is retrieved as the number of seconds since 00:00:00 UTC January 1, 1970

Parameters

[out]	p_utc_time	Returns the epoch time in seconds.

Return values

FSP_SUCCESS	Successfully retrieved the system time from module.
FSP_ERR_ASSERTION	The parameter utc_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Get the current system time as the number of seconds since epoch 1970-01-01 00:00:00 UTC

◆ RM_WIFI_ONCHIP_SILEX_LocalTimeGet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_LocalTimeGet (uint8_t * *p_local_time*, uint32_t *size_string*)

Get the current local time based on current timezone in a string . Exp: Wed Oct 15 1975 07:06:00

Parameters

[out]	p_local_time	Returns local time in string format.
[in]	size_string	Size of p_local_time string buffer.The size of this string needs to be at least 25 bytes

Return values

FSP_SUCCESS	Successfully returned the local time string.
FSP_ERR_ASSERTION	The parameter local_time or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	String size value passed in exceeds maximum.

Get the current local time based on current timezone in a string format

◆ RM_WIFI_ONCHIP_SILEX_SntpEnableSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpEnableSet (wifi_onchip_silex_sntp_enable_t *enable*)

Set the SNTP Client to Enable or Disable

Parameters

[in]	enable	Can be set to enable/disable for SNTP support.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Enable or Disable the SNTP Client Service

◆ RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpServerIpAddressSet (uint8_t * *p_ip_address*)

Set the SNTP Client Server IP Address

Parameters

[in]	p_ip_address	Pointer to IP address of SNTP server in byte array format.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_ASSERTION	The parameter p_ip_address or p_instance_ctrl is NULL.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.

Update the SNTP Server IP Address

◆ RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet()

fsp_err_t RM_WIFI_ONCHIP_SILEX_SntpTimeZoneSet (int32_t *hours*, uint32_t *minutes*, wifi_onchip_silex_sntp_daylight_savings_enable_t *daylightSavingsEnable*)

Set the SNTP Client Timezone

Parameters

[in]	hours	Number of hours (+/-) used for timezone offset from GMT.
[in]	minutes	Number of minutes used for timezone offset from GMT.
[in]	daylightSavingsEnable	Enable/Disable daylight saving in the timezone calculation.

Return values

FSP_SUCCESS	Successfully set the value.
FSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_ARGUMENT	Parameter passed into function was invalid.

Update the SNTP Timezone

5.2.12.34 gPTP Baremetal Porting Layer (rm_gptp_sys_baremetal)

Modules » Networking

Overview

This module provides system timer feature for baremetal.

Features

This porting layer includes the following features.

- Timer

5.2.12.35 gPTP Ethernet Switch Module(rm_gptp_eswm)

Modules » Networking

Overview

This module provides time synchronization based on the standard IEEE 802.1AS-2020.

Features

- Clock Source selection according to Best Master Clock Algorithm (BMCA)
- Time Aware Endstation
  - Clock Source (Synchronization Master)
  - Clock Sink (Synchronization Slave)

Usage Notes

Limitations

The supported clock are 200/250 MHz for ESW clock and 25MHz for ETHPHY clock.

Examples

Baremetal Example

This is a example of minimal use of the gPTP Ethernet switch module in the baremetal application.

```
void rm_gptp_eswm_baremetal_example (void)
{
 fsp_err_t err;
 /* Initialize gPTP ESWM module. */
    err = rm_gptp_eswm_init(&g_gptp_eswm0_ctrl, &g_gptp_eswm0_cfg);
    assert(FSP_SUCCESS == err);
 while (1)
    {
 /* Read a gPTP packet. */
       gptp_read();
 /* Check timer expired. */
       gptp_timer_check();
 /* Send a gPTP packet. */
       gptp_send();
 /* Detect timer counts. */
 while (!(gptp_detect_count()))
```

```
      {
            ;
       }
    }
}
```

FreeRTOS Example

This is a example of minimal use of the gPTP Ethernet switch module in the freertos application.

```
void rm_gptp_eswm_freertos_example (void)
{
 fsp_err_t err;
 /* Initialize gPTP ESWM module. */
    err = rm_gptp_eswm_init(&g_gptp_eswm0_ctrl, &g_gptp_eswm0_cfg);
    assert(FSP_SUCCESS == err);
 /* Create ptp task. */
    rm_gptp_sys_freertos_create_ptp_task(g_gptp_eswm0_ctrl.p_cfg->p_gptp_sys_port_ins
tance->p_ctrl);
 /* Create ptp message generation task. */
    rm_gptp_sys_freertos_create_ptp_message_gen_task(g_gptp_eswm0_ctrl.p_cfg->p_gptp_
sys_port_instance->p_ctrl);
 /* Create ptp read task. */
    rm_gptp_sys_freertos_create_ptp_read_task(g_gptp_eswm0_ctrl.p_cfg->p_gptp_sys_por
t_instance->p_ctrl);
 while (1)
    {
       vTaskDelay(1);
    }
}
```

Configuration API

The configuration application programming interface (configuration-api) can be used to change dedicated functions of the synchronization software stack during runtime. The interface has the following functions and is located in module r_ptp_configuration_api:

Function name	Brief description
set_priority1	Set the priority 1 value for the PTP instance
set_priority2	Set the priority 2 value for the PTP instance
set_domain_number	Set the domain number for the PTP instance
set_instance_enable	Enable or disable a PTP instance
set_enable_ptp_port	Enable a port for PTP
set_delay_mechanism	Set a delay mechanism for a PTP port
set_mean_link_delay_threshold	Set the mean link delay threshold for a PTP port
set_mgt_settable_log_announce_interval	Set the log announce message interval for a PTP port
set_use_mgt_settable_log_announce_interval	Use the settable log announce message interval for a PTP port
set_announce_receipt _timeout	Set the announce receipt timeout value for a PTP port
set_initial_log_sync_interval	Set the initial log sync interval
set_mgt_settable_log_sync_interval	Set the log sync message interval for a PTP port
set_use_mgt_settale_log_sync_interval	Use the settable log sync message interval for a PTP port
set_sync_receipt _timeout	Set the sync receipt timeout value for a PTP port
set_initial_log_pdelay_req_interval	Set the initial log Pdelay request interval
set_use_mgt_settable_log_pdelay_req_interval	Use the managementt settable log pdelay request intervalfor a PTP port
set_mgt_settable_log_pdelay_req_interval	Set the log Pdelay request interval for a PTP port
set_allowed_lost_responses	Set the number of allowed lost Pdelay responses for a PTP port
set_initial_log_gptp_capable_message_ineterval	Set the initial log gptp capable message interval
set_use_mgt_settable_log_gptp_capable_message_interval	Use the management settable log gptp capable message interval for a PTP port
set_mgt_settable_log_gptp_capable_message_interval	Set the management settable log gptp capable message interval
set_time_value	Set the management settable log gptp capable message interval

Diagnosis API

The diagnosis application programming interface (diagnosis-api) can be used to monitor dedicated functions of the synchronization software stack. The interface has the following functions and is located at r_ptp_diagnosis_api:

Function name	Brief description

get_clock_class	Get the clock class value for a PTP instance
get_clock_accuracy	Get the clock accuracy value for a PTP instance
get_offset_scaled_log_variance	Get the offset scaled log variance value for a PTP instance
get_priority1	Get the priority 1 value for a PTP instance
get_priority2	Get the priority 2 value for a PTP instance
get_domain_number	Get the domain number value for a PTP instance
get_offset_from_master	Get the current offset from master for a PTP instance
get_cumulative_rate_ratio	Get the cumulative rate ratio value for a PTP instance
get_grandmaster_clock_class	Get the grandmaster clock class value for a PTP instance
get_grandmaster_clock_accuracy	Get the grandmaster clock accuracy value for a PTP instance
get_grandmaster_offset_scaled_log_variance	Get_the grandmaster offset scaled log variance value for a PTP instance
get_grandmaster_priority1	Get the grandmaster priority1 value for a PTP instance
get_grandmaster_priority2	Get the grandmaster priority2 value for a PTP instance
get_ptp_port_enabled	Get the PTP port enabled status for a PTP port
get_delay_measurement	Get the delay measurement method for a PTP port
get_mean_link_delay_threshold	Get the mean link delay threshold value for a PTP port
get_mean_link_delay_threshold	Get the initial log announce interval value for a PTP port
get_current_log_announce_interval	Get the current log announce interval value for a PTP port
get_use_mgt_settable_log_announce_interval	Get the management settable log announce interval use status for a PTP port
get_announce_receipt_timeout	Get the announce receipt timeout value for a PTP port
get_initial_log_sync_interval	Get the initial log sync interval value for a PTP port
get_initial_log_sync_interval	Get the current log sync interval value for a PTP port
get_use_mgt_settable_log_sync_interval	Get the management settable log sync interval use state for a PTP port

get_sync_receipt_timeout	Get the sync receipt timeout value for a PTP port
get_initial_log_pdelay_req_interval	Get the initial log Pdelay request interval value
get_current_log_pdelay_req_interval	Get the current log Pdelay request interval value
get_use_mgt_settable_log_pdelay_req_interval	Get the management settable log Pdelay request interval use status value for a PTP port
get_allowed_lost_responses	Get the value of allowed lost Pdelay responses for a PTP port
get_initial_log_gptp_capable_message_interval	Get the initial log gptp capable signaling message interval
get_current_log_gptp_capable_message_interval	Get the current gptp capable signaling message interval
get_use_mgt_settable_log_gptp_capable_messag_interval	Get the management settable log gptp capable message interval use state
get_mgt_settable_log_gptp_capble_message_interval	Get the management settable log gptp capable message interval
get_cmlds_link_port_enable	Get the cmlds link port enable status for a PTP port
get_rx_sync_count	Get the counter value for received Sync messages for a PTP port
get_rx_one_step_sync_count	Get the counter value for received one step Sync messages for a PTP port
get_rx_follow_up_count	Get the counter value for received Follow-Up messages for a PTP port
get_rx_pdelay_request_count	Get the counter value for received Pdelay request messages for a PTP port
get_rx_pdelay_resp_count	Get the counter value for received Pdelay response messages for a PTP port
get_rx_pdelay_resp_fu_count	Get the counter value for received Pdelay response follow up messages for a PTP port
get_rx_announce_count	Get the counter value for received Announce messages for a PTP port
get_rx_packet_discard_count	Get the counter value for discarded PTP packets for a PTP port
get_sync_receipt_timeout_count	Get the counter value for Sync receipt timeouts for a PTP port
get_announce_receipt_timeout_count	Get the counter value for Announce receipt timeouts for a PTP port
get_pdelay_allowed_lost_responses_exceeded_count	Get the counter value for lost responses exceeded for a PTP port
get_sync_tx_count	Get the counter value for transmitted Sync messages for a PTP port

get_tx_one_step_sync_count	Get the counter value for transmitted one step Sync messages for a PTP port
get_tx_follow_up_count	Get the counter value for transmitted Follow-Up messages for a PTP port
get_tx_pdelay_request_count	Get the counter value for transmitted Pdelay request messages for a PTP port
get_tx_Pdelay_response_count	Get the counter value for transmitted Pdelay response messages for a PTP port
get_tx_Pdelay_response_follow_up_count	Get the counter value for transmitted Pdelay response follow up messages for a PTP port
get_tx_announce_count	Get the counter value for transmitted Announce messages for a PTP port
get_cmlds_rx_pdelay_request_count	Get the counter value for received Pdelay request messages with CMLDS tag for a PTP port
get_cmlds_rx_pdelay_response_count	Get the counter value for received Pdelay response messages with CMLDS tag for a PTP port
get_cmlds_rx_pdelay_response_fu_count	Get the counter value for received Pdelay response follow up messages with CMLDS tag for a PTP port
get_cmlds_rx_ptp_packet_discard_count	Get the counter value for discarded PTP packetes with CMLDS tag for a PTP port
get_cmlds_pdelay_allowed_lost_responses_exceeded_count	Get the counter value for lost responses exceeded with CMLDS tag for a PTP port
get_cmlds_tx_pdelay_request_count	Get the counter value for transmitted Pdelay request messages with CMLDS tag for a PTP port
get_cmlds_tx_pdelay_response_count	Get the counter value for transmitted Pdelay response messages with CMLDS tag for a PTP port
get_cmlds_tx_pdelay_response_fu_count	Get the counter value for transmitted Pdelay response follow up messages with CMLDS tag for a PTP port
get_time_value	Get the current time value of the timer (PTP clock)

5.2.12.36 gPTP FreeRTOS Porting Layer (rm_gptp_sys_freertos)

Modules » Networking

Overview

This module provides a gPTP porting layer for FreeRTOS.

Features

This porting layer includes the following features.

- Support PTP task
- Support message generation task
- Support read task

5.2.12.37 lwIP Baremetal Porting Layer (rm_lwip_sys_baremetal)

Modules » Networking

Overview

This module provides system timer feature for baremetal.

Please refer to the lwIP documentation for further details.

Features

This porting layer includes the following features.

- Timer
- Critical sections
- Compiler/Platform abstraction.

5.2.12.38 lwIP Ethernet Driver (rm_lwip_ether)

Modules » Networking

Functions

err_t	rm_lwip_ether_init (struct netif *p_netif)
void	rm_lwip_ether_callback (ether_callback_args_t *p_args)

Detailed Description

Overview

This module provides a lwIP driver that is implemented using the Ethernet Interface.

Please refer to the lwIP documentation for further details.

Features

- Packet Types Supported
  - ARP
  - IPv4
  - IPv6
- UDP (User Datagram Protocol) including experimental UDP-lite extensions
- TCP (Transmission Control Protocol) with congestion control, RTT estimation fast recovery/fast retransmit and sending SACKs
- raw/native API for enhanced performance
- Link status callback

Configuration

Configurations for Networking > lwIP Wrapper to (rm_lwip_ether)

Configuration	Options	Default	Description
RTOS			
RX thread stacksize	Must be a positive integer	1024	Stack size of RX thread.
RX thread priority	Must be a positive integer	4	Priority of RX thread.
Name	Name must be a valid C symbol	g_lwip_ether0	Module name.
MTU	Must be an integer from 576 to 1500	1500	MTU size.
Netif flags	• UP • BROADCAST • LINK_UP • ETHARP • ETHERNET • IGMP • MLD6	• BROADCAST • ETHARP	Flags representing the capabilities of the Ethernet device
Zero-copy mode	• Disable • Enable	Disable	Enable or disable zero-copy mode.
RX buffer pool size	Must be a positive integer	10	Buffer pool size for zero-copy RX.
Link check interval	Must be a positive integer	100	Interval for checking link status.
Callback for Ethernet events	Name must be a valid C symbol	NULL	Callback provided when an Ethernet events occurs

Usage Notes

Limitations

Examples

Basic Example

This is a basic example of minimal use of the lwIP Ether Driver in an application.

```
#include "lwip/tcp.h"
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#define LWIP_EXAMPLE_PORT_NUMBER 9000
/* TCP callback functions. */
static err_t lwip_example_connected_callback(void * arg, struct tcp_pcb * tpcb, err_t
err);
err_t       lwip_example_sent_callback(void * arg, struct tcp_pcb * tpcb, u16_t len);
err_t       lwip_example_recv_callback(void * arg, struct tcp_pcb * tpcb, struct pbuf
* p, err_t err);

    }
 return ERR_OK;
}
```

Function Documentation

◆ rm_lwip_ether_init()

err_t rm_lwip_ether_init (struct netif * *p_netif*)
Initialize ethernet hardware and lwIP network interface. This function is passed to netif_add()

◆ rm_lwip_ether_callback()

void rm_lwip_ether_callback (ether_callback_args_t * *p_args*)
Callback of Ethernet interrupt subroutine. This function is set to ethernet driver callback by configurator.

5.2.12.39 lwIP FreeRTOS Porting Layer (rm_lwip_sys_freertos)

Modules » Networking

Overview

This module provides a lwIP porting layer for FreeRTOS.

Please refer to the lwIP documentation for further details.

Features

This porting layer includes the following features.

- Compiler/Platform abstraction.

All other features of FreeRTOS porting layer are provided by the lwIP library.

5.2.12.40 lwIP HTTP Server

Modules » Networking

This module provides the lwIP HTTP Server integration documentation.

Overview

The LwIP HTTP Server library can be used to respond HTTP request. The documentation for the library can be found at the following link: lwIPServer.

Features

The LwIP HTTP Server:

- Can respond from HTTP GET and POST requests.
- Supports Server-Side Includes (SSI) and Common Gateway Interface (CGI).
- Can set up TLS connection handling (HTTPS).

Configuration

Build Time Configurations for Source

The following build time configurations are defined in lwip/lwip/apps/httpd_opts.h:

Configuration	Options	Default	Description
LwIP HTTPD CGI (old style)	• Enabled • Disabled	Disabled	Enable CGI support (old style). Use this CGI type e.g. to execute specific actions and return a page that does not depend on the CGI parameters.
LwIP HTTPD CGI SSI (new style)	• Enabled • Disabled	Disabled	Enable CGI support with SSI feature (new style). Use this CGI handler if you want CGI information passed on to SSI.
LwIP HTTPD SSI	• Enabled • Disabled	Disabled	Enable SSI support (Server-Side-Includes).
LwIP HTTPD SSI Raw	• Enabled • Disabled	Disabled	Enable to implement an SSI tag handler callback that gets a const char* to the tag (instead of an index into a pre-registered array of known tags).
LwIP HTTPD SSI By File Extension	• Overridden • Enabled • Disabled	Enabled	enable/disable or override the file SSI tag scan function. You need to provide an external function to perform the check: u8_t http_uri_is_ssi(struct fs_file *file, const char *uri)

LwIP HTTPD SSI Extension	Manual Entry	".shtml", ".shtm", ".ssi", ".xml", ".json"	List of file extensions handled as SSI files. Only used if LWIP_HTTPD_SSI_BY_FILE_EXTENSION != 0.
LwIP HTTPD Support POST	• Enabled • Disabled	Disabled	Set this to 1 to support HTTP POST.
LwIP HTTPD Maximum CGI Parameters	Must be a non zero positive interger.	16	The maximum number of parameters that the CGI handler can be sent.
LwIP HTTPD SSI Multipart	• Enabled • Disabled	Disabled	SSI handler function is called with 2 more arguments to handle string too long to be inserted at once
LwIP HTTPD Maximum Tag Name Length	Must be a non zero positive interger.	8	The maximum length of the string comprising the SSI tag name. The longer tags are ignored.
LwIP HTTPD Maximum Tag Insert Length	Must be a non zero positive interger.	192	The maximum length of string that can be returned to replace any given tag.
LwIP HTTPD POST Manual WND	• Enabled • Disabled	Disabled	Enable configurating POST window response for HTTP server
HTTPD Server Agent	Manual Entry	lwIP/" LWIP_VERSION_STRING " (http://savannah.nongnu.org/projects/lwip)	This string is passed in the HTTP header as 'Server: HTTPD_SERVER_AGENT'.
LwIP HTTPD Dynamic Headers	• Enabled • Disabled	Disabled	Set this to 1 if you want to include code that creates HTTP headers at runtime. Else use static header created by the makefsdata tool.
HTTPD Debug	• Disabled • Enabled	Disabled	Configure debug for HTTPD file send timing
HTTPD Use Mem Pool	• Enabled • Disabled	Disabled	Set this to 1 to allocate http_state instead of using heap.If enabled, define MEMP_NUM_PARALLEL_HTTPD_CONNS (and MEMP_NUM_PARALLEL_HTTPD_SSI_CONN

			S for SSI) to set the size of the pool(s).
HTTPD Server Port	Must be an interger in range 0-65535.	80	The http server port for HTTPD to use
HTTPD Server Port HTTPS	Must be an interger in range 0-65535.	443	The https server port for HTTPD to use
HTTPD Enable HTTPS	• Enabled • Disabled	Disabled	Enable https support.
HTTPD Maximum Retries	Must be a positive integer.	4	Maximum retries before the connection is aborted/closed.
HTTPD Poll Interval	Must be a non zero positive interger.	4	How long the Server will keep the connection. The poll delay is X*500ms.
HTTPD TCP Priority	Must be an interger in range 1-127.	1	Priority for tcp pcbs created by HTTPD 1 by default range from 1-127.
LwIP HTTPD Timing	• Enabled • Disabled	Disabled	Set this to 1 to enable timing each file sent.
HTTPD Debug Timing	• Disabled • Enabled	Disabled	Set this to 1 to enable timing each file sent.
LwIP HTTPD Support Extstatus	• Enabled • Disabled	Disabled	Set this to one to show error pages when parsing request fail. Else simply close the connection
LwIP HTTPD Support V09	• Enabled • Disabled	Enabled	Set this to 0 to drop support for HTTP/0.9 clients (to save some bytes).
LwIP HTTPD Support 11 Keepalive	• Enabled • Disabled	Disabled	Set this to 1 to enable HTTP/1.1 persistent connections.
LwIP HTTPD Support Requestlist	• Enabled • Disabled	Enabled	Set this to 1 to support HTTP request coming in in multiple packets/pbufs.
LwIP HTTPD Request Queuelen	Must be a non zero positive interger.	5	Number of rx pbufs to enqueue to parse an incoming request.
LwIP HTTPD Request Bufsize	Must be a non zero positive interger.	LWIP_HTTPD_MAX_REQ_LENGTH	Number of (TCP payload-) bytes (in pbufs) to enqueue to parse and incoming

			request.
LwIP HTTPD Maximum Request Length	Must be a non zero positive interger.	LWIP_MIN(1023, (LWIP_HTTPD_REQ_QUEUELEN * PBUF_POOL_BUFSIZE))	Defines the maximum length of a HTTP request line.
LwIP HTTPD Maximum Request URI Length	Must be a positive interger.	63	This is the size of a static buffer used when URIs end with '/'.
LwIP HTTPD POST Maximum Response URI Length	Must be a non zero positive interger.	63	Maximum length of the filename to send as response to a POST request.
LwIP HTTPD SSI Include Tag	• Enabled • Disabled	Enabled	Set this to 0 to not send the SSI tag.
LwIP HTTPD Abort On Close Memory Error	• Enabled • Disabled	Disabled	Set this to 1 to call tcp_abort when tcp_close fails with memory error.
LwIP HTTPD Kill Old On Connections Exceeded	• Enabled • Disabled	Disabled	Set this to 1 to kill the oldest connection.
LwIP HTTPD Omit Header For Extensionless URI	• Enabled • Disabled	Disabled	Set this to 1 to send URIs without extension without headers.
HTTPD Limit Sending To 2mss	• Enabled • Disabled	Enabled	By default, the httpd is limited to send 2*pcb->mss.
HTTPD Maximum Write Length	The name function must be a valid C symbol	altcp_mss	Define this to a function that returns the maximum amount of data to enqueue. The function have this signature: u16_t fn(struct altcp_pcb* pcb);.
LwIP HTTPD Custom Files	• Enabled • Disabled	Disabled	Set this to 1 and provide the functions: - int fs_open_custom(struct fs_file *file, const char *name) Called first for every opened file to allow opening files that are not included in fsdata(_custom).c - void fs_close_custom(struct fs_file *file) Called to free

			resources allocated by fs_open_custom().
LwIP HTTPD Dynamic File Read	• Enabled • Disabled	Disabled	Set this to 1 to support fs_read(). Else only one-block files are supported, and the contents must be ready after fs_open().
LwIP HTTPD File State	• Enabled • Disabled	Disabled	Set this to 1 to include an application stateargument per file that is opened.
LwIP HTTPD File Extension	• Enabled • Disabled	Disabled	Set this to 1 to add the pextension field to the fs_file structure.New code should use LWIP_ HTTPD_FILE_STATE instead.
HTTPD Precalculated Checksum	• Enabled • Disabled	Disabled	Support asynchronous read operations.
LwIP HTTPD FS Async Read	• Enabled • Disabled	Disabled	Set this to 1 to add the pextension field.
HTTPD Fsdata File	Manual Entry	fsdata_sample.c	Provide source name file of FS custom data. This data file will be included by fs.c file
HTTP Is Data Volatile	• Allow Copy and More • Allow Copy • Undefined	Allow Copy	Determines if HTTP data should be copied into the TCP buffer before transmission. Allow Copy: data will be copied into memory belonging to the stack. Allow Copy and More: Notify to TCP that data will be copied into memory belonging to the stack and additional data will follow in subsequent TCP transmissions.
LwIP HTTPD Use Default Template	• Enabled FSdata Generator • Disabled FSdata Generator	Enabled FSdata Generator	Set this to 1 to when intent to use the default template from the generator

Usage Notes

Limitations

- In normal mode, the user must select the "HTTP Is Data Volatile" option as Allow Copy mode (TCP_WRITE_FLAG_COPY) in the FSP Configurator properties to ensure tcp_write() functions correctly.
- When using the Server-Side Includes (SSI) mode or the Common Gateway Interface (CGI) mode, make sure that the "HTTP Is Data Volatile" option is set to Allow Copy and More mode (TCP_WRITE_FLAG_COPY | TCP_WRITE_FLAG_MORE) in the FSP Configurator properties to work properly.

How to use fsdata file

There are two ways to use fsdata file as follows:

1. Use the available fsdata_sample.c file

When the stack "LwIP HTTP Server" is added, by default it includes the stack "LwIP HTTP Server FS" which is the sample file provided in the LwIP HTTP Server library repository, and the fsdata_sample.c file is generated at the src/fsdata/ path.

2. Generate new fsdata.c file using makefsdata script

In case, creating a new fsdata.c file by makefsdata script, follow these detailed steps:

Note

Reffer to this link readme.txt for an introduction by the author about the makefsdata scripts.

- ***Setup Environment***
  1. *Make sure Perl is installed on your development environment to ensure the required script runs.*
- ***Convert Server Contents to C Source Code***
  1. *Create a new folder. (the created folder can be placed outside the project workspace).*
  2. *Copy the "makefsdata" folder from the LwIP HTTP Server library repository into the created folder.*
  3. *Inside the created folder, create a new subfolder named "fs" (the name "fs" is mandatory).*
  4. *Place the files to be converted into the "fs" folder.*
  5. *Open a terminal on Linux or Git Bash/Windows Command Prompt on Windows. (if Cygwin is installed) and navigate to the created folder.*
  6. *Type the command "perl makefsdata".*
  7. *The new "fsdata.c" file will be generated in the created folder.*
- ***Configure the Generated File***
  1. *Remove the the stack "LwIP HTTP Server FS".*
  2. *Add an "include guard" to prevent multiple inclusions in the new file "fsdata.c".*
  3. *Include the headers "lwip/apps/fs.h" and "lwip/def.h" in the new file "fsdata.c".*
  4. *Copy only the new file "fsdata.c" into the project workspace.*
  5. *In the FSP Configurator properties, set the "HTTPD Fsdata File" option to the new file "fsdata.c".*

TLS connection

The stack and heap sizes must be properly configured when using the TLS layer with MbedTLS. Depending on the specific configuration and use case, these values may need to be increased from their defaults. For more information on memory requirements, refer to the **Memory Usage** section in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Note

*When using hardware acceleration for the MbedTLS implementation, verify that the target device supports all required mbedCrypto features for the TLS layer of lwIP. Refer to the **HW Overview** and **Features** sections in Mbed*

Crypto H/W Acceleration (rm_psa_crypto) to check hardware support. If any required feature is not supported, configure the corresponding features to use the software crypto implementation instead.

Examples

Basic Example

This is a basic example of minimal use of the LwIP HTTP Server APIs in an application.

```
#if HTTPD_ENABLE_HTTPS
 #include "lwip/altcp_tls.h"
 #include "mbedtls/platform.h"
#endif
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#include "lwip/apps/httpd.h"
#if HTTPD_ENABLE_HTTPS
/* Example server key, needs to be updated. */
static uint8_t gs_server_key[] =
 "-----BEGIN PRIVATE KEY-----\n"
 "MIIEvgIBADANBgkqhkiG9w0BAQEFAASCBKgwggSkAgEAAoIBAQDKrJdfXTLDsPb4\n"

5.2.12.41 lwIP Iperf

Modules » Networking

This module provides the lwIP Iperf integration documentation.

Overview

The lwIP Iperf is a simple performance measuring bandwidth using iPerf2. The documentation for the library can be found at the following link: lwIPerf.

Features

- Check your bandwidth using Iperf2.
- Supports TCP stream.
- Compatible with Iperf2.
- Both iPerf2 server and client modes are supported.

Configuration

Build Time Configurations for source

The following build time configurations are defined in lwip/lwip/apps/lwiperf_opts.h:

Configuration	Options	Default	Description

Idle Timeout	Value must be a positive integer value and less than or equal to 255.	10	Specify the idle timeout (in seconds) after that the test fails.
lwIPerf IP version	• IPv4 • IPv6 • IPv4+IPv6(Dual-stack)	IPv4+IPv6(Dual-stack)	Configure whether lwIPerf listens on all IP versions.
Check format of received data	• Enabled • Disabled	Disabled	Enabled to verify the format of received data.

Usage Notes

Limitations

- UDP is not supported due to the limitation of lwIP OSS.
- Iperf3 is not supported due to the limitation of lwIP OSS.

Examples

Basic Example

This is a basic example of minimal use of the lwIP Iperf APIs in an application.

Note

When using printf with e² studio, build errors may occur. Please refer to https://en-support.renesas.com/knowledgeBase/16979385 and follow Method 2, which is recommended for smooth integration and to avoid build errors.

```
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/netif.h"
#include "lwip/apps/lwiperf.h"
/* LwIP Iperf example */

```

5.2.12.42 lwIP MQTT

Modules » Networking

This module provides the lwIP MQTT integration documentation.

Overview

The lwIP MQTT library can connect to a third party MQTT broker such as Mosquitto. The documentation for the library can be found at the following link: lwIPMQTT.

Features

- MQTT connections to MQTT broker
- Support set up TLS connection handling with one-way server authentication or two-way server/client authentication
- The version of MQTT protocol supported in lwIP is 3.1.1. Details of the MQTT protocol can be found at: mqtt-v3.1.1

Usage Notes

TLS connection

The stack and heap sizes must be properly configured when using the TLS layer with MbedTLS. Depending on the specific configuration and use case, these values may need to be increased from their defaults. For more information on memory requirements, refer to the **Memory Usage** section in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Note

*When using hardware acceleration for the MbedTLS implementation, verify that the target device supports all required mbedCrypto features for the TLS layer of lwIP. Refer to the **HW Overview** and **Features** sections in Mbed Crypto H/W Acceleration (rm_psa_crypto) to check hardware support. If any required feature is not supported, configure the corresponding features to use the software crypto implementation instead.*

Examples

Basic Example

This is a basic example of minimal use of the lwIP MQTT APIs in an application.

```

5.2.12.43 lwIP NETBIOSNS

Modules » Networking

This module implements the lwIP NETBIOSNS integration documentation.

Overview

This is a simple lwIP NetBIOS nameserver. It responds to name queries from a configurable name.

Features

The lwIP NetBIOS Responder opens a UDP socket on port 137 to handle NetBIOS name resolution requests:

- Respond to NB name query type, resolving the configured hostname to IPv4 address (always enabled).
- Respond to NBSTAT name query type with both exact-name and wildcard (*) queries (configurable).

Configuration

Build Time Configurations for source

The following build time configurations are defined in lwip/lwip/apps/netbiosns_opts.h:

Configuration	Options	Default	Description
NetBIOS Name Query Response	• Enabled • Disabled	Enabled	Enabling responses to NBSTAT queries is configurable, while responses to NB name queries are always enabled.
Use static NETBIOS name	• Enabled • Disabled	Disabled	Disable this option to allow changing the NetBIOS host name at runtime using netbiosns_set_name().
NetBIOS Name	String length minimum 1 maximum 15, allow A-Z,0-9, -, ., must not start with period (.).	LWIPDEVICE	Specifies a string for NetBIOS name. String length 1 to 15. Allowed uppercase letters A-Z, digit0-9, hyphen -, period .. Must not start with

period.

Usage Notes

Note

It is recommended to call netbiosns_stop() before reinitializing the NetBIOS Responder to avoid a potential memory leak.

Limitations

Note

1. Name conflict resolving is not supported.
2. The socket does not broadcast it's own name, thus can not detect duplicate names.
3. The socket always resolves name queries using the IP address of the default network interface.

Examples

Basic Example

This is a basic example of initailize NETBIOSNS responder and change hostname in run time.

```
#include "lwip/timeouts.h"
#include "lwip/init.h"
#include "lwip/ip4.h"
#include "lwip/apps/netbiosns.h"
struct netif g_netbiosns_netif;
/* LwIP netbiosns example */
void lwip_netbiosns_example () {
    ip_addr_t ipaddr;
    ip_addr_t netmask;
    ip_addr_t gw;
 /* Initializing lwIP core. */
    lwip_init();
 /* Set ip address of the board. */
    IP4_ADDR(&ipaddr, 192, 168, 10, 4);
    IP4_ADDR(&netmask, 255, 255, 255, 0);
    IP4_ADDR(&gw, 192, 168, 10, 1);
 /* Initialize netif. Please pass rm_lwip_ether_init() function and the instance of
rm_lwip_ether to netif_add(). */
    netif_add(&g_netbiosns_netif, &ipaddr, &netmask, &gw, &g_lwip_ether0_instance,
rm_lwip_ether_init, netif_input);
```

```
 /* Set netif as default and enable. */
    netif_set_default(&g_netbiosns_netif);
    netif_set_up(&g_netbiosns_netif);
    netif_set_link_up(&g_netbiosns_netif);
#ifndef NETBIOS_LWIP_NAME
 /* Set the NetBIOS name, host name can be change again during run time using
netbiosns_set_name */
    netbiosns_set_name("LWIPDEVICE");
#endif
 /* Init netbios responder */
    netbiosns_init();
 /* Program main loop. */
 while (true)
    {
 R_BSP_SoftwareDelay(1, BSP_DELAY_UNITS_MILLISECONDS);
       sys_check_timeouts();
    }
}
```

5.2.12.44 lwIP PPP

Modules » Networking

This module provides the lwIP PPP (Point-to-Point Protocol) integration documentation.

Overview

The lwIP PPP module enables IP communication over serial or USB-based links by implementing the Point-to-Point Protocol (PPP). This library provides both **PPP client and server** roles, supporting multiple link types such as:

- PPP over Serial (PPPoS)
- PPP over Ethernet (PPPoE)
- PPP over L2TP (PPPoL2TP)

The original lwIP PPP implementation is documented here: PPP in lwIP

Features

For detail information about PPP feature, refer to **Section 1** in PPP in lwIP.

Configuration

Configuration options for the lwIP PPP module are available in the FSP configuration editor. Detailed parameter descriptions can be found in the following document:

Build Time Configurations for Source

The following build time configurations are defined in lwip/pppopts.h:

Configuration	Options	Default	Description
PPPoL2TP			
LwIP support PPPoL2TP	• Enabled • Disabled	Disabled	Enable PPP over L2TP (Layer 2 Tunneling Protocol) support.
LwIP support PPPoL2TP AUTH	• Enabled • Disabled	Disabled	Enable PPP Over L2TP Auth (enable MD5 support)
Authentication			
PPP support PAP	• Enabled • Disabled	Disabled	Enable Password Authentication Protocol.
PPP support CHAP	• Enabled • Disabled	Disabled	Enable Challenge Handshake Authentication Protocol.
PPP support MSCHAP	• Enabled • Disabled	Disabled	Enable Microsoft Challenge Handshake Authentication Protocol (MS-CHAP) for enhanced PPP authentication with stronger security than standard CHAP. Required for MPPE encryption. Automatically enables CHAP support.
PPP support EAP	• Enabled • Disabled	Disabled	Enable Extensible Authentication Protocol.
PPP support MD5-RANDM	• (CHAP_SUPPORT || EAP_SUPPORT || PPPOL2TP_AUTH_SUPPORT) • Enabled	(CHAP_SUPPORT || EAP_SUPPORT || PPPOL2TP_AUTH_SUPPORT)	Enable MD5-RANDM support for PPP authentication.

	• Disabled		
Use external PolarSSL library	• Enabled • Disabled	Disabled	Use an external PolarSSL library for cryptographic operations in PPP authentication.
Use external mbedTLS library	• Enabled • Disabled	Disabled	Use external mbedTLS library for cryptographic operations in PPP authentication and TLS connections.
Max username length	Username length must be between 1 and 256.	256	Maximum length of hostname or name for auth.
Max secret length	Secret length must be between 1 and 256.	256	Maximum length of password or secret.
Internal memory pools			
PPP num connections	Must be a positive integer (minimum 1). Specifies the number of concurrent PPP connections supported.	1	Number of simultaneously active PPP connections (requires the PPP_SUPPORT option).
PPP num API messages	Must be a positive integer (minimum 1). Represents the number of available PPP API message buffers.	5	Number of concurrent PPP API messages.
PPPoL2TP num connections	At least 1 PPPoL2TP connection is required. Please enter a positive integer value.	1	Number of concurrently active PPPoL2TP interfaces (only used with PPPOL2TP_SUPPORT==1).
PPP num timeouts per PCB	Enter a positive integer greater than 1	2 + PPP_IPV4_SUPPORT + PPP_IPV6_SUPPORT + CCP_SUPPORT	The number of sys_timeouts running in parallel per ppp_pcb. See the detailed explanation at the end of ppp_impl.h about simultaneous timers analysis.
Debugging			
PPP debug	• LWIP_DBG_OFF • Enabled • Disabled	LWIP_DBG_OFF	Enable debugging in PPP.
PPP packet print support	• Enabled • Disabled	Disabled	Enable PPP print packet support. It displays

			exchanged packet content in debug trace.
Notification/Callback Options			
PPP phase notifications	• Enabled • Disabled	Disabled	Enable PPP notify phase support.
Compression/Optimization			
Enable Link Quality Reporting (LQR)	• Enabled • Disabled	Disabled	Support Link Quality Report. Do nothing except exchanging some LCP packets.
Enable VJ header compression	• Enabled • Disabled	Disabled	Support VJ header compression.
Role Configuration			
Enable PPP server mode	• Enabled • Disabled	Disabled	Enable PPP server mode. When enabled, the device acts as a PPP server and waits for the client to initiate the connection.
PPP local hostname	Name must be a valid C symbol	lwip_ppp	Local hostname used for authentication purposes. This name identifies the PPP peer when acting as a client or server.
MRU/MTU			
PPP max MRU	Value must be positive integer.	1500	This is the upper limit value to which we set our interface MTU. If the peer sends a larger number, we will just ignore it as we are not required to maximize the use of the peer capacity.
PPP min MRU	Value must be positive integer.	128	Peer must be able to receive at least our minimum MTU.
PPPoL2TP default MRU	Value must be positive integer.	1450	Default MTU and MRU for L2TP.
Timing/Retry Settings			
FSM default timeout	Value must be between 0 and 255	6	Default timeout (in seconds) for Finite State Machine (FSM) retransmissions.

FSM max terminate requests	Value must be between 0 and 255	2	Maximum number of Terminate-Request packets sent before giving up.
FSM max configure requests	Value must be between 0 and 255	10	Maximum number of Configure-Request packets sent before giving up.
FSM max NAK loops	Value must be between 0 and 255	5	Maximum number of NAK loops allowed during negotiation.
PAP default timeout	Value must be between 0 and 255	6	Default timeout (in seconds) for PAP authentication response.
PAP max transmits	Value must be between 0 and 255	10	Maximum number of PAP Authenticate-Request transmissions before giving up.
PAP request timeout	Value must be between 0 and 255	30	Request timeout (in seconds) before retransmitting PAP Authenticate-Request.
CHAP default timeout	Value must be between 0 and 255	6	Default timeout (in seconds) for CHAP challenge response.
CHAP max transmits	Value must be between 0 and 255	10	Maximum number of CHAP Challenge-Requests transmitted before giving up.
CHAP re-challenge time	Value must be between 0 and 255	0	Interval (in seconds) between periodic CHAP re-challenges. If this option is > 0, rechallenge the peer every n seconds.
EAP request time	Value must be between 0 and 255	6	Default request timeout (in seconds) for EAP authentication.
EAP allowed requests	Value must be between 0 and 255	10	Maximum number of EAP Request retries before failure.
EAP default timeout	Value must be between 0 and 255	6	Timeout (in seconds) for EAP packet acknowledgment.
EAP max transmits	Value must be between 0 and 255	10	Maximum number of EAP packet

			retransmissions.
LCP loopback fail threshold	Value must be between 0 and 255	10	Number of failed echo responses before declaring link down.
LCP echo interval	Value must be between 0 and 255	0	Time interval (in seconds) between LCP echo requests.
LCP max echo failures	Value must be between 0 and 255	3	Number of consecutive failed echo replies before declaring link dead.
PPP max idle flag	Value must be positive integer.	100	Max Xmit idle time (in ms) before resend flag char.
LwIP support PPP API	• Enabled • Disabled	Disabled	Enable high-level PPP API functions.
PPP support CCP	• Enabled • Disabled	Disabled	Enable Compression Control Protocol (CCP) for PPP data compression to reduce bandwidth usage.
PPP support MPPE	• Enabled • Disabled	Disabled	Enable Microsoft Point-to-Point Encryption (MPPE) for PPP data encryption and security. Automatically enables CCP and MS-CHAP support.

Specific configuration of PPPoE can be found in the following document:

Build Time Configurations for Source

The following build time configurations are defined in lwip/pppoe_opts.h:

Configuration	Options	Default	Description
LwIP support PPPoE SCNAME	• Enabled • Disabled	Disabled	Enable PPP Over Ethernet Service Name and Concentrator Name support.
PPPoE num connections	At least 1 PPPoE connection is required. Please enter a positive integer value.	1	Number of concurrently active PPPoE interfaces (only used with PPPOE_SUPPORT==1).

Specific configuration of PPPoS can be found in the following documents:

- For LwIP PPP on USB:

Build Time Configurations for Source

The following build time configurations are defined in lwip/pppos_usb_opts.h:

Configuration	Options	Default	Description
PPPoS num connections	At least 1 PPPoS connection is required. Please enter a positive integer value.	MEMP_NUM_PPP_PCB	Number of concurrently active PPPoS interfaces (only used with PPPOS_SUPPORT==1).
IRQ safe	• Enabled • Disabled	Disabled	If enabled, call pppos_input() using tcpip_callback().
Enable FCS lookup table	• Enabled • Disabled	Enabled	Keep a 256*2 byte table to speed up FCS calculation for PPPoS.
PPP MRU	Value must be positive integer.	1500	MRU value we want to negotiate (peer MTU). It only affects PPPoS because PPPoE value is derived from the Ethernet interface MTU and PPPoL2TP have a separate setting.

- For LwIP PPP on UART:

  Build Time Configurations for Source

  The following build time configurations are defined in lwip/pppos_uart_opts.h:

Configuration	Options	Default	Description
PPPoS num connections	At least 1 PPPoS connection is required. Please enter a positive integer value.	MEMP_NUM_PPP_PCB	Number of concurrently active PPPoS interfaces (only used with PPPOS_SUPPORT==1).
IRQ safe	• Enabled • Disabled	Disabled	If enabled, call pppos_input() using tcpip_callback().
Enable FCS lookup table	• Enabled • Disabled	Enabled	Keep a 256*2 byte table to speed up FCS calculation for PPPoS.
PPP MRU	Value must be positive integer.	1500	MRU value we want to negotiate (peer

MTU). It only affects PPPoS because PPPoE value is derived from the Ethernet interface MTU and PPPoL2TP have a separate setting.

Note

The configuration options for PPPoS on USB and UART are the same. This is the general configuration for PPPoS usage.

Examples

Basic LwIP PPPoS on Uart Example

The following demonstrates a basic example of LwIP PPPoS on Uart.

```
#define LWIP_PPP_UART_EXAMPLE_RING_BUF_SIZE (2048U)
#define LWIP_PPP_UART_EXAMPLE_READ_BUF_SIZE (64U)

```

5.2.12.45 lwIP SMTP

Modules » Networking

This module provides the lwIP SMTP integration documentation.

Overview

The documentation for the library can be found at the following link: lwIPSMTP.

Features

- Support authentication methods and send an email via the currently selected server, username and password.
- Support set up TLS connection handling with one-way server authentication or two-way server/client authentication.
- The common ports that used for SMTP:
  - Port 25:
    - Default port for SMTP since the beginning of email.
    - Supports plain, unencrypted SMTP.
  - Port 465:
    - Used for SMTPS (SMTP Secure), where the connection is immediately encrypted using SSL/TLS upon connection.
  - Custom ports: Based on the port of SMTP server.

  Note

  SMTP port usage reference in the RFC8314 documentation.

Configuration

Build Time Configurations for source

The following build time configurations are defined in lwip/lwip/apps/smtp_opts.h:

Configuration	Options	Default	Description
Data Handler Callback on BODY	• Enabled • Disabled	Disabled	Enable this option to invoke the user-defined

			callback for SMTP message BODY data.
SMTP Debug	• LWIP_DBG_ON • LWIP_DBG_OFF	LWIP_DBG_OFF	Set this to 1 to debug SMTP.
Maximum SMTP Server Name Length	Value must be a positive integer value	256	Specifies the maximum length of the SMTP server name.
Maximum SMTP Username Length	Value must be a positive integer value	32	Specifies the maximum length of the SMTP username.
Maximum Password Length	Value must be a positive integer value	32	Specifies the maximum length of the SMTP password.
Copy Authentication Data	• Enabled • Disabled	Enabled	Enable to copy username and password into internal buffers instead of using pointers to user data. Disabling this if you know the authentication data will not change during the smtp session, which saves some heap space.
Check Email Data	• Enabled • Disabled	Enabled	Enable to verify SMTP message fields for validity before transmission. Disabling this to save some code space if you know for sure that all data passed to this module conforms to the requirements in the SMTP RFC. WARNING: Use this with care!
AUTH PLAIN Support	• Enabled • Disabled	Enabled	Enable to support SMTP AUTH PLAIN authentication.
AUTH LOGIN Support	• Enabled • Disabled	Enabled	Enable to support SMTP AUTH LOGIN authentication.
Memory allocation	Name must be a valid C symbol	mem_malloc	Define the allocation function used for SMTP state machine memory. By default,

			uses lwIP mem_malloc. Override to FreeRTOS heap for RTOS-based systems.
Memory deallocation	Name must be a valid C symbol	mem_free	Define the free function used for SMTP state machine memory. By default, uses lwIP mem_free. Override to FreeRTOS heap for RTOS-based systems.

Usage Notes

TLS connection

The stack and heap sizes must be properly configured when using the TLS layer with MbedTLS. Depending on the specific configuration and use case, these values may need to be increased from their defaults. For more information on memory requirements, refer to the **Memory Usage** section in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Note

*When using hardware acceleration for the MbedTLS implementation, verify that the target device supports all required mbedCrypto features for the TLS layer of lwIP. Refer to the **HW Overview** and **Features** sections in Mbed Crypto H/W Acceleration (rm_psa_crypto) to check hardware support. If any required feature is not supported, configure the corresponding features to use the software crypto implementation instead.*

Authetication

The lwIP SMTP module supports the following authentication methods:

- **No Authentication**: Use smtp_set_auth(NULL, NULL) for servers that don't require authentication.
- **Authentication**: Use smtp_set_auth(username, password) for username/password authentication.
  - AUTH LOGIN: The username and password are sent separately. The server first asks for the username, then the password.
  - AUTH PLAIN: The username and password are sent together.
  - The client automatically selects PLAIN or LOGIN based on server capabilities.
  - Both methods use Base64 encoding (NOT encryption).

Note

Authentication credentials are sent in plain text (Base64 encoded only) unless TLS is enabled. Base64 can be easily decoded by anyone intercepting network traffic.

Always use TLS when sending credentials:

```
// INSECURE - Credentials visible on network
smtp_set_tls_config(NULL);
smtp_set_auth("user", "password");
// SECURE - Credentials encrypted
```

```
smtp_set_tls_config(tls_config); // Enable TLS encryption
smtp_set_auth("user", "password");
```

Examples

Basic Example

This is a basic example of minimal use of the lwIP SMTP APIs in an application.

Note

When using printf with e² studio, build errors may occur. Please refer to https://en-support.renesas.com/knowledgeBase/16979385 and follow Method 2, which is recommended for smooth integration and to avoid build errors.

5.2.12.46 lwIP SNMP Agent

Modules » Networking

This module provides the lwIP SNMP Agent integration documentation.

Overview

The LwIP SNMP Agent provides a lightweight implementation of the Simple Network Management Protocol (SNMP) for embedded systems. The documentation for the library can be found at the following link: lwIPSNMP.

Features

The LwIP SNMP Agent supports the following protocol versions:

- SNMPv1
- SNMPv2c
- SNMPv3 (experimental; not fully validated in the current release)

Configuration

Build Time Configurations for source

The following build time configurations are defined in lwip/lwip/apps/snmp_opts.h:

Configuration	Options	Default	Description
Community string			
SNMP read-access community	Name must be a valid C symbol.	public	Specifies the SNMP community string used for read-only operations (e.g., GET requests). Common default is 'public'.
SNMP write-access community	Name must be a valid C symbol.	private	Specifies the SNMP community string used for write-access operations (e.g., SET requests). Common default is 'private'.
SNMP trap community	Name must be a valid C symbol.	public	Specifies the SNMP community string used for sending traps. Common default is

			'public'.
Max community string length	Must be a positive integer value	LWIP_MAX(LWIP_MAX(sizeof(SNMP_COMMUNITY), sizeof(SNMP_COMMUNITY_WRITE)), sizeof(SNMP_COMMUNITY_TRAP))	The maximum length of community string. If community names shall be adjusted at runtime via snmp_set_community() calls, enter here the possible maximum length (+1 for terminating null character).
Debugging			
SNMP debug	• LWIP_DBG_ON • LWIP_DBG_OFF	LWIP_DBG_OFF	Enable debugging for SNMP messages.
SNMP MIB debug	• LWIP_DBG_ON • LWIP_DBG_OFF	LWIP_DBG_OFF	Enable debugging for SNMP MIBs.
MIB2			
MIB2 Implementation	• Enabled • Disabled	Disabled	Indicates if the MIB2 implementation of LWIP SNMP stack is used.
System Description	Name must be a valid C symbol.	lwIP	Value return for sysDesc field of MIB2.
System Name	Name must be a valid C symbol.	FQDN-unk	Value return for sysName field of MIB2.
System Contact	Name must be a valid C symbol.		Value return for sysContact field of MIB2.
System Location	Name must be a valid C symbol.		Value return for sysLocation field of MIB2.
SNMPv3			
SNMPv3 Support	• Enabled • Disabled	Disabled	Enable or disable SNMPv3 support.
Use mbed TLS for SNMPv3	• Enabled • Disabled	Disabled	Enable or disable mbed TLS usage for SNMPv3.
Use Crypto Library for SNMPv3	• Enabled • Disabled	Disabled	Enable or disable Crypto Library usage for SNMPv3.
Enable SNMP over Netconn API	• Enabled • Disabled	Disabled	Enable or disable SNMP Netconn interface support.
Enable SNMP over Raw API	• Enabled • Disabled	Enabled	Enable or disable SNMP Raw API support (UDP

			raw socket).
SNMP thread stack size (bytes)	Only symbols, numbers and arithmetic operators are valid.	DEFAULT_THREAD_STACKSIZE	Specifies the stack size (in bytes) used by the SNMP thread.
SNMP thread priority	Only symbols, numbers and arithmetic operators are valid.	DEFAULT_THREAD_PRIO	The priority assigned to SNMP thread.
SNMP Trap Destinations	At least one trap destination is required.	1	Maximum number of SNMP trap destinations that can be configured.
Enable SNMP Safe Requests	• Enabled • Disabled	Enabled	Only allow SNMP write actions that are 'safe' (e.g. disabling netifs is not a safe action when SNMP_SAFE_REQUESTS = 1).
Max Octet String Length	Must be a positive integer value	127	The maximum length of strings used.
Max Object ID Length	Object ID Length must fit into an u8_t.	50	The maximum number of Sub ID's inside an object identifier.
Min Value Size	Must be a positive integer value	2 * sizeof(u32_t*)	Minimum size of SNMP value.
Max Value Size	Must be a positive integer value	LWIP_MAX(LWIP_MAX((SNMP_MAX_OCTET_STRING_LEN), sizeof(u32_t)*(SNMP_MAX_OBJ_ID_LEN)), SNMP_MIN_VALUE_SIZE)	Maximum size of SNMP value.
Enterprise OID	Value must be a valid numeric OID.	63257	Specifies the Enterprise Object Identifier (OID) registered with IANA. Default 63257 corresponds to Renesas. Change this to your company's IANA enterprise ID if available.
GetBulk Max Repetitions	Must be a positive integer value	0	This value is used to limit the repetitions processed in GetBulk requests (value == 0 means no limitation).
Configure Supported SNMP Versions at Runtime	• Enabled • Disabled	Disabled	Enable or disable runtime configuration of supported SNMP versions.

Usage Notes

- **Memory Configuration:** Large MIBs or processing multiple SNMP requests simultaneously may require increasing the stack size and memory pool configurations in lwipopts.h, as well as the thread stack size if using an RTOS.
- **Ports:** By default, the SNMP agent listens for incoming requests on UDP port 161, while TRAP/INFORM messages are sent to the manager on UDP port 162.
- **SNMPv3:** When SNMPv3 is used, several functions from snmpv3.h must be implemented by the user. This is mainly for user management and persistence handling.

How to Create and Compile Custom MIBs for lwIP SNMP Agent

The lwIP SNMP Agent supports extending the standard MIB-2 tree with your own Custom MIBs (Management Information Base). This guide explains how to write a custom MIB file and generate the corresponding C code using the LwipMibCompiler tool.

1. Create Your Custom MIB File

Before generating the C code, you need a valid MIB file that defines your custom objects (OIDs, scalars, tables, etc.) that the SNMP Agent will expose.

- **How to Create:** You can write this file from scratch using any standard text editor (like VS Code, Notepad++) or use specialized MIB authoring tools. Ensure your syntax strictly follows the **SMIv2** standard.
- **References & Templates:** If you are new to writing MIBs, it is highly recommended to study the standard MIB files provided by the lwIP project. You can find excellent reference files (such as SNMPv2-MIB, IF-MIB, LLDP-MIB, etc.) in the Mibs directory of the compiler tool: LwipMibCompiler/Mibs

2. Set up the LwipMibCompiler Tool

The lwIP project provides a C# based tool called LwipMibCompiler to automatically generate C code (.c and .h files) from your MIB files.

- **Download the Tool:** You can find the source code for the compiler in the official lwIP repository: LwipMibCompiler
- **Build the Tool:**
  - Open the solution file (LwipMibCompiler.sln).
  - Build the project.
  - The executable **LwipMibCompiler.exe** will be generated in the *LwipMibCompiler/bin/Debug/* folder.

3. Generate C Code from the MIB File

Once you have **LwipMibCompiler.exe** and your custom **MIB** file ready, you can generate the C code via the command line.

For advanced usage with command line, you can refer to the example scripts provided in the repository compile_udp_mib.cmd or compile_udp_mib.sh.

4. Integrate the Generated Code into Your Project

After generating the code, you need to link it to the lwIP SNMP Agent in your application.

- **Add Files to Project:** Add the generated *.c* and *.h* files to your IDE/build system.
- **Implement the Callbacks:** The generated *.c* file will contain "skeleton" functions (e.g., customSensor_get_value, customSensor_set_value). You must implement the actual logic inside these functions to read from or write to your hardware/variables.
- **Register the MIB:** Finally, include the generated header and add your custom MIB to the lwIP SNMP Agent initialization sequence:

```
#include "lwip/apps/snmp.h"
#include "snmpv2-renesas.h" // Your generated header
/* Array of MIBs to load into the agent */
static const struct snmp_mib * my_snmp_mibs[] =
{
    &mib2,      /* Standard MIB-2 */
    &renesas    /* Your Custom MIB (Name matches the MODULE-IDENTITY) */
};
void my_snmp_init(void)
{
 /* Load the MIBs array */
    snmp_set_mibs(my_snmp_mibs, LWIP_ARRAYSIZE(my_snmp_mibs));
 /* Initialize SNMP Agent */
    snmp_init();
}
```

Examples

Basic Example

This is a basic example of minimal use of the lwIP SNMP Agent APIs in an application.

Note

This example provides a basic implementation of an LwIP SNMPv2c agent based on the default MIB-II. For further details regarding custom MIB development and the LwIP SNMPv3 agent, refer to: LwipSNMP_Example

```
#include "lwip/init.h"
#include "lwip/apps/snmp.h"
#include "lwip/apps/snmp_mib2.h"
#define LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSDESC "LwIP SNMP Agent Test Device"
#define LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSNAME "RA-BOARD_TEST"
#define LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSCONTACT "Renesas_Test_Contact"
#define LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSLOCATION "Renesas-LAB-TEST"
```

```
#if SNMP_LWIP_MIB2
/* Define variables for SNMP sysLocation to make it accessible read/write */
static u8_t sys_location[] = LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSLOCATION;
static u16_t sys_location_len = sizeof(LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSLOCATION) - 1;

 #endif  /* SNMP_USE_NETCONN */
 /* Configure MIB2 parameters */
    snmp_mib2_set_sysdescr((const u8_t *) LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSDESC,
NULL);
    snmp_mib2_set_sysname((u8_t *) LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSNAME, NULL, 0);
    snmp_mib2_set_syscontact((u8_t *) LWIP_SNMP_AGENT_EXAMPLE_MIB2_SYSCONTACT, NULL,
0);
    snmp_mib2_set_syslocation(sys_location, &sys_location_len, sizeof(sys_location));
#endif  /* SNMP_LWIP_MIB2 */
 /* Load the MIBs array into the SNMP Agent */
    snmp_set_mibs(mibs, LWIP_ARRAYSIZE(mibs));
 /* Initialize SNMP (call only once) */
    snmp_init();
}
```

5.2.12.47 lwIP SNTP

Modules » Networking

This module provides the lwIP SNTP integration documentation.

Overview

The lwIP SNTP library can be used to synchronize system time in a network by exchanging packets regularly. The documentation for the library can be found at the following link: lwIPSNTP.

Features

- This is simple "SNTP" client for the lwIP raw API. It is a minimal implementation of SNTPv4 as specified in RFC 4330.

Usage Notes

Note

MEMP_NUM_SYS_TIMEOUT at Infrastructure|Internal memory pools|Memp num sys timeout property of lwIP tcpip stack must be increased by one from the default value, as the SNTP module requires an additional timeout slot in the lwIP timer subsystem.

Examples

Basic Example

This is a basic example of minimal use of the lwIP SNTP APIs in an application.

Note

When using printf with e² studio, build errors may occur. Please refer to https://en-support.renesas.com/knowledgeBase/16979385 and follow Method 2, which is recommended for smooth integration and to avoid build errors.

```
#include <time.h>

}
```

5.2.13 Power

Modules

Detailed Description

Power Modules.

Modules

	Low Power Modes (r_lpm) Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

5.2.13.1 Low Power Modes (r_lpm)

Modules » Power

Functions

fsp_err_t	R_LPM_Open (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerReconfigure (lpm_ctrl_t *const p_api_ctrl, lpm_cfg_t const *const p_cfg)
fsp_err_t	R_LPM_LowPowerModeEnter (lpm_ctrl_t *const p_api_ctrl)
fsp_err_t	R_LPM_IoKeepClear (lpm_ctrl_t *const p_api_ctrl)

fsp_err_t R_LPM_Close (lpm_ctrl_t *const p_api_ctrl)

Detailed Description

Driver for the LPM peripheral on RA MCUs. This module implements the Low Power Modes Interface.

Overview

The low power modes driver is used to configure and place the device into the desired low power mode. Various sources can be configured to wake from standby, request snooze mode, end snooze mode or end deep standby mode.

Features

The LPM HAL module has the following key features:

- Supports the following low power modes:
  - Deep Software Standby mode (On supported MCUs)
  - Deep Sleep (On supported MCUs)
  - Software Standby mode
  - Sleep mode
  - Snooze mode (On supported MCUs)
- Supports reducing power consumption when in deep software standby mode through internal power supply control and by resetting the states of I/O ports.
- Supports disabling and enabling the MCU's other hardware peripherals

Supported Devices

Device Group	Devices
RA0	RA0E1, RA0E2, RA0E3, RA0L1
RA2	RA2A1, RA2A2, RA2E1, RA2E2, RA2E3, RA2L1, RA2L2, RA2T1
RA4	RA4C1, RA4E1, RA4E2, RA4L1, RA4M1, RA4M2, RA4M3, RA4T1, RA4W1
RA6	RA6E1, RA6E2, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2, RA6T3
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Build Time Configurations for r_lpm

The following build time configurations are defined in fsp_cfg/r_lpm_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

	• Disabled		included in the build.
Standby Limit	• Enabled • Disabled	Disabled	If enabled, standby configuration only applies in R_LPM_LowPowerModeEnter. Otherwise, standby configuration applies to any WFI call.

Configurations for Power > Low Power Modes (r_lpm)

This module can be added to the Stacks tab via New Stack > Power > Low Power Modes (r_lpm). Non-secure callable guard functions can be generated for this module by right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_lpm0	Module name.
Low Power Mode	MCU Specific Options		Power mode to be entered.
Output port state in standby and deep standby	MCU Specific Options		Select the state of output pins during standby. Applies to address output, data output, and other bus control output pins.
Supply of SOSC clock to peripheral function in standby	MCU Specific Options		If enabled, SOSC clock is provided to peripheral functions in Software Standby and Snooze modes.
Startup speed of the HOCO in Standby and Snooze modes	MCU Specific Options		If enabled, the HOCO enters high-speed startup mode, shortening standby release time, and snooze transition time.
Flash mode in sleep or snooze	MCU Specific Options		Select flash mode in sleep mode or in snooze mode.
Deep Sleep and Standby Options			
Deep Sleep and Standby Options > Snooze Options (Not available on every MCU)			
Snooze Request Source	MCU Specific Options		Select the event that will enter snooze.
Snooze End Sources	MCU Specific Options		Enable wake from snooze from these

		sources.
DTC state in Snooze Mode	MCU Specific Options	Enable wake from snooze from this source.
Snooze Cancel Source	MCU Specific Options	Select an interrupt source to cancel snooze.
Wake Sources	MCU Specific Options	Enable wake from deep sleep and standby from these Sources.
Wake Sources 2	MCU Specific Options	Enable wake from deep sleep and standby from these Sources.
RAM Retention Control (Not available on every MCU)		
RAM retention in Standby mode	MCU Specific Options	Select the memory regions that are retained in standby mode.
TCM retention in Deep Sleep and Standby modes	MCU Specific Options	Select if Tightly Coupled Memory (TCM) is retained in deep sleep and standby modes.
Standby RAM retention in Standby and Deep Standby modes	MCU Specific Options	Select if Standby RAM is retained in standby and deep standby modes.
Oscillator LDO Control (Not available on every MCU)		
PLL1 LDO State in standby mode	MCU Specific Options	Select the state PLL1 LDO state in standby mode.
PLL2 LDO State in standby mode	MCU Specific Options	Select the state PLL2 LDO state in standby mode.
HOCO LDO State in standby mode	MCU Specific Options	Select the state HOCO LDO state in standby mode.
Deep Standby Options (Not available on every MCU)		
I/O Port Retention	MCU Specific Options	Select the state of the IO Pins after exiting deep standby mode.
Power-Supply Control	MCU Specific Options	Select the state of the internal power supply in deep standby mode.
Cancel Sources	MCU Specific Options	Enable wake from deep

		standby using these sources.
Cancel Edges	MCU Specific Options	Falling edge trigger is default. Select sources to enable wake from deep standby with rising edge.
Soft Start Mode	MCU Specific Options	The soft start setting affects the inrush current, and wake-up time when waking from deep standby mode (See the MCU user manual for more information).

Clock Configuration

This module does not have any selectable clock sources.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Sleep Mode

At power on, by default sleep is set as the low-power mode. Sleep mode is the most convenient low-power mode available, as it does not require any special configuration (other than configuring and enabling a suitable interrupt or event to wake the MCU from sleep) to return to normal program-execution mode. The states of the SRAM, the processor registers, and the hardware peripherals are all maintained in sleep mode, and the time needed to enter and wake from sleep is minimal. Any interrupt causes the MCU device to wake from sleep mode, including the SysTick interrupt used by the RTOS scheduler.

Deep Sleep Mode

Deep sleep mode is similar to sleep mode with the exception that DTC and DMAC are stopped, access to TCM memory is not available, and only a subset of interrupts are available for waking the CPU.

Software Standby Mode

In software-standby mode, the CPU, as well as most of the on-chip peripheral functions and all of the internal oscillators, are stopped. The contents of the CPU internal registers and SRAM data, the states of on-chip peripheral functions, and I/O Ports are all retained. Software-standby mode allows significant reduction in power consumption, because most of the oscillators are stopped in this mode. Like sleep mode, standby mode requires an interrupt or event be configured and enabled to wake up.

Snooze Mode

Snooze mode can be used with some MCU peripherals to execute basic tasks while keeping the MCU in a low-power state. Many core peripherals and all clocks can be selected to run during Snooze, allowing for more flexible low-power configuration than Software Standby mode. To enable Snooze, select "Software Standby mode with Snooze mode enabled" for the "Low Power Mode" configuration option. Snooze mode settings (including entry/exit sources) are available under "Standby Options".

Deep Software Standby Mode

The MCU always wakes from Deep Software Standby Mode by going through reset, either by the negation of the reset pin or by one of the wakeup sources configurable in the "Deep Standby Options" configuration group.

The Reset Status Registers can be used to determine if the reset occurred after coming out of deep software standby. For example, R_SYSTEM->RSTSR0_b.DPSRSTF is set to 1 after a deep software standby reset.

I/O Port Retention can be enabled to maintain I/O port configuration across a deep software standby reset. Retention can be cancelled through the R_LPM_IoKeepClear API.

Limitations

Developers should be aware of the following limitations when using the LPM:

- Flash stop (code flash disable) is not supported. See the section "Flash Operation Control Register (FLSTOP)" of the RA2/RA4 Family Hardware User's Manual.
- Reduced SRAM retention area in software standby mode is not supported. See the section "Power Save Memory Control Register (PSMCR)" of the RA4 Hardware User's Manual.
- Only one Snooze Request Source can be used at a time.
- When using Snooze mode with SCI0 RXD as the snooze source the system clock must be HOCO and the MOCO, Main Oscillator and PLL clocks must be turned off.
- If the main oscillator or PLL with main oscillator source is used for the system clock, the wake time from standby mode can be affected by the Main Oscillator Wait Time Setting in the MOSCWTCR register. This register setting is available to be changed through the Main Oscillator Wait Time setting in the CGC module properties. See the "Wakeup Timing and Duration" table in Electrical Characteristics for more information.
- When using the DC-DC regulator (where available), the MCU will temporarily switch to the LDO if Software Standby or Snooze is requested and back again when it is cancelled. Switching to the LDO incurs a 60 microsecond critical section wherein all interrupts AND peripherals are stopped. Switching back to DCDC from the LDO incurs an additional 22 microsecond critical section (peripherals running).
- On RA8, there are delays inserted before and after switching to a lower power mode based on BSP configuration options and current CPUCLK speed. These delays do not disable interrupts for the entire delay as required by the RA8 Hardware Manual. Interrupts should be disabled by the application when possible before sleeping to meet the requirements, or the control of interrupts and the delay should be managed by the user to ensure the requirement is fully met.

Examples

LPM Sleep Example

This is a basic example of minimal use of the LPM in an application. The LPM instance is opened and

the configured low-power mode is entered.

```
void r_lpm_sleep (void)
{
 fsp_err_t err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_sleep);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
    assert(FSP_SUCCESS == err);
}
```

LPM Deep Software Standby Example

```
void r_lpm_deep_software_standby (void)
{
 fsp_err_t err;
#ifdef R_SYSTEM_RSTSR0_DPSRSTF_Msk
 /* Check the Deep Software Standby Reset Flag. If it is set, then the MCU is exiting
  * Deep Software Standby mode. */
 if (1U == R_SYSTEM->RSTSR0_b.DPSRSTF)
    {
 /* Clear the IOKEEP bit to allow I/O Port use.
  * Note that this function should be called before opening the LPM driver. */
       err = R_LPM_IoKeepClear(&g_lpm_ctrl);
      assert(FSP_SUCCESS == err);
    }
#endif
    err = R_LPM_Open(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Add user code here. */
 /* Reconfigure the module to set the IOKEEP bit before entering deep software
standby. */
    err = R_LPM_LowPowerReconfigure(&g_lpm_ctrl, &g_lpm_cfg_deep_software_standby);
    assert(FSP_SUCCESS == err);
```

```
    err = R_LPM_LowPowerModeEnter(&g_lpm_ctrl);
 /* Code after R_LPM_LowPowerModeEnter when using Deep Software Standby never be
executed.
  * Deep software standby exits by resetting the MCU. */
    assert(FSP_SUCCESS == err);
}
```

Data Structures

struct	lpm_instance_ctrl_t

Data Structure Documentation

◆ lpm_instance_ctrl_t

struct lpm_instance_ctrl_t
LPM private control block. DO NOT MODIFY. Initialization occurs when R_LPM_Open() is called.

Function Documentation

◆ R_LPM_Open()

fsp_err_t R_LPM_Open (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Perform any necessary initialization

Return values

FSP_SUCCESS	LPM instance opened
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_ALREADY_OPEN	LPM instance is already open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerReconfigure()

fsp_err_t R_LPM_LowPowerReconfigure (lpm_ctrl_t *const *p_api_ctrl*, lpm_cfg_t const *const *p_cfg*)

Configure a low power mode

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

FSP_SUCCESS	Low power mode successfully applied
FSP_ERR_ASSERTION	Null Pointer
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_UNSUPPORTED	This MCU does not support Deep Software Standby
FSP_ERR_INVALID_ARGUMENT	One of the following: • Invalid snooze entry source • Invalid snooze end sources
FSP_ERR_INVALID_MODE	One of the following: • Invalid low power mode • Invalid DTC option for snooze mode • Invalid deep standby end sources • Invalid deep standby end sources edges • Invalid power supply option for deep standby • Invalid IO port option for deep standby • Invalid output port state setting for standby or deep standby • Invalid sources for wake from standby mode • Invalid power supply option for standby • Invalid IO port option for standby • Invalid standby end sources • Invalid standby end sources edges

◆ R_LPM_LowPowerModeEnter()

fsp_err_t R_LPM_LowPowerModeEnter (lpm_ctrl_t *const *p_api_ctrl*)

Enter low power mode (sleep/deep sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

FSP_SUCCESS	Successful.
FSP_ERR_ASSERTION	Null pointer.
FSP_ERR_NOT_OPEN	LPM instance is not open
FSP_ERR_INVALID_MODE	One of the following: • HOCO was not system clock when using snooze mode with SCI0/RXD0. • HOCO was not stable when using snooze mode with SCI0/RXD0. • MOCO was running when using snooze mode with SCI0/RXD0. • MAIN OSCILLATOR was running when using snooze mode with SCI0/RXD0. • PLL was running when using snooze mode with SCI0/RXD0. • Unable to disable ocillator stop detect when using standby or deep standby.

◆ R_LPM_IoKeepClear()

fsp_err_t R_LPM_IoKeepClear (lpm_ctrl_t *const *p_api_ctrl*)

Clear the IOKEEP bit after deep software standby

Return values

FSP_SUCCESS	DPSBYCR_b.IOKEEP bit cleared Successfully.
FSP_ERR_UNSUPPORTED	Deep standby mode not supported on this MCU.

◆ R_LPM_Close()

fsp_err_t R_LPM_Close (lpm_ctrl_t *const *p_api_ctrl*)
Close the LPM Instance **Return values** FSP_SUCCESS — LPM driver closed FSP_ERR_NOT_OPEN — LPM instance is not open FSP_ERR_ASSERTION — Null Pointer

5.2.14 RTOS

Modules

Detailed Description

RTOS Modules.

Modules

	Azure RTOS ThreadX Port (rm_threadx_port) ThreadX port for RA MCUs.
	FreeRTOS Port (rm_freertos_port) FreeRTOS port for RA MCUs.

5.2.14.1 Azure RTOS ThreadX Port (rm_threadx_port)

Modules » RTOS

ThreadX port for RA MCUs.

Overview

Note

The ThreadX Port does not provide any interfaces to the user. Consult the ThreadX documentation at https://docs.microsoft.com/en-us/azure/rtos/threadx/ for further information.

Features

The RA ThreadX port supports the following features:

- Standard ThreadX configurations
- Hardware stack monitor

Configuration

Build Time Configurations for ThreadX

The following build time configurations are defined in fsp_cfg/azure/tx/tx_user.h:

Configuration	Options	Default	Description
General			
Custom tx_user.h	Manual Entry		Add a path to your custom tx_user.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Error Checking	• Enabled • Disabled	Enabled	The ThreadX basic API error checking can be bypassed by compiling with the symbol TX_DISABLE_ERROR_CHECKING defined.
Max Priorities	Value must be a multiple of 32 and in range 32 to 1024 or empty	32	Define the priority levels for ThreadX. Legal values range from 32 to 1024 and MUST be evenly divisible by 32.
Minimum Stack	Value must be greater than 0 or empty	200	Define the minimum stack for a ThreadX thread on this processor. If the size supplied during thread creation is less than this value, the thread create call will return an error.
Stack Filling	• Enabled • Disabled	Enabled	Determine is stack filling is enabled. By default, ThreadX stack filling is enabled, which places an 0xEF pattern in each byte of each

			thread's stack. This is used by debuggers with ThreadX-awareness and by the ThreadX run-time stack checking feature.
Preemption Threshold	• Enabled • Disabled	Disabled	Determine if preemption-threshold should be disabled. By default, preemption-threshold is disabled. If the application does not use preemption-threshold, it may be disabled to reduce code size and improve performance.
Notify Callbacks	• Enabled • Disabled	Disabled	Determine if the notify callback option should be disabled. By default, notify callbacks are disabled. If the application does not use notify callbacks, they may be disabled to reduce code size and improve performance.
Inline Thread Resume Suspend	• Enabled • Disabled	Disabled	Determine if the tx_thread_resume and tx_thread_suspend services should have their internal code in-line. This results in a larger image, but improves the performance of the thread resume and suspend services.
Not Interruptable	• Enabled • Disabled	Disabled	Determine if the internal ThreadX code is non-interruptable. This results in smaller code size and less processing overhead, but increases the interrupt lockout time.
IAR Library Support	• Enabled • Disabled	Disabled	Enable IAR library support (IAR compiler only). When IAR Library Support is Enabled, enable the linker option

			--threaded_lib. In the IAR IDE, this can be enabled in Project > Options > General Options > Library Configuration > Enable thread support in library.
BSD Support	• Enabled • Disabled	Disabled	Defines TX_THREAD_EXTENSION_1 to bsd_err_no in order to support NXD BSD.
FileX Pointer	• Enabled • Disabled	Enabled	Determine if there is a FileX pointer in the thread control block. By default, the pointer is there for legacy/backwards compatibility. The pointer must also be there for applications using FileX. Disable this to save space in the thread control block.
Timer			
Timer Ticks Per Second	Value must be greater than 0 or empty	100	Define the number of times the system timer runs per second. Default is 100 ticks per second, which results in a tick every 10ms.
Timer Thread Stack Size	Value must be greater than 0 or empty	1024	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Thread Priority	Value must be a positive integer or empty	0	Define the system timer thread's default stack size and priority. These are only applicable if TX_TIMER_PROCESS_IN_ISR is disabled.
Timer Process In ISR	• Enabled • Disabled	Enabled	Determine if timer expirations (application timers, timeouts, and tx_thread_sleep calls should be processed within the a system

			timer thread or directly in the timer ISR. When disabled, the timer thread is used. When enabled, timer expiration processing is done directly from the timer ISR, thereby eliminating the timer thread control block, stack, and context switching to activate it.
Reactivate Inline	• Enabled • Disabled	Disabled	Determine if in-line timer reactivation should be used within the timer expiration processing. By default, this is disabled and a function call is used. When enabled, reactivating is performed in-line resulting in faster timer processing but slightly larger code size.
Timer	• Enabled • Disabled	Enabled	Determine if no timer processing is required. This option will help eliminate the timer processing when not needed.
Trace			
Event Trace	• Enabled • Disabled	Disabled	Determine if the trace event logging code should be enabled. This causes slight increases in code size and overhead, but provides the ability to generate system trace information which is available for viewing in TraceX.
Trace Buffer Name	Name must be a valid C symbol	g_tx_trace_buffer	Name of trace buffer symbol, only used if Event Trace is enabled.
Memory section for Trace Buffer	Manual Entry	.bss	Specify the memory section where the Trace Buffer will be allocated, only used if Event Trace is enabled.

			To view TraceX data, export this buffer as raw binary data to a file (.trx extension recommended) and open it with Azure RTOS TraceX.
Trace Buffer Size	Value must be greater than 0	65536	Trace buffer size in bytes, only used if Event Trace is enabled
Trace Buffer Number of Registries	Value must be greater than 0	30	Number of registries available to TraceX, only used if Event Trace is enabled
Performance			
Block Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers block pool performance information.
Byte Pool Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers byte pool performance information.
Event Flags Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers event flags performance information.
Mutex Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers mutex performance information.
Queue Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers queue performance information.
Semaphore Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers semaphore performance information.
Thread Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers thread performance information.
Timer Performance Info	• Enabled • Disabled	Disabled	When enabled, ThreadX gathers timer performance information.

RA		
Hardware Thread Stack Monitoring	MCU Specific Options	Use RA Hardware Stack Monitors to monitor thread stacks for overflow. Not available on MCUs that support PSPLIM.
Interrupts		
SysTick Interrupt Priority	MCU Specific Options	Select the Systick interrupt priority.
Maximum Interrupt Priority	MCU Specific Options	The maximum priority (lowest numerical value) an interrupt can have and use scheduler services. Interrupts with higher priority can interrupt most scheduler critical sections. Setting this to Priority 0 (highest) disables this feature. This feature is not available on MCUs that do not have the BASEPRI register.

Clock Configuration

The ThreadX port uses the SysTick timer as the system clock. The timer rate is configured in the ThreadX component under General > Timer Ticks Per Second.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Interrupt Priorities

When no threads are ready to run, the ThreadX port spins in the PendSV_Handler, which is fixed at the lowest interrupt priority. The MCU does not service any other interrupts of the lowest priority while no threads are ready to run.

To get around this limitation, the application can create an idle thread that is always ready to run. If the idle thread enters a lower power mode, make sure all interrupts that are required to resume the scheduler can wake the MCU in the configured power mode. If the application expects to wake after a certain number of ticks, the idle thread should not enter standby mode because the SysTick cannot wake the MCU from standby mode. See Low Power Modes (r_lpm) for more information regarding low power modes.

Warning

Do not attempt to wake a thread from an interrupt with the lowest available interrupt

priority unless the application has created an idle thread.

Hardware Stack Monitor

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current thread. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Low Power Modes

The idle processing executes WFI() when no thread is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle processing executes WFI(), the RA ThreadX port changes the low power mode to sleep mode so the idle processing can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the thread has allocated a secure context (using tx_thread_secure_stack_allocate).

The secure context can be freed by deleting the thread or calling tx_thread_secure_stack_free.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback(bsp_grp_irq_t irq);
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
```

```
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
```

```
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the thread to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_threadx_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling tx_thread_secure_stack_allocate before calling any non-secure callable functions in a thread.

```
extern TX_THREAD * _tx_thread_current_ptr;
void rm_threadx_port_trustzone_thread_example (void)
{
 /* When ThreadX is used in a non-secure TrustZone application,
tx_thread_secure_stack_allocate must be called prior
  * to calling any non-secure callable function in a thread. The first parameter is a
pointer to the thread control block.
  * This function can be called when the thread is created or in the thread before an
non-secure callable function is
  * called. The second parameter is unused in the FSP implementation. */
    UINT status = tx_thread_secure_stack_allocate(_tx_thread_current_ptr, 0);
    assert(TX_SUCCESS == status);
```

```
    rm_threadx_port_nsc_function();
}
```

5.2.14.2 FreeRTOS Port (rm_freertos_port)

Modules » RTOS

FreeRTOS port for RA MCUs.

Overview

Note

The FreeRTOS Port does not provide any interfaces to the user. Consult the FreeRTOS documentation at https://www.freertos.org/Documentation for further information.

Features

The RA FreeRTOS port supports the following features:

- Standard FreeRTOS configurations
- Hardware stack monitor

Configuration

Note

The FreeRTOS Port and libraries use printf by default when logging is enabled. printf requires a heap (BSP Tab -> Properties -> RA Common -> Heap size (bytes)).

Build Time Configurations for all

The following build time configurations are defined in aws/FreeRTOSConfig.h:

Configuration	Options	Default	Description
General			
Custom FreeRTOSConfig.h	Manual Entry		Add a path to your custom FreeRTOSConfig.h file. It can be used to override some or all of the configurations defined here, and to define additional configurations.
Use Preemption	• Enabled • Disabled	Enabled	Set to Enabled to use the preemptive RTOS scheduler, or Disabled

			to use the cooperative RTOS scheduler.
Use Port Optimised Task Selection	• Enabled • Disabled	Disabled	Some FreeRTOS ports have two methods of selecting the next task to execute - a generic method, and a method that is specific to that port. The Generic method: Is used when Use Port Optimized Task Selection is set to 0, or when a port specific method is not implemented. Can be used with all FreeRTOS ports. Is completely written in C, making it less efficient than a port specific method. Does not impose a limit on the maximum number of available priorities. A port specific method: Is not available for all ports. Is used when Use Port Optimized Task Selection is Enabled. Relies on one or more architecture specific assembly instructions (typically a Count Leading Zeros [CLZ] or equivalent instruction) so can only be used with the architecture for which it was specifically written. Is more efficient than the generic method. Typically imposes a limit of 32 on the maximum number of available priorities.
Use Tickless Idle	• Enabled • Disabled	Disabled	Set Use Tickless Idle to Enabled to use the low power tickless mode, or Disabled to keep the

			tick interrupt running at all times. Low power tickless implementations are not provided for all FreeRTOS ports.
Cpu Clock Hz	Manual Entry	SystemCoreClock	Enter the frequency in Hz at which the internal clock that drives the peripheral used to generate the tick interrupt will be executing - this is normally the same clock that drives the internal CPU clock. This value is required in order to correctly configure timer peripherals.
Tick Rate Hz	Value must be greater than 0	1000	The frequency of the RTOS tick interrupt. The tick interrupt is used to measure time. Therefore a higher tick frequency means time can be measured to a higher resolution. However, a high tick frequency also means that the RTOS kernel will use more CPU time so be less efficient. The RTOS demo applications all use a tick rate of 1000Hz. This is used to test the RTOS kernel and is higher than would normally be required. More than one task can share the same priority. The RTOS scheduler will share processor time between tasks of the same priority by switching between the tasks during each RTOS tick. A high tick rate frequency will therefore also have the effect of reducing the

			'time slice' given to each task.
Max Priorities	Must be an integer and greater than 0	5	The number of priorities available to the application tasks. Any number of tasks can share the same priority. Each available priority consumes RAM within the RTOS kernel so this value should not be set any higher than actually required by your application.
Minimal Stack Size	Must be an integer and greater than 0	128	The size of the stack used by the idle task. Generally this should not be reduced from the value set in the FreeRTOSConfig.h file provided with the demo application for the port you are using. Like the stack size parameter to the xTaskCreate() and xTaskCreateStatic() functions, the stack size is specified in words, not bytes. If each item placed on the stack is 32-bits, then a stack size of 100 means 400 bytes (each 32-bit stack item consuming 4 bytes).
Max Task Name Len	Must be an integer and greater than 0	16	The maximum permissible length of the descriptive name given to a task when the task is created. The length is specified in the number of characters including the NULL termination byte.
Use 16-bit Ticks	Disabled	Disabled	Time is measured in 'ticks' - which is the number of times the tick interrupt has executed since the

			RTOS kernel was started. The tick count is held in a variable of type TickType_t. Defining configUSE_16_BIT_TICKS as 1 causes TickType_t to be defined (typedef'ed) as an unsigned 16bit type. Defining configUSE_16_BIT_TICKS as 0 causes TickType_t to be defined (typedef'ed) as an unsigned 32bit type. Using a 16-bit type will greatly improve performance on 8- and 16-bit architectures, but limits the maximum specifiable time period to 65535 'ticks'. Therefore, assuming a tick frequency of 250Hz, the maximum time a task can delay or block when a 16bit counter is used is 262 seconds, compared to 17179869 seconds when using a 32-bit counter.
Idle Should Yield	• Enabled • Disabled	Enabled	This parameter controls the behaviour of tasks at the idle priority. It only has an effect if: The preemptive scheduler is being used. The application creates tasks that run at the idle priority. If Use Time Slicing is Enabled then tasks that share the same priority will time slice. If none of the tasks get preempted then it might be assumed that each task at a given priority will be

allocated an equal amount of processing time - and if the priority is above the idle priority then this is indeed the case. When tasks share the idle priority the behaviour can be slightly different. If Idle Should Yield is Enabled then the idle task will yield immediately if any other task at the idle priority is ready to run. This ensures the minimum amount of time is spent in the idle task when application tasks are available for scheduling. This behaviour can however have undesirable effects (depending on the needs of your application) as depicted below:

The diagram above shows the execution pattern of four tasks that are all running at the idle priority. Tasks A, B and C are application tasks. Task I is the idle task. A context switch occurs with regular period at times T0, T1, ..., T6. When the idle task yields task A starts to execute - but the idle task has already consumed some of the current time slice. This results in task I and task A effectively sharing the same time slice. The application tasks B and C therefore get more processing time than the application task A.

			This situation can be avoided by: If appropriate, using an idle hook in place of separate tasks at the idle priority. Creating all application tasks at a priority greater than the idle priority. Setting Idle Should Yield to Disabled. Setting Idle Should Yield to Disabled prevents the idle task from yielding processing time until the end of its time slice. This ensure all tasks at the idle priority are allocated an equal amount of processing time (if none of the tasks get pre-empted) - but at the cost of a greater proportion of the total processing time being allocated to the idle task.
Use Task Notifications	• Enabled • Disabled	Enabled	Setting Use Task Notifications to Enabled will include direct to task notification functionality and its associated API in the build. Setting Use Task Notifications to Disabled will exclude direct to task notification functionality and its associated API from the build. Each task consumes 8 additional bytes of RAM when direct to task notifications are included in the build.
Task Notification Array Entries	Must be an integer and greater than 0	1	Set the Task Notifications Array

			Entries to enter the size of array needed
Use Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include mutex functionality in the build, or Disabled to omit mutex functionality from the build. Readers should familiarise themselves with the differences between mutexes and binary semaphores in relation to the FreeRTOS functionality.
Use Recursive Mutexes	• Enabled • Disabled	Disabled	Set to Enabled to include recursive mutex functionality in the build, or Disabled to omit recursive mutex functionality from the build.
Use Counting Semaphores	• Enabled • Disabled	Enabled	Set to Enabled to include counting semaphore functionality in the build, or Disabled to omit counting semaphore functionality from the build.
Queue Registry Size	Value must be positive integer greater than or equal to 0	10	The queue registry has two purposes, both of which are associated with RTOS kernel aware debugging: It allows a textual name to be associated with a queue for easy queue identification within a debugging GUI. It contains the information required by a debugger to locate each registered queue and semaphore. The queue registry has no purpose unless you are using a RTOS kernel aware debugger. Registry

			Size defines the maximum number of queues and semaphores that can be registered. Only those queues and semaphores that you want to view using a RTOS kernel aware debugger need be registered. See the API reference documentation for vQueueAddToRegistry( ) and vQueueUnregisterQueue() for more information.
Use Queue Sets	• Enabled • Disabled	Disabled	Set to Enabled to include queue set functionality (the ability to block, or pend, on multiple queues and semaphores), or Disabled to omit queue set functionality.
Use Time Slicing	• Enabled • Disabled	Disabled	If Use Time Slicing is Enabled, FreeRTOS uses prioritised preemptive scheduling with time slicing. That means the RTOS scheduler will always run the highest priority task that is in the Ready state, and will switch between tasks of equal priority on every RTOS tick interrupt. If Use Time Slicing is Disabled then the RTOS scheduler will still run the highest priority task that is in the Ready state, but will not switch between tasks of equal priority just because a tick interrupt has occurred.
Use Newlib Reentrant	• Enabled • Disabled	Disabled	If Use Newlib Reentrant is Enabled then a newlib reent structure will be allocated for

			each created task. Note Newlib support has been included by popular demand, but is not used by the FreeRTOS maintainers themselves. FreeRTOS is not responsible for resulting newlib operation. User must be familiar with newlib and must provide system-wide implementations of the necessary stubs. Be warned that (at the time of writing) the current newlib design implements a system-wide malloc() that must be provided with locks.
Enable Backward Compatibility	• Enabled • Disabled	Disabled	The FreeRTOS.h header file includes a set of #define macros that map the names of data types used in versions of FreeRTOS prior to version 8.0.0 to the names used in FreeRTOS version 8.0.0. The macros allow application code to update the version of FreeRTOS they are built against from a pre 8.0.0 version to a post 8.0.0 version without modification. Setting Enable Backward Compatibility to Disabled in FreeRTOSConfig.h excludes the macros from the build, and in so doing allowing validation that no pre version 8.0.0 names are being used.
Num Thread Local Storage Pointers	Value must be positive integer greater than or equal to 0	5	Sets the number of indexes in each task's thread local storage array.
Stack Depth Type	Manual Entry	uint32_t	Sets the type used to

			specify the stack depth in calls to xTaskCreate(), and various other places stack sizes are used (for example, when returning the stack high water mark). Older versions of FreeRTOS specified stack sizes using variables of type UBaseType_t, but that was found to be too restrictive on 8-bit microcontrollers. Stack Depth Type removes that restriction by enabling application developers to specify the type to use.
Message Buffer Length Type	Manual Entry	size_t	FreeRTOS Message buffers use variables of type Message Buffer Length Type to store the length of each message. If Message Buffer Length Type is not defined then it will default to size_t. If the messages stored in a message buffer will never be larger than 255 bytes then defining Message Buffer Length Type to uint8_t will save 3 bytes per message on a 32-bit microcontroller. Likewise if the messages stored in a message buffer will never be larger than 65535 bytes then defining Message Buffer Length Type to uint16_t will save 2 bytes per message on a 32-bit microcontroller.
Library Max Syscall Interrupt Priority	MCU Specific Options		The highest interrupt priority that can be used by any interrupt service routine that

makes calls to interrupt safe FreeRTOS API functions. DO NOT CALL INTERRUPT SAFE FREERTOS API FUNCTIONS FROM ANY INTERRUPT THAT HAS A HIGHER PRIORITY THAN THIS! (higher priorities are lower numeric values)

Below is explanation for macros that are set based on this value from FreeRTOS website.

In the RA port, configKERNEL_INTERRUPT_PRIORITY is not used and the kernel runs at the lowest priority.

Note in the following discussion that only API functions that end in "FromISR" can be called from within an interrupt service routine.

configMAX_SYSCALL_INTERRUPT_PRIORITY sets the highest interrupt priority from which interrupt safe FreeRTOS API functions can be called.

A full interrupt nesting model is achieved by setting configMAX_SYSCALL_INTERRUPT_PRIORITY above (that is, at a higher priority level) than configKERNEL_INTERRUPT_PRIORITY. This means the FreeRTOS kernel does not completely disable interrupts, even inside critical sections. Further, this is achieved without the

disadvantages of a segmented kernel architecture.

Interrupts that do not call API functions can execute at priorities above configMAX_SYSCALL_INTERRUPT_PRIORITY and therefore never be delayed by the RTOS kernel execution.

A special note for Arm Cortex-M users: Please read the page dedicated to interrupt priority settings on Arm Cortex-M devices. As a minimum, remember that Arm Cortex-M cores use numerically low priority numbers to represent HIGH priority interrupts, which can seem counter-intuitive and is easy to forget! If you wish to assign an interrupt a low priority do NOT assign it a priority of 0 (or other low numeric value) as this can result in the interrupt actually having the highest priority in the system - and therefore potentially make your system crash if this priority is above config MAX_SYSCALL_INTERRUPT_PRIORITY.

The lowest priority on a Arm Cortex-M core is in fact 255 - however different Arm Cortex-M vendors implement a different number of priority bits and supply library functions that expect priorities to be specified in different ways. For example, on the RA6M3 the lowest

			priority you can specify is 15 - and the highest priority you can specify is 0.
Assert	Manual Entry	assert(x)	The semantics of the configASSERT() macro are the same as the standard C assert() macro. An assertion is triggered if the parameter passed into configASSERT() is zero. configASSERT() is called throughout the FreeRTOS source files to check how the application is using FreeRTOS. It is highly recommended to develop FreeRTOS applications with configASSERT() defined. The example definition (shown at the top of the file and replicated below) calls vAssertCalled(), passing in the file name and line number of the triggering configASSERT() call (__FILE__ and __LINE__ are standard macros provided by most compilers). This is just for demonstration as vAssertCalled() is not a FreeRTOS function, configASSERT() can be defined to take whatever action the application writer deems appropriate. It is normal to define configASSERT() in such a way that it will prevent the application from executing any further. This if for two reasons; stopping the application at the point

of the assertion allows the cause of the assertion to be debugged, and executing past a triggered assertion will probably result in a crash anyway.

Note defining configASSERT() will increase both the application code size and execution time. When the application is stable the additional overhead can be removed by simply commenting out the configASSERT() definition in FreeRTOSConfig.h.

/* Define configASSERT() to call vAssertCalled() if the assertion fails. The assertion
has failed if the value of the parameter passed into configASSERT() equals zero. */
#define configASSERT((x)) if((x) == 0) vAssertCalled(__FILE__, __LINE__)
If running FreeRTOS under the control of a debugger, then configASSERT() can be defined to just disable interrupts and sit in a loop, as demonstrated below. That will have the effect of stopping the code on the line that failed the assert test - pausing the debugger will then immediately take you to the offending line so you can see why it failed.

			/* Define configASSERT() to disable interrupts and sit in a loop. */ #define configASSERT((x)) if((x) == 0) { taskDISABLE_INTERRUPTS(); for(;;); }
Include Application Defined Privileged Functions	• Enabled • Disabled	Disabled	Include Application Defined Privileged Functions is only used by FreeRTOS MPU. If Include Application Defined Privileged Functions is Enabled then the application writer must provide a header file called "application_defined_privileged_functions.h", in which functions the application writer needs to execute in privileged mode can be implemented. Note that, despite having a .h extension, the header file should contain the implementation of the C functions, not just the functions' prototypes. Functions implemented in "application_defined_privileged_functions.h" must save and restore the processor's privilege state using the prvRaisePrivilege() function and portRESET_PRIVILEGE() macro respectively. For example, if a library provided print function accesses RAM that is outside of the control of the application writer, and therefore cannot be allocated to a memory protected user mode task, then the print function can

			be encapsulated in a privileged function using the following code:
			
			void MPU_debug_printf(const char *pcMessage)
			{
			/* State the privilege level of the processor when the function was called. */
			BaseType_t xRunningPrivileged = prvRaisePrivilege();
			
			/* Call the library function, which now has access to all RAM. */
			debug_printf(pcMessage);
			
			/* Reset the processor privilege level to its original value. */
			portRESET_PRIVILEGE(xRunningPrivileged);
			}
			This technique should only be use during development, and not deployment, as it circumvents the memory protection.

Hooks			
Use Idle Hook	• Enabled • Disabled	Enabled	Set to Enabled if you wish to use an idle hook, or Disabled to omit an idle hook.
Use Malloc Failed Hook	• Enabled • Disabled	Disabled	The kernel uses a call to pvPortMalloc() to allocate memory from the heap each time a task, queue or semaphore is created. The official FreeRTOS download includes four sample memory allocation schemes for this purpose. The schemes are

			implemented in the heap_1.c, heap_2.c, heap_3.c, heap_4.c and heap_5.c source files respectively. Use Malloc Failed Hook is only relevant when one of these three sample schemes is being used. The malloc() failed hook function is a hook (or callback) function that, if defined and configured, will be called if pvPortMalloc() ever returns NULL. NULL will be returned only if there is insufficient FreeRTOS heap memory remaining for the requested allocation to succeed. If Use Malloc Failed Hook is Enabled then the application must define a malloc() failed hook function. If Use Malloc Failed Hook is set to Dosab;ed then the malloc() failed hook function will not be called, even if one is defined. Malloc() failed hook functions must have the name and prototype shown below. void vApplicationMalloc FailedHook(void);
Use Daemon Task Startup Hook	• Enabled • Disabled	Disabled	If Use Timers and Use Daemon Task Startup Hook are both Enabled then the application must define a hook function that has the exact name and prototype as shown below. The hook function will be called exactly once when the RTOS daemon task

			(also known as the timer service task) executes for the first time. Any application initialisation code that needs the RTOS to be running can be placed in the hook function. void void vApplicationDaemonTaskStartupHook(void);
Use Tick Hook	• Enabled • Disabled	Disabled	Set to Enabled if you wish to use an tick hook, or Disabled to omit an tick hook.
Check For Stack Overflow	• Enabled • Disabled	Disabled	The stack overflow detection page describes the use of this parameter. This is not recommended for RA MCUs with hardware stack monitor support. RA MCU designs should enable the RA hardware stack monitor instead.
Stats			
Use Trace Facility	• Enabled • Disabled	Disabled	Set to Enabled if you wish to include additional structure members and functions to assist with execution visualisation and tracing.
Use Stats Formatting Functions	• Enabled • Disabled	Disabled	Set Use Trace Facility and Use Stats Formatting Functions to Enabled to include the vTaskList() and vTaskGetRunTimeStats() functions in the build. Setting either to Disabled will omit vTaskList() and vTaskGetRunTimeStates() from the build.
Generate Run Time Stats	• Enabled • Disabled	Disabled	The Run Time Stats page describes the use of this parameter.
Memory Allocation			

Clear Memory on Free	• Enabled • Disabled	Disabled	If set to 1, then blocks of memory allocated using pvPortMalloc() will be cleared when freed using vPortFree()
Support Static Allocation	• Enabled • Disabled	Enabled	If Support Static Allocation is Enabled then RTOS objects can be created using RAM provided by the application writer. If Support Static Allocation is Disabled then RTOS objects can only be created using RAM allocated from the FreeRTOS heap. If Support Static Allocation is left undefined it will default to 0. If Support Static Allocation is Enabled then the application writer must also provide two callback functions: vApplication GetIdleTaskMemory() to provide the memory for use by the RTOS Idle task, and (if Use Timers is Enabled) vAp plicationGetTimerTask Memory() to provide memory for use by the RTOS Daemon/Timer Service task. Examples are provided below. /* Support Static Allocation is Enabled, so the application must provide an implementation of vAp plicationGetIdleTaskMe mory() to provide the memory that is used by the Idle task. */ void vApplicationGetIdl eTaskMemory(StaticTask_t **ppxIdleT

askTCBBuffer,
StackType_t **ppxIdleTaskStackBuffer,
uint32_t *pulIdleTaskStackSize)
{
/* If the buffers to be provided to the Idle task are declared inside this
function then they must be declared static - otherwise they will be allocated on
the stack and so not exists after this function exits. */
static StaticTask_t xIdleTaskTCB;
static StackType_t uxIdleTaskStack[configMINIMAL_STACK_SIZE];

/* Pass out a pointer to the StaticTask_t structure in which the Idle task's
state will be stored. */
*ppxIdleTaskTCBBuffer =

/* Pass out the array that will be used as the Idle task's stack. */
*ppxIdleTaskStackBuffer = uxIdleTaskStack;

/* Pass out the size of the array pointed to by *ppxIdleTaskStackBuffer.
Note that, as the array is necessarily of type StackType_t,
configMINIMAL_STACK_SIZE is specified in words, not bytes. */
*pulIdleTaskStackSize = configMINIMAL_STACK_SIZE;
}
/*---*/

/* Support Static

Allocation and Use Timers are both Enabled, so the application must provide an implementation of vApplicationGetTimerTaskMemory()
to provide the memory that is used by the Timer service task. */
void vApplicationGetTimerTaskMemory(
StaticTask_t **ppxTimerTaskTCBBuffer,
StackType_t **ppxTimerTaskStackBuffer,
uint32_t *pulTimerTaskStackSize)
{
/* If the buffers to be provided to the Timer task are declared inside this
function then they must be declared static - otherwise they will be allocated on
the stack and so not exists after this function exits. */
static StaticTask_t xTimerTaskTCB;
static StackType_t uxTimerTaskStack[configTIMER_TASK_STACK_DEPTH];

/* Pass out a pointer to the StaticTask_t structure in which the Timer
task's state will be stored. */
*ppxTimerTaskTCBBuffer =

/* Pass out the array that will be used as the Timer task's stack. */
*ppxTimerTaskStackBuffer =
uxTimerTaskStack;

			/* Pass out the size of the array pointed to by *ppxTimerTaskStackBuffer.
			Note that, as the array is necessarily of type StackType_t, configTIMER_TASK_STACK_DEPTH is specified in words, not bytes. */
			*pulTimerTaskStackSize = configTIMER_TASK_STACK_DEPTH;
			}
			
			Examples of the callback functions that must be provided by the application to supply the RAM used by the Idle and Timer Service tasks if Support Static Allocation is Enabled.
			
			See the Static Vs Dynamic Memory Allocation page for more information.

Support Dynamic Allocation	• Enabled • Disabled	Disabled	If Support Dynamic Allocation is Enabled then RTOS objects can be created using RAM that is automatically allocated from the FreeRTOS heap. If Support Dynamic Allocation is set to 0 then RTOS objects can only be created using RAM provided by the application writer. See the Static Vs Dynamic Memory Allocation page for more information.
Total Heap Size	Value must be positive integer greater than or equal to 0	1024	The total amount of RAM available in the FreeRTOS heap. This value will only be used if Support Dynamic Allocation is Enabled and the

			application makes use of one of the sample memory allocation schemes provided in the FreeRTOS source code download. See the memory configuration section for further details.
Application Allocated Heap	• Enabled • Disabled	Disabled	By default the FreeRTOS heap is declared by FreeRTOS and placed in memory by the linker. Setting Application Allocated Heap to Enabled allows the heap to instead be declared by the application writer, which allows the application writer to place the heap wherever they like in memory. If heap_1.c, heap_2.c or heap_4.c is used, and Application Allocated Heap is Enabled, then the application writer must provide a uint8_t array with the exact name and dimension as shown below. The array will be used as the FreeRTOS heap. How the array is placed at a specific memory location is dependent on the compiler being used - refer to your compiler's documentation. uint8_t ucHeap[configTOTAL_HEAP_SIZE];
Timers			
Use Timers	• Enabled • Disabled	Enabled	Set to Enabled to include software timer functionality, or Disabled to omit software timer functionality. See the

			FreeRTOS software timers page for a full description.
Timer Task Priority	Value must be positive integer greater than or equal to 0	3	Sets the priority of the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Timer Queue Length	Value must be a non-negative integer	10	Sets the length of the software timer command queue. See the FreeRTOS software timers page for a full description.
Timer Task Stack Depth	Value must be a non-negative integer	128	Sets the stack depth allocated to the software timer service/daemon task. See the FreeRTOS software timers page for a full description.
Optional Functions			
vTaskPrioritySet() Function	• Enabled • Disabled	Enabled	Include vTaskPrioritySet() function in build
uxTaskPriorityGet() Function	• Enabled • Disabled	Enabled	Include uxTaskPriorityGet() function in build
vTaskDelete() Function	• Enabled • Disabled	Enabled	Include vTaskDelete() function in build
vTaskSuspend() Function	• Enabled • Disabled	Enabled	Include vTaskSuspend() function in build
xResumeFromISR() Function	• Enabled • Disabled	Enabled	Include xResumeFromISR() function in build
vTaskDelayUntil() Function	• Enabled • Disabled	Enabled	Include vTaskDelayUntil() function in build
vTaskDelay() Function	• Enabled • Disabled	Enabled	Include vTaskDelay() function in build
xTaskGetSchedulerState() Function	• Enabled • Disabled	Enabled	Include xTaskGetSchedulerState() function in build
xTaskGetCurrentTaskHandle() Function	• Enabled • Disabled	Enabled	Include xTaskGetCurrentTaskHandle()

			function in build
uxTaskGetStackHighWaterMark() Function	• Enabled • Disabled	Disabled	Include uxTaskGetStackHighWaterMark() function in build
xTaskGetIdleTaskHandle() Function	• Enabled • Disabled	Disabled	Include xTaskGetIdleTaskHandle() function in build
eTaskGetState() Function	• Enabled • Disabled	Disabled	Include eTaskGetState() function in build
xEventGroupSetBitFromISR() Function	• Enabled • Disabled	Enabled	Include xEventGroupSetBitFromISR() function in build
xTimerPendFunctionCall() Function	• Enabled • Disabled	Disabled	Include xTimerPendFunctionCall() function in build
xTaskAbortDelay() Function	• Enabled • Disabled	Disabled	Include xTaskAbortDelay() function in build
xTaskGetHandle() Function	• Enabled • Disabled	Disabled	Include xTaskGetHandle() function in build
xTaskResumeFromISR() Function	• Enabled • Disabled	Enabled	Include xTaskResumeFromISR() function in build
RA			
Hardware Stack Monitor	• Enabled • Disabled	Disabled	Include RA stack monitor
Logging			
Print String Function	Manual Entry	vLoggingPrint(x)	
Logging Include Time and Task Name	• Disabled • Enabled	Disabled	
Debug Logging Name	Manual Entry	Log Name	
Logging Level	• LOG_NONE • LOG_ERROR • LOG_WARN • LOG_INFO • LOG_DEBUG	LOG_NONE	Set the logging level

Clock Configuration

The FreeRTOS port uses the SysTick timer as the system clock. The timer rate is configured in the FreeRTOS component under General > Tick Rate Hz.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Hardware Stack Monitor (PSPLIM)

A UsageFault is generated if PSP goes out of the memory area for the stack allocated for the current task. If UsageFault is not enabled, it is escalated to HardFault.

Hardware Stack Monitor (SPMON)

The hardware stack monitor generates an NMI if the PSP goes out of the memory area for the stack allocated for the current task. A callback can be registered using R_BSP_GroupIrqWrite() to be called whenever a stack overflow or underflow of the PSP for a particular thread is detected.

Stack Monitor Underflow Detection

By default the hardware stack monitor only checks for overflow of the process stack. To check for underflow define configRECORD_STACK_HIGH_ADDRESS as 1 on the command line.

Low Power Modes

When FreeRTOS is configured to use tickless idle, the idle task executes WFI() when no task is ready to run. If the MCU is configured to enter software standby mode or deep software standby mode when the idle task executes WFI(), the RA FreeRTOS port changes the low power mode to sleep mode so the idle task can wake from SysTick. The low power mode settings are restored when the MCU wakes from sleep mode.

TrustZone Integration

When using an RTOS in a TrustZone project, Arm recommends keeping the RTOS in the non-secure project. Tasks may call non-secure callable functions if the task has allocated a secure context (using portALLOCATE_SECURE_CONTEXT).

The secure context can be freed by deleting the thread or using the portCLEAN_UP_TCB(pxTCB) macro.

Examples

Stack Monitor Example

This is an example of using the stack monitor in an application.

```
#if BSP_FEATURE_BSP_HAS_SP_MON
void stack_monitor_callback (bsp_grp_irq_t irq)
{
 FSP_PARAMETER_NOT_USED(irq);
 if (1U == R_MPU_SPMON->SP[0].CTL_b.ERROR)
    {
 /* Handle main stack monitor error here. */
```

```
    }
 if (1U == R_MPU_SPMON->SP[1].CTL_b.ERROR)
    {
 /* Handle process stack monitor error here. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Register a callback to be called when the stack goes outside the allocated stack
area. */
 R_BSP_GroupIrqWrite(BSP_GRP_IRQ_MPU_STACK, stack_monitor_callback);
}
#else
/* Allocate stack space to return from UsageFault. */
uint32_t g_stack_overflow_exception_stack[8] BSP_ALIGN_VARIABLE(BSP_STACK_ALIGNMENT)
BSP_PLACE_IN_SECTION(
    BSP_UNINIT_SECTION_PREFIX ".ram_noinit");
/* MCUs that do not have an SPMON stack monitor use PSPLIM to detect stack overflows.
When a stack overflow error
 * occurs, the UsageFault_Handler fires if it has been enabled. */
void UsageFault_Handler (void)
{
 register uint32_t cfsr = SCB->CFSR;
 if (cfsr & SCB_CFSR_STKOF_Msk)
    {
 /* Update PSP and PSPLIM to point to an exception stack frame allocated for stack
overflows. */
 register uint32_t * p_exception_stack_frame = (uint32_t *)
(&g_stack_overflow_exception_stack);
       __set_PSP((uint32_t) p_exception_stack_frame);
       __set_PSPLIM((uint32_t) p_exception_stack_frame);
 /* Clear XPSR, only set T-bit. */
       p_exception_stack_frame[7] = 1U << 24;
 /* Set PC to stack overflow error while loop. When execution returns from the
```

```
UsageFault, it will go to the
  * stack_overflow_error_occurred function. It cannot return to the location where
the fault occurred because
  * the MCU does not save the exception stack frame to the stack when a stack
overflow error occurs. */
       p_exception_stack_frame[6] = (uint32_t) stack_overflow_error_occurred;
    }
 /* Clear flags. */
    SCB->CFSR = cfsr;
}
/* This function is called from UsageFault_Handler after a stack overflow occurs. */
void stack_overflow_error_occurred (void)
{
 /* When recovering from a stack overflow, move the task to a while(1) loop. */
 while (1)
    {
 /* Do nothing. */
    }
}
void rm_freertos_port_stack_monitor_example (void)
{
 /* Enable usage fault. */
    SCB->SHCSR |= SCB_SHCSR_USGFAULTENA_Msk;
}
#endif
```

TrustZone Example

This is an example of calling portALLOCATE_SECURE_CONTEXT before calling any non-secure callable functions in a task.

```
void rm_freertos_port_trustzone_task_example (void)
{
 /* When FreeRTOS is used in a non-secure TrustZone application,
portALLOCATE_SECURE_CONTEXT must be called prior
```

```
  * to calling any non-secure callable function in a task. The parameter is unused in
the FSP implementation. */
    portALLOCATE_SECURE_CONTEXT(0);
    rm_freertos_port_nsc_function();
}
```

5.2.15 Security

Modules

Detailed Description

Security Modules.

Modules

	AWS Device Provisioning AWS Device Provisioning example software.
	Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto) Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto API.
	Mbed Crypto H/W Acceleration (rm_psa_crypto) Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.
	Ocrypto (rm_ocrypto_port) Oberon Ocrypto crypto library for limited RA0 and RA2 devices.
	Renesas Secure IP (r_rsip_e11a_protected_cavp) Driver for the CAVP Certified Renesas Secure IP (RSIP-E11A) on RA MPUs.
	Renesas Secure IP (r_rsip_e31a_protected_cavp) Driver for the CAVP Certified Renesas Secure IP (RSIP-E31A) on RA MPUs.

	Renesas Secure IP (r_rsip_e51a_protected_cavp) Driver for the CAVP Certified Renesas Secure IP (RSIP-E51A) on RA MPUs.
	Renesas Secure IP (r_rsip_protected) Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.
	SCE Protected Mode Driver for the Secure Crypto Engine (SCE9) on RA MCUs.
	Secure Crypto Engine (r_sce_protected_cavp) Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.
	Secure Key Injection (r_rsip_key_injection) Driver for the Secure Key Injection on RA MCUs.
	Secure Key Injection (r_sce_key_injection) Driver for the Secure Key Injection on RA MCUs.
	TinyCrypt H/W Acceleration (rm_tinycrypt_port) AES128 Hardware acceleration for TinyCrypt on the RA2 family.

5.2.15.1 AWS Device Provisioning

Modules » Security

AWS Device Provisioning example software.

Overview

Terminology

The terminology defined below will be used in the following sections.

Term	Description
Service Provider	Entity that provides the cloud infrastructure and associated services, for example, AWS/Azure.
Device Manufacturer	Entity that provides the MCU, for example, Renesas.
OEM	Entity that uses the MCU to create a product.
Customer	End user of OEM product.

Device ID

For systems that intend to use Public Key Certificate (PKC), the Device ID is in the form of a key pair (RSA or ECC). A PKC comprises of a **public key**, metadata, and finally a signature over all that. This signature is generated by the entity that issues the certificate and is known as a CA (Certificate Authority). The most common format for a public certificate is the X.509 format which is typically PEM (base 64) encoded such that the certificate is human-readable. It can also be DER encoded which is binary encoding and thus not human readable. The **public key** portion of the Device ID is used for the Device Certificate.

Provisioning

Device Provisioning refers to the process by which a service provider links a certificate to a Device ID and thus a device. Depending on the provisioning model, an existing certificate from the device may be used or a new one will be issued at this stage. Provisioning (also referred to as Registration) occurs with respect to a particular service provider, for example, AWS or Azure. It is necessary that the certificate is issued by the service provider or a CA known to those providers. When a device is provisioned with AWS for example, the AWS IoT service associates the Device ID (and thus the device) with a specific certificate. The certificate will be programmed into the device and for all future transactions with AWS, the certificate will be used as the means of identifying the device. The public and private key are also stored on the MCU.

Provisioning Models

Provisioning services vary between service providers. There are essentially three general provisioning models.

1. Provisioning happens on the production line. This requires the provisioning Infrastructure to be present on the production line. This is the most secure model, but is expensive.
2. Devices are programmed with a shared credential that is linked into the code at build time and the provisioning occurs when a customer uses the device for the first time. The shared credential and a unique device serial number are used to uniquely identify the device during the provisioning process. So long as the product only has the shared credential, it will only operate with limited (as defined by certificate policy) functionality .Once the provisioning is done, then the device will be fully functional. This is the most common use case for consumer products where no sensitive information is being transmitted. AWS provides an example of this model.
3. Devices have no identity programmed in the factory; provisioning occurs through some other device like a smartphone which is already trusted by the service provider.

In all these cases, the Device Identity

1. Is unique to the device
2. Must have restricted access within the device
3. Can be used to issue more than one certificate and the certificates themselves have to be

updatable in the field.

AWS uses the PKCS11 API to erase, store and retrieve certificates. These PKCS11 functions (Write, Read and Erase) are separated out into a Physical Abstraction Layer (PAL) which the OEM/Device Manufacturer is expected to implement for the type of memory that they intend to use. The internal rm_aws_pkcs11_pal_littlefs module implements these requirements on RA MCU data flash.

AWS Provisioning Example

AWS provides an **example** implementation to support device provisioning. This implementation uses the PKCS11 API to store device credentials into the PKCS11 defined memory. The implementation (aws_dev_mode_key_provisioning.c) exposes:

1. vAlternateKeyProvisioning()

This function requires that the device credentials be provided in PEM format. Using this example function as is in production is not recommended.

Note **vDevModeKeyProvisioning()** is no longer supported.

Credentials can be created as follows: *Create your own CA and use that to generate the device certificate. This CA will have to be registered with the service provider with which the product will be used, for example Register your CA with AWS.

- Use AWS to generate the device certificate.

Examples

Basic Example

This is a basic example of provisioning a device using the AWS demo implementation.

```

    params.ulJITPCertificateLength   = 0;
    vAlternateKeyProvisioning(&params);
}
```

Limitations

The provisioning code is an example provided by AWS. It must be modified to meet product requirements.

5.2.15.2 Azure RTOS NetX Crypto HW Acceleration (rm_netx_secure_crypto)

Modules » Security

Detailed Description

Hardware acceleration for the Netx Crypto implementation of the Microsoft Azure RTOS NetX Crypto

API.

Overview

Please refer to the NetXDuo - NetX Crypto documentation for further details.

HW Overview

Crypto Peripheral version	Devices
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8P1
RSIP-E31A	RA4C1
RSIP-E11A	RA4L1
SCE9	RA6M4, RA4M3, RA4M2, RA6M5
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2
AES Engine	RA2A1, RA2E1, RA2E2, RA2L1
AES Engine 2	RA2A2
TRNG	RA0E1, RA0E2, RA2L2, RA4E1, RA4E2, RA4T1, RA6E1, RA6E2, RA6T3, RA8E1, RA8E2

Features

		AES Engine	AES Engine 2	SCE5	SCE5_B	SCE7	SCE9	RSIP-E11A	RSIP-E31A	RSIP-E51A	RSIP-E50D
TRNG		Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Hash	SHA224, SHA256	–	–	–	–	Yes	Yes	Yes	Yes	Yes	Yes
	SHA384, SHA512	–	–	–	–	–	–	–	Yes	Yes	Yes
	SHA512/224, SHA512/256	–	–	–	–	–	–	–	Yes	Yes	Yes
MAC	HMAC-SHA224, HMAC-SHA256	–	–	–	–	Yes	Yes	Yes	Yes	Yes	Yes
	HMAC-	–	–	–	–	–	–	–	Yes	Yes	Yes

ECC	secp256r1	–	–	–	–	Yes	Yes	Yes	Yes	Yes	Yes
	secp384r1	–	–	–	–	Yes	Yes	–	Yes	Yes	Yes
RSA	RSA-1024	–	–	–	–	–	Yes	–	–	Yes	Yes
	RSA-2048	–	–	–	–	Yes	Yes	–	–	Yes	Yes

RSA-3072 (3)	–	–	–	–	–	Yes	–	–	Yes	Yes
RSA-4096 (3)	–	–	–	–	–	Yes	–	–	Yes	Yes

Note

1. Only block cipher unit is HW accelerated
2. Encrypt - Fully accelerated; Decrypt - Only GHASH and block cipher unit is HW accelerated
3. Signature verification only

Configuration

Build Time Configurations for rm_netx_secure_crypto_sw_port

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.
Maximum RSA Modulus size (bits)	• 1024 • 2048 • 3072 • 4096	4096	

Build Time Configurations for rm_netx_secure_crypto

The following build time configurations are defined in fsp_cfg/middleware/rm_netx_secure_crypto_cfg.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Hash			
SHA256/224	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT.
SHA512/384	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT.
Hardware Acceleration > Cipher			
AES	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_M

			ETHODS_AES_ALT
Hardware Acceleration > Public Key Cryptography (PKC)			
Hardware Acceleration > Public Key Cryptography (PKC) > ECC			
ECC	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT
ECDSA Scratch Buffer Size (Bytes)	Value must be a non-negative integer	3016	Sets value of NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE
ECDH Scratch Buffer Size (Bytes)	Value must be a non-negative integer	2464	Sets value of NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE
Hardware Acceleration > Public Key Cryptography (PKC) > RSA			
RSA	MCU Specific Options		Enables/Disables RSA HW support
RSA 1024 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT to allow HW support
RSA 2048 (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT to allow HW support
RSA 3072 Verify/Encryption (HW)	MCU Specific Options		Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT to allow HW support
RSA 4096 Verify/Encryption (HW)	MCU Specific Options		Enables RSA NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT to allow HW support
RSA Scratch Buffer Size (Bytes)	MCU Specific Options		Sets value of NX_CRYPTO_RSA_SCRATCH_BUFFER_SIZE
TRNG	• Enabled • Disabled	Enabled	Enables NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT.
Standalone Usage	• Use Standalone Crypto Only • Use with TLS	Use Standalone Crypto Only	Defines NX_CRYPTO_STANDALONE_ENABLE.

Random Number Generator Configuration

To enable hardware acceleration for the TRNG, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_TRNG_ALT must be defined in the configuration file.

By default TRNG is enabled which can be disabled using the RA Configuration editor.

Once enabled 'rand' function will be mapped to HW TRNG; the 'srand' function is not supported, any calls to this function will have no effect. Functionality to re-seed the HW TRNG is not supported by the existing implementation.

If disabled, both 'rand' and 'srand' will be mapped to the C Standard Library. This would require setting up the heap as 'rand' implementation calls 'malloc'.

SHA Configuration

To enable hardware acceleration for the SHA256/224 or SHA384/512 calculation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA256_ALT or NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_SHA512_ALT must be defined in the configuration file. By default SHA is enabled which can be disabled using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/192/256 operation, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_AES_ALT must be defined in the configuration file. By default AES is enabled which can be disabled using the RA Configuration editor.

ECC Configuration

To enable hardware acceleration for the ECDSA and ECDH for curves SECP384R1 and SECP256R1, the macro NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_ECC_ALT must be defined in the configuration file. By default ECC operations are enabled which can be disabled using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA Encrypt/Decrypt (or Sign/Verify) operation(s), the macro(s) below must be must be defined in the configuration file:

Configuration Macro	Feature / Operation
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_1024_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_2048_ALT	Signature Generation / Signature Verification (Encryption / Decryption)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_3072_ALT	Signature Verification (Encryption Only)
NETX_SECURE_CRYPTO_NX_CRYPTO_METHODS_RSA_4096_ALT	Signature Verification (Encryption Only)

By default RSA 2048 is enabled which can be disabled using the RA Configuration editor.

RSA software implementation is completely disabled when any of the above macros are enabled.

Usage Notes

Memory Alignment

Use 32bit aligned buffer pointers as arguments to APIs for best performance.

Hardware Initialization

_nx_crypto_initialize() must be invoked before using the NetX Crypto APIs to ensure that the SCE peripheral is initialized.

Memory Usage

Sufficient memory must be allocated to be used as 'crypto_metadata' for the chosen crypto operation(s). Refer Azure RTOS NetX Crypto API description for recommended 'crypto_metadata_size' based on selected crypto operations. Sufficient amount of memory must be allocated for the thread stack to support low level crypto operations when using this module in the standalone mode or through NetX Secure (TLS). A minimum stack of 0x1000 is required to use ECC and RSA. This is either the main stack in a bare metal application or the specific thread stack for an RTOS based application.

AES Usage

GCM mode

The first byte of the IV must indicate the length of the subsequent IV. For example if the IV is {0x00, 0x00, 0x00}, then the IV pointer passed to the _nx_crypto_method_aes_operation must store the IV as {0x03, 0x00, 0x00, 0x00}. Refer to the example code for actual usage.

CTR mode

For CTR mode the IV pointer must be as defined in Using Advanced Encryption Standard (AES) Counter Mode With IPsec Encapsulating Security Payload (ESP) under 'Figure 2. Counter Block Format'. The IV must be 8 bytes in length. The Nonce field in the reference above must be 4 bytes and should be passed to _nx_crypto_method_aes_operation through the key pointer stored after the actual AES key. For Example, if the AES 128-bit Plain Key is {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00} and the Nonce is {0x01, 0x07, 0xBD, 0xFD}, the key passed to the _nx_crypto_method_aes_operation during Encryption/Decryption should be set as {0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x00, 0x01, 0x07, 0xBD, 0xFD}. This format would also be valid for Wrapped keys where the Nonce is appended at the end of the actual Wrapped key. Refer to the example code for actual usage.

The 'Block Counter' field in the above reference is fixed to {0x00, 0x00, 0x00, 0x01} at the beginning and increments internally after every subsequent AES block is processed. Test vectors that have the initial Block Counter not set to {0x00, 0x00, 0x00, 0x01} cannot be used in this implementation.

ECC Usage

ECC operations include ECDH and ECDSA. As a part of ECDSA operation the input message can be hashed before signing or verification, or the message digest can be provided directly. ECC Scratch buffer size can be optionally reduced as supported ECC computations are now done by the HW. This is controlled by NX_CRYPTO_ECDSA_SCRATCH_BUFFER_SIZE and NX_CRYPTO_ECDH_SCRATCH_BUFFER_SIZE macros for ECDSA and ECDH respectively.

Operation	Key Format
ECDSA Signature	Plain private key; Wrapped private key
ECDSA Signature-Verify	Uncompressed public key

Key Generation using ECDSA operation API	Wrapped private key; Uncompressed public key
ECDH private key import	Plain private key; Wrapped private key (Allows for Uncompressed and Formatted public key)
ECDH public key export	Uncompressed public key
ECDH setup	Uncompressed public key
ECDH shared secret calculate	Uncompressed public key
Key Generation using ECDH operation API	Wrapped private key; Uncompressed public key

Note:

- Uncompressed public key is of the form (0x04 || Qx || Qy). Refer Section 2.2. Subject Public Key under RFC5480
- Formatted public key is of the form (Key Info (4 bytes) || Qx || Qy || Key Info (16 bytes)). This is the key which is used internally by SCE peripheral.

RSA Usage

Wrapped Key Usage

To use the NetX Crypto stack with wrapped private keys (for signature generation/decryption), a dummy pointer (non-NULL) should be passed to the 'key' parameter during _nx_crypto_method_rsa_init API call. However, the 'key_size_in_bits' parameter should be equal to the intended RSA modulus length in bits. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_rsa_operation API call with its length in bits passed through the 'key_size_in_bits' parameter.

For PKCS1V15 operation 'key' and 'key_size_in_bits' parameters of _nx_crypto_method_pkcs1_v1_5_init are unused. These can be passed as NULL and 0 respectively. The actual wrapped key must be passed as the 'key' parameter to the _nx_crypto_method_pkcs1_v1_5_operation API call and the intended modulus length in bits must be passed through the 'key_size_in_bits' parameter.

Software Implementation

The plaintext data passed in to the RSA encryption API must be 4-byte aligned. If it is not aligned then when the resultant encrypted data is decrypted using the decryption API, the unaligned data will be endian-swapped. For instance, if {0x01, 0x02,0x03, 0x04, 0x05} is passed as input data for encryption, when decrypted, the result will be {0x01, 0x02, 0x03, 0x04, 0x00, 0x00, 0x00, 0x05}. Note that this alignment of input data need not be taken care while using Hardware accelerated RSA.

Limitations

- Only little endian mode is supported.
- RSA CRT keys are not supported.
- ECJPAKE related operations are unsupported for NIST 224, 256 and 384 bit curves when HW ECC is eanbled.

Examples

Initialization Example

This example shows how to initialize the HW crypto engine. This step must be performed before any crypto algorithm is used.

```
 /* Setup the platform; initialize the SCE and the TRNG */
    err = nx_crypto_initialize();
    assert(NX_CRYPTO_SUCCESS == err);
```

Hash Example

This is an example on calculating the SHA256 hash using the NetX Crypto API.

```
extern NX_CRYPTO_METHOD crypto_method_sha256;
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void netx_secure_crypto_sha256_example (void)
{
 size_t   actual_hash_len = RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES;
    uint8_t actual_hash[RM_NETX_SECURE_CRYPTO_EXAMPLE_SHA256_HASH_SIZE_BYTES];
    uint8_t metadata[sizeof(NX_CRYPTO_SHA256)];
    uint32_t metadata_size = sizeof(NX_CRYPTO_SHA256);
 void   * handler       = NX_CRYPTO_NULL;
    uint32_t err          = NX_CRYPTO_SUCCESS;
 /* Setup the platform; initialize the SCE and the TRNG */
    err = nx_crypto_initialize();
    assert(NX_CRYPTO_SUCCESS == err);
```

```
 /* Nx Crypto SHA256 init */
    err = _nx_crypto_method_sha256_init(&crypto_method_sha256, NX_CRYPTO_NULL, 0,
&handler, metadata, metadata_size);
    assert(NX_CRYPTO_SUCCESS == err);
 /* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_INITIALIZE */
    err = _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_INITIALIZE,
                                             handler,
                                             &crypto_method_sha256,
                                             NX_CRYPTO_NULL,
                                             0,
                                             NX_CRYPTO_NULL,
                                             0,
                                             NX_CRYPTO_NULL,
                                             NX_CRYPTO_NULL,
                                             0,
                                             metadata,
                                             metadata_size,
                                             NX_CRYPTO_NULL,
                                             NX_CRYPTO_NULL);
    assert(NX_CRYPTO_SUCCESS == err);
 /* Nx Crypto SHA256 operation - NX_CRYPTO_HASH_UPDATE,
  * call this multiple times if needed to hash multiple data batches */
    err =
       _nx_crypto_method_sha256_operation(NX_CRYPTO_HASH_UPDATE,
                                          handler,
                                          &crypto_method_sha256,
                                          NX_CRYPTO_NULL,
                                          0,

ECDH Example

This is an example on using the NetX Crypto API to generate a shared secret using ECDH. A shared secret is computed using known public key (from peer) and generated private key. Another shared secret is computed using the generated public key and known private key (imported to mimic peer). Both the shared secrets are checked to be the same.

```
extern NX_CRYPTO_METHOD crypto_method_ecdh;

int	mbedtls_platform_setup (mbedtls_platform_context *ctx)
void	mbedtls_platform_teardown (mbedtls_platform_context *ctx)
fsp_err_t	RM_PSA_CRYPTO_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes, uint32_t *p_num_gen_bytes) Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer. More...

Detailed Description

Hardware acceleration for the mbedCrypto implementation of the Arm PSA Crypto API.

Overview

Note

The PSA Crypto module does not provide any interfaces to the user. This release uses the mbedTLS version 3.6.6 which conforms to the PSA Crypto API 1.0 specification. Consult the Arm documentation at https://armmbed.github.io/mbed-crypto/psa/#application-programming-interface for further information. *FSP 3.0 onward adopts a change by Arm where mbedCrypto has been integrated back to MbedTLS and the term mbedCrypto has been deprecated. The mbedCrypto term in FSP now refers to the crypto portion of the MbedTLS module.*

	ML-KEM-768	–	–	–	–	–	–	–	–	–	(4)
	ML-KEM-1024	–	–	–	–	–	–	–	–	–	(4)

Note

1. Signature verification only
2. RSA-1024 and RSA-2048 only
3. RSA-2048, RSA-3072, RSA-4096 only
4. SHA3 only

Configuration

Build Time Configurations for mbedCrypto

The following build time configurations are defined in arm/mbedtls/config.h:

Configuration	Options	Default	Description
Hardware Acceleration			
Hardware Acceleration > Key Format			
AES	MCU Specific Options		Select AES key formats used
ECC	MCU Specific Options		Select ECC key formats used
RSA	MCU Specific Options		Select RSA key formats used
Hardware Acceleration > Hash			
SHA256/224	MCU Specific Options		Defines MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT.

SHA512/384	MCU Specific Options	Defines MBEDTLS_SHA512_ALT and MBEDTLS_SHA512_PROCESS_ALT.
SHA3_224/256/384/512	MCU Specific Options	Defines MBEDTLS_SHA3_ALT and MBEDTLS_SHA3_PROCESS_ALT.
Hardware Acceleration > Cipher		
AES	MCU Specific Options	Defines MBEDTLS_AES_ALT, MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT
Hardware Acceleration > Public Key Cryptography (PKC)		
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 3072		
Key Generation	MCU Specific Options	Enables RSA 3072 Key Generation.
Signing	MCU Specific Options	Enables RSA 3072 Key Signing.
Verification	MCU Specific Options	Enables RSA 3072 Verify.
Hardware Acceleration > Public Key Cryptography (PKC) > RSA 4096		
Key Generation	MCU Specific Options	Enables RSA 4096 Key Generation.
Signing	MCU Specific Options	Enables RSA 4096 Key Signing.
Verification	MCU Specific Options	Enables RSA 4096 Verify.
ECC	MCU Specific Options	Defines MBEDTLS_ECP_ALT
ECDSA	MCU Specific Options	Defines MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT
ECDH	MCU Specific Options	Defines MBEDTLS_ECDH_ALT
RSA 1024	MCU Specific Options	Defines MBEDTLS_RSA_1024_ALT. RSA 1024 Key Generation, Signing and Verification

			are also enabled.
RSA 2048	MCU Specific Options		Defines MBEDTLS_RSA_ALT. RSA 2048 Key Generation, Signing and Verification are also enabled.
TRNG	Enabled	Enabled	Defines MBEDTLS_ENTROPY_HARDWARE_ALT.
Crypto Engine Initialization	Enabled	Enabled	MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT
Platform			
Platform > Alternate			
MBEDTLS_PLATFORM_SETBUF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SETBUF_ALT
MBEDTLS_PLATFORM_EXIT_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_EXIT_ALT
MBEDTLS_PLATFORM_TIME_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_ALT
MBEDTLS_PLATFORM_FPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FPRINTF_ALT
MBEDTLS_PLATFORM_PRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_PRINTF_ALT
MBEDTLS_PLATFORM_SNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SNPRINTF_ALT
MBEDTLS_PLATFORM_VSNPRINTF_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_VSNPRINTF_ALT
MBEDTLS_PLATFORM_NV_SEED_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_ALT
MBEDTLS_PLATFORM_MS_TIME_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_MS_TIME_ALT
MBEDTLS_PLATFORM_ZEROIZE_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_ZEROIZE_ALT
MBEDTLS_PLATFORM_GMTIME_R_ALT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_GMTIME_R_ALT
MBEDTLS_HAVE_ASM	• Define • Undefine	Undefine	MBEDTLS_HAVE_ASM
MBEDTLS_NO_UDBL_DIVISION	• Define • Undefine	Undefine	MBEDTLS_NO_UDBL_DIVISION
MBEDTLS_NO_64BIT_MULTIPLICATION	• Define • Undefine	Undefine	MBEDTLS_NO_64BIT_MULTIPLICATION
MBEDTLS_HAVE_SSE2	• Define	Undefine	MBEDTLS_HAVE_SSE2

	• Undefine		
MBEDTLS_HAVE_TIME	• Define • Undefine	Undefine	MBEDTLS_HAVE_TIME
MBEDTLS_HAVE_TIME_DATE	• Define • Undefine	Undefine	MBEDTLS_HAVE_TIME_DATE
MBEDTLS_PLATFORM_MEMORY	• Define • Undefine	Define	MBEDTLS_PLATFORM_MEMORY
MBEDTLS_PLATFORM_NO_STD_FUNCTIONS	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NO_STD_FUNCTIONS
MBEDTLS_TIMING_ALT	• Define • Undefine	Undefine	MBEDTLS_TIMING_ALT
MBEDTLS_NO_PLATFORM_ENTROPY	• Define • Undefine	Define	MBEDTLS_NO_PLATFORM_ENTROPY
MBEDTLS_ENTROPY_C	• Define • Undefine	Define	MBEDTLS_ENTROPY_C
MBEDTLS_PLATFORM_C	• Define • Undefine	Define	MBEDTLS_PLATFORM_C
MBEDTLS_PLATFORM_STD_CALLOC	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_CALLOC
MBEDTLS_PLATFORM_STD_CALLOC value	Manual Entry	calloc	MBEDTLS_PLATFORM_STD_CALLOC value
MBEDTLS_PLATFORM_STD_FREE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_FREE
MBEDTLS_PLATFORM_STD_FREE value	Manual Entry	free	MBEDTLS_PLATFORM_STD_FREE value
MBEDTLS_PLATFORM_STD_SETBUF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_SETBUF
MBEDTLS_PLATFORM_STD_SETBUF value	Manual Entry	setbuf	MBEDTLS_PLATFORM_STD_SETBUF value
MBEDTLS_PLATFORM_STD_EXIT	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT
MBEDTLS_PLATFORM_STD_EXIT value	Manual Entry	exit	MBEDTLS_PLATFORM_STD_EXIT value
MBEDTLS_PLATFORM_STD_TIME	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_TIME
MBEDTLS_PLATFORM_STD_TIME value	Manual Entry	time	MBEDTLS_PLATFORM_STD_TIME value
MBEDTLS_PLATFORM_STD_FPRINTF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_FPRINTF
MBEDTLS_PLATFORM_STD_FPRINTF value	Manual Entry	fprintf	MBEDTLS_PLATFORM_STD_FPRINTF value
MBEDTLS_PLATFORM_S	• Define	Undefine	MBEDTLS_PLATFORM_S

TD_PRINTF	• Undefine		TD_PRINTF
MBEDTLS_PLATFORM_STD_PRINTF value	Manual Entry	printf	MBEDTLS_PLATFORM_STD_PRINTF value
MBEDTLS_PLATFORM_STD_SNPRINTF	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_SNPRINTF
MBEDTLS_PLATFORM_STD_SNPRINTF value	Manual Entry	snprintf	MBEDTLS_PLATFORM_STD_SNPRINTF value
MBEDTLS_PLATFORM_STD_EXIT_SUCCESS	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT_SUCCESS
MBEDTLS_PLATFORM_STD_EXIT_SUCCESS value	Manual Entry	0	MBEDTLS_PLATFORM_STD_EXIT_SUCCESS value
MBEDTLS_PLATFORM_STD_EXIT_FAILURE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_EXIT_FAILURE
MBEDTLS_PLATFORM_STD_EXIT_FAILURE value	Manual Entry	1	MBEDTLS_PLATFORM_STD_EXIT_FAILURE value
MBEDTLS_PLATFORM_STD_NV_SEED_READ	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_READ
MBEDTLS_PLATFORM_STD_NV_SEED_READ value	Manual Entry	mbedtls_platform_std_nv_seed_read	MBEDTLS_PLATFORM_STD_NV_SEED_READ value
MBEDTLS_PLATFORM_STD_NV_SEED_WRITE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_WRITE
MBEDTLS_PLATFORM_STD_NV_SEED_WRITE value	Manual Entry	mbedtls_platform_std_nv_seed_write	MBEDTLS_PLATFORM_STD_NV_SEED_WRITE value
MBEDTLS_PLATFORM_STD_NV_SEED_FILE	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_STD_NV_SEED_FILE
MBEDTLS_PLATFORM_STD_NV_SEED_FILE value	Manual Entry		MBEDTLS_PLATFORM_STD_NV_SEED_FILE value
MBEDTLS_PLATFORM_CALLOC_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_CALLOC_MACRO
MBEDTLS_PLATFORM_CALLOC_MACRO value	Manual Entry	calloc	MBEDTLS_PLATFORM_CALLOC_MACRO value
MBEDTLS_PLATFORM_FREE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FREE_MACRO
MBEDTLS_PLATFORM_FREE_MACRO value	Manual Entry	free	MBEDTLS_PLATFORM_FREE_MACRO value
MBEDTLS_PLATFORM_EXIT_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_EXIT_MACRO
MBEDTLS_PLATFORM_EXIT_MACRO value	Manual Entry	exit	MBEDTLS_PLATFORM_EXIT_MACRO value

MBEDTLS_PLATFORM_SETBUF_MACRO	• Define • Undefine	Define	MBEDTLS_PLATFORM_SETBUF_MACRO
MBEDTLS_PLATFORM_SETBUF_MACRO value	Manual Entry	dummy_setbuf	MBEDTLS_PLATFORM_SETBUF_MACRO value
MBEDTLS_PLATFORM_TIME_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_MACRO
MBEDTLS_PLATFORM_TIME_MACRO value	Manual Entry	time	MBEDTLS_PLATFORM_TIME_MACRO value
MBEDTLS_PLATFORM_TIME_TYPE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_TIME_TYPE_MACRO
MBEDTLS_PLATFORM_TIME_TYPE_MACRO value	Manual Entry	time_t	MBEDTLS_PLATFORM_TIME_TYPE_MACRO value
MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO
MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO value	Manual Entry	int64_t	MBEDTLS_PLATFORM_MS_TIME_TYPE_MACRO value
MBEDTLS_PRINTF_MS_TIME	• Define • Undefine	Undefine	MBEDTLS_PRINTF_MS_TIME
MBEDTLS_PLATFORM_DEV_RANDOM	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_DEV_RANDOM
MBEDTLS_PRINTF_MS_TIME value	Manual Entry	PRId64	MBEDTLS_PRINTF_MS_TIME value
MBEDTLS_PLATFORM_FPRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_FPRINTF_MACRO
MBEDTLS_PLATFORM_FPRINTF_MACRO value	Manual Entry	fprintf	MBEDTLS_PLATFORM_FPRINTF_MACRO value
MBEDTLS_PLATFORM_PRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_PRINTF_MACRO
MBEDTLS_PLATFORM_PRINTF_MACRO value	Manual Entry	printf	MBEDTLS_PLATFORM_PRINTF_MACRO value
MBEDTLS_PLATFORM_SNPRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_SNPRINTF_MACRO
MBEDTLS_PLATFORM_SNPRINTF_MACRO value	Manual Entry	snprintf	MBEDTLS_PLATFORM_SNPRINTF_MACRO value
MBEDTLS_PLATFORM_VSNPRINTF_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_VSNPRINTF_MACRO
MBEDTLS_PLATFORM_VSNPRINTF_MACRO value	Manual Entry	vsnprintf	MBEDTLS_PLATFORM_VSNPRINTF_MACRO value
MBEDTLS_PLATFORM_NV_SEED_READ_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_READ_MACRO

MBEDTLS_PLATFORM_NV_SEED_READ_MACRO value	Manual Entry	mbedtls_platform_std_nv_seed_read	MBEDTLS_PLATFORM_NV_SEED_READ_MACRO value
MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO	• Define • Undefine	Undefine	MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO
MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO value	Manual Entry	mbedtls_platform_std_nv_seed_write	MBEDTLS_PLATFORM_NV_SEED_WRITE_MACRO value
General			
MBEDTLS_PSA_CRYPTO_DRIVERS	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_DRIVERS
MBEDTLS_DEPRECATED_WARNING	• Define • Undefine	Undefine	MBEDTLS_DEPRECATED_WARNING
MBEDTLS_DEPRECATED_REMOVED	• Define • Undefine	Define	MBEDTLS_DEPRECATED_REMOVED
MBEDTLS_CHECK_RETURN_WARNING	• Define • Undefine	Undefine	MBEDTLS_CHECK_RETURN_WARNING
MBEDTLS_ERROR_STRERROR_DUMMY	• Define • Undefine	Define	MBEDTLS_ERROR_STRERROR_DUMMY
MBEDTLS_MEMORY_DEBUG	• Define • Undefine	Undefine	MBEDTLS_MEMORY_DEBUG
MBEDTLS_MEMORY_BACKTRACE	• Define • Undefine	Undefine	MBEDTLS_MEMORY_BACKTRACE
MBEDTLS_PSA_CRYPTO_CLIENT	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_CLIENT
MBEDTLS_PSA_CRYPTO_SPM	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_SPM
MBEDTLS_PSA_KEY_STORE_DYNAMIC	• Define • Undefine	Undefine	MBEDTLS_PSA_KEY_STORE_DYNAMIC
MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS	• Define • Undefine	Undefine	MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS
MBEDTLS_SELF_TEST	• Define • Undefine	Undefine	MBEDTLS_SELF_TEST
MBEDTLS_THREADING_ALT	• Define • Undefine	Define	MBEDTLS_THREADING_ALT
MBEDTLS_THREADING_PTHREAD	• Define • Undefine	Undefine	MBEDTLS_THREADING_PTHREAD
MBEDTLS_USE_PSA_CRYPTO	Undefine	Undefine	MBEDTLS_USE_PSA_CRYPTO
MBEDTLS_VERSION_FEATURES	• Define • Undefine	Define	MBEDTLS_VERSION_FEATURES
MBEDTLS_ERROR_C	• Define	Define	MBEDTLS_ERROR_C

	• Undefine		
MBEDTLS_MEMORY_BUFFER_ALLOC_C	• Define • Undefine	Undefine	MBEDTLS_MEMORY_BUFFER_ALLOC_C
MBEDTLS_PSA_CRYPTO_C	• Define • Undefine	Define	MBEDTLS_PSA_CRYPTO_C
MBEDTLS_PSA_CRYPTO_SE_C	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_SE_C
MBEDTLS_THREADING_C	• Define • Undefine	Define	MBEDTLS_THREADING_C
MBEDTLS_TIMING_C	• Define • Undefine	Undefine	MBEDTLS_TIMING_C
MBEDTLS_VERSION_C	• Define • Undefine	Define	MBEDTLS_VERSION_C
MBEDTLS_MEMORY_ALIGN_MULTIPLE	• Define • Undefine	Undefine	MBEDTLS_MEMORY_ALIGN_MULTIPLE
MBEDTLS_MEMORY_ALIGN_MULTIPLE value	Manual Entry	4	MBEDTLS_MEMORY_ALIGN_MULTIPLE value
MBEDTLS_CHECK_RETURN	• Define • Undefine	Define	MBEDTLS_CHECK_RETURN
MBEDTLS_IGNORE_RETURN	• Define • Undefine	Undefine	MBEDTLS_IGNORE_RETURN
MBEDTLS_PSA_CRYPTO_CONFIG	• Define • Undefine	Undefine	MBEDTLS_PSA_CRYPTO_CONFIG
Cipher			
Cipher > Alternate			
MBEDTLS_ARIA_ALT	• Define • Undefine	Undefine	MBEDTLS_ARIA_ALT
MBEDTLS_CAMELLIA_ALT	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_ALT
MBEDTLS_CCM_ALT	MCU Specific Options		MBEDTLS_CCM_ALT
MBEDTLS_CHACHA20_ALT	MCU Specific Options		MBEDTLS_CHACHA20_ALT
MBEDTLS_CHACHAPOLY_ALT	MCU Specific Options		MBEDTLS_CHACHAPOLY_ALT
MBEDTLS_CMAC_ALT	MCU Specific Options		MBEDTLS_CMAC_ALT
MBEDTLS_DES_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_ALT
MBEDTLS_GCM_ALT	MCU Specific Options		MBEDTLS_GCM_ALT
MBEDTLS_NIST_KW_ALT	• Define • Undefine	Undefine	MBEDTLS_NIST_KW_ALT

MBEDTLS_DES_SETKEY_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_SETKEY_ALT
MBEDTLS_DES_CRYPT_ECB_ALT	• Define • Undefine	Undefine	MBEDTLS_DES_CRYPT_ECB_ALT
MBEDTLS_DES3_CRYPT_ECB_ALT	• Define • Undefine	Undefine	MBEDTLS_DES3_CRYPT_ECB_ALT
Cipher > AES			
MBEDTLS_AES_ROM_TABLES	• Define • Undefine	Undefine	MBEDTLS_AES_ROM_TABLES
MBEDTLS_AES_FEWER_TABLES	• Define • Undefine	Undefine	MBEDTLS_AES_FEWER_TABLES
MBEDTLS_AES_ONLY_128_BIT_KEY_LENGTH	• Define • Undefine	Undefine	MBEDTLS_AES_ONLY_128_BIT_KEY_LENGTH
MBEDTLS_CAMELLIA_SMALL_MEMORY	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_SMALL_MEMORY
MBEDTLS_CIPHER_MODE_CBC	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CBC
MBEDTLS_CIPHER_MODE_CFB	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CFB
MBEDTLS_CIPHER_MODE_CTR	• Define • Undefine	Define	MBEDTLS_CIPHER_MODE_CTR
MBEDTLS_CIPHER_MODE_OFB	• Define • Undefine	Undefine	MBEDTLS_CIPHER_MODE_OFB
MBEDTLS_CIPHER_MODE_XTS	• Define • Undefine	Undefine	MBEDTLS_CIPHER_MODE_XTS
MBEDTLS_CIPHER_NULL_CIPHER	• Define • Undefine	Undefine	MBEDTLS_CIPHER_NULL_CIPHER
MBEDTLS_CIPHER_PADDING_PKCS7	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_PKCS7
MBEDTLS_CIPHER_PADDING_ONE_AND_ZEROS	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ONE_AND_ZEROS
MBEDTLS_CIPHER_PADDING_ZEROS_AND_LEN	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ZEROS_AND_LEN
MBEDTLS_CIPHER_PADDING_ZEROS	• Define • Undefine	Define	MBEDTLS_CIPHER_PADDING_ZEROS
MBEDTLS_AES_C	Define	Define	MBEDTLS_AES_C
MBEDTLS_BLOCK_CIPHER_NO_DECRYPT	• Define • Undefine	Undefine	MBEDTLS_BLOCK_CIPHER_NO_DECRYPT
MBEDTLS_CAMELLIA_C	• Define • Undefine	Undefine	MBEDTLS_CAMELLIA_C
MBEDTLS_ARIA_C	• Define • Undefine	Undefine	MBEDTLS_ARIA_C

MBEDTLS_CCM_C	• Define • Undefine	Define	MBEDTLS_CCM_C
MBEDTLS_CHACHA20_C	• Define • Undefine	Undefine	MBEDTLS_CHACHA20_C
MBEDTLS_CHACHAPOLY_C	• Define • Undefine	Undefine	MBEDTLS_CHACHAPOLY_C
MBEDTLS_CIPHER_C	• Define • Undefine	Define	MBEDTLS_CIPHER_C
MBEDTLS_DES_C	• Define • Undefine	Undefine	MBEDTLS_DES_C
MBEDTLS_GCM_C	• Define • Undefine	Define	MBEDTLS_GCM_C
MBEDTLS_GCM_LARGE_TABLE	• Define • Undefine	Undefine	MBEDTLS_GCM_LARGE_TABLE
MBEDTLS_NIST_KW_C	• Define • Undefine	Undefine	MBEDTLS_NIST_KW_C

Public Key Cryptography (PKC)

Public Key Cryptography (PKC) > DHM

Public Key Cryptography (PKC) > DHM > Alternate

MBEDTLS_DHM_ALT	• Define • Undefine	Undefine	MBEDTLS_DHM_ALT
MBEDTLS_DHM_C	• Define • Undefine	Undefine	MBEDTLS_DHM_C

Public Key Cryptography (PKC) > ECC

Public Key Cryptography (PKC) > ECC > Alternate

MBEDTLS_ECJPAKE_ALT	• Define • Undefine	Undefine	MBEDTLS_ECJPAKE_ALT
MBEDTLS_ECDSA_GENKEY_ALT	• Define • Undefine	Undefine	MBEDTLS_ECDSA_GENKEY_ALT
MBEDTLS_ECP_INTERNAL_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_INTERNAL_ALT
MBEDTLS_ECP_RANDOMIZE_JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_RANDOMIZE_JAC_ALT
MBEDTLS_ECP_ADD_MIXED_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_ADD_MIXED_ALT
MBEDTLS_ECP_DOUBLE_JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_DOUBLE_JAC_ALT
MBEDTLS_ECP_NORMALIZE_JAC_MANY_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMALIZE_JAC_MANY_ALT
MBEDTLS_ECP_NORMALIZE_JAC_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMALIZE_JAC_ALT

MBEDTLS_ECP_DOUBLE_ADD_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_DOUBLE_ADD_MXZ_ALT
MBEDTLS_ECP_RANDOMIZE_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_RANDOMIZE_MXZ_ALT
MBEDTLS_ECP_NORMALIZE_MXZ_ALT	• Define • Undefine	Undefine	MBEDTLS_ECP_NORMALIZE_MXZ_ALT
Public Key Cryptography (PKC) > ECC > Curves			
MBEDTLS_ECP_DP_SECP192R1_ENABLED	• Define • Undefine	Undefine	MBEDTLS_ECP_DP_SECP192R1_ENABLED

SHA256 Configuration

To enable hardware acceleration for the SHA256/224 calculation, the macro MBEDTLS_SHA256_ALT and MBEDTLS_SHA256_PROCESS_ALT must be defined in the configuration file. By default SHA256 is enabled. SHA256 can be disabled, but SHA512 then needs to be enabled (software version) because the PSA implementation uses it for the entropy accumulator. This can be done using the RA Configuration editor.

AES Configuration

To enable hardware acceleration for the AES128/256 operation, the macro MBEDTLS_AES_SETKEY_ENC_ALT, MBEDTLS_AES_SETKEY_DEC_ALT, MBEDTLS_AES_ENCRYPT_ALT and MBEDTLS_AES_DECRYPT_ALT must be defined in the configuration file. By default AES is enabled. AES cannot be disabled because the PSA implementation requires it for the CTR_DRBG random number generator. This can be done using the RA Configuration editor.

Note

Only AES XTS 128 is currently supported. RA2 devices support acceleration for ECB part alone, while other devices support full AES XTS hardware acceleration.

ECC Configuration

To enable hardware acceleration for the ECC Key Generation operation, the macro MBEDTLS_ECP_ALT must be defined in the configuration file. For ECDSA, the macros MBEDTLS_ECDSA_SIGN_ALT and MBEDTLS_ECDSA_VERIFY_ALT must be defined. By default ECC, ECDSA and ECDHE are enabled. To disable ECC, undefine MBEDTLS_ECP_C, MBEDTLS_ECDSA_C and

MBEDTLS_ECDH_C. This can be done using the RA Configuration editor.

RSA Configuration

To enable hardware acceleration for the RSA2048 operation, the macro MBEDTLS_RSA_ALT must be defined in the configuration file. By default RSA is enabled. To disable RSA, undefine MBEDTLS_RSA_C, MBEDTLS_PK_C, MBEDTLS_PK_PARSE_C, MBEDTLS_PK_WRITE_C. This can be done using the RA Configuration editor.

Post Quantum Cryptography (PQC) Configuration

ML-KEM Configuration

To enable software only PQC ML-KEM key generation, encapsulation, and decapsulation operations, the macro MBEDTLS_MLKEM_C must be defined in the configuration file. By default, PQC ML-KEM is disabled as the PQC stack is optional. This can be done using the RA Configuration editor.

ML-DSA Configuration

To enable software only PQC ML-DSA key generation, signing, and verification operations, the macro MBEDTLS_ML_DSA_C must be defined in the configuration file. By default, PQC ML-DSA is disabled as the PQC stack is optional. This can be done using the RA Configuration editor.

Wrapped Key Usage

To use the Secure Crypto Engine to generate and use wrapped keys, use PSA_KEY_TYPE_AES_WRAPPED or PSA_KEY_TYPE_ECC_KEY_PAIR_WRAPPED(curve) or PSA_KEY_TYPE_RSA_KEY_PAIR when setting the key type attribute. Setting the key's type attribute using this value will cause the SCE to use wrapped key mode for all operations related to that key. The user can use the export functionality to save the wrapped keys to user ROM and import it later for usage. This mode requires that Wrapped Key functionality for the algorithm is enabled in the project configuration.

Note

On the SCE9 devices, only the RSA public key can be exported. A file system must be used to store the internally generated private key.

Persistent Key Storage

Persistent key storage can be enabled by defining MBEDTLS_FS_IO, MBEDTLS_PSA_CRYPTO_STORAGE_C, and MBEDTLS_PSA_ITS_FILE_C. The key lifetime must also be specified as PSA_KEY_LIFETIME_PERSISTENT. A lower level storage module must be added in the RA Configuration editor and initialized in the code before generating persistent keys. Persistent storage supports the use of plaintext and vendor keys. Refer to the lower level storage module documentation for information on how it should be initialized. To generate a persistent key the key must be assigned a unique id prior to calling generate using the psa_set_key_id api.

```
if (PSA_KEY_LIFETIME_IS_PERSISTENT(lifetime))
   {
/* Set the id to a positive integer. */
      psa_set_key_id(&attributes, (psa_key_id_t) 5);
   }
```

Platform Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT must be defined in the configuration file. This enables code that will initialize the SCE. Parameter checking (General|MBEDTLS_CHECK_PARAMS) is enabled by default. To reduce code size, disable parameter checking.

Random Number Configuration

To run the mbedCrypto implementation of the PSA Crypto API on the MCU, the macro MBEDTLS_ENTROPY_HARDWARE_ALT must be defined in the configuration file. This enables using the TRNG as an entropy source. None of the other cryptographic operations (even in software only mode) will work without this feature.

Usage Notes

Hardware Initialization

mbedtls_platform_setup() must be invoked before using the PSA Crypto API to ensure that the SCE peripheral is initialized.

Memory Usage

In general, depending on the mbedCrypto features being used a heap size of 0x1000 to 0x5000 bytes is required. The total allocated heap should be the **sum** of the heap requirements of the individual algorithms.

A minimum stack of 0x1000 is required where the module is used. This is either the main stack in a bare metal application or the task stack of the task used for crypto operations. The total allocated stack should be the **sum** of the stack requirements of the individual algorithms.

Algorithm	Required Heap (bytes)	Required Stack (bytes)
SHA256/224	None	–
AES	0x200	–
Hardware ECC	0x400	–
Software ECC	0x1800	–
RSA	0x1500	–
ML-DSA	0x1800	0x1500
ML-KEM	0x1000	0x3000

Limitations

- Only little endian mode is supported.

Stdio Buffering

The MBEDTLS_PLATFORM_SETBUF_MACRO was introduced in mbedTLS 3.2.1 to prevent stdio

read/write functions from buffering stream data to reduce the likelihood of key leakage by setting the buffer argument in setbuf() to NULL. FSP uses a dummy_setbuf() function in rm_psa_crypto.c to prevent build errors; since FSP uses LittleFS by default (where the usage of a buffer is mandatory) this function does not perform any action. Setting the cache size in LittleFS to the minimum supported by the Data Flash (4) can minimize but not remove the likelihood of key data leakage. The dummy function can be replaced with a user-defined function by defining a different value for MBEDTLS_PLATFORM_SETBUF_MACRO_value in the FSP configurator.

Post Quantum Cryptography (PQC)

- The PSA API Specificiation v1.3 supports ML-KEM and ML-DSA however MbedTLS currently does not provide an implementation. The implementation in the FSP release is thus likely to change and may cause backward compatibility issues when MbedTLS officially supports it.
- ASN.1 encoding not implemented. Keys are currently implemented in raw bytes.
- The underlying PQC-Lib library is a release candidate of V2.00.

ML-DSA

- The FIPS204 Standard allows the user to provide an optional context string for ML-DSA signature generation and verification. The current implementation does not allow the user to provide such a string. Internally this field is set to a value of 0 with a length of 0.
- The data format for import and export of the key pair is a byte array of the 32 byte seed value.
- ML-DSA-44, ML-DSA-65, and ML-DSA-87 supported.
- The current implementation of ML-DSA is too big for devices with less than 64KB of RAM.

ML-KEM

- ML-KEM-512, ML-KEM-768, and ML-KEM-1024 supported.
- Key derivation not supported.
- The data format for import and export of the key pair is the concatenation of the two 32 byte seed values: d || z

SCE9 Usage

The SCE9 is used in Compatibility Mode for mbedCrypto acceleration. The crypto capabilities in this mode on the SCE9 are different which results in the below usage limitations with mbedCrypto:

- The module includes **both** wrapped and plaintext keys code irrespective of whether the application requires it.
- Plaintext key generation is not supported for RSA and ECC; only wrapped keys can be generated.
- If ECDH is used, only wrapped key will be generated on SCE9 and will not return an error even if the user context is somehow set for plain key. This may be relevant only if the psa_key_agreement() function with plaintext key on SCE9 is attempted.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

Using PSA Crypto with TrustZone

Unlike FSP drivers, PSA Crypto cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the PSA Crypto code as well as the keys must be placed in the secure region. Since the PSA Crypto API requires access to the keys directly during initialization

and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This section will provide a short explanation of how to add PSA Crypto to a secure project and have it usable by the non-secure project without exposing the keys. In this example the secure project will contain an RSA private key and the non-secure project is expected to be able to perform sign and verify operations using that key.

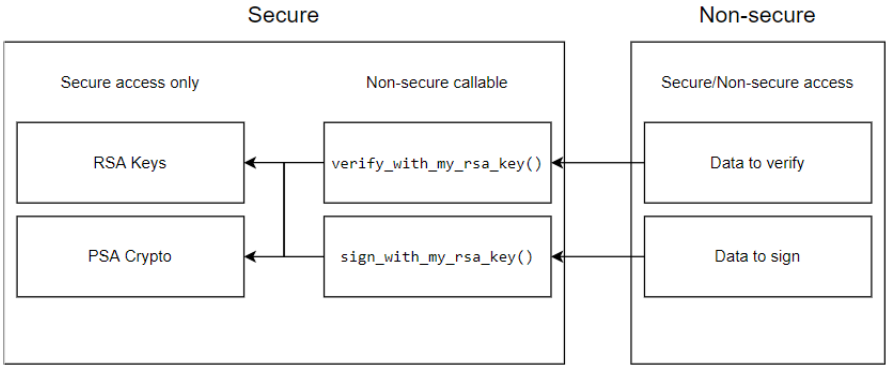

Figure 335: PSA Crypto Non-secure callable example

- Secure project
    - During secure project boot-up, psa_crypto_init() is called.
    - The RSA private key is programmed into secure flash either at the factory or by calling psa_generate_key() in persistent mode. Note that the data-flash area used by the LittleFS will have to be in the secure region if the key is generated as a persistent.
    - psa_import_key()/psa_open_key() are called with the resultant handle held in secure RAM.
    - The Non-secure callable section contains the following **user-defined** functions
    - verify_with_my_rsa_key(input_signature, input_hash, verification_result)
    - The implementation of this function in secure region will call psa_verify_hash() and return the result via verification_result.
    - sign_with_my_rsa_key(input_hash, output_signature)
    - The implementation of this function in secure region will call psa_sign_hash() and return the signature via output_signature.

- Non-secure project
    - Calls verify_with_my_rsa_key() to verify a signature. The implementation will use the public key that is present in the secure project.
    - Calls sign_with_my_rsa_key() to generate a signature. The implementation will use the private key that is present on the secure project.

  For more details on how to add user-code to the Non-secure callable region refer to the "Security Design with Arm TrustZone - IP Protection (R11AN0467EU0100)" Application Note.

Examples

Hash Example

This is an example on calculating the SHA256 hash using the PSA Crypto API.

```
const uint8_t NIST_SHA256ShortMsgLen200[] =
{
    0x2e, 0x7e, 0xa8, 0x4d, 0xa4, 0xbc, 0x4d, 0x7c, 0xfb, 0x46, 0x3e, 0x3f, 0x2c,
0x86, 0x47, 0x05,
    0x7a, 0xff, 0xf3, 0xfb, 0xec, 0xec, 0xa1, 0xd2, 00
};
const uint8_t NIST_SHA256ShortMsgLen200_expected[] =
{
    0x76, 0xe3, 0xac, 0xbc, 0x71, 0x88, 0x36, 0xf2, 0xdf, 0x8a, 0xd2, 0xd0, 0xd2,
0xd7, 0x6f, 0x0c,
    0xfa, 0x5f, 0xea, 0x09, 0x86, 0xbe, 0x91, 0x8f, 0x10, 0xbc, 0xee, 0x73, 0x0d,
0xf4, 0x41, 0xb9
};
void psa_crypto_sha256_example (void)
{
    psa_algorithm_t      alg               = PSA_ALG_SHA_256;
    psa_hash_operation_t operation         = {0};
 size_t               expected_hash_len = PSA_HASH_LENGTH(alg);
    uint8_t              actual_hash[PSA_HASH_MAX_SIZE];
 size_t               actual_hash_len;
 mbedtls_platform_context ctx = {0};
 /* Setup the platform; initialize the SCE and the TRNG */
 if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
    {
 /* Platform initialization failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_setup(&operation, alg))
    {
 /* Hash setup failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_update(&operation, NIST_SHA256ShortMsgLen200,
```

```
sizeof(NIST_SHA256ShortMsgLen200)))
    {
 /* Hash calculation failed */
       debugger_break();
    }
 else if (PSA_SUCCESS != psa_hash_finish(&operation, &actual_hash[0], sizeof
(actual_hash), &actual_hash_len))
    {
 /* Reading calculated hash failed */
       debugger_break();
    }
 else if (0 != memcmp(&actual_hash[0], &NIST_SHA256ShortMsgLen200_expected[0],
actual_hash_len))
    {
 /* Hash compare of calculated value with expected value failed */
       debugger_break();
    }
 else if (0 != memcmp(&expected_hash_len, &actual_hash_len, sizeof
(expected_hash_len)))
    {
 /* Hash size compare of calculated value with expected value failed */
       debugger_break();
    }
 else
    {
 /* SHA256 calculation succeeded */
       debugger_break();
    }
 /* De-initialize the platform. This is currently a placeholder function which does
not do anything. */
 mbedtls_platform_teardown(&ctx);
}
```

AES Example

This is an example on using the PSA Crypto API to generate an AES256 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
static psa_status_t cipher_operation (psa_cipher_operation_t * operation,
 const uint8_t          * input,
 size_t                   input_size,
 size_t                   part_size,
                                  uint8_t                * output,
 size_t                   output_size,
 size_t                * output_len)
{
    psa_status_t status;
 size_t       bytes_to_write = 0;

   {
 /* All the operations succeeded for MAC generation */
   }
 /* Steps to verify the generated MAC */
 if (PSA_SUCCESS != psa_mac_verify_setup(&verify_operation, key_handle, alg))
   {
 /* MAC verification setup failure */
       debugger_break();
   }
 else if (PSA_SUCCESS != psa_mac_update(&verify_operation, input, input_size))
   {
 /* MAC update failure */
       debugger_break();
   }
 else if (PSA_SUCCESS != psa_mac_verify_finish(&verify_operation, AES_CMAC_mac,
mac_ret))
   {
 /* MAC verification failed */
       debugger_break();
   }
 else
   {
 /* All the operations succeeded for MAC verification */
```

```
    }
```

ECC Example

This is an example on using the PSA Crypto API to generate an ECC-P256R1 key, signing and verifying data after hashing it first using SHA256.

Note

Unlike RSA, ECDSA does not have any padding schemes. Thus the hash argument for the ECC sign operation MUST have a size larger than or equal to the curve size; i.e. for PSA_ECC_CURVE_SECP256R1 the payload size must be at least 256/8 bytes. nist.fips.186-4: " A hash function that provides a lower security strength than the security strength associated with the bit length of 'n' ordinarily should not be used, since this would reduce the security strength of the digital signature process to a level no greater than that provided by the hash function."

```
#define ECC_256_BIT_LENGTH 256
#define ECC_256_EXPORTED_SIZE 500
uint8_t exportedECC_SECP256R1Key[ECC_256_EXPORTED_SIZE];
size_t exportedECC_SECP256R1Keylength = 0;
void psa_ecc256R1_example (void)
{
/* This example generates an ECC-P256R1 keypair, performs signing and verification
operations.
 * It then exports the generated key into ASN1 DER format to a RAM array which can
then be programmed to flash.
 * It then re-imports that key, and performs signing and verification operations. */
 unsigned char            payload[] = "ASYMMETRIC_INPUT_FOR_SIGN......";
 unsigned char            signature1[PSA_SIGNATURE_MAX_SIZE] = {0};

RSA Example

This is an example on using the PSA Crypto API to generate an RSA2048 key, encrypting and decrypting multi-block data and using PKCS7 padding.

```
#define RSA_2048_BIT_LENGTH 2048
#define RSA_2048_EXPORTED_SIZE 1210
/* The RSA 2048 key pair export in der format is roughly as follows
 * RSA private keys:
 * RSAPrivateKey ::= SEQUENCE { ------------------------------------- 1 + 3
 * version Version, ------------------------------------- 1 + 1 + 1
 * modulus INTEGER, ---------------- n ------------------- 1 + 3 + 256 + 1
 * publicExponent INTEGER, ---------------- e ------------------- 1 + 4
 * privateExponent INTEGER, ---------------- d ------------------- 1 + 3 + 256 (276
for Wrapped)
 * prime1 INTEGER, ---------------- p ------------------- 1 + 3 + (256 / 2)
 * prime2 INTEGER, ---------------- q ------------------- 1 + 3 + (256 / 2)
 * exponent1 INTEGER, ---------------- d mod (p-1) --------- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * exponent2 INTEGER, ---------------- d mod (q-1) --------- 1 + 2 + (256 / 2) (4 for
Wrapped)
 * coefficient INTEGER, ---------------- (inverse of q) mod p - 1 + 2 + (256 / 2) (4
for Wrapped)
 * otherPrimeInfos OtherPrimeInfos OPTIONAL ----------------------- 0 (not
```

```
supported)
 * }
 */

ML-DSA Example

These are examples on using the PSA Crypto API to generate an MLDSA-44 key, sign and verify a message.

Note

There are two ways to use this API. The first uses PSA_ALG_HASH_ML_DSA(hash_alg) which will require the message hash (calculated with the specified hash algorithm) as an input to sign and verify hash functions. See psa_mldsa44_hash_example(). Alternatively, you may use PSA_ALG_HASH_ML_DSA(hash_alg) with sign and verify message functions. In this case, PSA Crypto API will prehash the message for you using the specified hashing algorithm. The second way to use the API is with PSA_ALG_ML_DSA. This will require the use of sign and verify message functions. But this will perform the SHAKE hash calculation using an internal hash implementation as mbedTLS does not currently support SHAKE. Refer to psa_mldsa_message_example().

```
#define MLDSA_MESSAGE_LEN 512U
static uint8_t mldsa_test_message[MLDSA_MESSAGE_LEN] __ALIGNED(4) =
{
    0xF0, 0xA4, 0xA1, 0x8C, 0xCF, 0x98, 0x2E, 0x89, 0x1F, 0x3E, 0x91, 0x73, 0x27,
0x90, 0x1F, 0x73, // NOLINT(readability-magic-numbers)
    0x83, 0x90, 0xE1, 0x7A, 0xB9, 0x5F, 0xF1, 0xFB, 0x7C, 0x76, 0x83, 0x50, 0x38,

Migrating to MbedTLS 3.6.0

MBEDTLS_PSA_ASSUME_EXCLUSIVE_BUFFERS macro is disabled by default to handle shared memory in a secure manner. Note that this increases heap memory usage and code size. The macro can be enabled if all buffers passed to any PSA function reside in memory that is accessible only to the PSA function during its execution or if it possible otherwise for the user to conclude that the user buffers passed into PSA are secure from modification. Refer to https://github.com/Mbed-TLS/mbedtls-docs/blob/main/security-advisories/mbedtls-security-advisory-2024-03.md for more details.

psa_import_key() now only accepts RSA keys in the PSA standard formats. Applications that need other formats like: PKCS#8, SubjectPublicKey, PEM can call mbedtls_pk_parse_{public,}key() followed by mbedtls_pk_import_into_psa().

Function Documentation

◆ mbedtls_platform_setup()

int mbedtls_platform_setup (mbedtls_platform_context * *ctx*)

This function initializes the SCE and the TRNG. It **must** be invoked before the crypto library can be used. This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined.

Example:

```
mbedtls_platform_context ctx = {0};

/* Setup the platform; initialize the SCE and the TRNG */

if (PSA_SUCCESS != mbedtls_platform_setup(&ctx))
```

Return values

0	Initialization was successful.
MBEDTLS_ERR_PLATFORM_HW_ACCEL_FAILED	SCE Initialization error.

◆ mbedtls_platform_teardown()

void mbedtls_platform_teardown (mbedtls_platform_context * *ctx*)

This implementation is used if MBEDTLS_PLATFORM_SETUP_TEARDOWN_ALT is defined. It is intended to de-initialize any items that were initialized in the mbedtls_platform_setup() function, but currently is only a placeholder function.

Example:

```
/* De-initialize the platform. This is currently a placeholder function which does
not do anything. */

mbedtls_platform_teardown(&ctx);
```

Return values

N/A	

◆ RM_PSA_CRYPTO_TRNG_Read()

fsp_err_t RM_PSA_CRYPTO_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*, uint32_t * *p_num_gen_bytes*)

Reads requested length of random data from the TRNG. Generate nbytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- s_generate_16byte_random_data

Detailed Description

Oberon Ocrypto crypto library for limited RA0 and RA2 devices.

Overview

Ocrypto is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software is only licensed for a limited set of devices. Hardware acceleration varies by device.

Note

The Ocrypto port module does not provide any crypto interfaces to the user. See Ocrypto Licensed Functions.

Hardware Overview

Hardware acceleration summary:

Device	TRNG	AES
RA0E1	Yes	No
RA0E2	Yes	No
RA0L1	Yes	No
RA2E1	Yes	Yes
RA2E2	Yes	Yes
RA2L1	Yes	Yes

Features

For features supported by the software-only version, refer to the Ocrypto documentation.

Configuration

Build Time Configurations for rm_ocrypto_trng_port

The following build time configurations are defined in fsp_cfg/rm_ocrypto_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration (RA2 devices only) for the AES-EBC, CBC, and CTR operations, choose Ocrypto (H/W Accelerated) from the stack options. Be sure to initialize the hardware

Usage Notes

Hardware Initialization

Invoke RM_OCRYPTO_PORT_Init() to initialize the hardware before using Ocrypto if the TRNG or if H/W Acceleration is to be used.

Random Number Generation

Use the RM_OCRYPTO_PORT_TRNG_Read() function to obtain random data from the TRNG hardware. If purely random data is sufficient for the application, then RM_OCRYPTO_PORT_TRNG_Read() can be used directly instead.

Memory Usage

Ocrypto does not use dynamic allocation so there is no heap requirement.

A minimum stack of 0x800 is required to use Ocrypto.

Side Channel Safety Statement

See Ocrypto Side Channel Safety Statement.

Function Overview

Limitations

Licensed Devices

See Licensed Devices.

Ocrypto

Ocrypto does provide any API to generate keys. It is the responsibility of the caller to provide generated keys.

AES Reentrancy

Use the S/W only stack if AES reentrancy is required in your application.

Examples

Ocrypto Library Examples

For examples of how to use Ocrypto APIs, see Ocrypto test code under ra/oberon/ocrypto/tests/. These tests are not meant to be built or run in FSP and have been compiled out by the macro OCRYPTO_REFERENCE_TEST_CODE_DOES_NOT_BUILD by default.

TRNG Example

This is an example on using Ocrypto to generate a random number

```
#define TEST_SECRET_KEY_SIZE 32U
#define TEST_PUBLIC_KEY_SIZE 64U
void ocrypto_trng_example (void)
{
 fsp_err_t status       = FSP_SUCCESS;
    uint8_t   ecdsa_msg[3] = {'a', 'b', 'c'};
    uint8_t   secret_key[TEST_SECRET_KEY_SIZE];
    uint8_t   session_key[TEST_SECRET_KEY_SIZE];
    uint8_t   ecdsa_public_key[TEST_PUBLIC_KEY_SIZE];
    uint8_t   signature[TEST_PUBLIC_KEY_SIZE];
 /* Setup the platform; initialize the crypto engine. */
```

```
   status = RM_OCRYPTO_PORT_Init();
if (FSP_SUCCESS != status)
   {
      assert(0);
   }
/* Read random data from the TRNG to use as secret key. */
   status = RM_OCRYPTO_PORT_TRNG_Read(secret_key, sizeof(secret_key));
if (FSP_SUCCESS != status)
   {
      assert(0);
   }
if (0 != ocrypto_ecdsa_p256_public_key(ecdsa_public_key, secret_key))
   {
      assert(0);
   }
/* Read random data from the TRNG to use as session key */
   status = RM_OCRYPTO_PORT_TRNG_Read(session_key, sizeof(session_key));
if (FSP_SUCCESS != status)
   {
      assert(0);
   }
if (0 != ocrypto_ecdsa_p256_sign(signature, ecdsa_msg, sizeof(ecdsa_msg),
secret_key, session_key))
   {
      assert(0);
   }
if (0 != ocrypto_ecdsa_p256_verify(signature, ecdsa_msg, sizeof(ecdsa_msg),
ecdsa_public_key))
   {
      assert(0);
   }
/* Operation successful. */
while (1)
   {
```

```
        ;
    }
}
```

Function Documentation

◆ RM_OCRYPTO_PORT_Init()

fsp_err_t RM_OCRYPTO_PORT_Init ( )

Initialize the SCE.

Return values

FSP_SUCCESS	SCE initialized successfully

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_OCRYPTO_PORT_TRNG_Read()

fsp_err_t RM_OCRYPTO_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)

Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Parameters

[out]	p_rngbuf	Pointer to buffer to store generated random number
[in]	num_req_bytes	How many bytes of random numbers to generate

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

5.2.15.5 Renesas Secure IP (r_rsip_e11a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E11A) on RA MPUs.

Version

v2.0.0

The version that appears on the Components tab of the FSP Configuration editor is v2.0.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.0.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.0.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides RSIP-E11A CAVP Certified functions.

HW Overview

RSIP-E11A Protected Mode CAVP certification has been obtained using the RA4L1 as the target processor.

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - CTR 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - ECC
      - ECDSA
        - secp256r1
  - Key Agreement
    - ECDH
      - secp256r1

        - Key Derivation
            - Key Derivation Function (KDF) using SHA
                - SHA-256bit
            - Key Import by derived keying material
            - IV output by derived keying material
        - Public Key Infrastructure (PKI)
            - Certificate Verification
                - ECDSA
                    - secp256r1
            - Key Import from Certificate
                - ECC
                    - secp256r1
        - Hash Functions
            - SHA-2
                - SHA-224/256
        - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224/256bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - ECC
            - secp256r1
        - HMAC-SHA224/256bit
- Random Number Generate

Supported algorithms

The following algorithms are available on each devices.

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E11A
RSIP_KEY_TYPE_AES_128	Supported

Configuration

Build Time Configurations for r_rsip_e11a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses

			only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	Enabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
SHA-512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP-E11A Protected Mode - CAVP Certified (r_rsip_e11a_protected_cavp)

This module can be added to the Stacks tab via New Stack > Security > RSIP-E11A Protected Mode - CAVP Certified (r_rsip_e11a_protected_cavp).

Configuration	Options	Default	Description
General			

Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E11A Protected Mode (CAVP Certified).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
```

```
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define AES_GCM_TEST_GCM_BLOCK_LEN (16)

5.2.15.6 Renesas Secure IP (r_rsip_e31a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E31A) on RA MPUs.

Version

v2.4.0

The version that appears on the Components tab of the FSP Configuration editor is v2.4.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does

not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.4.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.4.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides RSIP-E31A CAVP Certified functions.

HW Overview

RSIP-E31A Protected Mode CAVP certification has been obtained using the RA4C1 as the target processor.

Crypto Peripheral version	Devices
RSIP-E31A	RA4C1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - CTR 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - ECC
      - ECDSA
        - secp256r1/secp384r1
        - secp256k1
        - brainpool P256r1/P384r1
      - EdDSA
        - Ed25519
  - Key Agreement
    - ECDH
      - secp256r1/secp384r1
      - brainpool P256r1/P384r1
  - Key Derivation
    - Key Derivation Function (KDF) using SHA
      - SHA-256/384bit
    - Key Derivation Function (KDF) using HMAC

                - HMAC-SHA256/384bit
            - Key Import by derived keying material
            - IV output by derived keying material
        - Public Key Infrastructure (PKI)
            - Certificate Verification
                - ECDSA
                    - secp256r1/secp384r1
                    - brainpool P256r1/P384r1
            - Key Import from Certificate
                - ECC
                    - secp256r1/secp384r1
                    - brainpool P256r1/P384r1
        - Hash Functions
            - SHA-2
                - SHA-224, 256, 384, 512, 512/224, 512/256
        - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA256, 384, 512, 512/224, 512/256 bit
    - AES-CMAC 128/256bit
- Key Manage
    - Key Support
        - AES 128/256bit
        - ECC
            - secp256r1/secp384r1
            - secp256k1
            - brainpool P256r1/P384r1
        - HMAC-SHA256, 384, 512, 512/224, 512/256 bit
- Random Number Generate
- DLMS/COSEM
    - xDLMS InitiateRequest message decryption

Supported algorithms

The following algorithms are available on each devices.

- RSIP-E31A: RA4C1

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E31A
RSIP_KEY_TYPE_AES_128	Supported
RSIP_KEY_TYPE_AES_192	Not Supported
RSIP_KEY_TYPE_AES_256	Supported
RSIP_KEY_TYPE_XTS_AES_128	Not Supported
RSIP_KEY_TYPE_XTS_AES_256	Not Supported
RSIP_KEY_TYPE_CHACHA20	Not Supported
RSIP_KEY_TYPE_HMAC_SHA224	Not Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported
RSIP_KEY_TYPE_HMAC_SHA384	Supported

RSIP_KEY_TYPE_HMAC_SHA512	Supported
RSIP_KEY_TYPE_HMAC_SHA512_224	Supported
RSIP_KEY_TYPE_HMAC_SHA512_256	Supported

Asymmetric Key

Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E31A
RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported
RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Supported
RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Not Supported
RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	Supported
RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE	Supported
RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE	Supported
RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC	RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE	Not Supported
RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC	RSIP_KEY_TYPE_ECC_EDWARDS25519_PRIVATE	Supported
RSIP_KEY_TYPE_RSA_2048_PUBLIC	RSIP_KEY_TYPE_RSA_2048_PRIVATE	Not Supported
RSIP_KEY_TYPE_RSA_3072_PUBLIC	RSIP_KEY_TYPE_RSA_3072_PRIVATE	Not Supported
RSIP_KEY_TYPE_RSA_4096_PUBLIC	RSIP_KEY_TYPE_RSA_4096_PRIVATE	Not Supported

AES Block Cipher Mode of Operation

Cipher mode (rsip_aes_cipher_mode_t)	RSIP-E31A
RSIP_AES_CIPHER_MODE_ECB_ENC	Supported
RSIP_AES_CIPHER_MODE_ECB_DEC	Supported
RSIP_AES_CIPHER_MODE_CBC_ENC	Supported
RSIP_AES_CIPHER_MODE_CBC_DEC	Supported
RSIP_AES_CIPHER_MODE_CTR	Supported
RSIP_AES_CIPHER_MODE_XTS_ENC	Not Supported
RSIP_AES_CIPHER_MODE_XTS_DEC	Not Supported

AEAD mode (rsip_aes_aead_mode_t)	RSIP-E31A

RSIP_AES_AEAD_MODE_GCM_ENC	Supported
RSIP_AES_AEAD_MODE_GCM_DEC	Supported
RSIP_AES_AEAD_MODE_CCM_ENC	Supported
RSIP_AES_AEAD_MODE_CCM_DEC	Supported

MAC mode (rsip_aes_mac_mode_t)	RSIP-E31A
RSIP_AES_MAC_MODE_CMAC	Supported

ChaCha20-Poly1305 Operation

This feature has a usage constraint that requires an input of at least one byte of encrypt/decrypt text data.

ChaCha20-Poly1305 mode (rsip_chacha_poly_mode_t)	RSIP-E31A
RSIP_CHACHA20_POLY1305_MODE_ENC	Not Supported
RSIP_CHACHA20_POLY1305_MODE_DEC	Not Supported

Hash Function

Using hardware-accelerated SHA-3 in Protected Mode for use with a software PQC library is prohibited by the Protected Mode security policy due to the requirement for plaintext key usage with a software cryptographic library.

Hash Function (rsip_hash_type_t)	RSIP-E31A
RSIP_HASH_TYPE_SHA224	Supported
RSIP_HASH_TYPE_SHA256	Supported
RSIP_HASH_TYPE_SHA384	Supported
RSIP_HASH_TYPE_SHA512	Supported
RSIP_HASH_TYPE_SHA512_224	Supported
RSIP_HASH_TYPE_SHA512_256	Supported
RSIP_HASH_TYPE_SHA3_224	Not Supported
RSIP_HASH_TYPE_SHA3_256	Not Supported
RSIP_HASH_TYPE_SHA3_384	Not Supported
RSIP_HASH_TYPE_SHA3_512	Not Supported

Key Derivation Function

Key Derivation Function	RSIP-E31A
SHA-256	Supported
SHA-384	Supported
SHA-512	Not Supported

HMAC-SHA256	Supported
HMAC-SHA384	Supported
HMAC-SHA512	Not Supported

Note : KDF-SHA 512 does not support using a shared secret generated by ECDH secp521r1 key agreement as input for the message.

DLMS/COSEM

xDLMS InitiateRequest message decryption	RSIP-E31A
AES-GCM 128	Supported
AES-GCM 256	Supported

Supported Devices

Device Group	Devices
RA4	RA4C1

Configuration

Build Time Configurations for r_rsip_e31a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20-Poly1305	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	Disabled	Disabled	If the application uses

			only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
HMAC_SHA512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP-E31A Protected Mode - CAVP Certified (r_rsip_e31a_protected_cavp)

This module can be added to the Stacks tab via New Stack > Security > RSIP-E31A Protected Mode - CAVP Certified (r_rsip_e31a_protected_cavp).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E31A Protected Mode (CAVP Certified).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.

STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_CHACHA	Computing ChaCha20.
STATE_CHACHA_POLY	Computing ChaCha20-Poly1305.
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

TRNG Initialization

The seed used for CTR-DRBG in R_RSIP_RandomNumberGenerate() is generated by R_RSIP_Open(). To reseed the random number generator, you need to call R_RSIP_Open() again.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
```

```
      0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
```

```
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define AES_GCM_TEST_GCM_BLOCK_LEN (16)
#define AES_GCM_TEST_GCM_TEXT_LEN (31)

5.2.15.7 Renesas Secure IP (r_rsip_e51a_protected_cavp)

Modules » Security

Driver for the CAVP Certified Renesas Secure IP (RSIP-E51A) on RA MPUs.

Version

v2.1.0

The version that appears on the Components tab of the FSP Configuration editor is v2.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Renesas Secure IP (r_rsip_protected) of FSP v6.1.0. For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v6.1.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides RSIP-E51A CAVP Certified functions.

HW Overview

RSIP-E51A Protected Mode CAVP certification has been obtained using the RA8M1 as the target processor.

Crypto Peripheral version	Devices
RSIP-E51A	RA8M1, RA8D1, RA8T1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit
      - CBC 128/192/256bit
      - CTR 128/192/256bit
      - GCM 128/192/256bit
      - CCM 128/192/256bit
      - XTS 128/256bit

- Asymmetric Encryption/Decryption
  - RSA
    - RSAES-PKCS1-V1_5 2048/3072/4096bit
    - RSAES-OAEP 2048/3072/4096bit
    - RSASSA-PKCS1-V1_5 2048/3072/4096bit
    - RSASSA-PSS 2048/3072/4096bit
  - ECC
    - ECDSA
      - secp256r1/secp384r1/secp521r1
      - secp256k1
      - brainpool P256r1/P384r1/P512r1
    - EdDSA
      - Ed25519
- Key Agreement
  - ECDH
    - secp256r1/secp384r1/secp521r1
      - brainpool P256r1/P384r1
- Key Derivation
  - Key Derivation Function (KDF) using SHA
    - SHA-256/384bit
  - Key Derivation Function (KDF) using HMAC
    - HMAC-SHA256/384/512bit
  - Key Import by derived keying material
  - IV output by derived keying material
- Public Key Infrastructure (PKI)
  - Certificate Verification
    - ECDSA
      - secp256r1/secp384r1/secp521r1
      - brainpool P256r1/P384r1
  - Key Import from Certificate
    - ECC
      - secp256r1/secp384r1/secp521r1
      - brainpool P256r1/P384r1
- Hash Functions
  - SHA-2
    - SHA-224, 256, 384, 512, 512/224, 512/256
- RFC3394 Key Wrap/Unwrap

- Message Authentication Code
  - HMAC-SHA224/256/384/512bit
  - AES-CMAC 128/192/256bit
- Key Manage
  - Key Support
    - AES 128/192/256bit
    - RSA 2048/3072/4096bit
    - ECC
      - secp256r1/secp384r1/secp521r1
      - secp256k1
      - brainpool P256r1/P384r1/P512r1
    - HMAC-SHA224/256/384/512bit
- Random Number Generate
- Secure boot for FSBL
  - Manifest verification and MAC generation (Refer to Application Note R11AN0774.)

Supported algorithms

The following algorithms are available on each devices.

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_TYPE_AES_128	Supported
RSIP_KEY_TYPE_AES_256	Supported
RSIP_KEY_TYPE_XTS_AES_128	Supported
RSIP_KEY_TYPE_XTS_AES_256	Supported
RSIP_KEY_TYPE_HMAC_SHA224	Supported
RSIP_KEY_TYPE_HMAC_SHA256	Supported
RSIP_KEY_TYPE_HMAC_SHA384	Supported
RSIP_KEY_TYPE_HMAC_SHA512	Supported

Asymmetric Key

Key pair type (rsip_key_pair_type_t)	Public key type (rsip_key_type_t)	Private key type (rsip_key_type_t)	RSIP-E51A
RSIP_KEY_PAIR_TYPE_ECC_SECP256R1	RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP384R1	RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP521R1	RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	Supported
RSIP_KEY_PAIR_TYPE_ECC_SECP256K1	RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	Supported

Configuration

Build Time Configurations for r_rsip_e51a_protected_cavp

The following build time configurations are defined in fsp_cfg/r_rsip_cavp_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled	Enabled	If the application uses

	• Disabled		only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Security > RSIP-E51A Protected Mode - CAVP Certified (r_rsip_e51a_protected_cavp)

This module can be added to the Stacks tab via New Stack > Security > RSIP-E51A Protected Mode - CAVP Certified (r_rsip_e51a_protected_cavp).

Configuration	Options	Default	Description
General			
Name	Name must be a valid C symbol	g_rsip	Module name.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP-E51A Protected Mode (CAVP Certified).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
```

```
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
```

```
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define AES_GCM_TEST_GCM_BLOCK_LEN (16)
#define AES_GCM_TEST_GCM_TEXT_LEN (31)

Detailed Description

Driver for the Renesas Secure IP on RA MPUs. This module implements the RSIP Interface.

Overview

This module provides RSIP functions in protected mode.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1
RSIP-E31A	RA4C1
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8M2, RA8D2, RA8T2, RA8P1

Features

The RSIP module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/192/256bit
      - CBC 128/192/256bit
      - CTR 128/192/256bit
      - GCM 128/192/256bit
      - CCM 128/192/256bit
      - XTS 128/256bit
    - ChaCha
      - ChaCha20
      - ChaCha20-Poly1305
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 2048/3072/4096bit
      - RSAES-OAEP 2048/3072/4096bit
      - RSASSA-PKCS1-V1_5 2048/3072/4096bit
      - RSASSA-PSS 2048/3072/4096bit
    - ECC
      - ECDSA
        - secp256r1/secp384r1/secp521r1
        - secp256k1
        - brainpool P256r1/P384r1/P512r1
      - EdDSA
        - Ed25519
  - Key Agreement
    - ECDH
      - secp256r1/secp384r1/secp521r1
      - brainpool P256r1/P384r1/P512r1
  - Key Derivation
    - Key Derivation Function (KDF) using SHA
      - SHA-256/384/512bit
    - Key Derivation Function (KDF) using HMAC
      - HMAC-SHA256/384/512bit

        - Key Import by derived keying material
        - IV output by derived keying material
    - Public Key Infrastructure (PKI)
        - Certificate Verification
            - RSA
                - RSASSA-PKCS1-V1_5 2048/3072/4096bit
                - RSASSA-PSS 2048/3072/4096bit
            - ECDSA
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1/P512r1
        - Key Import from Certificate
            - RSA 2048/3072/4096bit
            - ECC
                - secp256r1/secp384r1/secp521r1
                - brainpool P256r1/P384r1/P512r1
    - Hash Functions
        - SHA-2
            - SHA-224, 256, 384, 512, 512/224, 512/256
        - SHA-3
            - SHA3-224, 256, 384, 512
    - RFC3394 Key Wrap/Unwrap
- Message Authentication Code
    - HMAC-SHA224, 256, 384, 512, 512/224, 512/256 bit
    - HMAC-SHA3 224, 256, 384, 512 bit
    - AES-CMAC 128/192/256bit
- Key Manage
    - Key Support
        - AES 128/192/256bit
        - RSA 2048/3072/4096bit
        - ECC
            - secp256r1/secp384r1/secp521r1
            - secp256k1
            - brainpool P256r1/P384r1/P512r1
        - HMAC-SHA224, 256, 384, 512, 512/224, 512/256 bit
        - HMAC-SHA3 224, 256, 384, 512 bit
- Random Number Generate
- Secure boot for FSBL
    - Manifest verification and MAC generation (Refer to Application Note R11AN0774.)
- DLMS/COSEM
    - xDLMS InitiateRequest message decryption

Supported algorithms

The following algorithms are available on each devices.

Symmetric Key

Key type (rsip_key_type_t)	RSIP-E11A	RSIP-E31A	RSIP-E51A	RSIP-E50D
RSIP_KEY_TYPE_AES_128	Supported	Supported	Supported	Supported
RSIP_KEY_TYPE_AES_192	Not Supported	Not Supported	Supported	Supported

RSIP_KEY_TYPE_AES_256	Supported	Supported	Supported	Supported
RSIP_KEY_TYPE_XTS_AES_128	Not Supported	Not Supported	Supported	Supported
RSIP_KEY_TYPE_XTS_AES_256	Not Supported	Not Supported	Supported	Supported
RSIP_KEY_TYPE_CHACHA20	Not Supported	Not Supported	Not Supported	Supported
RSIP_KEY_TYPE_HMAC_SHA224	Supported	Not Supported	Supported	Supported

Configuration

Build Time Configurations for r_rsip_e11a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20-Poly1305	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
ECC SECP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	Disabled	Disabled	If the application uses

			only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
SHA3-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_224	Disabled	Disabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_512	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e31a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			

AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
XTS-AES-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20-Poly1305	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	Disabled	Disabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-256	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-384	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-512	Disabled	Disabled	If the application uses

			only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_224	Disabled	config.driver.rsip_e31a.algorithms_enable.hmac_sha3_224.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_256	Disabled	config.driver.rsip_e31a.algorithms_enable.hmac_sha3_256.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_384	Disabled	config.driver.rsip_e31a.algorithms_enable.hmac_sha3_384.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_512	Disabled	config.driver.rsip_e31a.algorithms_enable.hmac_sha3_512.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e51a_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
ChaCha20-Poly1305	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
SHA3-224	Disabled	config.driver.rsip.algorithms_enable.sha3_224.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-256	Disabled	config.driver.rsip.algorithms_enable.sha3_256.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-384	Disabled	config.driver.rsip.algorithms_enable.sha3_384.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-512	Disabled	config.driver.rsip.algorithms_enable.sha3_512.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size

			can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_224	• Enabled	Enabled	If the application uses

	• Disabled		only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_224	Disabled	config.driver.rsip.algorithms_enable.hmac_sha3_224.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_256	Disabled	config.driver.rsip.algorithms_enable.hmac_sha3_256.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA3_384	Disabled	config.driver.rsip.algorithms_enable.hmac_sha3_384.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the

			functions for which it works effectively.
HMAC_SHA3_512	Disabled	config.driver.rsip.algorithms_enable.hmac_sha3_512.enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Build Time Configurations for r_rsip_e50d_protected

The following build time configurations are defined in fsp_cfg/r_rsip_cfg.h:

Configuration	Options	Default	Description
Selection of algorithms to enable			
AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-192	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused

			algorithms. This configuration is provided only for the functions for which it works effectively.
AES-ECB CBC CTR	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-128	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
XTS-AES	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-GCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the

			function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CCM	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
AES-CMAC	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ChaCha20-Poly1305	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

ECC SECP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP521R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC SECP256K1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP256R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is

			provided only for the functions for which it works effectively.
ECC BRAINPOOLP384R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC BRAINPOOLP512R1	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
ECC EDWARDS25519	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-2048	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-3072	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by

			disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
RSA-4096	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-384	• Enabled • Disabled	Enabled	If the application uses only some of the

			algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA-512_256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it

			works effectively.
SHA3-256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
SHA3-512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA1	Disabled	Disabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This

			configuration is provided only for the functions for which it works effectively.
HMAC_SHA256	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA384	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.
HMAC_SHA512_224	• Enabled • Disabled	Enabled	If the application uses only some of the algorithm in the function, the code size can be reduced by disabling the unused algorithms. This configuration is provided only for the functions for which it works effectively.

Parameter Checking	• Default (BSP)	Default (BSP)	If selected code for

	• Enabled • Disabled	parameter checking is included in the build.

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a RSIP Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > RSIP Protected Mode (r_rsip_protected).

State Transition

This driver has the following states.

State Name	Details
STATE_INITIAL	Driver is not open.
STATE_MAIN	Ready to Compute.
STATE_AES	Computing AES (unauthenticated cipher)
STATE_AES_AEAD	Computing AES (AEAD).
STATE_AES_MAC	Computing AES (MAC).
STATE_CHACHA	Computing ChaCha20.
STATE_CHACHA_POLY	Computing ChaCha20-Poly1305.
STATE_SHA	Computing SHA.
STATE_HMAC	Computing HMAC.
STATE_KDF_SHA	Computing KDF SHA.
STATE_KDF_HMAC	Computing KDF HMAC.

There are two types of APIs provided by the RSIP driver for accelerating cryptographic operations: those that provide cryptographic operations in a single API and those that provide them in multiple APIs. In this document, the former is referred to as single-part operations and the latter as multi-part operations. Each corresponds to the following algorithms:

- Single-part operations: DRBG, Key management, ECC, RSA, SHA, HMAC
- Multi-part operations: AES, SHA, HMAC

Multi-part operations are APIs which split a single cryptographic operation into a sequence of separate steps (e.g. Init-Update-Finish). This enables fine control over the configuration of the cryptographic operation, and allows the message data to be processed in fragments instead of all at once.

Due to the above characteristics, it is necessary to manage the operational states in the multi-part operations.

TRNG Initialization

The seed used for CTR-DRBG in R_RSIP_RandomNumberGenerate() is generated by R_RSIP_Open(). To reseed the random number generator, you need to call R_RSIP_Open() again.

Examples

AES cipher Example

This is an example of AES-CBC encryption/decryption.

```
void r_rsip_example_aes ()
{
 fsp_err_t            err;
 static const uint8_t plain[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4) =
    {
       0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
       0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
    };
    uint8_t iv[RSIP_PRV_BYTE_SIZE_AES_BLOCK] BSP_ALIGN_VARIABLE(4) = {0};
    uint8_t cipher_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
    uint8_t plain_calculated[RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2] BSP_ALIGN_VARIABLE(4)
= {0};
 /* Prepare wrapped key data area */

uint8_t            wrapped_key_value[RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256
)] BSP_ALIGN_VARIABLE(4);
 rsip_wrapped_key_t wrapped_key =
    {
       .type = RSIP_KEY_TYPE_AES_256, .p_value = &wrapped_key_value
    };
 /* Initialize the driver */
    err = R_RSIP_Open(&g_rsip_ctrl, &g_rsip_cfg);
```

```
    assert(FSP_SUCCESS == err);
 /* Generate a aes 256-bit key */
    err = R_RSIP_KeyGenerate(&g_rsip_ctrl, &wrapped_key);
    assert(FSP_SUCCESS == err);
 /* Generate a nonce */
    err = R_RSIP_RandomNumberGenerate(&g_rsip_ctrl, iv);
    assert(FSP_SUCCESS == err);
 /* Encrypt a plaintext */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_ENC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, plain, cipher_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Decrypt a ciphertext using the same key */
    err = R_RSIP_AES_Cipher_Init(&g_rsip_ctrl, RSIP_AES_CIPHER_MODE_CBC_DEC,
&wrapped_key, iv);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl, cipher_calculated, plain_calculated,
RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Update(&g_rsip_ctrl,
                                   cipher_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   plain_calculated + RSIP_PRV_BYTE_SIZE_AES_BLOCK,
                                   RSIP_PRV_BYTE_SIZE_AES_BLOCK);
    assert(FSP_SUCCESS == err);
    err = R_RSIP_AES_Cipher_Finish(&g_rsip_ctrl);
    assert(FSP_SUCCESS == err);
 /* Compare plain and plain_calculated */
    assert(0 == memcmp(plain, plain_calculated, RSIP_PRV_BYTE_SIZE_AES_BLOCK * 2));
 /* Close the driver */
    err = R_RSIP_Close(&g_rsip_ctrl);
```

```
    assert(FSP_SUCCESS == err);
}
```

AES-GCM Example

This is an example of AES-GCM encryption/decryption.

```
#define AES_GCM_TEST_GCM_BLOCK_LEN (16)
#define AES_GCM_TEST_GCM_TEXT_LEN (31)
#define GCM_NONCE_LEN (12)
#define AES_GCM_TEST_GCM_AAD_LEN (8)

Data Structure Documentation

◆ rsip_sha_handle_t

struct rsip_sha_handle_t
Working area for SHA functions. DO NOT MODIFY.

◆ rsip_hmac_handle_t

struct rsip_hmac_handle_t
Working area for HMAC functions. DO NOT MODIFY.

◆ rsip_kdf_sha_handle_t

struct rsip_kdf_sha_handle_t
Working area for KDF SHA functions. DO NOT MODIFY.

◆ rsip_kdf_hmac_handle_t

struct rsip_kdf_hmac_handle_t
Working area for KDF HMAC functions. DO NOT MODIFY.

◆ rsip_verified_cert_info_t

struct rsip_verified_cert_info_t
Verified certificate information

◆ rsip_wrapped_secret_t

struct rsip_wrapped_secret_t
Wrapped ECDH secret structure for ECDH and KDF APIs.

◆ rsip_instance_ctrl_t

struct rsip_instance_ctrl_t
RSIP private control block. DO NOT MODIFY. Initialization occurs when R_RSIP_Open() is called.

Macro Definition Documentation

◆ RSIP_BYTE_SIZE_PLAIN_KEY

#define RSIP_BYTE_SIZE_PLAIN_KEY (key_type)
Returns the plain key size formatted for RSIP driver of the key type.

◆ RSIP_BYTE_SIZE_ENCRYPTED_KEY

#define RSIP_BYTE_SIZE_ENCRYPTED_KEY (key_type)
Returns the encrypted key size of the key type.

◆ RSIP_BYTE_SIZE_WRAPPED_KEY

#define RSIP_BYTE_SIZE_WRAPPED_KEY (key_type)
Returns the wrapped key size of the key type.

RSIP_BYTE_SIZE_ENCRYPTED_KEY_KUK	Key Update Key (KUK)

◆ rsip_byte_size_wrapped_dkm_t

enum rsip_byte_size_wrapped_dkm_t	
Byte size of wrapped key	
Enumerator	
RSIP_BYTE_SIZE_WRAPPED_DKM_HEADER	Header.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA256	A block of SHA-256.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA384	A block of SHA-384.
RSIP_BYTE_SIZE_WRAPPED_DKM_BLOCK_SHA512	A block of SHA-512.

◆ rsip_byte_size_wrapped_iv_t

enum rsip_byte_size_wrapped_iv_t	
Byte size of wrapped IV or nonce	
Enumerator	
RSIP_BYTE_SIZE_WRAPPED_IV	Wrapped IV size for all algorithms.

Function Documentation

◆ R_RSIP_Open()

fsp_err_t R_RSIP_Open (rsip_ctrl_t *const *p_ctrl*, rsip_cfg_t const *const *p_cfg*)

Enables use of Renesas Secure IP functionality.

Implements rsip_api_t::open.

State transition

This API can only be executed in **STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Internal key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Hardware initialization is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption or hardware fault is detected.

Note

This module does not provide an optional feature to disable TRNG initialization.

◆ R_RSIP_Close()

fsp_err_t R_RSIP_Close (rsip_ctrl_t *const *p_ctrl*)

Disables use of Renesas Secure IP functionality.

Implements rsip_api_t::close.

State transition

This API can be executed in **except STATE_INITIAL**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_INITIAL
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RandomNumberGenerate()

fsp_err_t R_RSIP_RandomNumberGenerate (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_random*)

Generates a 128-bit random number.

Implements rsip_api_t::randomNumberGenerate.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyGenerate()

fsp_err_t R_RSIP_KeyGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_key*)

Generates a wrapped symmetric key from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyGenerate.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FAIL	A generated AES-XTS key is illegal (Data Key == Tweak Key).
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KeyPairGenerate()

fsp_err_t R_RSIP_KeyPairGenerate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t *const *p_wrapped_public_key*, rsip_wrapped_key_t *const *p_wrapped_private_key*)

Generates a wrapped asymmetric key pair from a random number. In this API, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Implements rsip_api_t::keyPairGenerate.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Here, p_wrapped_public_key->type and p_wrapped_private_key->type must match. For example, if p_wrapped_public_key->type is RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC, then p_wrapped_public_key->type must be RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_EncryptedKeyWrap()

fsp_err_t R_RSIP_EncryptedKeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_key_update_key*, void const *const *p_initial_vector*, void const *const *p_encrypted_key*, rsip_wrapped_key_t *const *p_wrapped_key*)

Decrypts an encrypted user key with Key Update Key (KUK) and wrap it with the Hardware Unique Key (HUK).

Implements rsip_api_t::encryptedKeyWrap.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input KUK is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyWrap()

fsp_err_t R_RSIP_RFC3394_KeyWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, rsip_wrapped_key_t const *const *p_wrapped_target_key*, uint8_t *const *p_rfc3394_wrapped_target_key*)

This function provides Key Wrap algorithm compliant with RFC3394. Using p_wrapped_kek to wrap p_wrapped_target_key, and output the result to p_rfc3394_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyWrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RFC3394_KeyUnwrap()

fsp_err_t R_RSIP_RFC3394_KeyUnwrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_kek*, uint8_t const *const *p_rfc3394_wrapped_target_key*, rsip_wrapped_key_t *const *p_wrapped_target_key*)

This function provides Key Unwrap algorithm compliant with RFC3394. Using p_wrapped_kek to unwrap p_rfc3394_wrapped_target_key, and output the result to p_wrapped_target_key.

Implements rsip_api_t::rfc3394_KeyUnwrap.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PublicKeyExport()

fsp_err_t R_RSIP_PublicKeyExport (rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t *const *p_raw_public_key*)

Exports public key parameters from a wrapped key.

Implements rsip_api_t::publicKeyExport.

Relative position of each elements in p_raw_public_key is shown in below:

- ECC (RSIP_KEY_TYPE_ECC_*) : Qx placed first and Qy placed after that.

bit length	Qx	Qy
256	0	32
384	0	48
512	0	64
521	0	66

- RSA (RSIP_KEY_TYPE_RSA_*) : n placed first and e placed after that.

modulus	n	e
1024	0	128
2048	0	256
3072	0	384
4096	0	512

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

◆ R_RSIP_AES_Cipher_Init()

fsp_err_t R_RSIP_AES_Cipher_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_cipher_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_initial_vector*)

Starts AES cipher operation in confidentiality mode (ECB/CBC/CTR) or XTS mode.

Implements rsip_api_t::aesCipherInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument mode must be the following:

- AES key
  - RSIP_AES_CIPHER_MODE_ECB_ENC, RSIP_AES_CIPHER_MODE_ECB_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC, RSIP_AES_CIPHER_MODE_CBC_DEC
  - RSIP_AES_CIPHER_MODE_CBC_ENC_WRAPPED_IV, RSIP_AES_CIPHER_MODE_CBC_DEC_WRAPPED_IV
  - RSIP_AES_CIPHER_MODE_CTR
- XTS-AES key
  - RSIP_AES_CIPHER_MODE_XTS_ENC, RSIP_AES_CIPHER_MODE_XTS_DEC

Argument p_initial_vector must be the following:

- [ECB] Not used
- [CBC] Raw initial vector
- [CTR] Raw nonce
- [XTS] Raw initial vector

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type or mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FAIL	Input AES-XTS key value is illegal (Data Key == Tweak Key).
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_Cipher_Update()

fsp_err_t R_RSIP_AES_Cipher_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint8_t *const *p_output*, uint32_t const *length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesCipherUpdate.

Conditions

Argument length must be the following:

- [ECB][CBC][CTR] 0 or a multiple of 16.
- [XTS] 0 or greater than or equal to 16.

Output length

Output length to p_output is length.

State transition

This API can only be executed in **STATE_AES**, and does not cause any state transitions.

In XTS mode, if once an integer other than 0 or a multiple of 16 is input, this API can no longer be called.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_Cipher_Finish()

fsp_err_t R_RSIP_AES_Cipher_Finish (rsip_ctrl_t *const *p_ctrl*)

Finishes AES operation.

Implements rsip_api_t::aesCipherFinish.

State transition

This API can only be executed in **STATE_AES**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Init()

fsp_err_t R_RSIP_AES_AEAD_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_aead_mode_t *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length*)

Starts AES AEAD function.

Implements rsip_api_t::aesAeadInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

Argument nonce_length must be the following:

- [GCM] Any length is accepted, but 12 bytes is generally recommended.
- [CCM] 7 to 13 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_AEAD
Others	No change

The next callable API functions in STATE_AES_AEAD are as below.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_LengthsSet()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input key type is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_LengthsSet()

fsp_err_t R_RSIP_AES_AEAD_LengthsSet (rsip_ctrl_t *const *p_ctrl*, uint32_t const *total_aad_length*, uint32_t const *total_text_length*, uint32_t const *tag_length*)

Sets text and tag lengths for CCM mode.

Implements rsip_api_t::aesAeadLengthsSet.

Conditions

Argument total_aad_length must be equal to the length of AAD and must be 110 or less.

Argument total_test_length must be equal to the length of the plaintext or ciphertext.

Argument tag_length must be 4, 6, 8, 10, 12, 14, or 16.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

The next callable API functions in STATE_AES_AEAD are as below.

- [CCM] R_RSIP_AES_AEAD_AADUpdate()

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, this API must NOT be called. If called, FSP_ERR_INVALID_STATE will be returned. AAD length and text length are indeterminate and output tag length is fixed to 16 bytes.

◆ R_RSIP_AES_AEAD_AADUpdate()

fsp_err_t R_RSIP_AES_AEAD_AADUpdate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length*)

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::aesAeadAadUpdate.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_AADUpdate(), R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_AADUpdate() (AAD input is not completed), R_RSIP_AES_AEAD_Update() (AAD input is completed)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	aad_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

◆ R_RSIP_AES_AEAD_Update()

fsp_err_t R_RSIP_AES_AEAD_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::aesAeadUpdate.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 16 bytes.

State transition

This API can only be executed in **STATE_AES_AEAD**, and does not cause any state transitions.

- [GCM] R_RSIP_AES_AEAD_Update(), R_RSIP_AES_AEAD_Finish() (encryption), R_RSIP_AES_AEAD_Verify() (decryption)
- [CCM] R_RSIP_AES_AEAD_Update() (text input is not completed), R_RSIP_AES_AEAD_Finish() (text input is completed, encryption), R_RSIP_AES_AEAD_Verify() (text input is completed, decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_INVALID_STATE	Internal state is illegal.

Note

In GCM mode, if this API is skipped, GMAC will be calculated. For detailed usage, refer to example code.

◆ R_RSIP_AES_AEAD_Finish()

fsp_err_t R_RSIP_AES_AEAD_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag*)

Finalizes an AES AEAD encryption.

Implements rsip_api_t::aesAeadFinish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag as below.

- [GCM] 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_AEAD_Verify()

fsp_err_t R_RSIP_AES_AEAD_Verify (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length*)

Finalizes an AES AEAD decryption.

If there is 16-byte fractional data indicated by the total data length of the value of p_cipher that was input by R_RSIP_AES_GCM_DecryptUpdate(), this API will output the result of decrypting that fractional data to p_cipher. Here, the portion that does not reach 16 bytes will be padded with zeros.

Implements rsip_api_t::aesAeadVerify.

Conditions

Argument tag_length must be as below.

- [GCM] 1 to 16 bytes.
- [CCM] Input value as tag_length in R_RSIP_AES_AEAD_LengthsSet().

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **STATE_AES_AEAD**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	tag_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_Init()

fsp_err_t R_RSIP_AES_MAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_aes_mac_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Starts an AES MAC operation.

Implements rsip_api_t::aesMacInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument mode accepts any member of enumeration rsip_aes_aead_mode_t.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_AES_MAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

To calculate AES-GMAC, please use not R_RSIP_MAC_*() but R_RSIP_AEAD_*(). For detailed usage, refer to example code.

◆ R_RSIP_AES_MAC_Update()

fsp_err_t R_RSIP_AES_MAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::aesMacUpdate.

Inside this function, the data that is input by the user is buffered until the input value of p_message exceeds 16 bytes. If the input value, p_message, is not a multiple of 16 bytes, it will be padded within the function.

State transition

This API can only be executed in **STATE_AES_MAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_AES_MAC_SignFinish()

fsp_err_t R_RSIP_AES_MAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs AES MAC.

Implements rsip_api_t::aesMacSignFinish.

Output length

Output length to p_mac is 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_AES_MAC_VerifyFinish()

fsp_err_t R_RSIP_AES_MAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies AES MAC.

Implements rsip_api_t::aesMacVerifyFinish.

Conditions

Argument mac_length must be as below.

- [CMAC] 2 to 16 bytes.

State transition

This API can only be executed in **STATE_AES_MAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Internal error.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Init()

fsp_err_t R_RSIP_ChaCha20_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *counter*)

Prepares a ChaCha20 function.

Implements rsip_api_t::chacha20Init.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_CHACHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Update()

fsp_err_t R_RSIP_ChaCha20_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::chacha20Update.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 64 bytes.

State transition

This API can only be executed in **RSIP_STATE_CHACHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_ChaCha20_Finish()

fsp_err_t R_RSIP_ChaCha20_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Finalize ChaCha20 operation.

Implements rsip_api_t::chacha20Finish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **RSIP_STATE_CHACHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Poly1305_Init()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Init (rsip_ctrl_t *const *p_ctrl*, rsip_chacha_poly_mode_t const *mode*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_nonce*, uint32_t const *nonce_length*)

Prepares a ChaCha20-Poly1305 function.

Implements rsip_api_t::chacha20Poly1305Init.

Conditions

Key type of p_wrapped_key must be RSIP_KEY_TYPE_CHACHA20.

Argument mode accepts any member of enumeration rsip_chacha_poly_mode_t.

Argument nonce_length must be 12 bytes.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_CHACHA_POLY
Others	No change

The next callable API functions in STATE_CHACHA_POLY are as below.

- R_RSIP_ChaCha20_Poly1305_AADUpdate(), R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	nonce_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_ARGUMENT	Input mode is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Poly1305_AADUpdate()

fsp_err_t R_RSIP_ChaCha20_Poly1305_AADUpdate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_aad*, uint32_t const *aad_length*)

Inputs Additional Authentication Data (AAD).

Implements rsip_api_t::chacha20Poly1305AadUpdate.

State transition

This API can only be executed in **STATE_CHACHA_POLY**, and does not cause any state transitions.

- R_RSIP_ChaCha20_Poly1305_AADUpdate(), R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_ChaCha20_Poly1305_Update()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_input*, uint32_t const *input_length*, uint8_t *const *p_output*, uint32_t *const *p_output_length*)

Encrypts plaintext or decrypts ciphertext.

Implements rsip_api_t::chacha20Poly1305Update.

Output length

Output length to p_output (p_output_length) is calculated text that has not yet been output in multiple of 64 bytes.

At least one byte of data must be input with this API before calling R_RSIP_ChaCha20_Poly1305_Finish() or R_RSIP_ChaCha20_Poly1305_Verify().

State transition

This API can only be executed in **STATE_CHACHA_POLY**, and does not cause any state transitions.

- R_RSIP_ChaCha20_Poly1305_Update(), R_RSIP_ChaCha20_Poly1305_Finish() (encryption), R_RSIP_ChaCha20_Poly1305_Verify() (decryption)

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Poly1305_Finish()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t *const *p_tag*)

Finalizes a ChaCha20-Poly1305 encryption.

Implements rsip_api_t::chacha20Poly1305Finish.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

Output length to p_tag is 16 bytes.

State transition

This API can only be executed in **STATE_CHACHA_POLY**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
FSP_ERR_INVALID_SIZE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	Input text length is illegal. (zero byte)
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ChaCha20_Poly1305_Verify()

fsp_err_t R_RSIP_ChaCha20_Poly1305_Verify (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_output*, uint32_t *const *p_output_length*, uint8_t const *const *p_tag*, uint32_t const *tag_length*)

Finalizes a ChaCha20-Poly1305 decryption.

Implements rsip_api_t::chacha20Poly1305Verify.

Conditions

Argument tag_length must be 16 bytes.

Output length

Output length to p_output (p_output_length) is the remaining calculated text length.

State transition

This API can only be executed in **STATE_CHACHA_POLY**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	tag_length is illegal.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_xDLMS_InitiateRequest_Decrypt()

fsp_err_t R_RSIP_xDLMS_InitiateRequest_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*, uint8_t const *const *p_apdu*, uint8_t const *const *p_nonce*, uint8_t const *const *p_aad*, uint32_t const *aad_length*, rsip_wrapped_key_t *const *p_dedicated_key*, rsip_dlms_apdu_data_t *const *p_apdu_data*, rsip_dlms_ret_t *const *p_dlms_ret*)

Decrypts and Verifies ciphered InitiateRequest message, and wraps a Dedicated Key embedded in the message.

Implements rsip_api_t::xdlmsInitiateRequestDecrypt.

Conditions

Decrypted InitiateRequest message consists of the following:
Part 1 and Part 2 are obtained as p_apdu_data (rsip_dlms_apdu_data_t structure), and Dedicated Key is obtained as p_dedicated_key (wrapped key).

Decrypted InitiateRequest message		
Part 1 (The first 3 bytes of the message, consisting of APDU Choice, Key Flag, and Key Length)	Dedicated Key (AES-128 or AES-256 key)	Part 2 (Remaining message; Maximum 14 bytes)

Key type of p_wrapped_key must be one of the following and this must match Security Suite specified in SC (Security Control) byte:

- RSIP_KEY_TYPE_AES_128
- RSIP_KEY_TYPE_AES_256

The p_value of the p_dedicated_key must point to a buffer of size RSIP_BYTE_SIZE_WRAPPED_KEY(RSIP_KEY_TYPE_AES_256).
The type of the p_dedicated_key will be set to either RSIP_KEY_TYPE_AES_128 or RSIP_KEY_TYPE_AES_256 as per InitiateRequest message.

If the return value is FSP_SUCCESS, also refer to p_dlms_ret to check which result was returned:

- RSIP_DLMS_RET_SUCCESS : The process completed successfully, and both the Dedicated Key and the decrypted APDU data (p_apdu_data) were output.
- RSIP_DLMS_RET_NO_DEDICATED_KEY : The process completed successfully, but the Dedicated Key was not present within the InitiateRequest message. Only the decrypted APDU data was output.

If the return value is FSP_ERR_CRYPTO_RSIP_DLMS_ERROR, also refer to p_dlms_ret to identify the more specific error.

If the return value is neither FSP_SUCCESS nor FSP_ERR_CRYPTO_RSIP_DLMS_ERROR, p_dlms_ret will be indeterminate.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination. Refer also to the

	argument p_dlms_ret.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_AUTHENTICATION	Authentication is failed.
FSP_ERR_CRYPTO_RSIP_DLMS_ERROR	An error occurred during DLMS processing. Refer to the argument p_dlms_ret for more details.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDSA_Sign()

fsp_err_t R_RSIP_ECDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Generates an ECDSA signature.

Implements rsip_api_t::ecdsaSign.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature generation is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDSA_Verify()

fsp_err_t R_RSIP_ECDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies an ECDSA signature.

Implements rsip_api_t::ecdsaVerify.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PKI_ECDSA_CertVerify()

fsp_err_t R_RSIP_PKI_ECDSA_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a public key certificate with ECDSA.

Implements rsip_api_t::pkiEcdsaCertVerify.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance. In the case of hash length is less than the key length, padding is required to make it the same as the key length.

For secp521r1 operation, the length of p_hash must be set to 64 bytes.

For secp521r1 operation, the length of the argument p_signature must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	signature r (521 bit)	zero padding (7 bit)	signature s (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	• Input parameter is illegal. • Signature verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PureEdDSA_Sign()

fsp_err_t R_RSIP_PureEdDSA_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t *const *p_signature*)

Generates an EdDSA signature.

Implements rsip_api_t::eddsaSign.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PureEdDSA_Verify()

fsp_err_t R_RSIP_PureEdDSA_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_message*, uint64_t const *message_length*, uint8_t const *const *p_signature*)

Verifies an EdDSA signature.

Implements rsip_api_t::eddsaVerify.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_INVALID_SIZE	Input length is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDH_KeyAgree()

fsp_err_t R_RSIP_ECDH_KeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and wrapped public key.

Implements rsip_api_t::ecdhKeyAgree.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_ECDH_PlainKeyAgree()

fsp_err_t R_RSIP_ECDH_PlainKeyAgree (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_plain_public_key*, rsip_wrapped_secret_t *const *p_wrapped_secret*)

Computes ECDH secret with wrapped private key and plain public key.

Implements rsip_api_t::ecdhPlainKeyAgree.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

For secp521r1 operation, the length of the argument p_plain_public_key must be set as 132 byte. Since 521 bit is not a 8-bit multiple, zero padding is required and the data format is as follows:

Data Format for secp521r1 (132 byte)			
zero padding (7 bit)	public_key Qx (521 bit)	zero padding (7 bit)	public_key Qy (521 bit)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

Unauthenticated public key of Diffie–Hellman key exchange generally carry the risk of man-in-the-middle (MITM) attack. Please use R_RSIP_ECDH_KeyAgree() or implement signature verification whenever possible.

◆ R_RSIP_KDF_SHA_Init()

fsp_err_t R_RSIP_KDF_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Prepares a SHA generation.

Implements rsip_api_t::kdfShaInit.

Conditions

Argument hash_type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

◆ R_RSIP_KDF_SHA_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_SHA_ECDHSecretUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*)

Inputs wrapped ECDH secret as a message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_Update() in the desired order.

Implements rsip_api_t::kdfShaEcdhSecretUpdate.

Conditions

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree(). This API can only be called if there is no previous message input, or if a 4-byte message has been input using R_RSIP_KDF_SHA_Update(). This API cannot be called multiple times in a process of performing SHA operation.

State transition

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Update()

fsp_err_t R_RSIP_KDF_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message. Input the messages required to perform the SHA operation using this API and R_RSIP_KDF_SHA_ECDHSecretUpdate() in the desired order.

Implements rsip_api_t::kdfShaUpdate.

State transition

This API can only be executed in **STATE_KDF_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Finish()

fsp_err_t R_RSIP_KDF_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm*)

Finalizes a SHA operation and generate DKM (Derived Keying Material).

Implements rsip_api_t::kdfShaFinish.

State transition

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Suspend()

fsp_err_t R_RSIP_KDF_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfShaSuspend.

State transition

This API can only be executed in **STATE_KDF_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_SHA_Resume()

fsp_err_t R_RSIP_KDF_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_KDF_SHA_Suspend().

Implements rsip_api_t::kdfShaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_HMAC_DKMKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_DKMKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *key_length*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped MAC to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacDkmKeyImport.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration

The argument p_wrapped_dkm must be input the result of R_RSIP_KDF_HMAC_SignFinish().

Argument kdf_data_length depends on key type.

- 32 to 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA256)
- 48 to 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA384)
- 64 (RSIP_KEY_TYPE_KDF_HMAC_SHA512)

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_ECDHSecretKeyImport()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*, rsip_wrapped_key_t *const *p_wrapped_key*)

Converts wrapped ECDH secret to wrapped HMAC key for KDF.

Implements rsip_api_t::kdfHmacEcdhSecretKeyImport.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Init()

fsp_err_t R_RSIP_KDF_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Prepares a HMAC generation.

Implements rsip_api_t::kdfHmacInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.

◆ R_RSIP_KDF_HMAC_DKMUpdate()

fsp_err_t R_RSIP_KDF_HMAC_DKMUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*)

Inputs wrapped Derived Keying Material (DKM) as a message.

Implements rsip_api_t::kdfHmacDkmUpdate.

Conditions

The argument p_wrapped_dkm must be input the result of R_RSIP_KDF_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_HMAC_ECDHSecretUpdate()

fsp_err_t R_RSIP_KDF_HMAC_ECDHSecretUpdate (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_secret_t const *const *p_wrapped_secret*)

Inputs wrapped ECDH secret as a message.

Implements rsip_api_t::kdfHmacEcdhSecretUpdate.

Conditions

The argument p_wrapped_secret must be input the result of R_RSIP_ECDH_KeyAgree() or R_RSIP_ECDH_PlainKeyAgree().

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Update()

fsp_err_t R_RSIP_KDF_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs message.

Implements rsip_api_t::kdfHmacUpdate.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_SignFinish()

fsp_err_t R_RSIP_KDF_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t *const *p_wrapped_dkm*)

Finalizes a HMAC generation.

Implements rsip_api_t::kdfHmacSignFinish.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Suspend()

fsp_err_t R_RSIP_KDF_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::kdfHmacSuspend.

State transition

This API can only be executed in **STATE_KDF_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_HMAC_Resume()

fsp_err_t R_RSIP_KDF_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_kdf_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_KDF_HMAC_Suspend().

Implements rsip_api_t::kdfHmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_KDF_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_KDF_DKMConcatenate()

fsp_err_t R_RSIP_KDF_DKMConcatenate (rsip_wrapped_dkm_t *const *p_wrapped_dkm1*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm2*, uint32_t const *wrapped_dkm1_buffer_length*)

Concatenates two wrapped derived keying materials (DKMs).

DKM1 || DKM2 is output to p_wrapped_dkm1.

Implements rsip_api_t::kdfDkmConcatenate.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.

◆ R_RSIP_KDF_DerivedKeyImport()

fsp_err_t R_RSIP_KDF_DerivedKeyImport (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, uint32_t const *position*, rsip_wrapped_key_t *const *p_wrapped_key*)

Outputs a wrapped key from KDF output.

Implements rsip_api_t::kdfDerivedKeyImport.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument p_wrapped_dkm must be input the result of R_RSIP_KDF_SHA_Finish(), R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_DKMConcatenate().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_KDF_DerivedIVWrap()

fsp_err_t R_RSIP_KDF_DerivedIVWrap (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_dkm_t const *const *p_wrapped_dkm*, rsip_initial_vector_type_t const *initial_vector_type*, uint32_t const *position*, uint8_t const *const *p_tls_sequence_num*, uint8_t *const *p_wrapped_initial_vector*)

Outputs a initial vector from KDF output.

Implements rsip_api_t::kdfDerivedIvWrap

Conditions

Argument p_wrapped_dkm must be input the result of R_RSIP_KDF_SHA_Finish(), R_RSIP_KDF_HMAC_SignFinish() or R_RSIP_KDF_DKMConcatenate().

Argument initial_vector_type must be one of the following:

- RSIP_INITIAL_VECTOR_TYPE_AES_16_BYTE

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_OTF_Init()

fsp_err_t R_RSIP_OTF_Init (rsip_ctrl_t *const *p_ctrl*, rsip_otf_channel_t const *channel*, rsip_wrapped_key_t *const *p_wrapped_key*, uint8_t const *const *p_seed*)

Initialize on-the-fly decryption on RSIP. Implements rsip_api_t::otfInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled or selected channel is invalid.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Attention

This function is only part of on-the-fly decryption activation process and intended to be called from a higher level FSP module. Even if a user calls this function directly, the feature will not be enabled.

◆ R_RSIP_PKI_VerifiedCertInfoExport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoExport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t *const *p_verified_cert_info*)

Exports verified certificate information stored in this driver.

The certificate is last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), R_RSIP_PKI_RSASSA_PSS_CertVerify(), or R_RSIP_PKI_VerifiedCertInfoImport().

Implements rsip_api_t::pkiVerifiedCertInfoExport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_VerifiedCertInfoImport()

fsp_err_t R_RSIP_PKI_VerifiedCertInfoImport (rsip_ctrl_t *const *p_ctrl*, rsip_verified_cert_info_t const *const *p_verified_cert_info*)

Imports verified certificate information.

Implements rsip_api_t::pkiVerifiedCertInfoImport.

State transition

This API can be executed in **any state** including STATE_INITIAL, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.

◆ R_RSIP_PKI_CertKeyImport()

fsp_err_t R_RSIP_PKI_CertKeyImport (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_cert*, uint32_t const *cert_length*, uint8_t const *const *p_key_param1*, uint32_t const *key_param1_length*, uint8_t const *const *p_key_param2*, uint32_t const *key_param2_length*, rsip_hash_type_t const *hash_function*, rsip_wrapped_key_t *const *p_wrapped_public_key*)

Wraps the public key in the verified public key certificate.

Implements rsip_api_t::pkiCertKeyImport.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

- *Argument p_cert must correspond to the signature of the last called function R_RSIP_PKI_ECDSA_CertVerify(), R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify(), or R_RSIP_PKI_RSASSA_PSS_CertVerify().*
- *For arguments p_key_param1 and p_key_param2, specify an address inside the certificate. Addresses outside the certificate are invalid.*

◆ R_RSIP_RSA_Encrypt()

fsp_err_t R_RSIP_RSA_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint8_t *const *p_cipher*)

Encrypts plaintext with raw RSA.

Implements rsip_api_t::rsaEncrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSAEP/RSAVP1). It should be used in conjunction with any padding scheme.

◆ R_RSIP_RSA_Decrypt()

fsp_err_t R_RSIP_RSA_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*)

Decrypts ciphertext with raw RSA.

Implements rsip_api_t::rsaDecrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API provides RSA low-level primitives (RSADP/RSASP1). It should be used in conjunction with any padding scheme.

◆ R_RSIP_RSAES_PKCS1_V1_5_Encrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Encrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

mLen (plain_length) and k (modulus length) must meet the following condition.

- mLen <= k - 11

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSAES_PKCS1_V1_5_Decrypt()

fsp_err_t R_RSIP_RSAES_PKCS1_V1_5_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts with RSAES-PKCS1-v1_5.

Implements rsip_api_t::rsaesPkcs1V15Decrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

plain_buffer_length must be greater than or equal to mLen(plaintext length).

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.2.2 Step 1.

◆ R_RSIP_RSAES_OAEP_Encrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Encrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_plain*, uint32_t const *plain_length*, uint8_t *const *p_cipher*)

Encrypts plaintext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepEncrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

mLen (plain_length), hLen (hash length of hash_function), and k (modulus length) must meet the following condition.

- mLen <= k - 2 hLen - 2

Argument hash_function and mask_generation_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSAES_OAEP_Decrypt()

fsp_err_t R_RSIP_RSAES_OAEP_Decrypt (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const

p_wrapped_private_key, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint8_t const *const *p_label*, uint32_t const *label_length*, uint8_t const *const *p_cipher*, uint8_t *const *p_plain*, uint32_t *const *p_plain_length*, uint32_t const *plain_buffer_length*)

Decrypts ciphertext with RSAES-OAEP.

Implements rsip_api_t::rsaesOaepDecrypt.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

hLen (hash length of hash_function) and k (modulus length) must meet the following condition.

- k >= 2 hLen + 2

plain_buffer_length must be greater than or equal to mLen(plaintext length).

Argument hash_function and mask_generation_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

Note

This API skips the ciphertext length checking at RFC8017 (PKCS#1 v2.2) Section 7.1.2 Step 1.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Sign()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t *const *p_signature*)

Signs message with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Sign.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSASSA_PKCS1_V1_5_Verify()

fsp_err_t R_RSIP_RSASSA_PKCS1_V1_5_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PKCS1-v1_5.

Implements rsip_api_t::rsassaPkcs1V15Verify.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSASSA_PSS_Sign()

fsp_err_t R_RSIP_RSASSA_PSS_Sign (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_private_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t *const

p_signature)

Signs message with RSASSA-PSS.

Implements rsip_api_t::rsassaPssSign.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function and mask_generation_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_RSASSA_PSS_Verify()

fsp_err_t R_RSIP_RSASSA_PSS_Verify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies signature with RSASSA-PSS. Implements rsip_api_t::rsassaPssVerify.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function and mask_generation_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PKCS1_V1_5_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a certificate with RSASSA-PKCS1-v1_5.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_wrapped_public_key	Pointer to wrapped key of RSA public key.
[in]	hash_function	Hash function in EMSA-PKCS1-v1_5.
[in]	p_hash	Pointer to input hash.
[in]	p_signature	Pointer to input signature.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.

FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_PKI_RSASSA_PSS_CertVerify()

fsp_err_t R_RSIP_PKI_RSASSA_PSS_CertVerify (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_public_key*, rsip_hash_type_t const *hash_function*, rsip_mgf_type_t const *mask_generation_function*, uint32_t const *salt_length*, uint8_t const *const *p_hash*, uint8_t const *const *p_signature*)

Verifies a certificate with RSASSA-PSS.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Argument hash_function and mask_generation_function must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

Message hash p_hash should be computed in advance with hash_function.

Salt length salt_length must be one of the following:

- Any member of enumeration rsip_rsa_salt_length_t
  - RSIP_RSA_SALT_LENGTH_AUTO
  - RSIP_RSA_SALT_LENGTH_HASH
  - RSIP_RSA_SALT_LENGTH_MAX
- Integers that satisfies the formula: sLen <= emLen - hLen - 2
  - sLen is salt_length
  - emLen is the same as modulus length
  - hLen is the hash length

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_wrapped_public_key	Pointer to wrapped key of RSA public key.
[in]	hash_function	Hash function in EMSA-PSS-VERIFY.
[in]	mask_generation_function	Mask generation function in EMSA-PSS-VERIFY.
[in]	salt_length	Salt length. RSIP_RSA_SALT_LENGTH_AUTO, RSIP_RSA_SALT_LENGTH_HASH, RSIP_RSA_SALT_LENGTH_MA

		X, 0, or positive integers can be set, where salt_length <= emLen - hLen - 2 (emLen is the same as the key length and hLen is the hash length).
[in]	p_hash	Pointer to input hash.
[in]	p_signature	Pointer to input signature.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	Input parameter is invalid.
FSP_ERR_INVALID_SIZE	Any length is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Compute()

fsp_err_t R_RSIP_SHA_Compute (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_digest*)

Generates SHA message digest. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaCompute.

Conditions

See R_RSIP_SHA_Init().

Output length

See R_RSIP_SHA_Finish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

◆ R_RSIP_SHA_Init()

fsp_err_t R_RSIP_SHA_Init (rsip_ctrl_t *const *p_ctrl*, rsip_hash_type_t const *hash_type*)

Starts SHA operation.

Implements rsip_api_t::shaInit.

Conditions

Argument hash_type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.

◆ R_RSIP_SHA_Update()

fsp_err_t R_RSIP_SHA_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs SHA message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::shaUpdate.

State transition

This API can only be executed in **STATE_SHA**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Finish()

fsp_err_t R_RSIP_SHA_Finish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_digest*)

Outputs SHA message digest.

Implements rsip_api_t::shaFinish.

Output length

Output length to p_digest depends on hash_function.

- 28 (RSIP_HASH_TYPE_SHA224, RSIP_HASH_TYPE_SHA512_224, RSIP_HASH_TYPE_SHA3_224)
- 32 (RSIP_HASH_TYPE_SHA256, RSIP_HASH_TYPE_SHA512_256, RSIP_HASH_TYPE_SHA3_256)
- 48 (RSIP_HASH_TYPE_SHA384, RSIP_HASH_TYPE_SHA3_384)
- 64 (RSIP_HASH_TYPE_SHA512, RSIP_HASH_TYPE_SHA3_512)

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Suspend()

fsp_err_t R_RSIP_SHA_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t *const *p_handle*)

Suspends SHA operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::shaSuspend.

State transition

This API can only be executed in **STATE_SHA**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_SHA_Resume()

fsp_err_t R_RSIP_SHA_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_sha_handle_t const *const *p_handle*)

Resumes SHA operation suspended by R_RSIP_SHA_Suspend().

Implements rsip_api_t::shaResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_SHA
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_HMAC_Compute()

fsp_err_t R_RSIP_HMAC_Compute (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t *const *p_mac*)

Generates HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacCompute.

Conditions

See R_RSIP_HMAC_Init().

Output length

See R_RSIP_HMAC_SignFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Verify()

fsp_err_t R_RSIP_HMAC_Verify (rsip_ctrl_t *const *p_ctrl*, const rsip_wrapped_key_t * *p_wrapped_key*, uint8_t const *const *p_message*, uint32_t const *message_length*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacVerify.

Conditions

See R_RSIP_HMAC_Init() and R_RSIP_HMAC_VerifyFinish().

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key value is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Init()

fsp_err_t R_RSIP_HMAC_Init (rsip_ctrl_t *const *p_ctrl*, rsip_wrapped_key_t const *const *p_wrapped_key*)

Starts HMAC operation.

Implements rsip_api_t::hmacInit.

Conditions

Argument rsip_wrapped_key_t::type must be supported by both the function and the device, and must also be enabled in the configuration. For more details, please refer to Supported Algorithms and Configuration.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_NOT_ENABLED	Input key type is disabled in this function by configuration.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.

◆ R_RSIP_HMAC_Update()

fsp_err_t R_RSIP_HMAC_Update (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_message*, uint32_t const *message_length*)

Inputs HMAC message. (Total input message must be less than 2^64 bits.)

Implements rsip_api_t::hmacUpdate.

State transition

This API can only be executed in **STATE_HMAC**, and does not cause any state transitions.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_SignFinish()

fsp_err_t R_RSIP_HMAC_SignFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Outputs HMAC.

Implements rsip_api_t::hmacSignFinish.

Output length

Output length to p_mac depends on key type of p_wrapped_key.

- 28 (RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA512_224, RSIP_KEY_TYPE_HMAC_SHA3_224)
- 32 (RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA512_256, RSIP_KEY_TYPE_HMAC_SHA3_256)
- 48 (RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA3_384)
- 64 (RSIP_KEY_TYPE_HMAC_SHA512, RSIP_KEY_TYPE_HMAC_SHA3_512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_VerifyFinish()

fsp_err_t R_RSIP_HMAC_VerifyFinish (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*, uint32_t const *mac_length*)

Verifies HMAC.

Implements rsip_api_t::hmacVerifyFinish.

Conditions

Argument mac_length depends on key type of p_wrapped_key. Usually the longest length is recommended.

- 4 to 28 (RSIP_KEY_TYPE_HMAC_SHA224, RSIP_KEY_TYPE_HMAC_SHA512_224, RSIP_KEY_TYPE_HMAC_SHA3_224)
- 4 to 32 (RSIP_KEY_TYPE_HMAC_SHA256, RSIP_KEY_TYPE_HMAC_SHA512_256, RSIP_KEY_TYPE_HMAC_SHA3_256)
- 4 to 48 (RSIP_KEY_TYPE_HMAC_SHA384, RSIP_KEY_TYPE_HMAC_SHA3_384)
- 4 to 64 (RSIP_KEY_TYPE_HMAC_SHA512, RSIP_KEY_TYPE_HMAC_SHA3_512)

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
FSP_ERR_ASSERTION	No change
FSP_ERR_NOT_OPEN	No change
FSP_ERR_INVALID_STATE	No change
FSP_ERR_INVALID_SIZE	No change
Others	STATE_MAIN

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_INVALID_SIZE	mac_length is illegal.
FSP_ERR_CRYPTO_RSIP_KEY_SET_FAIL	Input key is illegal.
FSP_ERR_CRYPTO_RSIP_FAIL	MAC verification is failed.
FSP_ERR_CRYPTO_RSIP_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Suspend()

fsp_err_t R_RSIP_HMAC_Suspend (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t *const *p_handle*)

Suspends HMAC operation.

This API releases RSIP resource and outputs intermediate results. Therefore, it can be used in the following cases:

- Execute another cryptographic operations during inputting successive chunks of the message.
- Reuse intermediate results.

Implements rsip_api_t::hmacSuspend.

State transition

This API can only be executed in **STATE_HMAC**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_MAIN
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_CRYPTO_RSIP_FATAL	Software corruption is detected.

◆ R_RSIP_HMAC_Resume()

fsp_err_t R_RSIP_HMAC_Resume (rsip_ctrl_t *const *p_ctrl*, rsip_hmac_handle_t const *const *p_handle*)

Resumes HMAC operation suspended by R_RSIP_HMAC_Suspend().

Implements rsip_api_t::hmacResume.

State transition

This API can only be executed in **STATE_MAIN**, and causes state transition.

Return value	Next state
FSP_SUCCESS	STATE_HMAC
Others	No change

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.

◆ R_RSIP_FSBL_OEM_BL_Digest_Generate()

fsp_err_t R_RSIP_FSBL_OEM_BL_Digest_Generate (rsip_ctrl_t *const *p_ctrl*, uint8_t const *const *p_key_cert*, uint32_t const *key_cert_max_length*, uint8_t const *const *p_code_cert*, uint32_t const *code_cert_max_length*, uint32_t *const *p_mac*)

Verifies a Manifest signature and outputs the MAC of image and code certificate. The hash algorithm only supports HMAC-SHA256. The signature algorithm only supports ECDSA secp256r1.

State transition

This API can only be executed in **STATE_MAIN**, and does not cause any state transitions.

Note

If this API returns FSP_ERR_SB_LOWER_IMAGE_VERSION or FSP_ERR_SB_CRYPTO_AUTH_FAIL, RSIP stops working. In this case, RSIP can be resumed by executing R_RSIP_Close() and R_RSIP_Open() in that order.

Parameters

[in,out]	p_ctrl	Pointer to control block.
[in]	p_key_cert	Pointer to key certificate.
[in]	key_cert_max_length	Maximum length of key certificate.
[in]	p_code_cert	Pointer to key code certificate.

[in]	code_cert_max_length	Maximum length of code certificate.
[out]	p_mac	Pointer to output MAC. It is output in TLV format and consists of a 4-byte Type-Length and a 32-byte Value.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_STATE	Internal state is illegal.
FSP_ERR_SB_INTERNAL_FAIL	An internal failure.
FSP_ERR_SB_INVALID_ARG	An invalid argument was entered.
FSP_ERR_SB_UNSUPPORTED_FUNCTION	Unsupported function executed.
FSP_ERR_SB_INVALID_ALIGNMENT	Data entered with incorrect alignment.
FSP_ERR_SB_SAME_IMAGE_VERSION	An image of the same version as the current version is input. (verification completed successfully)
FSP_ERR_SB_LOWER_IMAGE_VERSION	Image version lower than the current image version is installed.
FSP_ERR_SB_MANI_INVALID_MAGIC	An invalid magic number is set.
FSP_ERR_SB_MANI_UNSUPPORTED_VERSION	Unsupported version is set.
FSP_ERR_SB_MANI_OUT_OF_RANGE_LEN	Out of range TLV Length is set.
FSP_ERR_SB_MANI_TLV_FIELD_ERR	Missing required TLV field.
FSP_ERR_SB_MANI_TLV_INVALID_LEN	The length exceeding the end of the manifest is specified in length of the TLV field.
FSP_ERR_SB_MANI_INVALID_IMAGE_LEN	An invalid image length is set.
FSP_ERR_SB_MANI_MISMATCH_SIGN_ALGORITHM	There is a wrong combination of signature algorithms.
FSP_ERR_SB_MANI_UNSUPPORTED_ALGORITHM	An algorithm was specified that the manifest does not support.
FSP_ERR_SB_CRYPTO_FAIL	Cryptographic processing failure.
FSP_ERR_SB_CRYPTO_AUTH_FAIL	Verification failed.
FSP_ERR_SB_CRYPTO_PARAM_ERR	Parameter error.
FSP_ERR_SB_CRYPTO_RESOURCE_CONFLICT	CryptoIP is in use.
FSP_ERR_UNSUPPORTED	This API is not supported on this device.

Detailed Description

Driver for the Secure Crypto Engine (SCE9) on RA MCUs.

Overview

This module provides SCE functions in protected mode.

Note

For a detailed description of the different SCE9 operating modes, refer to Application Note R11AN0498.

HW Overview

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1

    - HMAC-SHA256bit
- TRNG
- TLS
    - SSL / TLS support function (TLS1.2 compliant)

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4M2, RA4M3
RA6	RA6E1, RA6M4, RA6M5

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode. For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t *message, uint8_t* digest, uint32_t
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
```

```
    uint32_t            dummy;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */

Data Structures

struct	sce_instance_ctrl_t

Data Structure Documentation

◆ sce_instance_ctrl_t

struct sce_instance_ctrl_t
SCE private control block. DO NOT MODIFY. Initialization occurs when R_SCE_Open() is called.

Function Documentation

◆ R_SCE_Open()

fsp_err_t R_SCE_Open (sce_ctrl_t *const *p_ctrl*, sce_cfg_t const *const *p_cfg*)

Enables use of SCE functionality.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	The error-detection self-test failed to terminate normally.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_RETRY	Indicates that an entropy evaluation failure occurred. Run the function again.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

Note

The valid pre-run state is SCE disabled. The pre-run state is SCE Disabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_Close()

fsp_err_t R_SCE_Close (sce_ctrl_t *const *p_ctrl*)

Stops supply of power to the SCE.

Parameters

[in]	p_ctrl	Pointer to control structure.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_SoftwareReset()

fsp_err_t R_SCE_SoftwareReset (void)

Software reset to SCE.

Reverts the state to the SCE initial state.

Return values

FSP_SUCCESS	Normal termination

Note

The pre-run state is any state. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES128_WrappedKeyGenerate()

fsp_err_t R_SCE_AES128_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 128-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_AES256_WrappedKeyGenerate()

fsp_err_t R_SCE_AES256_WrappedKeyGenerate (sce_aes_wrapped_key_t * *wrapped_key*)

This API outputs 256-bit AES wrapped key from a random number.

This API generates a wrapped key from a random number in the SCE. Accordingly, user key input is unnecessary. By encrypting data using the wrapped key is output by this API, dead copying of data can be prevented.

Parameters

[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Disabled State.

◆ R_SCE_RSA1024_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA1024_WrappedKeyPairGenerate (sce_rsa1024_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 1024-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 1024-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_WrappedKeyPairGenerate()

fsp_err_t R_SCE_RSA2048_WrappedKeyPairGenerate (sce_rsa2048_wrapped_pair_key_t * *wrapped_pair_key*)

This API outputs a wrapped key pair for a 2048-bit RSA public key and private key pair. These keys are generated from a random value produced internally by the SCE. Consequently, there is no need to input a user key. Dead copying of data can be prevented by encrypting the data using the wrapped key output by this API. A public wrapped key is generated by wrapped_pair_key->pub_key, and a private wrapped key is generated by wrapped_pair_key->priv_key. As the public key exponent, only 0x00010001 is generated.

Parameters

[in,out]	wrapped_pair_key	User key index for RSA 2048-bit public key and private key pair

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred. Key generation failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp192r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp192r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp192r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp224r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp224r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp224r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp256r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp256r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp256r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_WrappedKeyPairGenerate()

fsp_err_t R_SCE_ECC_secp384r1_WrappedKeyPairGenerate (sce_ecc_wrapped_pair_key_t * *wrapped_pair_key*)

This is an API for outputting a wrapped key pair for secp384r1 public key and private key pair. These keys are generated from a random number value internally within the SCE. There is therefore no need to input user keys. It is possible to prevent dead copying of data by using the wrapped key output by this API to encrypt the data. The public key index is generated in wrapped_pair_key->pub_key, and the private key index is generated in wrapped_pair_key->priv_key.

Parameters

[in,out]	wrapped_pair_key	Wrapped pair key for secp384r1 public key and private key pair

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RandomNumberGenerate()

fsp_err_t R_SCE_RandomNumberGenerate (uint32_t * *random*)

This API can generate 4 words random number.

Parameters

[in,out]	random	Stores 4words (16 bytes) random data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_aes_wrapped_key_t * *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_RFC3394KeyWrap()

fsp_err_t R_SCE_AES128_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyWrap()

fsp_err_t R_SCE_AES256_RFC3394KeyWrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, sce_aes_wrapped_key_t * *target_key*, uint32_t * *rfc3394_wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for wrapping.
[in]	target_key_type	Selects key to be wrapped.
[in]	target_key	Key to be wrapped.
[out]	rfc3394_wrapped_key	Wrapped key.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES128_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES128_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 128-bit AES key within the user routine.

Parameters

[in]	master_key	AES-128 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_AES256_RFC3394KeyUnwrap()

fsp_err_t R_SCE_AES256_RFC3394KeyUnwrap (sce_aes_wrapped_key_t * *master_key*, uint32_t *target_key_type*, uint32_t * *rfc3394_wrapped_key*, sce_aes_wrapped_key_t * *target_key*)

This API unwraps 256-bit AES key within the user routine.

Parameters

[in]	master_key	AES-256 key used for unwrapping.
[in]	target_key_type	Selects key to be unwrapped.
[in]	rfc3394_wrapped_key	Wrapped key.
[out]	target_key	Key to be unwrapped.

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal user Key Generation Information.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

◆ R_SCE_SHA256HMAC_EncryptedKeyWrap()

fsp_err_t R_SCE_SHA256HMAC_EncryptedKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

This API wraps HMAC-SHA256 key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	HMAC-SHA256 wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA1024_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA1024_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

This API wraps 1024-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

This API wraps 2048-bit RSA private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

This API wraps 3072-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	3072-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

This API wraps 4096-bit RSA public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	1024-bit RSA public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 public key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 public wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp192r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp192r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp192r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp224r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp224r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp224r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp256r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp256r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_key_update_key_t * *key_update_key*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

This API wraps secp384r1 private key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	secp384r1 private wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptInit()

fsp_err_t R_SCE_AES128ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_EncryptUpdate() function and R_SCE_AES128ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptUpdate()

fsp_err_t R_SCE_AES128ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_EncryptFinal()

fsp_err_t R_SCE_AES128ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptInit()

fsp_err_t R_SCE_AES128ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptUpdate()

fsp_err_t R_SCE_AES128ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128ECB_DecryptFinal()

fsp_err_t R_SCE_AES128ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptInit()

fsp_err_t R_SCE_AES256ECB_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256ECB_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256ECB_EncryptUpdate() function and R_SCE_AES256ECB_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptUpdate()

fsp_err_t R_SCE_AES256ECB_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256ECB_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256ECB_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_EncryptFinal()

fsp_err_t R_SCE_AES256ECB_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptInit()

fsp_err_t R_SCE_AES256ECB_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128ECB_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128ECB_DecryptUpdate() function and R_SCE_AES128ECB_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptUpdate()

fsp_err_t R_SCE_AES256ECB_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256ECB_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256ECB_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256ECB_DecryptFinal()

fsp_err_t R_SCE_AES256ECB_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256ECB_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptInit()

fsp_err_t R_SCE_AES128CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_EncryptUpdate() function and R_SCE_AES128CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptUpdate()

fsp_err_t R_SCE_AES128CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES128CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_EncryptFinal()

fsp_err_t R_SCE_AES128CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptInit()

fsp_err_t R_SCE_AES128CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES128CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CBC_DecryptUpdate() function and R_SCE_AES128CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptUpdate()

fsp_err_t R_SCE_AES128CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES128CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CBC_DecryptFinal()

fsp_err_t R_SCE_AES128CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES128CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptInit()

fsp_err_t R_SCE_AES256CBC_EncryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_EncryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_EncryptUpdate() function and R_SCE_AES256CBC_EncryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initial vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptUpdate()

fsp_err_t R_SCE_AES256CBC_EncryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CBC_EncryptUpdate() function encrypts the second argument, plain, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the encryption result to the third argument, cipher. After plaintext input is completed, call R_SCE_AES256CBC_EncryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in,out]	plain_length	plaintext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_EncryptFinal()

fsp_err_t R_SCE_AES256CBC_EncryptFinal (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_EncryptFinal() function writes the calculation result to the second argument, cipher, and writes the length of the calculation result to the third argument, cipher_length. The original intent was for a portion of the encryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to cipher, and 0 is always written to cipher_length. The arguments cipher and cipher_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	cipher	ciphertext data area (nothing ever written here)
[in,out]	cipher_length	ciphertext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptInit()

fsp_err_t R_SCE_AES256CBC_DecryptInit (sce_aes_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*)

The R_SCE_AES256CBC_DecryptInit() function performs preparations for the execution of an AES calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CBC_DecryptUpdate() function and R_SCE_AES256CBC_DecryptFinal() function.

Parameters

[in,out]	handle	AES handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Input illegal wrapped key.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptUpdate()

fsp_err_t R_SCE_AES256CBC_DecryptUpdate (sce_aes_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CBC_DecryptUpdate() function decrypts the second argument, cipher, utilizing the key index stored in the handle specified in the first argument, handle, and writes the ongoing status to this first argument. In addition, it writes the decryption result to the third argument, plain. After plaintext input is completed, call R_SCE_AES256CBC_DecryptFinal().

Specify areas for plain and cipher that do not overlap. For plain and cipher, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in,out]	cipher_length	ciphertext data length (must be a multiple of 16)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CBC_DecryptFinal()

fsp_err_t R_SCE_AES256CBC_DecryptFinal (sce_aes_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*)

Using the handle specified in the first argument, handle, the R_SCE_AES256CBC_DecryptFinal() function writes the calculation result to the second argument, plain, and writes the length of the calculation result to the third argument, plain_length. The original intent was for a portion of the decryption result that was not a multiple of 16 bytes to be written to the second argument. However, as a result of the restriction that only multiples of 16 can be input to the Update function, nothing is ever written to plain, and 0 is always written to plain_length. The arguments plain and plain_length are provided for compatibility in anticipation of the time when this restriction is lifted.

Parameters

[in,out]	handle	AES handler (work area)
[in,out]	plain	plaintext data area (nothing ever written here)
[in,out]	plain_length	plaintext data length (0 always written here)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptInit()

fsp_err_t R_SCE_AES128GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_EncryptUpdate() function and R_SCE_AES128GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptUpdate()

fsp_err_t R_SCE_AES128GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_EncryptFinal()

fsp_err_t R_SCE_AES128GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES128GCM_EncryptUpdate (), the R_SCE_AES128GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptInit()

fsp_err_t R_SCE_AES128GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES128GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128GCM_DecryptUpdate() function and R_SCE_AES128GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptUpdate()

fsp_err_t R_SCE_AES128GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES128GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES128GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128GCM_DecryptFinal()

fsp_err_t R_SCE_AES128GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES128GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES128GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptInit()

fsp_err_t R_SCE_AES256GCM_EncryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_EncryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_EncryptUpdate() function and R_SCE_AES256GCM_EncryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptUpdate()

fsp_err_t R_SCE_AES256GCM_EncryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_EncryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from plain reaches 16 bytes or more, the encryption result is output to the ciphertext data area specified in the third argument, cipher. The lengths of the plain and aad data to input are respectively specified in the fourth argument, plain_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and plain input data, but rather the data length to input when the user calls this function. If the input values plain and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from plain. If aad data is input after starting to input plain data, an error will occur. If aad data and plain data are input to this function at the same time, the aad data will be processed, and then the function will transition to the plain data input state.

Specify areas for plain and cipher that do not overlap. For plain, cipher, initial_vector, and aad, specify RAM addresses that are multiples of 4

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_data_length	plaintext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_EncryptFinal()

fsp_err_t R_SCE_AES256GCM_EncryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_data_length*, uint8_t * *atag*)

If there is 16-byte fractional data indicated by the total data length of the value of plain that was input by R_SCE_AES256GCM_EncryptUpdate (), the R_SCE_AES256GCM_EncryptFinal() function will output the result of encrypting that fractional data to the ciphertext data area specified in the second argument, cipher. Here, the portion that does not reach 16 bytes will be padded with zeros. The authentication tag is output to the fourth argument, atag. For cipher and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area (cipher_data_length byte)
[in,out]	cipher_data_length	ciphertext data length (0 always written here)
[in,out]	atag	authentication tag area

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptInit()

fsp_err_t R_SCE_AES256GCM_DecryptInit (sce_gcm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *initial_vector*, uint32_t *initial_vector_length*)

The R_SCE_AES256GCM_DecryptInit() function performs preparations for the execution of an GCM calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256GCM_DecryptUpdate() function and R_SCE_AES256GCM_DecryptFinal() function.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	initial_vector	initialization vector area (initial_vector_length byte)
[in]	initial_vector_length	initialization vector length (1 ore more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptUpdate()

fsp_err_t R_SCE_AES256GCM_DecryptUpdate (sce_gcm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_data_length*, uint8_t * *aad*, uint32_t *aad_length*)

The R_SCE_AES256GCM_DecryptUpdate() function decrypts the ciphertext specified in the second argument, cipher, in GCM mode using the values specified for wrapped_key and initial_vector in R_SCE_AES256GCM_DecryptInit(), along with the additional authentication data specified in the fifth argument, aad. Inside this function, the data that is input by the user is buffered until the input values of aad and plain exceed 16 bytes. After the input data from cipher reaches 16 bytes or more, the decryption result is output to the plaintext data area specified in the third argument, plain. The lengths of the cipher and aad data to input are respectively specified in the fourth argument, cipher_data_length, and the sixth argument, aad_length. For these, specify not the total byte count for the aad and cipher input data, but rather the data length to input when the user calls this function. If the input values cipher and aad are not divisible by 16 bytes, they will be padded inside the function. First process the data that is input from aad, and then process the data that is input from cipher. If aad data is input after starting to input cipher data, an error will occur. If aad data and cipher data are input to this function at the same time, the aad data will be processed, and then the function will transition to the cipher data input state. Specify areas for plain and cipher that do not overlap. For plain, cipher, stage, initial_vector, and aad, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	cipher	ciphertext data area
[in]	plain	plaintext data area
[in]	cipher_data_length	ciphertext data length (0 or more bytes)
[in]	aad	additional authentication data (aad_length byte)
[in]	aad_length	additional authentication data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	After the data from plain was input, an invalid handle was input from aad.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256GCM_DecryptFinal()

fsp_err_t R_SCE_AES256GCM_DecryptFinal (sce_gcm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_data_length*, uint8_t * *atag*, uint32_t *atag_length*)

The R_SCE_AES256GCM_DecryptFinal() function decrypts, in GCM mode, the fractional ciphertext specified by R_SCE_AES256GCM_DecryptUpdate() that does not reach 16 bytes, and ends GCM decryption. The encryption data and authentication tag are respectively output to the plaintext data area specified in the second argument, plain, and the authentication tag area specified in the fourth argument, atag. The decoded data length is output to the third argument, plain_data_length. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. For the fourth argument, atag, input 16 bytes or less. If it is less than 16 bytes, it will be padded with zeros inside the function. For plain and atag, specify RAM addresses that are multiples of 4.

Parameters

[in,out]	handle	AES-GCM handler (work area)
[in,out]	plain	plaintext data area (cipher_data_length byte)
[in,out]	plain_data_length	plaintext data length (0 always written here)
[in,out]	atag	authentication tag area (atag_length byte)
[in]	atag_length	authentication tag length (4,8,12,13,14,15,16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptInit()

fsp_err_t R_SCE_AES128CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_EncryptUpdate() and R_SCE_AES128CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptUpdate()

fsp_err_t R_SCE_AES128CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES128CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES128CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_EncryptFinal()

fsp_err_t R_SCE_AES128CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES128CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes128CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptInit()

fsp_err_t R_SCE_AES128CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES128CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES128CCM_DecryptUpdate() and R_SCE_AES128CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	128-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptUpdate()

fsp_err_t R_SCE_AES128CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES128CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES128CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES128CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CCM_DecryptFinal()

fsp_err_t R_SCE_AES128CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES128GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES128GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes128CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptInit()

fsp_err_t R_SCE_AES256CCM_EncryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_EncryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_EncryptUpdate() and R_SCE_AES256CCM_EncryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptUpdate()

fsp_err_t R_SCE_AES256CCM_EncryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint8_t * *cipher*, uint32_t *plain_length*)

The R_SCE_AES256CCM_EncryptUpdate() function encrypts the plaintext specified in the second argument, plain, in CCM mode using the values specified by wrapped_key, nonce, and adata in R_SCE_AES256CCM_EncryptInit(). This function buffers internally the data input by the user until the input value of plain exceeds 16 bytes. Once the amount of plain input data is 16 bytes or greater, the encrypted result is output to cipher, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_EncryptInit() to specify the total data length of plain that will be input. Use plain_length in this function to specify the data length to be input when the user calls this function. If the input value of plain is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to plain and cipher do not overlap. Also, specify RAM addresses that are multiples of 4 for plain and cipher.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	plain	plaintext data area
[in,out]	cipher	ciphertext data area
[in]	plain_length	plaintext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_EncryptFinal()

fsp_err_t R_SCE_AES256CCM_EncryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint32_t * *cipher_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of plain input in R_SCE_AES256CCM_EncryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256CCM_EncryptFinal() function outputs the leftover encrypted data to cipher, which is specified in the second argument. The MAC value is output to the fourth argument, mac. Set the fifth argument, mac_length to the same value as that specified for the argument mac_length in Aes256CcmEncryptInit(). Also, specify RAM addresses that are multiples of 4 for cipher and mac.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	cipher	ciphertext data area
[in,out]	cipher_length	ciphertext data length
[in,out]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptInit()

fsp_err_t R_SCE_AES256CCM_DecryptInit (sce_ccm_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*, uint8_t * *nonce*, uint32_t *nonce_length*, uint8_t * *adata*, uint8_t *a_length*, uint32_t *payload_length*, uint32_t *mac_length*)

The R_SCE_AES256CCM_DecryptInit() function prepares to perform CCM computation and writes the result to the first argument, handle. The succeeding functions R_SCE_AES256CCM_DecryptUpdate() and R_SCE_AES256CCM_DecryptFinal() use handle as an argument.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	wrapped_key	256-bit AES wrapped key
[in]	nonce	Nonce
[in]	nonce_length	Nonce data length (7 to 13 bytes)
[in]	adata	additional authentication data
[in]	a_length	additional authentication data length (0 to 110 bytes)
[in]	payload_length	Payload length (any number of bytes)
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptUpdate()

fsp_err_t R_SCE_AES256CCM_DecryptUpdate (sce_ccm_handle_t * *handle*, uint8_t * *cipher*, uint8_t * *plain*, uint32_t *cipher_length*)

The R_SCE_AES256CCM_DecryptUpdate() function decrypts the ciphertext specified by the second argument, cipher, in CCM mode using the values specified by wrapped_key, nonce, and adata in in R_SCE_AES256CCM_DecryptInit(). This function buffers internally the data input by the user until the input value of cipher exceeds 16 bytes. Once the amount of cipher input data is 16 bytes or greater, the decrypted result is output to plain, which is specified in the third argument. Use payload_length in R_SCE_AES256CCM_DecryptInit() to specify the total data length of cipher that will be input. Use cipher_length in this function to specify the data length to be input when the user calls this function. If the input value of cipher is less than 16 bytes, the function performs padding internally.

Ensure that the areas allocated to cipher and plain do not overlap. Also, specify RAM addresses that are multiples of 4 for cipher and plain.

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in]	cipher	ciphertext data area
[in,out]	plain	plaintext data area
[in]	cipher_length	ciphertext data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CCM_DecryptFinal()

fsp_err_t R_SCE_AES256CCM_DecryptFinal (sce_ccm_handle_t * *handle*, uint8_t * *plain*, uint32_t * *plain_length*, uint8_t * *mac*, uint32_t *mac_length*)

If the data length of cipher input in R_SCE_AES256GCM_DecryptUpdate() results in leftover data after 16 bytes, the R_SCE_AES256GCM_DecryptFinal() function outputs the leftover decrypted data to cipher, which is specified in the second argument. In addition, the function verifies the fourth argument, mac. Set the fifth argument, mac_length, to the same value as that specified for the argument mac_length in Aes256CcmDecryptInit().

Parameters

[in,out]	handle	AES-CCM handler (work area)
[in,out]	plain	plaintext data area
[in,out]	plain_length	plaintext data length
[in]	mac	MAC area
[in]	mac_length	MAC length (4, 6, 8, 10, 12, 14, or 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error, or authentication failed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateInit()

fsp_err_t R_SCE_AES128CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES128CMAC_GenerateUpdate() function and R_SCE_AES128CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES128CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_GenerateFinal()

fsp_err_t R_SCE_AES128CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES128CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyInit()

fsp_err_t R_SCE_AES128CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES128CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES128CMAC_VerifyUpdate() function and R_SCE_AES128CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES128CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES128CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES128CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128CMAC_VerifyFinal()

fsp_err_t R_SCE_AES128CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES128CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateInit()

fsp_err_t R_SCE_AES256CMAC_GenerateInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_GenerateInit() function performs preparations for the execution of an CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_AES256CMAC_GenerateUpdate() function and R_SCE_AES256CMAC_GenerateFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateUpdate()

fsp_err_t R_SCE_AES256CMAC_GenerateUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_GenerateUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_GenerateInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_GenerateFinal()

fsp_err_t R_SCE_AES256CMAC_GenerateFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_AES256CMAC_GenerateFinal() function outputs the MAC value to the MAC data area specified in the second argument, mac, and ends CMAC mode.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (16byte)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Not used.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyInit()

fsp_err_t R_SCE_AES256CMAC_VerifyInit (sce_cmac_handle_t * *handle*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_AES256CMAC_VerifyInit() function performs preparations for the execution of a CMAC calculation, and writes the result to the first argument, handle. The value of handle is used as an argumentin the subsequent R_SCE_AES256CMAC_VerifyUpdate() function and R_SCE_AES256CMAC_VerifyFinal() function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyUpdate()

fsp_err_t R_SCE_AES256CMAC_VerifyUpdate (sce_cmac_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_AES256CMAC_VerifyUpdate() function performs MAC value generation based on the message specified in the second argument, message, using the value specified for wrapped_key in R_SCE_AES256CMAC_VerifyInit(). Inside this function, the data that is input by the user is buffered until the input value of message exceeds 16 bytes. The length of the message data to input is specified in the third argument, message_len. For these, input not the total byte count for message input data, but rather the message data length to input when the user calls this function. If the input value, message, is not a multiple of 16 bytes, it will be padded within the function. For message, specify a RAM address that are multiples of 4.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in]	message	message data area (message_length byte)
[in]	message_length	message data length (0 or more bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256CMAC_VerifyFinal()

fsp_err_t R_SCE_AES256CMAC_VerifyFinal (sce_cmac_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_AES256CMAC_VerifyFinal() function inputs the MAC value in the MAC data area specified in the second argument, mac, and verifies the MAC value. If authentication fails, the return value will be TSIP_ERR_AUTHENTICATION. If the MAC value is less than 16 bytes, it will be padded with zeros inside the function.

Parameters

[in,out]	handle	AES-CMAC handler (work area)
[in,out]	mac	MAC data area (mac_length byte)
[in,out]	mac_length	MAC data length (2 to 16 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Init()

fsp_err_t R_SCE_SHA256_Init (sce_sha_md5_handle_t * *handle*)

The R_SCE_SHA256_Init() function performs preparations for the execution of an SHA-256 hash calculation, and writes the result to the first argument, handle. The value of handle is used as an argument in the subsequent R_SCE_SHA256_Update() function and R_SCE_SHA256_Final() function.

Parameters

[in,out]	handle	SHA handler (work area)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Update()

fsp_err_t R_SCE_SHA256_Update (sce_sha_md5_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256_Update() function calculates a hash value based on the second argument, message, and the third argument, message_length, and writes the ongoing status to the first argument, handle. After message input is completed, call R_SCE_SHA256_Final().

Parameters

[in,out]	handle	SHA handler (work area)
[in]	message	message data area
[in]	message_length	message data length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256_Final()

fsp_err_t R_SCE_SHA256_Final (sce_sha_md5_handle_t * *handle*, uint8_t * *digest*, uint32_t * *digest_length*)

Using the handle specified in the first argument, handle, the R_SCE_SHA256_Final() function writes the calculation result to the second argument, digest, and writes the length of the calculation result to the third argument, digest_length.

Parameters

[in,out]	handle	SHA handler (work area)
[in,out]	digest	hasha data area
[in,out]	digest_length	hash data length (32bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateInit()

fsp_err_t R_SCE_SHA256HMAC_GenerateInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_GenerateInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_GenerateUpdate() function or R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateUpdate()

fsp_err_t R_SCE_SHA256HMAC_GenerateUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_GenerateUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_GenerateFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_GenerateFinal()

fsp_err_t R_SCE_SHA256HMAC_GenerateFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*)

The R_SCE_SHA256HMAC_GenerateFinal() function uses the handle specified by the first argument handle and writes the calculation result to the second argument mac.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in,out]	mac	HMAC area (32 bytes)

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyInit()

fsp_err_t R_SCE_SHA256HMAC_VerifyInit (sce_hmac_sha_handle_t * *handle*, sce_hmac_sha_wrapped_key_t * *wrapped_key*)

The R_SCE_SHA256HMAC_VerifyInit() function uses the second argument wrapped_key to prepare for execution of SHA256-HMAC calculation, then writes the result to the first argument handle. The argument handle is used by the subsequent R_SCE_SHA256HMAC_VerifyUpdate() function or R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handler (work area)
[in]	wrapped_key	MAC wrapped key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	An invalid MAC wrapped key was input.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyUpdate()

fsp_err_t R_SCE_SHA256HMAC_VerifyUpdate (sce_hmac_sha_handle_t * *handle*, uint8_t * *message*, uint32_t *message_length*)

The R_SCE_SHA256HMAC_VerifyUpdate() function uses the handle specified by the first argument handle, calculates a hash value from the second argument message and third argument message_length, then writes the intermediate result to the first argument handle. After message input finishes, call the R_SCE_SHA256HMAC_VerifyFinal() function.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	message	Message area
[in]	message_length	Message length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_SHA256HMAC_VerifyFinal()

fsp_err_t R_SCE_SHA256HMAC_VerifyFinal (sce_hmac_sha_handle_t * *handle*, uint8_t * *mac*, uint32_t *mac_length*)

The R_SCE_SHA256HMAC_VerifyFinal() function uses the handle specified by the first argument handle and verifies the mac value from the second argument mac and third argument mac_length. Input a value in bytes from 4 to 32 as mac_length.

Parameters

[in,out]	handle	SHA-HMAC handle (work area)
[in]	mac	HMAC area
[in]	mac_length	HMAC length

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the

		message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS1024_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS1024_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS1024_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureGenerate()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureGenerate (sce_rsa_byte_data_t * *message_hash*, sce_rsa_byte_data_t * *signature*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureGenerate() function generates, in accordance with RSASSA-PKCS1-V1_5, a signature from the message text or hash value that is input in the first argument, message_hash, using the private wrapped key input to the third argument, wrapped_key, and writes the signature text to the second argument, signature. When a message is specified in the first argument, message_hash->data_type, a hash value is calculated for the message as specified by the fourth argument, hash_type. When specifying a hash value in the first argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data

		_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : data length
[in]	wrapped_key	Inputs the 2048-bit RSA private wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS2048_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS2048_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS2048_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS3072_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS3072_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS3072_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify

		• message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.
[in]	hash_type	Only HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSASSA_PKCS4096_SignatureVerify()

fsp_err_t R_SCE_RSASSA_PKCS4096_SignatureVerify (sce_rsa_byte_data_t * *signature*, sce_rsa_byte_data_t * *message_hash*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*, uint8_t *hash_type*)

The R_SCE_RSASSA_PKCS4096_SignatureVerify() function verifies, in accordance with RSASSA-PKCS1-V1_5, the signature text input to the first argument signature, and the message text or hash value input to the second argument, message_hash, using the public wrapped key input to the third argument, wrapped_key. When a message is specified in the second argument, message_hash->data_type, a hash value is calculated using the public wrapped key input to the third argument, wrapped_key, and as specified by the fourth argument, hash_type. When specifying a hash value in the second argument, message_hash->data_type, a hash value calculated with a hash algorithm as specified by the fourth argument, hash_type, must be input to message_hash->pdata.

Parameters

[in]	signature	Signature text information to verify • signature->pdata : Specifies pointer to array storing the signature text • signature->data_length : Specifies effective data length of the array
[in]	message_hash	Message text or hash value to verify • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.
[in]	hash_type	Only

		HW_SCE_RSA_HASH_SHA256 is supported

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_AUTHENTICATION	Authentication failed
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa1024_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS1024_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS1024_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa1024_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS1024_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.

FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa2048_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 2048-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS2048_Decrypt()

fsp_err_t R_SCE_RSAES_PKCS2048_Decrypt (sce_rsa_byte_data_t * *cipher*, sce_rsa_byte_data_t * *plain*, sce_rsa2048_private_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS2048_Decrypt() function RSA-decrypts the ciphertext input to the first argument, cipher, according to RSAES-PKCS1-V1_5. It writes the decryption result to the second argument, plain.

Parameters

[in]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in,out]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Inputs plaintext buffer size. The following size is required. Plaintext buffer size >= public key n size -11. Outputs valid data length after decryption (public key n size).
[in]	wrapped_key	Inputs the 1024-bit RSA private wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.

FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS3072_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS3072_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa3072_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS3072_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 3072-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSAES_PKCS4096_Encrypt()

fsp_err_t R_SCE_RSAES_PKCS4096_Encrypt (sce_rsa_byte_data_t * *plain*, sce_rsa_byte_data_t * *cipher*, sce_rsa4096_public_wrapped_key_t * *wrapped_key*)

The R_SCE_RSAES_PKCS4096_Encrypt() function RSA-encrypts the plaintext input to the first argument, plain, according to RSAES-PKCS1-V1_5. It writes the encryption result to the second argument, cipher.

Parameters

[in]	plain	plaintext • plain->pdata : Specifies pointer to array containing plaintext. • plain->data_length : Specifies valid data length of plaintext array. data size <= public key n size - 11
[in,out]	cipher	ciphertext • cipher->pdata : Specifies pointer to array containing ciphertext. • cipher->data_length : Inputs ciphertext buffer size. Outputs valid data length after encryption (public key n size).
[in]	wrapped_key	Inputs the 4096-bit RSA public wrapped key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another

	processing routine.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Incorrect wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is illegal.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp192r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The

		signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp192r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp224r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the

		message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp224r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-256 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp256r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp256r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureGenerate()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureGenerate (sce_ecdsa_byte_data_t * *message_hash*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

When a message is specified in the first argument, message_hash->data_type, a SHA-384 hash of the message text input as the first argument, message_hash->pdata, is calculated, and the signature text is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the first argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-384 hash value input to the first argument, message_hash->pdata, is written to the second argument, signature, in accordance with secp384r1 using the private wrapped key input as the third argument, wrapped_key.

Parameters

[in]	message_hash	Message or hash value to which to attach signature • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash

		(Message: 0 Hash value: 1)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Data length (byte units)
[in]	wrapped_key	Input wrapped key of secp384r1 private key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp192r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp192r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 24 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp192r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (64 bits) || signature r (192 bits) || 0 padding (64 bits) || signature s (192 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)

[in]	wrapped_key	Input wrapped key of secp192r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp224r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp224r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 28 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp224r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "0 padding (32 bits) || signature r (224 bits) || 0 padding (32 bits) || signature s (224 bits)". • signature->data_length : Specifies the

		data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp224r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp256r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp256r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 32 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp256r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (256 bits) || signature s (256 bits)". • signature->data_length : Specifies the data length (byte units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of

		secp256r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDSA_secp384r1_SignatureVerify()

fsp_err_t R_SCE_ECDSA_secp384r1_SignatureVerify (sce_ecdsa_byte_data_t * *signature*, sce_ecdsa_byte_data_t * *message_hash*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

When a message is specified in the second argument, message_hash->data_type, a SHA-256 hash of the message text input as the second argument, message_hash->pdata, is calculated, and the signature text input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

To use message input, prepare a user-defined function for SHA384.

When a hash value is specified in the second argument, message_hash->data_type, the signature text for the first 48 bytes of the SHA-256 hash value input to the second argument, message_hash->pdata, input to the first argument, signature, is validated in accordance with secp384r1 using the public wrapped key input as the third argument, wrapped_key.

Parameters

[in]	signature	Signature text information to be verified • signature->pdata : Specifies pointer to array storing signature text The signature format is "signature r (384 bits) || signature s (384 bits)". • signature->data_length : Specifies the data length (byte

		units) (nonuse)
[in,out]	message_hash	Message or hash value to be verified • message_hash->pdata : Specifies pointer to array storing the message or hash value • message_hash->data_length : Specifies effective data length of the array (Specify only when Message is selected) • message_hash->data_type : Selects the data type of message_hash (Message: 0 Hash value: 1)
[in]	wrapped_key	Input wrapped key of secp384r1 public key.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_Init()

fsp_err_t R_SCE_ECDH_secp256r1_Init (sce_ecdh_handle_t * *handle*, uint32_t *key_type*, uint32_t *use_key_id*)

The R_SCE_ECDH_secp256r1_Init() function prepares to perform ECDH key exchange computation and writes the result to the first argument, handle. The succeeding functions R_SCE_ECDH_secp256r1_PublicKeySign(), R_SCE_ECDH_secp256r1_PublicKeyVerify(), R_SCE_ECDH_secp256r1_SharedSecretCalculate(), and R_SCE_ECDH_secp256r1_KeyDerivation() use handle as an argument.

Use the second argument, key_type, to select the type of ECDH key exchange. When ECDHE is selected, the R_SCE_ECDH_secp256r1_PublicKeySign() function uses the SCE's random number generation functionality to generate an secp256r1 key pair. When ECDH is selected, keys installed beforehand are used for key exchange.

Input 1 as the third argument, use_key_id, to use key_id when key exchange is performed. key_id is for applications conforming to the DLMS/COSEM standard for smart meters.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	key_type	Key exchange type (0: ECDHE, 1: ECDH, 2:ECDH(AES-GCM-128 with IV))
[in]	use_key_id	0: key_id not used, 1: key_id used

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_PARAMETER	Input data is invalid.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeySign()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeySign (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, uint8_t * *public_key*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_private_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeySign() function calculates a signature for a public key user wrapped key used for ECDH key exchange.

If ECDHE is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the SCE's random number generation functionality is used to generate an secp256r1 key pair. The public key is output to public_key and the private key is output to wrapped_key.

If ECDH is specified by the key_type argument of the R_SCE_ECDH_secp256r1_Init() function, the public key input as ecc_public_wrapped_key is output to public_key and nothing is output to wrapped_key.

The succeeding function R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses the first argument, handle, as an argument. R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area) When using key_id, input handle->key_id after running R_SCE_ECDH_secp256r1_Init().
[in]	ecc_public_wrapped_key	For ECDHE, input a null pointer. For ECDH, input the wrapped key of a secp256r1 public key.
[in]	ecc_private_wrapped_key	secp256r1 private key for signature generation
[in,out]	public_key	User secp256r1 public key (512-bit) for key exchange. When using key_id, key_id (8-bit) || public key (512-bit) || 0 padding (24-bit)
[in,out]	signature	Signature text storage destination information • signature->pdata : Specifies pointer to array storing signature text. The signature format is "signature r (256 bits) || signature s (256 bits)" • signature->data_leng

		th : Data length (in byte units)
[in,out]	wrapped_key	For ECDHE, a private wrapped key generated from a random number. Not output for ECDH.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyVerify()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyVerify (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, uint8_t * *public_key_data*, sce_ecdsa_byte_data_t * *signature*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyVerify() function verifies the signature of the secp256r1 public key of the other ECDH key exchange party. If the signature is correct, it outputs the public wrapped key to the fifth argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate(). R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key area for signature verification
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in]	signature	ECDSA secp256r1 signature of ecc_public_wrapped_key
[in,out]	wrapped_key	wrapped key of ecc_public_wrapped_key

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred or signature verification failed.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature()

fsp_err_t R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature (sce_ecdh_handle_t * *handle*, uint8_t * *public_key_data*, sce_ecc_public_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_PublicKeyReadWithoutSignature() function reads the secp256r1 public key of the other ECDH key exchange party and outputs the public wrapped key to the third argument. The first argument, handle, is used as an argument in the subsequent function R_SCE_ECDH_secp256r1_SharedSecretCalculate().
R_SCE_ECDH_secp256r1_SharedSecretCalculate() uses wrapped_key as input to calculate Z. This API does not verify signature of public_key_data, please protect this data by upper layer software.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	public_key_data	secp256r1 public key (512-bit). When key_id is used: key_id (8-bit) || public key (512-bit)
[in,out]	wrapped_key	wrapped key of public_key_data

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State. Please note that this is slightly contrary to the protected mode policy as it omits signature verification.

◆ R_SCE_ECDH_secp256r1_SharedSecretCalculate()

fsp_err_t R_SCE_ECDH_secp256r1_SharedSecretCalculate (sce_ecdh_handle_t * *handle*, sce_ecc_public_wrapped_key_t * *ecc_public_wrapped_key*, sce_ecc_private_wrapped_key_t * *ecc_private_wrapped_key*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*)

The R_SCE_ECDH_secp256r1_SharedSecretCalculate() function uses the ECDH key exchange algorithm to output the wrapped key of the shared secret Z derived from the public key of the other key exchange party and your own private key. Input as the second argument, ecc_public_wrapped_key, the public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify(). When key_type of R_SCE_ECDH_secp256r1_Init() is 0, input as the third argument, ecc_private_wrapped_key, the private wrapped key generated from a random number by R_SCE_ECDH_secp256r1_PublicKeySign(), and when key_type is other than 0, input the private wrapped key that forms a pair with the second argument of R_SCE_ECDH_secp256r1_PublicKeySign(). The subsequent R_SCE_ECDH_secp256r1_KeyDerivation() function uses shared_secret_wrapped_key as key material for outputting the wrapped key.

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	ecc_public_wrapped_key	Public wrapped key whose signature was verified by R_SCE_ECDH_secp256r1_PublicKeyVerify()
[in]	ecc_private_wrapped_key	Private wrapped key
[in,out]	shared_secret_wrapped_key	Wrapped key of shared secret Z calculated by ECDH key exchange

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECDH_secp256r1_KeyDerivation()

fsp_err_t R_SCE_ECDH_secp256r1_KeyDerivation (sce_ecdh_handle_t * *handle*, sce_ecdh_wrapped_key_t * *shared_secret_wrapped_key*, uint32_t *key_type*, uint32_t *kdf_type*, uint8_t * *other_info*, uint32_t *other_info_length*, sce_hmac_sha_wrapped_key_t * *salt_wrapped_key*, sce_aes_wrapped_key_t * *wrapped_key*)

The R_SCE_ECDH_secp256r1_KeyDerivation() function uses the shared secret "Z (shared_secret_index)" calculated by the R_SCE_ECDH_secp256r1_SharedSecretCalculate() function as the key material to derive the wrapped key specified by the third argument, key_type. The key derivation algorithm is one-step key derivation as defined in NIST SP800-56C. Either SHA-256 or SHA-256 HMAC is specified by the fourth argument, kdf_type. When SHA-256 HMAC is specified, the wrapped key output by the R_SCE_SHA256HMAC_EncryptedKeyWrap() function is specified as the seventh argument, salt_wrapped_key. Enter a fixed value for deriving a key shared with the key exchange partner in the fifth argument, other_info. A wrapped key corresponding to key_type is output as the eighth argument, wrapped_key. The correspondences between the types of derived wrapped_key and the functions with which they can be used as listed below.

- AES-128: All AES-128 Init functions
- AES-256: All AES-256 Init functions
- SHA256-HMAC: R_SCE_SHA256HMAC_GenerateInit() function and R_SCE_SHA256HMAC_VerifyInit() function

Parameters

[in,out]	handle	ECDH handler (work area)
[in]	shared_secret_wrapped_key	Z wrapped key calculated by R_SCE_ECDH_secp256r1_SharedSecretCalculate
[in]	key_type	Derived key type (0: AES-128, 1: AES-256, 2:SHA256-HMAC, 3: AES-GCM-128 with IV)
[in]	kdf_type	Algorithm used for key derivation calculation (0: SHA-256, 1:SHA256-HMAC)
[in]	other_info	Additional data used for key derivation calculation: AlgorithmID || PartyUInfo || PartyVInfo
[in]	other_info_length	Data length of other_info (up to 147 byte units)
[in]	salt_wrapped_key	Salt wrapped key (Input NULL when kdf_type is 0.)
[in,out]	wrapped_key	Wrapped key corresponding to key_type. When the value of key_type is 2, an SHA256-HMAC wrapped key is output. wrapped_key can be specified by casting the start address of the area

		reserved beforehand by the sce_hmac_sha_wrapped_key_t type with the (sce_aes_wrapped_key_t*) type.

Return values

FSP_SUCCESS	Normal end
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource required by the processing is in use by other processing.
FSP_ERR_CRYPTO_SCE_KEY_SET_FAIL	Invalid wrapped key was input.
FSP_ERR_CRYPTO_SCE_PARAMETER	An invalid handle was input.
FSP_ERR_CRYPTO_SCE_FAIL	Internal error occurred.
FSP_ERR_CRYPTO_SCE_PROHIBIT_FUNCTION	An invalid function was called.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall()

fsp_err_t R_SCE_TLS_RootCertificateRSA2048PublicKeyInstall (uint8_t * *encrypted_provisioning_key*, uint8_t * *initial_vector*, uint8_t * *encrypted_key*, sce_tls_ca_certification_public_wrapped_key_t * *wrapped_key*)

Generate TLS RSA Public key index data

Parameters

[in]	encrypted_provisioning_key	the provisioning key includes encrypted CBC/CBC-MAC key for user key
[in]	initial_vector	the initial_vector for user key CBC encrypt
[in]	encrypted_key	the user key encrypted with AES128-ECB mode
[out]	wrapped_key	the user Key Generation Information (141 words) of RSA2048 bit

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate()

fsp_err_t R_SCE_TLS_ECC_secp256r1_EphemeralWrappedKeyPairGenerate (sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint8_t * *ephemeral_ecdh_public_key*)

Generate TLS ECC key pair

Parameters

[in]	tls_p256_ecc_wrapped_key	P256 ECC key index for TLS
[in]	ephemeral_ecdh_public_key	ephemeral ECDH public key

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_ASSERTION	A required parameter is NULL.
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_RootCertificateVerify()

fsp_err_t R_SCE_TLS_RootCertificateVerify (uint32_t *public_key_type*, uint8_t * *certificate*, uint32_t *certificate_length*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint8_t * *signature*, uint32_t * *encrypted_root_public_key*)

Verify root CA certificate.

Parameters

[in]	public_key_type	key type
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[in]	signature	signature for certificates.
[out]	encrypted_root_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_CertificateVerify()

fsp_err_t R_SCE_TLS_CertificateVerify (uint32_t *public_key_type*, uint32_t * *encrypted_input_public_key*, uint8_t * *certificate*, uint32_t *certificate_length*, uint8_t * *signature*, uint32_t *public_key_n_start_position*, uint32_t *public_key_n_end_position*, uint32_t *public_key_e_start_position*, uint32_t *public_key_e_end_position*, uint32_t * *encrypted_output_public_key*)

Verify server certificate and intermediate certificate.

Parameters

[in]	public_key_type	key type
[in]	encrypted_input_public_key	public key.
[in]	certificate	certificates.
[in]	certificate_length	byte size of certificates.
[in]	signature	signature for certificates.
[in]	public_key_n_start_position	start position of public key n.
[in]	public_key_n_end_position	end position of public key n.
[in]	public_key_e_start_position	start position of public key e.
[in]	public_key_e_end_position	end position of public key e.
[out]	encrypted_output_public_key	public key for RSA 2048bit.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretEncryptWithRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretEncryptWithRSA2048 (uint32_t * *encrypted_public_key*, uint32_t * *sce_pre_master_secret*, uint8_t * *encrypted_pre_master_secret*)

Output the result encrypted pre-master secret with RSA 2048bit

Parameters

[in]	encrypted_public_key	public key data.
[in]	sce_pre_master_secret	pre-master secret value.
[out]	encrypted_pre_master_secret	the value encrypted pre-master secret.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForRSA2048()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForRSA2048 (uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[out]	sce_pre_master_secret	pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_MasterSecretGenerate()

fsp_err_t R_SCE_TLS_MasterSecretGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_pre_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint32_t * *sce_master_secret*)

Generate encrypted master secret.

Parameters

[in]	select_cipher_suite	cipher suite type
[in]	sce_pre_master_secret	pre-master secret value for SCE.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[out]	sce_master_secret	master secret value with SCE-specific conversion.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_SessionKeyGenerate()

fsp_err_t R_SCE_TLS_SessionKeyGenerate (uint32_t *select_cipher_suite*, uint32_t * *sce_master_secret*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *nonce_explicit*, sce_hmac_sha_wrapped_key_t * *client_mac_wrapped_key*, sce_hmac_sha_wrapped_key_t * *server_mac_wrapped_key*, sce_aes_wrapped_key_t * *client_crypto_wrapped_key*, sce_aes_wrapped_key_t * *server_crypto_wrapped_key*, uint8_t * *client_initial_vector*, uint8_t * *server_initial_vector*)

Output various key information.

Parameters

[in]	select_cipher_suite	Key suite information number.
[in]	sce_master_secret	master secret value.
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	nonce_explicit	nonce value
[out]	client_mac_wrapped_key	the mac key during communication from client to server.
[out]	server_mac_wrapped_key	the mac key during communication from server to client.
[out]	client_crypto_wrapped_key	the crypto key during communication from client to server.
[out]	server_crypto_wrapped_key	the crypto key during communication from server to client.
[in]	client_initial_vector	not use.
[in]	server_initial_vector	not use.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_VerifyDataGenerate()

fsp_err_t R_SCE_TLS_VerifyDataGenerate (uint32_t *select_verify_data*, uint32_t * *sce_master_secret*, uint8_t * *hand_shake_hash*, uint8_t * *verify_data*)

Generate verify data.

Parameters

[in]	select_verify_data	Select Client/Server data.
[in]	sce_master_secret	master secret data.
[in]	hand_shake_hash	TLS hand shake message SHA256 HASH value.
[out]	verify_data	verify data.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_ServerKeyExchangeVerify()

fsp_err_t R_SCE_TLS_ServerKeyExchangeVerify (uint32_t *public_key_type*, uint8_t * *client_random*, uint8_t * *server_random*, uint8_t * *server_ephemeral_ecdh_public_key*, uint8_t * *server_key_exchange_signature*, uint32_t * *encrypted_public_key*, uint32_t * *encrypted_ephemeral_ecdh_public_key*)

Retrives ECDH public key.

Parameters

[in]	public_key_type	key type
[in]	client_random	random value reported ClientHello.
[in]	server_random	random value reported ServerHello.
[in]	server_ephemeral_ecdh_public_key	Ephemeral ECDH public key from Server.
[in]	server_key_exchange_signature	Server Key Exchange sigunature.
[in]	encrypted_public_key	encrypted public key.
[out]	encrypted_ephemeral_ecdh_public_key	encrypted Ephemeral ECDH public key.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1()

fsp_err_t R_SCE_TLS_PreMasterSecretGenerateForECC_secp256r1 (uint32_t * *encrypted_public_key*, sce_tls_p256_ecc_wrapped_key_t * *tls_p256_ecc_wrapped_key*, uint32_t * *sce_pre_master_secret*)

Generate encrypted pre-master secret.

Parameters

[in]	encrypted_public_key	encrypted public key
[in]	tls_p256_ecc_wrapped_key	P-256 ECC key index.
[out]	sce_pre_master_secret	encrypted pre-master secret value for SCE.

Return values

FSP_SUCCESS	Normal termination
FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	A resource conflict occurred because a hardware resource needed by the processing routine was in use by another processing routine.
FSP_ERR_CRYPTO_SCE_FAIL	An internal error occurred.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

5.2.15.10 Secure Crypto Engine (r_sce_protected_cavp)

Modules » Security

Driver for the CAVP Certified Secure Crypto Engine (SCE) on RA MCUs.

Version

v1.1.0

The version that appears on the Components tab of the FSP Configuration editor is v1.1.0+fsp.<fsp_version>. The <fsp_version> metadata reflects tooling support files only and does not indicate any changes to the CAVP certified code. See Module Versioning for more information about component versioning in FSP.

Functions

The specifications of this module comply with the Secure Crypto Engine (r_sce_protected) of FSP v5.5.0.

For more information about the features of this module, see the "Renesas Flexible Software Package (FSP) v5.5.0 User's Manual." The documentation can be obtained from the following link:

See also
https://www.renesas.com/en/software-tool/flexible-software-package-fsp

Overview

This module provides SCE CAVP Certified functions.

HW Overview

SCE9 Protected Mode CAVP certification has been obtained using the RA6M4 as the target processor.

Crypto Peripheral version	Devices
SCE9 (Protected mode)	RA4M2, RA4M3, RA6M4, RA6M5

Features

The SCE module supports for the following features.

- Cryptography
  - Symmetric Encryption/Decryption
    - AES
      - ECB 128/256bit
      - CBC 128/256bit
      - GCM 128/256bit
      - CCM 128/256bit
  - Asymmetric Encryption/Decryption
    - RSA
      - RSAES-PKCS1-V1_5 1024/2048bit
      - RSAES-PKCS1-V1_5 3072/4096bit (Encryption only)
      - RSASSA-PKCS1-V1_5 1024/2048bit
      - RSASSA-PKCS1-V1_5 3072/4096bit (Verification only)
    - ECC
      - ECDSA secp192r1/secp224r1/secp256r1/secp384r1
      - ECDH secp256r1
  - Hash Functions
    - SHA-2
      - SHA-256
- Message Authentication Code
  - HMAC-SHA256bit
  - AES-CMAC 128/256bit
- Key Support
  - AES 128/256bit
  - AES Key Wrap/Key Unwrap 128/256bit
  - RSA 1024/2048bit
  - RSA 3072/4096bit (public key only)
  - ECC secp192r1/secp224r1/secp256r1/secp384r1
  - HMAC-SHA256bit
- TRNG
- TLS

- SSL / TLS support function (TLS1.2 compliant)

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4M2, RA4M3
RA6	RA6E1, RA6M4, RA6M5

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Getting Started: Creating a SCE Protected Mode Project

Start by creating a new project in e² studio or RASC. On the Stacks tab, add New > Security > SCE Protected Mode(CAVP Certified). For information on how to install and update secure keys, refer to the Application Note R11AN0496.

Reducing intialization time

The SCE intialization sequence can be modified to support a smaller subset of features and allow for a shorter intialization period. This is particularly useful in cases where startup time is important and the cryptographic features that are required are known in advance. The current fast boot configuration option supports the cryptographic primitives required by MCUBoot including:

- RSA 3K/4K signature verification
- ECC P256 signature verification
- SHA224/256 and GHASH calcuation

Limitations

Usage of R_SCE_ECDSA_secp384r1_SignatureGenerate/Verify

The SCE does not support SHA-384 in hardware, so the APIs listed below require the user to create a SHA-384 function for signature generation and verification. To use the APIs listed below, enable SCE_USER_SHA_384_ENABLED on RA Smart Configurator and prepare a function called SCE_USER_SHA_384_FUNCTION. The interface of SCE_USER_SHA_384_FUNCTION, which is called by the following APIs, is described below.

- R_SCE_ECDSA_secp384r1_SignatureGenerate()
- R_SCE_ECDSA_secp384r1_SignatureVerify()

SCE_USER_SHA_384_FUNCTION()

```
uint32_t SCE_USER_SHA_384_FUNCTION(uint8_t * message, uint8_t * digest, uint32_t
```

```
message_length)
```

SHA-384 hash calculation is performed for an area extending the number of bytes specified by the argument message_length from the address specified by the argument message. The calculation result should be stored at the address specified by the argument digest.

Parameters

message	[in] Start address of message
digest	[in,out] address for storing hash calculation result (48 bytes)
message_length	[in] Effective byte count of message

Return values

0	Hash value stored successfully.
others	Storing of hash value failed.

Examples

AES Example

This is an example of AES-256 encryption and decryption.

```
static uint8_t plain[BLOCK * 2] =
{
    0x52, 0x65, 0x6e, 0x65, 0x73, 0x61, 0x73, 0x20, 0x45, 0x6c, 0x65, 0x63, 0x74,
0x72, 0x6f, 0x6e,
    0x69, 0x63, 0x73, 0x20, 0x43, 0x6f, 0x72, 0x70, 0x6f, 0x72, 0x61, 0x74, 0x69,
0x6f, 0x6e, 0x00
};
void r_sce_example_aes ()
{
 sce_aes_handle_t      handle;
 sce_aes_wrapped_key_t wrapped_key;
    uint8_t               cipher_calculated[32] = {0};
    uint8_t               plain_calculated[32] = {0};
    uint32_t             dummy;
 /* SCE power on */
```

```
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random key */
 R_SCE_AES256_WrappedKeyGenerate(&wrapped_key);
 /* Encrypt a plain text */
 R_SCE_AES256ECB_EncryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_EncryptUpdate(&handle, plain, cipher_calculated, BLOCK * 2);
 R_SCE_AES256ECB_EncryptFinal(&handle, cipher_calculated, &dummy);
 /* Decrypt a cipher text using same key as Encryption */
 R_SCE_AES256ECB_DecryptInit(&handle, &wrapped_key);
 R_SCE_AES256ECB_DecryptUpdate(&handle, cipher_calculated, plain_calculated, BLOCK *
2);
 R_SCE_AES256ECB_DecryptFinal(&handle, plain_calculated, &dummy);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 /* Compare plain and plain_calculated */
 if (memcmp(plain, plain_calculated, BLOCK * 2))
    {
 while (1)
      {
 /* plain and plain_calculated are different (incorrect) */
       }
    }
 else
    {
 while (1)
      {
 /* plain and plain_calculated are the same (correct) */
       }
    }
}
```

ECC Example

This is an example of ECC secp-256 signature generate and verify.

```
uint8_t ecc256_data_msg[] =
{
 's', 'a', 'm', 'p', 'l', 'e'
};
void r_sce_example_ecc ()
{
 sce_ecc_wrapped_pair_key_t wrapped_pair_key;
 sce_ecdsa_byte_data_t      message_hash =
    {
       0
    };
 sce_ecdsa_byte_data_t signature;
    uint8_t               out_data[HW_SCE_ECDSA_DATA_BYTE_SIZE];
 fsp_err_t             return_code;
    message_hash.data_length = sizeof(ecc256_data_msg);
    message_hash.pdata       = (uint8_t *) ecc256_data_msg;
    signature.pdata          = out_data;
 /* SCE power on */
 R_SCE_Open(&sce_ctrl, &sce_cfg);
 /* Generate a random pair key */
 R_SCE_ECC_secp256r1_WrappedKeyPairGenerate(&wrapped_pair_key);
 /* Generate a Signature */
 R_SCE_ECDSA_secp256r1_SignatureGenerate(&message_hash, &signature,
&wrapped_pair_key.priv_key);
 /* Verify Signature and Public wrapped key */
    return_code = R_SCE_ECDSA_secp256r1_SignatureVerify(&signature, &message_hash,
&wrapped_pair_key.pub_key);
 /* SCE power off */
 R_SCE_Close(&sce_ctrl);
 if (FSP_SUCCESS != return_code)
    {
 while (1)
     {
 /* Verify Fail */
```

```
      }
   }
 else
   {
 while (1)
     {
 /* Verify Success */
      }
   }
}
```

RSA Example

This is an example of RSA-2048 encryption and decryption.

```
uint8_t rsa_msg[256] =
{
    0x00, 0x01, 0x02, 0x03, 0x04, 0x05, 0x06, 0x07, 0x08, 0x09, 0x0a, 0x0b, 0x0c,
0x0d, 0x0e, 0x0f,
    0x10, 0x11, 0x12, 0x13, 0x14, 0x15, 0x16, 0x17, 0x18, 0x19, 0x1a, 0x1b, 0x1c,
0x1d, 0x1e, 0x1f,

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides RSIP functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
RSIP-E11A	RA4L1

RSIP-E31A	RA4C1
RSIP-E51A	RA8M1, RA8D1, RA8T1
RSIP-E50D	RA8P1

Features

The RSIP Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used RSIP. Please refer to the following for details.

Key Support

AES Key Injection

Crypto Peripheral version	128 bit	192 bit	256 bit
RSIP-E11A	Support	No support	Support
RSIP-E31A	Support	No support	Support
RSIP-E51A	Support	Support	Support
RSIP-E50D	Support	Support	Support

AES XTS Key Injection

Crypto Peripheral version	128 bit XTS	256 bit XTS
RSIP-E11A	No support	No support
RSIP-E31A	No support	No support
RSIP-E51A	Support	Support
RSIP-E50D	Support	Support

ChaCha20 Key Injection

Crypto Peripheral version	ChaCha20
RSIP-E11A	No support
RSIP-E31A	No support
RSIP-E51A	No support
RSIP-E50D	Support

RSA Key Injection

Crypto Peripheral version	2048 bit	3072 bit	4096 bit
RSIP-E11A	No support	No support	No support
RSIP-E31A	No support	No support	No support
RSIP-E51A	Support	Support	Support

RSIP-E50D	Support	Support	Support

ECC Key Injection

Crypto Peripheral version	secp256r1	secp384r1	secp521r1	secp256k1	brainpoolP256r1	brainpoolP384r1	brainpoolP512r1	Ed25519
RSIP-E11A	Support	No support	No support	Support	Support	No support	No support	No support
RSIP-E31A	Support	Support	No support	Support	Support	Support	No support	Support
RSIP-E51A	Support	Support	Support	Support	Support	Support	Support	Support
RSIP-E50D	Support	Support	Support	Support	Support	Support	Support	Support

HMAC Key Injection

Crypto Peripheral version	SHA224	SHA256	SHA384	SHA512	SHA512/224	SHA512/256
RSIP-E11A	Support	Support	No support	No support	No support	No support
RSIP-E31A	No support	Support	Support	Support	Support	Support
RSIP-E51A	Support	Support	Support	Support	Support	Support
RSIP-E50D	Support	Support	Support	Support	Support	Support

Supported Devices

Device Group	Devices
RA4	RA4C1, RA4L1
RA8	RA8D1, RA8D2, RA8E1, RA8E2, RA8M1, RA8M2, RA8P1, RA8T1, RA8T2

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

RSIP Key Umport for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires RSIP Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injectin for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to injection and update secure keys, refer to the Application Note R11AN0496.

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Enumerations

enum	rsip_key_type_t

Enumeration Type Documentation

◆ rsip_key_type_t

enum rsip_key_type_t	
Enumerator	
RSIP_KEY_TYPE_INVALID	Invalid key.
RSIP_KEY_TYPE_AES_128	AES-128.
RSIP_KEY_TYPE_AES_192	AES-192.
RSIP_KEY_TYPE_AES_256	AES-256.
RSIP_KEY_TYPE_XTS_AES_128	XTS-AES-128.
RSIP_KEY_TYPE_XTS_AES_256	XTS-AES-256.
RSIP_KEY_TYPE_CHACHA20	ChaCha20.
RSIP_KEY_TYPE_ECC_SECP256R1_PUBLIC	secp256r1 public key (also known as NIST P-256, prime256v1)
RSIP_KEY_TYPE_ECC_SECP384R1_PUBLIC	secp384r1 public key (also known as NIST P-384)
RSIP_KEY_TYPE_ECC_SECP521R1_PUBLIC	secp521r1 public key (also known as NIST P-521)
RSIP_KEY_TYPE_ECC_SECP256K1_PUBLIC	secp256k1 public key
RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PUBLIC	brainpoolP256r1 public key
RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PUBLIC	brainpoolP384r1 public key

RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PUBLIC	brainpoolP512r1 public key
RSIP_KEY_TYPE_ECC_EDWARDS25519_PUBLIC	edwards25519 public key
RSIP_KEY_TYPE_ECC_SECP256R1_PRIVATE	secp256r1 private key (also known as NIST P-256, prime256v1)
RSIP_KEY_TYPE_ECC_SECP384R1_PRIVATE	secp384r1 private key (also known as NIST P-384)
RSIP_KEY_TYPE_ECC_SECP521R1_PRIVATE	secp521r1 private key (also known as NIST P-521)
RSIP_KEY_TYPE_ECC_SECP256K1_PRIVATE	secp256k1 private key
RSIP_KEY_TYPE_ECC_BRAINPOOLP256R1_PRIVATE	brainpoolP256r1 private key
RSIP_KEY_TYPE_ECC_BRAINPOOLP384R1_PRIVATE	brainpoolP384r1 private key
RSIP_KEY_TYPE_ECC_BRAINPOOLP512R1_PRIVATE	brainpoolP512r1 private key
RSIP_KEY_TYPE_ECC_EDWARDS25519_PRIVATE	edwards25519 private key
RSIP_KEY_TYPE_RSA_1024_PUBLIC	RSA-1024 public key.
RSIP_KEY_TYPE_RSA_2048_PUBLIC	RSA-2048 public key.
RSIP_KEY_TYPE_RSA_3072_PUBLIC	RSA-3072 public key.
RSIP_KEY_TYPE_RSA_4096_PUBLIC	RSA-4096 public key.
RSIP_KEY_TYPE_RSA_1024_PRIVATE	RSA-1024 private key.
RSIP_KEY_TYPE_RSA_2048_PRIVATE	RSA-2048 private key.
RSIP_KEY_TYPE_RSA_3072_PRIVATE	RSA-3072 private key.
RSIP_KEY_TYPE_RSA_4096_PRIVATE	RSA-4096 private key.
RSIP_KEY_TYPE_HMAC_SHA1	HMAC-SHA1.
RSIP_KEY_TYPE_HMAC_SHA224	HMAC-SHA224.
RSIP_KEY_TYPE_HMAC_SHA256	HMAC-SHA256.
RSIP_KEY_TYPE_HMAC_SHA384	HMAC-SHA384.

RSIP_KEY_TYPE_HMAC_SHA512	HMAC-SHA512.
RSIP_KEY_TYPE_HMAC_SHA512_224	HMAC-SHA512/224.
RSIP_KEY_TYPE_HMAC_SHA512_256	HMAC-SHA512/256.
RSIP_KEY_TYPE_HMAC_SHA3_224	HMAC-SHA3-224.
RSIP_KEY_TYPE_HMAC_SHA3_256	HMAC-SHA3-256.
RSIP_KEY_TYPE_HMAC_SHA3_384	HMAC-SHA3-384.
RSIP_KEY_TYPE_HMAC_SHA3_512	HMAC-SHA3-512.
RSIP_KEY_TYPE_KDF_HMAC_SHA256	KDF HMAC-SHA256.
RSIP_KEY_TYPE_KDF_HMAC_SHA384	KDF HMAC-SHA384.
RSIP_KEY_TYPE_KDF_HMAC_SHA512	KDF HMAC-SHA512.
RSIP_KEY_TYPE_KUK	Key Update Key (KUK)

Function Documentation

◆ R_RSIP_AES128_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES192_InitialKeyWrap()

fsp_err_t R_RSIP_AES192_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES128_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES128_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 128-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	128-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_AES256_XTS_InitialKeyWrap()

fsp_err_t R_RSIP_AES256_XTS_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_aes_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit AES-XTS key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit AES-XTS wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ChaCha20_InitialKeyWrap()

fsp_err_t R_RSIP_ChaCha20_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_chacha20_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ChaCha20-Poly-1305 key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ChaCha20 wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA2048_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa2048_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 2048-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	2048-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA3072_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA3072_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa3072_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 3072-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	3072-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_RSA4096_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_RSA4096_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_rsa4096_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 4096-bit RSA private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	4096-bit RSA wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp384r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp521r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 521-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	521-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_secp256k1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP256r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP384r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_brainpoolP512r1_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 512-bit brainpool ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap()

fsp_err_t R_RSIP_ECC_Ed25519_InitialPrivateKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_ecc_private_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit Edwards curve ECC private key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit ECC wrapped private key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA384_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA384_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *const *p_initial_vector*, uint8_t const *const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 384-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	384-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const p_wrapped_user_factory_programming_key*, uint8_t const *const p_initial_vector*, uint8_t const *const p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_224_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_224_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/224-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/224-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

◆ R_RSIP_HMAC_SHA512_256_InitialKeyWrap()

fsp_err_t R_RSIP_HMAC_SHA512_256_InitialKeyWrap (rsip_key_injection_type_t const *key_injection_type*, uint8_t const *const *p_wrapped_user_factory_programming_key*, uint8_t const *const *p_initial_vector*, uint8_t const *const *p_user_key*, rsip_hmac_sha_wrapped_key_t *const *p_wrapped_key*)

This API generates 512/256-bit HMAC-SHA key within the user routine.

Parameters

[in]	key_injection_type	Selection key injection type when generating wrapped key
[in]	p_wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key injection type is plain, this is not required and any value can be specified.
[in]	p_initial_vector	Initialization vector when generating encrypted key. When key injection type is plain, this is not required and any value can be specified.
[in]	p_user_key	User key. If key injection type is not plain, it is encrypted and MAC appended
[out]	p_wrapped_key	512/256-bit HMAC-SHA wrapped key

Return values

FSP_SUCCESS	Normal termination.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_ASSERTION A required parameter is NULL.
- FSP_ERR_CRYPTO_SCE_FAIL MAC anomaly detection.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT Resource conflict.
- FSP_ERR_CRYPTO_UNKNOWN An unknown error occurred.
- FSP_ERR_INVALID_STATE Internal state is illegal.
- FSP_ERR_UNSUPPORTED This API is not supported on this device.

Note

The pre-run state is RSIP Enabled State. After the function runs the state transitions to RSIP Enabled State.

Detailed Description

Driver for the Secure Key Injection on RA MCUs.

Overview

This module provides SCE functions in PSA Crypto.

HW Overview

Crypto Peripheral version	Devices
SCE9	RA6M5, RA6M4, RA4M3, RA4M2
SCE7	RA6M3, RA6M2, RA6M1, RA6T1
SCE5	RA4W1, RA4M1
SCE5B	RA6T2

Features

The SCE Key Injection Module has two types of APIs, InitialKeyWrap and EncryptedKeyWrap. The available APIs differ depending on used SCE. Please refer to the following for details.

- Key Support
  - AES 128/256bit

Crypto Peripheral version	128 bit	192 bit	256 bit
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only

SCE7	Support	Support	Support
SCE5	Support	No support	Support
SCE5B	InitialKeyWrap Only	No support	InitialKeyWrap Only

- RSA 2048/3072/4096bit

Crypto Peripheral version	2048 bit	3072 bit (public)	4096 bit (public)
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	No support	No support
SCE5	No support	No support	No support
SCE5B	No support	No support	No support

- ECC secp256r1/secp256k1/secp384r1

Crypto Peripheral version	secp256r1	secp256k1	secp384r1	secp256r1 Brainpool	secp384r1 Brainpool
SCE9	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only	InitialKeyWrap Only
SCE7	Support	Support	Support	Support	Support
SCE5	No support	No support	No support	No support	No support
SCE5B	No support	No support	No support	No support	No support

Supported Devices

Device Group	Devices
RA4	RA4E1, RA4M1, RA4M2, RA4M3, RA4W1
RA6	RA6E1, RA6M1, RA6M2, RA6M3, RA6M4, RA6M5, RA6T1, RA6T2

Configuration

Clock Configuration

This module does not require a specific clock configuration.

Pin Configuration

This module does not use I/O pins.

Usage Notes

Module activation

SCE Key Injection for PSA Crypto Module is off by default. To use it, please On the Stacks tab, add New > Security > MbedTLS or MbedTLS (Crypto Only), Add Requires SCE Driver > New > (*1), Add Key Injection for RSA Crypto (Optional) > New > Key Injection for RSA Crypto for PSA Crypto Module after adding MbedTLS. For information on how to import and update secure keys, refer to the Application Note R11AN0496.
(*1)

Crypto Peripheral version	String displayed in the Stacks tab
SCE9	SCE Compatibility Mode
SCE7	SCE7
SCE5	SCE5
SCE5B	SCE5B

Hardware Initialization

Please refer to Hardware Initialization in Mbed Crypto H/W Acceleration (rm_psa_crypto).

Function Documentation

◆ R_SCE_AES128_InitialKeyWrap()

fsp_err_t R_SCE_AES128_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 128-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_InitialKeyWrap()

fsp_err_t R_SCE_AES192_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 192-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_InitialKeyWrap()

fsp_err_t R_SCE_AES256_InitialKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit AES key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_KeyUpdateKeyWrap()

fsp_err_t R_SCE_KeyUpdateKeyWrap (const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_key_update_key_t *const *key_update_key*)

This API generates a key update key which is used for functions of the key updating.

Parameters

[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	key_update_key	Key update key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES128_EncryptedKeyWrap()

fsp_err_t R_SCE_AES128_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 128-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	128-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES192_EncryptedKeyWrap()

fsp_err_t R_SCE_AES192_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 192-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	192-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_AES256_EncryptedKeyWrap()

fsp_err_t R_SCE_AES256_EncryptedKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_aes_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit AES key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit AES wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA3072_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA3072_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa3072_public_wrapped_key_t *const *wrapped_key*)

This API generates 3072-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	3072-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA4096_InitialPublicKeyWrap()

fsp_err_t R_SCE_RSA4096_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa4096_public_wrapped_key_t *const *wrapped_key*)

This API generates 4096-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	4096-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_InitialPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API generates 2048-bit RSA key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_public_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_RSA2048_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_RSA2048_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_rsa2048_private_wrapped_key_t *const *wrapped_key*)

This API wraps 2048-bit RSA key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	2048-bit RSA wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp256k1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_secp384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPublicKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	364-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_InitialPrivateKeyWrap (const uint8_t *const *key_type*, const uint8_t *const *wrapped_user_factory_programming_key*, const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API generates 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	key_type	Selection key type when generating wrapped key (0: for encrypted key, 1: for plain key)
[in]	wrapped_user_factory_programming_key	Wrapped user factory programming key by the Renesas Key Wrap Service. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	initial_vector	Initialization vector when generating encrypted_key. When key_type is 1 as plain key, this is not required and any value can be specified.
[in]	encrypted_key	Encrypted user key and MAC appended
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP256r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 256-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	256-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPublicKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_public_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.

- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

◆ R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap()

fsp_err_t R_SCE_ECC_brainpoolP384r1_EncryptedPrivateKeyWrap (const uint8_t *const *initial_vector*, const uint8_t *const *encrypted_key*, const sce_key_update_key_t *const *key_update_key*, sce_ecc_private_wrapped_key_t *const *wrapped_key*)

This API wraps 384-bit Brainpool ECC key within the user routine.

Parameters

[in]	initial_vector	Initialization vector when generating encrypted_key
[in]	encrypted_key	User key encryptedand MAC appended
[in]	key_update_key	Key update keyring
[in,out]	wrapped_key	384-bit ECC wrapped key

Return values

FSP_SUCCESS	Normal termination.
FSP_ERR_UNSUPPORTED	API not supported.

Returns

If an error occurs, the return value will be as follows.
- FSP_ERR_CRYPTO_SCE_FAIL Internal I/O buffer is not empty.
- FSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT A resource conflict occurred because a hardware resource needed.

Note

The pre-run state is SCE Enabled State. After the function runs the state transitions to SCE Enabled State.

5.2.15.13 TinyCrypt H/W Acceleration (rm_tinycrypt_port)

Functions

fsp_err_t	RM_TINCYRYPT_PORT_Init ()
fsp_err_t	RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const p_rngbuf, uint32_t num_req_bytes) Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer. More...
int	default_CSPRNG (uint8_t *dest, unsigned int size) Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt. More...

Detailed Description

AES128 Hardware acceleration for TinyCrypt on the RA2 family.

Overview

Note

The TinyCrypt port module does not provide any interfaces to the user. Consult the documentation at https://github.com/intel/tinycrypt/blob/master/documentation/tinycrypt.rst for further information.

TinyCrypt is designed as a small footprint software crypto implementation to be used on resource constrained devices. The software only module is available in FSP on all RA devices. Hardware acceleration for AES-128 is provided only for the RA2 family. This release uses TinyCrypt v0.2.8.

Hardware Overview

Crypto Peripheral version	Devices
AES Engine	RA2A1, RA2E1, RA2L1

Features

For features supported by the software-only version, refer to the TinyCrypt documentation.

The TinyCrypt port module provides hardware support for the following operations

- AES
  - Keybits - 128, 192, 256
  - ECB, CBC, CTR, CCM, GCM and CMAC modes -TRNG

Configuration

Build Time Configurations for TinyCrypt_Acceleration

The following build time configurations are defined in fsp_cfg/rm_tinycrypt_port_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

AES Configuration

To enable hardware acceleration for the AES128 operation, choose TinyCrypt (H/W Accelerated) from the stack options . This feature is only supported on the RA2 family.

Usage Notes

Hardware Initialization

Invoke RM_TINCYRYPT_PORT_Init () to initialize the hardware before using Tinycrypt if either

hardware acceleration or the TRNG is to be used.

Random Number Generation

There are two Pseudo-random Number Generators (PRNG) provided in TinyCrypt

- CTR-PRNG which uses AES128 internally in its implementation. Enabling AES128 hardware acceleration will improve the performance of this module.
- HMAC-PRNG which uses SHA256 internally in its implementation.

Both these implementations will only be able to provide a random pseudo-random number sequence if they are seeded with truly random data. The TRNG module that is present in hardware and available in rm_tinycrypt_port must be used to seed these modules. When using CTR-PRNG or HMAC-PRNG, use the RM_TINCYRYPT_PORT_TRNG_Read() function to obtain random data from the TRNG hardware and use that to seed the PRNG modules before invoking the pseudo-random number generation. If purely random data is sufficient for the application, then RM_TINCYRYPT_PORT_TRNG_Read() can be used directly instead. The hardware TRNG implements the CTR_DRBG spec.

Default CSPRNG

The TinyCrypt ECC implementation requires a platform specific implementation of the default_CSPRNG() function. This function has been implemented using the hardware TRNG in the port to support software ECC usage. When using TinyCrypt in S/W mode, it is necessary to implement default_CSPRNG() if using ECC signature generation (ECDSA) or key derivation (ECDH).

AES-128 Usage

The AES ECB mode implementation is provided in aes_encrypt.decrypt.c. All the other modes of AES operation including CBC, CCN, CMAC and CTR use the ECB mode for the block operation. On the RA2, the ECB mode has been hardware accelerated which improves performance of the other modes as well. Additionally the CBC and CTR modes are also accelerated.

To use the different AES modes, first initialize the hardware (on the RA2) and then use the functions defined in the header file of each AES mode. Note that TinyCrypt does not provide any type of padding or buffering so the data provided to these modes should be multiples of AES block size.

Usage with RA2A2

On the RA2A2, the TinyCrypt API has been expanded to support GCM mode operation. Key lengths of 128, 192 and 256 are supported. GCM mode operation is not supported on other MCUs in hardware or software in the TinyCrypt API.

Memory Usage

TinyCrypt does not use dynamic allocation so there is no heap requirement.

Limitations

Usage with RA4 and RA6 devices

TinyCrypt (S/W Only) can be used on RA4 and RA6 devices. However, since ECC signature generation (ECDSA) and key derivation (ECDH) requires a random number source, that operation is currently not supported on these devices when using TinyCrypt (S/W Only). In order to support those operations the function default_CSPRNG() must be implemented in the user code.

TinyCrypt

- No padding is supported; the user is expected to provide adequately padded data depending on the algorithm used.
- AES Key generation is not supported.
- Key encoding/decoding is not supported.

Using TinyCrypt with TrustZone

Unlike FSP drivers, TinyCrypt cannot be configured as Non-secure callable in the RA Configurator for a secure project. The reason for this is that in order to achieve the security objective of controlling access to protected keys, both the crypto code as well as the keys must be placed in the secure region. Since the tinyCrypt API requires access to the keys directly during initialization and later via a key handle, allowing non-secure code to use the API by making it Non-secure callable will require the keys to be stored in non-secure memory.

This limitation is identical to that for PSA Crypto. Refer to the documentation of that module on how to create a crypto Non-Secure Callable layer to be used in such situations.

Examples

AES-CBC Example

This is an example on using TinyCrypt to encrypt and decrypt data using an AES-128 key in CBC mode.

```
#define TC_INPUT_PLAINTEXT_SIZE 64U
#define TF_AES_IV_SIZE TC_AES_BLOCK_SIZE
#define TC_OUTPUT_CIPHERTEXT_SIZE (TC_INPUT_PLAINTEXT_SIZE + TF_AES_IV_SIZE)

AES-GCM Example

This is an example on using AES Circuit (Hardware support) to encrypt data using an AES-128 key in GCM mode. This operation is supported only on the RA2A2 device.

```
/*

Function Documentation

◆ RM_TINCYRYPT_PORT_Init()

fsp_err_t RM_TINCYRYPT_PORT_Init ( )
Initialize the SCE.

◆ RM_TINCYRYPT_PORT_TRNG_Read()

fsp_err_t RM_TINCYRYPT_PORT_TRNG_Read (uint8_t *const *p_rngbuf*, uint32_t *num_req_bytes*)
Reads requested length of random data from the TRNG. Generate num_req_bytes of random bytes and store them in p_rngbuf buffer.

Return values

FSP_SUCCESS	Random number generation successful
FSP_ERR_ASSERTION	NULL input parameter(s).
FSP_ERR_CRYPTO_UNKNOWN	An unknown error occurred.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ default_CSPRNG()

int default_CSPRNG (uint8_t * *dest*, unsigned int *size*)
Implements the Cryptographically Secure Pseudo-Random Number Generator function required byt TinyCrypt.

Return values

TC_CRYPTO_SUCCESS	Random number generation successful
TC_CRYPTO_FAIL	Random number generation failed.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- RM_TINCYRYPT_PORT_TRNG_Read

5.2.16 Sensor

Modules

Detailed Description

Sensor Modules.

Modules

	FS3000 Flow Sensor (rm_fs3000) [Deprecated] Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.
	HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated] Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.
	HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated] Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.
	RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated] Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.
	RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated] Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.
	RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated] Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.
	ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated] Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

5.2.16.1 FS3000 Flow Sensor (rm_fs3000) [Deprecated]

Modules » Sensor

Functions

fsp_err_t	RM_FS3000_Open (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_cfg_t const *const p_cfg) Opens and configures the FS3000 Middle module. Implements

	rm_fsxxxx_api_t::open. More...
fsp_err_t	RM_FS3000_Close (rm_fsxxxx_ctrl_t *const p_api_ctrl) Disables specified FS3000 control block. Implements rm_fsxxxx_api_t::close. More...
fsp_err_t	RM_FS3000_Read (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data) Reads ADC data from FS3000. Implements rm_fsxxxx_api_t::read. More...
fsp_err_t	RM_FS3000_DataCalculate (rm_fsxxxx_ctrl_t *const p_api_ctrl, rm_fsxxxx_raw_data_t *const p_raw_data, rm_fsxxxx_data_t *const p_fs3000_data) Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate. More...

Detailed Description

Middleware to implement the FS3000 sensor interface. This module implements the FSXXXX Middleware Interface.

Overview

FS3000 is EOL.

Features

The FS3000 sensor interface implementation has the following key features:

- Getting ADC data from the sensor
- Calculating flow value from ADC data

Limitations

- I2C Master (r_sau_i2c) is not supported. FS3000 needs clock stretching, but is not supported by SAU I2C.

Configuration

Build Time Configurations for rm_fs3000

The following build time configurations are defined in fsp_cfg/rm_fs3000_cfg.h:

Configuration	Options	Default	Description

Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Device Type	FS3000-1005	FS3000-1005	Select FS3000 device used.

Configurations for Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > FS3000 Flow Sensor (rm_fs3000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_fs3000_sensor0	Module name.
Callback	Name must be a valid C symbol	fs3000_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

FS3000 datasheet is here.
If ADC data is invalid, it is needed to read ADC data from FS3000 again. The module only supports FS3000-1005.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The FS3000 interface expects a bus instance to be opened before opening any FS3000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of FS3000 sensor implementation in an application.

```
void rm_fs3000_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
```

```
 rm_fsxxxx_raw_data_t fs3000_raw_data;
 rm_fsxxxx_data_t    fs3000_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */

Data Structure Documentation

◆ rm_fs3000_instance_ctrl_t

struct rm_fs3000_instance_ctrl_t	
FS3000 Control Block	
Data Fields	
uint32_t	open
	Open flag.
rm_fsxxxx_cfg_t const *	p_cfg
	Pointer to FS3000 Configuration.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void *	p_context
	Pointer to the user-provided context.

Function Documentation

◆ RM_FS3000_Open()

fsp_err_t RM_FS3000_Open (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_cfg_t const *const *p_cfg*)

Opens and configures the FS3000 Middle module. Implements rm_fsxxxx_api_t::open.

Example:

```
    err = RM_FS3000_Open(&g_fs3000_ctrl, &g_fs3000_cfg);
```

Return values

FSP_SUCCESS	FS3000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_FS3000_Close()

fsp_err_t RM_FS3000_Close (rm_fsxxxx_ctrl_t *const *p_api_ctrl*)

Disables specified FS3000 control block. Implements rm_fsxxxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_Read()

fsp_err_t RM_FS3000_Read (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*)

Reads ADC data from FS3000. Implements rm_fsxxxx_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_FS3000_DataCalculate()

fsp_err_t RM_FS3000_DataCalculate (rm_fsxxxx_ctrl_t *const *p_api_ctrl*, rm_fsxxxx_raw_data_t *const *p_raw_data*, rm_fsxxxx_data_t *const *p_fs3000_data*)
Calculates flow [m/sec] from ADC data. Implements rm_fsxxxx_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

Detailed Description

Middleware to implement the HS300X sensor interface. This module implements the HS300X Middleware Interface.

Overview

HS300x is EOL.

Features

The HS300X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data
- Changing the sensor resolution
- Getting the sensor ID

Configuration

Build Time Configurations for rm_hs300x

The following build time configurations are defined in fsp_cfg/rm_hs300x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Data type	• Both humidity and temperature • Humidity only	Both humidity and temperature	Select Getting humidity only and both humidity and temperature.
Programming Mode	• ON • OFF	OFF	If selected the programming mode can be entered.

Configurations for Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS300X Temperature/Humidity Sensor (rm_hs300x) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs300x_sensor0	Module name.
Callback	Name must be a valid C symbol	hs300x_callback	A user callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS300x datasheet is here.
If ADC data is valid and calculating humidity and temperature is finished, it is needed to start a measurement again. If ADC data is invalid, it is needed to read ADC data from HS300x again.

If changing the sensor resolution and getting the sensor ID, RM_HS300X_ProgrammingModeEnter function must be called within 10ms after applying power to the sensor. Entering the programming mode takes 120us. Thresore, after calling RM_HS300X_ProgrammingModeEnter function, please wait 120us. After calling RM_HS300X_ResolutionChange function, 14ms must be waited because failure to comply with these times may result in data corruption and introduce errors in sensor measurements.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Bus Initialization

The HS300X interface expects a bus instance to be opened before opening any HS300X device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Examples

Basic Example

This is a basic example of minimal use of HS300X sensor implementation in an application.

```
void rm_hs300x_basic_example (void)
{
 fsp_err_t            err = FSP_SUCCESS;
 rm_hs300x_raw_data_t hs300x_raw_data;
 rm_hs300x_data_t    hs300x_data;
    uint8_t             calculated_flag = 0;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *) g_hs300x_cfg.p_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
```

```
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);

Function Documentation

◆ RM_HS300X_Open()

fsp_err_t RM_HS300X_Open (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_cfg_t const *const *p_cfg*)

Opens and configures the HS300X Middle module. Implements rm_hs300x_api_t::open.

Example:

```
    err = RM_HS300X_Open(&g_hs300x_ctrl, &g_hs300x_cfg);
```

Return values

FSP_SUCCESS	HS300X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.

◆ RM_HS300X_Close()

fsp_err_t RM_HS300X_Close (rm_hs300x_ctrl_t *const *p_api_ctrl*)

Disables specified HS300X control block. Implements rm_hs300x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_MeasurementStart()

fsp_err_t RM_HS300X_MeasurementStart (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the hs300x and start a measurement. Implements rm_hs300x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_Read()

fsp_err_t RM_HS300X_Read (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS300X. Implements rm_hs300x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS300X_DataCalculate()

fsp_err_t RM_HS300X_DataCalculate (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_raw_data_t *const *p_raw_data*, rm_hs300x_data_t *const *p_hs300x_data*)

Calculates humidity [RH] and temperature [Celsius] from ADC data. Implements rm_hs300x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

◆ RM_HS300X_ProgrammingModeEnter()

fsp_err_t RM_HS300X_ProgrammingModeEnter (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called within 10ms after applying power to the sensor. Sends the commands to enter the programming mode. After calling this function, please wait 120us. Implements rm_hs300x_api_t::programmingModeEnter.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ResolutionChange()

fsp_err_t RM_HS300X_ResolutionChange (rm_hs300x_ctrl_t *const *p_api_ctrl*, rm_hs300x_data_type_t const *data_type*, rm_hs300x_resolution_t const *resolution*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Changes the sensor resolution. This function blocks for 120 us software delay plus 9 bytes on the I2C bus. After calling this function, 14ms must be waited. Failure to comply with these times may result in data corruption and introduce errors in sensor measurements. Implements rm_hs300x_api_t::resolutionChange.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_SensorIdGet()

fsp_err_t RM_HS300X_SensorIdGet (rm_hs300x_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_sensor_id*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. Gets the sensor ID. This function blocks for 240 us software delay plus 12 bytes on the I2C bus. Implements rm_hs300x_api_t::sensorIdGet.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

◆ RM_HS300X_ProgrammingModeExit()

fsp_err_t RM_HS300X_ProgrammingModeExit (rm_hs300x_ctrl_t *const *p_api_ctrl*)

This function must be called after calling the RM_HS300X_ProgrammingModeEnter function. This function must be called to return to normal sensor operation and perform measurements. Sends the commands to exit the programming mode. Implements rm_hs300x_api_t::programmingModeExit.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_INVALID_MODE	Module is not entering the programming mode.
FSP_ERR_UNSUPPORTED	Programming mode is not supported.

fsp_err_t	RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const p_api_ctrl) This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart. More...

fsp_err_t	RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const p_api_ctrl) Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop. More...
fsp_err_t	RM_HS400X_Read (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data) Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read. More...
fsp_err_t	RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const p_api_ctrl, rm_hs400x_raw_data_t *const p_raw_data, rm_hs400x_data_t *const p_hs400x_data) Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate. More...

Detailed Description

Middleware to implement the HS400X sensor interface. This module implements the HS400X Middleware Interface.

Overview

HS400x is EOL.

Features

The HS400X sensor interface implementation has the following key features:

- Starting a measurement at any time
- Selecting one shot or a periodic measurement
- Getting ADC data from the sensor
- Calculating humidity and temperature value from getting ADC data

Limitations

- Alert feature is not supported. It will be supported in the future.
- I2C Master (r_sau_i2c) is not supported in Hold measurement. Hold measurement needs clock stretching, but is not supported by SAU I2C.

Notifications

The minimum frequency for the SCL clock in Hold measurement is 200kHz. Please configure I2C_MASTER_RATE_FAST or I2C_MASTER_RATE_FASTPLUS to "Rate" in I2C Master (r_iic_master) or I2C Master (r_sci_i2c).

Configuration

Build Time Configurations for rm_hs400x

The following build time configurations are defined in fsp_cfg/rm_hs400x_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Measurement Type	• Hold Measurement • No-Hold Measurement • Periodic Measurement	No-Hold Measurement	Select measurement type.
Data type	• Both humidity and temperature • Temperature only	Both humidity and temperature	Select getting temperature only or both humidity and temperature.

Configurations for Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > HS400X Temperature/Humidity Sensor (rm_hs400x) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_hs400x_sensor0	Module name.
Temperature Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of temperature.
Humidity Resolution	• 8-bit • 10-bit • 12-bit • 14-bit	14-bit	Set resolution of humidity.
Frequency for Periodic Measurement	• 0.4Hz • 1Hz • 2Hz	1Hz	Set frequency for periodic measurement.
Comms I2C Callback	Name must be a valid	hs400x_comms_i2c_cal	A user COMMS I2C

	C symbol	lback	callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

HS400x datasheet is here.
This module supports three measurement type :

- Hold measurement
- No-Hold measurement
- Periodic measurement

Hold and no-hold measurements also support measuring temperature data only. However, a periodic measurement only supports measuring both humidity and temperature data.

Hold Measurement

A hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired hold measurement command.
2. Change the direction of communication by sending a start bit, the HS400x I2C address, and a read bit. The SCL line is held low by the sensor during the measurement process, which prevents the master from initiating any communications with other slaves on the bus.
3. Once the requested measurement is completed by the HS400x series sensor, the SCL line is released and the chip waits for the SCL clock signal to send the results. The sensor will then transmit the requested measurement data on the bus for the master to capture.

No-Hold Measurement

A no-hold measurement sequence consists of the following steps.

1. Wake up the HS400x series sensor from sleep mode by sending its I2C address with a write bit, and initiate a measurement by sending the desired no-hold measurement command.
2. To read the result from the HS400x series sensor, the master has to send the chip its I2C address and a read bit. If the measurement is completed and the result is ready, the chip will send an ACK bit and starts to send the result over the bus. If the measurement is still in progress, the chip will send a NACK bit and the master will need to try to read the result again.

Periodic Measurement

The HS400x sensors can also be configured to measure at regular intervals without user intervention. In this mode, the user can read the latest relative humidity / temperature data by issuing a data fetch sequence, which consists of sending the HS400x I2C address with a read bit. The sensor will then send the latest measurement result over the I2C bus.
When the periodic measurement mode is active, the only commands the chip will respond to are the data fetch command, and a command to stop the periodic measurements. The command to stop periodic measurements is issued by sending the I2C address with a write bit, followed by the command 0x30. Sequence to Stop Periodic Measurements. Once the periodic measurements have been stopped, the chip returns to sleep and is ready to accept all valid I2C commands.

Bus Initialization

The HS400X interface expects a I2C bus instance to be opened before opening any I2C device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Initialization

Initialize with RM_HS400X_Open().

From measurement start to data acquisition

After normal completion, start the each measurement.

Hold Measurement

In hold measurement, the HS400x series sensor holds the SCL line low during the measurement and releases the SCL line when the measurement is complete.

1. Call RM_HS400X_Read(). This function will start a measurement and read the ADC data.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

No-Hold Measurement

In no-hold measurement, the HS400x series sensor does not hold the SCL line low, and the master is free to initiate communication with other slaves while the chip is performing the measurement.

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.
3. Call RM_HS400X_Read(). This function will read the ADC data.
4. If the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. User should call RM_HS400X_Read() again. If the measurement is completed, RM_HS400X_EVENT_SUCCESS is received in callback.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Periodic Measurement

In periodic measurement, the HS400x sensors measure at regular intervals without user intervention. If a periodic measurement is running, the resolution and the frequency cannot be changed. please stop the periodic measurement with RM_HS400X_MeasurementStop().

1. Call RM_HS400X_MeasurementStart(). This function will start a measurement. If the function is called once, a second call is not required.
2. Wait until RM_HS400X_EVENT_SUCCESS is received.

3. Wait for frequency for periodic measurement.
4. Call RM_HS400X_Read(). This function will read the ADC data.
5. Wait until RM_HS400X_EVENT_SUCCESS is received.
6. Call RM_HS400X_DataCalculate(). This function will calculate temperature and humidity data from the ADC data.

Examples

Basic Example

This is a basic examples of minimal use of HS400X sensor implementation in an application.

```
void rm_hs400x_basic_example (void)
{

Function Documentation

◆ RM_HS400X_Open()

fsp_err_t RM_HS400X_Open (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_cfg_t const *const *p_cfg*)

Opens and configures the HS400X middleware module. Implements rm_hs400x_api_t::open.

Example:

```
err = RM_HS400X_Open(&g_hs400x_ctrl, &g_hs400x_cfg);
```

Return values

FSP_SUCCESS	HS400X successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_HS400X_Close()

fsp_err_t RM_HS400X_Close (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Disables specified HS400X control block. Implements rm_hs400x_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_MeasurementStart()

fsp_err_t RM_HS400X_MeasurementStart (rm_hs400x_ctrl_t *const *p_api_ctrl*)

This function should be called when start one shot measurement. Sends the command of measurement to HS400X and start a measurement. This function supports No-Hold measurement and Periodic measurement only. If Hold measurement is enabled, please call RM_HS400X_Read() without calling this function. In Periodic measurement, if the periodic measurement has already run, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold measurement is unsupported.

◆ RM_HS400X_MeasurementStop()

fsp_err_t RM_HS400X_MeasurementStop (rm_hs400x_ctrl_t *const *p_api_ctrl*)

Stop a periodic measurement. Sends the command of stopping periodic measurement to HS400X. This function supports periodic measurement only. If a periodic measurement is not running, RM_HS400X_EVENT_ERROR is received in callback because HS400x device replies with NACK. Implements rm_hs400x_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_UNSUPPORTED	Hold and No-Hold measurement are unsupported.

◆ RM_HS400X_Read()

fsp_err_t RM_HS400X_Read (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*)

Reads ADC data from HS400X. If Hold measurement is enabled, HS400X holds the SCL line low during the measurement and releases the SCL line when the measurement is complete. If No-Hold measurement is enabled and the measurement result is not ready, RM_HS400X_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback. Implements rm_hs400x_api_t::read.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_HS400X_DataCalculate()

fsp_err_t RM_HS400X_DataCalculate (rm_hs400x_ctrl_t *const *p_api_ctrl*, rm_hs400x_raw_data_t *const *p_raw_data*, rm_hs400x_data_t *const *p_hs400x_data*)

Calculates temperature [Celsius] and humidity [RH] from ADC data. Implements rm_hs400x_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully data decoded.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_SENSOR_INVALID_DATA	Data is invalid.

Detailed Description

Middleware to implement the RRH46410 sensor module interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

RRH46410 is EOL.

This module provides an API for configuring and controlling the RRH46410 sensor module (ZMOD4410 + MCU).

I2C communication with the RRH46410 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH46410 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Start a measurement at any time
- Input current humidity for best performance.
- Receive status for wait until the measurement is done. This will also be signaled by an interrupt
- Get the measruement results from the sensor module
- Different from ZMOD sensors, no libraries are needed.

Configuration

Build Time Configurations for rm_rrh46410

The following build time configurations are defined in fsp_cfg/rm_rrh46410_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
Operation Mode	• IAQ 2nd Gen and Rel IAQ • IAQ 2nd Gen ULP and Rel IAQ ULP • Public Building AQ Standard (PBAQ)	IAQ 2nd Gen and Rel IAQ	Select operation mode.

Configurations for Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH46410 Gas Sensor Module (rm_rrh46410) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh46410_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	rrh46410_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	rrh46410_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH46410 datasheet is here.
The RRH46410 has three modes of operation.
The RRH46410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Operation mode	Description	Data
IAQ 2nd Generation and Relative IAQ	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs). Lightweight algorithm reacts to air quality changes and outputs a relative IAQ	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ
IAQ 2nd Generation Ultra Low Power and Relative IAQ Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This operation mode offers a much lower power consumption.	IAQ, TVOC[mg/m^3], EtOH[ppm], eCO2[ppm], Rel IAQ
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.	TVOC[mg/m^3], EtOH[ppm]

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH46410 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - Get Product ID
    - Get Tracking Number
    - Set Operation Mode -> Sensor cleaning
    - Config GPIO
    - Get GPIO
    - Set GPIO
    - Clear GPIO
    - Read Flash Shadow
    - Write Flash Shadow
    - Write Flash
    - Reset

Notifications

- The RRH46410 sensor module needs a reset before operation; please input a reset signal to the RES_N pin (active low).
- The RRH46410 sensor module needs some time (e.g. 1s) for self initialization after power-on and reset.

Bus Initialization

The RRH46410 interface expects a bus instance to be opened before opening any RRH46410 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH46410_Open().

From measurement start to data acquisition

After normal completion, start the measurement with RM_RRH46410_MeasurementStart(). An endless loop continuously checks the status of the RRH46410 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
2. Call RM_RRH46410_Read(). This function will read the measurement results.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_RRH46410_Read(). This function will read the measurement results.
2. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user

should wait some time and then call RM_RRH46410_Read() again.
3. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
4. Call the DataCalculate API according to the mode.

Examples

Basic Example

These are basic examples of minimal use of RRH46410 sensor implementation in an application.

Data Structures

struct	rm_rrh46410_init_process_params_t
struct	rm_rrh46410_instance_ctrl_t

Data Structure Documentation

◆ rm_rrh46410_init_process_params_t

struct rm_rrh46410_init_process_params_t		
RRH46410 initialization process block		
Data Fields		
volatile bool	communication_finished	Communication flag for blocking.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ rm_rrh46410_instance_ctrl_t

struct rm_rrh46410_instance_ctrl_t

RRH46410 control block

Data Fields	
uint32_t	open
	Open flag.
uint8_t	write_buf [RM_RRH46410_MAX_I2C_BUF_SIZE]
	Write buffer for I2C communications.
uint8_t	read_buf [RM_RRH46410_MAX_I2C_BUF_SIZE]
	Read buffer for I2C communications.
uint8_t *	p_read_data
	Pointer to read data. This is used for checking error code and checksum in callback.
uint8_t	read_bytes
	Read bytes. This is used for checking error code and checksum in callback.
volatile uint8_t	prev_sample_id
	Previous sample ID. This is used for checking if sensor is in stabilization.
volatile int16_t	warmup_counts
	Counts for warning up. This is used for checking if sensor is in stabilization.
volatile rm_zmod4xxx_event_t	event
	Callback event.

rm_rrh46410_init_process_params_t	init_process_params
	For the initialization process.
rm_zmod4xxx_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void const *	p_irq_instance
	Pointer to IRQ instance.
void *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Function Documentation

◆ RM_RRH46410_Open()

fsp_err_t RM_RRH46410_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

Opens and configures the RRH46410 sensor module. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	RRH46410 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Close()

fsp_err_t RM_RRH46410_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH46410_MeasurementStart()

fsp_err_t RM_RRH46410_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_MeasurementStop()

fsp_err_t RM_RRH46410_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully stopped.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Read()

fsp_err_t RM_RRH46410_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH46410_Iaq2ndGenDataCalculate()

fsp_err_t RM_RRH46410_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_PbaqDataCalculate()

fsp_err_t RM_RRH46410_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_rrh46410_data*)

This function should be called when calculating gas data from measurement results. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Unsupported operation mode.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_RRH46410_TemperatureAndHumiditySet()

fsp_err_t RM_RRH46410_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)
This function should be called before Read. Humidity measurements are needed for ambient compensation. temperature is not supported. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully humidity is set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

Detailed Description

Middleware to implement the RRH47000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

RRH47000 is EOL.

This module provides an API for configuring and controlling the RRH47000 sensor module.

I2C communication with the RRH47000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH47000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh47000

The following build time configurations are defined in fsp_cfg/rm_rrh47000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled	Default (BSP)	If selected code for parameter checking is

• Disabled		included in the build.

Configurations for Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH47000 NDIR CO2 Sensor Module (rm_rrh47000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh47000_sensor0	Module name.
Automatic Baseline Correction (ABC)	• Enable all • Enable only ABC • Enable only fast ABC • Disable all	Enable all	Set Automatic Baseline Correction (ABC).
Correction cycle period [days]	Value must be 1 or more	7	Set correction cycle period. Min = 1 and Max = 30.
CO2 baseline value [ppm]	Value must be 400 or more	400	Set CO2 baseline value. Min = 400 and Max = 1500.
Comms I2C Callback	Name must be a valid C symbol	rrh47000_comms_i2c_callback	A user COMMS I2C callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH47000 datasheet is here.
The RRH47000 sensor module uses nondispersive infrared (NDIR) technology to accurately measure CO2 in a compact package size while ensuring competitive pricing. An integrated relative humidity and temperature sensor enables calibration and compensation of the NDIR sensor for precise operation in different environments. Sensors for carbon dioxide (CO2, not estimated), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- This module supports I2C only (not support UART).
- The RRH47000 sensor module needs a minimum of 3 seconds to initiate communication via I²C after power-on.
- The RRH47000 sensor module supports a clock frequency ranging from 10kHz to 100kHz.

Limitations

- I2C Master (r_sau_i2c) is not supported. RRH47000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
  - Start CO2 Correction
  - Get Serial Number

Bus Initialization

The RRH47000 interface expects a bus instance to be opened before opening any RRH47000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH47000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH47000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH47000_Read() and read the measurement data.
2. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
3. Call RM_RRH47000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH47000 sensor implementation in an application.

```
void rm_rrh47000_basic_example (void)
{
 fsp_err_t                err = FSP_SUCCESS;
 rm_air_sensor_raw_data_t raw_data;
 rm_air_sensor_data_t     rrh47000_data;
 bool calculated = false;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_rrh47000_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
```

```
p_driver_instance->p_cfg);
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {

enum rm_rrh47000_abc_t	
RRH47000 Automatic Baseline Correction (ABC) setting.	
Enumerator	
RM_RRH47000_ABC_ENABLE_ALL	Enable all.
RM_RRH47000_ABC_ENABLE_ONLY_ABC	Enable only ABC (automatic baseline correction)
RM_RRH47000_ABC_ENABLE_ONLY_FAST_ABC	Enable only fast ABC (fast automatic baseline correction)
RM_RRH47000_ABC_DISABLE_ALL	Disable all.

Function Documentation

◆ RM_RRH47000_Open()

fsp_err_t RM_RRH47000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH47000 sensor module. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH47000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_Close()

fsp_err_t RM_RRH47000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH47000_Read()

fsp_err_t RM_RRH47000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_DataCalculate()

fsp_err_t RM_RRH47000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh47000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_INVALID_DATA	Checksum error occurs.

◆ RM_RRH47000_FirmwareVersionGet()

fsp_err_t RM_RRH47000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version will be set "ascii_code" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_INVALID_POINTER	Pointer is NULL.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH47000_StatusCheck()

fsp_err_t RM_RRH47000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

StatusCheck API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

◆ RM_RRH47000_AlgorithmVersionGet()

fsp_err_t RM_RRH47000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

AlgorithmVersionGet API is unsupported. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_ERR_UNSUPPORTED	Unsupported.

Detailed Description

Middleware to implement the RRH62000 sensor module interface. This module implements the SENSOR Middleware Interface.

Overview

RRH62000 is EOL.

This module provides an API for configuring and controlling the RRH62000 sensor module.

I2C communication with the RRH62000 sensor module is realized by connecting with the rm_comms_i2c module.

Features

The RRH62000 sensor interface implementation has the following key features:

- Initialize the sensor for measurement
- Receive status for wait until the measurement is done.
- Get the measruement results from the sensor module

Configuration

Build Time Configurations for rm_rrh62000

The following build time configurations are defined in fsp_cfg/rm_rrh62000_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > RRH62000 All-in-one Air Quality Module (rm_rrh62000) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rrh62000_sensor0	Module name.
Number of moving average [times]	Value must be 1 or more	10	Set number of moving average. Min = 1 and Max = 60.
Fan speed control [%]	Value must be 60 or more	86	Set fan speed control. Min = 60 and Max = 100.
Comms I2C Callback	Name must be a valid C symbol	rrh62000_comms_i2c_callback	A user COMMS I2C callback function can

be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master, SCI I2C and IICA Master.

Usage Notes

RRH62000 datasheet is here.
When using the sensor for the first time, allow up to 48 hours for re-hydration of the humidity sensor in ambient air and for TVOC sensor conditioning. This will allow the module to take optimal readings.
The RRH62000 is an integrated sensor module for the measurement of critical air quality parameters. Sensors for particulate matter (PM), total volatile organic compounds (TVOC), estimation of carbon dioxide (eCO2) optional nitrogen dioxide (NO2), optional ozone (O3), humidity (RH), and temperature (T), are combined in a single package.
If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

- After turning on the module for the first time, the sensor will automatically start in ZMOD sensor cleaning mode for 1 minute. Do not cut power to the sensor during this period.
- Interval time needs to be at least 1s after power-on or reset.
- I2C-master access interval for RRH62000 must be longer than 1s.
- This module supports I2C only (not support UART).

Limitations

- r_iic_master on RA8 series MCU is not supported.
- I2C Master (r_sau_i2c) is not supported. RRH62000 needs clock stretching, but is not supported by SAU I2C.
- The following commands are currently not supported.
    - SLEEP
    - CLEAN
    - TINTC_H
    - TINTC_L
    - TCLEAN
    - RMOX
    - UID

Bus Initialization

The RRH62000 interface expects a bus instance to be opened before opening any RRH62000 device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_RRH62000_Open().

From measurement start to data acquisition

An endless loop continuously checks the status of the RRH62000 sensor module and reads its data. The measurement results are subsequently processed, and the air quality values are calculated.

1. Call RM_RRH62000_StatusCheck(). This function will execute a status check over I2C.
2. If RM_AIR_SENSOR_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time (min=1s) and then call RM_RRH62000_StatusCheck() again.
3. Wait until RM_AIR_SENSOR_EVENT_MEASUREMENT_COMPLETE is received.
4. Call RM_RRH62000_Read() and read the measurement data.
5. Wait until RM_AIR_SENSOR_EVENT_SUCCESS is received.
6. Call RM_RRH62000_DataCalculate().

Examples

Basic Example

These are basic examples of minimal use of RRH62000 sensor implementation in an application.

```
void rm_rrh62000_basic_example (void)
{

	Callback event.
rm_rrh62000_status_params_t	status

	Status parameter for arriving new measurement results.
rm_rrh62000_status_params_t	cleaning_status
	Status parameter for ZMOD cleaning.
rm_rrh62000_init_process_params_t	init_process_params
	For the initialization process.
rm_air_sensor_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
void *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_air_sensor_callback_args_t *p_args)
	I2C Communications callback.

Function Documentation

◆ RM_RRH62000_Open()

fsp_err_t RM_RRH62000_Open (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_cfg_t const *const *p_cfg*)

Opens and configures the RRH62000 sensor module. If ZMOD cleaning is not complete, this function will take at least 1 minute. Implements rm_air_sensor_api_t::open.

Return values

FSP_SUCCESS	RRH62000 successfully configured.
FSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
FSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
FSP_ERR_NOT_INITIALIZED	ZMOD cleaning is not complete.

◆ RM_RRH62000_Close()

fsp_err_t RM_RRH62000_Close (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor module. Implements rm_air_sensor_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_RRH62000_StatusCheck()

fsp_err_t RM_RRH62000_StatusCheck (rm_air_sensor_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_air_sensor_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_RRH62000_Read()

fsp_err_t RM_RRH62000_Read (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_raw_data_t *const *p_raw_data*)

This function should be called to get measurement results after measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_air_sensor_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_DataCalculate()

fsp_err_t RM_RRH62000_DataCalculate (rm_air_sensor_ctrl_t *const *p_api_ctrl*, const rm_air_sensor_raw_data_t *const *p_raw_data*, rm_air_sensor_data_t *const *p_rrh62000_data*)

This function should be called when calculating gas data from measurement results. Implements rm_air_sensor_api_t::dataCalculate.

Return values

FSP_SUCCESS	Successfully gas data is calculated.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_RRH62000_FirmwareVersionGet()

fsp_err_t RM_RRH62000_FirmwareVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get firmware version. Firmware version does not use "patch" of p_version. Implements rm_air_sensor_api_t::firmwareVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

◆ RM_RRH62000_AlgorithmVersionGet()

fsp_err_t RM_RRH62000_AlgorithmVersionGet (rm_air_sensor_ctrl_t *const *p_api_ctrl*, rm_air_sensor_version_t *const *p_version*)

This function should be called to get algorithm version. Implements rm_air_sensor_api_t::algorithmVersionGet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.

fsp_err_t	RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const p_api_ctrl) This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck. More...

Detailed Description

Middleware to implement the ZMOD4XXX sensor interface. This module implements the ZMOD4XXX Middleware Interface.

Overview

ZMOD4410, ZMOD4450 and ZMOD4510 are EOL.

This module provides an API for configuring and controlling the ZMOD4XXX sensor. Supported ZMOD4XXX sensors are below.

- ZMOD4410
- ZMOD4450
- ZMOD4510

I2C communication with the ZMOD4XXX sensor is realized by connecting with the rm_comms_i2c module.

Features

The ZMOD4XXX sensor interface implementation has the following key features:

- Initialize the sensor for measurement

- Start a measurement at any time
- Read status register for wait until the measurement is done. This will also be signaled by an interrupt
- Get the ADC data from the sensor
- Input the ADC data and acquire the air quality values by calculation in the library.

Configuration

Build Time Configurations for rm_zmod4xxx

The following build time configurations are defined in fsp_cfg/rm_zmod4xxx_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated]

This module can be added to the Stacks tab via New Stack > Sensor > ZMOD4XXX Gas Sensor (rm_zmod4xxx) [Deprecated].

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_zmod4xxx_sensor0	Module name.
Comms I2C Callback	Name must be a valid C symbol	zmod4xxx_comms_i2c_callback	A user COMMS I2C callback function can be provided.
IRQ Callback	Name must be a valid C symbol	zmod4xxx_irq_callback	A user IRQ callback function can be provided.

Pin Configuration

This module use SDA and SCL pins of I2C Master and SCI I2C.

Usage Notes

ZMOD4410 datasheet is here.
The ZMOD4410 has five modes of operation.
The ZMOD4410 will respond to TVOC immediately upon start-up; however, a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.
Best results are achieved with continuous operation because the module algorithm can learn about the environment over time.

Method	Description
IAQ 1st Generation Continuous	Measurement of UBA levels for IAQ and eCO2, provides continuous data

IAQ 1st Generation Low Power	Measurement of UBA levels for IAQ and eCO2, fixed sampling interval of 6 seconds
IAQ 2nd Generation	Using AI for improved ppm TVOC, IAQ and eCO2 functionality (recommended for new designs)
IAQ 2nd Generation Ultra Low Power	Using AI for improved ppm TVOC, IAQ and eCO2 functionality. This method offers a much lower power consumption
Relative IAQ	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ
Relative IAQ Ultra Low Power	Lightweight algorithm reacts to air quality changes and outputs a relative IAQ. This method offers a much lower power consumption
Public Building AQ Standard (PBAQ)	For highly accurate and consistent sensor readings to fulfill public building standards.
Sulfur-based Odor Discrimination	The odors in "sulfur" (sulfur based) and "acceptable" (organic based) and shows an intensity level of the smell

ZMOD4450 datasheet is here.
The ZMOD4450 has one modes of operation.
The response time for a gas stimulation is always within a few seconds, depending on the gas and its concentration. An active or direct airflow onto the sensor module is not necessary since diffusion of ambient gas does not limit the sensor module response time. The ZMOD4450 will respond to typical refrigeration gases immediate upon start-up; however, a conditioning period of 48 hours in a refrigeration environment is recommended to improve stability and get maximum performance, as the module algorithm is able to learn about the refrigeration environment over time.

Method	Description
RAQ	Control signal based on Refrigerator Air Quality Changes

ZMOD4510 datasheet is here.
The ZMOD4510 has two modes of operation.
For OAQ 2nd Gen operation a response to ozone will be seen after a warmup time of 30 min.
For NO2 O3 operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
For Compensation for oxidizing gases ULP option operation a response to ozone will be seen after a warmup time of 30 min.
For Compensation for oxidizing gases option operation a response to nitrogen_dioxide and ozone will be seen after a warmup time of 5 min.
In all operation modes a conditioning period of 48 hours followed by a sensor module restart in an ambient environment is recommended to improve stability and obtain maximum performance.

Method	Description
OAQ 2nd Generation	Selective Ozone featuring Ultra-Low Power
NO2 O3	Selective nitrogen dioxide and ozone firmware
Compensation for oxidizing gases option	Measurement of compensation data for IAQ 2nd

	Gen, PBAQ
Compensation for oxidizing gases option ULP	Measurement of compensation data for IAQ 2nd Gen Ultra-Low Power

A library corresponding to each of these modes is required.
The **Compensation for oxidizing gases option** mode can be used with the **IAQ 2nd Generation** mode and the **Public Building AQ Standard (PBAQ)** mode.
The **Compensation for oxidizing gases option ULP** mode can be used with the **IAQ 2nd Generation Ultra Low Power** mode.
By setting in RA Configuration, the library will be generated in the ra/fsp/lib/rm_zmod4xxx folder of your project.

If an RTOS is used, blocking and bus lock is available.

- If blocking of an I2C bus is required, it is necessary to create a semaphore for blocking.
- If bus lock is required, it is necessary to create a mutex for bus lock. Bus lock is only available when a semaphore for blocking is used.

Notifications

The ZMOD4xxx sensor needs a reset before operation; please input a reset signal to the RES_N pin (active low).

Program flow for OAQ 2nd gen is changed in FSP v4.0.0. Please refer to the programming manual [R36US0004EU] and the application note[R01AN5899].
R01AN5899 : https://www.renesas.com/document/apn/zmod4xxx-sample-application
R36US0004EU : https://www.renesas.com/document/mat/zmod4510-programming-manual-read-me

Limitations

- The following modes are currently not supported for dev_assist.
  - Compensation
  - Compensation ULP

Bus Initialization

The ZMOD4XXX interface expects a bus instance to be opened before opening any ZMOD4XXX device. The interface will handle switching between devices on the bus but will not open or close the bus instance. The user should open the bus with the appropriate I2C Master Interface open call.

Initialization

Initialize with RM_ZMOD4XXX_Open(). One channel of timer is required to measure the waiting time at initialization.

From measurement start to data acquisition

After normal completion, start the measurement with RM_ZMOD4XXX_MeasurementStart(). An endless loop continuously checks the status of the ZMOD4XXX sensor and reads its data. The raw data is subsequently processed, and the air quality values are calculated.

If IRQ is enabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received via IRQ callback.
3. Call RM_ZMOD4XXX_Read(). This function will read the ADC data.
4. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
5. Call the DataCalculate API according to the mode.

If IRQ is disabled

1. Call RM_ZMOD4XXX_MeasurementStart().
2. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
3. Call RM_ZMOD4XXX_StatusCheck(). This function will execute a status check over I2C.
4. If RM_ZMOD4XXX_EVENT_MEASUREMENT_NOT_COMPLETE is received in callback, user should wait some time and then call RM_ZMOD4XXX_StatusCheck() again.
5. Wait until RM_ZMOD4XXX_EVENT_MEASUREMENT_COMPLETE is received.
6. Call RM_ZMOD4XXX_Read() and read the ADC data.
7. Wait until RM_ZMOD4XXX_EVENT_SUCCESS is received.
8. Call the DataCalculate API according to the mode.

Checking device error for IAQ 2nd Gen.

1. Call RM_ZMOD4XXX_DeviceErrorCheck(). This function will execute a device error check over I2C.
2. If any device error occurs, RM_ZMOD4XXX_EVENT_DEV_ERR_POWER_ON_RESET or RM_ZMOD4XXX_EVENT_DEV_ERR_ACCESS_CONFLICT are received in callback. If no device error, RM_ZMOD4XXX_EVENT_SUCCESS is received in callback.

Examples

Basic Example

These are basic examples of minimal use of ZMOD4XXX sensor implementation in an application.

IAQ 1st Gen. Continuous mode

```
void rm_zmod4xxx_iaq_1st_gen_continuous_basic_example (void)
{
 fsp_err_t                  err = FSP_SUCCESS;
 rm_zmod4xxx_raw_data_t    raw_data;
 rm_zmod4xxx_iaq_1st_data_t zmod4410_data;
 /* Open the I2C bus if it is not already open. */
    rm_comms_i2c_bus_extended_cfg_t * p_extend =
       (rm_comms_i2c_bus_extended_cfg_t *)
g_zmod4xxx_cfg.p_comms_instance->p_cfg->p_extend;
 i2c_master_instance_t * p_driver_instance = (i2c_master_instance_t *)
p_extend->p_driver_instance;
    p_driver_instance->p_api->open(p_driver_instance->p_ctrl,
p_driver_instance->p_cfg);
```

```
#if BSP_CFG_RTOS
 /* Create a semaphore for blocking if a semaphore is not NULL */
 if (NULL != p_extend->p_blocking_semaphore)
    {
 #if BSP_CFG_RTOS == 1 // AzureOS
       tx_semaphore_create(p_extend->p_blocking_semaphore->p_semaphore_handle,
                           p_extend->p_blocking_semaphore->p_semaphore_name,
                           (ULONG) 0);
 #elif BSP_CFG_RTOS == 2 // FreeRTOS
       *(p_extend->p_blocking_semaphore->p_semaphore_handle) =
            xSemaphoreCreateCountingStatic((UBaseType_t) 1,
                                           (UBaseType_t) 0,

p_extend->p_blocking_semaphore->p_semaphore_memory);
 #endif
    }
 /* Create a recursive mutex for bus lock if a recursive mutex is not NULL */
 if (NULL != p_extend->p_bus_recursive_mutex)
    {

Enumerations

enum	rm_zmod4xxx_lib_type_t

Data Structure Documentation

◆ rm_zmod4xxx_compensation_info_t

struct rm_zmod4xxx_compensation_info_t		
ZMOD4XXX compensation info		
Data Fields		
rm_zmod4xxx_cfg_t const *	p_compensation_sensor_cfg	Pointer to configuration structure of compensation sensor.
rm_zmod4xxx_raw_data_t *	p_raw_data	Pointer to compensation sensor raw data.

◆ rm_zmod4xxx_init_process_params_t

struct rm_zmod4xxx_init_process_params_t		
ZMOD4XXX initialization process block		
Data Fields		
volatile uint32_t	delay_ms	Delay milliseconds.
volatile bool	communication_finished	Communication flag for blocking.
volatile bool	measurement_finished	IRQ flag.
volatile rm_zmod4xxx_event_t	event	Callback event.

◆ rm_zmod4xxx_instance_ctrl_t

struct rm_zmod4xxx_instance_ctrl_t	
ZMOD4XXX control block	
Data Fields	
uint32_t	open
	Open flag.
uint8_t	buf [RM_ZMOD4XXX_MAX_I2C_BUF_SIZE]
	Buffer for I2C communications.

uint8_t	register_address
	Register address to access.
rm_zmod4xxx_status_params_t	status
	Status parameter.
volatile bool	dev_err_check
	Flag for checking device error.
volatile rm_zmod4xxx_event_t	event
	Callback event.
rm_zmod4xxx_init_process_params_t	init_process_params
	For the initialization process.
rm_zmod4xxx_cfg_t const *	p_cfg
	Pointer of configuration block.
rm_comms_instance_t const *	p_comms_i2c_instance
	Pointer of I2C Communications Middleware instance structure.
rm_zmod4xxx_lib_extended_cfg_t *	p_zmod4xxx_lib
	Pointer of ZMOD4XXX Lib extended configuration.
void const *	p_zmod4510_device

	Pointer of ZMOD4510 device.
rm_zmod4xxx_raw_data_t *	p_zmod4510_raw_data
	Raw data of ZMOD4510 device for calculating compensation data.
void const *	p_irq_instance
	Pointer to IRQ instance.
void *	p_context
	Pointer to the user-provided context.
void(*	p_comms_callback)(rm_zmod4xxx_callback_args_t *p_args)
	I2C Communications callback.
void(*	p_irq_callback)(rm_zmod4xxx_callback_args_t *p_args)
	IRQ callback.

Enumeration Type Documentation

◆ rm_zmod4xxx_lib_type_t

enum rm_zmod4xxx_lib_type_t
ZMOD4XXX Library type

Function Documentation

◆ RM_ZMOD4XXX_Open()

fsp_err_t RM_ZMOD4XXX_Open (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_cfg_t const *const *p_cfg*)

This function should be called when start a measurement and when measurement data is stale data. Sends the slave address to the zmod4xxx and start a measurement. Implements rm_zmod4xxx_api_t::open.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_ALREADY_OPEN	Module is already open.
FSP_ERR_UNSUPPORTED	Unsupport product ID.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Close()

fsp_err_t RM_ZMOD4XXX_Close (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when close the sensor. Implements rm_zmod4xxx_api_t::close.

Return values

FSP_SUCCESS	Successfully closed.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_ZMOD4XXX_MeasurementStart()

fsp_err_t RM_ZMOD4XXX_MeasurementStart (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when start a measurement. Implements rm_zmod4xxx_api_t::measurementStart.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_MeasurementStop()

fsp_err_t RM_ZMOD4XXX_MeasurementStop (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when stop a measurement. Implements rm_zmod4xxx_api_t::measurementStop.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_StatusCheck()

fsp_err_t RM_ZMOD4XXX_StatusCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function should be called when polling is used. It reads the status of sensor. Implements rm_zmod4xxx_api_t::statusCheck.

Return values

FSP_SUCCESS	Successfully started.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

◆ RM_ZMOD4XXX_Read()

fsp_err_t RM_ZMOD4XXX_Read (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::read.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	Communication is timeout.
FSP_ERR_ABORTED	Communication is aborted.
FSP_ERR_SENSOR_MEASUREMENT_NOT_FINISHED	Measurement is not finished.

◆ RM_ZMOD4XXX_Iaq1stGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq1stGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_1st_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq1stGenDataCalculate .

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Iaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Iaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_iaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::iaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_SulfurOdorDataCalculate()

fsp_err_t RM_ZMOD4XXX_SulfurOdorDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_sulfur_odor_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::sulfurOdorDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_Oaq2ndGenDataCalculate()

fsp_err_t RM_ZMOD4XXX_Oaq2ndGenDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_oaq_2nd_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::oaq2ndGenDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_raq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::raqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_RellaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_RellaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_rel_iaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::rellaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_PbaqDataCalculate()

fsp_err_t RM_ZMOD4XXX_PbaqDataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_pbaq_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::pbaqDataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_No2O3DataCalculate()

fsp_err_t RM_ZMOD4XXX_No2O3DataCalculate (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_raw_data_t *const *p_raw_data*, rm_zmod4xxx_no2_o3_data_t *const *p_zmod4xxx_data*)

This function should be called when measurement finishes. To check measurement status either polling or busy/interrupt pin can be used. Implements rm_zmod4xxx_api_t::no2O3DataCalculate.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter or library internal error occurred.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_SENSOR_IN_STABILIZATION	Module is stabilizing.
FSP_ERR_SENSOR_INVALID_DATA	Sensor probably damaged. Algorithm results may be incorrect.

◆ RM_ZMOD4XXX_CompensationInfoSet()

fsp_err_t RM_ZMOD4XXX_CompensationInfoSet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, rm_zmod4xxx_compensation_info_t const *const *p_compensation_info*)

This function should be called when setting the compensation info from ZMOD4510 device for the ZMOD4410 device and when the ZMOD4510 for oxidizing gas correction option is enabled. After reading the raw data from the ZMOD4510 device, set the compensation info for the ZMOD4410 to begin calculating the compensation data.

Return values

FSP_SUCCESS	Successfully compensation info are set.
FSP_ERR_ASSERTION	Null pointer passed as a parameter or library internal error occurred.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_UNSUPPORTED	Operation mode is not supported.

◆ RM_ZMOD4XXX_TemperatureAndHumiditySet()

fsp_err_t RM_ZMOD4XXX_TemperatureAndHumiditySet (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*, float *temperature*, float *humidity*)

This function is valid only for OAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before DataCalculate. Humidity and temperature measurements are needed for ambient compensation. Implements rm_zmod4xxx_api_t::temperatureAndHumiditySet.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.

◆ RM_ZMOD4XXX_DeviceErrorCheck()

fsp_err_t RM_ZMOD4XXX_DeviceErrorCheck (rm_zmod4xxx_ctrl_t *const *p_api_ctrl*)

This function is valid only for IAQ_2nd_Gen and IAQ_2nd_Gen_ULP. This function should be called before Read and DataCalculate. Check for unexpected reset occurs or getting unvalid ADC data. Implements rm_zmod4xxx_api_t::deviceErrorCheck.

Return values

FSP_SUCCESS	Successfully results are read.
FSP_ERR_ASSERTION	Null pointer passed as a parameter.
FSP_ERR_NOT_OPEN	Module is not opened configured.
FSP_ERR_TIMEOUT	communication is timeout.
FSP_ERR_ABORTED	communication is aborted.

5.2.17 Storage

Modules

Detailed Description

Storage Modules.

Modules

Block Media Custom Implementation (rm_block_media_user)

	Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.
	Block Media RAM (rm_block_media_ram) Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.
	Block Media SD/MMC (rm_block_media_sdmmc) Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.
	Block Media SPI Flash (rm_block_media_spi) Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.
	Block Media USB (rm_block_media_usb) Middleware to implement the block media interface on USB mass storage devices. This module implements the Block Media Interface.
	FileX I/O (rm_filex_block_media) Middleware for the Azure RTOS FileX File System control using Block Media on RA MCUs.
	FileX I/O (rm_filex_levelx_nor) Middleware for the Azure RTOS FileX File System control using LevelX NOR on RA MCUs.
	Flash (r_flash_hp) Driver for the flash memory on RA high-performance MCUs. This module implements the Flash Interface.
	Flash (r_flash_lp) Driver for the flash memory on RA low-power MCUs. This module implements the Flash Interface.
	FreeRTOS+FAT Port for RA (rm_freertos_plus_fat) Middleware for the FAT File System control on RA MCUs.

	LevelX NOR Port (rm_levelx_nor_spi) Middleware for using Azure RTOS LevelX on NOR SPI memory.
	LittleFS on Flash (rm_littlefs_flash) Middleware for the LittleFS File System control on RA MCUs.
	LittleFS on SPI Flash (rm_littlefs_spi_flash) Middleware for the LittleFS File System control on RA MCUs using external SPI Flash.
	MRAM (r_mram) Driver for the MRAM memory on RA MCUs. This module implements the Flash Interface.
	OSPI Flash (r_ospi) Driver for the OSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	OSPI Flash (r_ospi_b) Driver for the OSPI_B peripheral on RA MCUs. This module implements the SPI Flash Interface.
	QSPI (r_qspi) Driver for the QSPI peripheral on RA MCUs. This module implements the SPI Flash Interface.
	SD/MMC (r_sdhi) Driver for the SD/MMC Host Interface (SDHI) peripheral on RA MCUs. This module implements the SD/MMC Interface.
	Virtual EEPROM on Flash (rm_vee_flash) Virtual EEPROM on RA MCUs. This module implements the Virtual EEPROM Interface.

5.2.17.1 Block Media Custom Implementation (rm_block_media_user)

Modules » Storage

Middleware that implements a block media interface on the media of your choice. This module implements the Block Media Interface.

Overview

Features

This module is for using Block media with user-selected media.

Configuration

Block Media User has no output config settings.
The user is required to create the config settings etc. in the application.
The figure below is an example of the config definition when the user media in USB PMSC is RAM.

```
const rm_block_media_api_t g_rm_block_media_on_user_media =
{
    .open      = RM_BLOCK_MEDIA_RAM_Open,
    .mediaInit = RM_BLOCK_MEDIA_RAM_MediaInit,
    .read      = RM_BLOCK_MEDIA_RAM_Read,
    .write    = RM_BLOCK_MEDIA_RAM_Write,
    .erase    = RM_BLOCK_MEDIA_RAM_Erase,
    .infoGet   = RM_BLOCK_MEDIA_RAM_InfoGet,
    .statusGet = RM_BLOCK_MEDIA_RAM_StatusGet,
    .close    = RM_BLOCK_MEDIA_RAM_Close,
};
extern void r_usb_pmsc_block_media_event_callback(rm_block_media_callback_args_t *
p_args);
const rm_block_media_cfg_t g_rm_block_media0_cfg =
{.p_extend = NULL, .p_callback = r_usb_pmsc_block_media_event_callback, .p_context =
NULL, };
rm_block_media_instance_t g_rm_block_media0 =
{.p_api = &g_rm_block_media_on_user_media, .p_ctrl = NULL, .p_cfg =
&g_rm_block_media0_cfg, };
```

Note

If you use block_media_user, you need to create a function that matches the media you are using.
In the above example, this is the function with RM_BLOCK_MEDIA_.
Register the created function in rm_block_media_api_t.
The registered rm_block_media_api_t is registered in p_api, which is a member of rm_block_media_instance_t.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

Please refer to USB PMSC (r_usb_pmsc) for the PMSC application given as an example.

5.2.17.2 Block Media RAM (rm_block_media_ram)

Modules » Storage

Functions

fsp_err_t	RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_cfg_t const *const p_cfg)
fsp_err_t	RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const p_ctrl, uint8_t *const p_dest_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src_address, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const block_address, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const p_api_ctrl, rm_block_media_status_t *const p_status)
fsp_err_t	RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const p_ctrl, rm_block_media_info_t *const p_info)
fsp_err_t	RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware that implements a block media interface on RAM. This module implements the Block Media Interface.

Overview

Features

- This module is for using RAM as a media area.
- Supports using any read/write section of the address space as the media area.

Note

When using an external RAM as the media area (like SDRAM or OctaRAM), it must be initialized before calling RM_BLOCK_MEDIA_RAM_Open().
When using PMSC driver in combination with this module, the API of this module is called from the PMSC driver.

Configuration

Build Time Configurations for rm_block_media_ram

The following build time configurations are defined in fsp_cfg/rm_block_media_ram_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.
RAM Media Size	Please enter the RAM media size.	65536	Enter a RAM media size of 20K bytes or more.
Memory Storage Section	Manual Entry	.bss	This is the section of memory that will be used for the backing storage. Must be a valid Linker section. ('.bss', '.sdram', '.OSPI_DEVICE_0_RAM', etc). For AC6 preface any section with '.bss' e.g. '.bss.sdram'
Format during mediaInit	• Enabled • Disabled	Enabled	If disabled RAM must be formatted with filex_media_format before calling filex_media_open.

Configurations for Storage > Block Media RAM Implementation (rm_block_media_ram)

This module can be added to the Stacks tab via New Stack > Storage > Block Media RAM Implementation (rm_block_media_ram).

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Note

Specify RAM media size of 20 Kbytes or more. This module cannot be used with an MCU that cannot allocate at least 20 Kbytes of RAM as media area.
When using AC6 it is recommended to start section names with ".bss" (ex. ".bss.sdram") to prevent unnecessarily large binaries. This tells AC6 to create ZI sections rather than initialized sections.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the RAM block media implementation in an application.

```
#define RM_BLOCK_MEDIA_RAM_BLOCK_SIZE (512U)
uint8_t g_dest[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_RAM_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
rm_block_media_status_t status;
void rm_block_media_ram_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_RAM_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_RAM driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_RAM_Open(&g_rm_block_media0_ctrl,
```

```
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* When enabled, format RAM as FAT file system. */
    err = RM_BLOCK_MEDIA_RAM_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Get the RM_BLOCK_MEDIA_RAM driver status. */
    err = RM_BLOCK_MEDIA_RAM_StatusGet(&g_rm_block_media0_ctrl, &status);
    assert(FSP_SUCCESS == err);
 if (true == status.initialized)
    {
 /* Write a block of data to block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
      assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the RAM memory. */
       err = RM_BLOCK_MEDIA_RAM_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
      assert(FSP_SUCCESS == err);
    }
 else
    {
 /* Close the RM_BLOCK_MEDIA_RAM driver. */
 RM_BLOCK_MEDIA_RAM_Close(&g_rm_block_media0_ctrl);
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_RAM_Open()

fsp_err_t RM_BLOCK_MEDIA_RAM_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_RAM_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the RAM media area.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Read()

fsp_err_t RM_BLOCK_MEDIA_RAM_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from RAM media.

Implements rm_block_media_api_t::read().

This function blocks until the data is read into the destination buffer.

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Write()

fsp_err_t RM_BLOCK_MEDIA_RAM_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to RAM media.

Implements rm_block_media_api_t::write().

This function blocks until the write operation completes.

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_Erase()

fsp_err_t RM_BLOCK_MEDIA_RAM_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of RAM media.

Implements rm_block_media_api_t::erase().

This function blocks until erase is complete.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes.

◆ RM_BLOCK_MEDIA_RAM_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status.

Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_RAM_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_RAM_Close()

fsp_err_t RM_BLOCK_MEDIA_RAM_Close (rm_block_media_ctrl_t *const *p_ctrl*)

Closes the module.

Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

5.2.17.3 Block Media SD/MMC (rm_block_media_sdmmc)

fsp_err_t	RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const p_ctrl)

Detailed Description

Middleware to implement the block media interface on SD cards. This module implements the Block Media Interface.

Overview

Features

The SD/MMC implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from an SD card
- Callback called when card insertion or removal is detected
- Provides media information such as sector size and total number of sectors.

Configuration

Build Time Configurations for rm_block_media_sdmmc

The following build time configurations are defined in driver/rm_block_media_sdmmc_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected code for parameter checking is included in the build.

Configurations for Storage > Block Media SD/MMC (rm_block_media_sdmmc)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SD/MMC (rm_block_media_sdmmc). Non-secure callable guard functions can be generated for this module by

right clicking the module in the RA Configuration tool and checking the "Non-secure Callable" box.

Configuration	Options	Default	Description
Name	Name must be a valid C symbol	g_rm_block_media0	Module name.
Callback	Name must be a valid C symbol	NULL	A user callback function can be provided. If this callback function is provided, it will be called when a card is inserted or removed.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Examples

Basic Example

This is a basic example of minimal use of the SD/MMC block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE (512)
uint8_t g_dest[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint32_t g_transfer_complete = 0;
void rm_block_media_sdmmc_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SDMMC_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SDMMC driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SDMMC_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* A device shall be ready to accept the first command within 1ms from detecting VDD
min. Reference section 6.4.1.1
  * "Power Up Time of Card" in the SD Physical Layer Simplified Specification Version
6.00. */
 R_BSP_SoftwareDelay(1U, BSP_DELAY_UNITS_MILLISECONDS);
 /* Initialize the SD card. This should not be done until the card is plugged in for
SD devices. */
    err = RM_BLOCK_MEDIA_SDMMC_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from sector 3 of an SD card. */
    err = RM_BLOCK_MEDIA_SDMMC_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SDMMC_Open()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Opens the module.

Implements rm_block_media_api_t::open().

Return values

FSP_SUCCESS	Module is available and is now open.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_ALREADY_OPEN	Module has already been opened with this instance of the control structure.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::open

◆ RM_BLOCK_MEDIA_SDMMC_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the SD or eMMC device. This procedure requires several sequential commands. This function blocks until all identification and configuration commands are complete.

Implements rm_block_media_api_t::mediaInit().

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::mediaInit

◆ RM_BLOCK_MEDIA_SDMMC_Read()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements rm_block_media_api_t::read().

Return values

FSP_SUCCESS	Data read successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- sdmmc_api_t::read

◆ RM_BLOCK_MEDIA_SDMMC_Write()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Write (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t const *const *p_src_address*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements rm_block_media_api_t::write().

Return values

FSP_SUCCESS	Write finished successfully.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::write

◆ RM_BLOCK_MEDIA_SDMMC_Erase()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Erase (rm_block_media_ctrl_t *const *p_ctrl*, uint32_t const *block_address*, uint32_t const *num_blocks*)

Erases sectors of an SD card or eMMC device. Implements rm_block_media_api_t::erase().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- sdmmc_api_t::erase
- sdmmc_api_t::statusGet

◆ RM_BLOCK_MEDIA_SDMMC_CallbackSet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_CallbackSet (rm_block_media_ctrl_t *const *p_ctrl*, void(*)(rm_block_media_callback_args_t *) *p_callback*, void *const *p_context*, rm_block_media_callback_args_t *const *p_callback_memory*)

Updates the user callback with the option to provide memory for the callback argument structure. Implements rm_block_media_api_t::callbackSet.

Return values

FSP_SUCCESS	Callback updated successfully.
FSP_ERR_ASSERTION	A required pointer is NULL.
FSP_ERR_NOT_OPEN	The control block has not been opened.
FSP_ERR_NO_CALLBACK_MEMORY	p_callback is non-secure and p_callback_memory is either secure or NULL.

◆ RM_BLOCK_MEDIA_SDMMC_StatusGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_StatusGet (rm_block_media_ctrl_t *const *p_api_ctrl*, rm_block_media_status_t *const *p_status*)

Provides driver status. Implements rm_block_media_api_t::statusGet().

Return values

FSP_SUCCESS	Status stored in p_status.
FSP_ERR_ASSERTION	NULL pointer.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SDMMC_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information. Implements rm_block_media_api_t::infoGet().

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SDMMC_Close()

fsp_err_t RM_BLOCK_MEDIA_SDMMC_Close (rm_block_media_ctrl_t *const *p_ctrl*)
Closes an open SD/MMC device. Implements rm_block_media_api_t::close().

Return values

FSP_SUCCESS	Successful close.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

5.2.17.4 Block Media SPI Flash (rm_block_media_spi)

fsp_err_t	RM_BLOCK_MEDIA_SPI_Write (rm_block_media_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const start_block, uint32_t const num_blocks)
fsp_err_t	RM_BLOCK_MEDIA_SPI_CallbackSet (rm_block_media_ctrl_t *const p_ctrl, void(*p_callback)(rm_block_media_callback_args_t *), void *const p_context, rm_block_media_callback_args_t *const p_callback_memory)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Close (rm_block_media_ctrl_t *const p_ctrl)
fsp_err_t	RM_BLOCK_MEDIA_SPI_Erase (rm_block_media_ctrl_t *const p_ctrl, uint32_t const start_block, uint32_t const num_blocks)

Detailed Description

Middleware to implement the block media interface on SPI flash memory. This module implements the Block Media Interface.

Overview

Features

The SPI implementation of the block media interface has the following key features:

- Reading, writing, and erasing data from SPI flash memory
- Provides media information such as sector size and total number of sectors.

Note

By default, Block Media SPI Read, Write, and Erase are blocking operations. Non-blocking operation may be achieved by yielding control within the optional callback function.

Configuration

Build Time Configurations for rm_block_media_spi

The following build time configurations are defined in driver/rm_block_media_spi_cfg.h:

Configuration	Options	Default	Description
Parameter Checking	• Default (BSP) • Enabled • Disabled	Default (BSP)	If selected, code for parameter checking is included in the build

Configurations for Storage > Block Media SPI Flash (rm_block_media_spi)

This module can be added to the Stacks tab via New Stack > Storage > Block Media SPI Flash (rm_block_media_spi).

Configuration	Options	Default	Description
Module Instance Name	Name must be a valid C symbol	g_rm_block_media0	Module name
Block size (bytes)	Manual Entry	4096	Specify the size of a block in bytes.
Block count	Minimum block count is 1, maximum is defined by hardware and software design.	8192	Number of blocks available for use by this driver instance.
Base Address	Manual Entry	0	Base address offset (bytes) for instance memory region.
Callback Function	Name must be a valid C symbol	NULL	A user callback function can be

provided. If this callback is provided, it will be called after the completion of Read, Write, and Erase operations, or anytime these functions are waiting on hardware.

Clock Configuration

This module has no required clock configurations.

Pin Configuration

This module does not use I/O pins.

Limitations

Developers should be aware of the following limitations when using RM_BLOCK_MEDIA_SPI:

- Getting and setting Block Protection or Advanced Sector Protection modes is not supported.
- Addressing QSPI memory address ranges greater than 64 MB (one bank) is not supported.

Examples

Basic Example

This is a basic example of minimal use of the SPI block media implementation in an application.

```
#define RM_BLOCK_MEDIA_SPI_BLOCK_SIZE (256U)
uint8_t g_dest[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
uint8_t g_src[RM_BLOCK_MEDIA_SPI_BLOCK_SIZE] BSP_ALIGN_VARIABLE(4);
void rm_block_media_spi_basic_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
```

```
 /* Initialize the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Write a block of data to block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Write(&g_rm_block_media0_ctrl, g_src, 3, 1);
    assert(FSP_SUCCESS == err);
 /* Read a block of data from block 3 of the SPI flash memory. */
    err = RM_BLOCK_MEDIA_SPI_Read(&g_rm_block_media0_ctrl, g_dest, 3, 1);
    assert(FSP_SUCCESS == err);
}
```

Non-Blocking Example

This is a basic example of using the optional SPI callback to implement non-blocking operation.

```
#define RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT 0x1000
void rm_block_media_spi_non_blocking_example (void)
{
 /* Initialize g_src to known data */
 for (uint32_t i = 0; i < RM_BLOCK_MEDIA_SPI_BLOCK_SIZE; i++)
    {
       g_src[i] = (uint8_t) ('A' + (i % 26));
    }
 /* Open the RM_BLOCK_MEDIA_SPI driver. This enables the card detection interrupt. */
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_Open(&g_rm_block_media0_ctrl,
&g_rm_block_media0_cfg);
 /* Handle any errors. This function should be defined by the user. */
    assert(FSP_SUCCESS == err);
 /* Initialize the Block Media SPI driver. */
    err = RM_BLOCK_MEDIA_SPI_MediaInit(&g_rm_block_media0_ctrl);
    assert(FSP_SUCCESS == err);
 /* Erase a large quantity of data from SPI Flash Memory */
    err = RM_BLOCK_MEDIA_SPI_Erase(&g_rm_block_media0_ctrl, 0,
RM_BLOCK_MEDIA_EXAMPLE_DEVICE_BLOCK_COUNT);
    assert(FSP_SUCCESS == err);
```

```
}
/* The optional callback is invoked for Read, Write, and Erase operations, whenever
the operation completes or has
 * been blocked by the lower level SPI driver busy indication.
 */
void rm_block_media_spi_example_callback (rm_block_media_callback_args_t * p_args)
{
 if (RM_BLOCK_MEDIA_EVENT_OPERATION_COMPLETE == p_args->event)
    {
 /* Process operation complete. */
    }
 else if (RM_BLOCK_MEDIA_EVENT_POLL_STATUS == p_args->event)
    {
 rm_block_media_status_t status;
 rm_block_media_ctrl_t * p_ctrl = (rm_block_media_ctrl_t *) p_args->p_context;
 fsp_err_t err = RM_BLOCK_MEDIA_SPI_StatusGet(p_ctrl, &status);
      assert(FSP_SUCCESS == err);
 if (true == status.busy)
      {
 /* Run waiting tasks */
            vTaskSuspend(xTaskGetCurrentTaskHandle());
      }
    }
 else
    {
       assert(RM_BLOCK_MEDIA_EVENT_ERROR == p_args->event);
 /* Process Read, Write, or Erase error. */
    }
}
```

Function Documentation

◆ RM_BLOCK_MEDIA_SPI_Open()

fsp_err_t RM_BLOCK_MEDIA_SPI_Open (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_cfg_t const *const *p_cfg*)

Parameter checking and Acquires mutex, then handles driver initialization at the HAL SPI layer and marking the open flag in control block.

Implements rm_block_media_api_t::open.

Return values

FSP_SUCCESS	Block media for SPI framework is successfully opened.
FSP_ERR_ASSERTION	One of the input parameters or their data references may be null.
FSP_ERR_ALREADY_OPEN	The channel specified has already been opened. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls
- spi_flash_api_t::open

◆ RM_BLOCK_MEDIA_SPI_InfoGet()

fsp_err_t RM_BLOCK_MEDIA_SPI_InfoGet (rm_block_media_ctrl_t *const *p_ctrl*, rm_block_media_info_t *const *p_info*)

Retrieves module information.

Implements rm_block_media_api_t::infoGet.

Return values

FSP_SUCCESS	Erase operation requested.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.
FSP_ERR_NOT_INITIALIZED	Module has not been initialized.

◆ RM_BLOCK_MEDIA_SPI_MediaInit()

fsp_err_t RM_BLOCK_MEDIA_SPI_MediaInit (rm_block_media_ctrl_t *const *p_ctrl*)

Initializes the Block Media SPI Flash device.

Implements rm_block_media_api_t::mediaInit.

Return values

FSP_SUCCESS	Module is initialized and ready to access the memory device.
FSP_ERR_ASSERTION	An input parameter is invalid.
FSP_ERR_NOT_OPEN	Module is not open.

◆ RM_BLOCK_MEDIA_SPI_Read()

fsp_err_t RM_BLOCK_MEDIA_SPI_Read (rm_block_media_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_block*, uint32_t const *num_blocks*)

Reads a number of blocks from spi flash memory. By default, this is a function is blocking. Non-blocking operation may be achieved by yielding control within the optional callback function.
