Validate the cfg parameters. The key type is already validated.

Verify the key size.

Verify the domain parameter input buffer size. The length has to be exactly as specified

Verify the generator point input buffer size. The length has to be exactly as specified

Get a Crypto common control block and the interface.

Allocate memory for a Crypto HAL control block in the byte pool.

Get a ECC interface instance.

Set Crypto HAL API instance with the control common hardware api.

Open the Crypto HAL module.

◆ sf_crypto_key_open_rsa()

ssp_err_t sf_crypto_key_open_rsa (sf_crypto_key_instance_ctrl_t * *p_ctrl*, sf_crypto_key_cfg_t const *const *p_cfg*)

Subroutine to open a Crypto RSA HAL module. This function is called by SF_CRYPTO_KEY_Open().

Parameters

[in,out]	p_ctrl	Pointer to a Crypto Key Framework module control block
[in,out]	p_cfg	Pointer to a Crypto Key Framework module configuration structure

Return values

SSP_SUCCESS	RSA HAL module is successfully opened.
SSP_ERR_OUT_OF_MEMORY	Failed to allocate memory to store RSA HAL module control block.
SSP_ERR_INTERNAL	RTOS service returned a unexpected error.

Returns

See Common Error Codes for other possible return codes.

◆ sf_crypto_key_rsa_interface_get()

void sf_crypto_key_rsa_interface_get (sf_crypto_key_instance_ctrl_t *const *p_ctrl*)

Subroutine to get a RSA HAL API instance. This function is called by sf_crypto_key_open_rsa().

Parameters

[in,out]	p_ctrl	Pointer to a Key framework control block, whose p_hal_api filled with HAL RSA interface. This indicates NULL, for not supported MCUs

◆ sf_crypto_key_rsa_verify_crtplaintext_buffersize()

ssp_err_t sf_crypto_key_rsa_verify_crtplaintext_buffersize (sf_crypto_key_size_t *key_size*, uint32_t *buffer_length*)

Subroutine to verify that the provided buffer_length (buffer to hold the secret RSA CRT Plain text key) is sufficient or not, before proceeding with key Generate function. This function is called by sf_crypto_key_rsa_verify_privatekey_buffersize as an internal function call.

Parameters

[in]	key_size	Indicates RSA key size - 1024/2048-bits.
[in]	buffer_length	Length of the secret key which shall be filled by RSA Key generation algorithm.

Return values

SSP_SUCCESS	Key length is successful, and proceed with RSA Key Generation.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key length is not sufficient for the Key generation operation of RSA.

Note

This function is not a user API but an internal function for SF_CRYPTO_KEY to verify whether passed buffer size is sufficient for Key to hold in Key Generate API call.

◆ sf_crypto_key_rsa_verify_plaintext_buffersize()

ssp_err_t sf_crypto_key_rsa_verify_plaintext_buffersize (sf_crypto_key_size_t *key_size*, uint32_t *buffer_length*)

Subroutine to verify that the provided buffer_length (buffer to hold the secret RSA Plain text key) is sufficient or not, before proceeding with key Generate function. This function is called by sf_crypto_key_rsa_verify_privatekey_buffersize as an internal function call.

Parameters

[in]	key_size	Indicates RSA key size - 1024/2048-bits.
[in]	buffer_length	Length of the secret key which shall be filled by RSA Key generation algorithm.

Return values

SSP_SUCCESS	Key length is successful, and proceed with RSA Key Generation.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key length is not sufficient for the Key generation operation of RSA.

Note

This function is not a user API but an internal function for SF_CRYPTO_KEY to verify whether passed buffer size is sufficient for Key to hold in Key Generate API call.

◆ sf_crypto_key_rsa_verify_privatekey_buffersize()

ssp_err_t sf_crypto_key_rsa_verify_privatekey_buffersize (sf_crypto_key_type_t *key_type*, sf_crypto_key_size_t *key_size*, uint32_t *buffer_length*)

Subroutine to verify that the provided buffer_length (buffer to hold the secret RSA private key) is sufficient or not, before proceeding with key Generate function. This function is called by RSA Key Generate function before passing request to Crypto HAL Key generate API call.

Parameters

[in]	key_type	Indicates RSA key type - Plain text/CRT Plain Text/ Wrapped key.
[in]	key_size	Indicates RSA key size - 1024/2048-bits.
[in]	buffer_length	Length of the secret key which shall be filled by RSA Key generation algorithm.

Return values

SSP_SUCCESS	Key length is successful, and proceed with RSA Key Generation.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key length is not sufficient for the Key generation operation of RSA.

Note

This function is not a user API but an internal function for SF_CRYPTO_KEY to verify whether passed buffer size is sufficient for Key to hold in Key Generate API call.

◆ sf_crypto_key_rsa_verify_publickey_buffersize()

ssp_err_t sf_crypto_key_rsa_verify_publickey_buffersize (sf_crypto_key_type_t *key_type*, sf_crypto_key_size_t *key_size*, uint32_t *buffer_length*)

Subroutine to verify that the provided buffer_length (buffer to hold the secret RSA Public key) is sufficient or not, before proceeding with key Generate function. This function is called by RSA Key Generate function before passing request to Crypto HAL Key generate API call.

Parameters

[in]	key_type	Indicates RSA key type - Plain text/CRT Plain Text/ Wrapped key.
[in]	key_size	Indicates RSA key size - 1024/2048-bits.
[in]	buffer_length	Length of the secret key which shall be filled by RSA Key generation algorithm.

Return values

SSP_SUCCESS	Key length is successful, and proceed with RSA Key Generation.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key length is not sufficient for the Key generation operation of RSA.

Note

This function is not a user API but an internal function for SF_CRYPTO_KEY to verify whether passed buffer size is sufficient for Key to hold in Key Generate API call.

◆ sf_crypto_key_rsa_verify_wrapped_buffersize()

ssp_err_t sf_crypto_key_rsa_verify_wrapped_buffersize (sf_crypto_key_size_t *key_size*, uint32_t *buffer_length*)

Subroutine to verify that the provided buffer_length (buffer to hold the secret RSA Wrapped key) is sufficient or not, before proceeding with key Generate function. This function is called by sf_crypto_key_rsa_verify_privatekey_buffersize as an internal function call.

Parameters

[in]	key_size	Indicates RSA key size - 1024/2048-bits.
[in]	buffer_length	Length of the secret key which shall be filled by RSA Key generation algorithm.

Return values

SSP_SUCCESS	Key length is successful, and proceed with RSA Key Generation.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key length is not sufficient for the Key generation operation of RSA.

Note

This function is not a user API but an internal function for SF_CRYPTO_KEY to verify whether passed buffer size is sufficient for Key to hold in Key Generate API call.

◆ sf_crypto_key_scalar_multiplication_ecc()

ssp_err_t sf_crypto_key_scalar_multiplication_ecc (sf_crypto_key_instance_ctrl_t * *p_ctrl*, sf_crypto_key_t *const *p_secret_key*, sf_crypto_key_t *const *p_point_on_curve*, sf_crypto_key_t *const *p_resultant_vector*)

Subroutine to perform a ECC scalar multiplication. This function is called by SF_CRYPTO_KEY_ECDHCompute().

Parameters

[in]	p_ctrl	Pointer to a Crypto Key Framework module control block
[in]	p_secret_key	Pointer to a secret key
[in]	p_point_on_curve	Pointer to a point specified on the curve.
[in]	p_resultant_vector	Pointer to the resultant point on the curve.

Return values

SSP_SUCCESS	The module created a key successfully.
SSP_ERR_INVALID_SIZE	Failed, as the allocated key buffer length is not sufficient for the ECC Key generation operation.
SSP_ERR_UNSUPPORTED	Procedure is not supported for the supplied parameters.

Returns

See Common Error Codes for other possible return codes.

Verify the secret key buffer size that holds the generated private key.

Verify the input buffer size for holding the data, representing point on the curve data.

Verify the output buffer size to hold the resultant data, representing point on the curve.

Local variable created to call the HAL API.

Note that the HAL driver requires data in WORDS

Call Crypto HAL driver.

◆ SF_CRYPTO_KEY_VersionGet()

ssp_err_t SF_CRYPTO_KEY_VersionGet (ssp_version_t *const *p_version*)
Gets driver version based on compile time macros. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — The parameter p_version is NULL.

Detailed Description

RTOS-integrated Crypto Key Installation Framework Module.

Macro Definition Documentation

◆ SF_CRYPTO_KEY_INSTALLATION_CODE_VERSION_MAJOR

```
#define SF_CRYPTO_KEY_INSTALLATION_CODE_VERSION_MAJOR   (2U)
```

The API version of SSP Crypto Key Installation Framework

Function Documentation

◆ SF_CRYPTO_KEY_INSTALLATION_Close()

ssp_err_t SF_CRYPTO_KEY_INSTALLATION_Close (sf_crypto_key_installation_ctrl_t *const *p_api_ctrl*)

SSP Crypto Key Installation Framework Close operation.

Return values

SSP_SUCCESS	The module was successfully closed.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Call HAL API to Close Key Installation HAL Driver

◆ SF_CRYPTO_KEY_INSTALLATION_KeyInstall()

ssp_err_t SF_CRYPTO_KEY_INSTALLATION_KeyInstall (sf_crypto_key_installation_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t const *const *p_user_key_rsa_modulus*, sf_crypto_data_handle_t const *const *p_user_key_input*, sf_crypto_key_installation_shared_index_t const *shared_index_input*, sf_crypto_data_handle_t const *const *p_session_key_input*, uint32_t const *const *p_iv_input*, sf_crypto_data_handle_t *const *p_key_data_out*)

SSP Crypto Framework Key Installation operation.

Return values

SSP_SUCCESS	The module created a key successfully.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.
SSP_ERR_INVALID_ARGUMENT	At least one of the input arguments is invalid.
SSP_ERR_INVALID_SIZE	At least one of the buffers provided is of invalid size.

Returns

See Common Error Codes for other possible return codes.

Validate modulus and output buffers only in case of RSA key type.

Check if the Crypto Key Installation Framework has been opened. If not yet opened, return an error.

Call HAL API to perform Key Installation operation

◆ SF_CRYPTO_KEY_INSTALLATION_Open()

ssp_err_t SF_CRYPTO_KEY_INSTALLATION_Open (sf_crypto_key_installation_ctrl_t *const *p_api_ctrl*, sf_crypto_key_installation_cfg_t const *const *p_cfg*)

SSP Crypto Key Installation Framework Open operation.

Return values

SSP_SUCCESS	The module was successfully opened.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common Module has yet been opened.
SSP_ERR_ALREADY_OPEN	The module has been already opened.
SSP_ERR_INVALID_ARGUMENT	The module does not support the key type specified by user.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Check if SF Crypto Key Installation is already opened

Validate and copy configuration parameters to control block

Call HAL API to Open Key Installation HAL Driver

Set Key Installation Framework module status to Open

◆ SF_CRYPTO_KEY_INSTALLATION_VersionGet()

ssp_err_t SF_CRYPTO_KEY_INSTALLATION_VersionGet (ssp_version_t *const *p_version*)

Gets driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Detailed Description

RTOS-integrated Crypto Signature Framework Module.

Macro Definition Documentation

◆ SF_CRYPTO_SIGNATURE_CODE_VERSION_MAJOR

#define SF_CRYPTO_SIGNATURE_CODE_VERSION_MAJOR (2U)
The API version of SSP Crypto Signature Framework

Enumeration Type Documentation

◆ sf_crypto_signature_operation_state_t

enum sf_crypto_signature_operation_state_t	
Internal state codes for the SSP Crypto Signature framework module.	
Enumerator	
SF_CRYPTO_SIGNATURE_OPERATION_STATE_OPEN	Module opened to perform sign/verify operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_INITIALIZED	Context is initialized for Sign Operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_UPDATED	Sign operation is in progress.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_SIGN_FINALIZED	Sign operation has been completed.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_INITIALIZED	Context is initialized for Verify Operation.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_UPDATED	Verify operation is in progress.
SF_CRYPTO_SIGNATURE_OPERATION_STATE_VERIFY_FINALIZED	Verify operation has been completed.

◆ sf_crypto_signature_state_t

enum sf_crypto_signature_state_t

State codes for the SSP Crypto Signature framework module. Once the module is opened successfully, then the state is transition to OPENED state. After sign/verify operations, the Signature framework module must be closed with CLOSED state.

Enumerator	
SF_CRYPTO_SIGNATURE_CLOSED	The Signature module is closed.
SF_CRYPTO_SIGNATURE_OPENED	The Signature module is opened.

Function Documentation

◆ SF_CRYPTO_SIGNATURE_Close()

ssp_err_t SF_CRYPTO_SIGNATURE_Close (sf_crypto_signature_ctrl_t *const *p_api_ctrl*)

SSP Crypto Signature Framework Close operation.

Return values

SSP_SUCCESS	The module was successfully closed.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_NOT_OPEN	The module has yet been opened. Call Open API first.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Close Crypto HAL module.

Decrement Open counter to indicate a (this) module is closed.

◆ sf_crypto_signature_close_rsa()

ssp_err_t sf_crypto_signature_close_rsa (sf_crypto_signature_instance_ctrl_t * *p_ctrl*)

Function for Crypto Signature Framework to close the RSA HAL driver. This function is called by sf_crypto_signature_hal_close().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.

Return values

SSP_SUCCESS	The module was successfully closed.
SSP_ERR_INTERNAL	Critical internal error.

Returns

See Common Error Codes for other possible return codes.

◆ sf_crypto_signature_context_init_rsa()

ssp_err_t sf_crypto_signature_context_init_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_signature_mode_t *operation_mode*, sf_crypto_signature_algorithm_init_params_t *const *p_algorithm_specific_params*, sf_crypto_key_t const *const *p_key*)

Function for Crypto Signature Framework to initialize the Signature framework module context. This function is called by sf_crypto_signature_hal_context_init().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	operation_mode	Perform Sign Or Verify operation.
[in]	p_algorithm_specific_params	Algorithm specific params.
[in]	p_key	Private key if sign operation is to be performed. Public key if verify operation is to be performed.

Return values

SSP_SUCCESS	The module context was successfully initialized.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

◆ SF_CRYPTO_SIGNATURE_ContextInit()

ssp_err_t SF_CRYPTO_SIGNATURE_ContextInit (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_signature_mode_t *operation_mode*, sf_crypto_signature_algorithm_init_params_t *const *p_algorithm_specific_params*, sf_crypto_key_t const *const *p_key*)

SSP Crypto Signature Framework Context Initialization operation.

Return values

SSP_SUCCESS	The module context was successfully initialized.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Setup Context for HAL.

◆ sf_crypto_signature_key_size_config_rsa()

ssp_err_t sf_crypto_signature_key_size_config_rsa (sf_crypto_signature_cfg_t const *const *p_cfg*)

Function for Crypto Signature Framework to check configuration params - Key size. This function is called by sf_crypto_signature_validate_config().

Parameters

[in]	p_cfg	Pointer to sf_crypto_signature_cfg_t configuration structure.

Return values

SSP_SUCCESS	Valid RSA Key size.
SSP_ERR_INVALID_ARGUMENT	Invalid RSA Key size.

◆ SF_CRYPTO_SIGNATURE_Open()

ssp_err_t SF_CRYPTO_SIGNATURE_Open (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_signature_cfg_t const *const *p_cfg*)

SSP Crypto Signature Framework Open operation.

Return values

SSP_SUCCESS	The module was successfully opened.
SSP_ERR_ASSERTION	NULL is passed through an argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Framework Common Module has yet been opened.
SSP_ERR_ALREADY_OPEN	The module has been already opened.
SSP_ERR_UNSUPPORTED	The module does not support the key type specified by user.

Returns

See Common Error Codes for other possible return codes.

Setup control block with common framework module (instance control and API).

Setup control block with Hash framework module (instance).

Check if Crypto Common module is opened before calling this API.

Check if SF Crypto Signature is already opened.

Validate configuration parameters.

Copy configuration parameters to control block.

Open Crypto HAL module.

Set Signature Framework module internal operation state to Open.

Set Signature Framework module status to Open.

Increment Open counter to indicate a (this) module is open.

◆ sf_crypto_signature_open_rsa()

ssp_err_t sf_crypto_signature_open_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_signature_cfg_t const *const *p_cfg*)

Function for Crypto Signature Framework to open the RSA HAL driver. This function is called by sf_crypto_signature_hal_open().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	p_cfg	Pointer to sf_crypto_signature_cfg_t configuration structure.

Return values

SSP_SUCCESS	The module was successfully opened.
SSP_ERR_INTERNAL	Critical internal error.

Returns

See Common Error Codes for other possible return codes.

◆ sf_crypto_signature_sign_final_rsa()

ssp_err_t sf_crypto_signature_sign_final_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_data_handle_t const *const *p_message*, sf_crypto_data_handle_t *const *p_dest*)

Function for Crypto Signature Framework to perform sign final operation. This function is called by sf_crypto_signature_hal_sign_final().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	p_message	Pointer to data handle containing last block of data and its length. If there is no more data to be passed this param can be set to NULL.
[in,out]	p_dest	Pointer to data handle containing pointer to a buffer for storing signature. The data_length of this handle must be populated with the buffer length. Upon successful return this data_length will be updated with the number of bytes written to this buffer.

Return values

SSP_SUCCESS	Sign Final operation was performed successfully.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_INVALID_SIZE	Not enough space to store signature.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.

Returns

See Common Error Codes for other possible return codes.

◆ sf_crypto_signature_sign_update_rsa()

ssp_err_t sf_crypto_signature_sign_update_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_data_handle_t const *const *p_message*)

Function for Crypto Signature Framework to perform sign update operation. This function is called by sf_crypto_signature_hal_sign_update().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	p_message	Pointer to data handle containing update data and its length.

Return values

SSP_SUCCESS	Sign update was performed successfully.
SSP_ERR_ASSERTION	Critical internal error.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

◆ SF_CRYPTO_SIGNATURE_SignFinal()

ssp_err_t SF_CRYPTO_SIGNATURE_SignFinal (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t const *const *p_message*, sf_crypto_data_handle_t *const *p_dest*)

SSP Crypto Signature Framework Signature Final operation.

Return values

SSP_SUCCESS	Sign Final operation was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_CRYPTO_INVALID_SIZE	Not enough space to store signature.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Validate state transition.

Lock the module to access to Crypto HAL module.

Perform Sign Final.

Set Signature Framework internal state.

Unlock the module.

◆ SF_CRYPTO_SIGNATURE_SignUpdate()

ssp_err_t SF_CRYPTO_SIGNATURE_SignUpdate (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t const *const *p_message*)

SSP Crypto Signature Framework Signature Update operation.

Return values

SSP_SUCCESS	Sign update was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Validate state transition.

Lock the module to access to Crypto HAL module.

Perform Sign Update.

Set Signature Framework internal state.

Unlock the module.

◆ sf_crypto_signature_validate_sign_operation_state_transition()

ssp_err_t sf_crypto_signature_validate_sign_operation_state_transition (sf_crypto_signature_instance_ctrl_t * *p_ctrl*, sf_crypto_signature_operation_state_t *next_state*)

SSP Crypto Signature Framework State transition validation for sign operation.

Parameters

[in]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	next_state	Requested next state.

Return values

SSP_SUCCESS	Valid call to the calling API.
SSP_ERR_INVALID_CALL	Invalid call to the calling API.

◆ sf_crypto_signature_validate_verify_operation_state_transition()

ssp_err_t sf_crypto_signature_validate_verify_operation_state_transition (sf_crypto_signature_instance_ctrl_t * *p_ctrl*, sf_crypto_signature_operation_state_t *next_state*)

SSP Crypto Signature Framework State transition validation for verify operation.

Parameters

[in]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	next_state	Requested next state.

Return values

SSP_SUCCESS	Valid call to the calling API.
SSP_ERR_INVALID_CALL	Invalid call to the calling API.

◆ sf_crypto_signature_verify_final_rsa()

ssp_err_t sf_crypto_signature_verify_final_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_data_handle_t const *const *p_signature*, sf_crypto_data_handle_t const *const *p_message*)

Function for Crypto Signature Framework to perform verify final operation. This function is called by sf_crypto_signature_hal_verify_final().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	p_signature	Pointer to data handle containing signature and its length.
[in]	p_message	Pointer to data handle containing message in appropriate format and its length.

Return values

SSP_SUCCESS	Verify Final operation was performed successfully.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_CRYPTO_INVALID_SIZE	Invalid signature length.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.

Returns

See Common Error Codes for other possible return codes.

◆ sf_crypto_signature_verify_update_rsa()

ssp_err_t sf_crypto_signature_verify_update_rsa (sf_crypto_signature_instance_ctrl_t *const *p_ctrl*, sf_crypto_data_handle_t const *const *p_message*)

Function for Crypto Signature Framework to perform verify update operation. This function is called by sf_crypto_signature_hal_verify_update().

Parameters

[in,out]	p_ctrl	Pointer to Crypto Signature Framework instance control block structure.
[in]	p_message	Pointer to data handle containing message in appropriate format and its length.

Return values

SSP_SUCCESS	Verify update operation was performed successfully.
SSP_ERR_ASSERTION	Critical internal error.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

◆ SF_CRYPTO_SIGNATURE_VerifyFinal()

ssp_err_t SF_CRYPTO_SIGNATURE_VerifyFinal (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t const *const *p_signature*, sf_crypto_data_handle_t const *const *p_message*)

SSP Crypto Signature Framework Signature-Verification Update operation.

Return values

SSP_SUCCESS	Verify final operation is performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_CRYPTO_INVALID_SIZE	Invalid signature length.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Validate state transition.

Lock the module to access to Crypto HAL module.

Perform Verify Final.

Set Signature Framework internal state.

Unlock the module.

◆ SF_CRYPTO_SIGNATURE_VerifyUpdate()

ssp_err_t SF_CRYPTO_SIGNATURE_VerifyUpdate (sf_crypto_signature_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t const *const *p_message*)

SSP Crypto Signature Framework Signature-Verification Update operation.

Return values

SSP_SUCCESS	Verify update operation was performed successfully.
SSP_ERR_ASSERTION	NULL is passed through the argument.
SSP_ERR_INTERNAL	Critical internal error.
SSP_ERR_INVALID_CALL	Invalid call to this API.
SSP_ERR_UNSUPPORTED	Invalid Hash module request.
SSP_ERR_CRYPTO_BUF_OVERFLOW	Update data exceeded the block size.
SSP_ERR_CRYPTO_INVALID_OPERATION_MODE	Invalid operation mode requested.

Returns

See Common Error Codes for other possible return codes.

Check if the Crypto Framework has been opened. If not yet opened, return an error.

Validate state transition.

Lock the module to access to Crypto HAL module.

Perform Verify Update.

Set Signature Framework internal state.

Unlock the module.

◆ SF_CRYPTO_SIGNATURE_VersionGet()

ssp_err_t SF_CRYPTO_SIGNATURE_VersionGet (ssp_version_t *const *p_version*)

Gets driver version based on compile time macros.

Return values

SSP_SUCCESS	Function returned successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

sf_crypto_signature_context_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » SSP Crypto Signature Framework

#include <sf_crypto_signature.h>

Data Fields

sf_crypto_signature_mode_t	operation_mode
sf_crypto_signature_algorithm_init_params_t *	p_aglorithm_specific_params
sf_crypto_data_handle_t	buffer
uint8_t *	p_key_data
uint32_t	key_data_length

Detailed Description

Internal SSP Crypto Signature framework module context.

Field Documentation

◆ buffer

sf_crypto_data_handle_t sf_crypto_signature_context_t::buffer
Internal buffer to format input data

◆ key_data_length

uint32_t sf_crypto_signature_context_t::key_data_length
Length of key data.

◆ operation_mode

sf_crypto_signature_mode_t sf_crypto_signature_context_t::operation_mode
Operating mode. (Sign / Verify operation)

◆ p_aglorithm_specific_params

sf_crypto_signature_algorithm_init_params_t* sf_crypto_signature_context_t::p_aglorithm_specific_params
Algorithm specific parameters. OR hold formatted input data.

◆ p_key_data

uint8_t* sf_crypto_signature_context_t::p_key_data
Buffer to hold private key in case of Sign Operations. OR. Buffer to hold public key in case of Verify Operations.

Variables

const sf_crypto_trng_api_t	g_sf_crypto_trng_api

Detailed Description

RTOS-integrated Crypto TRNG Framework Module.

Macro Definition Documentation

◆ SF_CRYPTO_TRNG_CODE_VERSION_MAJOR

```
#define SF_CRYPTO_TRNG_CODE_VERSION_MAJOR  (2U)
```

The API version of SSP Crypto Framework

Function Documentation

◆ SF_CRYPTO_TRNG_Close()

ssp_err_t SF_CRYPTO_TRNG_Close (sf_crypto_trng_ctrl_t *const *p_api_ctrl*)

SSP Crypto TRNG Framework Close operation.

Return values

SSP_SUCCESS	The module was successfully closed
SSP_ERR_ASSERTION	One or more input parameters are NULL.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto Common module has not been opened.
SSP_ERR_NOT_OPEN	The module has not been opened before calling this API.

Returns

See Common Error Codes for other possible return codes.

Check if SF Crypto TRNG is opened before

Call HAL API to Close TRNG HAL Driver

Set TRNG status to Closed

Decrement Open counter to indicate a (this) module is closed

◆ SF_CRYPTO_TRNG_Open()

ssp_err_t SF_CRYPTO_TRNG_Open (sf_crypto_trng_ctrl_t *const *p_api_ctrl*, sf_crypto_trng_cfg_t const *const *p_cfg*)

SSP Crypto TRNG Framework Open operation.

Return values

SSP_SUCCESS	The module was successfully opened
SSP_ERR_ASSERTION	One or more input parameters are NULL.
SSP_ERR_CRYPTO_COMMON_NOT_OPENED	Crypto framework common module has not been opened before calling this API.
SSP_ERR_ALREADY_OPEN	The module has already been opened.

Returns

See Common Error Codes for other possible return codes.

Check if Crypto Common module is opened before calling this API

Check if SF Crypto TRNG is already opened

Setup HAL API

Call HAL API to Open TRNG HAL Driver

Set TRNG status to Open

Increment Open counter to indicate a (this) module is open

◆ SF_CRYPTO_TRNG_RandomNumberGenerate()

ssp_err_t SF_CRYPTO_TRNG_RandomNumberGenerate (sf_crypto_trng_ctrl_t *const *p_api_ctrl*, sf_crypto_data_handle_t *const *p_random_number_buff*)

SSP Crypto TRNG Framework True Random Generation operation.

Return values

SSP_SUCCESS	The module was successfully closed.
SSP_ERR_NOT_OPEN	The module has not been opened before calling this API.
SSP_ERR_ASSERTION	One or more input parameters are NULL.

Returns

See Common Error Codes for other possible return codes.

Check if SF Crypto TRNG is opened before

Acquire SF Crypto Common lock before accessing HAL

Call HAL API to generate true random number

Get 16-byte multiples of TRNs first and store/hold it in the user buffer

Release SF Crypto Common lock

◆ SF_CRYPTO_TRNG_VersionGet()

ssp_err_t SF_CRYPTO_TRNG_VersionGet (ssp_version_t *const *p_version*)

Sets TRNG Framework Code and API version based on compile time macros.

Return values

SSP_SUCCESS	Successful close
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Variable Documentation

◆ g_sf_crypto_trng_api

const sf_crypto_trng_api_t g_sf_crypto_trng_api

Filled in Interface API structure for this Instance.

Functions

void	SF_EL_FX_BlockDriver (FX_MEDIA *p_fx_media) Access Block Media device functions open, close, read, write and control. More...

Detailed Description

FileX adaptation layer for block media device drivers.

SF_EL_FX FileX I/O is a single entry function which adapts FileX to Renesas Synergy block media device drivers.

Summary

SF_EL_FX Has no API file.

Macro Definition Documentation

◆ SF_EL_FX_55AA_SIGNATURE_OFFSET

#define SF_EL_FX_55AA_SIGNATURE_OFFSET (0x1FEU)
SSP FileX Support.

◆ SF_EL_FX_API_VERSION_MAJOR

#define SF_EL_FX_API_VERSION_MAJOR (2)
Version of the API defined in this file

◆ SF_EL_FX_CODE_VERSION_MAJOR

#define SF_EL_FX_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ SF_EL_FX_OPEN

#define SF_EL_FX_OPEN (0x4649584FU)
"FIXO" in ASCII. Used to determine if the control block is open.

Enumeration Type Documentation

◆ sf_el_fx_media_init_status_t

enum sf_el_fx_media_init_status_t	
Media initialization status	
Enumerator	
SF_EL_FX_SYS_UNINIT	System not initialized.
SF_EL_FX_SYS_INIT_PARTIAL	System partial initialized.
SF_EL_FX_SYS_INIT_FULL	System full initialized.

◆ sf_el_fx_media_mbr_ebr_status_t

enum sf_el_fx_media_mbr_ebr_status_t	
Media MBR/EBR table status	
Enumerator	
SF_EL_FX_DONOT_EXIST_OR_INVALID	MBR/EBR table do not exist or is invalid.
SF_EL_FX_EXIST_AND_VALID	MBT/EBR table is valid.

◆ sf_el_fx_media_partition_ebr_buff_update_t

enum sf_el_fx_media_partition_ebr_buff_update_t	
Media partition EBR buffer update	
Enumerator	
SF_EL_FX_EBR_BUFF_UPDATE_PRESENT	Update present EBR table.
SF_EL_FX_EBR_BUFF_UPDATE_NEXT	Update next EBR table.

◆ sf_el_fx_media_partition_exist_status_t

enum sf_el_fx_media_partition_exist_status_t	
Media partition exist status	
Enumerator	
SF_EL_FX_NO_PARTITIONS	No partition in memory.
SF_EL_FX_MULTIPLE_PARTITIONS	Multiple partitions in memory.

◆ sf_el_fx_media_partition_format_status_t

enum sf_el_fx_media_partition_format_status_t	
Media partition format status	
Enumerator	
SF_EL_FX_PARTITION_UNFORMATED	Partition is not formated.
SF_EL_FX_PARTITION_PRE_RESET_FORMATED	Partition exist before reset of the system.
SF_EL_FX_PARTITION_POST_RESET_FORMATED	Partition created after system reset.

◆ sf_el_fx_media_partition_global_open_status_t

enum sf_el_fx_media_partition_global_open_status_t	
Media partition global open status	
Enumerator	
SF_EL_FX_PARTITION_GLOBAL_CLOSE	All partitions are closed.
SF_EL_FX_PARTITION_GLOBAL_OPEN	At least one partition is open.

◆ sf_el_fx_media_partition_open_status_t

enum sf_el_fx_media_partition_open_status_t	
Media partition open status	
Enumerator	
SF_EL_FX_PARTITION_CLOSE	Partition is close.
SF_EL_FX_PARTITION_OPEN	Partition is open.

◆ sf_el_fx_media_partition_table_update_status_t

enum sf_el_fx_media_partition_table_update_status_t	
Block Media Control Block Type Media partition table update status	
Enumerator	
SF_EL_FX_PARTITION_TABLE_UPDATE_DISABLE	Partition table update is disabled.
SF_EL_FX_PARTITION_TABLE_UPDATE_ENABLE	Partition table update is enabled.

◆ sf_el_fx_media_partition_type_t

enum sf_el_fx_media_partition_type_t	
Media partition types	
Enumerator	
SF_EL_FX_PARTITION_TYPE_UNKNOWN	Partition type unknown.
SF_EL_FX_PARTITION_TYPE_FAT_16_MEMORY_LESS_THAN_32MB	Partition type fat16 with size less than 32 MB.
SF_EL_FX_PARTITION_TYPE_EXTENDED	Partition type extended.
SF_EL_FX_PARTITION_TYPE_FAT_16_MEMORY_MORE_THAN_32MB	Partition type fat16 with size more than 32 MB.
SF_EL_FX_PARTITION_TYPE_EXFAT	Partition type exFAT.
SF_EL_FX_PARTITION_TYPE_FAT_32	Partition type fat32.
SF_EL_FX_PARTITION_TYPE_EXTENDED_INT13	Partition type extended with interrupt 13.

Function Documentation

◆ SF_EL_FX_BlockDriver()

void SF_EL_FX_BlockDriver (FX_MEDIA * *p_fx_media*)

Access Block Media device functions open, close, read, write and control.

The file system relies on the media to be formatted prior to creating directories and files The sector size and sector count will change depending on the media type and size.

The File Allocation Table (FAT) starts after the reserved sectors in the media. The FAT area is basically an array of 12-bit, 16-bit, or 32-bit entries that determine if that cluster is allocated or part of a chain of clusters comprising a subdirectory or a file. The size of each FAT entry is determined by the number of clusters that need to be represented. If the number of clusters (derived from the total sectors divided by the sectors per cluster) is less than 4,086, 12-bit FAT entries are used. If the total number of clusters is greater than 4,086 and less than or equal to 65,525, 16-bit FAT entries are used. Otherwise, if the total number of clusters is greater than 65,525, 32-bit FAT entries are used. The SF_EL_FX_BlockDriver function is called from the FileX file system driver and issues requests to a Block Media device through the Synergy Block Media Interface. Uses block media driver for accesses.

Parameters

[in,out]	p_fx_media	FileX media control block. All information about each open media device are maintained in by the FX_MEDIA data type. The I/O driver communicates the success or failure of the request through the fx_media_driver_status member of FX_MEDIA (p_fx_media->fx_media_driver_status). Possible values are documented in the FileX User Guide.

Return values

none.	

Note

This function returns nothing, but updates FileX media control block.This function calls sf_el_fx_driver_request_handler

Initialize FileX I/O status to error. It will change to FX_SUCCESS unless an operation fails.

Pass control to sf_el_fx_driver_request_handler, which is responsible for setting FX_MEDIA::fx_media_driver_status in-case of any failure.

- Update FX_MEDIA::fx_media_driver_status to FX_SUCCESS on successful driver request.

sf_el_fx_media_partition_data_info_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » FX_IO Framework

#include <sf_el_fx.h>

sf_el_fx_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » FX_IO Framework

#include <sf_el_fx.h>

Data Fields

uint32_t *	p_hidden_sector Partition base address.
void const *	p_context Placeholder for user data.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- sf_el_fx.h

sf_el_fx_config_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » FX_IO Framework

#include <sf_el_fx.h>

Data Fields

sf_block_media_instance_t *	p_lower_lvl_block_media Lower level block media pointer.
void const *	p_context Pointer to user-provided context.
void *	p_extend

	Any configuration data needed by the hardware.
uint32_t	total_partitions Total partition as per the user configuration input.
void(*	p_callback)(sf_el_fx_callback_args_t *p_args) User callback to specify partitions offset when partitions exist and board got reset.

Detailed Description

SF_EL_FX configuration block.

The documentation for this struct was generated from the following file:

- sf_el_fx.h

sf_el_fx_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » FX_IO Framework

#include <sf_el_fx.h>

Data Fields

uint32_t	open Flag to determine if the device is open.
sf_el_fx_media_info_t	media_info Available media and partition details.
sf_block_media_instance_t *	p_lower_lvl_block_media Lower level block media pointer.
void const *	p_context Pointer to user-provided context.

void(*	p_callback)(sf_el_fx_callback_args_t *p_args) User callback to specify partitions offset when partitions exist and board got reset.

Detailed Description

SF_EL_FX instance control block.

The documentation for this struct was generated from the following file:

- sf_el_fx.h

sf_el_fx_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » FX_IO Framework

#include <sf_el_fx.h>

Data Fields

sf_el_fx_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
sf_el_fx_config_t const *	p_config Pointer to the configuration structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- sf_el_fx.h

5.1.3.22 GUIX Synergy Port

Renesas Synergy Software Package Reference » Framework Layer

GUIX adaptation layer. More...

Data Structures

struct	sf_el_gx_instance_ctrl_t

Functions

ssp_err_t	SF_EL_GX_Open (sf_el_gx_ctrl_t *const p_api_ctrl, sf_el_gx_cfg_t const *const p_cfg) GUIX adaptation framework driver for Synergy, open function to configure the framework module. The function initialize RTOS resources used by the module, initialize the control block based on user configuration, and transition the module state to SF_EL_GX_OPENED. This function calls following functions: More...
ssp_err_t	SF_EL_GX_Close (sf_el_gx_ctrl_t *const p_api_ctrl) GUIX adaptation framework for Synergy, Close function. This function calls following functions: More...
ssp_err_t	SF_EL_GX_VersionGet (ssp_version_t *p_version) GUIX adaptation framework for Synergy, Version get function. More...
UINT	SF_EL_GX_Setup (GX_DISPLAY *p_display) GUIX adaptation framework for Synergy, Setup GUIX low level device drivers for Display and D/AVE 2D interface. This function has to be passed to the GUIX Studio display driver setup function gx_studio_display_configure() to let GUIX call this function and configure the GUIX low level device driver(s). This function calls following functions: More...
ssp_err_t	SF_EL_GX_CanvasInit (sf_el_gx_ctrl_t *const p_api_ctrl, GX_WINDOW_ROOT *p_window_root) GUIX adaptation framework for Synergy, Canvas initialization, setup the memory address of first canvas to be rendered. More...

Detailed Description

GUIX adaptation layer.

Function Documentation

◆ SF_EL_GX_CanvasInit()

ssp_err_t SF_EL_GX_CanvasInit (sf_el_gx_ctrl_t *const *p_api_ctrl*, GX_WINDOW_ROOT * *p_window_root*)

GUIX adaptation framework for Synergy, Canvas initialization, setup the memory address of first canvas to be rendered.

Return values

SSP_SUCCESS	Memory address is successfully configured to a canvas.
SSP_ERR_ASSERTION	Invalid control block (NULL pointer) or window root (NULL pointer) passed to driver.
SSP_ERR_INVALID_CALL	Function call was made when the driver is not in SF_EL_GX_CONFIGURED state.
SSP_ERR_INTERNAL	Mutex operation had an error.

Locks the driver to update the context.

Lets GUIX know the first canvas

Unlocks the driver.

◆ SF_EL_GX_Close()

ssp_err_t SF_EL_GX_Close (sf_el_gx_ctrl_t *const *p_api_ctrl*)

GUIX adaptation framework for Synergy, Close function. This function calls following functions:

- tx_mutex_delete() Deletes the mutex for driver
- tx_semaphore_delete() Deletes the semaphore for rendering and displaying synchronization.
- sf_el_gx_d2_close() Finalizes 2D Drawing Engine hardware.
- sf_el_gx_display_close() Finalizes display hardware.

Return values

SSP_SUCCESS	Closed the module successfully.
SSP_ERR_ASSERTION	NULL pointer error happens.
SSP_ERR_NOT_OPEN	SF_EL_GX is not opened.

Note

This function is re-entrant.

Finalizes display hardware

Changes the driver state

Deletes a semaphore for frame buffer flip

Deletes driver global mutex

Clears the temporary storage for the pointer to a control block. This procedure has done in SF_EL_GX_Setup() in the expected function call sequence, but clear it here as well in case SF_EL_GX_Setup() being not called.

◆ SF_EL_GX_Open()

ssp_err_t SF_EL_GX_Open (sf_el_gx_ctrl_t *const *p_api_ctrl*, sf_el_gx_cfg_t const *const *p_cfg*)

GUIX adaptation framework driver for Synergy, open function to configure the framework module. The function initialize RTOS resources used by the module, initialize the control block based on user configuration, and transition the module state to SF_EL_GX_OPENED. This function calls following functions:

- sf_el_gx_open_param_check() Check configuration parameters if parameter check is enabled.
- tx_mutex_create() Creates the mutex for lock the driver during the context update.
- tx_mutex_delete() Deletes the mutex if kernel service calls failed in the process.
- tx_semaphore_create() Creates the semaphore for rendering and displaying synchronization.

Return values

SSP_SUCCESS	Opened the module successfully.
SSP_ERR_ASSERTION	NULL pointer error happened.
SSP_ERR_IN_USE	SF_EL_GX is in-use.
SSP_ERR_INTERNAL	Error happened in kernel service calls.
SSP_ERR_INVALID_ARGUMENT	An invalid argument was passed to the driver.

Note

This function does not initialize the display or rendering hardware but setup function will do.
This function registers a user callback function but it is optional. Set NULL to p_cfg::p_callback if user callback is not required.
The configuration for the frame buffer B (p_cfg::p_framebuffer_b) is optional. Set NULL to p_framebuffer_b in case of a single-buffered system.

Creates global mutex for SF_EL_GX to protect access to the control structure and GUIX low level device drivers setup.

Locks the SF_EL_GX instance until driver setup is done by SF_EL_GX_Setup().

Creates a semaphore for frame buffer flip

Initializes the SF_EL_GX control block

Saves the control block to the global pointer inside the module temporarily. Stored data will be used in sf_el_gx_driver_setup() which will be invoked by GUIX. This pointer will be valid at last but be protected until SF_EL_GX_Setup() is done.

Changes the driver state

◆ SF_EL_GX_Setup()

UINT SF_EL_GX_Setup (GX_DISPLAY * *p_display*)

GUIX adaptation framework for Synergy, Setup GUIX low level device drivers for Display and D/AVE 2D interface. This function has to be passed to the GUIX Studio display driver setup function gx_studio_display_configure() to let GUIX call this function and configure the GUIX low level device driver(s). This function calls following functions:

- tx_mutex_put() Puts the driver global mutex when the low level driver setup is done
- tx_mutex_delete() Deletes the mutex if kernel service calls failed in the process
- _gx_synergy_display_driver_565rgb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is RGB565 format
- _gx_synergy_display_driver_24xrgb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is RGB888, unpacked format
- _gx_display_driver_32argb_setup() Setups default GUIX callback functions for RGB565 in case of display format format is ARGB8888, unpacked format
- sf_el_gx_driver_setup() Setups low level device drivers and overrides the GUIX default callback functions with hardware accelerated functions.

Return values

GX_SUCCESS	Device driver setup is successfully done.
GX_FAILURE	Device driver setup failed.

Note

Make sure SF_EL_GX_Open() has been called when this function is called back by GUIX. The behavior is not defined if this function were not invoked by GUIX.

Copies the GX_DISPLAY context for later use.

Setups GUIX low level device drivers

Changes the driver state

Clears the temporary storage for the pointer to a control block.

Unlocks the SF_EL_GX instance since driver setup is done

◆ SF_EL_GX_VersionGet()

ssp_err_t SF_EL_GX_VersionGet (ssp_version_t * *p_version*)
GUIX adaptation framework for Synergy, Version get function.

Parameters

[in,out]	p_version	The version number.

Return values

SSP_SUCCESS	Successfully returned the module version.
SSP_ERR_ASSERTION	NULL pointer is passed to function.

Note

This function is re-entrant.

sf_el_gx_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » GUIX Synergy Port

#include <sf_el_gx.h>

Data Fields

GX_DISPLAY *	p_display Pointer to the GUIX display context.
display_instance_t *	p_display_instance Pointer to a display instance.
display_runtime_cfg_t *	p_display_runtime_cfg Pointer to a runtime display configuration.
display_frame_layer_t	inherit_frame_layer Configured Inherit Screen Layer.
void *	p_canvas Pointer to a canvas(reserved)

void *	p_framebuffer_read Pointer to a frame buffer (for displaying)
void *	p_framebuffer_write Pointer to a frame buffer (for rendering)
void(*	p_callback)(sf_el_gx_callback_args_t *p_args) Pointer to callback function.
void *	p_context Pointer to a context.
TX_SEMAPHORE	semaphore Semaphore for the frame buffer flip sync.
bool	rendering_enable Sync flag between Rendering and displaying.
bool	display_list_flushed Flag to show the display list is flushed.
sf_el_gx_state_t	state State of this module.
void *	p_jpegbuffer Pointer to a JPEG work buffer.
uint32_t	jpegbuffer_size Size of a JPEG work buffer.
void *	p_sf_jpeg_decode_instance Pointer to a JPEG framework instance.

_Bool	dave2d_buffer_cache_enabled D/AVE 2D buffer cache enabled/disabled.
uint8_t	bytes_per_pixel Number of bytes per pixel.

Detailed Description

GUIX adaptation layer for SSP. Instance control block for the SSP GUIX adaptation framework

Detailed Description

LevelX NOR driver implementation.

Macro Definition Documentation

◆ SF_EL_LX_NOR_API_VERSION_MAJOR

```
#define SF_EL_LX_NOR_API_VERSION_MAJOR   (2U)
```

Common macro for SSP header files. There is also a corresponding SSP_FOOTER macro at the end of this file. Version of the API defined in this file

◆ SF_EL_LX_NOR_CODE_VERSION_MAJOR

```
#define SF_EL_LX_NOR_CODE_VERSION_MAJOR   (2U)
```

Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ sf_el_lx_nor_event_t

enum sf_el_lx_nor_event_t	
Options for the callback events.	
Enumerator	
SF_EL_LX_NOR_EVENT_BLOCK_ERASE	Block erase event triggered.

Function Documentation

◆ SF_EL_LX_NOR_BlockErase()

ssp_err_t SF_EL_LX_NOR_BlockErase (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*, ULONG *block*, ULONG *erase_count*)

LevelX NOR driver "block erase" service.

This is responsible for erasing the specified block of the NOR flash.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR framework instance.
[in]	block	Specifies which NOR block to erase.
[in]	erase_count	Provided for diagnostic purposes(currently unused).

Return values

SSP_SUCCESS	LevelX NOR flash block erase successful.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver not in OPEN state for erasing.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:erase

Validate the parameters

If the driver is not open return an error.

Calculate the block address

Erase using underlying API

Call the user function if available

Prepare the callback arguments

Invoke callback function

◆ SF_EL_LX_NOR_BlockErasedVerify()

ssp_err_t SF_EL_LX_NOR_BlockErasedVerify (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*, ULONG *block*)

LevelX NOR driver "block erased verify" service.

This is responsible for verifying the specified block of the NOR flash is erased.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR framework instance.
[in]	block	Specifies which block to verify that it is erased.

Return values

SSP_SUCCESS	LevelX flash block erase verification successful.
SSP_ERR_ASSERTION	p_ctrl or lower level driver is NULL.
SSP_ERR_NOT_OPEN	Driver not in OPEN state for verifying.
SSP_ERR_NOT_ERASED	The block is not erased properly.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:read

Validate the parameters

Check whether the driver is in OPEN state

Loop to check if the block is erased.

Check whether the driver read is success or not

Iterate over buffer and validate

Is this word erased?

◆ SF_EL_LX_NOR_Close()

ssp_err_t SF_EL_LX_NOR_Close (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*)

LevelX NOR driver close service.

This is responsible for closing the driver properly.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR framework instance.

Return values

SSP_SUCCESS	LevelX flash is available and is now open for read, write, and control access.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver not in OPEN state for closing.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:close

Validate the parameters

Check whether the driver is in OPEN state

Close underlying API

Reset OPEN state

◆ SF_EL_LX_NOR_Open()

ssp_err_t SF_EL_LX_NOR_Open (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*,
sf_el_lx_nor_instance_cfg_t const *const *p_cfg*)

Initializes LevelX NOR frame work read/write and control.

Name of module used by error logger macro Calls lower level driver initialization function.

Parameters

[in,out]	p_ctrl	Control block for the LevelX NOR framework instance.
[in,out]	p_cfg	LevelX NOR driver instance.

Return values

SSP_SUCCESS	LevelX NOR driver is successfully opened.
SSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.
SSP_ERR_ALREADY_OPEN	Driver is already in OPEN state.
SSP_ERR_INVALID_ARGUMENT	p_memory_settings structure configured to invalid values.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:open
- sf_memory_api_t:infoGet
- sf_memory_api_t:close

Validate the parameters

Check whether instance is already open

Update the instance control block

Open the underlying memory instance

Get the underlying NOR flash info

If unable to get NOR flash info, close lower layer driver

Update memory region info

Setup the base address of the flash memory.

Setup geometry of the flash.

Setup the base address of the flash memory.

Setup geometry of the flash.

Mark control block open so subsequent calls know the device is open.

◆ SF_EL_LX_NOR_Read()

ssp_err_t SF_EL_LX_NOR_Read (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash*, ULONG *const *p_dest*, ULONG *word_count*)

LevelX NOR driver "read sector" service.

This is responsible for reading a specific sector in a specific block of the NOR flash. All error checking and correcting logic is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR framework instance.
[in]	p_flash	Specifies the address of a logical sector within a NOR flash block of memory.
[in,out]	p_dest	Specifies where to place the sector contents.
[in]	word_count	Specifies how many 32-bit words to read.

Return values

SSP_SUCCESS	LevelX NOR flash sector read successful.
SSP_ERR_ASSERTION	p_ctrl, p_flash or p_dest is NULL.
SSP_ERR_NOT_OPEN	Driver not in OPEN state for reading.
SSP_ERR_INVALID_ARGUMENT	Requested range can't fit in the flash address range.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:read

Validate the parameters

Check whether the driver is in OPEN state

Read from underlying API

◆ SF_EL_LX_NOR_Write()

ssp_err_t SF_EL_LX_NOR_Write (sf_el_lx_nor_instance_ctrl_t *const *p_ctrl*, ULONG *const *p_flash*, ULONG *const *p_src*, ULONG *word_count*)

LevelX NOR driver "write sector" service.

This is responsible for writing a specific sector into a block of the NOR flash. All error checking is the responsibility of the this service.

Parameters

[in]	p_ctrl	Control block for the LevelX NOR framework instance.
[in,out]	p_flash	Specifies the address of a logical sector within a NOR flash block of memory.
[in]	p_src	Specifies the source of the write.
[in]	word_count	Specifies how many 32-bit words to write.

Return values

SSP_SUCCESS	LevelX NOR flash sector write successful.
SSP_ERR_ASSERTION	p_ctrl, p_flash or p_src is NULL.
SSP_ERR_NOT_OPEN	Driver not in OPEN state for writing.
SSP_ERR_INVALID_ARGUMENT	Requested range can't fit in the flash address range.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls

- sf_memory_api_t:write

Validate the parameters

Check whether the driver is in OPEN state

Write to underlying API

sf_el_lx_nor_memory_settings_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » EL_LX_NOR

#include <sf_el_lx_nor.h>

Data Fields

uint32_t	absolute_start_addr Starting address of memory partition.
uint32_t	size Size of the partitioned region.

Detailed Description

SF_EL_LX_NOR memory settings for partition functionality.

Detailed Description

RTOS-integrated USBX CDC ACM device implementation.

Function Documentation

◆ SF_EL_UX_COMMS_Close()

ssp_err_t SF_EL_UX_COMMS_Close (sf_comms_ctrl_t *const *p_api_ctrl*)

Releases all the ThreadX Resources.

Return values

SSP_SUCCESS	Channel successfully closed
SSP_ERR_ASSERTION	Pointer to control block is NULL
SSP_ERR_NOT_OPEN	Module is not opened.

Note

This function is reentrant.

Check if module has been opened.

Delete transmit mutex.

Delete receive mutex.

Deletes a semaphore for USBX CDC instance

◆ SF_EL_UX_COMMS_Lock()

ssp_err_t SF_EL_UX_COMMS_Lock (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_lock_t *lock_type*, UINT *timeout*)

Lock the USB COM resource.

Return values

SSP_SUCCESS	Locking a USB COM resource successful.
SSP_ERR_ASSERTION	Pointer to control block is NULL.
SSP_ERR_NOT_OPEN	Module is not opened.
SSP_ERR_TIMEOUT	Mutex not available in timeout.

If lock type is ALL, both TX and RX gets locked else either TX or RX is locked.

If TX or RX fails to acquire mutex, return error.

◆ SF_EL_UX_COMMS_Open()

ssp_err_t SF_EL_UX_COMMS_Open (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_cfg_t const *const *p_cfg*)

Initializes a USB channel for CDC ACM mode.

Parameters

[in]	p_api_ctrl	Pointer to control structure block.
[in]	p_cfg	Pointer to configuration structure block. This parameter is not used in the framework hence the NULL parameter check not implemented.

Return values

SSP_SUCCESS	Channel opened successfully.
SSP_ERR_ASSERTION	p_api_ctrl pointer parameter to control block is NULL.
SSP_ERR_TIMEOUT	Semaphore not available in timeout.
SSP_ERR_INTERNAL	Transmit/Receive mutex or Semaphore creation fails.
SSP_ERR_IN_USE	Channel/peripheral is running/busy.

Note

This function is reentrant.

Create semaphore if the USBX CDC instance is not ready.

If the semaphore creation fails, return error.

Suspend here until a USBX CDC instance is created by the USBX CDC for this module.

Create the mutex for protecting the access to control structure for transmit and related hardware

Create the mutex for protecting the access to control structure for receive and related hardware

Mark control block open.

◆ SF_EL_UX_COMMS_Read()

ssp_err_t SF_EL_UX_COMMS_Read (sf_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, UINT const *timeout*)

Read data from the USBX CDC-ACM driver.

Return values

SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_INTERNAL	An error has occurred if usb read operation fails or buffer overflow occurred.
SSP_ERR_TIMEOUT	Receive mutex get timed out

Note

This API is reentrant.

Get mutex.

Set timeout value in the transfer request.

If there is data leftover from the last packet, use it.

Read from the CDC class.

Release mutex in case of buffer overflow or read error .

Release mutex for Read API.

◆ SF_EL_UX_COMMS_Unlock()

ssp_err_t SF_EL_UX_COMMS_Unlock (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_lock_t *lock_type*)

Unlock the USB COM resource.

Return values

SSP_SUCCESS	Unlocking a USB COM resource successful.
SSP_ERR_ASSERTION	Pointer to control block is NULL.
SSP_ERR_NOT_OPEN	Module is not opened.
SSP_ERR_INTERNAL	Failed to release the mutex.

Unlock the USB CDC COM resource as per the user request.

If USB CDC COM resource fails to unlock,returns error.

◆ SF_EL_UX_COMMS_VersionGet()

ssp_err_t SF_EL_UX_COMMS_VersionGet (ssp_version_t *const *p_version*)

Get driver version.

Parameters

[out]	p_version	Version will be stored here.

Note

This function is reentrant.

◆ SF_EL_UX_COMMS_Write()

ssp_err_t SF_EL_UX_COMMS_Write (sf_comms_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, UINT const *timeout*)

Write data to the USBX CDC-ACM framework.

Return values

SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_INTERNAL	An error has occurred, when usb write operation fails.
SSP_ERR_TIMEOUT	Transmit mutex get timed out or when DTR and RTS state setting gets timed out.

Note

This function is reentrant.

Wait for DTR and RTS state to set.

Get Transmit mutex.

Set timeout value in the transfer request.

Release mutex in case of error condition and log the error .

Release Transmit mutex for Write API.

sf_el_ux_comms_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » USB Communication Framework V2

#include <sf_el_ux_comms_v2.h>

Detailed Description

USBX CDC ACM device communications instance control structure. DO NOT INITIALIZE. Initialization occurs when sf_comms_api_t::open is called

---

- sf_el_ux_comms_v2.h

5.1.3.25 External IRQ Framework

Renesas Synergy Software Package Reference » Framework Layer

RTOS-integrated external IRQ Framework. More...

Data Structures

struct	sf_external_irq_instance_ctrl_t

Functions

ssp_err_t	SF_EXTERNAL_IRQ_Open (sf_external_irq_ctrl_t *const p_api_ctrl, sf_external_irq_cfg_t const *const p_cfg) Configure external IRQ and optionally enable external IRQ callbacks. Implements sf_external_irq_api_t::open. More...
ssp_err_t	SF_EXTERNAL_IRQ_Wait (sf_external_irq_ctrl_t *const p_api_ctrl, ULONG const timeout) Get semaphore with specified timeout for external interrupt to expire. Implements sf_external_irq_api_t::wait. More...
ssp_err_t	SF_EXTERNAL_IRQ_VersionGet (ssp_version_t *const p_version) Get version and store it in provided pointer p_version. Implements sf_external_irq_api_t::versionGet. More...
ssp_err_t	SF_EXTERNAL_IRQ_Close (sf_external_irq_ctrl_t *const p_api_ctrl) Close channel at HAL layer and delete the semaphore . Implements sf_external_irq_api_t::close. More...

Detailed Description

RTOS-integrated external IRQ Framework.

Summary

This module is a ThreadX-aware external IRQ Framework for external inputs such as switches or other binary signals.

Function Documentation

◆ SF_EXTERNAL_IRQ_Close()

ssp_err_t SF_EXTERNAL_IRQ_Close (sf_external_irq_ctrl_t *const *p_api_ctrl*)

Close channel at HAL layer and delete the semaphore . Implements sf_external_irq_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_UNSUPPORTED	Unsupported operation.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- external_irq_api_t::close

Close low level driver

Clear information from control block so other functions know this instance is closed

Delete the semaphore used

◆ SF_EXTERNAL_IRQ_Open()

ssp_err_t SF_EXTERNAL_IRQ_Open (sf_external_irq_ctrl_t *const *p_api_ctrl*, sf_external_irq_cfg_t const *const *p_cfg*)

Configure external IRQ and optionally enable external IRQ callbacks. Implements sf_external_irq_api_t::open.

The SF_EXTERNAL_IRQ_Open() function creates semaphore for the external IRQ channel used, then calls the HAL driver open function. After successful initialization, the external IRQ is ready for use.

Return values

SSP_SUCCESS	Initialization was successful and external interrupt has started.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg, p_api, or p_api->open. See HAL driver for other possible causes.
SSP_ERR_IN_USE	This channel is already open.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls:

- external_irq_api_t::open

Note

This function is reentrant for any channel.

Save driver structure for use in other framework layer functions

Create semaphore for use with wait function

Prepare configuration for lower layer

Open lower layer

If low level initialization failed, delete the semaphore and exit the function with the error code

Delete the semaphore.

log the error and return the error

Mark control block open so other tasks know it is valid

◆ SF_EXTERNAL_IRQ_VersionGet()

ssp_err_t SF_EXTERNAL_IRQ_VersionGet (ssp_version_t *const *p_version*)

Get version and store it in provided pointer p_version. Implements sf_external_irq_api_t::versionGet .

Return values

SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

◆ SF_EXTERNAL_IRQ_Wait()

ssp_err_t SF_EXTERNAL_IRQ_Wait (sf_external_irq_ctrl_t *const *p_api_ctrl*, ULONG const *timeout*)

Get semaphore with specified timeout for external interrupt to expire. Implements sf_external_irq_api_t::wait.

Return values

SSP_SUCCESS	External interrupt stopped successfully.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_EXTERNAL_IRQ_Open to configure.
SSP_ERR_TIMEOUT	Time out happens while waiting a semaphore.
SSP_ERR_WAIT_ABORTED	Suspension was aborted by another thread.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Wait for semaphore post from ISR

sf_external_irq_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » External IRQ Framework

#include <sf_external_irq.h>

Data Fields

uint32_t	open Used by driver to check if control block is valid.

TX_SEMAPHORE	semaphore Semaphore used for SF_EXTERNAL_IRQ_Wait.
external_irq_instance_t const *	p_lower_lvl_irq Pointer to lower level driver instance.
bool	callback_used Used by driver to check if wait can be used.

Detailed Description

Instance control block. DO NOT INITIALIZE. Initialization occurs when sf_external_irq_api_t::open is called

---

The documentation for this struct was generated from the following file:

- sf_external_irq.h

ssp_err_t	SF_I2C_LockWait (sf_i2c_ctrl_t *const p_api_ctrl, uint32_t const timeout) Lock the I2C Bus resource. Once bus is locked by a device it can not be used by other devices. More...

Detailed Description

RTOS-integrated I2C Framework.

SSP I2C framework driver API

.

Summary

This is a ThreadX-aware I2C driver API. The API implements the I2C Framework interface and can

access several hardware peripherals at the HAL layer. The connection to the HAL layer is established by passing in a driver structure in SF_I2C_Open.

Interface Used

See also
I2C Framework

Function Documentation

◆ SF_I2C_Close()

ssp_err_t SF_I2C_Close (sf_i2c_ctrl_t *const *p_api_ctrl*)

Close the I2C device designated by the control handle and close the RTOS services used by the bus if last device is connected to the bus calls this API, else decrement the device count.

Return values

SSP_SUCCESS	Device is successfully closed.
SSP_ERR_NOT_OPEN	Device was not even opened.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:
- i2c_api_master_t::close

Note

This function is reentrant for any device.

Check whether device is opened or not.

Acquire the device count mutex before accessing the shared resource in close.

Check the count of opened devices on the bus. If there are no devices opened or all other devices on the bus are closed then close the low level I2C driver and release the RTOS services used by the bus.

Get the low level control in use.

Close low level driver.

Delete RTOS services used by the bus.

Decrement device count.

Delete the device count mutex

Decrement device count.

Release the device count mutex

Set device to closed state and restarted flag to false.

◆ SF_I2C_Lock()

ssp_err_t SF_I2C_Lock (sf_i2c_ctrl_t *const *p_api_ctrl*)

Lock the bus for a device. Once bus is locked by a device it can not be used by other devices.

Return values

SSP_SUCCESS	I2C channel is successfully locked.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

Note

This function is reentrant for any device.

Check whether device is opened or not.

Get mutex since this will access hardware registers.

Reconfigure the device address, if necessary

◆ SF_I2C_LockWait()

ssp_err_t SF_I2C_LockWait (sf_i2c_ctrl_t *const *p_api_ctrl*, uint32_t const *timeout*)

Lock the I2C Bus resource. Once bus is locked by a device it can not be used by other devices.

Return values

SSP_SUCCESS	I2C channel is successfully locked within the specified timeout.
SSP_ERR_ASSERTION	Pointer to I2C control block is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_TIMEOUT	Mutex not available in timeout.

Note

This function is reentrant for any device.

Check whether device is opened or not.

Get the mutex for this device.

Reconfigure the device address, if necessary

◆ SF_I2C_Open()

ssp_err_t SF_I2C_Open (sf_i2c_ctrl_t *const *p_api_ctrl*, sf_i2c_cfg_t const *const *p_cfg*)

Initialize a I2C bus and open low level I2C driver.

Return values

SSP_SUCCESS	I2C device is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_cfg, Pointer to Open, Close, Read, Write, or reset API interfaces,p_cfg->p_bus.
SSP_ERR_INTERNAL	Internal error occurred.
SSP_ERR_ALREADY_OPEN	Same I2C framework device is already open.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is

- i2c_api_master_t::open

Note

This function is reentrant for any channel.
Control handle must be cleared by caller before calling this function.

Check whether device is already opened or not.

Copy bus pointer to control

Set framework level callback function.

Save context for use in ISRs.

Enter a critical section before checking the device count mutex status.

Check if device count mutex is already created. If not then create the mutex.

Create device_count_mutex. This is used to protect shared variable device_count in bus control structure.

If mutex create fails, return error.

Exit critical section

Acquire the device count mutex before accessing the shared resource. Try again if the mutex was deleted in close.

Increment device count.

Release the device count mutex

Save device configuration for reconfiguration.

Set device state as Opened.

Initialize restarted flag to false.

◆ SF_I2C_Read()

ssp_err_t SF_I2C_Read (sf_i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*, uint32_t const *timeout*)

Start the transfer process and receive data from I2C device.

Return values

SSP_SUCCESS	Data received successfully.
SSP_ERR_NOT_OPEN	Device instance not opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_dest, bytes, timeout.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- i2c_api_master_t::read

Check whether device is opened or not.

Start transfer process - check reconfiguration, get Mutex.

Get the low level control in use.

Perform read.

Wait for callback to set event flag.

Finish transfer.

◆ SF_I2C_Reset()

ssp_err_t SF_I2C_Reset (sf_i2c_ctrl_t *const *p_api_ctrl*, uint32_t const *timeout*)

Abort any in-progress transfer.

Return values

SSP_SUCCESS	Channel was reseted without issue.
SSP_ERR_NOT_OPEN	Device was not even opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_INTERNAL	Internal error occurred.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- i2c_api_master_t::reset

Check whether device is opened or not.

Get the low level control in use.

Get mutex since this will access hardware registers.

◆ SF_I2C_Unlock()

ssp_err_t SF_I2C_Unlock (sf_i2c_ctrl_t *const *p_api_ctrl*)

Unlock the locked bus and make the bus usable for other devices.

Return values

SSP_SUCCESS	I2C bus is successfully unlocked.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.
SSP_ERR_ASSERTION	Following parameters is NULL: p_api_ctrl.

Note

This function is reentrant for any device.

Check whether device is opened or not.

Release the mutex so that others can use the bus.

◆ SF_I2C_VersionGet()

ssp_err_t SF_I2C_VersionGet (ssp_version_t *const *p_version*)

Get the version information of the framework.

Return values

SSP_SUCCESS	Got version number successfully.
SSP_ERR_ASSERTION	Following parameters is NULL: p_version.

Checks error. Further parameter checking can be done at the driver layer.

◆ SF_I2C_Write()

ssp_err_t SF_I2C_Write (sf_i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*, uint32_t const *timeout*)

Start the transfer process and send data on I2C bus.

Return values

SSP_SUCCESS	Data written successfully.
SSP_ERR_NOT_OPEN	Device instance not opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_src, bytes.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- i2c_api_master_t::write

Check whether device is opened or not.

Start transfer process - check reconfiguration, get Mutex.

Get the low level control in use.

Perform write.

Wait for callback to set event flag.

Finish transfer.

sf_i2c_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » I2C Framework

#include <sf_i2c.h>

Data Fields

sf_i2c_bus_t *	p_bus Bus using this device. Copy from configuration structure.
i2c_master_instance_t const *	p_lower_lvl_i2c I2C instance.
i2c_cfg_t	lower_lvl_cfg Used to reconfigure I2C driver.
i2c_ctrl_t *	p_lower_lvl_ctrl I2C peripheral control block.
sf_i2c_dev_state_t	dev_state Device status.
bool	restarted Indicates whether device issued a restart.

Detailed Description

I2C instance control block. DO NOT INITIALIZE. Initialization occurs when sf_i2c_api_t::open is called.

The documentation for this struct was generated from the following file:

- sf_i2c.h

Detailed Description

RTOS-integrated JPEG Framework.

Macro Definition Documentation

◆ SF_JPEG_DECODE_CODE_VERSION_MAJOR

#define SF_JPEG_DECODE_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ SF_JPEG_DECODE_OPEN

#define SF_JPEG_DECODE_OPEN (0x4A504547U)
"JPEG" in ASCII, used to identify general JPEG control block

◆ SF_JPEG_ERROR_RETURN

#define SF_JPEG_ERROR_RETURN (a, err) SSP_ERROR_RETURN((a), (err), &g_module_name[0], &s_sf_jpeg_version)
Macro for error logger.

Function Documentation

◆ SF_JPEG_Decode_Close()

ssp_err_t SF_JPEG_Decode_Close (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*)

Close JPEG codec device. Un-finished codec operation is interrupted, and output data are discarded.

Precondition

Call SF_JPEG_Decode_Open() to configure the timer before using this function.

Return values

SSP_SUCCESS	The JPEG decode device is successfully closed.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.

Call the low level driver to close the JPEG device.

Clear information from control block so other functions know this block is closed

◆ SF_JPEG_Decode_HorizontalStrideSet()

ssp_err_t SF_JPEG_Decode_HorizontalStrideSet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, uint32_t *horizontal_stride*)

Configure the horizontal stride value.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	Horizontal Stride value is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::horizontalStrideSet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_ImageSizeGet()

ssp_err_t SF_JPEG_Decode_ImageSizeGet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, uint16_t * *p_horizontal_size*, uint16_t * *p_vertical_size*)

Obtain the size of the image. This function is only useful for decoding a JPEG image.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	The JPEG image size is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::imageSizeGet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_ImageSubsampleSet()

ssp_err_t SF_JPEG_Decode_ImageSubsampleSet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_subsample_t *horizontal_subsample*, jpeg_decode_subsample_t *vertical_subsample*)

Configure the horizontal and vertical subsample values. This allows an application to reduce the size of the decoded image at runtime.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	Image subsample values are successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::imageSubsampleSet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_InputBufferSet()

ssp_err_t SF_JPEG_Decode_InputBufferSet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, void *const *p_buffer*, uint32_t const *buffer_size*)

Configures JPEG coded input data.

This API configures the decode input buffer address register. After the input buffer address is set, the driver checks whether the output buffer address is set, and verifies that the output buffer size is large enough to hold at least eight output lines of data. If both the input buffer and output buffer are set properly, the driver automatically starts the decode process.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	Decode input buffer is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::inputBufferSet

Obtain mutex before making HAL-level driver call.

Call the HAL driver layer inputBufferSet routine.

◆ SF_JPEG_Decode_LinesDecodedGet()

ssp_err_t SF_JPEG_Decode_LinesDecodedGet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_lines*)

Obtain number of lines decoded by the codec.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	Lines decoded value is successfully obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::linesDecodedGet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_Open()

ssp_err_t SF_JPEG_Decode_Open (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, sf_jpeg_decode_cfg_t const *const *p_cfg*)

Parameter checking and initialize JPEG decode with sf_jpeg_initialize helper function and marking the open flag in control block.

Return values

SSP_SUCCESS	JPEG Decode framework is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters may be null: p_ctrl or p_cfg.
SSP_ERR_ALREADY_OPEN	JPEG Decode framework is already open.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Initialize the JPEG framework

Save driver structure pointer for use in other framework layer functions.

Mark control block open so subsequent calls know the device is open.

◆ SF_JPEG_Decode_OutputBufferSet()

ssp_err_t SF_JPEG_Decode_OutputBufferSet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, void * *p_buffer*, uint32_t *buffer_size*)

Configure the decode output buffer.

This API configures the decode output buffer address register. After the output buffer address is set, the driver computers the number of output lines the buffer is able to hold. The hardware requires the number out output lines to decode at a time is multiple of eight. If both the input buffer and output buffer are set properly, the driver automatically starts the decode process.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	Output buffer is successfully configured.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::outputBufferSet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_PixelFormatGet()

ssp_err_t SF_JPEG_Decode_PixelFormatGet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_color_space_t *const *p_color_space*)

Obtain the format of the image. This function is only useful for decoding a JPEG image.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	The JPEG image size is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::pixelFormatGet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_StatusGet()

ssp_err_t SF_JPEG_Decode_StatusGet (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_status_t *const *p_status*)

Obtain JPEG codec status. This function can be used to poll the device instead of using SF_JPEG_Decode_Wait() to block on JPEG operations.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	The JPEG status information is obtained.
SSP_ERR_ASSERTION	p_ctrl is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_IN_USE	The mutex may be unavailable for the the device. See HAL driver for other possible causes.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::statusGet

Obtain mutex before making HAL-level driver call.

◆ SF_JPEG_Decode_VersionGet()

ssp_err_t SF_JPEG_Decode_VersionGet (ssp_version_t *const *p_version*)

Get version and store it in provided pointer p_version.

Return values

SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version is null.

◆ SF_JPEG_Decode_Wait()

ssp_err_t SF_JPEG_Decode_Wait (sf_jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_status_t *const *p_status*, uint32_t *timeout*)

Wait for current JPEG codec operation to finish.

Precondition

Call SF_JPEG_Decode_Open() to configure the JPEG codec block before using this function.

Return values

SSP_SUCCESS	The wait function returns successfully.
SSP_ERR_ASSERTION	p_ctrl or p_status is null.
SSP_ERR_NOT_OPEN	JPEG Decode Framework module is not yet initialized.
SSP_ERR_TIMEOUT	The wait operation timed out, the underlying driver did not response in time.
SSP_ERR_WAIT_ABORTED	System internal error occurred.

Obtain mutex before making HAL-level driver call.

◆ sf_jpeg_initialize()

ssp_err_t sf_jpeg_initialize (sf_jpeg_decode_instance_ctrl_t *const *p_ctrl*, sf_jpeg_decode_cfg_t const *const *p_cfg*)

Acquires mutex, then handles driver initialization at the HAL layer. This function releases the mutex before returns to the caller.

Parameters

[in,out]	p_ctrl	Control handle for JPEG framework context for a device.
[in]	p_cfg	Pointer to JPEG framework Configuration Structure.

Return values

SSP_SUCCESS	JPEG Decode driver is successfully opened.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes. This function calls

- jpeg_decode_api_t::open

Create event flags for use with wait function

Create the mutex for this instance, this mutex is used to protect access to lower level hardware

Duplicate the content of p_cfg.

Install framework callback and context.

Call the low level driver to configure the JPEG device.

If the operation failed, delete the resources.

sf_jpeg_decode_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » JPEG Framework

#include <sf_jpeg_decode.h>

Data Fields

uint32_t	open Indicate whether the driver is open.

uint32_t	state Used by driver to check if pointer to control block is valid.
TX_MUTEX	mutex Mutex used to protect access to lower level driver hardware.
TX_EVENT_FLAGS_GROUP	events Event flags used by the HAL driver to notify the framework driver of.
jpeg_decode_instance_t const *	p_lower_lvl_jpeg_decode Pointer to lower level instance.

Detailed Description

JPEG framework instance control block. DO NOT INITIALIZE. Initialization occurs when sf_jpeg_decode_api_t::open is called.

The documentation for this struct was generated from the following file:

- sf_jpeg_decode.h

Detailed Description

RTOS-integrated Memory framework for QSPI NOR driver.

Name of module used by error logger macro

Macro Definition Documentation

◆ SF_MEMORY_QSPI_NOR_CODE_VERSION_MAJOR

#define SF_MEMORY_QSPI_NOR_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

Function Documentation

◆ SF_MEMORY_QSPI_NOR_Close()

ssp_err_t SF_MEMORY_QSPI_NOR_Close (sf_memory_ctrl_t *const *p_ctrl*)

Close the Memory QSPI NOR driver module.

Return values

SSP_SUCCESS	Close was successful.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- qspi_api_t::close

Validate the parameters

Close the underlying QSPI

Mark instance as closed for future reference

◆ SF_MEMORY_QSPI_NOR_Erase()

ssp_err_t SF_MEMORY_QSPI_NOR_Erase (sf_memory_ctrl_t * *p_ctrl*, uint32_t const *memory_address*, uint32_t const *num_bytes*)

Erase a number of bytes from the flash.

Return values

SSP_SUCCESS	The command to erase the flash was executed successfully.
SSP_ERR_ASSERTION	p_ctrl or memory_address is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid num_bytes entered.
SSP_ERR_NOT_OPEN	Driver is not opened.
SSP_ERR_TIMEOUT	Wait timed out.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls
- qspi_api_t::erase
- qspi_api_t::statusGet

Validate the parameters

Check whether instance is open or not

Check whether the device address is valid

Calculate maximum erase size

Check whether we have valid erase size

◆ SF_MEMORY_QSPI_NOR_Flush()

ssp_err_t SF_MEMORY_QSPI_NOR_Flush (sf_memory_ctrl_t *const *p_ctrl*)

Flush any pending data to the disk. This is not required for QSPI NOR Flash.

Return values

SSP_SUCCESS	NO error detected.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Validate the parameters

Check whether instance is open or not

◆ SF_MEMORY_QSPI_NOR_InfoGet()

ssp_err_t SF_MEMORY_QSPI_NOR_InfoGet (sf_memory_ctrl_t *const *p_ctrl*, sf_memory_info_t *const *p_info*)

Returns the information about the flash.

Return values

SSP_SUCCESS	Memory info structure updated successfully.
SSP_ERR_ASSERTION	p_ctrl or p_info is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Returns

InfoGet status.

Validate the parameters

Memory info is obtained while opening, use it

◆ SF_MEMORY_QSPI_NOR_Open()

ssp_err_t SF_MEMORY_QSPI_NOR_Open (sf_memory_ctrl_t *const *p_ctrl*, sf_memory_cfg_t const *const *p_cfg*)

Open the SF Memory QSPI Nor driver module.

Open the SF Memory QSPI Nor driver module for the purposes of reading and writing flash memory.

Return values

SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
SSP_ERR_ALREADY_OPEN	Driver is already open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- qspi_api_t::open
- qspi_api_t::infoGet
- qspi_api_t::close

Validate the parameters

Check whether the framework is in already open state

Update instance control with the lower level driver and configuration information.

Open the QSPI driver

Update the memory info

Close QSPI in case of failure

Mark instance as open for future reference

◆ SF_MEMORY_QSPI_NOR_Read()

ssp_err_t SF_MEMORY_QSPI_NOR_Read (sf_memory_ctrl_t *const *p_ctrl*, uint8_t *const *p_dest_address*, uint32_t const *memory_address*, uint32_t const *num_bytes*)

Read data from the flash.

Read specified number of bytes of data from a particular address on the QSPI flash device.

Return values

SSP_SUCCESS	The data read was successful.
SSP_ERR_ASSERTION	p_ctrl,p_dest_address or memory_address is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.
SSP_ERR_INVALID_ARGUMENT	Number of bytes requested are invalid.
SSP_ERR_TIMEOUT	Wait timed out.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- qspi_api_t::read
- qspi_api_t::statusGet

Validate the parameters

Check whether instance is open or not

Check whether the device address is valid

Read data from banks using ROM area.

◆ SF_MEMORY_QSPI_NOR_VersionGet()

ssp_err_t SF_MEMORY_QSPI_NOR_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

Returns

API and Code version.

Validate the parameters

◆ SF_MEMORY_QSPI_NOR_Write()

ssp_err_t SF_MEMORY_QSPI_NOR_Write (sf_memory_ctrl_t *const *p_ctrl*, uint8_t *const *p_src_address*, uint32_t const *memory_address*, uint32_t const *num_bytes*)

Program data to the flash.

Return values

SSP_SUCCESS	The flash was programmed successfully.
SSP_ERR_ASSERTION	p_ctrl,p_src_address or memory_address is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter is passed.
SSP_ERR_NOT_OPEN	Driver is not opened.
SSP_ERR_TIMEOUT	Wait timed out.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- qspi_api_t::pageProgram
- qspi_api_t::statusGet

Validate the parameters

Check whether instance is open or not

Check whether the device address is valid

Check whether page size of QSPI NOR is larger than the read buffer size

Calculate current write size

Copy data from source address to a buffer for write if the source address is within address range of QSPI NOR

Program using underlying QSPI driver

Wait if there is any write operation in progress

sf_memory_qspi_nor_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Memory framework

#include <sf_memory_qspi_nor.h>

Data Fields

qspi_instance_t *	p_qspi QSPI instance.

qspi_info_t	qspi_info QSPI info.
uint32_t	open Track opened/closed status.
sf_memory_region_info_t	region_info Memory region info.
uint32_t	timeout_ticks Number of ticks to timeout on erase or write waiting.
sf_memory_qspi_nor_pending_operation_t	pending_operation The last operation sent to the QSPI chip.
uint32_t	pending_operation_size The size of the last operation.
void *	p_delay_callback_context Context passed to the delay callback.
void(*	p_delay_callback)(sf_memory_qspi_nor_delay_callback_args_t *p_args) Pointer to user callback function.

Detailed Description

Control block. DO NOT INITIALIZE. Initialization occurs when sf_memory_api_t::open is called

---

The documentation for this struct was generated from the following file:

- sf_memory_qspi_nor.h

sf_memory_qspi_nor_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Memory framework

#include <sf_memory_qspi_nor.h>

Data Fields

qspi_instance_t const *const	p_qspi Lower level driver.
uint32_t	timeout_ticks Number of ticks to timeout on erase or write waiting.
void *	p_delay_callback_context Context passed to the delay callback.
void(*	p_delay_callback)(sf_memory_qspi_nor_delay_callback_args_t *p_args)

Detailed Description

User configuration structure, used in open function

Field Documentation

◆ p_delay_callback

void(* sf_memory_qspi_nor_cfg_t::p_delay_callback) (sf_memory_qspi_nor_delay_callback_args_t *p_args)
A custom delay callback can be used to fine tune the amount of time to wait before starting to poll the QSPI chip after a write or erase operation. If a custom delay callback is used and a timeout occurs the p_args->timeout_remaining variable must be set to 0 to indicate to the calling function that a timeout has occurred.

The documentation for this struct was generated from the following file:

- sf_memory_qspi_nor.h

5.1.3.29 Messaging Framework

ssp_err_t	SF_MESSAGE_BufferAcquire (sf_message_ctrl_t const *const p_api_ctrl, sf_message_header_t **pp_buffer, sf_message_acquire_cfg_t const *const p_acquire_cfg, uint32_t const wait_option) Acquire buffer for message passing from the block. More...
ssp_err_t	SF_MESSAGE_BufferRelease (sf_message_ctrl_t *const p_api_ctrl, sf_message_header_t *const p_buffer, sf_message_release_option_t const option) Release buffer obtained by SF_MESSAGE_BufferAcquire(). More...
ssp_err_t	SF_MESSAGE_Post (sf_message_ctrl_t *const p_api_ctrl, sf_message_header_t const *const p_buffer, sf_message_post_cfg_t const *const p_post_cfg, sf_message_post_err_t *const p_post_err, uint32_t const wait_option) Post a message to the subscribers. More...

ssp_err_t	SF_MESSAGE_Pend (sf_message_ctrl_t const *const p_api_ctrl, TX_QUEUE const *const p_queue, sf_message_header_t **pp_buffer, uint32_t const wait_option) Pend on a message. More...
ssp_err_t	SF_MESSAGE_VersionGet (ssp_version_t *const p_version) Get the version of the messaging framework. Stores version information in provided pointer. More...

Detailed Description

RTOS-integrated Messaging Framework implementation.

Macro Definition Documentation

◆ SF_MESSAGE_CODE_VERSION_MAJOR

#define SF_MESSAGE_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ SF_MESSAGE_QUEUE_MESSAGE_WORDS

#define SF_MESSAGE_QUEUE_MESSAGE_WORDS (1)
The size of a message queue in words

Function Documentation

◆ SF_MESSAGE_BufferAcquire()

ssp_err_t SF_MESSAGE_BufferAcquire (sf_message_ctrl_t const *const *p_api_ctrl*, sf_message_header_t ** *pp_buffer*, sf_message_acquire_cfg_t const *const *p_acquire_cfg*, uint32_t const *wait_option*)

Acquire buffer for message passing from the block.

Return values

SSP_SUCCESS	Buffer acquisition was successful.
SSP_ERR_ASSERTION	p_ctrl, p_acquire_cfg or pp_buffer is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_NO_MORE_BUFFER	No more buffer found in the memory block pool.
SSP_ERR_TIMEOUT	OS service call returns timeout.
SSP_ERR_INTERNAL	OS service call fails.

Note

This API function allows to be called from not only thread but also ISR.

Allocates buffer in the block memory pool.

Clears buffer control block

Sets the buffer in-use flag

Sets the address of the allocated buffer to 'pp_buffer'

Clears the event class and event code in the buffer. This is because the initial value in the buffer control block is unknown and it would not be safe.

Sets the 'buffer_keep' flag in the buffer control block if SF_MESSAGE_ACQUIRE_OPTION_KEEP is set to the 'option' argument

◆ SF_MESSAGE_BufferRelease()

ssp_err_t SF_MESSAGE_BufferRelease (sf_message_ctrl_t *const *p_api_ctrl*, sf_message_header_t *const *p_buffer*, sf_message_release_option_t const *option*)

Release buffer obtained by SF_MESSAGE_BufferAcquire().

Return values

SSP_SUCCESS	Buffer release was successful.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_ASSERTION	p_ctrl or p_buffer is NULL.
SSP_ERR_ILLEGAL_BUFFER_ADDRESS	If buffer address is not aligned or p_buffer is not in the block pool range.
SSP_ERR_BUFFER_RELEASED	Buffer has been released.
SSP_ERR_INTERNAL	OS service call fails

Note

This API function allows to be called from thread but also from ISR.

Calculates the address of the buffer control block

Release buffer in the condition below. (1) The counting semaphore is zero and the buffer keep option is not specified. (2) 'option' is set to SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE.

Clears the flags in the buffer control block.

Release the buffer using ThreadX API "tx_block_release"

Set back the backed up interrupt mask level.

Invokes an user callback function if it is registered in the condition below. (1) The counting semaphore is zero. (2) 'option' is set to SF_MESSAGE_RELEASE_OPTION_FORCED_RELEASE.

Sets SF_MESSAGE_CALLBACK_EVENT_NAK if any subscribers for the message have responded NAK

Sets SF_MESSAGE_CALLBACK_EVENT_ACK if all subscribers for the message have responded ACK

Sets the pointer to the context to kept in the buffer control block

Invokes the registered user callback function.

◆ SF_MESSAGE_Close()

ssp_err_t SF_MESSAGE_Close (sf_message_ctrl_t *const *p_api_ctrl*)

Closes message framework.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.

Note

This API function only allows to be called from thread context.

Finds subscribers and flushes their queues

Deletes memory pools allocated in the work memory

◆ SF_MESSAGE_Open()

ssp_err_t SF_MESSAGE_Open (sf_message_ctrl_t *const *p_api_ctrl*, sf_message_cfg_t const *const *p_cfg*)

Initialize message framework. This function initiates the messaging framework control block, configures the work memory corresponding to the configuration parameters.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	p_ctrl, p_cfg or p_cfg->p_work_memory_start is NULL.
SSP_ERR_INTERNAL	OS service call fails.
SSP_ERR_IN_USE	The Messaging Framework is in use.
SSP_ERR_INVALID_WORKBUFFER_SIZE	Invalid work buffer size.
SSP_ERR_INVALID_MSG_BUFFER_SIZE	Message buffer size is invalid.
SSP_ERR_ILLEGAL_SUBSCRIBER_LISTS	Message subscriber lists is illegal.

Note

This API function is allowed to be called once per instance. The behavior if called twice is undefined.
This API function only allows to be called from thread context.

Creates the memory pools in the work memory area

Registers subscriber lists

Changes the messaging framework status from CLOSED to OPENED

◆ SF_MESSAGE_Pend()

ssp_err_t SF_MESSAGE_Pend (sf_message_ctrl_t const *const *p_api_ctrl*, TX_QUEUE const *const *p_queue*, sf_message_header_t ** *pp_buffer*, uint32_t const *wait_option*)

Pend on a message.

Return values

SSP_SUCCESS	Message pending was successful.
SSP_ERR_ASSERTION	p_ctrl, pp_buffer or p_queue is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_MESSAGE_QUEUE_EMPTY	Queue is empty.
SSP_ERR_TIMEOUT	OS service call returns timeout.
SSP_ERR_INTERNAL	OS service call fails.

Note

This API function allows to be called from not only thread but also ISR(if wait_option is TX_NO_WAIT).

Receiving message here. Receiving data is not message itself but the pointer to the buffer

If there is no data in the message queue and TX_NO_WAIT is specified to wait_option, return immediately with SSP_ERR_MESSAGE_QUEUE_EMPTY error code

◆ SF_MESSAGE_Post()

ssp_err_t SF_MESSAGE_Post (sf_message_ctrl_t *const *p_api_ctrl*, sf_message_header_t const *const *p_buffer*, sf_message_post_cfg_t const *const *p_post_cfg*, sf_message_post_err_t *const *p_post_err*, uint32_t const *wait_option*)

Post a message to the subscribers.

Return values

SSP_SUCCESS	Message posting was successful.
SSP_ERR_ASSERTION	p_ctrl or p_buffer is NULL.
SSP_ERR_NOT_OPEN	Message framework module has yet to be opened.
SSP_ERR_NO_SUBSCRIBER_FOUND	No subscriber found.
SSP_ERR_BUFFER_RELEASED	Buffer has been released.
SSP_ERR_MESSAGE_QUEUE_FULL	Queue is full (Timeout occurs before sending a message if timeout option is specified)
SSP_ERR_ILLEGAL_BUFFER_ADDRESS	If buffer address is not aligned or p_buffer is not in the block pool range.
SSP_ERR_INTERNAL	OS service call fails

Note

This API function allows to be called from not only thread but also ISR(if wait_option is TX_NO_WAIT). Another buffer writing to the buffer before the message read by message consumers results data overwriting.

- Checks the number of the subscribers of specified event class

Calculates the address of the buffer control block

Counts up the counting semaphore in the buffer control block

Registers user callback function and context passed from user

◆ SF_MESSAGE_VersionGet()

ssp_err_t SF_MESSAGE_VersionGet (ssp_version_t *const *p_version*)

Get the version of the messaging framework. Stores version information in provided pointer.

Return values

SSP_SUCCESS	Got version number successfully.
SSP_ERR_ASSERTION	p_version is NULL.

sf_message_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Messaging Framework

#include <sf_message.h>

Data Fields

TX_BLOCK_POOL	block_pool Pointer to the memory block pool control.
sf_message_subscriber_list_t **	pp_subscriber_lists Pointer array to the subscriber lists.
uint32_t	buffer_size Bytes of the message buffer.
uint32_t	number_of_buffers The number of allocated buffers.
uint16_t	number_of_subscriber_groups The number of subscriber groups.
sf_message_state_t	state Status of the message framework.

Detailed Description

Power Profiles Framework.

Macro Definition Documentation

◆ SF_POWER_PROFILES_V2_CODE_VERSION_MAJOR

#define SF_POWER_PROFILES_V2_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

Function Documentation

◆ SF_POWER_PROFILES_V2_Close()

ssp_err_t SF_POWER_PROFILES_V2_Close (sf_power_profiles_v2_ctrl_t *const *p_ctrl*)

Closes the framework.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.

Clear information from control block so other functions know this block is closed.

◆ SF_POWER_PROFILES_V2_LowPowerApply()

ssp_err_t SF_POWER_PROFILES_V2_LowPowerApply (sf_power_profiles_v2_ctrl_t *const *p_ctrl*, sf_power_profiles_v2_low_power_cfg_t const *const *p_cfg*)

Applies a Low Power profile.

The SF_POWER_PROFILES_V2_LowPowerApply function will:

- Apply a LPMv2 configuration to prepare for low power
- Apply an IO port configuration to prepare for low power, if supplied
- Notify application that low power is about to be entered
- Enter low power mode
- When low power mode is exited, apply an IO port configuration for wake up, if supplied
- Notify application that wake up has occurred

Return values

SSP_SUCCESS	Entered and exited low power mode successfully.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.
SSP_ERR_UNSUPPORTED	This function is not supported by one of the HAL drivers, r_lpmv2, r_ioport.
SSP_ERR_INVALID_MODE	r_lpmv2 mode is not LPMV2_LOW_POWER_MODE_SLEEP but r_lmv2 p_extend is NULL.
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.

Returns

See Common Error Codes, r_ioport, or r_lpmv2 drivers for other possible return codes or causes.

Apply the LPM configuration.

Apply the pre-low power IOPORT configuration.

Notify application.

Enter low power mode.

Apply the post-low power IOPORT configuration.

Notify application.

◆ SF_POWER_PROFILES_V2_Open()

ssp_err_t SF_POWER_PROFILES_V2_Open (sf_power_profiles_v2_ctrl_t *const *p_ctrl*, sf_power_profiles_v2_cfg_t const *const *p_cfg*)

Configures the Power Profiles framework and opens any required HAL layer drivers that will be used.

The SF_POWER_PROFILES_V2_Open function initializes the critical data structures and variables.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_IN_USE	Power profiles framework is already open.
SSP_ERR_INTERNAL	Unable to obtain mutex. Unable to release mutex.

Returns

See Common Error Codes for other possible return codes or causes.

Initialize the LPM HAL driver.

Mark control block open so other tasks know it is valid.

◆ SF_POWER_PROFILES_V2_RunApply()

ssp_err_t SF_POWER_PROFILES_V2_RunApply (sf_power_profiles_v2_ctrl_t *const *p_ctrl*, sf_power_profiles_v2_run_cfg_t const *const *p_cfg*)

Applies a Run profile.

The SF_POWER_PROFILES_V2_RunApply function will:

- Apply an IO port configuration, if supplied
- Apply a clock configuration

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_INVALID_ARGUMENT	Clock configuration is invalid.
SSP_ERR_NOT_OPEN	Power profiles framework is not open.
SSP_ERR_IN_USE	Unable to obtain mutex.
SSP_ERR_INTERNAL	Unable to release mutex.
SSP_ERR_INVALID_HW_CONDITION	Incompatible system clock configuration.

Returns

See Common Error Codes, r_ioport, or r_cgc driver for other possible return codes or causes.

Apply the ioport configuration.

Set the clock config, this also sets the operating mode based on the clock speed.

◆ SF_POWER_PROFILES_V2_VersionGet()

ssp_err_t SF_POWER_PROFILES_V2_VersionGet (ssp_version_t *const *p_version*)

Gets version and stores it in provided pointer p_version.

Return values

SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was null.

Detailed Description

RTOS-integrated SPI Framework.

Function Documentation

◆ SF_SPI_Close()

ssp_err_t SF_SPI_Close (sf_spi_ctrl_t *const *p_api_ctrl*)

Disable the SPI device designated by the control handle and close the RTOS services used by the bus if no devices are connected to the bus.

Return values

SSP_SUCCESS	SPI channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Device not opened.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- spi_api_t::close

Note

This function is reentrant for any device.

Check whether device is open.

Acquire the device count mutex before accessing the shared resource in close.

Check the count of opened devices on the bus. If there are no devices opened or all other devices on the bus are closed then close the low level SPI driver and release the RTOS services used by the bus.

Get the low level control in use.

Close low level driver.

Delete RTOS services used by the bus.

Decrement device count.

Delete the device count mutex

Decrement device count.

Release the device count mutex

Set device to closed state

◆ SF_SPI_Lock()

ssp_err_t SF_SPI_Lock (sf_spi_ctrl_t *const *p_api_ctrl*)

Lock the bus for a device.

Return values

SSP_SUCCESS	SPI bus is successfully locked.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.

Note

This function is reentrant for any device.

Check whether device is open.

Get the mutex for this device.

Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.

Release the mutex

Set lock flag.

◆ SF_SPI_LockWait()

ssp_err_t SF_SPI_LockWait (sf_spi_ctrl_t *const *p_api_ctrl*, uint32_t const *timeout*)

Lock the SPI bus resource. Once bus is locked by a device it can not be used by other devices.

Return values

SSP_SUCCESS	SPI channel is successfully locked within the specified timeout.
SSP_ERR_ASSERTION	Pointer to SPI control block is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_TIMEOUT	Mutex not available in timeout.

Note

This function is reentrant for any device.

Check whether device is open.

Get the mutex for this device.

Set lock flag.

Enable slave.

◆ SF_SPI_Open()

ssp_err_t SF_SPI_Open (sf_spi_ctrl_t *const *p_api_ctrl*, sf_spi_cfg_t const *const *p_cfg*)

Initialize a SPI bus and open low level SPI driver.

Return values

SSP_SUCCESS	SPI channel is successfully opened.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_cfg, Pointer to Open, Close, Read, Write, or Writeread API interfaces, p_cfg->p_bus or p_cfg->p_lower_lvl_cfg.
SSP_ERR_INTERNAL	Internal error occurred.
SSP_ERR_ALREADY_OPEN	Same SPI framework device is already open.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is

- spi_api_t::open

Note

This function is reentrant for any channel.
Control block must be cleared by caller before calling this function.

Check whether device is already opened or not.

Copy bus to control

Copy chip_select to control

Copy chip_select level to control

Initialize bus lock to false

Set framework level callback function.

Save context for use in ISRs.

Use bus channel in device open.

Enter a critical section before checking the device count mutex status.

Check if device count mutex is already created. If not then create the mutex.

Create device_count_mutex. This is used to protect shared variable device_count in bus control structure.

If mutex create fails, return error.

Exit critical section

Acquire the device count mutex before accessing the shared resource. Try again if the mutex was deleted in close.

Increment device count.

Save device configuration for reconfiguration.

Set device state as Opened.

Initialize chip select.

◆ SF_SPI_Read()

ssp_err_t SF_SPI_Read (sf_spi_ctrl_t *const *p_api_ctrl*, void *const *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*, uint32_t const *timeout*)

Starts the transfer process and receives data from SPI device.

Return values

SSP_SUCCESS	Data read completed successfully.
SSP_ERR_ASSERTION	One of the following parameters is NULL: p_api_ctrl, p_dest, length.
SSP_ERR_NOT_OPEN	Device not opened.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- spi_api_t::read

Check whether device is open.

Get mutex for this bus.

Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.

Release the mutex

Perform read.

Finish transfer.

◆ SF_SPI_Unlock()

ssp_err_t SF_SPI_Unlock (sf_spi_ctrl_t *const *p_api_ctrl*)

Unlock the bus for a particular device and make the bus usable for other devices.

Return values

SSP_SUCCESS	SPI bus is successfully unlocked.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_IN_USE	In-use error.

Note

This function is reentrant for any device.

Check whether device is open.

Acquire the mutex.

Clear lock flag.

Disable slave.

Release the mutex so that others can use the bus.

◆ SF_SPI_VersionGet()

ssp_err_t SF_SPI_VersionGet (ssp_version_t *const *p_version*)

Get the version information of the framework.

Return values

SSP_ERR_ASSERTION	p_version is NULL.
SSP_SUCCESS	Successful return.

Checks error. Further parameter checking can be done at the driver layer.

◆ SF_SPI_Write()

ssp_err_t SF_SPI_Write (sf_spi_ctrl_t *const *p_api_ctrl*, void *const *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*, uint32_t const *timeout*)

Starts the transfer process and writes data to SPI device.

Return values

SSP_SUCCESS	Data write completed successfully.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_api_ctrl, p_src, length.
SSP_ERR_NOT_OPEN	Device not opened.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- spi_api_t::write

Check whether device is open.

Get mutex for this bus.

Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.

Release the mutex

Perform write.

Finish transfer.

◆ SF_SPI_WriteRead()

ssp_err_t SF_SPI_WriteRead (sf_spi_ctrl_t *const *p_api_ctrl*, void *const *p_src*, void *const *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*, uint32_t const *timeout*)

Simultaneously transmit data to SPI device while receiving data from SPI device(full duplex).

Return values

SSP_SUCCESS	Data write completed successfully.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_api_ctrl, p_src, p_dest, length.
SSP_ERR_NOT_OPEN	Device not opened.

Returns

See Common Error Codes and lower level driver function for other possible return codes. This driver function is:

- spi_api_t::writeRead

Check whether device is open.

Get mutex for this bus.

Start transfer process - check lock, check reconfiguration, check bus compatibility, enable chip select.

Release the mutex

Perform write read.

Finish transfer.

sf_spi_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » SPI Framework

#include <sf_spi.h>

Data Fields

sf_spi_bus_t *	p_bus Bus using this device (copy from cfg)
ioport_port_pin_t	chip_select Chip select for this device (copy from cfg)
ioport_level_t	chip_select_level_active

	Polarity of CS, active High or Low (copy from cfg)
spi_cfg_t	lower_lvl_cfg SPI peripheral configuration, use for bus reconfiguration.
spi_ctrl_t *	p_lower_lvl_ctrl SPI peripheral control block.
sf_spi_dev_state_t	dev_state Device status.
bool	locked Lock and unlock bus for a device.

Detailed Description

SPI device context. DO NOT INITIALIZE. Initialization occurs when sf_spi_api_t::open is called.

Detailed Description

Framework module providing monitoring of threads.

Any misbehaving threads result in the device being reset. Both the WDT and IWDT HAL modules are supported by this framework module.

Interface Used

See also
WDT Interface

Macro Definition Documentation

◆ SF_THREAD_MONITOR_CODE_VERSION_MAJOR

#define SF_THREAD_MONITOR_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

Function Documentation

◆ SF_THREAD_MONITOR_Close()

ssp_err_t SF_THREAD_MONITOR_Close (sf_thread_monitor_ctrl_t *const *p_api_ctrl*)

Stop the thread monitoring thread. All threads are unregistered and no longer monitored.

Return values

SSP_SUCCESS	Close was successful and watchdog monitoring thread has stopped.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open() has either not been called or it was not called successfully.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Note

This function is not reentrant.
This function DOES NOT stop the watchdog timer (e.g. WDT or IWDT). It does however stop the thread which refreshes the these timers. To prevent the hardware watchdog from reseting the device the watchdog must be refreshed elsewhere.
The Thread Monitor can be closed with SF_THREAD_MONITOR_Close(). However, if the underlying watchdog timer hardware such as WDT or IWDT cannot be closed or stopped then there are likely to be undesirable results.

◆ SF_THREAD_MONITOR_CountIncrement()

ssp_err_t SF_THREAD_MONITOR_CountIncrement (sf_thread_monitor_ctrl_t *const *p_api_ctrl*)

Safely increment the counter of a thread. A mutex is used to ensure this increment occurs without corruption.

Return values

SSP_SUCCESS	Thread counter successfully incremented.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_INSUFFICIENT_SPACE	Not enough entries in the threads to be monitored array to add this thread.
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open() has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Note

This function is reentrant.

◆ SF_THREAD_MONITOR_Open()

ssp_err_t SF_THREAD_MONITOR_Open (sf_thread_monitor_ctrl_t *const *p_api_ctrl*, sf_thread_monitor_cfg_t const *const *p_cfg*)

Calls the driver .open function in the p_lower_lvl_wdt parameter.

After successively opening and configuring the HAL driver, the SF_THREAD_MONITOR_Open() function starts the thread monitoring thread. This thread is responsible for checking thread execution through thread count variables and for refreshing the implemented watchdog timer peripheral.

Return values

SSP_SUCCESS	Initialization was successful and watchdog monitoring thread has started.
SSP_ERR_ASSERTION	p_ctrl, p_cfg, p_cfg->p_lower_lvl_wdt pointers and/or p_cfg->p_lower_lvl_wdt are NULL.
SSP_ERR_IN_USE	Thread monitor has already been opened.
SSP_ERR_INVALID_MODE	Low level watchdog peripheral returned an error when opened.
SSP_ERR_UNSUPPORTED	Data structure could not be allocated.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options is invalid for the low level driver.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Note

This function is not reentrant.
If there are no threads registered to be monitored the monitoring thread refreshes the watchdog and prevents the watchdog from reseting the device.
The Thread Monitor can be closed with SF_THREAD_MONITOR_Close and then SF_THREAD_MONITOR_Open can be called again. However, if the underlying watchdog timer hardware such as WDT or IWDT cannot be closed or stopped then there are likely to be undesirable results.

◆ SF_THREAD_MONITOR_Thread()

void SF_THREAD_MONITOR_Thread (ULONG *thread_input*)

The SF_THREAD_MONITOR_thread() is the main thread monitor thread which runs periodically.

The period is determined from the timeout period of the Watchdog hardware. This thread's period should be half of that of the watchdog hardware so the watchdog is refreshed at 50% of the count value.

Parameters

[in]	thread_input	This is the address of the control block for the thread monitor module. This allows this thread to be created multiple times with the data used and hardware interfaced with governed by the control structure.

As this is a ThreadX thread this function does not return.

Note

This function is not reentrant.
If there are no threads registered to be monitored the monitoring thread will refresh/tickle/kick the watchdog and so prevent the watchdog from reseting the device.

◆ SF_THREAD_MONITOR_ThreadRegister()

ssp_err_t SF_THREAD_MONITOR_ThreadRegister (sf_thread_monitor_ctrl_t *const *p_api_ctrl*, sf_thread_monitor_counter_min_max_t const * *p_counter_min_max*)

Register a thread to be monitored by the watchdog monitoring thread.

This thread must supply the minimum and maximum expected values for the thread. The mininimum and maximum values can be determined by using monitoring mode.

Return values

SSP_SUCCESS	Thread successfully registered.
SSP_ERR_ASSERTION	p_ctrl or p_counter_min_max pointers are NULL.
SSP_ERR_INSUFFICIENT_SPACE	Not enough entries in the threads to be monitored array to add this thread. Increase the value of THREAD_MONITOR_CFG_MAX_NUMBER_OF_THREADS in sf_thread_moinitor_cfg.h
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open() has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Note

This function is reentrant.

◆ SF_THREAD_MONITOR_ThreadUnregister()

ssp_err_t SF_THREAD_MONITOR_ThreadUnregister (sf_thread_monitor_ctrl_t *const *p_api_ctrl*)

Remove a thread from being monitored by the Watchdog monitoring thread.

Return values

SSP_SUCCESS	Thread successfully unregistered.
SSP_ERR_ASSERTION	p_ctrl pointer is NULL.
SSP_ERR_NOT_OPEN	SF_THREAD_MONITOR_Open() has either not been called or it was not called successfully.
SSP_ERR_INTERNAL	An internal ThreadX error has occurred.

Returns

See Common Error Codes or HAL driver for other possible return codes or causes.

Note

This function is reentrant.

◆ SF_THREAD_MONITOR_VersionGet()

ssp_err_t SF_THREAD_MONITOR_VersionGet (ssp_version_t *const *p_version*)
Get version and store it in provided pointer p_version. Implements sf_thread_monitor_api_t::versionGet. **Return values** SSP_SUCCESS — Version returned successfully. SSP_ERR_ASSERTION — Parameter p_version was null.

sf_thread_monitor_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Thread Monitor Framework

TX_THREAD	thread

	Thread monitor thread.
void const *	p_extend Extended configuration data.

Detailed Description

Thread monitor control block. DO NOT INITIALIZE. Initialization occurs when sf_thread_monitor_api_t::open is called.

Member Function Documentation

◆ BSP_ALIGN_VARIABLE_V2()

uint8_t stack [THREAD_MONITOR_THREAD_STACK_SIZE] sf_thread_monitor_instance_ctrl_t::BSP_ALIGN_VARIABLE_V2 (BSP_STACK_ALIGNMENT)
Stack for thread monitor thread.

Field Documentation

◆ open

uint32_t sf_thread_monitor_instance_ctrl_t::open
Used by driver to check if the control structure is valid

◆ p_lower_lvl_wdt

wdt_instance_t const* sf_thread_monitor_instance_ctrl_t::p_lower_lvl_wdt
Pointer to interface structure for the watchdog peripheral

◆ profiling_mode_check

uint32_t sf_thread_monitor_instance_ctrl_t::profiling_mode_check
Value used to verify profiling mode is enabled when prfiling_mode_enabled == true.

◆ profiling_mode_enabled

bool sf_thread_monitor_instance_ctrl_t::profiling_mode_enabled
Used by the driver to check if profiling mode is enabled.

◆ thread_counters

sf_thread_monitor_thread_counter_t sf_thread_monitor_instance_ctrl_t::thread_counters[THREAD_MONITOR_CFG_MAX_NUMBER_OF_THREADS]
Data storage for the thread counter information.

◆ timeout_period_msec

uint32_t sf_thread_monitor_instance_ctrl_t::timeout_period_msec
Time in milliseconds of the watchdog timeout period. Used to calculate the period of the monitoring thread.

◆ timeout_period_watchdog_clocks

uint32_t sf_thread_monitor_instance_ctrl_t::timeout_period_watchdog_clocks
Maximum count value of the watchdog. Used to synchronise to the count.

ssp_err_t	SF_TOUCH_CTSU_VersionGet (ssp_version_t *const p_version)

Detailed Description

CTSU V2 Framework.

Function Documentation

◆ SF_TOUCH_CTSU_CallbackSet()

ssp_err_t SF_TOUCH_CTSU_CallbackSet (sf_touch_ctsu_ctrl_t *const *p_api_ctrl*, void(*)(sf_touch_ctsu_callback_args_t *) *p_callback*, void const *const *p_context*, sf_touch_ctsu_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements sf_touch_ctsu_api_t::callbackSet

Return values

SSP_SUCCESS	Callback updated successfully.
SSP_ERR_ASSERTION	A required pointer is NULL.
SSP_ERR_NOT_OPEN	The control block has not been opened.

◆ SF_TOUCH_CTSU_Close()

ssp_err_t SF_TOUCH_CTSU_Close (sf_touch_ctsu_ctrl_t *const *p_ctrl*)

Disables specified TOUCH control block. Implements sf_touch_ctsu_api_t::close.

Return values

SSP_SUCCESS	Successfully closed.
SSP_ERR_ASSERTION	p_ctrl or p_ctrl->p_api is NULL.
SSP_ERR_NOT_OPEN	Driver control block not valid. Call SF_TOUCH_CTSU_Open to configure.

◆ SF_TOUCH_CTSU_DataGet()

ssp_err_t SF_TOUCH_CTSU_DataGet (sf_touch_ctsu_ctrl_t *const *p_ctrl*, uint64_t * *p_button_status*, uint16_t * *p_slider_position*, uint16_t * *p_wheel_position*)

Gets the 64-bit mask indicating which buttons are pressed. Also, this function gets the current position of where slider or wheel is being pressed. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements sf_touch_ctsu_api_t::dataGet.

Return values

SSP_SUCCESS	Successfully data decoded.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.
SSP_ERR_CTSU_SCANNING	Scanning this instance.
SSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.

◆ SF_TOUCH_CTSU_Open()

ssp_err_t SF_TOUCH_CTSU_Open (sf_touch_ctsu_ctrl_t *const *p_ctrl*, sf_touch_ctsu_cfg_t const *const *p_cfg*)

Opens and configures the TOUCH Middle module. Implements sf_touch_ctsu_api_t::open.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_ctrl, p_api, or p_cfg. See HAL driver for other possible causes.
SSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
SSP_ERR_INVALID_ARGUMENT	Configuration parameter error.

Parameter Setting

◆ SF_TOUCH_CTSU_ScanStart()

ssp_err_t SF_TOUCH_CTSU_ScanStart (sf_touch_ctsu_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with SF_TOUCH_CTSU_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements sf_touch_ctsu_api_t::scanStart.

Return values

SSP_SUCCESS	Successfully started.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.
SSP_ERR_CTSU_SCANNING	Scanning this instance or other.
SSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

◆ SF_TOUCH_CTSU_VersionGet()

ssp_err_t SF_TOUCH_CTSU_VersionGet (ssp_version_t *const *p_version*)
Return TOUCH Middle module version. Implements sf_touch_ctsu_api_t::versionGet. **Return values** SSP_SUCCESS — Version returned successfully. SSP_ERR_ASSERTION — Null pointer passed as a parameter

sf_touch_ctsu_button_info_t Struct Reference

Detailed Description

RTOS-integrated touch panel V2 Framework implementation touch chips.

Summary

This is a ThreadX touch panel framework implemented for external touch controllers with IRQ pins used to notify the application when new data is available.

Macro Definition Documentation

◆ SF_TOUCH_PANEL_V2_ERROR_RETURN

#define SF_TOUCH_PANEL_V2_ERROR_RETURN (a, err) SSP_ERROR_RETURN((a), (err), &g_module_name[0], &g_version)
Macro for error logger.

◆ SF_TOUCH_PANEL_V2_OPEN

#define SF_TOUCH_PANEL_V2_OPEN (0x54504e4cU)
"TPNL" in ASCII, used to identify touch panel handle

◆ SF_TOUCH_PANEL_V2_STACK_SIZE

#define SF_TOUCH_PANEL_V2_STACK_SIZE (SF_TOUCH_PANEL_V2_CFG_THREAD_STACK_SIZE)
Stack size for touch panel thread.

Function Documentation

◆ SF_TOUCH_PANEL_V2_Calibrate()

ssp_err_t SF_TOUCH_PANEL_V2_Calibrate (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*, sf_touch_panel_v2_calibrate_t const *const *p_display*, sf_touch_panel_v2_calibrate_t const *const *p_touchscreen*, ULONG const *timeout*)

Implements sf_touch_panel_v2_api_t::calibrate.

Return values

SSP_SUCCESS	Touch panel calibrated successfully.
SSP_ERR_ASSERTION	A pointer parameter was NULL.
SSP_ERR_CALIBRATE_FAILED	Failed to calibrate
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_V2_Open.
SSP_ERR_INVALID_ARGUMENT	Set of display or touch screen coordinates passed are invalid.

Returns

See Common Error Codes or lower level drivers for other possible return codes.

Note

This function is reentrant for any panel.

Timeout not used in this implementation.

◆ SF_TOUCH_PANEL_V2_Close()

ssp_err_t SF_TOUCH_PANEL_V2_Close (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*)

Implements sf_touch_panel_v2_api_t::close.

Return values

SSP_SUCCESS	Touch panel instance successfully closed.
SSP_ERR_ASSERTION	Parameter p_api_ctrl was NULL, or a lower level driver reported this error.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_V2_Open.

Note

This function is reentrant.

Close the lower level driver.

Suspend internal thread.

Delete RTOS services used

Mark control block close

◆ SF_TOUCH_PANEL_V2_Open()

ssp_err_t SF_TOUCH_PANEL_V2_Open (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*, sf_touch_panel_v2_cfg_t const *const *p_cfg*)

Implements sf_touch_panel_v2_api_t::open.

Return values

SSP_SUCCESS	Touch panel thread created and lower level drivers opened successfully.
SSP_ERR_ASSERTION	A pointer parameter was NULL, or a lower level driver reported this error.
SSP_ERR_INTERNAL	The touch panel thread or event flags could not be created, or a lower level driver reported this error.
SSP_ERR_ALREADY_OPEN	Touch panel framework is already configured.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- sf_touch_panel_chip_api_t::open
- sf_touch_panel_chip_api_t::reset

Note

This function is reentrant for any panel.

Store user configurations in control block.

Create a mutex to protect access to the control structure and the lower level hardware.

Open the lower level driver.

Delete RTOS services used and log the error

Reset the touch chip.

Delete RTOS services used and log the error

Create event flags for internal communication.

Create semaphore for use with touchDataGet function

Delete RTOS services used

Create main touch panel thread.

Delete RTOS services used

Mark control block open so other tasks know it is valid

◆ SF_TOUCH_PANEL_V2_Reset()

ssp_err_t SF_TOUCH_PANEL_V2_Reset (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*)

Implements sf_touch_panel_v2_api_t::reset.

Return values

SSP_SUCCESS	Touch chip reset successful.
SSP_ERR_ASSERTION	Parameter p_api_ctrl was NULL, or a lower level driver reported this error.
SSP_ERR_IN_USE	Mutex was not available, or a lower level driver reported this error.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Use Open API to configure.

Returns

See Common Error Codes or lower level drivers for other possible return codes. This function calls:

- sf_touch_panel_chip_api_t::reset

Note

This function is reentrant for any panel.

Obtain mutex since this accesses shared resources.

Call hardware specific reset function.

Release mutex.

◆ SF_TOUCH_PANEL_V2_Start()

ssp_err_t SF_TOUCH_PANEL_V2_Start (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*)

Implements sf_touch_panel_v2_api_t::start.

Return values

SSP_SUCCESS	Enabled touch panel thread to scan for new touch events.
SSP_ERR_ASSERTION	A pointer parameter was NULL.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_V2_Open.

Note

This function is reentrant for any panel.

Set start flag.

◆ SF_TOUCH_PANEL_V2_Stop()

ssp_err_t SF_TOUCH_PANEL_V2_Stop (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*)

Implements sf_touch_panel_v2_api_t::stop.

Return values

SSP_SUCCESS	Disabled touch panel thread from scanning the touch events.
SSP_ERR_ASSERTION	A pointer parameter was NULL.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_V2_Open.

Note

This function is reentrant for any panel.

Set stop flag.

◆ SF_TOUCH_PANEL_V2_TouchDataGet()

ssp_err_t SF_TOUCH_PANEL_V2_TouchDataGet (sf_touch_panel_v2_ctrl_t *const *p_api_ctrl*, sf_touch_panel_v2_payload_t * *p_payload*, ULONG const *timeout*)

Implements sf_touch_panel_v2_api_t::touchDataGet.

Return values

SSP_SUCCESS	Touch panel data read successfully.
SSP_ERR_ASSERTION	A pointer parameter was NULL.
SSP_ERR_NOT_OPEN	Touch panel is not configured. Call SF_TOUCH_PANEL_V2_Open.
SSP_ERR_TIMEOUT	Time out occurs while waiting for semaphore.
SSP_ERR_WAIT_ABORTED	Suspension was aborted by another thread.

Note

This function is reentrant for any panel.
The function will pend until new touch event data is available or it will timeout.

◆ SF_TOUCH_PANEL_V2_VersionGet()

ssp_err_t SF_TOUCH_PANEL_V2_VersionGet (ssp_version_t *const *p_version*)
Implements sf_touch_panel_v2_api_t::versionGet. **Return values** SSP_SUCCESS — Version returned successfully. SSP_ERR_ASSERTION — Parameter p_version was null.

sf_touch_panel_v2_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Touch Panel V2 Framework

#include <sf_touch_panel_v2.h>

Public Member Functions

uint8_t stack [SF_TOUCH_PANEL_V2_STACK_SIZE]	BSP_ALIGN_VARIABLE_V2 (BSP_STACK_ALIGNMENT)

Data Fields

uint32_t	open Used by driver to check if control block is valid.
uint16_t	hsize_pixels Horizontal size of screen in pixels.
uint16_t	vsize_pixels Vertical size of screen in pixels.
sf_touch_panel_v2_payload_t	payload Pointer to buffer used to store payload.
TX_MUTEX	mutex

	Mutex used to protect access to shared resources.
TX_EVENT_FLAGS_GROUP	flags Event flags for internal communication.
TX_THREAD	thread Main touch panel thread.
TX_SEMAPHORE	semaphore Semaphore used for SF_TOUCH_PANEL_V2_TouchDataGet.
sf_touch_panel_chip_instance_t const *	p_chip Pointer to touch chip.
uint16_t	update_hz
uint16_t	rotation_angle Touch coordinate rotation angle(0/90/180/270)
void const *	p_context Pointer to user callback context data.
bool	calibrate Used to check if calibration is required or not.

Detailed Description

Instance control block. DO NOT INITIALIZE. Initialization occurs when sf_touch_panel_v2_api_t::open is called

Member Function Documentation

◆ BSP_ALIGN_VARIABLE_V2()

uint8_t stack [SF_TOUCH_PANEL_V2_STACK_SIZE] sf_touch_panel_v2_instance_ctrl_t::BSP_ALIGN_VARIABLE_V2 (BSP_STACK_ALIGNMENT)
Stack for touch panel thread

Field Documentation

◆ update_hz

uint16_t sf_touch_panel_v2_instance_ctrl_t::update_hz
The frequency to report repeat (SF_TOUCH_PANEL_V2_EVENT_DOWN or SF_TOUCH_PANEL_V2_EVENT_HOLD) touch events in Hertz. ***Note*** *This will be converted to RTOS ticks in the driver and rounded up to the nearest integer value of RTOS ticks.*

Detailed Description

RTOS-integrated Communications Framework UART implementation.

Macro Definition Documentation

◆ SF_UART_COMMS_CODE_VERSION_MAJOR

#define SF_UART_COMMS_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ sf_uart_comms_state_t

enum sf_uart_comms_state_t	
Framework UART state	
Enumerator	
SF_UART_COMMS_STATE_CLOSED	UART port is closed.
SF_UART_COMMS_STATE_OPENED	UART port is opened.
SF_UART_COMMS_STATE_READING	UART port is on data reception.
SF_UART_COMMS_STATE_WRITING	UART port is on data transmission.

Function Documentation

◆ SF_UART_COMMS_Close()

ssp_err_t SF_UART_COMMS_Close (sf_comms_ctrl_t *const *p_api_ctrl*)

Close the UART Channel and clean up the resources.

Parameters

[in]	p_api_ctrl	Pointer to the UART control block

Return values

SSP_SUCCESS	UART channel is successfully closed.
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL. • Pointer p_ctrl->p_lower_lvl_uart is NULL • Pointer p_ctrl->p_lower_lvl_uart->p_api is NULL • Pointer p_ctrl->p_lower_lvl_uart->p_api->close is NULL
SSP_ERR_NOT_OPEN	Channel is not opened.

Note

This function is reentrant for any channel.

Checks error. Further parameter checking can be done at the driver layer.

Calls close function of UART HAL driver

Release ThreadX resources

◆ SF_UART_COMMS_Lock()

ssp_err_t SF_UART_COMMS_Lock (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_lock_t *lock_type*, UINT *timeout*)

Lock the UART resource.

Parameters

[in]	p_api_ctrl	Pointer to the UART control block
[in]	lock_type	Type of Lock.
[in]	timeout	timeout for lock.

Return values

SSP_SUCCESS	Locking UART resource successful.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_TIMEOUT	Timeout Error. 'Receive mutex get' timed out 'Transmit mutex get' timed out

Get both lock if requested, else get the lock type requested

◆ SF_UART_COMMS_Open()

ssp_err_t SF_UART_COMMS_Open (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_cfg_t const *const *p_cfg*)

Open the UART for communication.

Parameters

[in,out]	p_api_ctrl	Pointer to the UART control block
[in]	p_cfg	Pointer to the configuration structure

Return values

SSP_SUCCESS	Channel opened successfully.
SSP_ERR_IN_USE	Channel already in use.
SSP_ERR_ASSERTION	Parameter check failed for one of the following: • Pointer p_api_ctrl is NULL. • Pointer p_cfg is NULL • Pointer p_cfg->p_extend is NULL • Pointer p_cfg_extend->p_lower_lvl_uart is NULL • Pointer p_cfg_extend->p_lower_lvl_uart->p_api->open is NULL • Pointer p_cfg_extend->p_lower_lvl_uart->p_cfg is NULL
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

Returns

See Common Error Codes or functions called by this function for other possible codes. This function calls:

- uart_api_t::open

Note

This function is reentrant for any channel. Handle must be cleared by caller before calling this function.

Checks error. Further parameter checking can be done at the driver layer.

Initialize and start ThreadX resources

Calls open function of UART HAL driver

◆ SF_UART_COMMS_Read()

ssp_err_t SF_UART_COMMS_Read (sf_comms_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, UINT const *timeout*)

Read user specified number of bytes into destination buffer pointer.

Parameters

[in]	p_api_ctrl	Pointer to the UART control block
[in]	bytes	No.of bytes to be read
[in]	timeout	timeout for read
[out]	p_dest	Destination buffer

Return values

SSP_SUCCESS	Data reception ends successfully.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_HW_LOCKED	Channel is locked.
SSP_ERR_ASSERTION	Pointer to UART control block/pointer to destination address is NULL.
SSP_ERR_INVALID_MODE	Channel is used for non-UART mode.
SSP_ERR_INSUFFICIENT_DATA	Not enough data in receive circular buffer.
SSP_ERR_OVERFLOW	Hardware overflow.
SSP_ERR_FRAMING	Framing error.
SSP_ERR_PARITY	Parity error.
SSP_ERR_BREAK_DETECT	Break signal detected.
SSP_ERR_TIMEOUT	One of the following operation timed out. • 'Event flags get' timed out • 'Receive mutex get' timed out
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- uart_api_t::read
- uart_api_t::communicationAbort

Locks the UART reception hardware resource

Unlock the UART reception hardware resource

◆ SF_UART_COMMS_Unlock()

ssp_err_t SF_UART_COMMS_Unlock (sf_comms_ctrl_t *const *p_api_ctrl*, sf_comms_lock_t *lock_type*)

UnLock the UART resource.

Parameters

[in]	p_api_ctrl	Pointer to the UART control block
[in]	lock_type	Type of Lock.

Return values

SSP_SUCCESS	Unlocking UART resource successful.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_INTERNAL	Failed to release the mutex.

◆ SF_UART_COMMS_VersionGet()

ssp_err_t SF_UART_COMMS_VersionGet (ssp_version_t *const *p_version*)

Return values

SSP_SUCCESS	Version number obtained successfully.
SSP_ERR_ASSERTION	Pointer to version is NULL

◆ SF_UART_COMMS_Write()

ssp_err_t SF_UART_COMMS_Write (sf_comms_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*, UINT const *timeout*)

Write user specified number of bytes from the source buffer.

Parameters

[in]	p_api_ctrl	Pointer to the UART control block
[in]	bytes	Number of bytes to be written.
[in]	timeout	Timeout for write. This timeout must be long enough for the write to complete. A timeout of 0 or

		TX_NO_WAIT results in a return value of SSP_ERR_TIMEOUT.
[out]	p_src	Source buffer

Return values

SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL. Pointer to source buffer is NULL.
SSP_ERR_NOT_OPEN	Channel is not opened.
SSP_ERR_INVALID_MODE	Channel is used for non-UART mode or illegal mode is set in handle.
SSP_ERR_INSUFFICIENT_SPACE	Not enough space in transmission circular buffer.
SSP_ERR_HW_LOCKED	Could not lock hardware.
SSP_ERR_TIMEOUT	'Transmit mutex get' timed out
SSP_ERR_INTERNAL	An internal ThreadX error has occurred. This is typically a failure to create/use thread mutex or failure create/use event flags or queue.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- uart_api_t::write
- uart_api_t::communicationAbort

Locks the UART transmission hardware resource

Clear the event flag.

Calls write function of UART HAL driver

Wait until write operation is completed. Event is signaled in event flag object

Calls communicationAbort function of UART HAL driver to abort write operation.

Unlock the UART transmission hardware resource

sf_uart_comms_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » UART Framework Instance

#include <sf_uart_comms.h>

Data Fields

uint32_t	state UART status.
uart_instance_t const *	p_lower_lvl_uart Pointer to UART interface (copied from cfg)
TX_MUTEX	mutex [2] Pointer to the mutex object for UART resource mutual exclusion.
TX_EVENT_FLAGS_GROUP	eventflag [2] Pointer to the event flag object for UART data transfer.
TX_QUEUE	queue Queue for reading.
uint32_t	queue_mem [SF_UART_COMMS_CFG_QUEUE_SIZE_WORDS] Queue memory.

Detailed Description

UART communications instance control structure. DO NOT INITIALIZE. Initialization occurs when sf_comms_api_t::open is called

Detailed Description

RTOS-integrated NetX Ethernet driver for the Renesas Synergy software and Synergy Ethernet IP.

Macro Definition Documentation

◆ DESCRIPTOR_FLAG_ACTIVE

```
#define DESCRIPTOR_FLAG_ACTIVE   0x80000000U /* TACT/RACT - Tx/Rx descriptor active */
```

Bits in the status word of the tx / rx descriptors

◆ MAX_ENET_INSTANCES

```
#define MAX_ENET_INSTANCES   2
```

Determine if the driver uses IP deferred processing or direct ISR processing.

◆ NX_ENET_MAX_MTU

```
#define NX_ENET_MAX_MTU   1518U
```

Max Ethernet packet size (14+ 1500 +2)

◆ NX_INITIALIZE_DONE

```
#define NX_INITIALIZE_DONE   0x0002U
```

Device is Initialized

◆ NX_LINK_ENABLED

```
#define NX_LINK_ENABLED   0x0004U
```

Device is enabled

◆ SF_EL_NX_API_VERSION_MAJOR

#define SF_EL_NX_API_VERSION_MAJOR (2U)
Version of the API defined in this file

◆ SF_EL_NX_CODE_VERSION_MAJOR

#define SF_EL_NX_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ TX_QUEUE_DEPTH

#define TX_QUEUE_DEPTH 10
Netx packets queued before dropping

Function Documentation

◆ edmac_eint_isr()

void edmac_eint_isr (void)
edmac_eint_isr This is the Ethernet interrupt service routine. It clears the interrupt flag and calls nx_ether_interrupt to process the interrupt. Save context if RTOS is used Process the interrupt. Clear pending interrupt flag to make sure it doesn't fire again after exiting. Restore context if RTOS is used

◆ enet_hw_enable_interrupt()

void enet_hw_enable_interrupt (NX_REC * *nx_rec_ptr*)

enet_hw_enable_interrupt

This function enables interrupts for the given Ethernet port.

Parameters

[in]	nx_rec_ptr	: Pointer to Ethernet record structure.

Note

The pointer parameter passed to this function is already validated at the higher level.

Enable interrupts at the NVIC.

Enable interrupts at the Ethernet controller

◆ nx_driver_event_handler()

void nx_driver_event_handler (NX_REC * *nx_rec_ptr*)

nx_driver_event_handler

This function is called from the IP thread deferred event. On every deferred event, this routine checks for Phy link status and handles link up/down and link change. During initialization this routine is responsible for checking for autonegotiation.

Parameters

[in]	nx_rec_ptr	: Pointer to Ethernet record structure.

Determine previous link status.

Save link status and changed polling interval.

Check PHY link status.

Save link status and changed polling interval.

◆ nx_ether_custom_packet_send()

ssp_err_t nx_ether_custom_packet_send (NX_PACKET_POOL * *pool_ptr*, NX_REC * *nx_record_ptr*, UCHAR * *data*, UINT *length*, USHORT *ether_type*, nx_mac_address_t *dest_mac_address*)

nx_ether_custom_packet_send

Ethernet driver routine to send a user data in raw Ethernet packet frame from a Source HW address to destination HW address with the requested EtherType through a Ethernet channel

Parameters

[in]	pool_ptr	: Pointer to packet pool to use
[in]	nx_record_ptr	: Pointer to Ethernet record structure
[in]	data	: Pointer to data to be send
[in]	length	: length of data to send
[in]	ether_type	: Type of Ethernet packet
[in]	dest_mac_address	: Destination hardware address to send the user data

Return values

SSP_SUCCESS	: Call successful
SSP_ERR_ASSERTION	: - A parameter pointers point to NULL • Invalid Ethernet record structure pointer • Invalid data length
SSP_ERR_OUT_OF_MEMORY	: No memory is free to allocate the packet in the pool buffer
SSP_ERR_NOT_OPEN	: Link not enabled
SSP_ERR_INTERNAL	: - Maximum transmit queue depth has been reached • No packet is available to append the data

Free the packet that we will not send.

Setup the prepend pointer in order to build the Ethernet frame. Backup another 2 bytes to get 32-bit word alignment.

Build the actual Ethernet frame.

Build the sender's MAC access.

Set the Ethernet frame type.

Endian swapping if necessary.

Put the frame on the wire.

◆ nx_ether_driver()

ssp_err_t nx_ether_driver (NX_IP_DRIVER * *driver_req_ptr*, NX_REC * *nx_rec_ptr*, sf_el_nx_cfg_t * *sf_el_nx_cfg_ptr*)

nx_ether_driver

Ethernet driver function for Renesas Synergy.

Parameters

[in]	driver_req_ptr	: Pointer to driver request structure
[in]	nx_rec_ptr	: Pointer to Ethernet record structure
[in]	sf_el_nx_cfg_ptr	: sf_el_nx configuration structure pointer. This is similar to SSP configuration structure

Return values

SSP_SUCCESS	: Call successful.
SSP_ERR_ASSERTION	: One or more pointers point to NULL.

Returns

See NX user manual for all possible return values.

Perform parameter checking

Setup the IP pointer from the driver request.

Default to successful return.

Extract driver command.

Process the driver request.

Save the callback record pointer in the record structure.

Record the interface structure in the driver record.

This command is used in multi homed devices - return NX_SUCCESS by default.

Process driver initialization.

Initialize BDs.

Record the interface structure in the driver record.

Update associated channel information in driver record

Configure mac address.

Get MAC address from user.

Detect S5D5 Mask Rev 02 to enable software padding for it

Initialize the ETHERC and E-DMAC hardware.

Setup the link maximum IP layer transfer unit.

See if we can honor the NX_LINK_ENABLE request. NX_ALREADY_ENABLED: Device has already been enabled

Enable the interrupts, at the interrupt controller and Ethernet controller.

Make sure we are in the right state to do the NX_LINK_DISABLE.

Disable receive and transmit.

Clear link enabled flag.

Clear the enabled flag since there is no-one else.

Free the packet that we will not send.

Process driver send packet. Place the Ethernet frame at the front of the packet.

Adjust the prepend pointer to accommodate Ethernet header.

Check if there is enough space in packet to append data.

Packet underflow.

Free the packet as there is not enough space to append data in it.

Adjust packet length.

Setup the prepend pointer in order to build the Ethernet frame. Backup another 2 bytes to get 32-bit word alignment.

Build the actual Ethernet frame.

Use MAC broadcast for this frame.

Build the sender's MAC access.

Set the Ethernet frame type.

Endian swapping if necessary.

Put the frame on the wire.

Enable multicast.

The device automatically receives multicast packets. Nothing needs to be done.

Process driver deferred requests. Process a device driver function on behalf of the IP thread.

Un-Initialize the ETHERC, E-DMAC and EPTPC hardware

Return the unhandled command status.

Return NULL in the supplied return pointer.

◆ nx_ether_interrupt()

void nx_ether_interrupt (NX_REC * *nx_rec_ptr*)

nx_ether_interrupt

This function is the main Renesas Ethernet interrupt handler.

Parameters

[in]	nx_rec_ptr	: Pointer to Ethernet record structure

Read EDMAC and EtherC status register.

Clear all interrupts.

Frame transmit completed interrupt The MAC sets Transmit Complete flag only if all frames are transmitted. This creates a delay in processing transmitted frames. The work around: this driver process transmitted packets when frame receive interrupt occurs. This way the transmitted packets can be released before processing received packets, reducing the delay.

Frame received.

Special case for ECI interrupt + link change.

To report link status changes to the application, add a semaphore put or event flag set to the statement below.

Link present.

◆ nx_ethernet_version_get()

ssp_err_t nx_ethernet_version_get (ssp_version_t *const *p_version*)

Retrieve the API version number.

Return values

SSP_SUCCESS	Successful return.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

◆ nx_synergy_ethernet_deinit()

UINT nx_synergy_ethernet_deinit (NX_REC * *nx_rec_ptr*, sf_el_nx_cfg_t * *sf_el_nx_cfg_ptr*)

nx_synergy_ethernet_deinit

This function performs reset of the ethernet controller and PTP controller.

Parameters

[in]	nx_rec_ptr	: Pointer to Ethernet record structure.
[in]	sf_el_nx_cfg_ptr	: sf_el_nx configuration structure pointer

Return values

NX_SUCCESS	: Call successful
NX_NOT_SUCCESSFUL	: Call not successful

Disable transmission and reception at the Ethernet controller

Reset the EPTPC, Resetting after detection of an erroneous flag

Reset the ETHERC and EDMAC

Wait for 64 PCLKA cycles to reset ETHERC and EDMAC

Double check the Interrupts are disabled

Disable interrupts at the NVIC.

Check for the ether channel

Hold PHY in Reset for channel 1

Hold PHY in Reset for channel 0

Disable clock to the module

◆ nx_synergy_ethernet_init()

UINT nx_synergy_ethernet_init (NX_REC * *nx_rec_ptr*, sf_el_nx_cfg_t * *sf_el_nx_cfg_ptr*, bool *hw_padding*)

nx_synergy_ethernet_init

This function initializes the specified Ethernet port.

Parameters

[in]	nx_rec_ptr	Pointer to Ethernet record structure.
[in]	hw_padding	Flag to indicate hardware 2 byte padding is used or not.
[in]	sf_el_nx_cfg_ptr	Pointer to configuration structure.

Return values

SSP_SUCCESS	Call successful.
NX_NOT_SUCCESSFUL	Call not successful.

Configure the Ethernet interrupt.

Enable clock

Reset PHY

Initialize & reset EDMAC and ETHERC

Wait at least 64 cycles of PCLKA to reset the EDMAC and ETHERC. PCLKA must be at least 12.5 MHz to use Ethernet, so wait at least 5.12 us.

Set ETHERC default modes 100 Mbps, Full duplex

Set to little Endian.

Initialize controller

Set up descriptor addresses

Configure FIFO

Enable EDMAC receive

Enable receive, transmit, ECI interrupts.

Initialize PHY.

Start PHY auto negotiation

Create a timer to poll for completion of autonegotiation.

Interface file between SF_EL_NX and PHY driver

Renesas Synergy Software Package Reference » Framework Layer » NetX Synergy Port

Data Structures

struct	phy_record_t

Macros

#define	R_PHY_OK (int16_t)(0) PHY device is initialized successfully.
#define	R_PHY_ERROR (int16_t)(-1) PHY device is not initialized successfully.
#define	R_PHY_NORMAL_PREAMBLE 0x20U Standard preamble length (32bit 1's)
#define	R_PHY_SUPPRESSED_PREAMBLE 0x01U Preamble suppression value.
#define	PHY_MII_READ (0x2U << 12) PHY read OP code.
#define	PHY_MII_WRITE (0x1U << 12) PHY write OP code.
#define	PHY_REG_CONTROL (0x0000U) Basic Control register.

SF_EL_NX callback record structure

The documentation for this struct was generated from the following file:

- nx_renesas_synergy.h

sf_el_nx_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » NetX Synergy Port

#include <nx_renesas_synergy.h>

Detailed Description

sf_el_nx configuration structure is similar to SSP configuration structure. This is collection of parameters for this module that is required for an instance initialization.

The documentation for this struct was generated from the following file:

- nx_renesas_synergy.h

NX_REC Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » NetX Synergy Port

#include <nx_renesas_synergy.h>

Data Fields

UINT	nx_state state of this driver
NX_IP *	ip_ptr NetX IP structure handling this controller.
uint16_t	channel Channel associated with this record.
UCHAR	rx_bd_space [sizeof(EMAC_BD) *(NUM_RX_DESC+1)]
EMAC_BD *	driver_rx_bd Pointer to Receive BD.

EMAC_BD *	driver_tx_bd Pointer to Transmit BD.
ULONG	driver_tx_bd_index Transmit BD buffer index.
ULONG	driver_tx_bd_in_use Number of transmit BD in use.
ULONG	driver_tx_release_index Index of Transmit buffer index to release.
ULONG	driver_rx_bd_index Receive BD buffer index.
UINT	driver_packets_queued [not used]
NX_PACKET *	driver_tx_packet_queue [not used]
NX_PACKET *	driver_tx_packet_queue_end [not used]
R_ETHERC0_Type *	etherc_ptr Pointer to ETHERC register base address.
R_EDMAC0_Type *	edmac_ptr Pointer to EDMAC register base address.
UINT	link_established link status flag

UINT	nx_driver_phy_polling_requested Polling flag.
NX_CALLBACK_REC *	p_callback_rec pointer to the user callback function
IRQn_Type	irq Interrupt priority number.

Detailed Description

Driver record structure is similar to SSP control structure that describes an open instance of sf_el_nx module.

Field Documentation

◆ rx_bd_space

UCHAR NX_REC::rx_bd_space[sizeof(EMAC_BD) *(NUM_RX_DESC+1)]
Allocate space for the BDs. Build one extra BD there because the BDs must be 16 byte aligned.

The documentation for this struct was generated from the following file:

- nx_renesas_synergy.h

5.1.3.37 NetX Synergy Port PHY Driver

Renesas Synergy Software Package Reference » Framework Layer

	Sets Auto-Negotiation advertisement and starts auto-negotiation. More...
int16_t	bsp_ethernet_phy_get_autonegotiate (uint32_t channel, uint16_t *p_line_speed_duplex, uint16_t *p_local_pause, uint16_t *p_partner_pause) Gets capabilities of an Ethernet PHY device. More...
int16_t	bsp_ethernet_phy_get_link_status (uint32_t channel) bsp_ethernet_phy_get_link_status - Returns the status of the physical link. More...

Detailed Description

Interface between SF_EL_NX Ethernet framework and PHY driver.

Function Documentation

◆ bsp_ethernet_phy_get_autonegotiate()

int16_t bsp_ethernet_phy_get_autonegotiate (uint32_t *channel*, uint16_t * *p_line_speed_duplex*, uint16_t * *p_local_pause*, uint16_t * *p_partner_pause*)

Gets capabilities of an Ethernet PHY device.

Parameters

[in]	channel	Ethernet channel number
[in]	p_line_speed_duplex	A pointer to the location of both the line speed and the duplex
[in]	p_local_pause	A pointer to the location to store the local pause bits
[in]	p_partner_pause	A pointer to the location to store the partner pause bits

Return values

R_PHY_OK	Got information successfully
R_PHY_ERROR	PHY device is yet to be initialized

Note

Validating parameters is not required by this function as it by design is only called by sf_el_nx framework with valid parameters.

Reads the status register. Because reading the first time shows the previous state, the Link status bit should be read twice.

Checks the link status

Check the auto-negotiation status

Gets local pause capability

◆ bsp_ethernet_phy_get_link_status()

int16_t bsp_ethernet_phy_get_link_status (uint32_t *channel*)

bsp_ethernet_phy_get_link_status - Returns the status of the physical link.

Parameters

[in]	channel	Ethernet channel number

Return values

R_PHY_OK	PHY device is initialized successfully
R_PHY_ERROR	PHY device is not initialized successfully

◆ bsp_ethernet_phy_init()

int16_t bsp_ethernet_phy_init (uint32_t *channel*)

bsp_ethernet_phy_init - Initialize Ethernet PHY device.

Parameters

[in]	channel	Ethernet channel number

Return values

R_PHY_OK	PHY device is initialized successfully
R_PHY_ERROR	PHY device is not initialized successfully or Validation of PHY chip fails.

Note

Refer HW manual for valid channels for a target MCU

Read the PHY Identifier register and compare read value with the PHY chip OUI identifier number

Resets PHY device

Waits the reset completion, PHY_CONTROL_RESET bit is self-cleared after 1 is written to it.

When MICREL_KSZ8091RNB of the Micrel, Inc. is used, the pin that outputs the state of LINK is used combinedly with ACTIVITY in default. The setting of the pin is changed so that only the state of LINK is output. Set Clock Mode to 50MHz

Sets Duplex Mode as Full-duplex

◆ bsp_ethernet_phy_start_autonegotiate()

void bsp_ethernet_phy_start_autonegotiate (uint32_t *channel*, uint8_t *pause*)

Sets Auto-Negotiation advertisement and starts auto-negotiation.

Parameters

[in]	channel	Ethernet channel number
[in]	pause	Using state of pause frames

5.1.3.38 BLE Framework on RL78G1D

Renesas Synergy Software Package Reference » Framework Layer

RTOS-integrated BLE Framework example. Implementation of RL78G1D BLE Driver. It implements the following interfaces: More...

Data Structures

struct	sf_ble_on_rl78g1d_cfg_t

Macros

#define	SF_BLE_RL78G1D_CODE_VERSION_MAJOR (2U)
#define	SF_BLE_RL78G1D_CODE_VERSION_MINOR (0U)

Functions

ssp_err_t	SF_BLE_RL78G1D_Open (sf_ble_ctrl_t *const p_ctrl, sf_ble_cfg_t const *const p_cfg) Initialize BLE RL78G1D driver Implements sf_ble_api_t::open Following tasks are performed Initialize module Store user specified configuration in internal driver data for further use. More...
ssp_err_t	SF_BLE_RL78G1D_Close (sf_ble_ctrl_t *const p_ctrl) De-Initialize BLE driver Implements sf_ble_api_t::close Following tasks are performed Terminate working threads and timers Reset internal driver data. More...
ssp_err_t	SF_BLE_RL78G1D_InfoGet (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_info_t *const p_ble_info) Get BLE module information Implements sf_ble_api_t::infoGet Gets module information like chip-set information and RSSI value. More...
ssp_err_t	SF_BLE_RL78G1D_ProvisioningGet (sf_ble_ctrl_t *const p_ctrl, sf_ble_provisioning_t *const p_ble_provisioning) Reads the current BLE Provisioning information. More...
ssp_err_t	SF_BLE_RL78G1D_ProvisioningSet (sf_ble_ctrl_t *const p_ctrl, sf_ble_provisioning_t const *const p_ble_provisioning) Provisions the RL78G1D BLE Driver. More...

ssp_err_t	SF_BLE_RL78G1D_AdvertisementStart (sf_ble_ctrl_t *const p_ctrl, sf_ble_adv_info_t *const p_adv_info) Make the device discoverable Implements

	sf_ble_api_t::advertisementStart Broadcasts device information to make it discoverable for other BLE modules. More...
ssp_err_t	SF_BLE_RL78G1D_AdvertisementStop (sf_ble_ctrl_t *const p_ctrl) Stop the device from being discoverable Implements sf_ble_api_t::advertisementStop Stop broadcasting device information to other BLE modules. More...
ssp_err_t	SF_BLE_RL78G1D_WhitelistAdd (sf_ble_ctrl_t *const p_ctrl, uint8_t const *const p_bd_addr) Add specified devices to whitelist Implements sf_ble_api_t::whitelistAdd Adds the devices to whitelist. More...
ssp_err_t	SF_BLE_RL78G1D_WhitelistDel (sf_ble_ctrl_t *const p_ctrl, uint8_t const *const p_bd_addr) Remove specified devices from whitelist Implements sf_ble_api_t::whitelistDel Removes devices from whiteList. More...
ssp_err_t	SF_BLE_RL78G1D_BondingStart (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint8_t const *const p_bd_addr, sf_ble_bonding_start_t *p_bonding_start) Initiate bonding process with remote BLE device Implements sf_ble_api_t::bondingStart Initiates bonding process and exchange security keys if enabled. More...
ssp_err_t	SF_BLE_RL78G1D_BondingResponse (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint8_t const *const p_bd_addr, sf_ble_bonding_response_t *p_bonding_resp) Respond to the bonding request from the remote BLE device Implements sf_ble_api_t::bondingResponse Send bonding response on reception of SF_BLE_EVENT_BONDING_INDICATION. More...
ssp_err_t	SF_BLE_RL78G1D_StartEncryption (sf_ble_ctrl_t *const p_ctrl, sf_ble_sm_enc_info_t const *p_enc_info) Start encryption with remote BLE device Implements sf_ble_api_t::startEncryption Encrypts with remote BLE device. More...
ssp_err_t	SF_BLE_RL78G1D_Connect (sf_ble_ctrl_t *const p_ctrl, sf_ble_connection_t const *const p_conn, sf_ble_conn_handle_t *p_handle) Connect to a remote BLE device Implements sf_ble_api_t::connect

	Initiate a connection with remote BLE device. More...
ssp_err_t	SF_BLE_RL78G1D_Listen (sf_ble_ctrl_t *const p_ctrl) Listen for connection request from remote device Implements sf_ble_api_t::listen. More...
ssp_err_t	SF_BLE_RL78G1D_Authorization (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle) Specifies remote device has been authorized by user Implements sf_ble_api_t::authorization Indicates that the specified remote device has been authorized by user. More...
ssp_err_t	SF_BLE_RL78G1D_Disconnect (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle) Terminate connection with remote BLE device Implements sf_ble_api_t::disconnect Disconnects with remote BLE device. More...
ssp_err_t	SF_BLE_RL78G1D_SetTxPower (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *const p_handle, sf_ble_set_tx_pwr_info_t *p_tx_power_info) Sets the transmit power for the procedure specified by the connection handle Implements sf_ble_api_t::setTxPower Sets the transmit power for the procedure. Valid values of TX power level (p_tx_power_info->power_lvl) for RL78G1D in dBm are -15, -10, -7, -2, -1 and 0. More...
ssp_err_t	SF_BLE_RL78G1D_AddCustomProfiles (sf_ble_ctrl_t *const p_ctrl, sf_ble_svc_attribute_t *p_svc_attr, uint32_t svc_attr_len, sf_ble_char_attribute_t *p_char_attr, uint32_t char_attr_len) Add GATT Attributes to create Custom GATT Profile Implements sf_ble_api_t::gattAddCustomProfiles This function is called with list of service and characteristics which is to be added to GATT database. Services and characteristics which were previously added will be removed and newly passed services and characteristics will be added. More...
ssp_err_t	SF_BLE_RL78G1D_GATTServiceDiscovery (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_service_discovery_req_t const *const p_sf_ble_svc_dscv_req, sf_ble_service_discovery_rsp_t *const p_sf_ble_svc_dscv_rsp, uint32_t *const p_rsp_cnt) Perform service discovery used by GATT client Implements sf_ble_api_t::gattServiceDiscovery GATT client performs service discovery of GATT server. More...

ssp_err_t	SF_BLE_RL78G1D_GATTCharDiscovery (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_char_discovery_req_t const *const p_sf_ble_char_dscv_req, sf_ble_char_discovery_rsp_t *const p_sf_ble_char_dscv_rsp, uint32_t *const p_rsp_cnt) Perform characteristics discovery used by GATT client Implements sf_ble_api_t::gattCharDiscovery GATT client performs characteristics discovery of GATT server. More...
ssp_err_t	SF_BLE_RL78G1D_GATTCharDescDiscovery (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint16_t start_handle, uint16_t end_handle, sf_ble_char_desc_discovery_rsp_t *const p_sf_ble_chardesc_dscv_rsp, uint32_t *const p_rsp_cnt) Perform characteristics descriptor discovery used by GATT client Implements sf_ble_api_t::gattCharDescDiscovery GATT client performs characteristics descriptor discovery of GATT server. More...
ssp_err_t	SF_BLE_RL78G1D_GATTCharRead (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_char_read_req_t const *const p_char_read_req, sf_ble_char_read_rsp_t *const p_char_read_rsp) Perform read characteristic used by GATT client Implements sf_ble_api_t::gattCharRead GATT client reads from GATT server. More...
ssp_err_t	SF_BLE_RL78G1D_GATTCharWrite (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_char_write_req_t const *const p_char_write_req) Perform write characteristic used by GATT client Implements sf_ble_api_t::gattCharWrite GATT client performs write operation on GATT server. More...
ssp_err_t	SF_BLE_RL78G1D_GATTCharExecuteWrite (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, sf_ble_execute_write_t execute_flag) Perform execute write on all pending write operations, used by GATT client Implements sf_ble_api_t::gattCharExecuteWrite GATT client performs execute write on all pending write operations on GATT server. More...
ssp_err_t	SF_BLE_RL78G1D_GATTCharWriteLocal (sf_ble_ctrl_t *const p_ctrl, uint16_t char_handle, uint16_t data_length, uint8_t *const p_data) Perform local characteristic write used by GATT server Implements sf_ble_api_t::gattCharWriteLocal GATT server performs local characteristic write. More...

ssp_err_t	SF_BLE_RL78G1D_GATTSendNotify (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint16_t char_handle) Send notification to GATT client, used by GATT server Implements sf_ble_api_t::gattSendNotify GATT server sends notification to GATT client. More...
ssp_err_t	SF_BLE_RL78G1D_GATTSendIndicate (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint16_t char_handle) Send indication to GATT client, used by GATT server Implements sf_ble_api_t::gattSendIndicate GATT server sends indication to GATT client. More...
ssp_err_t	SF_BLE_RL78G1D_GATTWriteResponse (sf_ble_ctrl_t *const p_ctrl, sf_ble_conn_handle_t *p_handle, uint16_t handle, sf_ble_attribute_error_code_t error_code) Send response to write operation received by GATT client, used by GATT server Implements sf_ble_api_t::gattWriteResponse GATT server sends response of write operation to GATT client. More...
ssp_err_t	SF_BLE_RL78G1D_VersionGet (ssp_version_t *const p_version) Get driver version based on compile time macros. Implements sf_ble_api_t::versionGet. More...

Detailed Description

RTOS-integrated BLE Framework example. Implementation of RL78G1D BLE Driver. It implements the following interfaces:

- SF BLE Framework Interface

Macro Definition Documentation

◆ SF_BLE_RL78G1D_CODE_VERSION_MAJOR

```
#define SF_BLE_RL78G1D_CODE_VERSION_MAJOR   (2U)
```

BLE Interface. Major Version of code that implements the API defined in this file

◆ SF_BLE_RL78G1D_CODE_VERSION_MINOR

```
#define SF_BLE_RL78G1D_CODE_VERSION_MINOR   (0U)
```

Minor Version of code that implements the API defined in this file

Function Documentation

◆ SF_BLE_RL78G1D_AddCustomProfiles()

ssp_err_t SF_BLE_RL78G1D_AddCustomProfiles (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_svc_attribute_t * *p_svc_attr*, uint32_t *svc_attr_len*, sf_ble_char_attribute_t * *p_char_attr*, uint32_t *char_attr_len*)

Add GATT Attributes to create Custom GATT Profile Implements sf_ble_api_t::gattAddCustomProfiles This function is called with list of service and characteristics which is to be added to GATT database. Services and characteristics which were previously added will be removed and newly passed services and characteristics will be added.

If services and characteristics were previously added and now those services and characteristics are to be removed and no new services and characteristics are to be added , then call this API with service and characteristics length as zero

Return values

SSP_ERR_UNSUPPORTED	Unsupported Feature

◆ SF_BLE_RL78G1D_AdvertisementStart()

ssp_err_t SF_BLE_RL78G1D_AdvertisementStart (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_adv_info_t *const *p_adv_info*)

Make the device discoverable Implements sf_ble_api_t::advertisementStart Broadcasts device information to make it discoverable for other BLE modules.

Return values

SSP_SUCCESS	Start the advertisement of device successfully
SSP_ERR_BLE_FAILED	Advertisement Start failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_INVALID_MODE	Invalid GAP Role

◆ SF_BLE_RL78G1D_AdvertisementStop()

ssp_err_t SF_BLE_RL78G1D_AdvertisementStop (sf_ble_ctrl_t *const *p_ctrl*)

Stop the device from being discoverable Implements sf_ble_api_t::advertisementStop Stop broadcasting device information to other BLE modules.

Return values

SSP_SUCCESS	Stop the advertisement of device successfully
SSP_ERR_BLE_FAILED	Advertisement Stop failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_Authorization()

ssp_err_t SF_BLE_RL78G1D_Authorization (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*)

Specifies remote device has been authorized by user Implements sf_ble_api_t::authorization Indicates that the specified remote device has been authorized by user.

Return values

SSP_SUCCESS	Authorization success
SSP_ERR_BLE_FAILED	Authorization failed
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_BondingResponse()

ssp_err_t SF_BLE_RL78G1D_BondingResponse (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, uint8_t const *const *p_bd_addr*, sf_ble_bonding_response_t * *p_bonding_resp*)

Respond to the bonding request from the remote BLE device Implements sf_ble_api_t::bondingResponse Send bonding response on reception of SF_BLE_EVENT_BONDING_INDICATION.

Return values

SSP_SUCCESS	Bonding response success
SSP_ERR_BLE_FAILED	Failed getting bonding response
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_BondingStart()

ssp_err_t SF_BLE_RL78G1D_BondingStart (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, uint8_t const *const *p_bd_addr*, sf_ble_bonding_start_t * *p_bonding_start*)

Initiate bonding process with remote BLE device Implements sf_ble_api_t::bondingStart Initiates bonding process and exchange security keys if enabled.

Return values

SSP_SUCCESS	Bonding start success
SSP_ERR_BLE_FAILED	Bonding start failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_Close()

ssp_err_t SF_BLE_RL78G1D_Close (sf_ble_ctrl_t *const *p_ctrl*)

De-Initialize BLE driver Implements sf_ble_api_t::close Following tasks are performed Terminate working threads and timers Reset internal driver data.

Return values

SSP_SUCCESS	Suspend the driver functionality
SSP_ERR_BLE_FAILED	Close failure
SSP_ERR_NOT_OPEN	Module is not opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_Connect()

ssp_err_t SF_BLE_RL78G1D_Connect (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_connection_t const *const *p_conn*, sf_ble_conn_handle_t * *p_handle*)

Connect to a remote BLE device Implements sf_ble_api_t::connect Initiate a connection with remote BLE device.

Return values

SSP_SUCCESS	Connect success
SSP_ERR_BLE_FAILED	Failed to connect
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_INVALID_MODE	Invalid GAP Role

◆ SF_BLE_RL78G1D_Disconnect()

ssp_err_t SF_BLE_RL78G1D_Disconnect (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*)

Terminate connection with remote BLE device Implements sf_ble_api_t::disconnect Disconnects with remote BLE device.

Return values

SSP_SUCCESS	Disconnect success
SSP_ERR_BLE_FAILED	Disconnect failed
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharDescDiscovery()

ssp_err_t SF_BLE_RL78G1D_GATTCharDescDiscovery (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, uint16_t *start_handle*, uint16_t *end_handle*, sf_ble_char_desc_discovery_rsp_t *const *p_sf_ble_chardesc_dscv_rsp*, uint32_t *const *p_rsp_cnt*)

Perform characteristics descriptor discovery used by GATT client Implements sf_ble_api_t::gattCharDescDiscovery GATT client performs characteristics descriptor discovery of GATT server.

Return values

SSP_ERR_BLE_FAILED	Characteristics descriptor discovery failed
SSP_SUCCESS	Characteristics descriptor discovery successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharDiscovery()

ssp_err_t SF_BLE_RL78G1D_GATTCharDiscovery (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_char_discovery_req_t const *const *p_sf_ble_char_dscv_req*, sf_ble_char_discovery_rsp_t *const *p_sf_ble_char_dscv_rsp*, uint32_t *const *p_rsp_cnt*)

Perform characteristics discovery used by GATT client Implements sf_ble_api_t::gattCharDiscovery GATT client performs characteristics discovery of GATT server.

Return values

SSP_ERR_BLE_FAILED	Characteristics discovery failed
SSP_SUCCESS	Characteristics discovery successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharExecuteWrite()

ssp_err_t SF_BLE_RL78G1D_GATTCharExecuteWrite (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_execute_write_t *execute_flag*)

Perform execute write on all pending write operations, used by GATT client Implements sf_ble_api_t::gattCharExecuteWrite GATT client performs execute write on all pending write operations on GATT server.

Return values

SSP_ERR_BLE_FAILED	Execute write failed
SSP_SUCCESS	Execute write successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharRead()

ssp_err_t SF_BLE_RL78G1D_GATTCharRead (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_char_read_req_t const *const *p_char_read_req*, sf_ble_char_read_rsp_t *const *p_char_read_rsp*)

Perform read characteristic used by GATT client Implements sf_ble_api_t::gattCharRead GATT client reads from GATT server.

Return values

SSP_ERR_BLE_FAILED	Characteristic read failed
SSP_SUCCESS	Characteristic read successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharWrite()

ssp_err_t SF_BLE_RL78G1D_GATTCharWrite (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_char_write_req_t const *const *p_char_write_req*)

Perform write characteristic used by GATT client Implements sf_ble_api_t::gattCharWrite GATT client performs write operation on GATT server.

Return values

SSP_ERR_BLE_FAILED	Characteristic write failed
SSP_SUCCESS	Characteristic write successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTCharWriteLocal()

ssp_err_t SF_BLE_RL78G1D_GATTCharWriteLocal (sf_ble_ctrl_t *const *p_ctrl*, uint16_t *char_handle*, uint16_t *data_length*, uint8_t *const *p_data*)

Perform local characteristic write used by GATT server Implements sf_ble_api_t::gattCharWriteLocal GATT server performs local characteristic write.

Return values

SSP_ERR_BLE_FAILED	Local characteristic write failed
SSP_SUCCESS	Local characteristic write successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTSendIndicate()

ssp_err_t SF_BLE_RL78G1D_GATTSendIndicate (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t *p_handle*, uint16_t *char_handle*)

Send indication to GATT client, used by GATT server Implements sf_ble_api_t::gattSendIndicate GATT server sends indication to GATT client.

Return values

SSP_ERR_BLE_FAILED	Send Indication failed
SSP_SUCCESS	Send Indication successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTSendNotify()

ssp_err_t SF_BLE_RL78G1D_GATTSendNotify (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, uint16_t *char_handle*)

Send notification to GATT client, used by GATT server Implements sf_ble_api_t::gattSendNotify GATT server sends notification to GATT client.

Return values

SSP_ERR_BLE_FAILED	Send notification failed
SSP_SUCCESS	Send notification successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTServiceDiscovery()

ssp_err_t SF_BLE_RL78G1D_GATTServiceDiscovery (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_service_discovery_req_t const *const *p_sf_ble_svc_dscv_req*, sf_ble_service_discovery_rsp_t *const *p_sf_ble_svc_dscv_rsp*, uint32_t *const *p_rsp_cnt*)

Perform service discovery used by GATT client Implements sf_ble_api_t::gattServiceDiscovery GATT client performs service discovery of GATT server.

Return values

SSP_ERR_BLE_FAILED	Service discovery failed
SSP_SUCCESS	Service discovery successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_GATTWriteResponse()

ssp_err_t SF_BLE_RL78G1D_GATTWriteResponse (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, uint16_t *handle*, sf_ble_attribute_error_code_t *error_code*)

Send response to write operation received by GATT client, used by GATT server Implements sf_ble_api_t::gattWriteResponse GATT server sends response of write operation to GATT client.

Return values

SSP_ERR_BLE_FAILED	Send write response failed
SSP_SUCCESS	Send write response successful
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_InfoGet()

ssp_err_t SF_BLE_RL78G1D_InfoGet (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t * *p_handle*, sf_ble_info_t *const *p_ble_info*)

Get BLE module information Implements sf_ble_api_t::infoGet Gets module information like chip-set information and RSSI value.

Return values

SSP_SUCCESS	Successfully get the BLE information
SSP_ERR_BLE_FAILED	Info get failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_TIMEOUT	BLE event timeout

Initialize RSSI to zero and do not check return value of Read RSSI API since InfoGet API can be called before connection is established and in that case Read RSSI API will return error but InfoGet API should return Success with 0 RSSI

◆ SF_BLE_RL78G1D_Listen()

ssp_err_t SF_BLE_RL78G1D_Listen (sf_ble_ctrl_t *const *p_ctrl*)

Listen for connection request from remote device Implements sf_ble_api_t::listen.

Return values

SSP_ERR_UNSUPPORTED	Functionality is not supported.

◆ SF_BLE_RL78G1D_Open()

ssp_err_t SF_BLE_RL78G1D_Open (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_cfg_t const *const *p_cfg*)

Initialize BLE RL78G1D driver Implements sf_ble_api_t::open Following tasks are performed Initialize module Store user specified configuration in internal driver data for further use.

Return values

SSP_SUCCESS	Module initialization successful
SSP_ERR_BLE_FAILED	Failed to initialize module
SSP_ERR_ALREADY_OPEN	Device is already open
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_INTERNAL	GATT Initialization failure

If mutex is already created then mutex create returns TX_MUTEX_ERROR which is a valid condition

◆ SF_BLE_RL78G1D_ProvisioningGet()

ssp_err_t SF_BLE_RL78G1D_ProvisioningGet (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_provisioning_t *const *p_ble_provisioning*)

Reads the current BLE Provisioning information.

Implements sf_ble_api_t::provisionGet Reads the provisioning information

Return values

SSP_SUCCESS	Successfully reads provisioning information
SSP_ERR_BLE_FAILED	Provisioning get failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_ProvisioningSet()

ssp_err_t SF_BLE_RL78G1D_ProvisioningSet (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_provisioning_t const *const *p_ble_provisioning*)

Provisions the RL78G1D BLE Driver.

Implements sf_ble_api_t::provisionSet This function performs the following tasks: Provisions the BLE driver. Set bonding and security modes as provisioned.

Return values

SSP_SUCCESS	Successfully provisioned the device.
SSP_ERR_BLE_FAILED	Provisioning set failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_UNSUPPORTED	Unsupported feature

◆ SF_BLE_RL78G1D_Scan()

ssp_err_t SF_BLE_RL78G1D_Scan (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_scan_t *const *p_scan*, uint8_t *const *p_cnt*, sf_ble_scan_info_t * *p_scan_info*)

Scans for available BLE devices.

Implements sf_ble_api_t::scan Scans for available BLE devices and return the list to caller.

Return values

SSP_SUCCESS	Successful scan of available BLE devices
SSP_ERR_BLE_FAILED	Scan failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_INVALID_MODE	Invalid GAP Role

◆ SF_BLE_RL78G1D_SetTxPower()

ssp_err_t SF_BLE_RL78G1D_SetTxPower (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_conn_handle_t *const *p_handle*, sf_ble_set_tx_pwr_info_t * *p_tx_power_info*)

Sets the transmit power for the procedure specified by the connection handle Implements sf_ble_api_t::setTxPower Sets the transmit power for the procedure. Valid values of TX power level (p_tx_power_info->power_lvl) for RL78G1D in dBm are -15, -10, -7, -2, -1 and 0.

Return values

SSP_SUCCESS	TX power set successfully
SSP_ERR_BLE_FAILED	TX power set failed
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments
SSP_ERR_INVALID_ARGUMENT	Invalid transmit power level parameter not supported by device

◆ SF_BLE_RL78G1D_StartEncryption()

ssp_err_t SF_BLE_RL78G1D_StartEncryption (sf_ble_ctrl_t *const *p_ctrl*, sf_ble_sm_enc_info_t const * *p_enc_info*)

Start encryption with remote BLE device Implements sf_ble_api_t::startEncryption Encrypts with remote BLE device.

Return values

SSP_SUCCESS	in case of success
SSP_ERR_BLE_FAILED	Failed to start encryption
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_VersionGet()

ssp_err_t SF_BLE_RL78G1D_VersionGet (ssp_version_t *const *p_version*)

Get driver version based on compile time macros. Implements sf_ble_api_t::versionGet.

Return values

SSP_SUCCESS	Success
SSP_ERR_ASSERTION	Argument NULL is passed

◆ SF_BLE_RL78G1D_WhitelistAdd()

ssp_err_t SF_BLE_RL78G1D_WhitelistAdd (sf_ble_ctrl_t *const *p_ctrl*, uint8_t const *const *p_bd_addr*)

Add specified devices to whitelist Implements sf_ble_api_t::whitelistAdd Adds the devices to whitelist.

Return values

SSP_SUCCESS	Whitelist add success
SSP_ERR_BLE_FAILED	Whitelist add failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

◆ SF_BLE_RL78G1D_WhitelistDel()

ssp_err_t SF_BLE_RL78G1D_WhitelistDel (sf_ble_ctrl_t *const *p_ctrl*, uint8_t const *const *p_bd_addr*)

Remove specified devices from whitelist Implements sf_ble_api_t::whitelistDel Removes devices from whiteList.

Return values

SSP_SUCCESS	Whitelist delete success
SSP_ERR_BLE_FAILED	Whitelist delete failure
SSP_ERR_NOT_OPEN	Device Not Opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_TIMEOUT	BLE event timeout
SSP_ERR_ASSERTION	Invalid Arguments

sf_ble_on_rl78g1d_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » BLE Framework on RL78G1D

#include <sf_ble_rl78g1d.h>

Data Fields

sf_comms_instance_t const *	p_low_lvl_sf_comms Pointer to Communication Framework instance.
timer_instance_t const *	p_low_lvl_timer Pointer to timer instance.
UINT	ble_driver_thread_priority BLE Driver Thread Priority.
UINT	ble_serial_thread_priority BLE Serial Thread Priority.

Detailed Description

Extension structure for this Implementation. Each implementation can have its own extension structure. For example one implementation may use RSPI for communicating with the BLE chip while another may use SDIO.

The documentation for this struct was generated from the following file:

- sf_ble_rl78g1d.h

5.1.3.39 BLE On-Board Profile Framework on RL78G1D

Renesas Synergy Software Package Reference » Framework Layer

RTOS-integrated BLE On-Board Profile Framework example. Implementation of RL78G1D BLE On-Board Profile Driver. It implements the following interfaces: More...

Data Fields

ioport_port_pin_t	pin Reset pin.
sf_i2c_instance_t const *	p_lower_lvl_framewrk Pointer to lower level I2C framework.
sf_external_irq_instance_t const *	p_lower_lvl_irq Pointer to lower level external IRQ.
sf_touch_panel_v2_payload_t	last_payload Stores most recent payload for comparison.

Detailed Description

Instance control block. DO NOT INITIALIZE. Initialization occurs when sf_touch_panel_chip_api_t::open is called

---

The documentation for this struct was generated from the following file:

- sf_touch_panel_chip_ft5x06.h

sf_touch_panel_chip_on_ft5x06_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » Touch Panel Framework Example for FT5X06

#include <sf_touch_panel_chip_ft5x06.h>

Data Fields

ioport_port_pin_t	pin Port pin connected to reset line on touch controller chip.
sf_i2c_instance_t const *	p_lower_lvl_framewrk Pointer to lower level I2C framework.
sf_external_irq_instance_t const *	p_lower_lvl_irq Pointer to lower level external IRQ.

Detailed Description

Configuration for RTOS touch panel driver.

The documentation for this struct was generated from the following file:

- sf_touch_panel_chip_ft5x06.h

5.1.3.45 Touch Panel Framework Example for SX8654

Detailed Description

RTOS-integrated WiFi Framework example. Implementation of Atheros WiFi Driver. It implements the following interfaces:

- SF WIFI Framework Interface

Macro Definition Documentation

◆ SF_WIFI_GT202_CODE_VERSION_MAJOR

#define SF_WIFI_GT202_CODE_VERSION_MAJOR (2U)
WiFi Interface. Major Version of code that implements the API defined in this file

◆ SF_WIFI_GT202_CODE_VERSION_MINOR

#define SF_WIFI_GT202_CODE_VERSION_MINOR (0U)
Minor Version of code that implements the API defined in this file

Function Documentation

◆ SF_WIFI_GT202_ACLAdd()

ssp_err_t SF_WIFI_GT202_ACLAdd (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*)
Add MAC address from Access control list. Implements sf_wifi_api_t::ACLAdd Add specified mac address in access control list **Return values** SSP_ERR_UNSUPPORTED — Functionality is not supported.

◆ SF_WIFI_GT202_ACLDelete()

ssp_err_t SF_WIFI_GT202_ACLDelete (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*)
Delete MAC address from Access control list. Implements sf_wifi_api_t::ACLDelete Delete specified mac address from access control list **Return values** SSP_ERR_UNSUPPORTED — Functionality is not supported.

◆ SF_WIFI_GT202_Close()

ssp_err_t SF_WIFI_GT202_Close (sf_wifi_ctrl_t *const *p_ctrl*)

Stop WiFi module functionality.

Implements sf_wifi_api_t::close This function performs the following tasks: Update global variables for future use. Disable the Interrupt and suspend the driver task thread.

Return values

SSP_SUCCESS	Suspend the driver functionality.
SSP_ERR_NOT_OPEN	Device is not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to close

Dis-associate or Stop Access Point

Stop WiFi Driver

Delete byte pool used by WiFi driver

Terminate and Delete WiFi Driver task thread

Set init done flag to false and driver handle to NULL

◆ SF_WIFI_GT202_InfoGet()

ssp_err_t SF_WIFI_GT202_InfoGet (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_info_t *const *p_wifi_info*)

Get WiFi module information.

Implements sf_wifi_api_t::infoGet Get WiFi module information like chipset/driver information, RSSI, noise level, link quality

Return values

SSP_SUCCESS	Successfully get the WiFi information
SSP_ERR_NOT_OPEN	Driver not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_WIFI_FAILED	Failed reading WiFi information
SSP_ERR_IN_USE	Module in use

◆ SF_WIFI_GT202_MACAddressGet()

ssp_err_t SF_WIFI_GT202_MACAddressGet (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t *const *p_mac*)

Get MAC address of WiFi module.

Implements sf_wifi_api_t::getMACAddress Read configured MAC address of the WiFi module.

Return values

SSP_SUCCESS	Successfully reads the mac address.
SSP_ERR_WIFI_FAILED	Failed to read mac address
SSP_ERR_NOT_OPEN	Driver not opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Argument NULL is passed

Driver param structure for ioctl

◆ SF_WIFI_GT202_MACAddressSet()

ssp_err_t SF_WIFI_GT202_MACAddressSet (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac*)

Set MAC address of WiFi module.

Implements sf_wifi_api_t::setMACAddress Configure MAC address of the WiFi module.

Return values

SSP_ERR_UNSUPPORTED	Functionality is not supported.

◆ SF_WIFI_GT202_MulticastListAdd()

ssp_err_t SF_WIFI_GT202_MulticastListAdd (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr*)

Add MAC address in multicast list.

Implements sf_wifi_api_t::multicastListAdd Adds specified MAC address in Multicast list

Return values

SSP_ERR_UNSUPPORTED	Functionality is not supported by WiFi module

◆ SF_WIFI_GT202_MulticastListDelete()

ssp_err_t SF_WIFI_GT202_MulticastListDelete (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t const *const *p_mac_addr*)

Delete MAC address from multicast list.

Implements sf_wifi_api_t::multicastListDelete Deletes specified MAC Address from Multicast list

Return values

SSP_ERR_UNSUPPORTED	Functionality is not supported.

◆ SF_WIFI_GT202_Open()

ssp_err_t SF_WIFI_GT202_Open (sf_wifi_ctrl_t * *p_ctrl*, sf_wifi_cfg_t const *const *p_cfg*)

Initialize WiFi module.

Implements sf_wifi_api_t::open This function performs the following tasks: Initializes WiFi module and Configure the parameters as per the p_cfg Update global variables for future use.

Return values

SSP_SUCCESS	Module initialization successful
SSP_ERR_ALREADY_OPEN	WiFi module is already opened
SSP_ERR_WIFI_CONFIG_FAILED	WiFi module Configuration failed
SSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to initialize
SSP_ERR_UNSUPPORTED	Unsupported Parameter configuration
SSP_ERR_INTERNAL	Extended Configuration is NULL

◆ SF_WIFI_GT202_ProvisioningGet()

ssp_err_t SF_WIFI_GT202_ProvisioningGet (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_provisioning_t *const *p_wifi_provisioning*)

Reads the current WiFi Provisioning information of the WiFi module.

Implements sf_wifi_api_t::provisioningGet Reads the provisioning information

Return values

SSP_SUCCESS	Successfully reads provisioning information
SSP_ERR_NOT_OPEN	Device is not opened
SSP_ERR_WIFI_FAILED	Failed to get provisioning information
SSP_ERR_ASSERTION	Argument NULL is passed

◆ SF_WIFI_GT202_ProvisioningSet()

ssp_err_t SF_WIFI_GT202_ProvisioningSet (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_provisioning_t const *const *p_wifi_provisioning*)

Provisions the WiFi module.

Implements sf_wifi_api_t::provisioningSet This function performs the following tasks: Provisions the WiFi driver. Start WiFi interface in AP or Client mode as provisioned.

Return values

SSP_SUCCESS	Successfully provisioned the driver.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_NOT_OPEN	Device is not opened
SSP_ERR_WIFI_FAILED	Failed to set provisioning configuration.
SSP_ERR_INVALID_SIZE	Invalid length of security key
SSP_ERR_INVALID_ARGUMENT	Invalid encryption type for given security
SSP_ERR_IN_USE	Module in use

if is_opened

◆ SF_WIFI_GT202_Scan()

ssp_err_t SF_WIFI_GT202_Scan (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_scan_t *const *p_scan*, uint8_t *const *p_cnt*)

Scans for available APs.

Implements sf_wifi_api_t::scan Scan for available AP's SSID and return the list to caller.

Return values

SSP_SUCCESS	Successfully scan the network for available APs
SSP_ERR_NOT_OPEN	Driver not opened
SSP_ERR_WIFI_FAILED	Failed to scan
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use

◆ SF_WIFI_GT202_StatisticsGet()

ssp_err_t SF_WIFI_GT202_StatisticsGet (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_stats_t *const *p_wifi_device_stats*)

Get the interface statistics.

Implements sf_wifi_api_t::statisticsGet Collect the statistics information of WiFi interface

Return values

SSP_SUCCESS	Successfully get the Statistics information.
SSP_ERR_UNSUPPORTED	Functionality is not supported.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed reading WiFi statistics

Statistics are not available in case of On chip Stack

◆ SF_WIFI_GT202_Transmit()

ssp_err_t SF_WIFI_GT202_Transmit (sf_wifi_ctrl_t *const *p_ctrl*, uint8_t *const *p_buf*, uint32_t *length*)

Transmit data packets.

Implements sf_wifi_api_t::transmit Adds packets in transmit Queue.

Return values

SSP_SUCCESS	Successfully added the packet in transmit queue
SSP_ERR_NOT_OPEN	WiFi driver is not opened
SSP_ERR_OUT_OF_MEMORY	Memory allocation failed
SSP_ERR_WIFI_TRANSMIT_FAILED	Transmission failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to transmit
SSP_ERR_UNSUPPORTED	When using On-Chip stack

Transmit function will be used only when using NSAL

◆ SF_WIFI_GT202_VersionGet()

ssp_err_t SF_WIFI_GT202_VersionGet (ssp_version_t *const *p_version*)

Set driver version based on compile time macros. Implements sf_wifi_api_t::versionGet.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ SF_WIFI_GT202_WpsStart()

ssp_err_t SF_WIFI_GT202_WpsStart (sf_wifi_ctrl_t *const *p_ctrl*, sf_wifi_wps_t const *const *p_wps*)

Start WiFi WPS.

Implements sf_wifi_api_t::wpsStart Start WPS to connect device.

Return values

SSP_SUCCESS	WPS started Successfully and device is able to connect
SSP_ERR_INTERNAL	Internal error
SSP_ERR_WIFI_FAILED	Failed to connect WiFi module using WPS method
SSP_ERR_NOT_OPEN	Driver not opened
SSP_ERR_IN_USE	Module in use
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_INVALID_ARGUMENT	Invalid input parameters
SSP_ERR_WIFI_WPS_MULTIPLE_PB_SESSIONS	Another Push button session is already in progress
SSP_ERR_TIMEOUT	WPS Timer expired
SSP_ERR_WIFI_WPS_M2D_RECEIVED	M2D Error code received which means Registrar is unable to authenticate with the Enrollee
SSP_ERR_WIFI_WPS_AUTHENTICATION_FAILED	WPS authentication failed
SSP_ERR_WIFI_WPS_CANCELLED	WPS Request was not accepted by underlying driver
SSP_ERR_WIFI_WPS_INVALID_PIN	Invalid WPS Pin

sf_wifi_on_gt202_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » WiFi Framework on GT202

#include <sf_wifi_gt202.h>

Data Fields

spi_instance_t const *	p_lower_lvl_spi SPI Interface used for WiFi communications.

external_irq_instance_t const *	p_lower_lvl_icu ICU Interface used for WiFi communications.
ioport_port_pin_t	pin_reset Port pin used for resetting chipset.
ioport_port_pin_t	pin_slave_select Port pin used for SPI slave select.
uint32_t	driver_task_priority Driver task thread priority, should be high priority.

Detailed Description

Extension structure for this Implementation. Each implementation can have its own extension structure. For example one implementation may use RSPI for communicating with the WiFi chip while another may use SDIO.

The documentation for this struct was generated from the following file:

- sf_wifi_gt202.h

5.1.3.47 WiFi On Chip Stack on GT202

Renesas Synergy Software Package Reference » Framework Layer

RTOS-integrated WiFi On Chip Stack Framework example. Implementation of Atheros WiFi Driver. It implements the following interfaces: More...

Macros

Detailed Description

RTOS-integrated WiFi Framework example. Implementation of Silex ULPGN WiFi Driver. It implements the following interfaces:

- SF WIFI QCA4010 Framework Interface

Macro Definition Documentation

◆ SF_WIFI_QCA4010_CODE_VERSION_MAJOR

#define SF_WIFI_QCA4010_CODE_VERSION_MAJOR (2U)
WiFi Interface. Major Version of code that implements the API defined in this file

◆ SF_WIFI_QCA4010_CODE_VERSION_MINOR

#define SF_WIFI_QCA4010_CODE_VERSION_MINOR (0U)
Minor Version of code that implements the API defined in this file

Function Documentation

◆ SF_WiFi_QCA4010_Close()

ssp_err_t SF_WiFi_QCA4010_Close (sf_wifi_qca4010_ctrl_t *const *p_ctrl*)

Stop Wifi QCA4010 driver functionality.

Implements sf_wifi_qca4010_api_t::close De-initializes the lower level interface

Parameters

[in]	p_ctrl	Wifi control block

Return values

SSP_SUCCESS	Wifi Driver stop successfully.
SSP_ERR_NOT_OPEN	Device is not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_WIFI_FAILED	Driver De-initialization failed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex

Disconnect from the access point

close module

Set module open flag to false and delete mutex

Release the mutex

Delete the mutex

◆ SF_Wifi_QCA4010_CommandSend()

ssp_err_t SF_Wifi_QCA4010_CommandSend (sf_wifi_qca4010_ctrl_t *const *p_ctrl*, sf_wifi_qca4010_cmd_resp_t *const *p_input_at_command*, sf_wifi_qca4010_cmd_resp_t *const *p_output*, uint32_t const *timeout*)

Send custom AT command to SX-ULPGN module.

This API will send AT command provided by user to the SX-ULPGN and will collect the response from the modem and will send it back to the user. If silex is in Data Mode when this API is called then Framework will first switch Modem to Command Mode, then send the AT command and collect the response and then switches the Modem back to Data Mode.

Parameters

[in]	p_ctrl	Pointer to the wifi control block
[in]	p_input_at_command	Pointer to structure which contains command to send
[in,out]	p_output	Pointer to buffer in which response will be sent to user, Also user will pass the size of the buffer which is pointed by p_output
[in]	timeout	Timeout for which framework will wait for response in milliseconds

Return values

SSP_SUCCESS	Successfully sent AT command and collected response
SSP_ERR_WIFI_FAILED	Failed to either send AT command or collect response
SSP_ERR_NOT_OPEN	Device is not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Device already in use

Get Mutex

Send AT command

Release the mutex

◆ SF_WiFi_QCA4010_Open()

ssp_err_t SF_WiFi_QCA4010_Open (sf_wifi_qca4010_ctrl_t * *p_ctrl*, sf_wifi_qca4010_cfg_t const *const *p_cfg*)

Initialize WiFi module.

Implements sf_wifi_qca4010_api_t::open This function performs the following tasks: Initializes WiFi module and Configure the parameters as per the p_cfg Update global variables for future use.

Parameters

[out]	p_ctrl	Wifi control block
[in]	p_cfg	Wifi configuration structure

Return values

SSP_SUCCESS	Module initialization successful
SSP_ERR_ALREADY_OPEN	WiFi module is already opened
SSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Module initialization failed
SSP_ERR_INTERNAL	Internal Error occurred

Create Mutex for Synchronization

Get Mutex Lock

Open and configure the wifi module

Release Mutex

◆ SF_WiFi_QCA4010_ProvisioningSet()

ssp_err_t SF_WiFi_QCA4010_ProvisioningSet (sf_wifi_qca4010_ctrl_t *const *p_ctrl*, sf_wifi_qca4010_provisioning_t const *const *p_wifi_provisioning*)

Sets the provisioning information.

Implements sf_wifi_qca4010_api_t::provisioningSet Sets Wifi's provisioning information

Parameters

[in]	p_ctrl	Wifi control block
[in]	p_wifi_provisioning	Wifi provisioning structure

Return values

SSP_SUCCESS	Successfully set the provisioning information.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_WIFI_FAILED	Provisioning failed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_INTERNAL	Internal Error occurred
SSP_ERR_INVALID_ARGUMENT	Invalid input value or No commas are accepted in the SSID or key.

Get Mutex

Provision in AP or client mode

Release the mutex

◆ SF_WiFi_QCA4010_Scan()

ssp_err_t SF_WiFi_QCA4010_Scan (sf_wifi_qca4010_ctrl_t * *p_ctrl*, sf_wifi_qca4010_scan_t *const *p_scan*, uint8_t *count*)

Scans for available APs.

Implements sf_wifi_qca4010_api_t::scan Scan for available AP's SSID and return the list to caller.

Parameters

[in]	p_ctrl	Wifi control block
[out]	p_scan	Wifi scan structure
[in]	count	Number of access points to be scanned

Return values

SSP_SUCCESS	Successfully scan the network for available APs
SSP_ERR_NOT_OPEN	Driver not opened
SSP_ERR_WIFI_FAILED	Failed to scan
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex

Scan for available access points

Release the mutex

◆ SF_WiFi_QCA4010_VersionGet()

ssp_err_t SF_WiFi_QCA4010_VersionGet (ssp_version_t *const *p_version*)

Set driver version based on compile time macros. Implements sf_wifi_qca4010_api_t::versionGet.

Parameters

[in]	p_version	Wifi version

Return values

SSP_SUCCESS	Version information retrieved successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ SF_WiFi_QCA4010_WifiStatusGet()

ssp_err_t SF_WiFi_QCA4010_WifiStatusGet (sf_wifi_qca4010_ctrl_t *const *p_ctrl*, sf_wifi_qca4010_status_t *const *p_wifi_status*)

Get the network information.

Implements sf_wifi_qca4010_api_t::statisticsGet Collect the statistics information of WiFi interface

Parameters

[in]	p_ctrl	Wifi control block
[out]	p_wifi_status	Wifi status structure

Return values

SSP_SUCCESS	Successfully get the Statistics information.
SSP_ERR_NOT_OPEN	Device not opened
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed reading WiFi statistics information
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex

Get Wifi Network information

Release the mutex

sf_wifi_qca4010_instance_cfg_t Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » WiFi Framework on QCA4010

#include <sf_wifi_qca4010.h>

Data Fields

uint32_t	num_uarts number of UARTS currently used for communication with module
uint8_t	is_opened Status flag storing framework open status.

uint8_t	init_done Status flag storing driver initialization status.
uint32_t	curr_cmd_port Current UART instance index for AT commands.
uint32_t	curr_data_port Current UART instance index for data.
volatile uint8_t	curr_socket_index Currently active socket instance.
sf_wifi_qca4010_cfg_t const *	p_cfg Instance configuration.
sf_wifi_qca4010_provisioning_t	prov_info Provisioning information.
TX_MUTEX *	p_wifi_mutex Mutex for Framework API synchronization.
uart_instance_t *	p_uart_instance_objects [SF_WIFI_QCA4010_CFG_MAX_NUMBER_UART_PORTS] UART instance objects.
TX_QUEUE	socket_queue [12] Queue to read data from socket.
uint8_t	command_flag Variable to indicate data or command mode.
uint8_t *	p_resp_buff Array to store AT command response.

uint32_t	resp_buffer_length Response buffer length.
uint8_t	is_data_mode_on Status flag storing data mode status.

Detailed Description

SF Wifi framework instance configuration

Detailed Description

RTOS-integrated WiFi On Chip Stack Framework example. Implementation of SILEX WiFi Driver. It implements the following interfaces:

- SF WIFI QCA4010 On-Chip Interface

Macro Definition Documentation

◆ SF_WIFI_QCA4010_ONCHIP_CODE_VERSION_MAJOR

```
#define SF_WIFI_QCA4010_ONCHIP_CODE_VERSION_MAJOR  (2U)
```

WiFi Interface. Major Version of code that implements the API defined in this file

◆ SF_WIFI_QCA4010_ONCHIP_CODE_VERSION_MINOR

```
#define SF_WIFI_QCA4010_ONCHIP_CODE_VERSION_MINOR  (0U)
```

Minor Version of code that implements the API defined in this file

Function Documentation

◆ SF_WIFI_QCA4010_ONCHIP_STACK_Close()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_Close (sf_wifi_qca4010_onchip_stack_ctrl_t *const *p_ctrl*)

Close the Wifi Device driver.

Parameters

[in]	p_ctrl	Wifi control block Implements sf_wifi_qca4010_onchip_stack_api_t::close Calls the low level wifi device driver's Close API to close the wifi Driver.

Return values

SSP_SUCCESS	Wifi Driver stop successfully.
SSP_ERR_NOT_OPEN	Device is not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_WIFI_FAILED	Driver De-initialization failed
SSP_ERR_IN_USE	Device already in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex

Close lower level wifi driver

Release the mutex

Delete Mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_DhcpServerStart()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_DhcpServerStart (sf_wifi_qca4010_onchip_stack_ctrl_t *const *p_ctrl*, ULONG * *p_start_ip*, ULONG * *p_end_ip*)

Starts DHCP server.

Implements sf_wifi_qca4010_onchip_stack_api_t::dhcpServerStart Starts DHCP server using on CHIP networking stack support.

Parameters

[in]	p_ctrl	Wifi control block
[in]	p_start_ip	Pointer to Start IP address
[in]	p_end_ip	Pointer to End IP address

Return values

SSP_SUCCESS	Successfully started DHCP Server
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_NOT_OPEN	WiFi Driver in not open
SSP_ERR_IN_USE	Device already in use
SSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

Get the mutex

Start DHCP server

Release the mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_DhcpServerStop()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_DhcpServerStop (sf_wifi_qca4010_onchip_stack_ctrl_t *const *p_ctrl*, ULONG * *p_start_ip*, ULONG * *p_end_ip*)

Stops DHCP server.

Implements sf_wifi_qca4010_onchip_stack_api_t::dhcpServerStop Stops DHCP server using on CHIP networking stack support.

Parameters

[in]	p_ctrl	Wifi control block
[in]	p_start_ip	Pointer to Start IP
[in]	p_end_ip	Pointer to End IP

Return values

SSP_SUCCESS	Successfully stopped DHCP Server
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_NOT_OPEN	WiFi Driver is not open
SSP_ERR_IN_USE	Device already in use
SSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.

Get mutex

Stop DHCP server

Release the mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_IPAddressConfigure()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_IPAddressConfigure (sf_wifi_qca4010_onchip_stack_ctrl_t *const *p_ctrl*, sf_wifi_qca4010_onchip_stack_ip_cfg_t *const *p_ip_cfg*)

Configure static IP or enable DHCP.

Implements sf_wifi_qca4010_onchip_stack_api_t::ipAddressConfigure Configures the IP address of the interface or enables DHCP using on CHIP networking stack support.

Parameters

[in]	p_ctrl	Wifi control block
[out]	p_ip_cfg	Pointer to IP Address configuration structure

Return values

SSP_SUCCESS	Successfully configured IP address.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_NOT_OPEN	WiFi Driver in not open
SSP_ERR_UNSUPPORTED	Functionality Unsupported
SSP_ERR_IN_USE	Device already in use
SSP_ERR_WIFI_FAILED	IP configuration failed.
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex

Configure static IP or enable DHCP

Release the mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_Open()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_Open (sf_wifi_qca4010_onchip_stack_ctrl_t * *p_ctrl*, sf_wifi_qca4010_onchip_stack_cfg_t const *const *p_cfg*)

Open the WiFi Device driver to use the Onchip stack support.

Implements sf_wifi_qca4010_onchip_stack_api_t::open Calls the low level WiFi device driver's Open API to Initialize the WiFi Device Driver, for using onchip stack.

Return values

SSP_SUCCESS	Module initialization successful
SSP_ERR_ALREADY_OPEN	WiFi module is already opened
SSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to initialize
SSP_ERR_INTERNAL	Internal Error occurred

Create Mutex for Synchronization

Get Mutex Lock

Initialize Wifi module

Initialize Socket Interface global variable , if module open is successful or already open

Release Mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_Ping()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_Ping (sf_wifi_qca4010_onchip_stack_ctrl_t *const *p_ctrl*, ULONG * *p_ip_addr*, uint32_t *count*, uint32_t *interval_ms*)

Ping an IP address on the network.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_ip_addr	Pointer to IP address.
[in]	count	Number of ping attempts.
[in]	interval_ms	Interval between ping attempts.

Return values

SSP_SUCCESS	Function completed successfully.
SSP_ERR_WIFI_FAILED	Error occurred with command to Wifi module.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_IN_USE	Device already in use

Get Mutex

Ping specified IP address

Release the mutex

◆ SF_WIFI_QCA4010_ONCHIP_STACK_VersionGet()

ssp_err_t SF_WIFI_QCA4010_ONCHIP_STACK_VersionGet (ssp_version_t *const *p_version*)

This function gets the version information of the underlying driver.

Implements sf_wifi_qca4010_onchip_stack_api_t::versionGet

Parameters

[out]	p_version	Driver version information

Return values

SSP_ERR_ASSERTION	Argument NULL is passed
SSP_SUCCESS	Successfully read version information

5.1.3.51 Socket on QCA4010

Renesas Synergy Software Package Reference » Framework Layer

Implementation of QCA4010 Socket layer over QCA4010 On-Chip stack. More...

ssp_err_t	SF_WIFI_QCA4010_Socket_Recv (sf_wifi_qca4010_socket_ctrl_t *p_ctrl, uint8_t socket_no, uint8_t *const p_data, uint32_t length, uint32_t timeout_ms)
ssp_err_t	SF_WIFI_QCA4010_Socket_Status_Get (sf_wifi_qca4010_socket_ctrl_t *p_ctrl, uint8_t socket_no, uint32_t *p_socket_status)

Detailed Description

Implementation of QCA4010 Socket layer over QCA4010 On-Chip stack.

- SF Socket WIFI Framework Interface

Macro Definition Documentation

◆ AF_INET

```
#define AF_INET   (4U)
```

IPV4 Socket Family.

WiFi Interface.

◆ SF_WIFI_QCA4010_SOCKET_CODE_VERSION_MAJOR

```
#define SF_WIFI_QCA4010_SOCKET_CODE_VERSION_MAJOR   (2U)
```

Major Version of code that implements the API defined in this file

◆ SF_WIFI_QCA4010_SOCKET_CODE_VERSION_MINOR

```
#define SF_WIFI_QCA4010_SOCKET_CODE_VERSION_MINOR   (0U)
```

Minor Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ sf_wifi_qca4010_socket_status_t

enum sf_wifi_qca4010_socket_status_t
Silex ULPGN Wifi socket status types

Function Documentation

◆ SF_WIFI_QCA4010_Socket_Close()

ssp_err_t SF_WIFI_QCA4010_Socket_Close (sf_wifi_qca4010_socket_ctrl_t *const *p_ctrl*)

Close the WiFi Device driver.

Parameters

[in]	p_ctrl	Socket control block Implements sf_wifi_qca4010_socket_api_t ::close Call the low level WiFi device driver's Close API to close the WiFi Driver.

Return values

SSP_SUCCESS	Suspend the driver functionality.
SSP_ERR_NOT_OPEN	Device is not opened.
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to close
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Close lower level drivers

Delete thread created for each socket

Release Mutex

Delete the mutex

◆ SF_WIFI_QCA4010_Socket_Connect()

ssp_err_t SF_WIFI_QCA4010_Socket_Connect (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*, const struct sockaddr * *p_serv_addr*, socklen_t *addrlen*)

Connect to a specific IP and Port using socket.

Parameters

[in]	p_ctrl	pointer to Socket Wifi control block
[in]	socket_no	Socket ID number.
[in]	p_serv_addr	Pointer to remote socket address
[in]	addrlen	Size of sock address structure

Return values

SSP_SUCCESS	Socket connection is successful.
SSP_ERR_WIFI_FAILED	Socket connection failed
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Change socket index for multiple socket communication

Connect socket to specified address

For UDP server, specify the destination address and port

Specify the destination address and port for UDP data to be sent

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Create()

ssp_err_t SF_WIFI_QCA4010_Socket_Create (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*, sf_wifi_socket_type_t *type*, uint8_t *ipversion*)

This creates socket for communication.

Parameters

[in]	p_ctrl	pointer to Socket control block
[in]	socket_no	Socket ID number.
[in]	type	Socket type (SOCK_STREAM for TCP and SOCK_DGRAM for UDP)
[in]	ipversion	Socket IP type.(for IPV4 -> AF_INET or for IPV6 -> AF_INET6)

Return values

SSP_SUCCESS	Socket creation is successful
SSP_ERR_WIFI_FAILED	Failed to create socket
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_INVALID_ARGUMENT	Invalid argument
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Change socket index for multiple socket communication

Create socket

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Disconnect()

ssp_err_t SF_WIFI_QCA4010_Socket_Disconnect (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*)

This closes socket. Close opened socket.

Parameters

[in]	p_ctrl	pointer to Socket Wifi control block
[in]	socket_no	Socket no

Return values

SSP_SUCCESS	Disconnect and close socket network
SSP_ERR_WIFI_FAILED	Failed to close socket network
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Change socket index for multiple socket communication

If only one UART is used then send escape sequence command

Close the socket network

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Open()

ssp_err_t SF_WIFI_QCA4010_Socket_Open (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, sf_wifi_qca4010_socket_cfg_t const *const *p_cfg*)

Open the WiFi Device driver to use the Socket Layer on WiFi Driver On-Chip stack.

Parameters

[out]	p_ctrl	pointer to Socket control block
[in]	p_cfg	pointer to Socket configuration structure Implements sf_wifi_qca4010_socket_api_t ::open Call the low level WiFi device driver's Open API to Initialize the WiFi Device Driver, for using Socket Layer on On-Chip stack.

Return values

SSP_SUCCESS	Module initialization successful
SSP_ERR_ALREADY_OPEN	WiFi module is already opened
SSP_ERR_WIFI_INIT_FAILED	WiFi module initialization failed
SSP_ERR_ASSERTION	Argument NULL is passed
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed to initialize
SSP_ERR_INTERNAL	Internal Error occurred
SSP_ERR_INVALID_ARGUMENT	Failed due to invalid argument

Create Mutex for Synchronization

Get Mutex Lock

Socket open

Initialize global variables

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Recv()

ssp_err_t SF_WIFI_QCA4010_Socket_Recv (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*, uint8_t *const *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Receive data over TCP/UDP from server/client.

Parameters

[in]	p_ctrl	pointer to Socket Wifi control block
[in]	socket_no	Socket ID number.
[out]	p_data	Pointer to data received from socket.
[in]	length	Length of data array used for receive.
[in]	timeout_ms	Timeout to wait for data to be received from socket.

Return values

SSP_SUCCESS	Data reception us successful
SSP_ERR_WIFI_FAILED	Failed to receive data
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Change socket index for multiple socket communication

Receive data which is sent from server/client

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Send()

ssp_err_t SF_WIFI_QCA4010_Socket_Send (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*, const uint8_t * *p_data*, uint32_t *length*, uint32_t *timeout_ms*)

Send data over TCP/UDP to server/client.

Parameters

[in]	p_ctrl	pointer to Socket Wifi control block
[in]	socket_no	Socket ID number.
[in]	p_data	Pointer to data to send.
[in]	length	Length of data to send.
[in]	timeout_ms	Timeout to wait for transmit end event

Return values

SSP_SUCCESS	Data send to client/server is successful.
SSP_ERR_WIFI_FAILED	Failed to send data.
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_IN_USE	Module in use
SSP_ERR_INTERNAL	Internal Error occurred
SSP_ERR_TIMEOUT	Timeout to send data

Get Mutex Lock

Change socket index for multiple socket communication

Send data over data port

Release Mutex

◆ SF_WIFI_QCA4010_Socket_Status_Get()

ssp_err_t SF_WIFI_QCA4010_Socket_Status_Get (sf_wifi_qca4010_socket_ctrl_t * *p_ctrl*, uint8_t *socket_no*, uint32_t * *p_socket_status*)

Get the socket status.

Parameters

[in]	p_ctrl	Socket Wifi control block
[in]	socket_no	Socket ID number.
[out]	p_socket_status	Pointer to an integer to hold the socket status

Return values

SSP_SUCCESS	Socket status obtained successfully.
SSP_ERR_ASSERTION	Assertion error occurred.
SSP_ERR_NOT_OPEN	The instance has not been opened.
SSP_ERR_IN_USE	Module in use
SSP_ERR_WIFI_FAILED	Failed obtain socket status
SSP_ERR_INTERNAL	Internal Error occurred

Get Mutex Lock

Obtain socket status

Release Mutex

◆ SF_WIFI_QCA4010_Socket_VersionGet()

ssp_err_t SF_WIFI_QCA4010_Socket_VersionGet (ssp_version_t *const *p_version*)

This function gets the version information of the underlying driver.

Implements sf_wifi_qca4010_socket_api_t::versionGet

Return values

SSP_SUCCESS	Retrieval of version information is successful
SSP_ERR_ASSERTION	Argument NULL is passed

5.1.3.52 USBX Framework

Renesas Synergy Software Package Reference » Framework Layer

RTOS-integrated USBX adaptation framework for Synergy. Implements USB HOST and DEVICE low level device drivers. More...

void	usbfs_resume_isr (void) VBINT (VBUS interrupt), RESM (Resume interrupt), OVRCR (Over current input), BCHG (Change interrupt), and PDDETINT0 (Bus change interrupt) fire this ISR. This is only used for canceling following standby modes. More...
VOID	ux_dcd_synergy_buffer_empty_interrupt (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, ULONG flag) This function processes the BEMP interrupt for the specific endpoint. More...
VOID	ux_dcd_synergy_buffer_notready_interrupt (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, ULONG flag) This function processes the NRDY(Not Ready) interrupt for the specific endpoint. More...
UINT	ux_dcd_synergy_buffer_read (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function reads from a specified pipe into a buffer. More...
VOID	ux_dcd_synergy_buffer_ready_interrupt (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, ULONG flag) This function enable or disable the BRDY(Ready) interrupt for the pipe. More...
UINT	ux_dcd_synergy_buffer_write (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function writes a data from input buffer to the specified PIPE. More...
VOID	ux_dcd_synergy_current_endpoint_change (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, ULONG direction)

	This function configures the FIFO as per the request specified in endpoint descriptor. More...
ULONG	ux_dcd_synergy_data_buffer_size (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function returns the size of the data buffer and selects the specified pipe. More...
UINT	ux_dcd_synergy_endpoint_create (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_ENDPOINT *endpoint) This function creates a physical endpoint. More...
UINT	ux_dcd_synergy_endpoint_destroy (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_ENDPOINT *endpoint) This function will destroy a physical endpoint. More...
VOID	ux_dcd_synergy_endpoint_nak_set (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function sets a NAK(Not Acknowledged) to an endpoint. More...
UINT	ux_dcd_synergy_endpoint_reset (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_ENDPOINT *endpoint) This function will reset a physical endpoint. More...
UINT	ux_dcd_synergy_remote_wakeup (UX_DCD_SYNERGY *dcd_synergy, ULONG *parameter) This function is called when the device wants to wake up the host. More...
UINT	ux_dcd_synergy_endpoint_stall (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_ENDPOINT *endpoint) This function will stall a physical endpoint. More...
UINT	ux_dcd_synergy_endpoint_status (UX_DCD_SYNERGY *dcd_synergy, ULONG endpoint_index) This function will retrieve the status of the endpoint. More...
ULONG	ux_dcd_synergy_fifo_port_change (UX_DCD_SYNERGY *dcd_synergy,

	UX_DCD_SYNERGY_ED *ed, ULONG direction) This function configures the FIFO port. More...
UINT	ux_dcd_synergy_fifoc_read (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function reads from the hardware FIFO C and stores in the destination buffer. More...
UINT	ux_dcd_synergy_fifo_read (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function reads from the hardware FIFO D0 or D1 and stores in the destination buffer. More...
UINT	ux_dcd_synergy_fifo_read_dma (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, UINT dma_bytes_to_transfer) This function reads the data from HW D0/ D1 FIFO using DMA. More...
UINT	ux_dcd_synergy_fifoc_write (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function writes a data from a buffer into USB FIFO using CPU. More...
VOID	ux_dcd_synergy_fifo_write_software_copy (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_PAYLOAD_TRANSFER *p_payload, VOID *p_fifo, ULONG fifo_sel) USBX DCD FIFO write by software copy. Call a subroutine for selected USB controller hardware. More...
VOID	ux_dcd_synergy_fifo_write_last_bytes (UX_DCD_SYNERGY_PAYLOAD_TRANSFER *p_payload, VOID *p_fifo, ULONG usb_base) USBX DCD FIFO write - Copy last bytes to FIFO by software if the rest bytes are less than FIFO access width. More...
UINT	ux_dcd_synergy_fifod_write (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed) This function writes a buffer to FIFOD0 or FIFOD1. More...
UINT	ux_dcd_synergy_fifod_write_dma (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_ED *ed, UINT dma_bytes_to_transfer)

	This function writes a buffer to FIFOD0 or FIFOD1 using DMA. More...
VOID	ux_dcd_synergy_write_dma_configure (UX_DCD_SYNERGY *dcd_synergy, UX_DCD_SYNERGY_PAYLOAD_TRANSFER *p_payload, ULONG fifo_sel, ULONG endpoint_size) USBX DCD DMA write setup function. Call a subroutine for selected USB controller hardware. More...
VOID	ux_dcd_synergy_fifo_dma_start_write (UX_DCD_SYNERGY *dcd_synergy, UCHAR *p_payload_buffer, VOID *p_fifo_add, VOID *p_fifo_ctrl, VOID *p_fifo_sel) USBX DCD DMA FIFO write - DMA start function. More...
UINT	ux_dcd_synergy_frame_number_get (UX_DCD_SYNERGY *dcd_synergy, ULONG *frame_number) This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes. More...
UINT	ux_dcd_synergy_function (UX_SLAVE_DCD *dcd, UINT function, VOID *parameter) This function act as interface between upper layer USBX device stack and synergy controller. More...
UINT	ux_dcd_synergy_initialize (ULONG dcd_io) This function initializes the USB slave controller for Renesas Synergy MCUs. More...
UINT	ux_dcd_synergy_initialize_transfer_support (ULONG dcd_io, UX_DCD_SYNERGY_TRANSFER *p_transfer_instance) The function initializes the USB slave controller of the Renesas Synergy MCUs with associated DMA transfer modules. More...
UINT	ux_dcd_synergy_initialize_complete (VOID) This function completes the initialization of the USB slave controller for the Renesas Synergy MCUs. More...
VOID	ux_dcd_synergy_interrupt_handler (VOID) This function is the interrupt handler for the synergy controller.

	More...
VOID	ux_dcd_synergy_register_clear (UX_DCD_SYNERGY *dcd_synergy, ULONG synergy_register, USHORT value) This function clears a bit in a register of the synergy. More...
VOID	ux_dcd_synergy_usb_status_register_clear (UX_DCD_SYNERGY *dcd_synergy, ULONG synergy_register, USHORT value) This function clears a bit in a status register of the synergy.To clear the status bits, need to write 0 only to the bits to be cleared. Write 1 to the other bits. More...
ULONG	ux_dcd_synergy_register_read (UX_DCD_SYNERGY *dcd_synergy, ULONG synergy_register) This function reads a synergy USB register. More...
VOID	ux_dcd_synergy_register_set (UX_DCD_SYNERGY *dcd_synergy, ULONG synergy_register, USHORT value) This function set a bit in synergy USB register. More...
VOID	ux_dcd_synergy_register_write (UX_DCD_SYNERGY *dcd_synergy, ULONG synergy_register, USHORT value) This function writes a bit in synergy USB register. More...
UINT	ux_dcd_synergy_transfer_abort (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_TRANSFER *transfer_request) This function will terminate the transfer. More...
UINT	ux_dcd_synergy_transfer_callback (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_TRANSFER *transfer_request, ULONG interrupt_status, ULONG ctsq_mask) This function is invoked under ISR when an event happens on a specific endpoint. More...
UINT	ux_dcd_synergy_transfer_request (UX_DCD_SYNERGY *dcd_synergy, UX_SLAVE_TRANSFER *transfer_request) This function will initiate a transfer to a specific endpoint. If the endpoint is IN, the endpoint register will be set to accept the request. If the endpoint is IN, the endpoint FIFO will be filled with the buffer and the endpoint register set. More...

void	ux_dcd_synergy_disconnect (void) USBX DCD disconnect the USB controller communication from the host.
UINT	ux_dcd_synergy_uninitialize (ULONG dcd_io) USBX DCD un-initialization the USB controller. More...
UINT	ux_dcd_synergy_uninitialize_transfer_support (ULONG dcd_io) The function un-initializes the USB slave controller of the Renesas Synergy MCUs with associated DMA transfer modules. More...
VOID	ux_hcd_synergy_asynch_queue_process (UX_HCD_SYNERGY *hcd_synergy) This function process the asynchronous transactions. The function will identify the USB interrupts occurred associated with an endpoint and will process the interrupts. More...
VOID	ux_hcd_synergy_asynch_queue_process_bemp (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the BEMP(Buffer Empty) interrupt that occurred on a specific ED. More...
VOID	ux_hcd_synergy_asynch_queue_process_brdy (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED. More...
VOID	ux_hcd_synergy_asynch_queue_process_nrdy (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED. More...
VOID	ux_hcd_synergy_asynch_queue_process_sign (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the Setup transaction Error Interrupt. More...
VOID	ux_hcd_synergy_asynch_schedule (UX_HCD_SYNERGY *hcd_synergy) This function schedules new transfers from the control or bulk lists.

	More...
UINT	ux_hcd_synergy_asynchronous_endpoint_create (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will create an asynchronous endpoint. The control and bulk endpoints fall into this category. More...
UINT	ux_hcd_synergy_asynchronous_endpoint_destroy (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will destroy an asynchronous endpoint. The control and bulk endpoints fall into this category. More...
VOID	ux_hcd_synergy_buffer_empty_interrupt (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed, ULONG flag) This function enable or disable the BEMP(Buffer Empty) interrupt for the pipe. More...
VOID	ux_hcd_synergy_buffer_notready_interrupt (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed, ULONG flag) This function enable or disable the NRDY(Not Ready) interrupt for the pipe. More...
UINT	ux_hcd_synergy_buffer_read (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function reads from a specified pipe into a buffer. More...
VOID	ux_hcd_synergy_buffer_ready_interrupt (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed, ULONG flag) This function enable or disable the BRDY(Ready) interrupt for the pipe. More...
UINT	ux_hcd_synergy_buffer_write (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function writes data to the selected FIFO of the endpoint. More...
UINT	ux_hcd_synergy_bulk_endpoint_create (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will create a bulk endpoint. More...

UINT	ux_hcd_synergy_bulk_int_td_add (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function adds a transfer descriptor to an Bulk or INT ED. More...
UINT	ux_hcd_synergy_control_endpoint_create (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will create a control endpoint. More...
UINT	ux_hcd_synergy_control_td_add (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function adds a transfer descriptor to an ED. More...
UINT	ux_hcd_synergy_controller_disable (UX_HCD_SYNERGY *hcd_synergy) This function will disable the Synergy controller. The controller will release all its resources (memory, IO ...). After this, the controller will not send SOF any longer. All transactions should have been completed, all classes should have been closed. More...
VOID	ux_hcd_synergy_current_endpoint_change (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed, ULONG direction) This function change the endpoint in the FIFO. More...
ULONG	ux_hcd_synergy_data_buffer_size (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function returns the size of the buffer data. More...
UX_SYNERGY_ED *	ux_hcd_synergy_ed_obtain (UX_HCD_SYNERGY *hcd_synergy) This function obtains a free ED from the ED list. More...
VOID	ux_hcd_synergy_ed_td_clean (UX_SYNERGY_ED *ed) This function process cleans the ED of all tds except the last dummy TD. More...
VOID	ux_hcd_synergy_endpoint_nak_set (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function sets a NAK(Not Acknowledged) to an endpoint. More...

UINT	ux_hcd_synergy_endpoint_reset (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will reset an endpoint. More...
UINT	ux_hcd_synergy_entry (UX_HCD *hcd, UINT function, VOID *parameter) This function is the entry function to the USB driver from the USB stack. More...
ULONG	ux_hcd_synergy_fifo_port_change (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed, ULONG direction) This function change the port of the FIFO. More...
UINT	ux_hcd_synergy_fifo_read (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function read data from the FIFO configured for the PIPE(FIFO C, D0 or D1). More...
UINT	ux_hcd_synergy_fifoc_write (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function writes a buffer to FIFOC. More...
VOID	ux_hcd_synergy_fifo_write_software_copy (UX_HCD_SYNERGY *hcd_synergy, ULONG payload_length, UCHAR *payload_buffer, VOID *fifo_addr, ULONG fifo_sel) USBX HCD CPU FIFO write by software copy. Call a suitable subroutine for selected USB controller hardware. More...
VOID	ux_hcd_synergy_fifo_write_software_copy_remaining_bytes (UX_HCD_SYNERGY *hcd_synergy, ULONG payload_length, UCHAR *payload_buffer, VOID *fifo_addr) USBX HCD CPU FIFO write - Copy remaining bytes to FIFO by software if the rest bytes are less than FIFO access width. More...
UINT	ux_hcd_synergy_fifod_write (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function writes a buffer data to FIFOD0 or FIFOD1. More...
UINT	ux_hcd_synergy_frame_number_get (UX_HCD_SYNERGY

	*hcd_synergy, ULONG *frame_number) This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes and for timing. More...
VOID	ux_hcd_synergy_frame_number_set (UX_HCD_SYNERGY *hcd_synergy, ULONG frame_number) This function will set the current frame number to the one specified. This function is mostly used for isochronous purpos.es. More...
UINT	ux_hcd_synergy_initialize (UX_HCD *hcd) This function initializes the Synergy controller. More...
UINT	ux_hcd_synergy_initialize_transfer_support (UX_HCD *hcd, const UX_HCD_SYNERGY_TRANSFER *p_transfer_instance) USBX HCD Transfer Support with DMA support. More...
UINT	ux_hcd_synergy_interrupt_endpoint_create (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will create an interrupt endpoint. The interrupt endpoint has an interval of operation from 1 to 255. The Synergy has no hardware scheduler but we still build an interrupt tree similar to the OHCI controller. More...
VOID	ux_hcd_synergy_interrupt_handler (UINT hcd_index) This function is the interrupt handler for the Synergy USB HS controller. Normally an interrupt occurs from the controller when there is either a EOF signal and there has been transfers within the frame or when there is a change on one of the downstream ports. More...
VOID	ux_hcd_synergy_iso_queue_process (UX_HCD_SYNERGY *hcd_synergy) This function process the isochronous transactions that happened in the last frame. More...
VOID	ux_hcd_synergy_iso_queue_process_bemp (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the BEMP(Buffer Empty) Interrupt that occurred on a specific ED used for Isochronous transfer. More...

VOID	ux_hcd_synergy_iso_queue_process_brdy (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED used for isochronous transfer. More...
VOID	ux_hcd_synergy_iso_queue_process_nrdy (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED used for Isochronous transfer. More...
VOID	ux_hcd_synergy_iso_schedule (UX_HCD_SYNERGY *hcd_synergy) This function schedules new transfers from isochronous list. More...
UINT	ux_hcd_synergy_iso_td_add (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function adds a transfer descriptor to an Isochronous Endpoint Descriptor. More...
UINT	ux_hcd_synergy_isochronous_endpoint_create (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function creates an isochronous endpoint. More...
UX_SYNERGY_ISO_TD *	ux_hcd_synergy_isochronous_td_obtain (UX_HCD_SYNERGY *hcd_synergy) This function obtains a free TD from the isochronous TD list. More...
UX_SYNERGY_ED *	ux_hcd_synergy_least_traffic_list_get (UX_HCD_SYNERGY *hcd_synergy) This function return a pointer to the first ED in the periodic tree that has the least traffic registered. More...
UINT	ux_hcd_synergy_periodic_endpoint_destroy (UX_HCD_SYNERGY *hcd_synergy, UX_ENDPOINT *endpoint) This function will destroy an isochronous endpoint. More...
VOID	ux_hcd_synergy_periodic_schedule (UX_HCD_SYNERGY *hcd_synergy) This function schedules new transfers from the periodic interrupt list.

	More...
UINT	ux_hcd_synergy_periodic_tree_create (UX_HCD_SYNERGY *hcd_synergy) This function creates the periodic static tree for the interrupt and isochronous eds. More...
UINT	ux_hcd_synergy_port_disable (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will disable a specific port attached to the root HUB. More...
UINT	ux_hcd_synergy_port_enable (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will enable a specific port attached to the root HUB. More...
UINT	ux_hcd_synergy_port_reset (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will reset a specific port attached to the root HUB. More...
UINT	ux_hcd_synergy_port_resume (UX_HCD_SYNERGY *hcd_synergy, UINT port_index) This function will resume a specific port attached to the root HUB. Present, this function is not supported for resume port. More...
ULONG	ux_hcd_synergy_port_status_get (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will return the status for each port attached to the root HUB. More...
UINT	ux_hcd_synergy_port_suspend (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will suspend a specific port attached to the root HUB. Present, this function is does not supported. More...
UINT	ux_hcd_synergy_power_down_port (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will power down a specific port attached to the root

	HUB. Present, this function is does not supported. More...
UINT	ux_hcd_synergy_power_on_port (UX_HCD_SYNERGY *hcd_synergy, ULONG port_index) This function will power a specific port attached to the root HUB. Present, this function is does not supported. More...
VOID	ux_hcd_synergy_power_root_hubs (UX_HCD_SYNERGY *hcd_synergy) This function will power the root HUB. Present, this function is does not supported. More...
VOID	ux_hcd_synergy_register_clear (UX_HCD_SYNERGY *hcd_synergy, ULONG synergy_register, USHORT value) This function clears flags in a synergy USB register. More...
VOID	ux_hcd_synergy_register_status_clear (UX_HCD_SYNERGY *hcd_synergy, ULONG synergy_register, USHORT value) This function clears a bit in a status register of the synergy controller.To clear the status bits, need to write 0 only to the bits to be cleared. Write 1 to the other bits. More...
ULONG	ux_hcd_synergy_register_read (UX_HCD_SYNERGY *hcd_synergy, ULONG synergy_register) This function reads a data from synergy USB register. More...
VOID	ux_hcd_synergy_register_set (UX_HCD_SYNERGY *hcd_synergy, ULONG synergy_register, USHORT value) This function sets flags in a synergy USB register. More...
VOID	ux_hcd_synergy_register_write (UX_HCD_SYNERGY *hcd_synergy, ULONG synergy_register, USHORT value) This function writes a data to a Synergy USB register. More...
UX_SYNERGY_TD *	ux_hcd_synergy_regular_td_obtain (UX_HCD_SYNERGY *hcd_synergy) This function obtains a free TD from the regular TD list. More...
UINT	ux_hcd_synergy_request_bulk_transfer (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request)

	This function performs a bulk transfer request. A bulk transfer can be larger than the size of the Synergy buffer so it may be required to chain multiple tds to accommodate this transfer request. A bulk transfer is non blocking, so we return before the transfer request is completed. More...
UINT	ux_hcd_synergy_request_control_transfer (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request) This function performs a control transfer from a transfer request. The USB control transfer is in 3 phases (setup, data, status). This function will chain all phases of the control sequence before setting the Synergy endpoint as a candidate for transfer. More...
UINT	ux_hcd_synergy_request_interrupt_transfer (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request) This function performs an interrupt transfer request. An interrupt transfer can only be as large as the MaxpacketField in the endpoint descriptor. This was verified at the USB layer and does not need to be reverified here. More...
UINT	ux_hcd_synergy_request_isochronous_transfer (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request) This function performs an isochronous transfer request. More...
UINT	ux_hcd_synergy_request_transfer (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request) This function is the handler for all the transactions on the USB. The transfer request passed as parameter contains the endpoint and the device descriptors in addition to the type of transaction de be executed. This function routes the transfer request to according to the type of transfer to be executed. More...
UINT	ux_hcd_synergy_td_add (UX_HCD_SYNERGY *hcd_synergy, UX_SYNERGY_ED *ed) This function add new TD for control, Bulk or Interrupt endpoint. More...
UINT	ux_hcd_synergy_transfer_abort (UX_HCD_SYNERGY *hcd_synergy, UX_TRANSFER *transfer_request) This function will abort transactions attached to a transfer request. More...

UINT	ux_hcd_synergy_disable (ULONG ux_hcd_io) This function disables the Synergy HOST controller. More...
UINT	ux_hcd_synergy_uninitialize (ULONG ux_hcd_io) This function un-initializes the Synergy HOST controller. More...
UINT	ux_hcd_synergy_uninitialize_transfer_support (UX_HCD_SYNERGY *hcd_synergy) This function un-initializes the transfer module associated with the USBX HOST controller. More...

Detailed Description

RTOS-integrated USBX adaptation framework for Synergy. Implements USB HOST and DEVICE low level device drivers.

USBX Component SYNERGY Controller Driver

Macro Definition Documentation

◆ UX_DCD_SYNERGY_ED_STATE_IDLE

```
#define UX_DCD_SYNERGY_ED_STATE_IDLE   (0U)
```

Define USB SYNERGY physical endpoint state machine definition.

◆ UX_DCD_SYNERGY_ED_STATUS_UNUSED

```
#define UX_DCD_SYNERGY_ED_STATUS_UNUSED   (0U)
```

Define USB SYNERGY physical endpoint status definition.

◆ UX_DCD_SYNERGY_SLAVE_CONTROLLER

```
#define UX_DCD_SYNERGY_SLAVE_CONTROLLER   (0x80U)
```

Define SYNERGY generic equivalences.

◆ UX_SYNERGY_CONTROLLER

```
#define UX_SYNERGY_CONTROLLER   (0)
```

Define Synergy generic definitions.

◆ UX_SYNERGY_DCD_BUSWAIT_CALC_FREQ_PCLK_CYC

#define UX_SYNERGY_DCD_BUSWAIT_CALC_FREQ_PCLK_CYC (17142857U)
Register access wait cycles for USBHS controller. 7cycles at Peripheral clock 120MHz

◆ UX_SYNERGY_DCD_COMMAND_STATUS_RESET

#define UX_SYNERGY_DCD_COMMAND_STATUS_RESET (0)
Define synergy initialization values.

◆ UX_SYNERGY_DCD_DCP

#define UX_SYNERGY_DCD_DCP (0)
Define synergy command/status bitmaps.

◆ UX_SYNERGY_DCD_ED_BRDY

#define UX_SYNERGY_DCD_ED_BRDY (0x00000001U)
Define synergy physical endpoint definitions.

◆ UX_SYNERGY_DCD_FIFO_READING

#define UX_SYNERGY_DCD_FIFO_READING (2U)
Define synergy FIFO read completion code.

◆ UX_SYNERGY_DCD_FIFO_WRITING

#define UX_SYNERGY_DCD_FIFO_WRITING (2U)
Define synergy FIFO write completion code.

◆ UX_SYNERGY_DCD_MAIN_OSC_24MHz

#define UX_SYNERGY_DCD_MAIN_OSC_24MHz (24000000U)
Supported USBMCLK frequency for S7G2 and S5D9.

◆ UX_SYNERGY_DCD_PHYSLEW_SLEW_SLEWR00

#define UX_SYNERGY_DCD_PHYSLEW_SLEW_SLEWR00 (1U<<0)
PHY Cross Point Adjustment, note that Hardware Manual to be updated(0xE->0x5)

◆ UX_SYNERGY_DCD_PIPE0_SIZE

#define UX_SYNERGY_DCD_PIPE0_SIZE (256U)
Define synergy fifo definition.

◆ UX_SYNERGY_DCD_PIPESEL_NO_PIPE

#define UX_SYNERGY_DCD_PIPESEL_NO_PIPE (0x000FU)
Define synergy PIPE selection definitions.

◆ UX_SYNERGY_DCD_SYSCFG

#define UX_SYNERGY_DCD_SYSCFG (0x00UL)
Define SYNERGY HCOR register mapping.

◆ UX_SYNERGY_DCD_SYSCFG_SCKE

#define UX_SYNERGY_DCD_SYSCFG_SCKE (1U<<10)
Define SYNERGY control register values.

◆ UX_SYNERGY_ED_STATIC

#define UX_SYNERGY_ED_STATIC (0x80000000)
Define Synergy ED bitmap.

◆ UX_SYNERGY_HC_AVAILABLE_BANDWIDTH

#define UX_SYNERGY_HC_AVAILABLE_BANDWIDTH (2304UL)
Define Synergy static definition. This macro is used for checking the available bandwidth for periodic transfers(Isochronous and Interrupt) Maximum bandwidth is calculated as {2048byes(2x ISO PIPEs) + 256bytes(4x INT PIPEs)} for high-speed operation.

◆ UX_SYNERGY_HC_BUSWAIT_CALC_FREQ_PCLK_CYC

#define UX_SYNERGY_HC_BUSWAIT_CALC_FREQ_PCLK_CYC (17142857U)
Register access wait cycles for USBHS controller. 7cycles at Peripheral clock 120MHz

◆ UX_SYNERGY_HC_COMMAND_STATUS_RESET

#define UX_SYNERGY_HC_COMMAND_STATUS_RESET (0)
Define Synergy initialization values.

◆ UX_SYNERGY_HC_DCP

#define UX_SYNERGY_HC_DCP (0)
Define Synergy HCOR command/status bitmaps.

◆ UX_SYNERGY_HC_ED_BRDY

#define UX_SYNERGY_HC_ED_BRDY (0x00000001U)
Define Synergy physical endpoint definitions.

◆ UX_SYNERGY_HC_FIFO_READING

#define UX_SYNERGY_HC_FIFO_READING (2)
Define Synergy FIFO read completion code.

◆ UX_SYNERGY_HC_FIFO_WRITING

#define UX_SYNERGY_HC_FIFO_WRITING (2)
Define Synergy FIFO write completion code.

◆ UX_SYNERGY_HC_MAIN_OSC_24MHz

#define UX_SYNERGY_HC_MAIN_OSC_24MHz (24000000U)
Supported USBMCLK frequency for S7G2 and S5D9.

◆ UX_SYNERGY_HC_PHYSLEW_SLEW_SLEWR00

#define UX_SYNERGY_HC_PHYSLEW_SLEW_SLEWR00 (1U<<0)
PHY Cross Point Adjustment, note that Hardware Manual to be updated(0xE->0x5)

◆ UX_SYNERGY_HC_PIPE0_SIZE

#define UX_SYNERGY_HC_PIPE0_SIZE (256)
Define Synergy fifo definition.

◆ UX_SYNERGY_HC_PIPESEL_NO_PIPE

#define UX_SYNERGY_HC_PIPESEL_NO_PIPE 0x000f
Define Synergy PIPE selection definitions.

◆ UX_SYNERGY_HC_PORT_ENABLED

#define UX_SYNERGY_HC_PORT_ENABLED (1)
Define Synergy Root hub states.

◆ UX_SYNERGY_HC_SYSCFG

#define UX_SYNERGY_HC_SYSCFG (0x00UL)
Protection against no definition of Synergy controller.

◆ UX_SYNERGY_HC_SYSCFG_SCKE

#define UX_SYNERGY_HC_SYSCFG_SCKE (1U<<10)
Define Synergy control register values.

◆ UX_SYNERGY_TD_SETUP_PHASE

#define UX_SYNERGY_TD_SETUP_PHASE (0x00010000)
Define Synergy TD bitmap.

Function Documentation

◆ usbfs_resume_isr()

void usbfs_resume_isr (void)
VBINT (VBUS interrupt), RESM (Resume interrupt), OVRCR (Over current input), BCHG (Change interrupt), and PDDETINT0 (Bus change interrupt) fire this ISR. This is only used for canceling following standby modes. • Canceling the software standby mode • Canceling deep standby mode

◆ ux_dcd_synergy_buffer_empty_interrupt()

VOID ux_dcd_synergy_buffer_empty_interrupt (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, ULONG *flag*)
This function processes the BEMP interrupt for the specific endpoint. **Parameters**

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to physical Endpoint(ED) control block
[in]	flag	Flag to enable or disable the buffer empty interrupt.

◆ ux_dcd_synergy_buffer_notready_interrupt()

VOID ux_dcd_synergy_buffer_notready_interrupt (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, ULONG *flag*)
This function processes the NRDY(Not Ready) interrupt for the specific endpoint. **Parameters**

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to physical Endpoint(ED) control block
[in]	flag	Flag for DCD synergy enable or disable.

◆ ux_dcd_synergy_buffer_read()

UINT ux_dcd_synergy_buffer_read (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function reads from a specified pipe into a buffer.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block

Return values

UX_SUCCESS	Read a data from buffer successfully.
UX_ERROR	Unable to read a data from buffer.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_fifo_read()

◆ ux_dcd_synergy_buffer_ready_interrupt()

VOID ux_dcd_synergy_buffer_ready_interrupt (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, ULONG *flag*)

This function enable or disable the BRDY(Ready) interrupt for the pipe.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block
[in]	flag	Check whether DCD synergy is enable or disable.

◆ ux_dcd_synergy_buffer_write()

UINT ux_dcd_synergy_buffer_write (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function writes a data from input buffer to the specified PIPE.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block

Return values

UX_SUCCESS	Write a data to FIFO(D0, D1 and C) successfully.
UX_ERROR	Unable to write a data to FIFO(D0, D1 and C).

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_fifod_write()
- ux_dcd_synergy_fifoc_write()

◆ ux_dcd_synergy_current_endpoint_change()

VOID ux_dcd_synergy_current_endpoint_change (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, ULONG *direction*)

This function configures the FIFO as per the request specified in endpoint descriptor.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block
[in]	direction	Endpoint direction

◆ ux_dcd_synergy_data_buffer_size()

ULONG ux_dcd_synergy_data_buffer_size (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function returns the size of the data buffer and selects the specified pipe.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block

Return values

buffer_size	Maximum packet size.

◆ ux_dcd_synergy_endpoint_create()

UINT ux_dcd_synergy_endpoint_create (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_ENDPOINT * *endpoint*)

This function creates a physical endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	endpoint	Pointer to a Device Controller Endpoint structure.

Return values

UX_SUCCESS	Endpoint is created successfully.
UX_ERROR	Buffer is not free or endpoint creation is unsuccessful.
UX_NO_ED_AVAILABLE	Endpoint is already in use.

◆ ux_dcd_synergy_endpoint_destroy()

UINT ux_dcd_synergy_endpoint_destroy (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_ENDPOINT * *endpoint*)

This function will destroy a physical endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	endpoint	Pointer to a Device Controller Endpoint structure.

Return values

UX_SUCCESS	Endpoint is destroyed successfully.

◆ ux_dcd_synergy_endpoint_nak_set()

VOID ux_dcd_synergy_endpoint_nak_set (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function sets a NAK(Not Acknowledged) to an endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block

◆ ux_dcd_synergy_endpoint_reset()

UINT ux_dcd_synergy_endpoint_reset (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_ENDPOINT * *endpoint*)

This function will reset a physical endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	endpoint	Pointer to a Device Controller Endpoint structure.

Return values

UX_SUCCESS	Endpoint is reset successfully.
UX_NO_ED_AVAILABLE	Device Controller Endpoint structure pointer is NULL

Abort the transfer request on this endpoint.

◆ ux_dcd_synergy_endpoint_stall()

UINT ux_dcd_synergy_endpoint_stall (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_ENDPOINT * *endpoint*)

This function will stall a physical endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	endpoint	Pointer to a Device Controller Endpoint structure.

Return values

UX_SUCCESS	Endpoint is stalled successfully.
UX_NO_ED_AVAILABLE	Device Controller Endpoint control pointer is Null.

◆ ux_dcd_synergy_endpoint_status()

UINT ux_dcd_synergy_endpoint_status (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *endpoint_index*)

This function will retrieve the status of the endpoint.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	endpoint_index	Endpoint number who's status is to be known.

Return values

UX_ERROR	Endpoint already in use.
UX_FALSE	Endpoint is stalled.
UX_TRUE	Endpoint is not stalled.

◆ ux_dcd_synergy_fifo_dma_start_write()

VOID ux_dcd_synergy_fifo_dma_start_write (UX_DCD_SYNERGY * *dcd_synergy*, UCHAR * *p_payload_buffer*, VOID * *p_fifo_add*, VOID * *p_fifo_ctrl*, VOID * *p_fifo_sel*)

USBX DCD DMA FIFO write - DMA start function.

Parameters

[in]	dcd_synergy	Pointer to the DCD control block
[in,out]	p_payload_buffer	Pointer to a payload buffer
[in]	p_fifo_add	FIFO register address
[in]	p_fifo_ctrl	FIFO port control register address
[in]	p_fifo_sel	FIFO port selection register address

◆ ux_dcd_synergy_fifo_port_change()

ULONG ux_dcd_synergy_fifo_port_change (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, ULONG *direction*)

This function configures the FIFO port.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	ed	Pointer to a physical Endpoint(ED) control block
[in]	direction	Direction to switch

Return values

UX_ERROR	Unable to change fifo port.

Returns

synergy_register Current endpoint index(pipe)

◆ ux_dcd_synergy_fifo_read()

UINT ux_dcd_synergy_fifo_read (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function reads from the hardware FIFO D0 or D1 and stores in the destination buffer.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_READ_OVER	FIFO read overflow.
UX_SYNERGY_DCD_FIFO_READ_SHORT	Short packet is received.
UX_SYNERGY_DCD_FIFO_READING	Continue reading FIFO.

◆ ux_dcd_synergy_fifo_read_dma()

UINT ux_dcd_synergy_fifo_read_dma (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, UINT *dma_bytes_to_transfer*)

This function reads the data from HW D0/ D1 FIFO using DMA.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block
[in,out]	dma_bytes_to_transfer	: No of bytes to be transferred using DMA

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_READ_OVER	FIFO read overflow.
UX_SYNERGY_DCD_FIFO_READ_SHORT	Short packet is received.
UX_SYNERGY_DCD_FIFO_READING	Continue reading FIFO.

◆ ux_dcd_synergy_fifo_write_last_bytes()

VOID ux_dcd_synergy_fifo_write_last_bytes (UX_DCD_SYNERGY_PAYLOAD_TRANSFER * *p_payload*, VOID * *p_fifo*, ULONG *usb_base*)

USBX DCD FIFO write - Copy last bytes to FIFO by software if the rest bytes are less than FIFO access width.

Parameters

[in,out]	p_payload	Pointer to a payload transfer structure
[in]	p_fifo	FIFO register address
[in]	usb_base	USB controller hardware base address

◆ ux_dcd_synergy_fifo_write_software_copy()

VOID ux_dcd_synergy_fifo_write_software_copy (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_PAYLOAD_TRANSFER * *p_payload*, VOID * *p_fifo*, ULONG *fifo_sel*)

USBX DCD FIFO write by software copy. Call a subroutine for selected USB controller hardware.

Parameters

[in]	dcd_synergy	Pointer to the DCD control block
[in,out]	p_payload	Pointer to a payload transfer structure
[in]	p_fifo	FIFO register address
[in]	fifo_sel	FIFO select register

◆ ux_dcd_synergy_fifoc_read()

UINT ux_dcd_synergy_fifoc_read (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function reads from the hardware FIFO C and stores in the destination buffer.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_READ_OVER	FIFO read overflow.
UX_SYNERGY_DCD_FIFO_READ_SHORT	Short packet is received.
UX_SYNERGY_DCD_FIFO_READING	Continue reading FIFO.

◆ ux_dcd_synergy_fifoc_write()

UINT ux_dcd_synergy_fifoc_write (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function writes a data from a buffer into USB FIFO using CPU.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_WRITE_END	Status for fifo write ends.
UX_SYNERGY_DCD_FIFO_WRITING	Status for fifo multiple writes.

◆ ux_dcd_synergy_fifod_write()

UINT ux_dcd_synergy_fifod_write (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*)

This function writes a buffer to FIFOD0 or FIFOD1.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_WRITE_END	Write ends of FIFO.
UX_SYNERGY_DCD_FIFO_WRITING	Continue multiple write to FIFO.

◆ ux_dcd_synergy_fifod_write_dma()

UINT ux_dcd_synergy_fifod_write_dma (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_ED * *ed*, UINT *dma_bytes_to_transfer*)

This function writes a buffer to FIFOD0 or FIFOD1 using DMA.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	ed	: Pointer to a physical Endpoint(ED) control block
[in,out]	dma_bytes_to_transfer	: No of bytes to be transferred using DMA

Return values

UX_ERROR	FIFO is not accessible.
UX_SYNERGY_DCD_FIFO_WRITE_END	Write ends of FIFO.
UX_SYNERGY_DCD_FIFO_WRITING	Continue multiple write to FIFO.
UX_SYNERGY_DCD_FIFO_WRITE_ERROR	Return error if timeout occurs or endpoint reset occurs.

Setup DMA transfer.

Start DMA transfer by software control.

Wait till DMA transfer is done.

Return error, if semaphore timeouts or endpoint reset occurs.

Wait for certain time - if the buffer is not ready return error

Clear the DELSR.n.IR flag by starting the dummy DMA transfer.

◆ ux_dcd_synergy_frame_number_get()

UINT ux_dcd_synergy_frame_number_get (UX_DCD_SYNERGY * *dcd_synergy*, ULONG * *frame_number*)

This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	frame_number	: Pointer to a frame number in use

Return values

UX_SUCCESS	In use frame number is returned successfully.

◆ ux_dcd_synergy_function()

UINT ux_dcd_synergy_function (UX_SLAVE_DCD * *dcd*, UINT *function*, VOID * *parameter*)

This function act as interface between upper layer USBX device stack and synergy controller.

Parameters

[in,out]	dcd	: Pointer to a USBX control block.
[in,out]	function	: Function requested to be despatched.
[in,out]	parameter	: Pointer to requested function parameters.

Return values

UX_CONTROLLER_UNKNOWN	Desired controller is not specified.
UX_FUNCTION_NOT_SUPPORTED	DCD function is not supported by the controller.
UX_SUCCESS	DCD function despatched successfully.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_frame_number_get()
- ux_dcd_synergy_transfer_request()
- ux_dcd_synergy_transfer_abort()
- ux_dcd_synergy_endpoint_create()
- ux_dcd_synergy_endpoint_destroy()
- ux_dcd_synergy_endpoint_reset()
- ux_dcd_synergy_endpoint_stall()
- ux_dcd_synergy_endpoint_status()

◆ ux_dcd_synergy_initialize()

UINT ux_dcd_synergy_initialize (ULONG *dcd_io*)

This function initializes the USB slave controller for Renesas Synergy MCUs.

Parameters

[in,out]	dcd_io	Address of DCD

Returns

See Common Error Codes for other possible return codes or causes.

```
This function calls:
* ux_dcd_synergy_initialize_common()
```

◆ ux_dcd_synergy_initialize_complete()

UINT ux_dcd_synergy_initialize_complete (VOID)
This function completes the initialization of the USB slave controller for the Renesas Synergy MCUs. **Return values** UX_SUCCESS — USB slave is initialized successfully.

◆ ux_dcd_synergy_initialize_transfer_support()

UINT ux_dcd_synergy_initialize_transfer_support (ULONG *dcd_io*, UX_DCD_SYNERGY_TRANSFER * *p_transfer_instance*)

The function initializes the USB slave controller of the Renesas Synergy MCUs with associated DMA transfer modules.

Parameters

[in]	dcd_io	Address of the USB controller.
[in]	p_transfer_instance	Pointer to Synergy Transfer module instances.

Return values

UX_SUCCESS	Completed the USB controller initialization successfully.
UX_CONTROLLER_INIT_FAILED	Failed to initialize the USB controller.
UX_MEMORY_INSUFFICIENT	Memory was not allocated properly for the Synergy DCD instance.

Get the pointer to the Synergy DCD instance.

To begin, initialize D0 and D1 FIFO as free.

Initialize Transfer instances.

Setup the Transfer module for transmission.

DTC is not supported in S1 series - so no need of activation source

Clear the DMA transfer end callback flag.

Open Transfer module for transmission.

Setup the Transfer module for reception.

Note address mode in rx is reverst of tx: Destination (which is ram) is incremented and source (which is FIFO_1 buffer)

DTC is not supported in S1 series - so no need of activation source

Clear the DMA transfer end callback flag.

Open Transfer module for reception.

Return successful completion.

◆ ux_dcd_synergy_interrupt_handler()

VOID ux_dcd_synergy_interrupt_handler (VOID)

This function is the interrupt handler for the synergy controller.

The controller will trigger an interrupt when something happens on an endpoint whose mask has been set in the interrupt enable register.

Get the pointer to the DCD.

Get the pointer to the synergy DCD.

Get the pointer to the device.

Read the interrupt status register from the controller.

Check if we have an RESUME.

Check the source of the interrupt. Is it VBUS transition?

Check the source of the interrupt. Is it Device State transition (DVST) ?

We enter this state when there is a Bus Reset.

If the device is marked as configured, the device is reset.

Decide what speed is used by the host, read DVSTCTR and isolate speed.

Check if we have a BEMP interrupt.

Check if we have a BRDY interrupt.

Check if we have a NRDY interrupt.

Check if we have a SETUP transaction phase.

◆ ux_dcd_synergy_register_clear()

VOID ux_dcd_synergy_register_clear (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function clears a bit in a register of the synergy.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to clear
[in,out]	value	: Value to clear

◆ ux_dcd_synergy_register_read()

ULONG ux_dcd_synergy_register_read (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *synergy_register*)

This function reads a synergy USB register.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to read

Return values

dcd_reg	Value read from USB register.

◆ ux_dcd_synergy_register_set()

VOID ux_dcd_synergy_register_set (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function set a bit in synergy USB register.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to set
[in,out]	value	: Value to set

◆ ux_dcd_synergy_register_write()

VOID ux_dcd_synergy_register_write (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function writes a bit in synergy USB register.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to write
[in,out]	value	: Value to write

◆ ux_dcd_synergy_remote_wakeup()

UINT ux_dcd_synergy_remote_wakeup (UX_DCD_SYNERGY * *dcd_synergy*, ULONG * *parameter*)

This function is called when the device wants to wake up the host.

Parameters

[in]	dcd_synergy	Pointer to a DCD control block
[in]	parameter	Pointer to a remote wakeup parameter.

Return values

UX_SUCCESS	Remote wakeup signaled to the USB HOST successfully.
UX_ERROR	Remote wakeup signal failed from DEVICE to the USB HOST.

◆ ux_dcd_synergy_transfer_abort()

UINT ux_dcd_synergy_transfer_abort (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_TRANSFER * *transfer_request*)

This function will terminate the transfer.

Parameters

[in]	dcd_synergy	: Pointer to a DCD control block
[in]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Transfer Abort is initiated successfully.

Set the ACLRM bit to 1 and then to 0 for clearing FIFO buffers.

Clear the FIFO buffer memory.

◆ ux_dcd_synergy_transfer_callback()

UINT ux_dcd_synergy_transfer_callback (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_TRANSFER * *transfer_request*, ULONG *interrupt_status*, ULONG *ctsq_mask*)

This function is invoked under ISR when an event happens on a specific endpoint.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	transfer_request	: Pointer to USBX Device Transfer Request structure
[in,out]	interrupt_status	: Check if we have SETUP condition or BRDY or BEMP interrupt.
[in,out]	ctsq_mask	: Mask to isolate the CTSQ field.

Return values

UX_SUCCESS	Function is invoked under ISR successfully.

◆ ux_dcd_synergy_transfer_request()

UINT ux_dcd_synergy_transfer_request (UX_DCD_SYNERGY * *dcd_synergy*, UX_SLAVE_TRANSFER * *transfer_request*)

This function will initiate a transfer to a specific endpoint. If the endpoint is IN, the endpoint register will be set to accept the request. If the endpoint is IN, the endpoint FIFO will be filled with the buffer and the endpoint register set.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Transfer to a specific endpoint is initiated successfully.
ux_slave_transfer_request_completion_code	Pointer to structure UX_SLAVE_TRANSFER(transfer request completion code).
UX_TRANSFER_ERROR	Transfer is completed with error.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_dcd_synergy_buffer_write()

Set the ACLRM bit to 1 and then to 0 for clearing FIFO buffers.

Clear the D1 FIFO buffer memory.

Clear the CFIFO buffer memory.

Clean the pending semaphore due to timeout on this transfer request.

Check the completion code, and if it is not successful abort this transfer and return the error to the caller

Check the completion code, and if it is not successful abort this transfer and return the error to the caller

◆ ux_dcd_synergy_uninitialize()

UINT ux_dcd_synergy_uninitialize (ULONG *dcd_io*)

USBX DCD un-initialization the USB controller.

Parameters

[in]	dcd_io	Address of the USB controller.

Return values

UX_SUCCESS	Completed the USB controller Un-initialization successfully.
UX_DCD_SYNERGY_UNINIT_FAILED	Failed to Un-initialize the USB controller.

Disable interrupt requests

uninitialize and disable DMA support

Stop the clock to the USB module. The SCKE clearing is required for USBFS controller but not for USBHS

Reset USB Module.

Clear the Pending IRQ in NVIC

Disable the IRQ in NVIC

Stop the module usage

Free up resource.

◆ ux_dcd_synergy_uninitialize_transfer_support()

UINT ux_dcd_synergy_uninitialize_transfer_support (ULONG *dcd_io*)

The function un-initializes the USB slave controller of the Renesas Synergy MCUs with associated DMA transfer modules.

Parameters

[in]	dcd_io	Address of the USB controller.

Return values

UX_SUCCESS	Completed the USB controller Un-initialization successfully.
UX_DCD_SYNERGY_UNINIT_FAILED	Failed to Un-initialize the USB controller.

◆ ux_dcd_synergy_usb_status_register_clear()

VOID ux_dcd_synergy_usb_status_register_clear (UX_DCD_SYNERGY * *dcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function clears a bit in a status register of the synergy.To clear the status bits, need to write 0 only to the bits to be cleared. Write 1 to the other bits.

Parameters

[in,out]	dcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to clear
[in,out]	value	: Value to clear

◆ ux_dcd_synergy_write_dma_configure()

VOID ux_dcd_synergy_write_dma_configure (UX_DCD_SYNERGY * *dcd_synergy*, UX_DCD_SYNERGY_PAYLOAD_TRANSFER * *p_payload*, ULONG *fifo_sel*, ULONG *endpoint_size*)

USBX DCD DMA write setup function. Call a subroutine for selected USB controller hardware.

Parameters

[in]	dcd_synergy	Pointer to the DCD control block
[in,out]	p_payload	Pointer to a payload transfer structure
[in]	fifo_sel	FIFO select register
[in]	endpoint_size	Endpoint size

◆ ux_hcd_synergy_asynch_queue_process()

VOID ux_hcd_synergy_asynch_queue_process (UX_HCD_SYNERGY * *hcd_synergy*)

This function process the asynchronous transactions. The function will identify the USB interrupts occurred associated with an endpoint and will process the interrupts.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_asynch_queue_process_bemp()

VOID ux_hcd_synergy_asynch_queue_process_bemp (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the BEMP(Buffer Empty) interrupt that occurred on a specific ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_asynch_queue_process_brdy()

VOID ux_hcd_synergy_asynch_queue_process_brdy (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_asynch_queue_process_nrdy()

VOID ux_hcd_synergy_asynch_queue_process_nrdy (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- UX_TRANSFER::ux_transfer_request_completion_function

◆ ux_hcd_synergy_asynch_queue_process_sign()

VOID ux_hcd_synergy_asynch_queue_process_sign (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the Setup transaction Error Interrupt.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_asynch_schedule()

VOID ux_hcd_synergy_asynch_schedule (UX_HCD_SYNERGY * *hcd_synergy*)

This function schedules new transfers from the control or bulk lists.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_asynchronous_endpoint_create()

UINT ux_hcd_synergy_asynchronous_endpoint_create (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will create an asynchronous endpoint. The control and bulk endpoints fall into this category.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to endpoint

Return values

UX_NO_ED_AVAILABLE	ED for new endpoint not available.
UX_NO_TD_AVAILABLE	Dummy TD not available for terminating the ED transfer chain.
UX_SUCCESS	Asynchronous endpoint created successfully.

◆ ux_hcd_synergy_asynchronous_endpoint_destroy()

UINT ux_hcd_synergy_asynchronous_endpoint_destroy (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will destroy an asynchronous endpoint. The control and bulk endpoints fall into this category.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to endpoint

Return values

UX_ENDPOINT_HANDLE_UNKNOWN	Physical endpoint has not been initialized properly.
UX_SUCCESS	Asynchronous endpoint destroyed successfully.

◆ ux_hcd_synergy_buffer_empty_interrupt()

VOID ux_hcd_synergy_buffer_empty_interrupt (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*, ULONG *flag*)

This function enable or disable the BEMP(Buffer Empty) interrupt for the pipe.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to physical Endpoint(ED) control block
[in]	flag	: Check whether DCD synergy is enable or disable.

Reset the BEMPE, NRDYE, BRDYE bits.

◆ ux_hcd_synergy_buffer_notready_interrupt()

VOID ux_hcd_synergy_buffer_notready_interrupt (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*, ULONG *flag*)

This function enable or disable the NRDY(Not Ready) interrupt for the pipe.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to physical Endpoint(ED) control block
[in]	flag	: Check whether DCD synergy is enable or disable.

◆ ux_hcd_synergy_buffer_read()

UINT ux_hcd_synergy_buffer_read (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function reads from a specified pipe into a buffer.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to a physical Endpoint(ED) control block

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_fifo_read()

◆ ux_hcd_synergy_buffer_ready_interrupt()

VOID ux_hcd_synergy_buffer_ready_interrupt (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*, ULONG *flag*)

This function enable or disable the BRDY(Ready) interrupt for the pipe.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to physical Endpoint(ED) control block
[in]	flag	: Check whether DCD synergy is enable or disable.

◆ ux_hcd_synergy_buffer_write()

UINT ux_hcd_synergy_buffer_write (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function writes data to the selected FIFO of the endpoint.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to a physical Endpoint(ED) control block

Return values

UX_SUCCESS	Buffer written to the specified PIPE successfully.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_fifod_write()
- ux_hcd_synergy_fifoc_write()

◆ ux_hcd_synergy_bulk_endpoint_create()

UINT ux_hcd_synergy_bulk_endpoint_create (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will create a bulk endpoint.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to a USBX Endpoint Container structure

Return values

UX_ERROR	PIPE is not available for bulk endpoint creation .
UX_SUCCESS	Bulk endpoints created successfully.
UX_NO_ED_AVAILABLE	ED for bulk endpoint is not available.
UX_NO_TD_AVAILABLE	Dummy TD for terminating the ED transfer chain is not available.

Limit the max packet size to the size the HW supports.

◆ ux_hcd_synergy_bulk_int_td_add()

UINT ux_hcd_synergy_bulk_int_td_add (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function adds a transfer descriptor to an Bulk or INT ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to a Synergy ED structure

Return values

UX_SUCCESS	Transfer descriptor added successfully.

Clear the BRDY and BEMP status for this pipe.

◆ ux_hcd_synergy_control_endpoint_create()

UINT ux_hcd_synergy_control_endpoint_create (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will create a control endpoint.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	Control endpoint created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED for control endpoint.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for control endpoint.

◆ ux_hcd_synergy_control_td_add()

UINT ux_hcd_synergy_control_td_add (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function adds a transfer descriptor to an ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to Synergy ED structure

Return values

UX_SUCCESS	Transfer descriptor added to an ED successfully.

Get transmit descriptors.

Set TD into response pending state.

Check data, status for setup phase.

We are processing a SETUP phase. Set the device address register if different.

And store it. Note that the device address is not an index.

DEVADDm.USBSPD[1:0] is set by the Software after the speed of the device is obtained and reset after connecting/disconnecting the device every time. To set the TRNENSEL bit, when LS device is connected to FS Hub, we are indirectly examining the speed of the device by examining DEVADDm.USBSPD[1:0].

Check if the speed of the connected HUB is FS

Clear the address field first.

Store the new address but leave the MPS field intact.

Set the buffer address to be accessed.

Copy the payload of the control transfer into each register : Request.

Copy the payload of the control transfer into each register : Value.

Copy the payload of the control transfer into each register : Index.

Copy the payload of the control transfer into each register : Length.

Start transmission.

We are processing data/status stage of control transfer. Check direction now.

This is an IN. Reset the PID mask register.

Set PIPE0 FIFO in in status.

Set DATA0-DATA1 toggle.

We are doing a read. Reset the Direction bit in the DCPCFG register.

Clear the FIFO buffer memory.

Enable the Buffer empty interrupt.

Enable the Ready interrupt.

Start transmission - set PID to NAK then set PID to BUF.

Must be an OUT now.

Clear the FIFO buffer memory.

Set PID to NAK.

Set DATA0-DATA1 toggle.

Write the buffer to the pipe.

Check status.

Return successful completion.

◆ ux_hcd_synergy_controller_disable()

UINT ux_hcd_synergy_controller_disable (UX_HCD_SYNERGY * *hcd_synergy*)

This function will disable the Synergy controller. The controller will release all its resources (memory, IO ...). After this, the controller will not send SOF any longer. All transactions should have been completed, all classes should have been closed.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

UX_SUCCESS	Synergy controller disabled successfully.

◆ ux_hcd_synergy_current_endpoint_change()

VOID ux_hcd_synergy_current_endpoint_change (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*, ULONG *direction*)

This function change the endpoint in the FIFO.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure
[in]	direction	: Direction to transfer

◆ ux_hcd_synergy_data_buffer_size()

ULONG ux_hcd_synergy_data_buffer_size (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function returns the size of the buffer data.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure

Return values

buffer_size	buffer size

◆ ux_hcd_synergy_disable()

UINT ux_hcd_synergy_disable (ULONG *ux_hcd_io*)

This function disables the Synergy HOST controller.

Parameters

[in]	ux_hcd_io	: HCD controller base address

Return values

UX_SUCCESS	HCD controller disabled successfully.
UX_SYNERGY_UNINIT_FAILED	HCD controller un-initialization failed.

◆ ux_hcd_synergy_ed_obtain()

UX_SYNERGY_ED* ux_hcd_synergy_ed_obtain (UX_HCD_SYNERGY * *hcd_synergy*)

This function obtains a free ED from the ED list.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

UX_NULL	No available ED in the ED list.

Returns

ed Endpoint descriptor pointer address.

◆ ux_hcd_synergy_ed_td_clean()

VOID ux_hcd_synergy_ed_td_clean (UX_SYNERGY_ED * *ed*)

This function process cleans the ED of all tds except the last dummy TD.

Parameters

[in,out]	ed	: Pointer to Synergy ED structure

◆ ux_hcd_synergy_endpoint_nak_set()

VOID ux_hcd_synergy_endpoint_nak_set (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function sets a NAK(Not Acknowledged) to an endpoint.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure

◆ ux_hcd_synergy_endpoint_reset()

UINT ux_hcd_synergy_endpoint_reset (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will reset an endpoint.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	Endpoint reset successfully.

◆ ux_hcd_synergy_entry()

UINT ux_hcd_synergy_entry (UX_HCD * *hcd*, UINT *function*, VOID * *parameter*)

This function is the entry function to the USB driver from the USB stack.

Parameters

[in]	hcd	: Pointer to USBX Host Controller structure.
[in]	function	: Function for driver to perform
[in]	parameter	: Pointer to function parameter(s)

Return values

UX_SUCCESS	HCD function is dispatched successfully.
UX_CONTROLLER_UNKNOWN	Synergy controller is not known.
UX_FUNCTION_NOT_SUPPORTED	Function not supported.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_controller_disable()
- ux_hcd_synergy_port_status_get()
- ux_hcd_synergy_port_enable()
- ux_hcd_synergy_port_disable()
- ux_hcd_synergy_power_on_port()
- ux_hcd_synergy_power_down_port()
- ux_hcd_synergy_port_suspend()
- ux_hcd_synergy_port_resume()
- ux_hcd_synergy_port_reset()
- ux_hcd_synergy_frame_number_get()
- ux_hcd_synergy_request_transfer()
- ux_hcd_synergy_transfer_abort()
- ux_hcd_synergy_control_endpoint_create()
- ux_hcd_synergy_bulk_endpoint_create()
- ux_hcd_synergy_interrupt_endpoint_create()
- ux_hcd_synergy_isochronous_endpoint_create()
- ux_hcd_synergy_asynchronous_endpoint_destroy()
- ux_hcd_synergy_periodic_endpoint_destroy()
- ux_hcd_synergy_endpoint_reset()

◆ ux_hcd_synergy_fifo_port_change()

ULONG ux_hcd_synergy_fifo_port_change (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*, ULONG *direction*)

This function change the port of the FIFO.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure
[in]	direction	: Direction to transfer

Return values

synergy_register	Content of FIFO control register.
UX_ERROR	Port not changed successfully or unable to access FIFO.

◆ ux_hcd_synergy_fifo_read()

UINT ux_hcd_synergy_fifo_read (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function read data from the FIFO configured for the PIPE(FIFO C, D0 or D1).

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure

Return values

UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_READ_OVER	Status set to read overflow.
UX_SYNERGY_HC_FIFO_READ_SHORT	Short packet to read.
UX_SYNERGY_HC_FIFO_READING	Continue reading buffer.

◆ ux_hcd_synergy_fifo_write_software_copy()

VOID ux_hcd_synergy_fifo_write_software_copy (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *payload_length*, UCHAR * *payload_buffer*, VOID * *fifo_addr*, ULONG *fifo_sel*)

USBX HCD CPU FIFO write by software copy. Call a suitable subroutine for selected USB controller hardware.

Parameters

[in]	hcd_synergy	Pointer to the HCD control block
[in]	payload_length	Payload length
[in]	payload_buffer	Payload buffer address
[in]	fifo_addr	FIFO register address
[in]	fifo_sel	FIFO select register

◆ ux_hcd_synergy_fifo_write_software_copy_remaining_bytes()

VOID ux_hcd_synergy_fifo_write_software_copy_remaining_bytes (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *payload_length*, UCHAR * *payload_buffer*, VOID * *fifo_addr*)

USBX HCD CPU FIFO write - Copy remaining bytes to FIFO by software if the rest bytes are less than FIFO access width.

Parameters

[in]	hcd_synergy	Pointer to the HCD control block
[in,out]	payload_length	Payload length
[in,out]	payload_buffer	Payload buffer address
[in,out]	fifo_addr	FIFO register address

◆ ux_hcd_synergy_fifoc_write()

UINT ux_hcd_synergy_fifoc_write (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function writes a buffer to FIFOC.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to Synergy ED structure

Return values

UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_WRITE_END	Writing at ends.
UX_SYNERGY_HC_FIFO_WRITE_SHORT	Writing short data.
UX_SYNERGY_HC_FIFO_WRITING	Doing multiple writes.

◆ ux_hcd_synergy_fifod_write()

UINT ux_hcd_synergy_fifod_write (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function writes a buffer data to FIFOD0 or FIFOD1.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to Synergy ED structure

Return values

UX_ERROR	Unable to access FIFO successfully.
UX_SYNERGY_HC_FIFO_WRITE_END	Writing at ends.
UX_SYNERGY_HC_FIFO_WRITE_SHORT	Writing short data.
UX_SYNERGY_HC_FIFO_WRITING	Doing multiple writes.

◆ ux_hcd_synergy_frame_number_get()

UINT ux_hcd_synergy_frame_number_get (UX_HCD_SYNERGY * *hcd_synergy*, ULONG * *frame_number*)

This function will return the frame number currently used by the controller. This function is mostly used for isochronous purposes and for timing.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	frame_number	: Frame number to set

Return values

UX_SUCCESS	Frame number returned successfully.

◆ ux_hcd_synergy_frame_number_set()

VOID ux_hcd_synergy_frame_number_set (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *frame_number*)

This function will set the current frame number to the one specified. This function is mostly used for isochronous purpos.es.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	frame_number	: Frame number to set

◆ ux_hcd_synergy_initialize()

UINT ux_hcd_synergy_initialize (UX_HCD * *hcd*)

This function initializes the Synergy controller.

Parameters

[in,out]	hcd	: Pointer to USBX host controller structure.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_initialize_common()

◆ ux_hcd_synergy_initialize_transfer_support()

UINT ux_hcd_synergy_initialize_transfer_support (UX_HCD * *hcd*, const UX_HCD_SYNERGY_TRANSFER * *p_transfer_instance*)

USBX HCD Transfer Support with DMA support.

Parameters

[in,out]	hcd	Pointer to the USBX HCD control block.
[in]	p_transfer_instance	Pointer to Transfer module instances.

Return values

UX_SUCCESS	Initialize hcd transfer support successfully.
UX_CONTROLLER_INIT_FAILED	Failed in Transfer module setup, or Unsupported USB controller was specified.
UX_SEMAPHORE_ERROR	Failed in creating a semaphore used for DMA transfer.
UX_MEMORY_INSUFFICIENT	Failed in allocation memory.

◆ ux_hcd_synergy_interrupt_endpoint_create()

UINT ux_hcd_synergy_interrupt_endpoint_create (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will create an interrupt endpoint. The interrupt endpoint has an interval of operation from 1 to 255. The Synergy has no hardware scheduler but we still build an interrupt tree similar to the OHCI controller.

This routine will match the best interval for the Synergy hardware. It will also determine the best node to hook the endpoint based on the load that already exists on the horizontal ED chain.

The tricky part is to understand how the interrupt matrix is constructed. We have used eds with the skip bit on to build a frame of anchor eds. Each ED creates a node for an appropriate combination of interval frequency in the list.

After obtaining a pointer to the list with the lowest traffic, we traverse the list from the highest interval until we reach the interval required. At that node, we anchor our real ED to the node and link the ED that was attached to the node to our ED.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	Interrupt endpoint created successfully.
UX_ERROR	Available pipe is not found for interrupt endpoint.
UX_NO_ED_AVAILABLE	Failed to obtain an ED for new endpoint.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for terminating the ED transfer chain.

◆ ux_hcd_synergy_interrupt_handler()

VOID ux_hcd_synergy_interrupt_handler (UINT *hcd_index*)

This function is the interrupt handler for the Synergy USB HS controller. Normally an interrupt occurs from the controller when there is either a EOF signal and there has been transfers within the frame or when there is a change on one of the downstream ports.

All we need to do in the ISR is scan the controllers to find out which one has issued a IRQ. If there is work to do for this controller we need to wake up the corresponding thread to take care of the job.

Parameters

[in]	hcd_index	: HCD number

Check if the controller is operational, if not, skip it.

Examine the source of interrupts. Check for SOF signal.

Check for Over Current condition.

Check if we have a BEMP interrupt.

Do we have a BRDY interrupt ?

Do we have a NRDY interrupt ?

Check for attach signal.

Is it a detach signal ?

Check for BCHG signal.

Is it a EOFERR signal.

Did we get a SACK interrupt ?

Did we get a SIGN interrupt ?

◆ ux_hcd_synergy_iso_queue_process()

VOID ux_hcd_synergy_iso_queue_process (UX_HCD_SYNERGY * *hcd_synergy*)

This function process the isochronous transactions that happened in the last frame.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_iso_queue_process_bemp()

VOID ux_hcd_synergy_iso_queue_process_bemp (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the BEMP(Buffer Empty) Interrupt that occurred on a specific ED used for Isochronous transfer.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_iso_queue_process_brdy()

VOID ux_hcd_synergy_iso_queue_process_brdy (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the BRDY(Buffer Ready)interrupt that occurred on a specific ED used for isochronous transfer.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_iso_queue_process_nrdy()

VOID ux_hcd_synergy_iso_queue_process_nrdy (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function process the NRDY(Not Ready) Interrupt that occurred on a specific ED used for Isochronous transfer.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

◆ ux_hcd_synergy_iso_schedule()

VOID ux_hcd_synergy_iso_schedule (UX_HCD_SYNERGY * *hcd_synergy*)

This function schedules new transfers from isochronous list.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_iso_td_add()

UINT ux_hcd_synergy_iso_td_add (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function adds a transfer descriptor to an Isochronous Endpoint Descriptor.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	ed	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	A transfer descriptor was added to an Isochronous Endpoint Descriptor successfully.
Others	See Common Error Codes for other possible return codes or causes. This function calls : ux_hcd_synergy_buffer_write()

◆ ux_hcd_synergy_isochronous_endpoint_create()

UINT ux_hcd_synergy_isochronous_endpoint_create (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function creates an isochronous endpoint.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	Isochronous endpoint is created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED terminating the ED transfer chain.
UX_NO_TD_AVAILABLE	Failed to obtain a TD for new endpoint.

◆ ux_hcd_synergy_isochronous_td_obtain()

UX_SYNERGY_ISO_TD* ux_hcd_synergy_isochronous_td_obtain (UX_HCD_SYNERGY * *hcd_synergy*)

This function obtains a free TD from the isochronous TD list.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

td	Pointer to Synergy ISO Trasfer Descriptor.
UX_NULL	TD not available in the TD list.

◆ ux_hcd_synergy_least_traffic_list_get()

UX_SYNERGY_ED* ux_hcd_synergy_least_traffic_list_get (UX_HCD_SYNERGY * *hcd_synergy*)

This function return a pointer to the first ED in the periodic tree that has the least traffic registered.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

min_bandwidth_ed	End descriptor interrupt Number(ed)

◆ ux_hcd_synergy_periodic_endpoint_destroy()

UINT ux_hcd_synergy_periodic_endpoint_destroy (UX_HCD_SYNERGY * *hcd_synergy*, UX_ENDPOINT * *endpoint*)

This function will destroy an isochronous endpoint.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	endpoint	: Pointer to an Endpoint control block

Return values

UX_SUCCESS	Isochronous endpoint is destroyed successfully.
UX_ENDPOINT_HANDLE_UNKNOWN	Physical endpoint has not been initialized properly.

◆ ux_hcd_synergy_periodic_schedule()

VOID ux_hcd_synergy_periodic_schedule (UX_HCD_SYNERGY * *hcd_synergy*)

This function schedules new transfers from the periodic interrupt list.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_periodic_tree_create()

UINT ux_hcd_synergy_periodic_tree_create (UX_HCD_SYNERGY * *hcd_synergy*)

This function creates the periodic static tree for the interrupt and isochronous eds.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

UX_SUCCESS	Periodic tree created successfully.
UX_NO_ED_AVAILABLE	Failed to obtain an ED.

◆ ux_hcd_synergy_port_disable()

UINT ux_hcd_synergy_port_disable (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will disable a specific port attached to the root HUB.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_SUCCESS	Port disabled successfully.
UX_PORT_INDEX_UNKNOWN	Invalid port .

◆ ux_hcd_synergy_port_enable()

UINT ux_hcd_synergy_port_enable (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will enable a specific port attached to the root HUB.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_SUCCESS	Port enabled successfully.
UX_PORT_INDEX_UNKNOWN	Invalid port.
UX_NO_DEVICE_CONNECTED	Device not connected properly.

◆ ux_hcd_synergy_port_reset()

UINT ux_hcd_synergy_port_reset (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will reset a specific port attached to the root HUB.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_SUCCESS	Port reset successfully.
UX_PORT_INDEX_UNKNOWN	Invalid port.
UX_NO_DEVICE_CONNECTED	Device not connected properly.

◆ ux_hcd_synergy_port_resume()

UINT ux_hcd_synergy_port_resume (UX_HCD_SYNERGY * *hcd_synergy*, UINT *port_index*)

This function will resume a specific port attached to the root HUB. Present, this function is not supported for resume port.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

◆ ux_hcd_synergy_port_status_get()

ULONG ux_hcd_synergy_port_status_get (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will return the status for each port attached to the root HUB.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_PORT_INDEX_UNKNOWN	Invalid port.
port_status	Synergy Port status

Check to see if this port is valid on this controller.

The port is valid, build the status mask for this port. This function returns a controller agnostic bit field.

Provides a delay of 100 ms to stabilize while initial power up

Find the number of enumeration events occurred on another HOST.

Wait for the semaphore to be put by the root hub or a regular hub.

◆ ux_hcd_synergy_port_suspend()

UINT ux_hcd_synergy_port_suspend (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will suspend a specific port attached to the root HUB. Present, this function is does not supported.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

◆ ux_hcd_synergy_power_down_port()

UINT ux_hcd_synergy_power_down_port (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will power down a specific port attached to the root HUB. Present, this function is does not supported.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

◆ ux_hcd_synergy_power_on_port()

UINT ux_hcd_synergy_power_on_port (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *port_index*)

This function will power a specific port attached to the root HUB. Present, this function is does not supported.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	port_index	: Port Index

Return values

UX_FUNCTION_NOT_SUPPORTED	Unsupported function.

◆ ux_hcd_synergy_power_root_hubs()

VOID ux_hcd_synergy_power_root_hubs (UX_HCD_SYNERGY * *hcd_synergy*)

This function will power the root HUB. Present, this function is does not supported.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block

◆ ux_hcd_synergy_register_clear()

VOID ux_hcd_synergy_register_clear (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function clears flags in a synergy USB register.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	synergy_register	: Register to write
[in]	value	: Value to clear

◆ ux_hcd_synergy_register_read()

ULONG ux_hcd_synergy_register_read (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *synergy_register*)

This function reads a data from synergy USB register.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	synergy_register	: Register to read

Return values

hcd_reg	Value read from the specified register(ULONG value).

◆ ux_hcd_synergy_register_set()

VOID ux_hcd_synergy_register_set (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function sets flags in a synergy USB register.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	synergy_register	: Register to read
[in]	value	: Value to be set

◆ ux_hcd_synergy_register_status_clear()

VOID ux_hcd_synergy_register_status_clear (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function clears a bit in a status register of the synergy controller.To clear the status bits, need to write 0 only to the bits to be cleared. Write 1 to the other bits.

Parameters

[in,out]	hcd_synergy	: Pointer to a DCD control block
[in,out]	synergy_register	: Register to clear
[in,out]	value	: Value to clear

◆ ux_hcd_synergy_register_write()

VOID ux_hcd_synergy_register_write (UX_HCD_SYNERGY * *hcd_synergy*, ULONG *synergy_register*, USHORT *value*)

This function writes a data to a Synergy USB register.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in]	synergy_register	: Register to write
[in]	value	: Value to write

◆ ux_hcd_synergy_regular_td_obtain()

UX_SYNERGY_TD* ux_hcd_synergy_regular_td_obtain (UX_HCD_SYNERGY * *hcd_synergy*)

This function obtains a free TD from the regular TD list.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block

Return values

td	A pointer to Synergy TD.
UX_NULL	Null pointer.

◆ ux_hcd_synergy_request_bulk_transfer()

UINT ux_hcd_synergy_request_bulk_transfer (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function performs a bulk transfer request. A bulk transfer can be larger than the size of the Synergy buffer so it may be required to chain multiple tds to accommodate this transfer request. A bulk transfer is non blocking, so we return before the transfer request is completed.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Bulk transfer happened successfully.
UX_NO_TD_AVAILABLE	Unavailable New TD.

Perform bulk transfer. If transfer request payload length is zero, transfer it once.

◆ ux_hcd_synergy_request_control_transfer()

UINT ux_hcd_synergy_request_control_transfer (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function performs a control transfer from a transfer request. The USB control transfer is in 3 phases (setup, data, status). This function will chain all phases of the control sequence before setting the Synergy endpoint as a candidate for transfer.

Parameters

[in,out]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_MEMORY_INSUFFICIENT	Insufficient memory to build the SETUP request.
UX_NO_TD_AVAILABLE	Unavailable New TD.
ux_transfer_request_completion_code	Pointer to USBX transfer request structure(request completion code).

◆ ux_hcd_synergy_request_interrupt_transfer()

UINT ux_hcd_synergy_request_interrupt_transfer (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function performs an interrupt transfer request. An interrupt transfer can only be as large as the MaxpacketField in the endpoint descriptor. This was verified at the USB layer and does not need to be reverified here.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Interrupt transfer request processed successfully.
UX_NO_TD_AVAILABLE	Unavailable new TD.

◆ ux_hcd_synergy_request_isochronous_transfer()

UINT ux_hcd_synergy_request_isochronous_transfer (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function performs an isochronous transfer request.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Isochronous transfer request processed successfully.
UX_NO_TD_AVAILABLE	Unavailable new TD.

◆ ux_hcd_synergy_request_transfer()

UINT ux_hcd_synergy_request_transfer (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function is the handler for all the transactions on the USB. The transfer request passed as parameter contains the endpoint and the device descriptors in addition to the type of transaction de be executed. This function routes the transfer request to according to the type of transfer to be executed.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_ERROR	Error while Isolating the endpoint type and routing the transfer request.
UX_NO_DEVICE_CONNECTED	No device attached.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_request_control_transfer()
- ux_hcd_synergy_request_bulk_transfer()
- ux_hcd_synergy_request_interrupt_transfer()
- ux_hcd_synergy_request_isochronous_transfer()

◆ ux_hcd_synergy_td_add()

UINT ux_hcd_synergy_td_add (UX_HCD_SYNERGY * *hcd_synergy*, UX_SYNERGY_ED * *ed*)

This function add new TD for control, Bulk or Interrupt endpoint.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in]	ed	: Pointer to Synergy ED structure

Return values

UX_SUCCESS	Transfer done successfully.

◆ ux_hcd_synergy_transfer_abort()

UINT ux_hcd_synergy_transfer_abort (UX_HCD_SYNERGY * *hcd_synergy*, UX_TRANSFER * *transfer_request*)

This function will abort transactions attached to a transfer request.

Parameters

[in]	hcd_synergy	: Pointer to a HCD control block
[in,out]	transfer_request	: Pointer to transfer request

Return values

UX_SUCCESS	Transactions attached to transfer request are aborted successfully.
UX_ENDPOINT_HANDLE_UNKNOWN	Endpoint is not initialized properly.

◆ ux_hcd_synergy_uninitialize()

UINT ux_hcd_synergy_uninitialize (ULONG *ux_hcd_io*)

This function un-initializes the Synergy HOST controller.

Parameters

[in]	ux_hcd_io	: HCD controller base address

Return values

UX_SUCCESS	Completed the USB controller Un-initialization successfully.
UX_SYNERGY_UNINIT_FAILED	HCD controller un-initialization failed.

Returns

See Common Error Codes for other possible return codes or causes. This function calls:

- ux_hcd_synergy_uninitialize_transfer_support()

Reset the BEMPE, NRDYE, BRDYE, SOFE bits.

Clear the INTENB1 bits.

Reset the BRDY, NRDY, BEMPE for all pipes.

Clear USB interrupt status0 register.

Clear USB interrupt status1 register.

Clear all the physical endpoint.

Disable pull-up/pull-down of the D+/D- line.

Disable USB clock operation.

uninitialize and disable DMA support

Stop the module usage

◆ ux_hcd_synergy_uninitialize_transfer_support()

UINT ux_hcd_synergy_uninitialize_transfer_support (UX_HCD_SYNERGY * *hcd_synergy*)
This function un-initializes the transfer module associated with the USBX HOST controller.

Parameters

[in]	hcd_synergy	: HCD synergy controller instance.

Return values

UX_SUCCESS	Completed the transfer Un-initialization successfully.
UX_SYNERGY_UNINIT_FAILED	Failed to Un-initialize the USB controller.

UX_DCD_SYNERGY_ED Struct Reference

Renesas Synergy Software Package Reference » Framework Layer » USBX Framework

#include <ux_dcd_synergy.h>

Data Fields

TX_SEMAPHORE	ux_dcd_synergy_ep_slave_transfer_request_semaphore

Detailed Description

Define USB SYNERGY physical endpoint structure.

Field Documentation

◆ ux_dcd_synergy_ep_slave_transfer_request_semaphore

TX_SEMAPHORE UX_DCD_SYNERGY_ED::ux_dcd_synergy_ep_slave_transfer_request_semaphore
Each pipe to have its own transfer request semaphore

Detailed Description

Function Documentation

◆ d1_allocmem()

void* d1_allocmem (d1_uint_t *size*)

Allocates memory in the driver heap.

Parameters

[in]	size	Size of the memory to be allocated.

Return values

Non-NULL	The function returns the pointer to memory chunk if memory allocation was successful.
NULL	The function returns NULL if memory allocation was failed.

Create a byte memory pool in the driver heap if this function call is the first time.

Allocate memory from a byte memory pool.

◆ d1_allocvidmem()

void* d1_allocvidmem (d1_device * *handle*, d1_int_t *memtype*, d1_uint_t *size*)

Allocate video memory. Synergy does not use the virtual memory space so this function exactly works same as d1_allocmem.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	memtype	Type of memory.
[in]	size	Number of bytes.

Return values

Non-NULL	The function returns the pointer to memory chunk if memory allocation was successful.
NULL	The function returns Null if memory allocation was failed.

◆ d1_cacheblockflush()

d1_int_t d1_cacheblockflush (d1_device * *handle*, d1_int_t *memtype*, const void * *ptr*, d1_uint_t *size*)

Flush part of CPU data caches. Synergy does not have a cache memory so does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	memtype	Memory pools to flush (can be ored together).
[in]	ptr	Start address of memory to be flushed.
[in]	size	Size of memory to be flushed.

Return values

1	The function always return 1.

◆ d1_cacheflush()

d1_int_t d1_cacheflush (d1_device * *handle*, d1_int_t *memtype*)

Flush CPU data caches. Synergy does not have a cache memory so does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	memtype	Memory pools to flush (can be ored together).

Return values

1	The function always return 1.

◆ d1_closedevice()

d1_int_t d1_closedevice (d1_device * *handle*)

Close a device handle. It is called by the D/AVE 2D driver function d2_deinithw to de-initialize the D/AVE 2D hardware. Disables the D/AVE 2D interrupt and stop the module clock supply.

Parameters

[in]	handle	Pointer to the d1_device object.

Return values

0	The function returns 0 if error occurred, NULL is passed to the argument handle.
1	The function returns 1 if successfully device handle was closed.

Disable the D/AVE 2D interrupt.

Stop clock supply to the D/AVE 2D hardware.

Delete used semaphore

◆ d1_copyfromvidmem()

d1_int_t d1_copyfromvidmem (d1_device * *handle*, void * *dst*, const void * *src*, d1_uint_t *size*, d1_int_t *flags*)

Copy data from video memory. Source (video) memory area has to be allocated by d1_allocvidmem.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	dst	pointer into system memory (destination).
[in]	src	Pointer into video memory (source).
[in]	size	Number of bytes to copy.
[in]	flags	Reserved for future use.

Return values

1	The function always return 1.

Simply use C standard memcpy.

◆ d1_copytovidmem()

d1_int_t d1_copytovidmem (d1_device * *handle*, void * *dst*, const void * *src*, d1_uint_t *size*, d1_int_t *flags*)

Copy data to video memory. Destination (video) memory area has to be allocated by d1_allocvidmem.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	dst	pointer into video memory (destination).
[in]	src	Pointer into system memory (source).
[in]	size	Number of bytes to copy.
[in]	flags	Bitfield containing additional information on data to be copied.

Return values

1	The function always return 1.

Simply use C standard memcpy.

◆ d1_devicesupported()

d1_int_t d1_devicesupported (d1_device * *handle*, d1_int_t *deviceid*)

Check if the specified device ID is valid for the D/AVE 2D implemented for Synergy. Use this function to verify that a specific hardware interface is available on the current host system.

Parameters

[in]	handle	Pointer to a device handle.
[in]	deviceid	D1_DAVE2D(Rendering core). The others are ignored.

Return values

0	The function returns 0 if specified device ID not supported.
1	The function returns 1 if specified device ID supported.

Check the deviceid.

Return 1 in case of valid deviceid.

Return 0 in case of Unknown device ID.

◆ d1_freemem()

void d1_freemem (void * *ptr*)

Free the specified memory area in the driver heap.

Parameters

[in]	ptr	Pointer to the memory area to be freed.

Free specified memory allocated by d1_allocmem.

◆ d1_freevidmem()

void d1_freevidmem (d1_device * *handle*, d1_int_t *memtype*, void * *ptr*)

Free video memory. Synergy does not use the virtual memory space so this function exactly works same as d1_freemem.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	memtype	Type of memory.
[in]	ptr	Address returned by d1_allocvidmem.

◆ d1_getregister()

d1_long_t d1_getregister (d1_device * *handle*, d1_int_t *deviceid*, d1_int_t *index*)

Read data from hardware register. Reading a register from an invalid or unsupported device ID will always return 0.

Parameters

[in]	handle	Pointer to a device handle.
[in]	deviceid	D1_DAVE2D(Rendering core) or D1_DLISTINDIRECT(Lists of dlist support). The others are ignored.
[in]	index	Register index (starts with 0).

Return values

Value	The function returns 32-bit value of the register.

Check the deviceid to see whether Register addressing or dlist mode is being used.

If Register addressing is used return the value stored in specified D/AVE 2D register.

If dlist mode is used return the dlist address.

If neither Register addressing nor dlist mode is used return 0.

◆ d1_initirq_intern()

d1_int_t d1_initirq_intern (d1_device_synergy * *handle*)

Initialize IRQ for D/AVE 2D hardware.

Parameters

[in]	handle	Pointer to the d1_device object.

Return values

0	The function returns 0 if failed in the IRQ initialization.
1	The function returns 1 if successfully IRQ is initialized.

Clear all the D/AVE 2D IRQs and enable Display list IRQ.

Access to FMI through the eventInfoGet interface and get the D/AVE 2D IRQ information.

Check return value of eventInfoGet API, if SUCCESS Enable the D/AVE 2D IRQ Vector

Set D/AVE 2D interrupt priority in NVIC if the IRQ vector is valid.

Enable D/AVE 2D interrupt in NVIC if the IRQ vector is valid.

◆ d1_mapfromvidmem()

void* d1_mapfromvidmem (d1_device * *handle*, void * *ptr*)

Map already allocated video memory address to an address for direct CPU access.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	ptr	Video memory address returned by d1_allocvidmem.

Return values

ptr	The function just returns ptr back since no mapping required for Synergy.

◆ d1_maptovidmem()

void* d1_maptovidmem (d1_device * *handle*, void * *ptr*)

Map CPU accessible address of a video memory block back to video memory address. Synergy does not use the virtual memory space so this function does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	ptr	CPU accessible address pointing to a video memory block originally allocated using d1_allocvidmem.

Return values

ptr	The function just returns ptr back since no mapping required for Synergy.

◆ d1_mapvidmem()

void* d1_mapvidmem (d1_device * *handle*, void * *ptr*, d1_int_t *flags*)

Map video memory for direct CPU access. Synergy does not use the virtual memory space so this function does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	ptr	Video memory address returned by d1_allocvidmem.
[in]	flags	Memory mapping flags.

Return values

ptr	The function just returns ptr back since no mapping required for Synergy.

◆ d1_memsize()

d1_uint_t d1_memsize (void * *ptr*)

This function intends to return the size of the given memory block but we don't return valid value. This function returns always 1.

Parameters

[in]	ptr	Pointer to a memory block in Heap.

Return values

1	The function always return 1.

Always return 1.

◆ d1_opendevice()

d1_device* d1_opendevice (d1_long_t *flags*)

Creates a device handle to access hardware. This function initializes the D1 device handle, supply module clock to D/AVE 2D hardware and enables the D/AVE 2D interrupt. It is called by the D/AVE 2D driver function d2_inithw() to initialize the D/AVE 2D hardware.

Parameters

[in]	flags	Reserved. Not used in this function.

Return values

Non-NULL	The function returns the pointer to a d1_device object if the D1 device handle was successfully initialized.
NULL	The function returns NULL if failed to create the display list synchronization semaphore.

Get new device handle.

Initialize device data.

Access to FMI through the productFeatureGet interface and get the D/AVE 2D hardware information.

If failed to get the D/AVE 2D information from FMI, set NULL to handle and return.

Initialize the D/AVE 2D hardware bass address in the device context.

Supply clock to the D/AVE 2D hardware.

Create the semaphore to notify the completion of display list execution.

Enable the D/AVE 2D interrupt if semaphore creation was successful.

If failed to enable the D/AVE 2D interrupt, set NULL to handle.

If failed to create the semaphore, set NULL to handle.

Returns the pointer to the d1_device object.

◆ d1_queryarchitecture()

d1_int_t d1_queryarchitecture (d1_device * *handle*)

Return hints about systems memory architecture.

Parameters

[in]	handle	Pointer to the d1_device object.

Return values

d1_ma_unified	The function always return d1_ma_unified (Unified memory architecture).

Return d1_ma_unified as Memory architecture is such that CPU can directly access pointers returned by allocvidmem.

◆ d1_queryirq()

d1_int_t d1_queryirq (d1_device * *handle*, d1_int_t *irqmask*, d1_int_t *timeout*)

Wait for next IRQ being happened.

Parameters

[in]	handle	Pointer to the d1_device object (Not used).
[in]	irqmask	Interrupt ID (Not used. Synergy only uses Display list IRQ).
[in]	timeout	Timeout value.

Return values

0	The function returns 0 if wait through semaphore is not successful
1	The function returns 1 if wait through semaphore is successful.

Wait for dlist processing to complete.

◆ d1_queryvidmem()

d1_int_t d1_queryvidmem (d1_device * *handle*, d1_int_t *memtype*, d1_int_t *query*)

Get current memory status. This function does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	memtype	Type of memory.
[in]	query	Type of requested information.

Return values

0	The function always return 0.

◆ d1_setregister()

void d1_setregister (d1_device * *handle*, d1_int_t *deviceid*, d1_int_t *index*, d1_long_t *value*)

Write data to the D/AVE 2D hardware register.

Parameters

[in]	handle	Pointer to a device handle.
[in]	deviceid	D1_DAVE2D(Rendering core) or D1_DLISTINDIRECT(Lists of dlist support). The others are ignored.
[in]	index	Register index (word offset from the D/AVE 2D base address).
[in]	value	32-bit value to write.

Write data to specified D/AVE 2D register.

◆ d1_shutdownirq_intern()

d1_int_t d1_shutdownirq_intern (d1_device_synergy * *handle*)

De-initialize IRQ for D/AVE 2D hardware.

Parameters

[in]	handle	Pointer to the d1_device object.

Return values

0	The function returns 0 if failed in the IRQ de-initialization.
1	The function returns 1 if successfully IRQ is de-initialized.

Access to FMI through the eventInfoGet interface and get the D/AVE 2D IRQ information.

Check return value of eventInfoGet API, if SUCCESS disable the D/AVE 2D IRQ Vector

Disable D/AVE 2D interrupt in NVIC if the IRQ vector is valid.

Clear all the D/AVE 2D IRQs and disable Display list IRQ.

◆ d1_unmapvidmem()

d1_int_t d1_unmapvidmem (d1_device * *handle*, void * *ptr*)

Release memory mapping. Synergy does not use the virtual memory space so this function does not do anything special.

Parameters

[in]	handle	Pointer to the d1_device object.
[in]	ptr	Mapped video memory address returned by d1_mapvidmem.

Return values

1	The function always return 1.

◆ drw_int_isr()

void drw_int_isr (void)
DRW ISR. Just in case, check if the driver initialization done. Get D/AVE 2D interrupt status. Clear all the D/AVE 2D interrupts (keep the Display list interrupt enable). Display list interrupt? Signal semaphore for driver. Clear IRQ status.

5.1.4 HAL Interfaces

Renesas Synergy Software Package Reference

Modules

ADC Interface	Interface for A/D Converters.
Analog Connect Interface	Interface for analog connections.
CAC Interface	Interface for clock frequency accuracy measurements.
CAN Interface	Interface for CAN peripheral.
CGC Interface	Interface for clock generation.
COMPARATOR Interface	Interface for Comparators.

	CRC Interface Interface for cyclic redundancy checking.
	Crypto Interface Cryptographic algorithm APIs for encryption/decryption, signing/verification, and hashing.
	CTSU v2 Interface Interface for Capacitive Touch Controllers.
	DAC Interface Interface for D/A converters.
	Display Interface Interface for LCD panel displays.
	DOC Interface Interface for the Data Operation Circuit.
	events and peripheral definitions Interface for the Event Link Controller.
	External IRQ Interface Interface for detecting external interrupts.
	Flash Interface Interface for the flash controller.
	FMI Interface Interface for reading on-chip factory information.
	I2C Interface Interface for I2C communication.

	I2S Interface The I2S (Inter-IC Sound) interface provides APIs and definitions for I2S audio communication.
	Input Capture Interface Interface for sampling input signals for pulse width.
	I/O Port Interface Interface for accessing I/O ports and configuring I/O functionality.
	JPEG Decode Interface Interface for JPEG decode functions.
	JPEG Encode Interface Interface for JPEG encode functions.
	Key Matrix Interface Interface for key matrix functions.
	Low Power Modes V2 Interface Interface for accessing low power modes.
	Low Voltage Detection Interface This section defines the API for the LVD (Low Voltage Detection) Driver.
	OPAMP Interface Interface for Operational Amplifiers.
	PDC Interface Interface for PDC functions.
	PTP driver Interface Interface for PTP functions.

	PTPEDMAC driver Interface Interface for PTPEDMAC functions.
	Quad SPI Flash Interface Interface for accessing external SPI flash devices.
	RTC Interface Interface for accessing the Realtime Clock.
	SD/MMC Interface Interface for accessing SD, eMMC, and SDIO devices.
	SLCDC Interface Interface for Segment LCD controllers.
	SPI Interface Interface for SPI communications.
	Timer Interface Interface for timer functions.
	Transfer Interface Interface for data transfer functions.
	UART Interface Interface for UART communications.
	WDT Interface Interface for watch dog timer functions.

Detailed Description

The HAL Interfaces offer common APIs for functional use cases. They can be implemented by one or more HAL layer drivers. Framework Layer drivers connect to these HAL drivers through the Interface

Layer.

Detailed Description

Interface for A/D Converters.

Summary

The ADC interface provides standard ADC functionality including one-shot mode (single scan), continuous scan and group scan. It also allows configuration of hardware and software triggers for starting scans. After each conversion an interrupt can be triggered, and if a callback function is provided, the call back is invoked with the appropriate event information.

Implemented by: ADC Sigma Delta ADC (SDADC)

ADC Interface description: ADC Driver

Macro Definition Documentation

◆ ADC_API_VERSION_MAJOR

#define ADC_API_VERSION_MAJOR (2U)
Includes board and MCU related header files. Version Number of API.

Typedef Documentation

◆ adc_ctrl_t

typedef void adc_ctrl_t
ADC control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ adc_add_t

enum adc_add_t	
ADC data sample addition and averaging options	
Enumerator	
ADC_ADD_OFF	Addition turned off for channels/sensors.
ADC_ADD_TWO	Add two samples.
ADC_ADD_THREE	Add three samples.
ADC_ADD_FOUR	Add four samples.
ADC_ADD_SIXTEEN	Add sixteen samples.
ADC_ADD_AVERAGE_TWO	Average two samples.
ADC_ADD_AVERAGE_FOUR	Average four samples.
ADC_ADD_AVERAGE_EIGHT	Average eight samples.
ADC_ADD_AVERAGE_SIXTEEN	Average sixteen samples.

◆ adc_alignment_t

enum adc_alignment_t	
ADC data alignment definitions	
Enumerator	
ADC_ALIGNMENT_RIGHT	Data alignment right.
ADC_ALIGNMENT_LEFT	Data alignment left.

◆ adc_cb_event_t

enum adc_cb_event_t	
ADC callback event definitions	
Enumerator	
ADC_EVENT_SCAN_COMPLETE	Normal/Group A scan complete.
ADC_EVENT_SCAN_COMPLETE_GROUP_B	Group B scan complete.
ADC_EVENT_CALIBRATION_COMPLETE	Calibration complete.
ADC_EVENT_CONVERSION_COMPLETE	Conversion complete.

◆ adc_clear_t

enum adc_clear_t	
ADC clear after read definitions	
Enumerator	
ADC_CLEAR_AFTER_READ_OFF	Clear after read off.
ADC_CLEAR_AFTER_READ_ON	Clear after read on.

◆ adc_group_a_t

enum adc_group_a_t	
ADC action for group A interrupts group B scan. This enumeration is used to specify the priority between Group A and B in group mode.	
Enumerator	
ADC_GROUP_A_PRIORITY_OFF	Group A ignored and does not interrupt ongoing group B scan.
ADC_GROUP_A_GROUP_B_WAIT_FOR_TRIGGER	Group A interrupts Group B(single scan) which restarts at next Group B trigger.
ADC_GROUP_A_GROUP_B_RESTART_SCAN	Group A interrupts Group B(single scan) which restarts immediately after Group A scan is complete.
ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN	Group A interrupts Group B(continuous scan) which continues scanning without a new Group B trigger.

◆ adc_mode_t

enum adc_mode_t	
ADC operation mode definitions	
Enumerator	
ADC_MODE_SINGLE_SCAN	Single scan - one or more channels.
ADC_MODE_GROUP_SCAN	Two trigger sources to trigger scan for two groups which contain one or more channels.
ADC_MODE_CONTINUOUS_SCAN	Continuous scan - one or more channels.

◆ adc_over_current_t

enum adc_over_current_t	
ADC reference voltage selection (Applicable for S1/S3 series MCU's only	
Enumerator	
OVER_CURRENT_DETECTION_DISABLE	ADC over current detection disable.
OVER_CURRENT_DETECTION_ENABLE	ADC over current detection enable.

◆ adc_pga_t

enum adc_pga_t	
ADC pga setting definitions	
Enumerator	
SINGLE_INPUT_GAIN_1	Single ended input Gain_1.
SINGLE_INPUT_GAIN_2	Single ended input Gain_2.
SINGLE_INPUT_GAIN_3	Single ended input Gain_3.
SINGLE_INPUT_GAIN_4	Single ended input Gain_4.
SINGLE_INPUT_GAIN_5	Single ended input Gain_5.
SINGLE_INPUT_GAIN_6	Single ended input Gain_6.
SINGLE_INPUT_GAIN_7	Single ended input Gain_7.
SINGLE_INPUT_GAIN_8	Single ended input Gain_8.
SINGLE_INPUT_GAIN_9	Single ended input Gain_9.
SINGLE_INPUT_GAIN_10	Single ended input Gain_10.
SINGLE_INPUT_GAIN_11	Single ended input Gain_11.
SINGLE_INPUT_GAIN_12	Single ended input Gain_12.
SINGLE_INPUT_GAIN_13	Single ended input Gain_13.
SINGLE_INPUT_GAIN_14	Single ended input Gain_14.
SINGLE_INPUT_GAIN_15	Single ended input Gain_15.
DIFFERENTIAL_INPUT_GAIN_1	Differential input Gain_1 ADPGADCR0 = 0x8, ADPGAGS0 = 0x1.
DIFFERENTIAL_INPUT_GAIN_2	Differential input Gain_2.
DIFFERENTIAL_INPUT_GAIN_3	Differential input Gain_3.
DIFFERENTIAL_INPUT_GAIN_4	Differential input Gain_4.

◆ adc_register_t

enum adc_register_t	
ADC registers used for the Read() argument	
Enumerator	
ADC_REG_CHANNEL_0	ADC channel 0.
ADC_REG_CHANNEL_1	ADC channel 1.
ADC_REG_CHANNEL_2	ADC channel 2.
ADC_REG_CHANNEL_3	ADC channel 3.
ADC_REG_CHANNEL_4	ADC channel 4.
ADC_REG_CHANNEL_5	ADC channel 5.
ADC_REG_CHANNEL_6	ADC channel 6.
ADC_REG_CHANNEL_7	ADC channel 7.
ADC_REG_CHANNEL_8	ADC channel 8.
ADC_REG_CHANNEL_9	ADC channel 9.
ADC_REG_CHANNEL_10	ADC channel 10.
ADC_REG_CHANNEL_11	ADC channel 11.
ADC_REG_CHANNEL_12	ADC channel 12.
ADC_REG_CHANNEL_13	ADC channel 13.
ADC_REG_CHANNEL_14	ADC channel 14.
ADC_REG_CHANNEL_15	ADC channel 15.
ADC_REG_CHANNEL_16	ADC channel 16.
ADC_REG_CHANNEL_17	ADC channel 17.
ADC_REG_CHANNEL_18	ADC channel 18.
ADC_REG_CHANNEL_19	ADC channel 19.
ADC_REG_CHANNEL_20	ADC channel 20.

ADC_REG_CHANNEL_21	ADC channel 21.
ADC_REG_CHANNEL_22	ADC channel 22.
ADC_REG_CHANNEL_23	ADC channel 23.
ADC_REG_CHANNEL_24	ADC channel 24.
ADC_REG_CHANNEL_25	ADC channel 25.
ADC_REG_CHANNEL_26	ADC channel 26.
ADC_REG_CHANNEL_27	ADC channel 27.
ADC_REG_TEMPERATURE	ADC channel temperature.
ADC_REG_VOLT	ADC channel volt.

◆ adc_resolution_t

enum adc_resolution_t	
ADC data resolution definitions	
Enumerator	
ADC_RESOLUTION_12_BIT	12 bit resolution
ADC_RESOLUTION_10_BIT	10 bit resolution
ADC_RESOLUTION_8_BIT	8 bit resolution
ADC_RESOLUTION_14_BIT	14 bit resolution
ADC_RESOLUTION_16_BIT	16 bit resolution
ADC_RESOLUTION_24_BIT	24 bit resolution

◆ adc_sample_state_reg_t

enum adc_sample_state_reg_t	
ADC sample state registers	
Enumerator	
ADC_SAMPLE_STATE_CHANNEL_0	Sample state register channel 0.

ADC_SAMPLE_STATE_CHANNEL_1	Sample state register channel 1.
ADC_SAMPLE_STATE_CHANNEL_2	Sample state register channel 2.
ADC_SAMPLE_STATE_CHANNEL_3	Sample state register channel 3.
ADC_SAMPLE_STATE_CHANNEL_4	Sample state register channel 4.
ADC_SAMPLE_STATE_CHANNEL_5	Sample state register channel 5.
ADC_SAMPLE_STATE_CHANNEL_6	Sample state register channel 6.
ADC_SAMPLE_STATE_CHANNEL_7	Sample state register channel 7.
ADC_SAMPLE_STATE_CHANNEL_8	Sample state register channel 8.
ADC_SAMPLE_STATE_CHANNEL_9	Sample state register channel 9.
ADC_SAMPLE_STATE_CHANNEL_10	Sample state register channel 10.
ADC_SAMPLE_STATE_CHANNEL_11	Sample state register channel 11.
ADC_SAMPLE_STATE_CHANNEL_12	Sample state register channel 12.
ADC_SAMPLE_STATE_CHANNEL_13	Sample state register channel 13.
ADC_SAMPLE_STATE_CHANNEL_14	Sample state register channel 14.
ADC_SAMPLE_STATE_CHANNEL_15	Sample state register channel 15.
ADC_SAMPLE_STATE_CHANNEL_16_TO_21	Sample state register channel 16 to 21 for unit 0 on S7G2.
ADC_SAMPLE_STATE_CHANNEL_16_TO_20	Sample state register channel 16 to 20 for unit 1 on S7G2.
ADC_SAMPLE_STATE_CHANNEL_16_TO_27	Sample state register channel 16 to 27 for unit 0 on S3A7.
ADC_SAMPLE_STATE_TEMPERATURE	Sample state register channel temperature.
ADC_SAMPLE_STATE_VOLTAGE	Sample state register channel voltage.

◆ adc_trigger_t

enum adc_trigger_t	
ADC trigger mode definitions	
Enumerator	
ADC_TRIGGER_ASYNC_EXT_TRG0	External asynchronous trigger; not for group modes.
ADC_TRIGGER_SYNC_ELC	Synchronous trigger via ELC.
ADC_TRIGGER_SOFTWARE	Software trigger; not for group modes.

◆ adc_voltage_reference_t

enum adc_voltage_reference_t	
ADC reference voltage selection (Applicable for S1/S3 series MCU's only	
Enumerator	
ADC_EXTERNAL_VOLTAGE	External voltage(VREFH0)
ADC_INTERNAL_VREF_1_5V	Internal voltage(1.5V)
ADC_INTERNAL_VREF_2_0V	Internal voltage(2.0V)
ADC_INTERNAL_VREF_2_5V	Internal voltage(2.5V)

adc_sample_state_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

adc_sample_state_reg_t	reg_id Sample state register ID.
uint8_t	num_states Number of sampling states for conversion. Ch16-20/21 use the same

	value.

Detailed Description

ADC sample state configuration

The documentation for this struct was generated from the following file:

- r_adc_api.h

adc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

uint16_t	unit ADC device in use.
adc_cb_event_t	event ADC callback event.
void const *	p_context Placeholder for user data.
adc_register_t	channel Channel of conversion result. Only valid for ADC_EVENT_CONVERSION_COMPLETE.

Detailed Description

ADC callback arguments definitions

The documentation for this struct was generated from the following file:

- r_adc_api.h

adc_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

__I uint16_t *	p_address The address to start reading the data from.
uint32_t	length The total number of transfers to read.
transfer_size_t	transfer_size The size of each transfer.
elc_peripheral_t	elc_peripheral Name of the peripheral in the ELC list.
elc_event_t	elc_event Name of the ELC event for the peripheral.
uint32_t	calibration_data
int16_t	slope_microvolts Temperature sensor slope in microvolts/°C.
bool	calibration_ongoing Calibration is in progress.

Detailed Description

ADC Information Structure for Transfer Interface

Field Documentation

◆ calibration_data

uint32_t adc_info_t::calibration_data
Temperature sensor calibration data (0xFFFFFFFF if unsupported). Refer to hardware manual for steps on using slope with calibration data to determine temperature

---

The documentation for this struct was generated from the following file:

- r_adc_api.h

adc_channel_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

uint32_t	scan_mask
uint32_t	scan_mask_group_b Valid for group modes. Use #define ADC_MASK_CHANNEL_x from r_adc.h.
adc_group_a_t	priority_group_a Valid for group modes.
uint32_t	add_mask Valid if add enabled in Open(). Use #define ADC_MASK_CHANNEL_x from r_adc.h.
uint8_t	sample_hold_mask Channels/bits 0-2. Use #define ADC_MASK_CHANNEL_x from r_adc.h.
uint8_t	sample_hold_states Number of states to be used for sample and hold. Affects channels

	0-2.

Detailed Description

ADC channel(s) configuration

Field Documentation

◆ scan_mask

uint32_t adc_channel_cfg_t::scan_mask
Channels/bits: bit 0 is ch0; bit 15 is ch15. Use #define ADC_MASK_CHANNEL_x from r_adc.h.

The documentation for this struct was generated from the following file:

- r_adc_api.h

adc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

uint16_t	unit ADC Unit to be used.
adc_mode_t	mode ADC operation mode.
adc_resolution_t	resolution ADC resolution 8, 10, or 12-bit.
adc_alignment_t	alignment Specify left or right alignment; ignored if addition used.

adc_add_t	add_average_count Add or average samples.
adc_clear_t	clearing Clear after read.
adc_trigger_t	trigger Default and Group A trigger source.
adc_trigger_t	trigger_group_b Group B trigger source; valid only for group mode.
uint8_t	scan_end_ipl Scan end interrupt priority.
uint8_t	scan_end_b_ipl Scan end group B interrupt priority.
bool	calib_adc_skip Option to perform calibration when channels are configured.
void(*	p_callback)(adc_callback_args_t *p_args) Callback function; set to NULL for none.
void const *	p_context Placeholder for user data. Passed to the user callback in adc_api_t::adc_callback_args_t.
void const *	p_extend Extension parameter for hardware specific settings.
adc_voltage_reference_t	voltage_ref ADC reference voltage selection. Default is VREF.

adc_over_current_t	over_current ADC reference voltage selection. Default is Over current.
adc_pga_t	pga0 PGA0 setting.
adc_pga_t	pga1 PGA1 setting.
adc_pga_t	pga2 PGA2 setting.

Detailed Description

ADC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ calibrate

ssp_err_t(* adc_api_t::calibrate) (adc_ctrl_t *const p_ctrl, void *const p_extend)

Calibrate ADC or associated PGA (programmable gain amplifier). The driver may require implementation specific arguments to the p_extend input. Not supported for all implementations. See implementation for details.

Implemented as

- R_SDADC_Calibrate()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_extend	Pointer to implementation specific arguments

◆ close

ssp_err_t(* adc_api_t::close) (adc_ctrl_t *const p_ctrl)

Close the specified ADC unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Implemented as

- R_ADC_Close()
- R_SDADC_Close()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ infoGet

ssp_err_t(* adc_api_t::infoGet) (adc_ctrl_t *const p_ctrl, adc_info_t *const p_adc_info)

Return the ADC data register address of the first (lowest number) channel and the total number of bytes to be read in order for the DTC/DMAC to read the conversion results of all configured channels. Return the temperature sensor calibration and slope data.

Implemented as

- R_ADC_InfoGet()
- R_SDADC_InfoGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_adc_info	Pointer to ADC information structure

◆ offsetSet

ssp_err_t(* adc_api_t::offsetSet) (adc_ctrl_t *const p_ctrl, adc_register_t const reg_id, int32_t const offset)

Set offset for input PGA configured for differential input. Not supported for all implementations. See implementation for details.

Implemented as

- R_SDADC_OffsetSet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_register_t)
[in]	offset	See implementation for details.

◆ open

ssp_err_t(* adc_api_t::open) (adc_ctrl_t *const p_ctrl, adc_cfg_t const *const p_cfg)

Initialize ADC Unit; apply power, set the operational mode, trigger sources, interrupt priority, and configurations common to all channels and sensors.

Implemented as

- R_ADC_Open()
- R_SDADC_Open()

Precondition

Configure peripheral clocks, ADC pins and IRQs prior to calling this function.

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_cfg	Pointer to configuration structure

◆ read

ssp_err_t(* adc_api_t::read) (adc_ctrl_t *const p_ctrl, adc_register_t const reg_id, uint16_t *const p_data)

Read ADC conversion result.

Implemented as

- R_ADC_Read()
- R_SDADC_Read()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_register_t)
[in]	p_data	Pointer to variable to load value into.

◆ read32

ssp_err_t(* adc_api_t::read32) (adc_ctrl_t *const p_ctrl, adc_register_t const reg_id, uint32_t *const p_data)

Read ADC conversion result into a 32-bit word.

Implemented as

- R_SDADC_Read32()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	reg_id	ADC channel to read (see enumeration adc_register_t)
[in]	p_data	Pointer to variable to load value into.

◆ sampleStateCountSet

ssp_err_t(* adc_api_t::sampleStateCountSet) (adc_ctrl_t *const p_ctrl, adc_sample_state_t *p_sample)

Set the sample state count for the specified channel. Not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_SetSampleStateCount()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_sample	Pointer to the ADC channels and corresponding sample states to be set

◆ scanCfg

ssp_err_t(* adc_api_t::scanCfg) (adc_ctrl_t *const p_ctrl, adc_channel_cfg_t const *const p_channel_cfg)

Configure the scan including the channels, groups and scan triggers to be used for the unit that was initialized in the open call. Some configurations are not supported for all implementations. See implementation for details.

Implemented as

- R_ADC_ScanConfigure()
- R_SDADC_ScanConfigure()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_channel_cfg	Pointer to scan configuration structure

◆ scanStart

ssp_err_t(* adc_api_t::scanStart) (adc_ctrl_t *const p_ctrl)

Start the scan (in case of a software trigger), or enable the hardware trigger.

Implemented as

- R_ADC_ScanStart()
- R_SDADC_ScanStart()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanStatusGet

ssp_err_t(* adc_api_t::scanStatusGet) (adc_ctrl_t *const p_ctrl)

Check scan status.

Implemented as

- R_ADC_CheckScanDone()
- R_SDADC_CheckScanDone()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ scanStop

ssp_err_t(* adc_api_t::scanStop) (adc_ctrl_t *const p_ctrl)

Stop the ADC scan (in case of a software trigger), or disable the hardware trigger.

Implemented as

- R_ADC_ScanStop()
- R_SDADC_ScanStop()

Parameters

[in]	p_ctrl	Pointer to control handle structure

◆ versionGet

ssp_err_t(* adc_api_t::versionGet) (ssp_version_t *const p_version)

Retrieve the API version.

Implemented as

- R_ADC_VersionGet()
- R_SDADC_VersionGet()

Precondition

This function retrieves the API version.

Parameters

[in]	p_version	Pointer to version structure

The documentation for this struct was generated from the following file:

- r_adc_api.h

adc_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » ADC Interface

#include <r_adc_api.h>

Data Fields

adc_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
adc_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
adc_channel_cfg_t const *	p_channel_cfg Pointer to the channel configuration structure for this instance.
adc_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_adc_api.h

5.1.4.2 Analog Connect Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for analog connections. More...

Data Structures

struct	analog_connect_cfg_t
struct	analog_connect_table_t
struct	analog_connect_api_t
struct	analog_connect_instance_t

Macros

#define	ANALOG_CONNECT_API_VERSION_MAJOR (2U)

Detailed Description

Interface for analog connections.

Summary

The analog connection interface allows the user to configure internal analog connections.

Implemented by: Analog Connections

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Analog Connect Interface description: Analog Connection Driver on r_analog_connect

Macro Definition Documentation

◆ ANALOG_CONNECT_API_VERSION_MAJOR

#define ANALOG_CONNECT_API_VERSION_MAJOR (2U)
Includes board and MCU related header files. Version Number of API.

analog_connect_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Analog Connect Interface

#include <r_analog_connect_api.h>

Data Fields

uint8_t	unused Placeholder for future use.

Detailed Description

User configuration structure, used in init function

The documentation for this struct was generated from the following file:

- r_analog_connect_api.h

analog_connect_table_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Analog Connect Interface

#include <r_analog_connect_api.h>

Data Fields

uint32_t	number_of_connections Number of connections in the table.
analog_connect_t const *	p_connection_table List of connections.

Detailed Description

Table of connections.

The documentation for this struct was generated from the following file:

- r_analog_connect_api.h

analog_connect_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Analog Connect Interface

#include <r_analog_connect_api.h>

Data Fields

ssp_err_t(*	init)(analog_connect_cfg_t const *const p_cfg)
ssp_err_t(*	connect)(analog_connect_t const connection)
ssp_err_t(*	connectMultiple)(analog_connect_table_t const *const p_table)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Comparator functions implemented at the HAL layer will follow this API.

Field Documentation

◆ connect

ssp_err_t(* analog_connect_api_t::connect) (analog_connect_t const connection)

Make one internal analog connection.

Implemented as

- R_ANALOG_CONNECT_Connect()

Parameters

[in]	connection	Internal analog connection to make

◆ connectMultiple

ssp_err_t(* analog_connect_api_t::connectMultiple) (analog_connect_table_t const *const p_table)

Make multiple internal analog connections. Connections are made in the order they are listed in the table. This API is most efficient when all connections for the same module/channel combination are grouped together.

Implemented as

- R_ANALOG_CONNECT_ConnectMultiple()

Parameters

[in]	p_table	Pointer to table of internal analog connection to make

◆ init

ssp_err_t(* analog_connect_api_t::init) (analog_connect_cfg_t const *const p_cfg)

Initialize the analog connect module.

Implemented as

- R_ANALOG_CONNECT_Init()

Parameters

[in]	p_cfg	Pointer to configuration

◆ versionGet

ssp_err_t(* analog_connect_api_t::versionGet) (ssp_version_t *const p_version)

Retrieve the API version.

Implemented as

- R_ANALOG_CONNECT_VersionGet()

Parameters

[in]	p_version	Pointer to version structure

The documentation for this struct was generated from the following file:

- r_analog_connect_api.h

analog_connect_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Analog Connect Interface

#include <r_analog_connect_api.h>

Data Fields

analog_connect_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
analog_connect_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_analog_connect_api.h

5.1.4.3 CAC Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for clock frequency accuracy measurements. More...

Detailed Description

Interface for clock frequency accuracy measurements.

Register definitions, common services and error codes.

Summary

The interface for the clock frequency accuracy measurement circuit (CAC) peripheral is used to

check a system clock frequency with a reference clock signal by counting the number of pulses of the clock (system clock) to be measured.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

CAC Interface description: Clock Accurate Circuit Driver

Typedef Documentation

◆ cac_ctrl_t

typedef void cac_ctrl_t
CAC control block. Allocate an instance specific control block to pass into the CAC API calls. **Implemented as** ◦ cac_instance_ctrl_t

Enumeration Type Documentation

◆ cac_clock_source_t

enum cac_clock_source_t	
Enumeration of the possible clock sources for both the reference and measurement clocks.	
Enumerator	
CAC_CLOCK_SOURCE_MAIN_OSC	Main clock oscillator.
CAC_CLOCK_SOURCE_SUBCLOCK	Sub-clock.
CAC_CLOCK_SOURCE_HOCO	HOCO (High speed on chip oscillator)
CAC_CLOCK_SOURCE_MOCO	MOCO (Middle speed on chip oscillator)
CAC_CLOCK_SOURCE_LOCO	LOCO (Middle speed on chip oscillator)
CAC_CLOCK_SOURCE_PCLKB	PCLKB (Peripheral Clock B)
CAC_CLOCK_SOURCE_IWDT	IWDT- Dedicated on-chip oscillator.
CAC_CLOCK_SOURCE_MEAS_MAX	Maximum measured clock.
CAC_CLOCK_SOURCE_EXTERNAL	Externally supplied measurement clock on CACREF pin.
CAC_CLOCK_SOURCE_REF_MAX	Maximum reference clock.

◆ cac_clock_type_t

enum cac_clock_type_t	
Enumeration of the two possible clocks.	
Enumerator	
CAC_CLOCK_MEASURED	Measurement clock.
CAC_CLOCK_REFERENCE	Reference clock.

◆ cac_event_t

enum cac_event_t	
Event types returned by the ISR callback when used in CAC interrupt mode	
Enumerator	
CAC_EVENT_FREQUENCY_ERROR	Frequency error.
CAC_EVENT_MEASUREMENT_COMPLETE	Measurement complete.
CAC_EVENT_COUNTER_OVERFLOW	Counter overflow.

◆ cac_meas_divider_t

enum cac_meas_divider_t	
Enumeration of available dividers for the measurement clock	
Enumerator	
CAC_MEAS_DIV_1	Measurement clock divided by 1.
CAC_MEAS_DIV_4	Measurement clock divided by 4.
CAC_MEAS_DIV_8	Measurement clock divided by 8.
CAC_MEAS_DIV_32	Measurement clock divided by 32.

◆ cac_ref_digfilter_t

enum cac_ref_digfilter_t	
Enumeration of available digital filter settings for an external reference clock.	
Enumerator	
CAC_REF_DIGITAL_FILTER_OFF	No digital filter on the CACREF pin for reference clock.
CAC_REF_DIGITAL_FILTER_1	Sampling clock for digital filter = measuring frequency.
CAC_REF_DIGITAL_FILTER_4	Sampling clock for digital filter = measuring frequency/4.
CAC_REF_DIGITAL_FILTER_16	Sampling clock for digital filter = measuring frequency/16.

◆ cac_ref_divider_t

enum cac_ref_divider_t	
Enumeration of available dividers for the reference clock.	
Enumerator	
CAC_REF_DIV_32	Reference clock divided by 32.
CAC_REF_DIV_128	Reference clock divided by 128.
CAC_REF_DIV_1024	Reference clock divided by 1024.
CAC_REF_DIV_8192	Reference clock divided by 8192.

◆ cac_ref_edge_t

enum cac_ref_edge_t	
Enumeration of available edge detect settings for the reference clock.	
Enumerator	
CAC_REF_EDGE_RISE	Rising edge detect for the Reference clock.
CAC_REF_EDGE_FALL	Falling edge detect for the Reference clock.
CAC_REF_EDGE_BOTH	Both Rising and Falling edges detect for the Reference clock.

cac_ref_clock_config_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAC Interface

#include <r_cac_api.h>

Data Fields

cac_ref_divider_t	divider Divider specification for the Reference clock.
cac_clock_source_t	clock Clock source for the Reference clock.

cac_ref_digfilter_t	digfilter Digital filter selection for the CACREF ext clock.
cac_ref_edge_t	edge Edge detection for the Reference clock.

Detailed Description

Structure defining the settings that apply to reference clock configuration.

The documentation for this struct was generated from the following file:

- r_cac_api.h

cac_meas_clock_config_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAC Interface

#include <r_cac_api.h>

Data Fields

cac_meas_divider_t	divider Divider specification for the Measurement clock.
cac_clock_source_t	clock Clock source for the Measurement clock.

Detailed Description

Structure defining the settings that apply to measurement clock configuration.

The documentation for this struct was generated from the following file:

- r_cac_api.h

cac_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAC Interface

#include <r_cac_api.h>

Data Fields

cac_event_t	event The event can be used to identify what caused the callback (cac ready or error).
void const *	p_context Placeholder for user data. Set in cac_api_t::open function in cac_cfg_t .

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_cac_api.h

cac_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAC Interface

#include <r_cac_api.h>

Data Fields

cac_ref_clock_config_t	cac_ref_clock reference clock specific settings
cac_meas_clock_config_t	cac_meas_clock measurement clock specific settings

uint16_t	cac_upper_limit the upper limit counter threshold
uint16_t	cac_lower_limit the lower limit counter threshold
bool	mei_interrupt_enabled True if Measurement Complete interrupt is enabled.
bool	ovf_interrupt_enabled True if Overflow interrupt is enabled.
bool	ferr_interrupt_enabled True if Frequency Error interrupt is enabled.
bool	continuous_mode True if measurement continuously restarts after completing.
uint8_t	frequency_error_ipl Frequency error interrupt priority.
uint8_t	measurement_end_ipl Measurement end interrupt priority.
uint8_t	overflow_ipl Overflow interrupt priority.
void(*	p_callback)(cac_callback_args_t *p_args) Callback provided when a CAC interrupt ISR occurs.
void const *	p_extend CAC hardware dependent configuration.
void const *	p_context

	Placeholder for user data. Passed to user callback in cac_callback_args_t.

Detailed Description

CAC Configuration

ssp_err_t(*	reset)(cac_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)

Detailed Description

CAC functions implemented at the HAL layer API

Field Documentation

◆ close

ssp_err_t(* cac_api_t::close) (cac_ctrl_t *const p_ctrl)

Close function for CAC device.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ open

ssp_err_t(* cac_api_t::open) (cac_ctrl_t *const p_ctrl, cac_cfg_t const *const p_cfg)

Open function for CAC device.

Parameters

[out]	p_ctrl	Pointer to CAC device control. Must be declared by user. Value set here.
[in]	cac_cfg_t	Pointer to CAC configuration structure. All elements of this structure must be set by user.

◆ read

ssp_err_t(* cac_api_t::read) (cac_ctrl_t *const p_ctrl, uint8_t *const p_status, uint16_t *const p_counter)

Read function for CAC peripheral.

Parameters

[in]	p_ctrl	Control for the CAC device context.
[in]	p_status	Pointer to variable in which to store the current CASTR register contents.
[in]	p_counter	Pointer to variable in which to store the current CACNTBR register contents.

◆ reset

ssp_err_t(* cac_api_t::reset) (cac_ctrl_t *const p_ctrl)

Reset function for CAC device.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ startMeasurement

ssp_err_t(* cac_api_t::startMeasurement) (cac_ctrl_t *const p_ctrl)

Begin a measurement for the CAC peripheral.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ stopMeasurement

ssp_err_t(* cac_api_t::stopMeasurement) (cac_ctrl_t *const p_ctrl)

End a measurement for the CAC peripheral.

Parameters

[in]	p_ctrl	Pointer to CAC device control.

◆ versionGet

ssp_err_t(* cac_api_t::versionGet) (ssp_version_t *p_version)

Get the CAC API and code version information.

Parameters

[out]	p_version	is value returned.

The documentation for this struct was generated from the following file:

- r_cac_api.h

cac_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAC Interface

enum	can_command_t { CAN_COMMAND_MODE_SWITCH = 1 }

Detailed Description

Interface for CAN peripheral.

Summary

The CAN interface provides common APIs for CAN HAL drivers. CAN interface supports following features.

- Full-duplex CAN communication
- Generic CAN parameter setting
- Interrupt driven transmit/receive processing
- Callback function support with returning event code
- Hardware resource locking during a transaction

Typedef Documentation

◆ can_ctrl_t

typedef void can_ctrl_t

CAN control block. Allocate an instance specific control block to pass into the CAN API calls.

Implemented as

- can_instance_ctrl_t

◆ can_id_t

typedef uint32_t can_id_t
CAN Id

Enumeration Type Documentation

◆ can_clock_source_t

enum can_clock_source_t	
CAN Source Clock	
Enumerator	
CAN_CLOCK_SOURCE_PCLKB	PCLB is the source of the CAN Clock.
CAN_CLOCK_SOURCE_CANMCLK	CANMCLK is the source of the CAN Clock.

◆ can_command_t

enum can_command_t	
CAN control commands.	
Enumerator	
CAN_COMMAND_MODE_SWITCH	Switch CAN operating mode..

◆ can_event_t

enum can_event_t	
CAN event codes	
Enumerator	
CAN_EVENT_RX_COMPLETE	Receive complete event.
CAN_EVENT_TX_COMPLETE	Transmit complete event.
CAN_EVENT_ERR_BUS_OFF	Bus Off event.
CAN_EVENT_BUS_RECOVERY	Bus Off Recovery event.
CAN_EVENT_ERR_PASSIVE	Error Passive event.
CAN_EVENT_ERR_WARNING	Error Warning event.
CAN_EVENT_MAILBOX_OVERWRITE_OVERRUN	DEPRECATED, Mailbox has been overrun. This event is not used when the mailbox is overwritten.
CAN_EVENT_MAILBOX_OVERRUN	Mailbox has been overrun.

◆ can_frame_type_t

enum can_frame_type_t	
CAN frame types	
Enumerator	
CAN_FRAME_TYPE_DATA	Data frame type.
CAN_FRAME_TYPE_REMOTE	Remote frame type.

◆ can_id_mode_t

enum can_id_mode_t	
CAN ID modes	
Enumerator	
CAN_ID_MODE_STANDARD	Standard IDs of 11 bits used.
CAN_ID_MODE_EXTENDED	Extended IDs of 29 bits used.

◆ can_mailbox_send_receive_t

enum can_mailbox_send_receive_t	
CAN Mailbox type	
Enumerator	
CAN_MAILBOX_RECEIVE	Mailbox is for receiving.
CAN_MAILBOX_TRANSMIT	Mailbox is for sending.

◆ can_message_mode_t

enum can_message_mode_t	
CAN Message Modes	
Enumerator	
CAN_MESSAGE_MODE_OVERWRITE	Receive data will be overwritten if not read before the next frame.
CAN_MESSAGE_MODE_OVERRUN	Receive data will be retained until it is read.

◆ can_mode_t

enum can_mode_t	
CAN Operation modes	
Enumerator	
CAN_MODE_NORMAL	CAN Normal Mode.
CAN_MODE_HALT	CAN Halt Mode.
CAN_MODE_SLEEP	CAN SLEEP Mode.
CAN_MODE_EXIT_SLEEP	CAN Exit SLEEP Mode.
CAN_MODE_RESET	CAN Reset Mode.
CAN_MODE_LISTEN	CAN Listen Mode.
CAN_MODE_LOOPBACK_INTERNAL	CAN Internal Loopback Mode.
CAN_MODE_LOOPBACK_EXTERNAL	CAN External Loopback Mode.

◆ can_sync_jump_width_t

enum can_sync_jump_width_t	
CAN Synchronization Jump Width Time Quanta	
Enumerator	
CAN_SYNC_JUMP_WIDTH_TQ1	Synchronization Jump Width setting for 1 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ2	Synchronization Jump Width setting for 2 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ3	Synchronization Jump Width setting for 3 Time Quanta.
CAN_SYNC_JUMP_WIDTH_TQ4	Synchronization Jump Width setting for 4 Time Quanta.

◆ can_time_segment1_t

enum can_time_segment1_t	
CAN Time Segment 1 Time Quanta	
Enumerator	
CAN_TIME_SEGMENT1_TQ4	Time Segment 1 setting for 4 Time Quanta.
CAN_TIME_SEGMENT1_TQ5	Time Segment 1 setting for 5 Time Quanta.
CAN_TIME_SEGMENT1_TQ6	Time Segment 1 setting for 6 Time Quanta.
CAN_TIME_SEGMENT1_TQ7	Time Segment 1 setting for 7 Time Quanta.
CAN_TIME_SEGMENT1_TQ8	Time Segment 1 setting for 8 Time Quanta.
CAN_TIME_SEGMENT1_TQ9	Time Segment 1 setting for 9 Time Quanta.
CAN_TIME_SEGMENT1_TQ10	Time Segment 1 setting for 10 Time Quanta.
CAN_TIME_SEGMENT1_TQ11	Time Segment 1 setting for 11 Time Quanta.
CAN_TIME_SEGMENT1_TQ12	Time Segment 1 setting for 12 Time Quanta.
CAN_TIME_SEGMENT1_TQ13	Time Segment 1 setting for 13 Time Quanta.
CAN_TIME_SEGMENT1_TQ14	Time Segment 1 setting for 14 Time Quanta.
CAN_TIME_SEGMENT1_TQ15	Time Segment 1 setting for 15 Time Quanta.
CAN_TIME_SEGMENT1_TQ16	Time Segment 1 setting for 16 Time Quanta.

◆ can_time_segment2_t

enum can_time_segment2_t	
CAN Time Segment 2 Time Quanta	
Enumerator	
CAN_TIME_SEGMENT2_TQ2	Time Segment 2 setting for 2 Time Quanta.
CAN_TIME_SEGMENT2_TQ3	Time Segment 2 setting for 3 Time Quanta.
CAN_TIME_SEGMENT2_TQ4	Time Segment 2 setting for 4 Time Quanta.
CAN_TIME_SEGMENT2_TQ5	Time Segment 2 setting for 5 Time Quanta.
CAN_TIME_SEGMENT2_TQ6	Time Segment 2 setting for 6 Time Quanta.
CAN_TIME_SEGMENT2_TQ7	Time Segment 2 setting for 7 Time Quanta.
CAN_TIME_SEGMENT2_TQ8	Time Segment 2 setting for 8 Time Quanta.

can_status_t Union Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Detailed Description

CAN Status

The documentation for this union was generated from the following file:

- r_can_api.h

can_error_t Union Reference

The documentation for this union was generated from the following file:

- r_can_api.h

can_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Data Fields

uint32_t	channel Device channel number.
can_event_t	event Event code.
uint32_t	mailbox Mailbox number of interrupt source.
void const *	p_context Context provided to user during callback.

Detailed Description

CAN callback parameter definition

The documentation for this struct was generated from the following file:

- r_can_api.h

can_bit_timing_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Data Fields

uint32_t	baud_rate_prescaler Baud rate prescaler. Valid values: 1 - 1024.
can_time_segment1_t	time_segment_1 Time segment 1 control.
can_time_segment2_t	time_segment_2 Time segment 2 control.
can_sync_jump_width_t	synchronization_jump_width Synchronization jump width.

Detailed Description

CAN bit rate configuration.

The documentation for this struct was generated from the following file:

- r_can_api.h

can_frame_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Data Fields

can_id_t	id CAN id.

uint8_t	data_length_code CAN Data Length code, number of bytes in the message.
uint8_t	data [8] CAN data, up to 8 bytes.
can_frame_type_t	type Frame type, data or remote frame.

Detailed Description

CAN data Frame

The documentation for this struct was generated from the following file:

- r_can_api.h

can_mailbox_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Data Fields

can_id_t	mailbox_id Mailbox ID.
can_mailbox_send_receive_t	mailbox_type Receive or Transmit mailbox type.
can_frame_type_t	frame_type Frame type for receive mailbox.

Detailed Description

CAN Mailbox

The documentation for this struct was generated from the following file:

ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Shared Interface definition for CAN

Field Documentation

◆ close

ssp_err_t(* can_api_t::close) (can_ctrl_t *const p_ctrl)

Close function for CAN device

Implemented as

- R_CAN_Close()

Parameters

[in]	p_ctrl	Pointer to the CAN control block.

◆ control

ssp_err_t(* can_api_t::control) (can_ctrl_t *const p_ctrl, can_command_t const command, void *p_data)

Control function for CAN device

Implemented as

- R_CAN_Control()

Parameters

[in]	p_ctrl	Pointer to the CAN control block.
[in]	command	Command type.
[in]	p_data	Command data.

◆ infoGet

ssp_err_t(* can_api_t::infoGet) (can_ctrl_t *const p_ctrl, can_info_t *const p_info)

Get CAN channel info.

Implemented as

- R_CAN_InfoGet()

Parameters

[in]	p_ctrl	Handle for channel (pointer to channel control block)
[out]	p_info	Memory address to return channel specific data to.

◆ open

ssp_err_t(* can_api_t::open) (can_ctrl_t *const p_ctrl, can_cfg_t const *const p_cfg)

Open function for CAN device

Implemented as

- R_CAN_Open()

Parameters

[in,out]	p_ctrl	Pointer to the CAN control block Must be declared by user. Value set here.
[in]	can_cfg_t	Pointer to CAN configuration structure. All elements of this structure must be set by user.

◆ read

ssp_err_t(* can_api_t::read) (can_ctrl_t *const p_ctrl, uint32_t mailbox, can_frame_t *const p_frame)

Read function for CAN device, non-Blocking.

Implemented as

- R_CAN_Read()

Parameters

[in]	p_ctrl	Pointer to the CAN control block for the channel.
[in]	mailbox	Mailbox to read from.
[out]	p_frame	Pointer for frame of CAN ID, DLC, data and frame type.

◆ versionGet

ssp_err_t(* can_api_t::versionGet) (ssp_version_t *const p_version)

Version get function for CAN device

Implemented as

- R_CAN_VersionGet()

Parameters

[in]	p_version	Pointer to the memory to store the version information

◆ write

ssp_err_t(* can_api_t::write) (can_ctrl_t *const p_ctrl, uint32_t mailbox, can_frame_t *const p_frame)

Write function for CAN device

Implemented as

- R_CAN_Write()

Parameters

[in]	p_ctrl	Pointer to the CAN control block.
[in]	mailbox	Mailbox to write to.
[in]	p_frame	Pointer for frame of CAN ID, DLC, data and frame type to write.

The documentation for this struct was generated from the following file:

- r_can_api.h

can_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CAN Interface

#include <r_can_api.h>

Data Fields

can_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
can_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
can_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_can_api.h

enum	cgc_clock_change_t { CGC_CLOCK_CHANGE_NONE, CGC_CLOCK_CHANGE_STOP, CGC_CLOCK_CHANGE_START }

Detailed Description

Interface for clock generation.

Summary

The CGC interface provides the ability to configure and use all of the CGC module's capabilities. Among the capabilities is the selection of several clock sources to use as the system clock source. Additionally, the system clocks can be divided down to provide a wide range of frequencies for various system and peripheral needs.

Clock stability can be checked and clocks may also be stopped to save power when not needed. The API has a function to return the frequency of the system and system peripheral clocks at run time. There is also a feature to detect when the main oscillator has stopped, with the option of calling a user provided callback function.

CGC Interface description: CGC Driver

Enumeration Type Documentation

◆ cgc_bclockout_dividers_t

enum cgc_bclockout_dividers_t	
Divider values for the external bus clock output.	
Enumerator	
CGC_BCLOCKOUT_DIV_1	External bus clock source is divided by 1.
CGC_BCLOCKOUT_DIV_2	External bus clock source is divided by 2.

◆ cgc_clock_change_t

enum cgc_clock_change_t	
Clock options	
Enumerator	
CGC_CLOCK_CHANGE_NONE	No change to the clock.
CGC_CLOCK_CHANGE_STOP	Stop the clock.
CGC_CLOCK_CHANGE_START	Start the clock.

◆ cgc_clock_t

enum cgc_clock_t	
System clock source identifiers - The source of ICLK, BCLK, FCLK, PCLKS A-D and UCLK prior to the system clock divider	
Enumerator	
CGC_CLOCK_HOCO	The high speed on chip oscillator.
CGC_CLOCK_MOCO	The middle speed on chip oscillator.
CGC_CLOCK_LOCO	The low speed on chip oscillator.
CGC_CLOCK_MAIN_OSC	The main oscillator.
CGC_CLOCK_SUBCLOCK	The subclock oscillator.
CGC_CLOCK_PLL	The PLL oscillator.

◆ cgc_clockout_dividers_t

enum cgc_clockout_dividers_t	
Divider values for the CLKOUT output.	
Enumerator	
CGC_CLOCKOUT_DIV_1	Clockout source is divided by 1.
CGC_CLOCKOUT_DIV_2	Clockout source is divided by 2.
CGC_CLOCKOUT_DIV_4	Clockout source is divided by 4.
CGC_CLOCKOUT_DIV_8	Clockout source is divided by 8.
CGC_CLOCKOUT_DIV_16	Clockout source is divided by 16.
CGC_CLOCKOUT_DIV_32	Clockout source is divided by 32.
CGC_CLOCKOUT_DIV_64	Clockout source is divided by 64.
CGC_CLOCKOUT_DIV_128	Clockout source is divided by 128.

◆ cgc_event_t

enum cgc_event_t	
Events that can trigger a callback function	
Enumerator	
CGC_EVENT_OSC_STOP_DETECT	Oscillator stop detection has caused the event.

◆ cgc_pll_div_t

enum cgc_pll_div_t	
PLL divider values	
Enumerator	
CGC_PLL_DIV_1	PLL divider of 1.
CGC_PLL_DIV_2	PLL divider of 2.
CGC_PLL_DIV_3	PLL divider of 3 (S7G2 only).
CGC_PLL_DIV_4	PLL divider of 4 (S3A7 only).

◆ cgc_sys_clock_div_t

enum cgc_sys_clock_div_t	
System clock divider values - The individually selectable divider of each of the system clocks, ICLK, BCLK, FCLK, PCLKS A-D	
Enumerator	
CGC_SYS_CLOCK_DIV_1	System clock divided by 1.
CGC_SYS_CLOCK_DIV_2	System clock divided by 2.
CGC_SYS_CLOCK_DIV_4	System clock divided by 4.
CGC_SYS_CLOCK_DIV_8	System clock divided by 8.
CGC_SYS_CLOCK_DIV_16	System clock divided by 16.
CGC_SYS_CLOCK_DIV_32	System clock divided by 32.
CGC_SYS_CLOCK_DIV_64	System clock divided by 64.

◆ cgc_system_clocks_t

enum cgc_system_clocks_t	
System clock identifiers - Used as an input parameter to the cgc_api_t::systemClockFreqGet function.	
Enumerator	
CGC_SYSTEM_CLOCKS_PCLKA	PCLKA - Peripheral module clock A.
CGC_SYSTEM_CLOCKS_PCLKB	PCLKB - Peripheral module clock B.
CGC_SYSTEM_CLOCKS_PCLKC	PCLKC - Peripheral module clock C.
CGC_SYSTEM_CLOCKS_PCLKD	PCLKD - Peripheral module clock D.
CGC_SYSTEM_CLOCKS_BCLK	BCLK - External bus Clock.
CGC_SYSTEM_CLOCKS_FCLK	FCLK - FlashIF clock.
CGC_SYSTEM_CLOCKS_ICLK	ICLK - System clock.

◆ cgc_systick_period_units_t

enum cgc_systick_period_units_t	
Available period units for R_CGC_SystickUpdate()	
Enumerator	
CGC_SYSTICK_PERIOD_UNITS_MILLISECONDS	Requested period in milliseconds.
CGC_SYSTICK_PERIOD_UNITS_MICROSECONDS	Requested period in microseconds.

◆ cgc_usb_clock_div_t

enum cgc_usb_clock_div_t	
USB clock divider values	
Enumerator	
CGC_USB_CLOCK_DIV_3	Divide USB source clock by 3.
CGC_USB_CLOCK_DIV_4	Divide USB source clock by 4.
CGC_USB_CLOCK_DIV_5	Divide USB source clock by 5.

cgc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CGC Interface

#include <r_cgc_api.h>

Data Fields

cgc_event_t	event The event can be used to identify what caused the callback.
void const *	p_context Placeholder for user data.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_cgc_api.h

cgc_clock_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CGC Interface

#include <r_cgc_api.h>

Data Fields

cgc_clock_t	source_clock PLL source clock (S7G2 only).
cgc_pll_div_t	divider PLL divider.
float	multiplier

	PLL multiplier.

Detailed Description

Clock configuration structure - Used as an input parameter to the cgc_api_t::clockStart function for the PLL clock.

The documentation for this struct was generated from the following file:

- r_cgc_api.h

cgc_system_clock_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CGC Interface

#include <r_cgc_api.h>

Data Fields

cgc_sys_clock_div_t	pclka_div Divider value for PCLKA.
cgc_sys_clock_div_t	pclkb_div Divider value for PCLKB.
cgc_sys_clock_div_t	pclkc_div Divider value for PCLKC.
cgc_sys_clock_div_t	pclkd_div Divider value for PCLKD.
cgc_sys_clock_div_t	bclk_div Divider value for BCLK.
cgc_sys_clock_div_t	fclk_div Divider value for FCLK.

cgc_sys_clock_div_t	iclk_div Divider value for ICLK.

Detailed Description

Clock configuration structure - Used as an input parameter to the cgc_api_t::systemClockSet and cgc_api_t::systemClockGet functions.

The documentation for this struct was generated from the following file:

- r_cgc_api.h

cgc_clocks_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CGC Interface

#include <r_cgc_api.h>

Data Fields

cgc_clock_t	system_clock System clock source enumeration.
cgc_clock_cfg_t	pll_cfg PLL configuration structure.
cgc_system_clock_cfg_t	sys_cfg Clock dividers structure.
cgc_clock_change_t	loco_state State of LOCO.
cgc_clock_change_t	moco_state State of MOCO.
cgc_clock_change_t	hoco_state

	State of HOCO.
cgc_clock_change_t	subosc_state State of Sub-oscillator.
cgc_clock_change_t	mainosc_state State of Main oscillator.
cgc_clock_change_t	pll_state State of PLL.

Detailed Description

CGC functions implemented at the HAL layer follow this API.

Field Documentation

◆ busClockOutCfg

ssp_err_t(* cgc_api_t::busClockOutCfg) (cgc_bclockout_dividers_t divider)

Configure the bus clock output secondary divider. The primary divider is set using the bsp clock configuration and the cgc_api_t::systemClockSet function (S7G2 and S3A7 only).

Implemented as

- R_CGC_BusClockOutCfg()

Parameters

[in]	divider	The divider of 1 or 2 of the clock source.

◆ busClockOutDisable

ssp_err_t(* cgc_api_t::busClockOutDisable) (void)

Disable the bus clock output (S7G2 and S3A7 only).

Implemented as

- R_CGC_BusClockOutDisable()

◆ busClockOutEnable

ssp_err_t(* cgc_api_t::busClockOutEnable) (void)

Enable the bus clock output (S7G2 and S3A7 only).

Implemented as

- R_CGC_BusClockOutEnable()

◆ clockCheck

ssp_err_t(* cgc_api_t::clockCheck) (cgc_clock_t clock_source)

Check the stability of the selected clock.

Implemented as

- R_CGC_ClockCheck()

Parameters

[in]	clock_source	Which clock source to check for stability.

◆ clockOutCfg

ssp_err_t(* cgc_api_t::clockOutCfg) (cgc_clock_t clock, cgc_clockout_dividers_t divider)

Configure clockOut.

Implemented as

- R_CGC_ClockOutCfg()

Parameters

[in]	clock	Clock source.
[in]	divider	Divider of between 1 and 128 of the clock source.

◆ clockOutDisable

ssp_err_t(* cgc_api_t::clockOutDisable) (void)

Disable clock output on the CLKOUT pin. The source of the clock is controlled by cgc_api_t::clockOutCfg.

Implemented as

- R_CGC_ClockOutDisable()

◆ clockOutEnable

ssp_err_t(* cgc_api_t::clockOutEnable) (void)

Enable clock output on the CLKOUT pin. The source of the clock is controlled by cgc_api_t::clockOutCfg.

Implemented as

- R_CGC_ClockOutEnable()

◆ clocksCfg

ssp_err_t(* cgc_api_t::clocksCfg) (cgc_clocks_cfg_t const *const p_clock_cfg)

Configure all system clocks.

Implemented as

- R_CGC_ClocksCfg()

Note

The BSP module calls this function at startup, but it can also be called from the application to change clocks at runtime.

Parameters

[in]	p_clock_cfg	Pointer to a structure that contains the dividers or multipliers to be used when configuring the PLL.

◆ clockStart

ssp_err_t(* cgc_api_t::clockStart) (cgc_clock_t clock_source, cgc_clock_cfg_t *p_clock_cfg)

Start a clock.

Implemented as

- R_CGC_ClockStart()

Precondition

Clock to be started must not be running prior to calling this function or an error will be returned.

Parameters

[in]	clock_source	Clock source to initialize.
[in]	p_clock_cfg	Pointer to a structure that contains the dividers or multipliers to be used when configuring the PLL.

◆ clockStop

ssp_err_t(* cgc_api_t::clockStop) (cgc_clock_t clock_source)

Stop a clock.

Implemented as

- R_CGC_ClockStop()

Precondition

Clock to be stopped must not be stopped prior to calling this function or an error will be returned.

Parameters

[in]	clock_source	The clock source to stop.

◆ init

ssp_err_t(* cgc_api_t::init) (void)

Initial configuration

Implemented as

- R_CGC_Init()

Note

The BSP module calls this function at startup. No further initialization is necessary.

◆ lcdClockCfg

ssp_err_t(* cgc_api_t::lcdClockCfg) (cgc_clock_t clock)

Configure the segment LCD Clock (S3A7 and S124 only).

Implemented as

- R_CGC_LCDClockCfg()

Parameters

[in]	clock	Segment LCD clock source.

◆ lcdClockDisable

ssp_err_t(* cgc_api_t::lcdClockDisable) (void)

Disables the LCD clock (S3A7 and S124 only).

Implemented as

- R_CGC_LCDClockDisable()

◆ lcdClockEnable

ssp_err_t(* cgc_api_t::lcdClockEnable) (void)

Enable the LCD clock (S3A7 and S124 only).

Implemented as

- R_CGC_LCDClockEnable()

◆ oscStopDetect

ssp_err_t(* cgc_api_t::oscStopDetect) (void(*p_callback)(cgc_callback_args_t *p_args), bool enable)

Configure the Main Oscillator stop detection.

Implemented as

- R_CGC_OscStopDetect()

Parameters

[in]	p_callback	Callback function that will be called by the NMI interrupt when an oscillation stop is detected. If the second argument is "false", then this argument can be NULL.
[in]	enable	Enable/disable Oscillation Stop Detection.

◆ oscStopStatusClear

ssp_err_t(* cgc_api_t::oscStopStatusClear) (void)

Clear the oscillator stop detection flag.

Implemented as

- R_CGC_OscStopStatusClear()

◆ sdadcClockCfg

ssp_err_t(* cgc_api_t::sdadcClockCfg) (cgc_clock_t clock)

Configure the 24-bit Sigma-Delta A/D Converter Clock (S1JA only).

Implemented as

- R_CGC_SDADCClockCfg()

Parameters

[in]	clock	SDADC clock source.

◆ sdadcClockDisable

ssp_err_t(* cgc_api_t::sdadcClockDisable) (void)

Disables the SDADC clock (S1JA only).

Implemented as

- R_CGC_SDADCClockDisable()

◆ sdadcClockEnable

ssp_err_t(* cgc_api_t::sdadcClockEnable) (void)

Enable the SDADC clock (S1JA only).

Implemented as

- R_CGC_SDADCClockEnable()

◆ sdramClockOutDisable

ssp_err_t(* cgc_api_t::sdramClockOutDisable) (void)

Disables the SDRAM clock (S7G2 only).

Implemented as

- R_CGC_SDRAMClockOutDisable()

◆ sdramClockOutEnable

ssp_err_t(* cgc_api_t::sdramClockOutEnable) (void)

Enables the SDRAM clock output (S7G2 only).

Implemented as

- R_CGC_SDRAMClockOutEnable()

◆ systemClockFreqGet

ssp_err_t(* cgc_api_t::systemClockFreqGet) (cgc_system_clocks_t clock, uint32_t *p_freq_hz)

Return the frequency of the selected clock.

Implemented as

- R_CGC_SystemClockFreqGet()

Parameters

[in]	clock	Specifies the internal clock whose frequency is returned.
[out]	p_freq_hz	Returns the frequency in Hz referenced by this pointer.

◆ systemClockGet

ssp_err_t(* cgc_api_t::systemClockGet) (cgc_clock_t *p_clock_source, cgc_system_clock_cfg_t *p_set_clock_cfg)

Get the system clock information.

Implemented as

- R_CGC_SystemClockGet()

Parameters

[in]	p_set_clock_cfg	Pointer to clock configuration structure
[out]	clock_source	Returns the current system clock.
[out]	p_clock_cfg	Returns the current system clock dividers.

◆ systemClockSet

ssp_err_t(* cgc_api_t::systemClockSet) (cgc_clock_t clock_source, cgc_system_clock_cfg_t const *const p_clock_cfg)

Set the system clock.

Implemented as

- R_CGC_SystemClockSet()

Precondition

The clock to be set as the system clock must be running prior to calling this function.

Parameters

[in]	clock_source	Clock source to set as system clock
[in]	p_clock_cfg	Pointer to the clock dividers configuration passed by the caller.

◆ systickUpdate

ssp_err_t(* cgc_api_t::systickUpdate) (uint32_t period_count, cgc_systick_period_units_t units)

Update the Systick timer.

Implemented as

- R_CGC_SystickUpdate()

Parameters

[in]	period_count	The duration for the systick period.
[in]	units	The units for the provided period.

◆ usbClockCfg

ssp_err_t(* cgc_api_t::usbClockCfg) (cgc_usb_clock_div_t divider)
Configures the USB clock (S7G2 only). **Implemented as** ◦ R_CGC_USBClockCfg() **Parameters**

[in]	divider	The divider of 3, 4 or 5, of the clock source.

◆ versionGet

ssp_err_t(* cgc_api_t::versionGet) (ssp_version_t *p_version)
Gets the CGC driver version. **Implemented as** ◦ R_CGC_VersionGet() **Parameters**

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_cgc_api.h

cgc_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CGC Interface

#include <r_cgc_api.h>

Data Fields

cgc_clock_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
cgc_api_t const *	p_api

	Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_cgc_api.h

Detailed Description

Interface for Comparators.

Summary

The comparator interface provides standard comparator functionality, including generating an event when the comparator result changes.

Implemented by: High-Speed Analog Comparator Low Power Analog Comparator

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

COMPARATOR Interface description: Comparator Driver on r_acmphs and HALACMPLPModule

Macro Definition Documentation

◆ COMPARATOR_API_VERSION_MAJOR

#define COMPARATOR_API_VERSION_MAJOR (2U)
Includes board and MCU related header files. Version Number of API.

Typedef Documentation

◆ comparator_ctrl_t

typedef void comparator_ctrl_t
Comparator control block. Allocate an instance specific control block to pass into the comparator API calls. **Implemented as** ◦ acmphs_instance_ctrl_t ◦ acmplp_instance_ctrl_t

Enumeration Type Documentation

◆ comparator_filter_t

enum comparator_filter_t	
Comparator digital filtering sample clock divisor settings.	
Enumerator	
COMPARATOR_FILTER_OFF	Disable debounce filter.
COMPARATOR_FILTER_1	Filter using PCLK divided by 1, not supported by all implementations.
COMPARATOR_FILTER_8	Filter using PCLK divided by 8.
COMPARATOR_FILTER_16	Filter using PCLK divided by 16, not supported by all implementations.
COMPARATOR_FILTER_32	Filter using PCLK divided by 32.

◆ comparator_mode_t

enum comparator_mode_t	
Select whether to invert the polarity of the comparator output.	
Enumerator	
COMPARATOR_MODE_NORMAL	Normal mode.
COMPARATOR_MODE_WINDOW	Window mode, not supported by all implementations.

◆ comparator_pin_output_t

enum comparator_pin_output_t	
Select whether to include the comparator output on the output pin.	
Enumerator	
COMPARATOR_PIN_OUTPUT_OFF	Do not include comparator output on output pin.
COMPARATOR_PIN_OUTPUT_ON	Include comparator output on output pin.

◆ comparator_polarity_invert_t

enum comparator_polarity_invert_t	
Select whether to invert the polarity of the comparator output.	
Enumerator	
COMPARATOR_POLARITY_INVERT_OFF	Do not invert polarity.
COMPARATOR_POLARITY_INVERT_ON	Invert polarity.

◆ comparator_state_t

enum comparator_state_t	
Current comparator state.	
Enumerator	
COMPARATOR_STATE_OUTPUT_DISABLED	comparator_api_t::outputEnable() has not been called
COMPARATOR_STATE_OUTPUT_LOW	VCMP < VREF if polarity is not inverted, VCMP > VREF if inverted.
COMPARATOR_STATE_OUTPUT_HIGH	VCMP > VREF if polarity is not inverted, VCMP < VREF if inverted.

◆ comparator_trigger_t

enum comparator_trigger_t	
Trigger type: rising edge, falling edge, both edges, low level.	
Enumerator	
COMPARATOR_TRIGGER_RISING	Rising edge trigger.
COMPARATOR_TRIGGER_FALLING	Falling edge trigger.
COMPARATOR_TRIGGER_BOTH_EDGE	Both edges trigger.

comparator_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

Data Fields

uint32_t	min_stabilization_wait_us Minimum stabilization wait time in microseconds.

Detailed Description

Comparator information.

The documentation for this struct was generated from the following file:

- r_comparator_api.h

comparator_status_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

Data Fields

comparator_state_t	state Current comparator state.

Detailed Description

Comparator status.

The documentation for this struct was generated from the following file:

- r_comparator_api.h

comparator_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

Data Fields

void const *	p_context
uint32_t	channel The physical hardware channel that caused the interrupt.

Detailed Description

Callback function parameter data

Field Documentation

◆ p_context

void const* comparator_callback_args_t::p_context
Placeholder for user data. Set in comparator_api_t::open function in comparator_cfg_t.

The documentation for this struct was generated from the following file:

- r_comparator_api.h

comparator_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

Data Fields

uint8_t	channel Hardware channel used.
uint8_t	irq_ipl Interrupt priority.
comparator_mode_t	mode Normal or window mode.
comparator_trigger_t	trigger Trigger setting.
comparator_filter_t	filter Digital filter clock divisor setting.
comparator_polarity_invert_t	invert Whether to invert output.
comparator_pin_output_t	pin_output Whether to include output on output pin.
void(*	p_callback)(comparator_callback_args_t *p_args)
void const *	p_context
void const *	p_extend Comparator hardware dependent configuration.

Detailed Description

User configuration structure, used in open function

Field Documentation

◆ p_callback

void(* comparator_cfg_t::p_callback) (comparator_callback_args_t *p_args)
Callback called when comparator event occurs.

◆ p_context

void const* comparator_cfg_t::p_context
Placeholder for user data. Passed to the user callback in comparator_callback_args_t.

The documentation for this struct was generated from the following file:

- r_comparator_api.h

comparator_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

Data Fields

ssp_err_t(*	open)(comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)
ssp_err_t(*	outputEnable)(comparator_ctrl_t *const p_ctrl)
ssp_err_t(*	infoGet)(comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)
ssp_err_t(*	statusGet)(comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)
ssp_err_t(*	close)(comparator_ctrl_t *const p_ctrl)

ssp_err_t(* versionGet)(ssp_version_t *const p_version)

Detailed Description

Comparator functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* comparator_api_t::close) (comparator_ctrl_t *const p_ctrl)

Stop the comparator.

Implemented as

- R_ACMPHS_Close()
- R_ACMPLP_Close()

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ infoGet

ssp_err_t(* comparator_api_t::infoGet) (comparator_ctrl_t *const p_ctrl, comparator_info_t *const p_info)

Provide information such as the recommended minimum stabilization wait time.

Implemented as

- R_ACMPHS_InfoGet()
- R_ACMPLP_InfoGet()

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_info	Comparator information stored here

◆ open

ssp_err_t(* comparator_api_t::open) (comparator_ctrl_t *const p_ctrl, comparator_cfg_t const *const p_cfg)

Initialize the comparator.

Implemented as

- R_ACMPHS_Open()
- R_ACMPLP_Open()

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	p_cfg	Pointer to configuration

◆ outputEnable

ssp_err_t(* comparator_api_t::outputEnable) (comparator_ctrl_t *const p_ctrl)

Start the comparator.

Implemented as

- R_ACMPHS_OutputEnable()
- R_ACMPLP_OutputEnable()

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ statusGet

ssp_err_t(* comparator_api_t::statusGet) (comparator_ctrl_t *const p_ctrl, comparator_status_t *const p_status)

Provide current comparator status.

Implemented as

- R_ACMPHS_StatusGet()
- R_ACMPLP_StatusGet()

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_status	Status stored here

◆ versionGet

ssp_err_t(* comparator_api_t::versionGet) (ssp_version_t *const p_version)

Retrieve the API version.

Implemented as

- R_ACMPHS_VersionGet()
- R_ACMPLP_VersionGet()

Precondition

This function retrieves the API version.

Parameters

[in]	p_version	Pointer to version structure

The documentation for this struct was generated from the following file:

- r_comparator_api.h

comparator_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » COMPARATOR Interface

#include <r_comparator_api.h>

5.1.4.7 CRC Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for cyclic redundancy checking. More...

Data Structures

struct	crc_cfg_t
struct	crc_snoop_cfg_t
struct	crc_api_t
struct	crc_instance_t

Typedefs

typedef void	crc_ctrl_t

Enumerations

enum	crc_polynomial_t { CRC_POLYNOMIAL_CRC_8 = 1, CRC_POLYNOMIAL_CRC_16, CRC_POLYNOMIAL_CRC_CCITT, CRC_POLYNOMIAL_CRC_32, CRC_POLYNOMIAL_CRC_32C }
enum	crc_bit_order_t { CRC_BIT_ORDER_LMS_LSB = 0, CRC_BIT_ORDER_LMS_MSB }
enum	crc_snoop_direction_t { CRC_SNOOP_DIRECTION_RECEIVE = 0, CRC_SNOOP_DIRECTION_TRANSMIT }

Detailed Description

Interface for cyclic redundancy checking.

Summary

The CRC (Cyclic Redundancy Check) calculator generates CRC codes using five different polynomials including 8 bit, 16 bit, and 32 bit variations. Calculation can be performed by sending data to the

block using the CPU or by snooping on read or write activity on one of 10 SCI channels.

ssp_err_t(*	versionGet)(ssp_version_t *version)

Detailed Description

CRC driver structure. General CRC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ calculate

ssp_err_t(* crc_api_t::calculate) (crc_ctrl_t *const p_ctrl, void *p_input_buffer, uint32_t num_bytes, uint32_t crc_seed, uint32_t *p_crc_result)

Perform a CRC calculation on a block of data.

Implemented as

- R_CRC_Calculate()

Parameters

[in]	p_ctrl	Pointer to crc device handle.
[in]	input_buffer	A pointer to an array of data values.
[in]	num_bytes	The number of bytes (not elements) in the array.
[in]	crc_seed	The seeded value for crc calculations.
[out]	crc_result	The calculated value of the CRC calculation.

◆ close

ssp_err_t(* crc_api_t::close) (crc_ctrl_t *const p_ctrl)

Close the CRC module driver

Implemented as

- R_CRC_Close()

Parameters

[in]	p_ctrl	Pointer to crc device handle

Return values

SSP_SUCCESS	Configuration was successful.

◆ crcResultGet

ssp_err_t(* crc_api_t::crcResultGet) (crc_ctrl_t *const p_ctrl, uint32_t *crc_result)

Return the current calculated value.

Implemented as

- R_CRC_CalculatedValueGet()

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[out]	crc_result	The calculated value from the last CRC calculation.

◆ open

ssp_err_t(* crc_api_t::open) (crc_ctrl_t *const p_ctrl, crc_cfg_t const *const p_cfg)

Open the CRC driver module.

Implemented as

- R_CRC_Open()

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[in]	p_cfg	Pointer to a configuration structure.

◆ snoopCfg

ssp_err_t(* crc_api_t::snoopCfg) (crc_ctrl_t *const p_ctrl, crc_snoop_cfg_t *const p_snoop_cfg)

Configure the snoop channel and direction.

Implemented as

- R_CRC_SnoopCfg()

Parameters

[in]	p_ctrl	Pointer to crc device handle.
[in]	p_snoopCfg	Snoop configuration.

◆ snoopDisable

ssp_err_t(* crc_api_t::snoopDisable) (crc_ctrl_t *const p_ctrl)

Disable snooping.

Implemented as

- R_CRC_SnoopDisable()

Parameters

[in]	p_ctrl	Pointer to crc device handle.

◆ snoopEnable

ssp_err_t(* crc_api_t::snoopEnable) (crc_ctrl_t *const p_ctrl, uint32_t crc_seed)

Enable snooping.

Implemented as

- R_CRC_SnoopEnable()

Parameters

[in]	p_ctrl	Pointer to CRC device handle.
[in]	crc_seed	CRC seed.

◆ versionGet

ssp_err_t(* crc_api_t::versionGet) (ssp_version_t *version)

Get the driver version based on compile time macros.

Implemented as

- R_CRC_VersionGet()

The documentation for this struct was generated from the following file:

const aes_api_t	g_aes128ecb_on_sceHrk
const aes_api_t	g_aes192gcm_on_sceHrk

Detailed Description

AES encryption and decryption APIs.

Macro Definition Documentation

◆ AES128_SECRET_KEY_SIZE_BYTES

```
#define AES128_SECRET_KEY_SIZE_BYTES  (16)
```

Return AES secret key size in bytes for a 128-bit AES Key

◆ AES128_WRAPPPED_SECRET_KEY_SIZE_BYTES

```
#define AES128_WRAPPPED_SECRET_KEY_SIZE_BYTES  (36)
```

Return Wrapped AES secret key size in bytes for a 128-bit AES Key

◆ AES192_SECRET_KEY_SIZE_BYTES

```
#define AES192_SECRET_KEY_SIZE_BYTES  (24)
```

Return AES secret key size in bytes for a 192-bit AES Key

◆ AES192_WRAPPPED_SECRET_KEY_SIZE_BYTES

```
#define AES192_WRAPPPED_SECRET_KEY_SIZE_BYTES  (52)
```

Return Wrapped AES secret key size in bytes for a 192-bit AES Key

◆ AES256_SECRET_KEY_SIZE_BYTES

```
#define AES256_SECRET_KEY_SIZE_BYTES  (32)
```

Return AES secret key size in bytes for a 256-bit AES Key

◆ AES256_WRAPPPED_SECRET_KEY_SIZE_BYTES

#define AES256_WRAPPPED_SECRET_KEY_SIZE_BYTES (52)
Return Wrapped AES secret key size in bytes for a 256-bit AES Key

◆ AES_API_VERSION_MAJOR

#define AES_API_VERSION_MAJOR (1U)
Register definitions, common services and error codes.

◆ AES_XTS_128_WRAPPPED_SECRET_KEY_SIZE_BYTES

#define AES_XTS_128_WRAPPPED_SECRET_KEY_SIZE_BYTES (52)
Return Wrapped AES-XTS secret key size in bytes for a 128-bit AES XTS Mode Key

◆ AES_XTS_256_WRAPPPED_SECRET_KEY_SIZE_BYTES

#define AES_XTS_256_WRAPPPED_SECRET_KEY_SIZE_BYTES (84)
Return AES-XTS secret key size in bytes for a 256-bit AES XTS Mode Key

Variable Documentation

◆ g_aes128cbc_on_sce

const aes_api_t g_aes128cbc_on_sce
AES 128-bit CBC mode implementation

◆ g_aes128ctr_on_sce

const aes_api_t g_aes128ctr_on_sce
AES 128-bit CTR mode implementation

◆ g_aes128ecb_on_sce

const aes_api_t g_aes128ecb_on_sce
AES interface available boards - S7G2, S5D9, S5D5, S3A7, S3A3 and S3A6 - Chaining modes CBC, GCM, CTR, ECB, XTS for 128 & 256-bit S7G2, S5D9, and S5D5 - Chaining modes CBC, GCM, CTR, ECB for 192-bit AES 128-bit ECB mode implementation

◆ g_aes128ecb_on_sceHrk

const aes_api_t g_aes128ecb_on_sceHrk
HRK Supported global structure definitions

◆ g_aes128gcm_on_sce

const aes_api_t g_aes128gcm_on_sce
AES 128-bit GCM mode implementation

◆ g_aes128xts_on_sce

const aes_api_t g_aes128xts_on_sce
AES 128-bit CCM mode implementation

◆ g_aes192cbc_on_sce

const aes_api_t g_aes192cbc_on_sce
AES 192-bit CBC mode implementation

◆ g_aes192ctr_on_sce

const aes_api_t g_aes192ctr_on_sce
AES 192-bit CTR mode implementation

◆ g_aes192ecb_on_sce

const aes_api_t g_aes192ecb_on_sce
AES 192-bit ECB mode implementation

◆ g_aes192gcm_on_sce

const aes_api_t g_aes192gcm_on_sce
AES 192-bit GCM mode implementation

◆ g_aes192gcm_on_sceHrk

const aes_api_t g_aes192gcm_on_sceHrk
AES 192-bit GCM HRK mode implementation

◆ g_aes256cbc_on_sce

const aes_api_t g_aes256cbc_on_sce
AES 256-bit CBC mode implementation

◆ g_aes256ctr_on_sce

const aes_api_t g_aes256ctr_on_sce
AES 256-bit CTR mode implementation

◆ g_aes256ecb_on_sce

const aes_api_t g_aes256ecb_on_sce
AES 256-bit ECB mode implementation

◆ g_aes256gcm_on_sce

const aes_api_t g_aes256gcm_on_sce
AES 256-bit GCM mode implementation

◆ g_aes256xts_on_sce

const aes_api_t g_aes256xts_on_sce
AES 256-bit XTS mode implementation

aes_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » AES Interface

#include <r_aes_api.h>

Data Fields

crypto_ctrl_t *	p_crypto_ctrl pointer to crypto engine control structure
crypto_api_t const *	p_crypto_api pointer to crypto engine API
uint32_t	work_buffer [DRV_AES_CONTEXT_BUFFER_SIZE] Examples: AES-GCM mode uses this for storing authentication tag etc. More...

Detailed Description

AES Interface control structure

Field Documentation

◆ work_buffer

uint32_t aes_ctrl_t::work_buffer[DRV_AES_CONTEXT_BUFFER_SIZE]
Examples: AES-GCM mode uses this for storing authentication tag etc. used for storing context/state of the Cipher

The documentation for this struct was generated from the following file:

uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

AES_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ addAdditionalAuthenticationData

uint32_t(* aes_api_t::addAdditionalAuthenticationData) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source)

Add additional authentication data (called before starting an encryption or decryption operation)

Parameters

[in]	*p_key	pointer to the AES plain-text key
[in]	*p_iv	unused for ECB mode
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_source	input data buffer

◆ close

uint32_t(* aes_api_t::close) (aes_ctrl_t *const p_ctrl)

Close the AES module.

Parameters

[in]	p_ctrl	pointer to the control structure

◆ createKey

uint32_t(* aes_api_t::createKey) (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_key)

Generate an AES key for encrypt / decrypt operations.

Parameters

[in,out]	p_ctrl	pointer to control structure for the AES interface.
[in]	num_words	number of words in buffer p_key
[out]	p_key	pointer to key buffer. Generated key will be stored at this location.

◆ decrypt

uint32_t(* aes_api_t::decrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t imaxcnt, uint32_t *p_source, uint32_t *p_dest)

AES Decryption.

Decrypt input data with ECB mode using a 128-bit AES key

Parameters

[in]	*p_key	128-bit plain key
[in]	*p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	num_words	Size in words of p_source and p_dest data buffers. Each word is 4-bytes. Must be multiples of 4 words.
[in]	*p_source	input data buffer
[out]	*p_dest	output data buffer

◆ encrypt

uint32_t(* aes_api_t::encrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

AES encryption.

Encrypt input data with ECB mode using a 128-bit AES key

Parameters

[in]	*p_key	pointer to the AES plain-text key
[in]	*p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_source	input data buffer
[out]	*p_dest	output data buffer

◆ getGcmTag

uint32_t(* aes_api_t::getGcmTag) (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_dest)

Get authentication tag data.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	num_words	number of words in p_dest buffer. This must be atleast 4 words
[in]	p_dest	pointer to data buffer, must be of size 4 words.

◆ open

uint32_t(* aes_api_t::open) (aes_ctrl_t *const p_ctrl, aes_cfg_t const *const p_cfg)

AES module open function. Must be called before performing any encrypt/decrypt operations.

Parameters

[in,out]	p_ctrl	pointer to control structure for the AES interface. Must be declared by user. Elements are set here.
[in]	p_cfg	pointer to control structure for the AES configuration. All elements of this structure must be set by user.

◆ setGcmTag

uint32_t(* aes_api_t::setGcmTag) (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_source)

set parameter specific to the mode

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	num_words	number of words in p_source buffer. This must be atleast 4 words
[in]	p_source	pointer to authentication tag data buffer, must be of size 4 words.

◆ versionGet

uint32_t(* aes_api_t::versionGet) (ssp_version_t *const p_version)

Gets version and stores it in provided pointer p_version.

Parameters

[out]	p_version	Code and API version used.

◆ zeroPaddingDecrypt

uint32_t(* aes_api_t::zeroPaddingDecrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t *p_dest)

AES zero padding decryption using the chaining mode and padding mode specified.
Implementation for GCM mode only API usage -.

1. Set expected tag value using the setGcmTag() function
2. Provide any Add Authentication Data (AAD), invoke this API using p_dest = NULL
1. Decryption: set p_source to input encrypted data, decrypted data will be returned in p_dest
2. Verify the tag, invoke this API using p_source = NULL and p_dest = NULL, the return value indicates authentication tag verification status.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	*p_key	pointer to the AES plain-text key, the buffer size should be equal to the keylength
[in]	*p_iv	the buffer size must be 16 bytes
[in]	num_bytes	data buffer size in bytes.
[in]	*p_source	input data buffer, computes tag when set to NULL.
[out]	*p_dest	output data buffer, adds authentication data when set to NULL.

Note

this function is not thread safe.

◆ zeroPaddingEncrypt

uint32_t(* aes_api_t::zeroPaddingEncrypt) (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t *p_dest)

AES zero padding encryption using the chaining mode and padding mode specified.
Implementation for GCM mode only API usage -.

1. Provide any Add Authentication Data (AAD): set p_dest = NULL
2. Encryption: set p_source to input data and p_dest will return encrypted data
3. Get/Compute Tag: set p_source = NULL

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	*p_key	pointer to the AES plain-text key, the buffer size should be equal to the keylength
[in]	*p_iv	the buffer size must be 16 bytes
[in]	num_bytes	data buffer size in bytes.
[in]	*p_source	input data buffer, computes tag when set to NULL.
[out]	*p_dest	output data buffer, adds authentication data when set to NULL.

Note

this function is not thread safe.

The documentation for this struct was generated from the following file:

- r_aes_api.h

aes_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » AES Interface

#include <r_aes_api.h>

Data Fields

aes_ctrl_t *	p_ctrl Pointer to the control structure for this instance.

aes_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
aes_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

uint32_t(*	close)(arc4_ctrl_t *const p_ctrl)
uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

ARC4_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ arc4Process

uint32_t(* arc4_api_t::arc4Process) (arc4_ctrl_t *const p_ctrl, uint32_t num_bytes, uint8_t *p_source, uint8_t *p_dest)

Encrypt or decrypt source data p_source of length num_bytes and write the results to destination buffer p_dest

Parameters

[in,out]	p_ctrl	pointer to control structure for ARC4 interface.
[in]	num_bytes	number of bytes to encrypt or decrypt, the value must be a multiple of 16
[in]	p_source	pointer to source data buffer
[out]	p_dest	pointer to destination data buffer

◆ close

uint32_t(* arc4_api_t::close) (arc4_ctrl_t *const p_ctrl)

Close the ARC4 module.

Parameters

[in,out]	p_ctrl	pointer to the control structure

◆ keySet

uint32_t(* arc4_api_t::keySet) (arc4_ctrl_t *const p_ctrl, uint32_t length, uint8_t const *p_key)

ARC4 module key set function. Resets the state of the ARC4 encryption block.

Parameters

[in,out]	p_ctrl	pointer to control structure for the ARC4 interface.
[in]	length	length of the p_key key material in bytes
[in]	p_key	pointer to the key material to use for encryption operations.

◆ open

uint32_t(* arc4_api_t::open) (arc4_ctrl_t *const p_ctrl, arc4_cfg_t const *const p_cfg)		
ARC4 module open function. Must be called before performing any encrypt/decrypt operations. Initializes the context for the encrypt or decrypt operations using the chosen Cipher interface.		
Parameters		
[in,out]	p_ctrl	pointer to control structure for the ARC4 interface. Must be declared by user. Elements are set here.
[in]	p_cfg	pointer to control structure for the ARC4 configuration. All elements of this structure must be set by user.

◆ versionGet

uint32_t(* arc4_api_t::versionGet) (ssp_version_t *const p_version)		
Gets version and stores it in provided pointer p_version.		
Parameters		
[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_arc4_api.h

arc4_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » ARC4 Interface

#include <r_arc4_api.h>

Data Fields

arc4_ctrl_t *	p_ctrl Pointer to the control structure for this instance.

arc4_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
arc4_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

Detailed Description

DSA_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* dsa_api_t::close) (dsa_ctrl_t *const p_ctrl)

Close the DSA module.

Parameters

[in]	p_ctrl	pointer to the control structure

◆ hashSign

uint32_t(* dsa_api_t::hashSign) (dsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_paddedHash, uint32_t *p_dest)

DSA Signature generation using DSA private key.

Generate signature for the buffer p_paddedHash with the given DSA private key p_key for the domain parameters p_domain. The result will be written to the buffer p_dest

Parameters

[in]	*p_ctrl	pointer to control structure
[in]	*p_key	DSA plain text private key
[in]	*p_domain	pointer to DSA domain parameters.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_paddedHash	input data buffer
[out]	*p_dest	output data buffer

◆ hashVerify

uint32_t(* dsa_api_t::hashVerify) (dsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_signature, uint32_t *p_paddedHash)

DSA signature verification using given DSA public key.

Verify DSA signature from buffer p_signature using the given DSA public key p_key with domain parameters from p_domain for the input message hash p_paddedHash

Parameters

[in]	*p_ctrl	pointer to DSA control structure
[in]	*p_key	pointer to the DSA plain-text key.
[in]	*p_domain	pointer to DSA domain parameters.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_signature	signature data buffer to be verified
[in]	*p_paddedHash	padded hash of the input message

◆ open

uint32_t(* dsa_api_t::open) (dsa_ctrl_t *const p_ctrl, dsa_cfg_t const *const p_cfg)

DSA module open function. Must be called before performing any encrypt/decrypt operations.

Parameters

[in,out]	p_ctrl	pointer to control structure for the DSA interface. Must be declared by user. Elements are set here.
[in]	p_cfg	pointer to control structure for the DSA configuration. All elements of this structure must be set by user.

◆ sign

uint32_t(* dsa_api_t::sign) (const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_paddedHash, uint32_t *p_dest)

DSA Signature generation using DSA private key.

Generate signature for the buffer p_paddedHash with the given DSA private key p_key for the domain parameters p_domain. The result will be written to the buffer p_dest

Parameters

[in]	*p_key	DSA plain text private key
[in]	*p_domain	pointer to DSA domain parameters.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_paddedHash	input data buffer
[out]	*p_dest	output data buffer

◆ verify

uint32_t(* dsa_api_t::verify) (const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_signature, uint32_t *p_paddedHash)

DSA signature verification using given DSA public key.

Verify DSA signature from buffer p_signature using the given DSA public key p_key with domain parameters from p_domain for the input message hash p_paddedHash

Parameters

[in]	*p_key	pointer to the DSA plain-text key.
[in]	*p_domain	pointer to DSA domain parameters.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_signature	signature data buffer to be verified
[in]	*p_paddedHash	padded hash of the input message

◆ versionGet

uint32_t(* dsa_api_t::versionGet) (ssp_version_t *const p_version)		
Gets version and stores it in provided pointer p_version. **Parameters** [out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_dsa_api.h

dsa_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » DSA Interface

#include <r_dsa_api.h>

Data Fields

dsa_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
dsa_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
dsa_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_dsa_api.h

ECC Interface

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface

ECC cryptographic functions for scalar multiplication, generate key, generate sign, verify sign and version get. More...

Data Structures

struct	ecc_ctrl_t

Detailed Description

ECC_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* ecc_api_t::close) (ecc_ctrl_t *const p_ctrl)

Close the ECC module.

Parameters

[in]	p_ctrl	Pointer to the control structure.

◆ keyCreate

ssp_err_t(* ecc_api_t::keyCreate) (ecc_ctrl_t *const p_ctrl, r_crypto_data_handle_t *const p_domain, r_crypto_data_handle_t *const p_generator_point, r_crypto_data_handle_t *const p_key_private, r_crypto_data_handle_t *const p_key_public)

keyCreate: This API generates key pair for ECC.

Parameters

[in]	p_ctrl	Pointer to control structure for the ECC interface.
[in]	p_domain	a||b||p||n - These are domain parameters for ECC as defined in FIPS186-3.
[in]	p_generator_point	Gx||Gy - Base point of the curve, where, Gx and Gy are x and y coordinates respectively. This parameter is one of the domain parameters.
[in,out]	p_key_private	Private Key generated. Data length in words is updated in the output buffer data handle.
[in,out]	p_key_public	Public Key generated. Data length in words is updated in the output buffer data handle.

◆ open

ssp_err_t(* ecc_api_t::open) (ecc_ctrl_t *const p_ctrl, ecc_cfg_t const *const p_cfg)

Open the ECC driver. This API must be called before performing any ECC operations.

Parameters

[in]	p_ctrl	Pointer to control structure. Must be allocated by user before calling the API. Elements are set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user before calling this API.

◆ scalarMultiplication

ssp_err_t(* ecc_api_t::scalarMultiplication) (ecc_ctrl_t *const p_ctrl, r_crypto_data_handle_t *const p_domain, r_crypto_data_handle_t *const p_k, r_crypto_data_handle_t *const p_p, r_crypto_data_handle_t *const p_r)

scalarMultiplication: This API calculates R=kP.

Parameters

[in]	p_ctrl	Pointer to control structure for the ECC interface.
[in]	p_domain	a||b||p - These are domain parameters for ECC as defined in IEEE1363.
[in]	p_k	Scalar.
[in]	p_p	Px||Py, where, Px and Py are x and y coordinates respectively.
[in,out]	p_r	Rx||Ry (R=kP), where, Rx and Ry are x and y coordinates respectively. Data length in words is updated in the output buffer data handle.

◆ sign

ssp_err_t(* ecc_api_t::sign) (ecc_ctrl_t *const p_ctrl, r_crypto_data_handle_t *const p_domain, r_crypto_data_handle_t *const p_generator_point, r_crypto_data_handle_t *const p_key_private, r_crypto_data_handle_t *const msg_digest, r_crypto_data_handle_t *const signature_r, r_crypto_data_handle_t *const signature_s)

sign: This API generates signature of ECDSA

Parameters

[in]	p_ctrl	Pointer to control structure for the ECC interface.
[in]	p_domain	a||b||p||n - These are domain parameters for ECC as defined in IEEE1363.
[in]	p_generator_point	Gx||Gy - Base point of the curve, where, Gx and Gy are x and y coordinates respectively. This parameter is one of the domain parameters.
[in]	p_key_private	Private Key to process signature generation.
[in]	msg_digest	Message Digest. Length of this buffer must be equal to the ECC curve size in words.
[in,out]	signature_r	Signature r generated. Data length in words is updated in the output buffer data handle.
[in,out]	signature_s	Signature s generated. Data length in words is updated in the output buffer data handle.

◆ verify

ssp_err_t(* ecc_api_t::verify) (ecc_ctrl_t *const p_ctrl, r_crypto_data_handle_t *const p_domain, r_crypto_data_handle_t *const p_generator_point, r_crypto_data_handle_t *const p_key_public, r_crypto_data_handle_t *const msg_digest, r_crypto_data_handle_t *const signature_r, r_crypto_data_handle_t *const signature_s)

verify: This is a procedure for signature verification of ECDSA.

Parameters

[in]	p_ctrl	Pointer to control structure for the ECC interface.
[in]	p_domain	a||b||p||n - These are domain parameters for ECC as defined in IEEE1363.
[in]	p_generator_point	Gx||Gy - Base point of the curve, where, Gx and Gy are x and y coordinates respectively. This parameter is one of the domain parameters.
[in]	p_key_public	Public Key for signature verification.
[in]	msg_digest	Padded Message Digest. Length of this buffer must be equal to the ECC curve size in words.
[in]	signature_r	Signature r.
[in]	signature_s	Signature s.

◆ versionGet

ssp_err_t(* ecc_api_t::versionGet) (ssp_version_t *const p_version)

versionGet: Gets version and stores it in provided pointer p_version.

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_ecc_api.h

ecc_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » ECC Interface

#include <r_ecc_api.h>

Data Fields

ecc_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
ecc_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
ecc_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

uint32_t(*	close)(hash_ctrl_t *const p_ctrl)
uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

HASH_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* hash_api_t::close) (hash_ctrl_t *const p_ctrl)

Close the hash module.

Parameters

[in]	p_ctrl	Pointer to the hash_ctrl_t control structure

◆ hashUpdate

uint32_t(* hash_api_t::hashUpdate) (hash_ctrl_t *const p_ctrl, const uint32_t *p_source, uint32_t num_words, uint32_t *p_dest)

update hash for the num_words words from source buffer p_source.

Parameters

[in]	p_ctrl	pointer to hash_ctrl_t control structure.
[in]	p_source	pointer to input message buffer. size must be a multiple of 64-bytes
[in]	num_words	number of words to be hashed from the buffer p_source
[in,out]	p_dest	pointer to the message digest. on input contains initialization value.

◆ open

uint32_t(* hash_api_t::open) (hash_ctrl_t *const p_ctrl, hash_cfg_t const *const p_cfg)

HASH_Interface: Initial configuration

Precondition

HASH_Interface: Peripheral clocks and any required output pins should be configured prior to calling this function.

Parameters

[in,out]	HASH_Interface	p_ctrl Pointer to control structure. Must be declared by user. Elements set here.
[in]	HASH_Interface	p_cfg Pointer to configuration structure. All elements of this structure must be set by user.

◆ updateHash

uint32_t(* hash_api_t::updateHash) (const uint32_t *p_source, uint32_t num_words, uint32_t *p_dest)

update hash for the num_words words from source buffer p_source.

Parameters

[in]	p_source	pointer to input message buffer. size must be a multiple of 64-bytes
[in]	num_words	number of words to be hashed from the buffer p_source
[in,out]	p_dest	pointer to the message digest. on input contains initialization value.

◆ versionGet

uint32_t(* hash_api_t::versionGet) (ssp_version_t *const p_version)

Gets version and stores it in provided pointer p_version.

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_hash_api.h

hash_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » HASH Algorithm Interface

◆ KEY_INSTALLATION_AES256_WRAPPED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_AES256_WRAPPED_KEY_SIZE_IN_WORDS (13U)
AES Wrapped (output) key size in words for a 256-bit AES Key

◆ KEY_INSTALLATION_AES256_WRAPPED_XTS_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_AES256_WRAPPED_XTS_KEY_SIZE_IN_WORDS (21U)
AES Wrapped (output) key size in words for a 256-bit AES Key in XTS chaining mode

◆ KEY_INSTALLATION_ECC192_ENCRYPTED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC192_ENCRYPTED_KEY_SIZE_IN_WORDS (12U)
Macro definitions for ECC Key sizes ECC Encrypted key size in words for a 192-bit ECC Key

◆ KEY_INSTALLATION_ECC192_WRAPPED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC192_WRAPPED_KEY_SIZE_IN_WORDS (13U)
ECC Wrapped (output) key size in words for a 192-bit ECC Key

◆ KEY_INSTALLATION_ECC224_ENCRYPTED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC224_ENCRYPTED_KEY_SIZE_IN_WORDS (12U)
ECC Encrypted key size in words for a 224-bit ECC Key

◆ KEY_INSTALLATION_ECC224_WRAPPED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC224_WRAPPED_KEY_SIZE_IN_WORDS (13U)
ECC Wrapped (output) key size in words for a 224-bit ECC Key

◆ KEY_INSTALLATION_ECC256_ENCRYPTED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC256_ENCRYPTED_KEY_SIZE_IN_WORDS (12U)
ECC Encrypted key size in words for 256-bit ECC Key

◆ KEY_INSTALLATION_ECC256_WRAPPED_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_ECC256_WRAPPED_KEY_SIZE_IN_WORDS (13U)
ECC Wrapped (output) key size in words for a 256-bit ECC Key

◆ KEY_INSTALLATION_ECC384_ENCRYPTED_KEY_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_ECC384_ENCRYPTED_KEY_SIZE_IN_WORDS  (16U)
```

ECC Encrypted key size in words for a 384-bit ECC Key

◆ KEY_INSTALLATION_ECC384_WRAPPED_KEY_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_ECC384_WRAPPED_KEY_SIZE_IN_WORDS  (17U)
```

ECC Wrapped (output) key size in words for a 384-bit ECC Key

◆ KEY_INSTALLATION_RSA1024_ENCRYPTED_KEY_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_RSA1024_ENCRYPTED_KEY_SIZE_IN_WORDS  (36U)
```

RSA Encrypted key size in words for a 1024-bit RSA (private) Key

◆ KEY_INSTALLATION_RSA1024_MODULUS_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_RSA1024_MODULUS_SIZE_IN_WORDS  (32U)
```

Macro definitions for RSA Key sizes RSA Modulus size in words for a 1024-bit RSA Key

◆ KEY_INSTALLATION_RSA1024_WRAPPED_PRIVKEY_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_RSA1024_WRAPPED_PRIVKEY_SIZE_IN_WORDS  (37U)
```

RSA Wrapped (output) private key size in words for a 1024-bit RSA Key

◆ KEY_INSTALLATION_RSA2048_ENCRYPTED_KEY_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_RSA2048_ENCRYPTED_KEY_SIZE_IN_WORDS  (68U)
```

RSA Encrypted key size in words for a 2048-bit RSA (private) Key

◆ KEY_INSTALLATION_RSA2048_MODULUS_SIZE_IN_WORDS

```
#define KEY_INSTALLATION_RSA2048_MODULUS_SIZE_IN_WORDS  (64U)
```

RSA Modulus size in words for a 2048-bit RSA Key

◆ KEY_INSTALLATION_RSA2048_WRAPPED_PRIVKEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_RSA2048_WRAPPED_PRIVKEY_SIZE_IN_WORDS (69U)
RSA Wrapped (output) private key size in words for a 2048-bit RSA Key

◆ KEY_INSTALLATION_SESSION_KEY_SIZE_IN_WORDS

#define KEY_INSTALLATION_SESSION_KEY_SIZE_IN_WORDS (8U)
Macro definitions for universal KeyInstall Session/ IV Key sizes

◆ SCE_KEY_INSTALLATION_API_VERSION_MAJOR

#define SCE_KEY_INSTALLATION_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

Typedef Documentation

◆ key_installation_ctrl_t

typedef void key_installation_ctrl_t
Key Installation control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ key_installation_key_format_t

enum key_installation_key_format_t	
A structure to handle data for Key Installation module operation Supported key format definitions	
Enumerator	
KEY_INSTALLATION_KEY_FORMAT_ENCRYPTED_RSA_PRIVATE_KEY	Encrypted RSA Private key.
KEY_INSTALLATION_KEY_FORMAT_WRAPPED_RSA_PRIVATE_KEY	RSA Private Key wrapped.
KEY_INSTALLATION_KEY_FORMAT_ENCRYPTED_AES_KEY	Encrypted AES Private key.
KEY_INSTALLATION_KEY_FORMAT_WRAPPED_AES_KEY	AES Private Key wrapped.
KEY_INSTALLATION_KEY_FORMAT_ENCRYPTED_INSTALL_KEY	TO BE REMOVED w/ RSA/ ECC MODS.
KEY_INSTALLATION_KEY_FORMAT_ENCRYPTED_ECC_PRIVATE_KEY	Encrypted ECC Private key.
KEY_INSTALLATION_KEY_FORMAT_WRAPPED_ECC_PRIVATE_KEY	ECC Private Key wrapped.
KEY_INSTALLATION_KEY_FORMAT_ENCRYPTED_RSA_PRIVATE_CRT_KEY	Encrypted RSA Private CRT key.
KEY_INSTALLATION_KEY_FORMAT_WRAPPED_RSA_PRIVATE_CRT_KEY	RSA Private CRT Key wrapped.
KEY_INSTALLATION_KEY_FORMAT_SESSION_KEY	Session key for keyInstall API.

◆ key_installation_key_shared_index_t

enum key_installation_key_shared_index_t	
Supported Shared Key Index values (for keyInstall)	
Enumerator	
KEY_INSTALLATION_KEY_SHARED_INDEX_0	Shared Key Index 0.
KEY_INSTALLATION_KEY_SHARED_INDEX_1	Shared Key Index 1.
KEY_INSTALLATION_KEY_SHARED_INDEX_2	Shared Key Index 2.
KEY_INSTALLATION_KEY_SHARED_INDEX_3	Shared Key Index 3.
KEY_INSTALLATION_KEY_SHARED_INDEX_4	Shared Key Index 4.
KEY_INSTALLATION_KEY_SHARED_INDEX_5	Shared Key Index 5.
KEY_INSTALLATION_KEY_SHARED_INDEX_6	Shared Key Index 6.
KEY_INSTALLATION_KEY_SHARED_INDEX_7	Shared Key Index 7.
KEY_INSTALLATION_KEY_SHARED_INDEX_8	Shared Key Index 8.
KEY_INSTALLATION_KEY_SHARED_INDEX_9	Shared Key Index 9.
KEY_INSTALLATION_KEY_SHARED_INDEX_A	Shared Key Index 10.
KEY_INSTALLATION_KEY_SHARED_INDEX_B	Shared Key Index 11.
KEY_INSTALLATION_KEY_SHARED_INDEX_C	Shared Key Index 12.
KEY_INSTALLATION_KEY_SHARED_INDEX_D	Shared Key Index 13.
KEY_INSTALLATION_KEY_SHARED_INDEX_E	Shared Key Index 14.
KEY_INSTALLATION_KEY_SHARED_INDEX_F	Shared Key Index 15.

◆ key_installation_key_size_t

enum key_installation_key_size_t	
Supported key sizes	
Enumerator	
KEY_INSTALLATION_KEY_SIZE_RSA_1024	RSA 1024-bit key.
KEY_INSTALLATION_KEY_SIZE_RSA_2048	RSA 2048-bit key.
KEY_INSTALLATION_KEY_SIZE_AES_128	AES 128-bit key for CBC, CTR, ECB, GCM chaining modes.
KEY_INSTALLATION_KEY_SIZE_AES_XTS_128	AES 128-bit key for XTS chaining mode only.
KEY_INSTALLATION_KEY_SIZE_AES_192	AES 192-bit key for CBC, CTR, ECB, GCM chaining modes.
KEY_INSTALLATION_KEY_SIZE_AES_256	AES 256-bit key for CBC, CTR, ECB, GCM chaining modes.
KEY_INSTALLATION_KEY_SIZE_AES_XTS_256	AES 256-bit key for XTS chaining mode only.
KEY_INSTALLATION_KEY_SIZE_ENCRYPTED_INSTALL_416	Renesas provided install key size.
KEY_INSTALLATION_KEY_SIZE_ECC_192	ECC 192-bit key.
KEY_INSTALLATION_KEY_SIZE_ECC_224	ECC 224-bit key.
KEY_INSTALLATION_KEY_SIZE_ECC_256	ECC 256-bit key.
KEY_INSTALLATION_KEY_SIZE_ECC_384	ECC 384-bit key.
KEY_INSTALLATION_KEY_SIZE_SESSION	Session Key size for all operations.

key_installation_key_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » KEY_INSTALLATION Interface

#include <r_key_installation_api.h>

Data Fields

key_installation_key_format_t	key_format Indicates the key_format.
key_installation_key_size_t	key_size Indicates the key_type.
uint32_t *	p_data
uint32_t	data_length The length of data in WORDS(32-bits), pointed by p_data.

Detailed Description

Definition for Key data structure for Key Installation API operations

Field Documentation

◆ p_data

uint32_t* key_installation_key_t::p_data
Pointer to input (encrypted user key (OR) output data buffer to hold the wrapped key)

The documentation for this struct was generated from the following file:

- r_key_installation_api.h

key_installation_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » KEY_INSTALLATION Interface

#include <r_key_installation_api.h>

Data Fields

crypto_api_t const *	p_lower_lvl_crypto_api pointer to crypto engine api

void const *	p_extend Extension parameter for hardware specific settings.

Detailed Description

Key Installation Interface configuration structure. User must fill in these values before invoking the open() function

---

The documentation for this struct was generated from the following file:

- r_key_installation_api.h

key_installation_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » KEY_INSTALLATION Interface

#include <r_key_installation_api.h>

Data Fields

ssp_err_t(*	open)(key_installation_ctrl_t *const p_ctrl, key_installation_cfg_t const *const p_cfg)
ssp_err_t(*	keyInstall)(key_installation_ctrl_t *const p_ctrl, r_crypto_data_handle_t const *const p_user_key_rsa_modulus, key_installation_key_t const *const p_user_key, key_installation_key_shared_index_t const shared_index, key_installation_key_t const *const p_session_key, uint32_t const *const p_iv, key_installation_key_t *const p_key_data)
ssp_err_t(*	close)(key_installation_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

KEY_INSTALLATION_Interface functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* key_installation_api_t::close) (key_installation_ctrl_t *const p_ctrl)
Close API function of Key Installation module. **Parameters** [in] p_ctrl — Pointer to the control structure

◆ keyInstall

ssp_err_t(* key_installation_api_t::keyInstall) (key_installation_ctrl_t *const p_ctrl, r_crypto_data_handle_t const *const p_user_key_rsa_modulus, key_installation_key_t const *const p_user_key, key_installation_key_shared_index_t const shared_index, key_installation_key_t const *const p_session_key, uint32_t const *const p_iv, key_installation_key_t *const p_key_data)

Key installation API function that takes the user's encrypted key, a shared index, session key, and an IV then returns wrapped key of the user's plain-text key.

Parameters

[in]	p_ctrl	Pointer to the control structure.
[in]	p_user_key_rsa_modulus	Pointer to a user key's RSA modulus. Only applicable for Key Installation using RSA keys. For other crypto algorithms this parameter should be NULL.
[in]	p_user_key	Pointer to a user's encrypted key. In case of Key Installation using RSA keys, this will be the encrypted exponent.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to output wrapped output key. 'key_size' of p_key_data structure is UNUSED.

Note

For AES crypto algorithms, the buffer length required to hold the output wrapped key will be - 'Plaintext key word length + 5'. Expected values are defined by macros for each supported key length/ mode, for example KEY_INSTALLATION_AES128_WRAPPED_KEY_SIZE_IN_WORDS for 128-bit AES.

◆ open

ssp_err_t(* key_installation_api_t::open) (key_installation_ctrl_t *const p_ctrl, key_installation_cfg_t const *const p_cfg)
Key Installation module open API function. Must be called before invoking Key Installation operation. **Parameters** [in,out] p_ctrl — Pointer to control structure for the KEY_INSTALLATION interface. Must be declared by user. [in] p_cfg — Pointer to configuration structure for the KEY_INSTALLATION configuration. All elements of this structure must be set by user.

◆ versionGet

ssp_err_t(* key_installation_api_t::versionGet) (ssp_version_t *const p_version)
Gets version and stores it in provided pointer p_version. **Parameters** [out] p_version — Code and API version used.

The documentation for this struct was generated from the following file:

- r_key_installation_api.h

key_installation_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface » KEY_INSTALLATION Interface

#include <r_key_installation_api.h>

Data Fields

key_installation_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
key_installation_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
key_installation_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_key_installation_api.h

Detailed Description

RSA cryptographic functions for signature generation, verification, encryption and decryption.

Macro Definition Documentation

◆ RSA_API_VERSION_MAJOR

#define RSA_API_VERSION_MAJOR (1U)
Register definitions, common services and error codes.

◆ RSA_MODULUS_SIZE_BYTES

#define RSA_MODULUS_SIZE_BYTES (RSA_SIZE_BITS) ((RSA_SIZE_BITS)/8U)
Return RSA modulus size in bytes from the specified RSA modulus size in bits

◆ RSA_PLAIN_TEXT_CRT_KEY_SIZE_BYTES

#define RSA_PLAIN_TEXT_CRT_KEY_SIZE_BYTES (RSA_SIZE_BITS) (((uint32_t)5*((uint32_t)RSA_SIZE_BITS))/16U)
Return RSA CRT private key size in bytes from the specified RSA modulus size in bits

◆ RSA_PLAIN_TEXT_PRIVATE_KEY_SIZE_BYTES

#define RSA_PLAIN_TEXT_PRIVATE_KEY_SIZE_BYTES (RSA_SIZE_BITS) (((uint32_t)2*(uint32_t)RSA_SIZE_BITS)/8U)
Return RSA private key size in bytes from the specified RSA modulus size in bits

◆ RSA_PLAIN_TEXT_PUBLIC_KEY_SIZE_BYTES

#define RSA_PLAIN_TEXT_PUBLIC_KEY_SIZE_BYTES (RSA_SIZE_BITS) (((uint32_t)32+(uint32_t)RSA_SIZE_BITS)/8U)
Return RSA public key size in bytes from the specified RSA modulus size in bits

◆ RSA_WRAPPPED_PRIVATE_CRT_KEY_SIZE_BYTES

#define RSA_WRAPPPED_PRIVATE_CRT_KEY_SIZE_BYTES (RSA_SIZE_BITS) ((RSA_PLAIN_TEXT_CRT_KEY_SIZE_BYTES(RSA_SIZE_BITS))+20U)
Return RSA wrapped private CRT key size in bytes from the specified RSA modulus size in bits

◆ RSA_WRAPPPED_PRIVATE_KEY_SIZE_BYTES

#define RSA_WRAPPPED_PRIVATE_KEY_SIZE_BYTES (RSA_SIZE_BITS) ((((uint32_t)2 * (uint32_t)RSA_SIZE_BITS)+(uint32_t)160)/8U)
Return RSA wrapped private key size in bytes from the specified RSA modulus size in bits

Enumeration Type Documentation

◆ rsa_key_format_t

enum rsa_key_format_t	
RSA key format definitions	
Enumerator	
RSA_KEY_FORMAT_PLAIN_TEXT_PUBLIC_KEY	RSA public key in plain text format.
RSA_KEY_FORMAT_PLAIN_TEXT_PRIVATE_KEY	RSA private key in plain text format.
RSA_KEY_FORMAT_PLAIN_TEXT_CRT_KEY	RSA CRT Key in plain text format.
RSA_KEY_FORMAT_WRAPPED_PRIVATE_KEY	RSA private Key wrapped using device specific key.
RSA_KEY_FORMAT_WRAPPED_PRIVATE_CRT_KEY	RSA private CRT Key wrapped using device specific key.

Variable Documentation

◆ g_rsa1024_on_sce

const rsa_api_t g_rsa1024_on_sce
RSA interface is only available on S7G2, S5D9 and S5D5. SCE/RSA implementation of RSA API.

◆ g_rsa1024_on_sce_hrk

const rsa_api_t g_rsa1024_on_sce_hrk
SCE/RSA implementation of RSA API.

◆ g_rsa2048_on_sce_hrk

const rsa_api_t g_rsa2048_on_sce_hrk
SCE/RSA implementation of RSA API.

Detailed Description

RSA_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* rsa_api_t::close) (rsa_ctrl_t *const p_ctrl)

Close the RSA module.

Parameters

[in]	p_ctrl	pointer to the control structure

◆ decrypt

uint32_t(* rsa_api_t::decrypt) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

Decrypt source data from p_source using an RSA private key from p_key and write the results to destination buffer p_dest. The RSA private key data p_key is specified in the standard format that consists of private exponent and the RSA modulus. The size of the private exponent and the RSA modulus is 1024-bits for the g_rsa1024_on_sce implementation and 2048-bits for the g_rsa2048_on_sce implementation.

Parameters

[in]	*p_ctrl	pointer to control structure for RSA interface
[in]	*p_key	pointer to RSA plain-text private key consisting of private exponent and the RSA modulus.
[in]	*p_domain	unused parameter for RSA decryption. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes.
[in]	*p_source	input data buffer to be decrypted.
[out]	*p_dest	output destination data buffer, decryption result will be stored here.

◆ decryptCrt

uint32_t(* rsa_api_t::decryptCrt) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

Decrypt source data from p_source using an RSA private key from p_key and write the results to destination buffer p_dest. RSA private key data is specified in CRT format. The RSA CRT key consists of the exponent2 || prime2 || exponent1 || prime1 || coefficient, starting with exponent2 at index 0. The size of each of these parameter is 512-bits for the g_rsa1024_on_sce implementation and 1024-bits for the g_rsa2048_on_sce implementation.

Parameters

[in]	*p_key	pointer to RSA private key in CRT format.
[in]	*p_domain	unused parameter for RSA decryption. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes.
[in]	*p_source	input data buffer to be decrypted.
[out]	*p_dest	output destination data buffer, decryption result will be stored here.

◆ encrypt

uint32_t(* rsa_api_t::encrypt) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

Encrypt source data from p_source using an RSA public key from p_key and write the results to destination buffer p_dest.

Parameters

[in]	*p_ctrl	pointer to control structure for RSA interface
[in]	*p_key	pointer to the RSA plain-text public key consisting of 32-bit public exponent and RSA public modulus of size either 1024-bits or 2048-bits.
[in]	*p_domain	unused parameter for RSA encryption. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes.
[in]	*p_source	source data buffer to be encrypted.
[out]	*p_dest	destination data buffer, encryption result will be stored here.

◆ keyCreate

uint32_t(* rsa_api_t::keyCreate) (rsa_ctrl_t *const p_ctrl, rsa_key_t *p_private_key, rsa_key_t *p_public_key)

Generates an RSA key. This is a blocking call

Parameters

[in]	*p_ctrl	pointer to control structure for RSA interface
[in,out]	*p_private_key	pointer to a private key structure
[in,out]	*p_public_key	pointer to a public key structure

```
{
```

```
 // The following code snippet gives an example for generating and using a 1024-bit
RSA key.
 // For simplicity, the below code snippet does not check return values.
 rsa_ctrl_t rsa_ctrl;

 g_rsa1024_on_sce.keyCreate(p_ctrl, &rsa_secret_key, &rsa_public_key);
 // p_source is a pointer to a padded hash data. The computed signature will be
stored at p_dest
 // The example below uses an RSA private key in standard format.
 // To compute signature using an RSA CRT private key, use the signCrt() interface
function.
 g_rsa1024_on_sce.sign(p_ctrl, num_words, rsa_secret_key.p_data, p_source, p_dest)
 g_rsa1024_on_sce.verify(p_ctrl, num_words, rsa_public_key.p_data, p_dest, p_source);
}
```

◆ open

uint32_t(* rsa_api_t::open) (rsa_ctrl_t *const p_ctrl, rsa_cfg_t const *const p_cfg)

RSA module open function. Must be called before performing any encrypt/decrypt or sign/verify operations.

Parameters

[in,out]	p_ctrl	pointer to control structure for the RSA interface. Must be declared by user. Elements are set here.
[in]	p_cfg	pointer to control structure for the RSA configuration. All elements of this structure must be set by user.

◆ sign

uint32_t(* rsa_api_t::sign) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_padded_hash, uint32_t *p_dest)

Generate signature for the given padded hash buffer p_padded_hash using the RSA private key p_key. Write the results to the buffer p_dest.

Parameters

[in]	*p_ctrl	pointer to control structure for RSA interface
[in]	*p_key	pointer to RSA private key consisting of private exponent and the RSA modulus.
[in]	*p_domain	unused parameter. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_padded_hash	padded hash for the input message for which an RSA signature is desired
[out]	*p_dest	generated signature data will be written here.

◆ signCrt

uint32_t(* rsa_api_t::signCrt) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_padded_hash, uint32_t *p_dest)

Generate signature for the given padded hash buffer p_padded_hash using the RSA private key p_key. RSA private key p_key is assumed to be in CRT format. Write the results to the buffer p_dest. The RSA CRT key consists of the exponent2 || prime2 || exponent1 || prime1 || coefficient, starting with exponent2 at index 0. The size of each of these parameter is 512-bits for the g_rsa1024_on_sce implementation and 1024-bits for the g_rsa2048_on_sce implementation.

Parameters

[in]	*p_ctrl	pointer to control structure for RSA interface
[in]	*p_key	pointer to RSA private key in CRT format.
[in]	*p_domain	unused parameter. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes. multiples of 4
[in]	*p_padded_hash	padded hash for the input message for which an RSA signature is desired
[out]	*p_dest	generated signature data will be written here.

◆ verify

uint32_t(* rsa_api_t::verify) (rsa_ctrl_t *const p_ctrl, const uint32_t *p_key, const uint32_t *p_domain, uint32_t num_words, uint32_t *p_signature, uint32_t *p_padded_hash)

Verify signature given in buffer p_signature using the RSA public key p_key for the given padded message hash from buffer p_padded_hash.

Parameters

[in]	*p_key	pointer to the RSA plain-text public key consisting of 32-bit public exponent and RSA public modulus of size either 1024-bits or 2048-bits.
[in]	*p_domain	unused parameter. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each word is 4-bytes.
[in]	*p_signature	signature data that needs to be verified
[in]	*p_paddedHash	padded hash value of the input message buffer

◆ versionGet

uint32_t(* rsa_api_t::versionGet) (ssp_version_t *const p_version)

Gets version and stores it in provided pointer p_version.

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_rsa_api.h

	TDES decryption. More...
uint32_t(*	close)(tdes_ctrl_t *const p_ctrl)
uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

TDES_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* tdes_api_t::close) (tdes_ctrl_t *const p_ctrl)

Close the TDES module.

Parameters

[in]	p_ctrl	pointer to the control structure

◆ decrypt

uint32_t(* tdes_api_t::decrypt) (tdes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

TDES decryption.

Decrypt input data with a 192-bit TDES key and the chaining mode specified.

Parameters

[in]	*p_key	pointer to the 192-bit plain-text key
[in,out]	*p_iv	pointer to initialization vector. Should be 8 bytes long. Unused for ECB mode. Next IV value is returned on successful completion.
[in]	num_words	Specifies the size of the input data in words. Should be multiples of 2. Note: 1 word is 4-bytes long.
[in]	*p_source	input data buffer - should be at least num_words long.
[out]	*p_dest	output data buffer - should be at least num_words long.

◆ encrypt

uint32_t(* tdes_api_t::encrypt) (tdes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest)

TDES encryption.

Encrypt input data with a 192-bit TDES key and the chaining mode specified.

Parameters

[in]	*p_key	pointer to the TDES plain-text key.
[in,out]	*p_iv	pointer to initialization vector. Should be 8 bytes long. Unused for ECB mode. Next IV value is returned on successful completion.
[in]	num_words	Specifies the size of the input data in words. Should be multiples of 2. Note: 1 word is 4-bytes long.
[in]	*p_source	input data buffer - should be at least num_words long.
[out]	*p_dest	output data buffer - should be at least num_words long.

◆ open

uint32_t(* tdes_api_t::open) (tdes_ctrl_t *const p_ctrl, tdes_cfg_t const *const p_cfg)

TDES module open function. Must be called before performing any encrypt/decrypt operations.

Parameters

[in,out]	p_ctrl	pointer to control structure for the TDES interface. Must be declared by user. Elements are set here.
[in]	p_cfg	pointer to control structure for the TDES configuration. All elements of this structure must be set by user.

◆ versionGet

uint32_t(* tdes_api_t::versionGet) (ssp_version_t *const p_version)		
Gets version and stores it in provided pointer p_version. **Parameters** [out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

TRNG_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* trng_api_t::close) (trng_ctrl_t *const p_ctrl)

Close the TRNG interface driver

Parameters

[in]	p_ctrl	pointer to trng interface control structure

◆ open

uint32_t(* trng_api_t::open) (trng_ctrl_t *const p_ctrl, trng_cfg_t const *const p_cfg)

Open the TRNG driver for reading random data from the hardware TRNG module

Parameters

[in,out]	p_ctrl	Pointer to control structure. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ read

uint32_t(* trng_api_t::read) (trng_ctrl_t *const p_ctrl, uint32_t *const p_rngbuf, uint32_t nwords)

Generate nwords of random number words and store them in p_rngbuf buffer

Parameters

[in]	p_ctrl	pointer to trng control structure
[out]	p_rngbuf	generated random numbers will be stored to the buffer p_rngbuf
[in]	nwords	number of random words to generate

◆ versionGet

uint32_t(* trng_api_t::versionGet) (ssp_version_t *const p_version)

Gets version and stores it in provided pointer p_version.

Parameters

[out]	p_version	Code and API version used.

#include <r_crypto_api.h>

Data Fields

void(*	p_sce_long_plg_end_callback)(void)

crypto_word_endian_t	endian_flag
void *	p_sce_api_interfaces

Detailed Description

Crypto engine configuration parameters

Field Documentation

◆ endian_flag

crypto_word_endian_t crypto_cfg_t::endian_flag
Endian flag, indicates word endianness for the uint32_t[] array inputs used in Crypto APIs

◆ p_sce_api_interfaces

void* crypto_cfg_t::p_sce_api_interfaces
Pointer to the structure containing crypto API interfaces available to the selected MCU.

◆ p_sce_long_plg_end_callback

void(* crypto_cfg_t::p_sce_long_plg_end_callback) (void)
Callback provided when a ISR occurs. Set to NULL for no CPU interrupt.

The documentation for this struct was generated from the following file:

- r_crypto_api.h

crypto_interface_get_param_t Struct Reference

crypto_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Crypto Interface

#include <r_crypto_api.h>

Data Fields

uint32_t(*	open)(crypto_ctrl_t *const p_ctrl, crypto_cfg_t const *const p_cfg)
uint32_t(*	close)(crypto_ctrl_t *const p_ctrl)
uint32_t(*	interfaceGet)(crypto_interface_get_param_t *const interface_info, void *const p_interface)
uint32_t(*	statusGet)(uint32_t *p_status)
uint32_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Crypto_Interface SCE functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

uint32_t(* crypto_api_t::close) (crypto_ctrl_t *const p_ctrl)

Close the crypto interface module for the given control structure p_ctrl

Parameters

[in]	p_ctrl	pointer to control structure

◆ interfaceGet

uint32_t(* crypto_api_t::interfaceGet) (crypto_interface_get_param_t *const interface_info, void *const p_interface)

Get API interface structure object based on the interface_info provided.

Parameters

[in]	interface_info	pointer to structure containing requested interface information.
[out]	p_interface	pointer whose value points to interface structure object.

Note

p_interface must be of pointer type and its address must be passed in this API. Passing the pointer and not its address may result in undefined behavior at run-time.
Value of p_interface is allowed to be passed as NULL at the time of API call.

◆ open

uint32_t(* crypto_api_t::open) (crypto_ctrl_t *const p_ctrl, crypto_cfg_t const *const p_cfg)

Open crypto module using the given configuration

Parameters

[in,out]	p_ctrl	pointer to control structure. Must be declared by user. Elements set here.
[in]	p_cfg	pointer to configuration structure. All elements of this structure must be set by user

◆ statusGet

uint32_t(* crypto_api_t::statusGet) (uint32_t *p_status)

Get status of SCE initialization

Parameters

[out]	p_status	initialization status of SCE module will be written to the memory pointed to by p_status

◆ versionGet

uint32_t(* crypto_api_t::versionGet) (ssp_version_t *const p_version)		
Gets version and stores it in provided pointer p_version. **Parameters**		
[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_crypto_api.h

crypto_instance_t Struct Reference

uint8_t	ctsuchac3 TS24-TS31 enable mask.

uint8_t	ctsuchac4 TS32-TS39 enable mask.
uint8_t	ctsuchtrc0 TS00-TS07 mutual-tx mask.
uint8_t	ctsuchtrc1 TS08-TS15 mutual-tx mask.
uint8_t	ctsuchtrc2 TS16-TS23 mutual-tx mask.
uint8_t	ctsuchtrc3 TS24-TS31 mutual-tx mask.
uint8_t	ctsuchtrc4 TS32-TS39 mutual-tx mask.
ctsu_element_cfg_t const *	p_elements Pointer to elements configuration array.
uint8_t	num_rx Number of receive terminals.
uint8_t	num_tx Number of transmit terminals.
uint16_t	num_moving_average Number of moving average for measurement data.
bool	tunning_enable Initial offset tuning flag.
void(*	p_callback)(ctsu_callback_args_t *p_args)

	Callback provided when CTSUFN ISR occurs.
transfer_instance_t const *	p_transfer_tx DTC instance for transmit at CTSUWR. Set to NULL if unused.
transfer_instance_t const *	p_transfer_rx DTC instance for receive at CTSURD. Set to NULL if unused.
IRQn_Type	write_irq CTSU_CTSUWR interrupt vector.
IRQn_Type	read_irq CTSU_CTSURD interrupt vector.
IRQn_Type	end_irq CTSU_CTSUFN interrupt vector.
void const *	p_context User defined context passed into callback function.
void const *	p_extend Pointer to extended configuration by instance of interface.
uint16_t	tuning_self_target_value Target self value for initial offset tuning.
uint16_t	tuning_mutual_target_value Target mutual value for initial offset tuning.

Detailed Description

User configuration structure, used in open function

The documentation for this struct was generated from the following file:

- r_ctsuv2_api.h

ctsu_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CTSU v2 Interface

#include <r_ctsuv2_api.h>

Data Fields

ssp_err_t(*	open)(ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg)
ssp_err_t(*	scanStart)(ctsu_ctrl_t *const p_ctrl)
ssp_err_t(*	dataGet)(ctsu_ctrl_t *const p_ctrl, uint16_t *p_data)
ssp_err_t(*	diagnosis)(ctsu_ctrl_t *const p_ctrl)
ssp_err_t(*	callbackSet)(ctsu_ctrl_t *const p_api_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)
ssp_err_t(*	close)(ctsu_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_data)

Detailed Description

Functions implemented at the HAL layer will follow this API.

Field Documentation

◆ callbackSet

ssp_err_t(* ctsu_api_t::callbackSet) (ctsu_ctrl_t *const p_api_ctrl, void(*p_callback)(ctsu_callback_args_t *), void const *const p_context, ctsu_callback_args_t *const p_callback_memory)

Specify callback function and optional context pointer and working memory pointer.

Implemented as

- R_CTSU_CallbackSet()

Parameters

[in]	p_ctrl	Pointer to the CTSU control block.
[in]	p_callback	Callback function
[in]	p_context	Pointer to send to callback function
[in]	p_working_memory	Pointer to volatile memory where callback structure can be allocated. Callback arguments allocated here are only valid during the callback.

◆ close

ssp_err_t(* ctsu_api_t::close) (ctsu_ctrl_t *const p_ctrl)

Close driver.

Implemented as

- R_CTSU_Close()

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ dataGet

ssp_err_t(* ctsu_api_t::dataGet) (ctsu_ctrl_t *const p_ctrl, uint16_t *p_data)

Data get.

Implemented as

- R_CTSU_DataGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_data	Pointer to get data array.

◆ diagnosis

ssp_err_t(* ctsu_api_t::diagnosis) (ctsu_ctrl_t *const p_ctrl)

Diagnosis.

Implemented as

- R_CTSU_Diagnosis()

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ open

ssp_err_t(* ctsu_api_t::open) (ctsu_ctrl_t *const p_ctrl, ctsu_cfg_t const *const p_cfg)

Open driver.

Implemented as

- R_CTSU_Open()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ scanStart

ssp_err_t(* ctsu_api_t::scanStart) (ctsu_ctrl_t *const p_ctrl)

Scan start.

Implemented as

- R_CTSU_ScanStart()

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ versionGet

ssp_err_t(* ctsu_api_t::versionGet) (ssp_version_t *const p_data)

Return the version of the driver.

Implemented as

- R_CTSU_VersionGet()

Parameters

[out]	p_data	Memory address to return version information to.

The documentation for this struct was generated from the following file:

- r_ctsuv2_api.h

ctsu_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » CTSU v2 Interface

#include <r_ctsuv2_api.h>

Data Fields

ctsu_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
ctsu_cfg_t const *	p_cfg

	Pointer to the configuration structure for this instance.
ctsu_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_ctsuv2_api.h

5.1.4.10 DAC Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for D/A converters. More...

Data Structures

struct	dac_info_t
struct	dac_cfg_t
struct	dac_api_t
struct	dac_instance_t

Typedefs

typedef uint16_t	dac_size_t
typedef void	dac_ctrl_t

Enumerations

enum	dac_data_format_t { DAC_DATA_FORMAT_FLUSH_RIGHT = 0, DAC_DATA_FORMAT_FLUSH_LEFT = 1 }

Detailed Description

Interface for D/A converters.

Summary

The DAC interface provides standard Digital/Analog Converter functionality. A DAC application writes digital sample data to the device and generates analog output on the DAC output pin.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

DAC Interface description: DAC Driver

Typedef Documentation

◆ dac_ctrl_t

typedef void dac_ctrl_t
DAC control block. Allocate an instance specific control block to pass into the DAC API calls. **Implemented as** ◦ dac_instance_ctrl_t

◆ dac_size_t

typedef uint16_t dac_size_t
Data type to store DAC output value.

Enumeration Type Documentation

◆ dac_data_format_t

enum dac_data_format_t	
DAC Open API AD/DA data format settings.	
Enumerator	
DAC_DATA_FORMAT_FLUSH_RIGHT	LSB of data is flush to the right leaving the top 4 bits unused.
DAC_DATA_FORMAT_FLUSH_LEFT	MSB of data is flush to the left leaving the bottom 4 bits unused.

dac_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DAC Interface

#include <r_dac_api.h>

Data Fields

uint8_t	bit_width Resolution of the DAC.

Detailed Description

DAC information structure to store various information for a DAC

The documentation for this struct was generated from the following file:

- r_dac_api.h

dac_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DAC Interface

#include <r_dac_api.h>

Data Fields

uint8_t	channel ID associated with this DAC channel.
bool	ad_da_synchronized AD/DA synchronization.
dac_data_format_t	data_format Data format.
bool	output_amplifier_enabled Output amplifier enable.

Detailed Description

DAC Open API configuration parameter

The documentation for this struct was generated from the following file:

- r_dac_api.h

dac_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DAC Interface

#include <r_dac_api.h>

Data Fields

ssp_err_t(*	open)(dac_ctrl_t *p_ctrl, dac_cfg_t const *const p_cfg)
ssp_err_t(*	close)(dac_ctrl_t *p_ctrl)
ssp_err_t(*	write)(dac_ctrl_t *p_ctrl, dac_size_t value)
ssp_err_t(*	start)(dac_ctrl_t *p_ctrl)
ssp_err_t(*	stop)(dac_ctrl_t *p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)
ssp_err_t(*	infoGet)(dac_info_t *const p_info)

Detailed Description

DAC driver structure. General DAC functions implemented at the HAL layer follow this API.

Field Documentation

◆ close

ssp_err_t(* dac_api_t::close) (dac_ctrl_t *p_ctrl)

Close the D/A Converter.

Implemented as

- R_DAC_Close()
- R_DAC8_Close()

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ infoGet

ssp_err_t(* dac_api_t::infoGet) (dac_info_t *const p_info)

Get information about DAC Resolution and store it in provided pointer p_info.

Implemented as

- R_DAC_InfoGet()
- R_DAC8_InfoGet()

Parameters

[out]	p_info	Collection of information for this DAC.

◆ open

ssp_err_t(* dac_api_t::open) (dac_ctrl_t *p_ctrl, dac_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_DAC_Open()
- R_DAC8_Open()

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ start

ssp_err_t(* dac_api_t::start) (dac_ctrl_t *p_ctrl)

Start the D/A Converter if it has not been started yet.

Implemented as

- R_DAC_Start()
- R_DAC8_Start()

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ stop

ssp_err_t(* dac_api_t::stop) (dac_ctrl_t *p_ctrl)

Stop the D/A Converter if the converter is running.

Implemented as

- R_DAC_Stop()
- R_DAC8_Stop()

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.

◆ versionGet

ssp_err_t(* dac_api_t::versionGet) (ssp_version_t *p_version)

Get version and store it in provided pointer p_version.

Implemented as

- R_DAC_VersionGet()
- R_DAC8_VersionGet()

Parameters

[out]	p_version	Code and API version used.

◆ write

ssp_err_t(* dac_api_t::write) (dac_ctrl_t *p_ctrl, dac_size_t value)

Write sample value to the D/A Converter.

Implemented as

- R_DAC_Write()
- R_DAC8_Write()

Parameters

[in]	p_ctrl	Control block set in dac_api_t::open call for this timer.
[in]	value	Sample value to be written to the D/A Converter.

The documentation for this struct was generated from the following file:

Detailed Description

Interface for LCD panel displays.

Summary

The display interface provides standard display functionality:

- Signal timing configuration for LCD panels with RGB interface.
- Dot clock source selection (internal or external) and frequency divider.
- Blending of multiple graphics layers on the background screen.
- Color correction (brightness/configuration/gamma correction).
- Interrupts and callback function.

Implemented by: GLCDC

Typedef Documentation

◆ display_ctrl_t

typedef void display_ctrl_t
Display control block. Allocate an instance specific control block to pass into the display API calls. **Implemented as** ◦ glcd_instance_ctrl_tDisplay control block

Enumeration Type Documentation

◆ display_color_order_t

enum display_color_order_t	
RGB color order select	
Enumerator	
DISPLAY_COLOR_ORDER_RGB	Color order RGB.
DISPLAY_COLOR_ORDER_BGR	Color order BGR.

◆ display_endian_t

enum display_endian_t	
Data endian select	
Enumerator	
DISPLAY_ENDIAN_LITTLE	Little-endian.
DISPLAY_ENDIAN_BIG	Big-endian.

◆ display_event_t

enum display_event_t	
Display event codes	
Enumerator	
DISPLAY_EVENT_GR1_UNDERFLOW	Graphics frame1 underflow occurs.
DISPLAY_EVENT_GR2_UNDERFLOW	Graphics frame2 underflow occurs.
DISPLAY_EVENT_LINE_DETECTION	Designated line is processed.

◆ display_fade_control_t

enum display_fade_control_t	
Fading control	
Enumerator	
DISPLAY_FADE_CONTROL_NONE	Applying no fading control.
DISPLAY_FADE_CONTROL_FADEIN	Applying fade-in control.
DISPLAY_FADE_CONTROL_FADEOUT	Applying fade-out control.

◆ display_fade_status_t

enum display_fade_status_t	
Fading status	
Enumerator	
DISPLAY_FADE_STATUS_NOT_UNDERWAY	Fade-in/fade-out is not in progress.
DISPLAY_FADE_STATUS_FADING_UNDERWAY	Fade-in or fade-out is in progress.
DISPLAY_FADE_STATUS_UNCERTAIN	Fade-in/fade-out status is uncertain just before hardware working.

◆ display_frame_layer_t

enum display_frame_layer_t	
Display frame number	
Enumerator	
DISPLAY_FRAME_LAYER_1	Frame layer 1.
DISPLAY_FRAME_LAYER_2	Frame layer 2.

◆ display_in_format_t

enum display_in_format_t	
Input format setting	
Enumerator	
DISPLAY_IN_FORMAT_32BITS_ARGB8888	ARGB8888, 32 bits.
DISPLAY_IN_FORMAT_32BITS_RGB888	RGB888, 32 bits.
DISPLAY_IN_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB1555	ARGB1555, 16 bits.
DISPLAY_IN_FORMAT_16BITS_ARGB4444	ARGB4444, 16 bits.
DISPLAY_IN_FORMAT_CLUT8	CLUT8.
DISPLAY_IN_FORMAT_CLUT4	CLUT4.
DISPLAY_IN_FORMAT_CLUT1	CLUT1.

◆ display_out_format_t

enum display_out_format_t	
Output format setting	
Enumerator	
DISPLAY_OUT_FORMAT_24BITS_RGB888	RGB888, 24 bits.
DISPLAY_OUT_FORMAT_18BITS_RGB666	RGB666, 18 bits.
DISPLAY_OUT_FORMAT_16BITS_RGB565	RGB565, 16 bits.
DISPLAY_OUT_FORMAT_8BITS_SERIAL	SERIAL, 8 bits.

◆ display_signal_polarity_t

enum display_signal_polarity_t	
Polarity of a signal select	
Enumerator	
DISPLAY_SIGNAL_POLARITY_LOACTIVE	Low active signal.
DISPLAY_SIGNAL_POLARITY_HIACTIVE	High active signal.

◆ display_state_t

enum display_state_t	
Display interface operation state	
Enumerator	
DISPLAY_STATE_CLOSED	Display closed.
DISPLAY_STATE_OPENED	Display opened.
DISPLAY_STATE_DISPLAYING	Displaying.

◆ display_sync_edge_t

enum display_sync_edge_t	
Signal synchronization edge select	
Enumerator	
DISPLAY_SIGNAL_SYNC_EDGE_RISING	Signal is synchronized to rising edge.
DISPLAY_SIGNAL_SYNC_EDGE_FALLING	Signal is synchronized to falling edge.

display_timing_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Display Interface

#include <r_display_api.h>

Data Fields

uint16_t	total_cyc Total cycles in one line or total lines in one frame.
uint16_t	display_cyc Active video cycles or lines.
uint16_t	back_porch Back poach cycles or lines.
uint16_t	sync_width Sync signal asserting width.
display_signal_polarity_t	sync_polarity Sync signal polarity.

Detailed Description

Display signal timing setting

The documentation for this struct was generated from the following file:

Data Fields

ssp_err_t(*	open)(display_ctrl_t *const p_ctrl, display_cfg_t const *const p_cfg)
ssp_err_t(*	close)(display_ctrl_t *const p_ctrl)
ssp_err_t(*	start)(display_ctrl_t *const p_ctrl)
ssp_err_t(*	stop)(display_ctrl_t *const p_ctrl)
ssp_err_t(*	layerChange)(display_ctrl_t const *const p_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t frame)

ssp_err_t(*	correction)(display_ctrl_t const *const p_ctrl, display_correction_t const *const p_param)
ssp_err_t(*	clut)(display_ctrl_t const *const p_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t frame)
ssp_err_t(*	statusGet)(display_ctrl_t const *const p_ctrl, display_status_t *const p_status)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)

Detailed Description

Shared Interface definition for display peripheral

Field Documentation

◆ close

ssp_err_t(* display_api_t::close) (display_ctrl_t *const p_ctrl)

Close display device.

Implemented as

- R_GLCD_Close()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ clut

ssp_err_t(* display_api_t::clut) (display_ctrl_t const *const p_ctrl, display_clut_cfg_t const *const p_clut_cfg, display_frame_layer_t frame)

Set CLUT for display device.

Implemented as

- R_GLCD_ClutUpdate()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	p_clut_cfg	Pointer to CLUT configuration structure.
[in]	frame	Number of frame buffer corresponding to the CLUT.

◆ correction

ssp_err_t(* display_api_t::correction) (display_ctrl_t const *const p_ctrl, display_correction_t const *const p_param)

Color correction.

Implemented as

- R_GLCD_ColorCorrection()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	param	Pointer to color correction configuration structure.

◆ layerChange

ssp_err_t(* display_api_t::layerChange) (display_ctrl_t const *const p_ctrl, display_runtime_cfg_t const *const p_cfg, display_frame_layer_t frame)

Change layer parameters at runtime.

Implemented as

- R_GLCD_LayerChange()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	p_cfg	Pointer to run-time layer configuration structure.
[in]	frame	Number of graphic frames.

◆ open

ssp_err_t(* display_api_t::open) (display_ctrl_t *const p_ctrl, display_cfg_t const *const p_cfg)

Open display device.

Implemented as

- R_GLCD_Open()

Parameters

[in,out]	p_ctrl	Pointer to display interface control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to display configuration structure. All elements of this structure must be set by user.

◆ start

ssp_err_t(* display_api_t::start) (display_ctrl_t *const p_ctrl)

Display start.

Implemented as

- R_GLCD_Start()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ statusGet

ssp_err_t(* display_api_t::statusGet) (display_ctrl_t const *const p_ctrl, display_status_t *const p_status)

Get status for display device.

Implemented as

- R_GLCD_StatusGet()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	status	Pointer to display interface status structure.

◆ stop

ssp_err_t(* display_api_t::stop) (display_ctrl_t *const p_ctrl)

Display stop.

Implemented as

- R_GLCD_Stop()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ versionGet

ssp_err_t(* display_api_t::versionGet) (ssp_version_t *p_version)
Get version. **Implemented as** ◦ R_GLCD_VersionGet() **Parameters**

[in]	p_version	Pointer to the memory to store the version information.

The documentation for this struct was generated from the following file:

- r_display_api.h

display_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Display Interface

#include <r_display_api.h>

Data Fields

display_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
display_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
display_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_display_api.h

5.1.4.12 DOC Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for the Data Operation Circuit. More...

Data Structures

struct	doc_callback_args_t
struct	doc_data_t
struct	doc_cfg_t
struct	doc_api_t
struct	doc_instance_t

Macros

#define	DOC_API_VERSION_MAJOR (2U)

Typedefs

typedef uint16_t	doc_size_t
typedef void	doc_ctrl_t

Enumerations

enum	doc_event_t { DOC_EVENT_COMPARISON_MISMATCH = 0x00, DOC_EVENT_ADDITION = 0x01, DOC_EVENT_SUBTRACTION = 0x02, DOC_EVENT_COMPARISON_MATCH = 0x04 }
enum	doc_status_t { DOC_STATUS_CONDITION_FALSE = 0, DOC_STATUS_CONDITION_TRUE = 1 }

Detailed Description

Interface for the Data Operation Circuit.

Defines the API and data structures for the DOC implementation of the Data Operation Circuit (DOC) interface.

Summary

This module implements the DOC_API using the Data Operation Circuit (DOC).

Implemented by: DOC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

DOC Interface description: Data Operation Circuit Driver

Macro Definition Documentation

◆ DOC_API_VERSION_MAJOR

#define DOC_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

Typedef Documentation

◆ doc_ctrl_t

typedef void doc_ctrl_t
DOC control block. Allocate an instance specific control block to pass into the DOC API calls. **Implemented as** ◦ doc_instance_ctrl_t

◆ doc_size_t

typedef uint16_t doc_size_t
Size of the comparison data supported by the Data Operation Circuit (DOC)

Enumeration Type Documentation

◆ doc_event_t

enum doc_event_t	
Event that can trigger a callback function.	
Enumerator	
DOC_EVENT_COMPARISON_MISMATCH	Comparison of data has resulted in a mismatch.
DOC_EVENT_ADDITION	Addition of data has resulted in a value greater than H'FFFF.
DOC_EVENT_SUBTRACTION	Subtraction of data has resulted in a value less than H'0000.
DOC_EVENT_COMPARISON_MATCH	Comparison of data has resulted in a match.

◆ doc_status_t

enum doc_status_t	
Status of the data comparison operation.	
Enumerator	
DOC_STATUS_CONDITION_FALSE	Data comparison condition NOT met (match or mismatch), addition result NOT > H'FFFF, subtraction result NOT < H'0000.
DOC_STATUS_CONDITION_TRUE	Data comparison condition met (match or mismatch), addition result > H'FFFF, subtraction result < H'0000.

doc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DOC Interface

#include <r_doc_api.h>

Data Fields

doc_event_t	event The event is used to identify what caused the callback.

void const *	p_context

Detailed Description

Callback function parameter data.

Field Documentation

◆ p_context

void const* doc_callback_args_t::p_context
Placeholder for user data. Set in doc_api_t::open function in doc_cfg_t.

The documentation for this struct was generated from the following file:

- r_doc_api.h

doc_data_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DOC Interface

#include <r_doc_api.h>

Data Fields

doc_size_t	dodir Value to be written to the DOC DODIR.
doc_size_t	dodsr Value to be written to the DOC DODSR.

Detailed Description

Data to be written to DOC register for comparison/addition/subtraction.

The documentation for this struct was generated from the following file:

- r_doc_api.h

doc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DOC Interface

#include <r_doc_api.h>

Data Fields

doc_event_t	event Select enumerated value from doc_event_t.
uint8_t	irq_ipl DOC interrupt priority.
void(*	p_callback)(doc_callback_args_t *p_args)
void const *	p_context

Detailed Description

User configuration structure, used in the open function.

Field Documentation

◆ p_callback

void(* doc_cfg_t::p_callback) (doc_callback_args_t *p_args)
Callback provided when a DOC ISR occurs.

◆ p_context

void const* doc_cfg_t::p_context
Placeholder for user data. Passed to the user callback in doc_callback_args_t.

The documentation for this struct was generated from the following file:

- r_doc_api.h

doc_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DOC Interface

#include <r_doc_api.h>

Data Fields

ssp_err_t(*	open)(doc_ctrl_t *const p_ctrl, doc_cfg_t const *const p_cfg)
ssp_err_t(*	close)(doc_ctrl_t *const p_ctrl)
ssp_err_t(*	statusGet)(doc_ctrl_t *const p_ctrl, doc_status_t *p_status)
ssp_err_t(*	statusClear)(doc_ctrl_t *const p_ctrl)
ssp_err_t(*	write)(doc_ctrl_t *const p_ctrl, doc_data_t *const p_data)
ssp_err_t(*	inputRegisterWrite)(doc_ctrl_t *const p_ctrl, doc_size_t data)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Data Operation Circuit (DOC) API structure. DOC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* doc_api_t::close) (doc_ctrl_t *const p_ctrl)

Allow the driver to be reconfigured. Will reduce power consumption.

Implemented as

- R_DOC_Close()

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.

◆ inputRegisterWrite

ssp_err_t(* doc_api_t::inputRegisterWrite) (doc_ctrl_t *const p_ctrl, doc_size_t data)

Write to the DODIR register.

Implemented as

- R_DOC_InputRegisterWrite()

Precondition

Call doc_api_t::open to configure the DOC before using this function.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.
[in]	data	Data to be written to DOC DODIR register.

◆ open

ssp_err_t(* doc_api_t::open) (doc_ctrl_t *const p_ctrl, doc_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_DOC_Open()

Precondition

Peripheral clocks should be configured prior to calling this function.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ statusClear

ssp_err_t(* doc_api_t::statusClear) (doc_ctrl_t *const p_ctrl)

Clear DOPCF status flag.

Implemented as

- R_DOC_StatusClear()

Precondition

Call doc_api_t::open to configure the DOC before using this function.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.

◆ statusGet

ssp_err_t(* doc_api_t::statusGet) (doc_ctrl_t *const p_ctrl, doc_status_t *p_status)

Get the DOC status and stores it in the provided pointer p_status.

Implemented as

- R_DOC_StatusGet()

Precondition

Call doc_api_t::open to configure the DOC before using this function.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.
[out]	p_status	Indicates the status of the comparison/addition/subtraction operation. Result will be one of doc_status_t.

◆ versionGet

ssp_err_t(* doc_api_t::versionGet) (ssp_version_t *const p_version)

Get version and stores it in provided pointer p_version.

Implemented as

- R_DOC_VersionGet()

Parameters

[out]	p_version	Code and API version used.

◆ write

ssp_err_t(* doc_api_t::write) (doc_ctrl_t *const p_ctrl, doc_data_t *const p_data)

Write to the DODIR and DODSR registers.

Implemented as

- R_DOC_Write()

Precondition

Call doc_api_t::open to configure the DOC before using this function.

Parameters

[in]	p_ctrl	Control block set in doc_api_t::open call.
[in]	p_data	Pointer to data to be written to DOC DODIR and DODSR registers.

The documentation for this struct was generated from the following file:

- r_doc_api.h

doc_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » DOC Interface

#include <r_doc_api.h>

Data Fields

doc_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
doc_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
doc_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_doc_api.h

5.1.4.13 events and peripheral definitions

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for the Event Link Controller. More...

Data Structures

struct	elc_link_t
struct	elc_cfg_t
struct	elc_api_t
struct	elc_instance_t

Enumerations

enum	elc_software_event_t { ELC_SOFTWARE_EVENT_0, ELC_SOFTWARE_EVENT_1 }

Detailed Description

Interface for the Event Link Controller.

Event Link Controller Interface description: ELC Driver

Enumeration Type Documentation

◆ elc_software_event_t

enum elc_software_event_t	
Software event number	
Enumerator	
ELC_SOFTWARE_EVENT_0	Software event 0.
ELC_SOFTWARE_EVENT_1	Software event 1.

elc_link_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » events and peripheral definitions

#include <r_elc_api.h>

Data Fields

elc_peripheral_t	peripheral Peripheral to receive the signal.
elc_event_t	event Signal that gets sent to the Peripheral.

Detailed Description

Individual event link. The actual peripheral definitions can be found in the MCU specific (ie. /mcu/S124/bsp_elc.h) bsp_elc.h files.

The documentation for this struct was generated from the following file:

- r_elc_api.h

elc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » events and peripheral definitions

#include <r_elc_api.h>

Data Fields

bool	autostart Start operation and enable interrupts during open().
uint32_t	link_count Number of event links.
elc_link_t const *	link_list Event links.

Detailed Description

Main configuration structure for the Event Link Controller

The documentation for this struct was generated from the following file:

- r_elc_api.h

elc_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » events and peripheral definitions

#include <r_elc_api.h>

Data Fields

ssp_err_t(*	init)(elc_cfg_t const *const p_cfg)
ssp_err_t(*	softwareEventGenerate)(elc_software_event_t event_num)
ssp_err_t(*	linkSet)(elc_peripheral_t peripheral, elc_event_t signal)
ssp_err_t(*	linkBreak)(elc_peripheral_t peripheral)
ssp_err_t(*	enable)(void)
ssp_err_t(*	disable)(void)

```
ssp_err_t(*  versionGet )(ssp_version_t *const p_version)
```

Detailed Description

ELC driver structure. General ELC functions implemented at the HAL layer follow this API.

Field Documentation

◆ disable

ssp_err_t(* elc_api_t::disable) (void)

Disable the operation of the Event Link Controller.

Implemented as

- R_ELC_Disable()

◆ enable

ssp_err_t(* elc_api_t::enable) (void)

Enable the operation of the Event Link Controller.

Implemented as

- R_ELC_Enable()

◆ init

ssp_err_t(* elc_api_t::init) (elc_cfg_t const *const p_cfg)

Initialize all links in the Event Link Controller.

Implemented as

- R_ELC_Init()

Parameters

[in]	p_cfg	Pointer to configuration structure.

◆ linkBreak

ssp_err_t(* elc_api_t::linkBreak) (elc_peripheral_t peripheral)

Break an event link.

Implemented as

- R_ELC_LinkBreak()

Parameters

[in]	peripheral	The peripheral that should no longer be linked.

◆ linkSet

ssp_err_t(* elc_api_t::linkSet) (elc_peripheral_t peripheral, elc_event_t signal)

Create a single event link.

Implemented as

- R_ELC_LinkSet()

Parameters

[in]	peripheral	The peripheral block that will receive the event signal.
[in]	signal	The event signal.

◆ softwareEventGenerate

ssp_err_t(* elc_api_t::softwareEventGenerate) (elc_software_event_t event_num)

Generate a software event in the Event Link Controller.

Implemented as

- R_ELC_SoftwareEventGenerate()

Parameters

[in]	eventNum	Software event number to be generated.

◆ versionGet

ssp_err_t(* elc_api_t::versionGet) (ssp_version_t *const p_version)
Get the driver version based on compile time macros. **Implemented as** ◦ R_ELC_VersionGet() **Parameters** [out] p_version is value returned.

The documentation for this struct was generated from the following file:

- r_elc_api.h

elc_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » events and peripheral definitions

#include <r_elc_api.h>

Data Fields

elc_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
elc_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

5.1.4.14 External IRQ Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for detecting external interrupts. More...

Data Structures

struct	external_irq_callback_args_t
struct	external_irq_cfg_t
struct	external_irq_api_t
struct	external_irq_instance_t

Macros

#define	EXTERNAL_IRQ_API_VERSION_MAJOR (2U) EXTERNAL IRQ API version number (Major)
#define	EXTERNAL_IRQ_API_VERSION_MINOR (0U) EXTERNAL IRQ API version number (Minor)

Typedefs

typedef void	external_irq_ctrl_t

Enumerations

enum	external_irq_trigger_t { EXTERNAL_IRQ_TRIG_FALLING = 0, EXTERNAL_IRQ_TRIG_RISING = 1, EXTERNAL_IRQ_TRIG_BOTH_EDGE = 2, EXTERNAL_IRQ_TRIG_LEVEL_LOW = 3 }
enum	external_irq_pclk_div_t { EXTERNAL_IRQ_PCLK_DIV_BY_1 = 0, EXTERNAL_IRQ_PCLK_DIV_BY_8 = 1, EXTERNAL_IRQ_PCLK_DIV_BY_32 = 2, EXTERNAL_IRQ_PCLK_DIV_BY_64 = 3 }

Detailed Description

Interface for detecting external interrupts.

Summary

The external IRQ interface supports external inputs, for example input from pins or capacitive touch buttons. When an input trigger is detected, a user provided callback function will be called.

Implemented by: ICU

Related interfaces: Key Matrix Interface

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

External IRQ Interface description: External IRQ Driver

Typedef Documentation

◆ external_irq_ctrl_t

typedef void external_irq_ctrl_t
External IRQ control block. Allocate an instance specific control block to pass into the external IRQ API calls. **Implemented as** ◦ icu_instance_ctrl_t

Enumeration Type Documentation

◆ external_irq_pclk_div_t

enum external_irq_pclk_div_t	
External IRQ input pin digital filtering sample clock divisor settings.	
Enumerator	
EXTERNAL_IRQ_PCLK_DIV_BY_1	Filter using PCLK divided by 1.
EXTERNAL_IRQ_PCLK_DIV_BY_8	Filter using PCLK divided by 8.
EXTERNAL_IRQ_PCLK_DIV_BY_32	Filter using PCLK divided by 32.
EXTERNAL_IRQ_PCLK_DIV_BY_64	Filter using PCLK divided by 64.

◆ external_irq_trigger_t

enum external_irq_trigger_t	
Trigger type: rising edge, falling edge, both edges, low level.	
Enumerator	
EXTERNAL_IRQ_TRIG_FALLING	Falling edge trigger.
EXTERNAL_IRQ_TRIG_RISING	Rising edge trigger.
EXTERNAL_IRQ_TRIG_BOTH_EDGE	Both edges trigger.
EXTERNAL_IRQ_TRIG_LEVEL_LOW	Low level trigger.

external_irq_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » External IRQ Interface

#include <r_external_irq_api.h>

Data Fields

void const *	p_context
uint32_t	channel The physical hardware channel that caused the interrupt.

Detailed Description

Callback function parameter data

Field Documentation

◆ p_context

void const* external_irq_callback_args_t::p_context
Placeholder for user data. Set in external_irq_api_t::open function in external_irq_cfg_t.

The documentation for this struct was generated from the following file:

- r_external_irq_api.h

external_irq_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » External IRQ Interface

ssp_err_t(*	close)(external_irq_ctrl_t *const p_ctrl)

ssp_err_t(* versionGet)(ssp_version_t *const p_version)

Detailed Description

External interrupt driver structure. External interrupt functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* external_irq_api_t::close) (external_irq_ctrl_t *const p_ctrl)

Allow driver to be reconfigured. May reduce power consumption.

Implemented as

- R_ICU_ExternalIrqClose()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ disable

ssp_err_t(* external_irq_api_t::disable) (external_irq_ctrl_t *const p_ctrl)

Disable callback when external IRQ occurs.

Implemented as

- R_ICU_ExternalIrqDisable()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ enable

ssp_err_t(* external_irq_api_t::enable) (external_irq_ctrl_t *const p_ctrl)

Enable callback when external IRQ occurs.

Implemented as

- R_ICU_ExternalIrqEnable()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ filterDisable

ssp_err_t(* external_irq_api_t::filterDisable) (external_irq_ctrl_t *const p_ctrl)

Disable noise filter.

Implemented as

- R_ICU_ExternalIrqFilterDisable()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ filterEnable

ssp_err_t(* external_irq_api_t::filterEnable) (external_irq_ctrl_t *const p_ctrl)

Enables noise filter.

Implemented as

- R_ICU_ExternalIrqFilterEnable()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.

◆ open

ssp_err_t(* external_irq_api_t::open) (external_irq_ctrl_t *const p_ctrl, external_irq_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_ICU_ExternalIrqOpen()

Parameters

[out]	p_ctrl	Pointer to control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to configuration structure. All elements of the structure must be set by user.

◆ triggerSet

ssp_err_t(* external_irq_api_t::triggerSet) (external_irq_ctrl_t *const p_ctrl, external_irq_trigger_t const trigger)

Set trigger.

Implemented as

- R_ICU_ExternalIrqTriggerSet()

Parameters

[in]	p_ctrl	Control block set in Open call for this external interrupt.
[in]	trigger	Trigger type

◆ versionGet

ssp_err_t(* external_irq_api_t::versionGet) (ssp_version_t *const p_version)
Get version and store it in provided pointer p_version. **Implemented as** ◦ R_ICU_ExternalIrqVersionGet() **Parameters** [out] p_version Code and API version used.

The documentation for this struct was generated from the following file:

- r_external_irq_api.h

external_irq_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » External IRQ Interface

#include <r_external_irq_api.h>

Data Fields

external_irq_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
external_irq_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
external_irq_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_external_irq_api.h

Interface for the flash controller.

Summary

The Flash interface provides the functionality necessary to read, write, erase and blank check the Flash memory. Additionally functions are provided to configure the access window and swap areas of the flash memory.

Implemented by:

- High-performance Flash
- Low Power Flash

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Flash Interface description: Flash Driver

Macro Definition Documentation

◆ FLASH_API_VERSION_MAJOR

#define FLASH_API_VERSION_MAJOR (2U)
FLASH HAL API version number (Major)

◆ FLASH_API_VERSION_MINOR

#define FLASH_API_VERSION_MINOR (0U)
FLASH HAL API version number (Minor)

Typedef Documentation

◆ flash_ctrl_t

typedef void flash_ctrl_t

Flash control block. Allocate an instance specific control block to pass into the flash API calls.

Implemented as

- flash_lp_instance_ctrl_t
- flash_hp_instance_ctrl_t

Enumeration Type Documentation

◆ flash_event_t

enum flash_event_t

Event types returned by the ISR callback when used in Data Flash BGO mode

Enumerator	
FLASH_EVENT_ERASE_COMPLETE	Erase operation successfully completed.
FLASH_EVENT_WRITE_COMPLETE	Write operation successfully completed.
FLASH_EVENT_BLANK	Blank check operation successfully completed. Specified area is blank.
FLASH_EVENT_NOT_BLANK	Blank check operation successfully completed. Specified area is NOT blank.
FLASH_EVENT_ERR_DF_ACCESS	Data Flash operation failed. Can occur when writing an unerased section.
FLASH_EVENT_ERR_CF_ACCESS	Code Flash operation failed. Can occur when writing an unerased section.
FLASH_EVENT_ERR_CMD_LOCKED	Operation failed, FCU is in Locked state (often result of an illegal command)
FLASH_EVENT_ERR_FAILURE	Erase or Program Operation failed.
FLASH_EVENT_ERR_ONE_BIT	A 1-bit error has been corrected when reading the flash memory area by the sequencer.

◆ flash_id_code_mode_t

enum flash_id_code_mode_t	
ID Code Modes for writing to ID code registers	
Enumerator	
FLASH_ID_CODE_MODE_UNLOCKED	ID code is ignored.
FLASH_ID_CODE_MODE_LOCKED_WITH_ALL_ERASE_SUPPORT	ID code is checked. All erase is available.
FLASH_ID_CODE_MODE_LOCKED	ID code is checked.

◆ flash_result_t

enum flash_result_t	
Result type for certain operations	
Enumerator	
FLASH_RESULT_BLANK	Return status for Blank Check Function.
FLASH_RESULT_NOT_BLANK	Return status for Blank Check Function.
FLASH_RESULT_BGO_ACTIVE	Flash is configured for BGO mode. Result is returned in callback.

◆ flash_startup_area_swap_t

enum flash_startup_area_swap_t	
Parameter for specifying the startup area swap being requested by startupAreaSelect()	
Enumerator	
FLASH_STARTUP_AREA_BLOCK1	Startup area will be set to Block 1.
FLASH_STARTUP_AREA_BLOCK0	Startup area will be set to Block 0.
FLASH_STARTUP_AREA_BTFLG	Startup area will be set based on the value of the BTFLG.

flash_fmi_block_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Flash Interface

#include <r_flash_api.h>

Data Fields

uint32_t	block_section_st_addr starting address for this block section (blocks of this size)
uint32_t	block_section_end_addr ending address for this block section (blocks of this size)
uint32_t	block_size Flash erase block size.
uint32_t	block_size_write Flash write block size.

Detailed Description

Flash block details stored in factory flash.

The documentation for this struct was generated from the following file:

- r_flash_api.h

flash_fmi_regions_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Flash Interface

#include <r_flash_api.h>

Data Fields

uint32_t	num_regions Length of block info array.
flash_fmi_block_info_t const	p_block_array

*	Block info array base address.

Detailed Description

Flash block details

The documentation for this struct was generated from the following file:

Detailed Description

Shared Interface definition for FLASH

Field Documentation

◆ accessWindowClear

ssp_err_t(* flash_api_t::accessWindowClear) (flash_ctrl_t *const p_ctrl)

Clear any existing Code Flash access window for FLASH device.

Implemented as

- R_FLASH_LP_AccessWindowClear()
- R_FLASH_HP_AccessWindowClear()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.
[in]	start_addr	Determines the Starting block for the Code Flash access window.
[in]	end_addr	Determines the Ending block for the Code Flash access window.

◆ accessWindowSet

ssp_err_t(* flash_api_t::accessWindowSet) (flash_ctrl_t *const p_ctrl, uint32_t const start_addr, uint32_t const end_addr)

Set Access Window for FLASH device.

Implemented as

- R_FLASH_LP_AccessWindowSet()
- R_FLASH_HP_AccessWindowSet()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.
[in]	start_addr	Determines the Starting block for the Code Flash access window.
[in]	end_addr	Determines the Ending block for the Code Flash access window.

◆ blankCheck

ssp_err_t(* flash_api_t::blankCheck) (flash_ctrl_t *const p_ctrl, uint32_t const address, uint32_t const num_bytes, flash_result_t *const p_blank_check_result)

Blank check FLASH device.

Implemented as

- R_FLASH_LP_BlankCheck()
- R_FLASH_HP_BlankCheck()

Parameters

[in]	p_ctrl	Control for the FLASH device context.
[in]	address	The starting address of the Flash area to blank check.
[in]	num_bytes	Specifies the number of bytes that need to be checked. See the specific handler for details.
[out]	p_blank_check_result	Pointer that will be populated by the API with the results of the blank check operation in non-BGO (blocking) mode. In this case the blank check operation completes here and the result is returned. In Data Flash BGO mode the blank check operation is only started here and the result obtained later when the supplied callback routine is called. In this case FLASH_RESULT_BGO_ACTIVE will be returned in p_blank_check_result.

◆ close

ssp_err_t(* flash_api_t::close) (flash_ctrl_t *const p_ctrl)

Close FLASH device.

Implemented as

- R_FLASH_LP_Close()
- R_FLASH_HP_Close()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.

◆ erase

ssp_err_t(* flash_api_t::erase) (flash_ctrl_t *const p_ctrl, uint32_t const address, uint32_t const num_blocks)

Erase FLASH device.

Implemented as

R_FLASH_LP_Erase() R_FLASH_HP_Erase()

Parameters

[in]	p_ctrl	Control for the FLASH device.
[in]	address	The block containing this address is the first block erased.
[in]	num_blocks	Specifies the number of blocks to be erased, the starting block determined by the block_erase_address.

◆ idCodeSet

ssp_err_t(* flash_api_t::idCodeSet) (flash_ctrl_t *const p_ctrl, uint8_t const *const p_id_bytes, flash_id_code_mode_t mode)

Set ID Code for FLASH device. Setting the ID code can restrict access to the device. The ID code will be required to connect to the device. Bits 126 and 127 are set based on the mode. e.g. uint8_t id_bytes[] = {0x00, 0x11, 0x22, 0x33, 0x44, 0x55, 0x66, 0x77, 0x88, 0x99, 0xaa, 0xbb, 0xcc, 0xdd, 0xee, 0x00}; with mode FLASH_ID_CODE_MODE_LOCKED_WITH_ALL_ERASE_SUPPORT will result in an ID code of 00112233445566778899aabbccddeec0 and with mode FLASH_ID_CODE_MODE_LOCKED will result in an ID code of 00112233445566778899aabbccddee80

Implemented as

- R_FLASH_LP_IdCodeSet()
- R_FLASH_HP_IdCodeSet()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.
[in]	p_id_bytes	Ponter to the ID Code to be written.
[in]	mode	Mode used for checking the ID code.

◆ infoGet

ssp_err_t(* flash_api_t::infoGet) (flash_ctrl_t *const p_ctrl, flash_info_t *const p_info)

Close FLASH device.

Implemented as

- R_FLASH_LP_InfoGet()
- R_FLASH_HP_InfoGet()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.
[out]	p_info	Pointer to FLASH info structure.

◆ open

ssp_err_t(* flash_api_t::open) (flash_ctrl_t *const p_ctrl, flash_cfg_t const *const p_cfg)

Open FLASH device.

Implemented as

- R_FLASH_LP_Open()
- R_FLASH_HP_Open()

Parameters

[out]	p_ctrl	Pointer to FLASH device control. Must be declared by user. Value set here.
[in]	flash_cfg_t	Pointer to FLASH configuration structure. All elements of this structure must be set by the user.

◆ read

ssp_err_t(* flash_api_t::read) (flash_ctrl_t *const p_ctrl, uint8_t *const p_dest_address, uint32_t const flash_address, uint32_t const num_bytes)

Read FLASH device.

Implemented as

- R_FLASH_LP_Read()
- R_FLASH_HP_Read()

Parameters

[in]	p_ctrl	Control for the FLASH device context.
[in]	p_dest_address	Pointer to caller's destination buffer used to hold the data read from Flash.
[in]	flash_address	Code Flash or Data Flash starting address to read from.
[in]	num_bytes	The number of bytes to read.

◆ reset

ssp_err_t(* flash_api_t::reset) (flash_ctrl_t *const p_ctrl)

Reset function for FLASH device.

Implemented as

- R_FLASH_LP_Reset()
- R_FLASH_HP_Reset()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.

◆ startupAreaSelect

ssp_err_t(* flash_api_t::startupAreaSelect) (flash_ctrl_t *const p_ctrl, flash_startup_area_swap_t swap_type, bool is_temporary)

Select which block - Default (Block 0) or Alternate (Block 1) is used as the start-up area block.

Implemented as

- R_FLASH_LP_StartUpAreaSelect()
- R_FLASH_HP_StartUpAreaSelect()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.
[in]	swap_type	FLASH_STARTUP_AREA_BLOCK0, FLASH_STARTUP_AREA_BLOCK1 or FLASH_STARTUP_AREA_BTFLG.
[in]	is_temporary	True or false. See table below.

swap_type | is_temporary | Operation FLASH_STARTUP_AREA_BLOCK0: false On next reset Startup area will be Block 0.
FLASH_STARTUP_AREA_BLOCK0 | false | On next reset Startup area will be Block 0. Block 0.
FLASH_STARTUP_AREA_BLOCK1: false On next reset Startup area will be Block 1.
FLASH_STARTUP_AREA_BLOCK1 | true | Startup area is immediately, but temporarily switched to Block 1. Block 1.
FLASH_STARTUP_AREA_BTFLG | true | Startup area is immediately, but temporarily switched to... taken.
the Block determined by the Configuration BTFLG.

◆ statusGet

ssp_err_t(* flash_api_t::statusGet) (flash_ctrl_t *const p_ctrl)

Get Status for FLASH device.

Implemented as

- R_FLASH_LP_StatusGet()
- R_FLASH_HP_StatusGet()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.

◆ updateFlashClockFreq

ssp_err_t(* flash_api_t::updateFlashClockFreq) (flash_ctrl_t *const p_ctrl)

Update Flash clock frequency (FCLK) and recalculate timeout values

Implemented as

- R_FLASH_LP_UpdateFlashClockFreq()
- R_FLASH_HP_UpdateFlashClockFreq()

Parameters

[in]	p_ctrl	Pointer to FLASH device control.

◆ versionGet

ssp_err_t(* flash_api_t::versionGet) (ssp_version_t *p_version)

Get Flash driver version.

Implemented as

- R_FLASH_LP_VersionGet()
- R_FLASH_HP_VersionGet()

Parameters

[out]	p_version	Returns version.

◆ write

ssp_err_t(* flash_api_t::write) (flash_ctrl_t *const p_ctrl, uint32_t const src_address, uint32_t const flash_address, uint32_t const num_bytes)

Write FLASH device.

Implemented as

- R_FLASH_LP_Write()
- R_FLASH_HP_Write()

Parameters

[in]	p_ctrl	Control for the FLASH device context.
[in]	src_address	Address of the buffer containing the data to write to Flash.
[in]	flash_address	Code Flash or Data Flash address to write. The address must be on a programming line boundary.
[in]	num_bytes	The number of bytes to write. This number must be a multiple of the programming size. For Code Flash this is FLASH_MIN_PGM_SIZE_CF. For Data Flash this is FLASH_MIN_PGM_SIZE_DF.

Warning

Specifying a number that is not a multiple of the programming size will result in SF_FLASH_ERR_BYTES being returned and no data written.

5.1.4.16 FMI Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for reading on-chip factory information. More...

Data Structures

struct	fmi_api_t
struct	fmi_instance_t

Macros

#define	FMI_API_VERSION_MAJOR (2U)

Detailed Description

Interface for reading on-chip factory information.

Summary

The FMI (Factory MCU Information) module provides a function for reading the Product Information record.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

FMI Interface description: FMI Driver

Macro Definition Documentation

◆ FMI_API_VERSION_MAJOR

#define FMI_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

fmi_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » FMI Interface

#include <r_fmi_api.h>

Data Fields

ssp_err_t(*	init)(void)
ssp_err_t(*	productInfoGet)(fmi_product_info_t **pp_product_info)
ssp_err_t(*	uniqueIdGet)(fmi_unique_id_t *p_unique_id)
ssp_err_t(*	productFeatureGet)(ssp_feature_t const *const p_feature, fmi_feature_info_t *const p_info)
ssp_err_t(*	eventInfoGet)(ssp_feature_t const *const p_feature, ssp_signal_t signal, fmi_event_info_t *const p_info)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

fmi driver structure. General fmi functions implemented at the HAL layer will follow this API.

Field Documentation

◆ eventInfoGet

ssp_err_t(* fmi_api_t::eventInfoGet) (ssp_feature_t const *const p_feature, ssp_signal_t signal, fmi_event_info_t *const p_info)

Get event information and store it in p_info.

Parameters

[in]	p_feature	Definition of SSP feature.
[in]	signal	Feature signal ID.
[out]	p_info	Event information for feature signal.

Implemented as

- R_FMI_EventInfoGet()

◆ init

ssp_err_t(* fmi_api_t::init) (void)

Initialize the FMI base pointer.

Implemented as

- R_FMI_Init()

◆ productFeatureGet

ssp_err_t(* fmi_api_t::productFeatureGet) (ssp_feature_t const *const p_feature, fmi_feature_info_t *const p_info)

Get feature information and store it in p_info.

Parameters

[in]	p_feature	Definition of SSP feature.
[out]	p_info	Feature specific information.

Implemented as

- R_FMI_ProductFeatureGet()

◆ productInfoGet

ssp_err_t(* fmi_api_t::productInfoGet) (fmi_product_info_t **pp_product_info)

Get product information record address into caller's pointer.

Warning

fmi_product_info_t::unique_id is deprecated and will not contain a unique ID if the factory MCU information is linked in by the application code. Use fmi_api_t::uniqueIdGet for the unique ID.

Parameters

[in,out]	pp_product_info	Pointer to store pointer to product info.

Implemented as

- R_FMI_ProductInfoGet()

◆ uniqueIdGet

ssp_err_t(* fmi_api_t::uniqueIdGet) (fmi_unique_id_t *p_unique_id)

Copy unique ID into p_unique_id.

Parameters

[out]	p_unique_id	Pointer to unique ID.

Implemented as

- R_FMI_UniqueIdGet()

◆ versionGet

ssp_err_t(* fmi_api_t::versionGet) (ssp_version_t *const p_version)

Get the driver version based on compile time macros.

Implemented as

- R_FMI_VersionGet()

enum	i2c_hw_err_event_t { I2C_HW_ERR_EVENT_TIMEOUT = 1, I2C_HW_ERR_EVENT_ARBITRATION_LOSS = 2, I2C_HW_ERR_EVENT_NACK = 16, I2C_HW_ERR_EVENT_UNDEFINED = 255 }

Detailed Description

Interface for I2C communication.

Summary

The I2C master interface provides a common API for I2C HAL drivers. The I2C master interface supports:

- Interrupt driven transmit/receive processing
- Callback function support which can return an event code

Implemented by:

- Simple I2C on SCI
- IIC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

I2C Interface description: I2C Master Driver and I2C Slave Driver

Typedef Documentation

◆ i2c_ctrl_t

typedef void i2c_ctrl_t
I2C control block. Allocate an instance specific control block to pass into the I2C API calls. **Implemented as** ◦ sci_i2c_instance_ctrl_t ◦ riic_instance_ctrl_t

Enumeration Type Documentation

◆ i2c_addr_mode_t

enum i2c_addr_mode_t	
Addressing mode options	
Enumerator	
I2C_ADDR_MODE_7BIT	Use 7-bit addressing mode.
I2C_ADDR_MODE_10BIT	Use 10-bit addressing mode.

◆ i2c_event_t

enum i2c_event_t	
Callback events	
Enumerator	
I2C_EVENT_ABORTED	A transfer was aborted.
I2C_EVENT_RX_COMPLETE	A receive operation was completed successfully.
I2C_EVENT_TX_COMPLETE	A transmit operation was completed successfully.
I2C_SLAVE_EVENT_RX_REQUEST	A read operation expected from slave. Detected a write from master.
I2C_SLAVE_EVENT_TX_REQUEST	A write operation expected from slave. Detected a read from master.
I2C_SLAVE_EVENT_RX_MORE_REQUEST	A read operation expected from slave. Master sends out more data than configured to be read in slave.
I2C_SLAVE_EVENT_TX_MORE_REQUEST	A write operation expected from slave. Master requests more data than configured to be written by slave.

◆ i2c_hw_err_event_t

enum i2c_hw_err_event_t	
RIIC master hardware error callback events	
Enumerator	
I2C_HW_ERR_EVENT_TIMEOUT	Timeout generated during transfer.
I2C_HW_ERR_EVENT_ARBITRATION_LOSS	Arbitration loss.
I2C_HW_ERR_EVENT_NACK	NACK event generation.
I2C_HW_ERR_EVENT_UNDEFINED	Error not defined.

◆ i2c_rate_t

enum i2c_rate_t	
Communication speed options	
Enumerator	
I2C_RATE_STANDARD	100 kHz
I2C_RATE_FAST	400 kHz
I2C_RATE_FASTPLUS	1 MHz

ssp_err_t(*	reset)(i2c_ctrl_t *const p_ctrl)
ssp_err_t(*	slaveAddressSet)(i2c_ctrl_t *const p_ctrl, uint16_t const slave, i2c_addr_mode_t const addr_mode)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Interface definition for I2C access as master

Field Documentation

◆ close

ssp_err_t(* i2c_api_master_t::close) (i2c_ctrl_t *const p_ctrl)

Closes the driver and releases the I2C device.

Implemented as

- R_RIIC_MasterClose()
- R_SCI_SIIC_MasterClose()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_master_t::open call.

◆ open

ssp_err_t(* i2c_api_master_t::open) (i2c_ctrl_t *const p_ctrl, i2c_cfg_t const *const p_cfg)

Opens the I2C driver and initializes the hardware.

Implemented as

- R_RIIC_MasterOpen()
- R_SCI_SIIC_MasterOpen()

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements are set here.
[in]	p_cfg	Pointer to configuration structure.

◆ read

ssp_err_t(* i2c_api_master_t::read) (i2c_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes, bool const restart)

Performs a read operation on an I2C device.

Implemented as

- R_RIIC_MasterRead()
- R_SCI_SIIC_MasterRead()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_master_t::open call.
[in]	p_dest	Pointer to the location to store read data.
[in]	bytes	Number of bytes to read.
[in]	restart	Specify if the restart condition should be issued after reading.

◆ reset

ssp_err_t(* i2c_api_master_t::reset) (i2c_ctrl_t *const p_ctrl)

Performs a reset of the peripheral.

Implemented as

- R_RIIC_MasterReset()
- R_SCI_SIIC_MasterReset()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_master_t::open call.

◆ slaveAddressSet

ssp_err_t(* i2c_api_master_t::slaveAddressSet) (i2c_ctrl_t *const p_ctrl, uint16_t const slave, i2c_addr_mode_t const addr_mode)

Sets address of the slave device without reconfiguring the bus.

Implemented as

- R_RIIC_MasterSlaveAddressSet()
- R_SCI_SIIC_MasterSlaveAddressSet()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_master_t::open call.
[in]	slave_address	Address of the slave device.
[in]	address_mode	Addressing mode.

◆ versionGet

ssp_err_t(* i2c_api_master_t::versionGet) (ssp_version_t *const p_version)

Gets version information and stores it in the provided version struct.

Implemented as

- R_RIIC_MasterVersionGet()
- R_SCI_SIIC_MasterVersionGet()

Parameters

[out]	p_version	Code and API version used.

◆ write

ssp_err_t(* i2c_api_master_t::write) (i2c_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes, bool const restart)

Performs a write operation on an I2C device.

Implemented as

- R_RIIC_MasterWrite()
- R_SCI_SIIC_MasterWrite()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_master_t::open call.
[in]	p_src	Pointer to the location to get write data from.
[in]	bytes	Number of bytes to write.
[in]	restart	Specify if the restart condition should be issued after writing.

The documentation for this struct was generated from the following file:

- r_i2c_api.h

i2c_api_slave_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I2C Interface

ssp_err_t(*	masterReadSlaveWrite)(i2c_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)

ssp_err_t(* versionGet)(ssp_version_t *const p_version)

Detailed Description

Interface definition for I2C access as slave

Field Documentation

◆ close

ssp_err_t(* i2c_api_slave_t::close) (i2c_ctrl_t *const p_ctrl)

Closes the driver and releases the I2C device.

Implemented as

- R_RIIC_SlaveClose()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_slave_t::open call.

◆ masterReadSlaveWrite

ssp_err_t(* i2c_api_slave_t::masterReadSlaveWrite) (i2c_ctrl_t *const p_ctrl, uint8_t *const p_src, uint32_t const bytes)

Performs a write operation on an I2C device.

Implemented as

- R_RIIC_MasterReadSlaveWrite()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_slave_t::open call.
[in]	p_src	Pointer to the location to get write data from.
[in]	bytes	Number of bytes to write.

◆ masterWriteSlaveRead

ssp_err_t(* i2c_api_slave_t::masterWriteSlaveRead) (i2c_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const bytes)

Performs a read operation on an I2C device.

Implemented as

- R_RIIC_MasterWriteSlaveRead()

Parameters

[in]	p_ctrl	Pointer to control block set in i2c_api_slave_t::open call.
[in]	p_dest	Pointer to the location to store read data.
[in]	bytes	Number of bytes to read.

◆ open

ssp_err_t(* i2c_api_slave_t::open) (i2c_ctrl_t *const p_ctrl, i2c_cfg_t const *const p_cfg)

Opens the I2C driver and initializes the hardware.

Implemented as

- R_RIIC_SlaveOpen()

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements are set here.
[in]	p_cfg	Pointer to configuration structure.

◆ versionGet

ssp_err_t(* i2c_api_slave_t::versionGet) (ssp_version_t *const p_version)

Gets version information and stores it in the provided version struct.

Implemented as

- R_RIIC_SlaveVersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_i2c_api.h

i2c_master_instance_t Struct Reference

Macro Definition Documentation

◆ I2S_API_VERSION_MAJOR

#define I2S_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

Typedef Documentation

◆ i2s_ctrl_t

typedef void i2s_ctrl_t
I2S control block. Allocate an instance specific control block to pass into the I2S API calls. **Implemented as** ◦ ssi_instance_ctrl_t

Enumeration Type Documentation

◆ i2s_dir_t

enum i2s_dir_t	
I2S communication direction	
Enumerator	
I2S_DIR_TX	Transmit direction only.
I2S_DIR_RX	Receive direction only.
I2S_DIR_TX_RX	Transmit and receive direction.

◆ i2s_event_t

enum i2s_event_t	
Events that can trigger a callback function	
Enumerator	
I2S_EVENT_IDLE	Communication is idle.
I2S_EVENT_TX_EMPTY	Transmit buffer is below FIFO trigger level.
I2S_EVENT_RX_FULL	Receive buffer is above FIFO trigger level.

◆ i2s_mode_t

enum i2s_mode_t	
I2S communication mode	
Enumerator	
I2S_MODE_SLAVE	Slave mode.
I2S_MODE_MASTER	Master mode.

◆ i2s_mute_t

enum i2s_mute_t	
Mute audio samples.	
Enumerator	
I2S_MUTE_ON	Enable mute.
I2S_MUTE_OFF	Disable mute.

◆ i2s_pcm_width_t

enum i2s_pcm_width_t	
Audio PCM width	
Enumerator	
I2S_PCM_WIDTH_8_BITS	Using 8-bit PCM.
I2S_PCM_WIDTH_16_BITS	Using 16-bit PCM.
I2S_PCM_WIDTH_18_BITS	Using 18-bit PCM.
I2S_PCM_WIDTH_20_BITS	Using 20-bit PCM.
I2S_PCM_WIDTH_22_BITS	Using 22-bit PCM.
I2S_PCM_WIDTH_24_BITS	Using 24-bit PCM.

◆ i2s_status_t

enum i2s_status_t	
Possible status values returned by i2s_api_t::infoGet.	
Enumerator	
I2S_STATUS_IN_USE	I2S is in use.
I2S_STATUS_STOPPED	I2S is stopped.

◆ i2s_word_length_t

enum i2s_word_length_t	
Audio system word length.	
Enumerator	
I2S_WORD_LENGTH_8_BITS	Using 8-bit system word length.
I2S_WORD_LENGTH_16_BITS	Using 16-bit system word length.
I2S_WORD_LENGTH_24_BITS	Using 24-bit system word length.
I2S_WORD_LENGTH_32_BITS	Using 32-bit system word length.

◆ i2s_ws_continue_t

enum i2s_ws_continue_t	
Whether to continue WS (word select line) transmission during idle state.	
Enumerator	
I2S_WS_CONTINUE_ON	Enable WS continue mode.
I2S_WS_CONTINUE_OFF	Disable WS continue mode.

i2s_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I2S Interface

#include <r_i2s_api.h>

Data Fields

void const *	p_context
i2s_event_t	event The event can be used to identify what caused the callback (overflow or error).

Detailed Description

Callback function parameter data

Field Documentation

◆ p_context

void const* i2s_callback_args_t::p_context
Placeholder for user data. Set in i2s_api_t::open function in i2s_cfg_t.

The documentation for this struct was generated from the following file:

- r_i2s_api.h

i2s_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I2S Interface

#include <r_i2s_api.h>

Data Fields

uint32_t	sampling_freq_hz Sampling frequency in Hertz.

Detailed Description

Timer information structure to store various information for an I2S instance.

The documentation for this struct was generated from the following file:

- r_i2s_api.h

i2s_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I2S Interface

#include <r_i2s_api.h>

Data Fields

uint8_t	channel
i2s_pcm_width_t	pcm_width Audio PCM data width.
i2s_word_length_t	word_length Audio word length, bits must be >= i2s_cfg_t::pcm_width bits.
i2s_ws_continue_t	ws_continue Whether to continue WS transmission during idle state.
uint32_t	sampling_freq_hz Sampling frequency in Hertz.
i2s_mode_t	operating_mode Operating mode selection (i.e., Master/Slave mode)
uint32_t	audio_clk_freq_hz
timer_instance_t const *	p_timer
transfer_instance_t const *	p_transfer_tx
transfer_instance_t const *	p_transfer_rx
void(*	p_callback)(i2s_callback_args_t *p_args)

void const *	p_context
void const *	p_extend Extension parameter for hardware specific settings.
uint8_t	rxi_ipl Receive interrupt priority.
uint8_t	txi_ipl Transmit interrupt priority.
uint8_t	idle_err_ipl Idle/Error interrupt priority.

Detailed Description

User configuration structure, used in open function

Field Documentation

◆ audio_clk_freq_hz

uint32_t i2s_cfg_t::audio_clk_freq_hz
Audio clock frequency in Hertz. Must be a multiple between 1 and 128 of (16 * i2s_cfg_t::sampling_freq_hz * (i2s_cfg_t::word_length <enum_value> + 1)

◆ channel

uint8_t i2s_cfg_t::channel
Select a channel corresponding to the channel number of the hardware.

◆ p_callback

void(* i2s_cfg_t::p_callback) (i2s_callback_args_t *p_args)
Callback provided when an I2S ISR occurs. Set to NULL for no CPU interrupt.

◆ p_context

void const* i2s_cfg_t::p_context
Placeholder for user data. Passed to the user callback in i2s_callback_args_t.

◆ p_timer

timer_instance_t const* i2s_cfg_t::p_timer
To generate audio clock with GPT, link a timer instance here. Set to NULL if unused.

◆ p_transfer_rx

transfer_instance_t const* i2s_cfg_t::p_transfer_rx
To use DTC during read, link a DTC instance here. Set to NULL if unused.

◆ p_transfer_tx

transfer_instance_t const* i2s_cfg_t::p_transfer_tx
To use DTC during write, link a DTC instance here. Set to NULL if unused.

The documentation for this struct was generated from the following file:

ssp_err_t(*	close)(i2s_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

I2S functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* i2s_api_t::close) (i2s_ctrl_t *const p_ctrl)

Allows driver to be reconfigured and may reduce power consumption.

Implemented as

- R_SSI_Close()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.

◆ infoGet

ssp_err_t(* i2s_api_t::infoGet) (i2s_ctrl_t *const p_ctrl, i2s_info_t *const p_info)

Get instance specific information and store it in provided pointer p_info.

Implemented as

- R_SSI_InfoGet()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[out]	p_info	Collection of information for this instance.

◆ mute

ssp_err_t(* i2s_api_t::mute) (i2s_ctrl_t *const p_ctrl, i2s_mute_t const mute_enable)

Enable or disable mute.

Implemented as

- R_SSI_Mute()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	mute_enable	Whether to enable or disable mute.

◆ open

ssp_err_t(* i2s_api_t::open) (i2s_ctrl_t *const p_ctrl, i2s_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_SSI_Open()

Precondition

Peripheral clocks and any required output pins should be configured prior to calling this function.

Note

To reconfigure after calling this function, call i2s_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ read

ssp_err_t(* i2s_api_t::read) (i2s_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint16_t const bytes)

Read I2S data. Reception is complete when callback is called with I2S_EVENT_RX_EMPTY.

Implemented as

- R_SSI_Read()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_dest	Buffer to store PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, receive will stop at the multiple of 8 below requested bytes.

◆ stop

ssp_err_t(* i2s_api_t::stop) (i2s_ctrl_t *const p_ctrl, i2s_dir_t const dir)

Stop communication. Transmission is stopped when callback is called with I2S_EVENT_IDLE. Reception is stopped when callback is called with I2S_EVENT_RX_EMPTY.

Implemented as

- R_SSI_Stop()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	dir	Direction of communication to stop.

◆ versionGet

ssp_err_t(* i2s_api_t::versionGet) (ssp_version_t *const p_version)

Get version and store it in provided pointer p_version.

Implemented as

- R_SSI_VersionGet()

Parameters

[out]	p_version	Code and API version used.

◆ write

ssp_err_t(* i2s_api_t::write) (i2s_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint16_t const bytes)

Write I2S data. All transmit data is queued when callback is called with I2S_EVENT_TX_EMPTY. Transmission is complete when callback is called with I2S_EVENT_IDLE.

Implemented as

- R_SSI_Write()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_src	Buffer of PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffer. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8.

◆ writeRead

ssp_err_t(* i2s_api_t::writeRead) (i2s_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint8_t *const p_dest, uint16_t const bytes)

Simultaneously write and read I2S data. Transmission and reception are complete when callback is called with I2S_EVENT_IDLE.

Implemented as

- R_SSI_WriteRead()

Parameters

[in]	p_ctrl	Control block set in i2s_api_t::open call for this instance.
[in]	p_src	Buffer of PCM samples. Must be 4 byte aligned.
[in]	p_dest	Buffer to store PCM samples. Must be 4 byte aligned.
[in]	bytes	Number of bytes in the buffers. Recommended requesting a multiple of 8 bytes. If not a multiple of 8, padding 0s will be added to transmission to make it a multiple of 8, and receive will stop at the multiple of 8 below requested bytes.

enum	input_capture_status_t { INPUT_CAPTURE_STATUS_IDLE, INPUT_CAPTURE_STATUS_CAPTURING }
enum	input_capture_variant_t { INPUT_CAPTURE_VARIANT_32_BIT, INPUT_CAPTURE_VARIANT_16_BIT }

Detailed Description

Interface for sampling input signals for pulse width.

Summary

The input capture interface provides for sampling of input signals to determine the width of a pulse (from one edge to the opposite edge). An interrupt can be triggered after each measurement is captured.

Implemented by:

- GPT Input Capture
- AGT Input Capture

See also: Timer Interface

Related SSP architecture topics:

- Using SSP Modules

Macro Definition Documentation

◆ info_capture_info_t

#define info_capture_info_t input_capture_info_t
Mapping of deprecated info_capture_info_t.

Typedef Documentation

◆ input_capture_ctrl_t

typedef void input_capture_ctrl_t
Input capture control block. Allocate an instance specific control block to pass into the input capture API calls. **Implemented as** ◦ gpt_input_capture_instance_ctrl_t ◦ agt_input_capture_instance_ctrl_t

Enumeration Type Documentation

◆ input_capture_event_t

enum input_capture_event_t	
Events that can trigger a callback function	
Enumerator	
INPUT_CAPTURE_EVENT_MEASUREMENT	A capture measurement has been captured.
INPUT_CAPTURE_EVENT_OVERFLOW	A capture measurement overflowed the counter.

◆ input_capture_mode_t

enum input_capture_mode_t	
Input capture operational modes	
Enumerator	
INPUT_CAPTURE_MODE_PULSE_WIDTH	Measure a signal pulse width.
INPUT_CAPTURE_MODE_PERIOD	Measure a signal Cycle period.
INPUT_CAPTURE_MODE_PULSE_COUNT	Measure a signal event count.

◆ input_capture_repetition_t

enum input_capture_repetition_t	
Specifies either a one-time or continuous measurements	
Enumerator	
INPUT_CAPTURE_REPETITION_PERIODIC	Capture continuous measurements, until explicitly stopped or disabled.
INPUT_CAPTURE_REPETITION_ONE_SHOT	Capture a single measurement, then interrupts are disabled.

◆ input_capture_signal_edge_t

enum input_capture_signal_edge_t	
Input capture signal edge trigger	
Enumerator	
INPUT_CAPTURE_SIGNAL_EDGE_RISING	The capture begins at the rising edge.
INPUT_CAPTURE_SIGNAL_EDGE_FALLING	The capture begins at the falling edge.

◆ input_capture_signal_level_t

enum input_capture_signal_level_t	
Input capture signal level, primarily used for the enable signal	
Enumerator	
INPUT_CAPTURE_SIGNAL_LEVEL_NONE	Use this if signal_level is not applicable to a particular measurement.
INPUT_CAPTURE_SIGNAL_LEVEL_LOW	The capture is enabled at the low level.
INPUT_CAPTURE_SIGNAL_LEVEL_HIGH	The capture is enabled at the high level.

◆ input_capture_status_t

enum input_capture_status_t	
Input capture status.	
Enumerator	
INPUT_CAPTURE_STATUS_IDLE	The input capture timer is idle.
INPUT_CAPTURE_STATUS_CAPTURING	A capture measurement is in progress.

◆ input_capture_variant_t

enum input_capture_variant_t	
Input capture timer variant types.	
Enumerator	
INPUT_CAPTURE_VARIANT_32_BIT	32-bit timer
INPUT_CAPTURE_VARIANT_16_BIT	16-bit timer

input_capture_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

uint8_t	channel The channel being used.
input_capture_event_t	event The event that caused the interrupt and callback.
uint32_t	counter The value of the timer captured at the time of interrupt.
uint32_t	overflows

	The number of counter overflows that occurred during this measurement.
void const *	p_context Placeholder for user data, set in input_capture_cfg_t::p_context.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

input_capture_capture_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

uint32_t	counter The value of the timer captured at the time of interrupt.
uint32_t	overflows The number of counter overflows that occurred during this measurement.

Detailed Description

Capture data

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

input_capture_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

input_capture_status_t	status Whether or not a capture is in progress.
input_capture_variant_t	variant Whether timer is 16 or 32 bits.

Detailed Description

Driver information

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

input_capture_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

uint8_t	channel The channel in use.
uint8_t	capture_irq_ipl Capture interrupt priority.
uint8_t	overflow_irq_ipl Overflow interrupt priority.

input_capture_mode_t	mode The mode of measurement to be performed.
input_capture_signal_edge_t	edge The triggering edge to start a measurement (rise or fall).
input_capture_repetition_t	repetition One-shot or periodic measurement.
bool	autostart Specifies whether interrupts are enabled or not after open.
void const *	p_extend
void(*	p_callback)(input_capture_callback_args_t *p_args)
void const *	p_context Pointer to user's context data, to be passed to the callback.

Detailed Description

User configuration structure, passed to input_capture_api_t::open function

Field Documentation

◆ p_callback

void(* input_capture_cfg_t::p_callback) (input_capture_callback_args_t *p_args)
Pointer to user's callback function, or NULL if no interrupt desired.

◆ p_extend

void const* input_capture_cfg_t::p_extend
REQUIRED. Pointer to peripheral-specific extension parameters. See gpt_input_capture_extend_t for GPT.

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

input_capture_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

ssp_err_t(*	open)(input_capture_ctrl_t *const p_ctrl, input_capture_cfg_t const *const p_cfg)
ssp_err_t(*	disable)(input_capture_ctrl_t const *const p_ctrl)
ssp_err_t(*	enable)(input_capture_ctrl_t const *const p_ctrl)
ssp_err_t(*	infoGet)(input_capture_ctrl_t const *const p_ctrl, input_capture_info_t *const p_info)
ssp_err_t(*	lastCaptureGet)(input_capture_ctrl_t const *const p_ctrl, input_capture_capture_t *const p_counter)
ssp_err_t(*	close)(input_capture_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Input capture API structure. Functions implemented at the HAL layer will implement this API.

Field Documentation

◆ close

ssp_err_t(* input_capture_api_t::close) (input_capture_ctrl_t *const p_ctrl)

Close the input capture operation. Allows driver to be reconfigured, and may reduce power consumption.

Implemented as

- R_GPT_InputCaptureClose()
- R_AGT_InputCaptureClose()

Parameters

[in]	p_ctrl	Pointer to control block initialized by input_capture_api_t::open call.

◆ disable

ssp_err_t(* input_capture_api_t::disable) (input_capture_ctrl_t const *const p_ctrl)

Disables input capture measurement.

Implemented as

- R_GPT_InputCaptureDisable()
- R_AGT_InputCaptureDisable()

Parameters

[in]	p_ctrl	Pointer to control block initialized by input_capture_api_t::open call.

◆ enable

ssp_err_t(* input_capture_api_t::enable) (input_capture_ctrl_t const *const p_ctrl)

Enables input capture measurement.

Implemented as

- R_GPT_InputCaptureEnable()
- R_AGT_InputCaptureEnable()

Parameters

[in]	p_ctrl	Pointer to control block initialized by input_capture_api_t::open call.

Note

Interrupts may already be enabled if specified by input_capture_cfg_t::irq_enable.

◆ infoGet

ssp_err_t(* input_capture_api_t::infoGet) (input_capture_ctrl_t const *const p_ctrl, input_capture_info_t *const p_info)

Gets the status (running or not) of the measurement counter.

Implemented as

- R_GPT_InputCaptureInfoGet()
- R_AGT_InputCaptureInfoGet()

Parameters

[in]	p_ctrl	Pointer to control block initialized by input_capture_api_t::open call.
[out]	p_info	Pointer to returned status. Result will be one of input_capture_status_t.

◆ lastCaptureGet

ssp_err_t(* input_capture_api_t::lastCaptureGet) (input_capture_ctrl_t const *const p_ctrl, input_capture_capture_t *const p_counter)

Gets the last captured timer/counter value

Implemented as

- R_GPT_InputCaptureLastCaptureGet()
- R_AGT_InputCaptureLastCaptureGet()

Parameters

[in]	p_ctrl	Pointer to control block initialized by input_capture_api_t::open call.
[out]	p_counter	Pointer to location to store last captured counter value.

◆ open

ssp_err_t(* input_capture_api_t::open) (input_capture_ctrl_t *const p_ctrl, input_capture_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_GPT_InputCaptureOpen()
- R_AGT_InputCaptureOpen()

Note

To reconfigure after calling this function, call input_capture_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control block: memory allocated by caller, contents filled in by open.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ versionGet

ssp_err_t(* input_capture_api_t::versionGet) (ssp_version_t *const p_version)
Gets the version of this API and stores it in structure pointed to by p_version. **Implemented as** ◦ R_GPT_InputCaptureVersionGet() ◦ R_AGT_InputCaptureVersionGet() **Parameters** [out] p_version Code and API version used.

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

input_capture_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Input Capture Interface

#include <r_input_capture_api.h>

Data Fields

input_capture_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
input_capture_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
input_capture_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_input_capture_api.h

	}

Detailed Description

Interface for accessing I/O ports and configuring I/O functionality.

The IOPort shared interface provides the ability to access the IOPorts of a device at both bit and port level. Port and pin direction can be changed.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

IOPORT Interface description: I/O Port Driver

Typedef Documentation

◆ ioport_size_t

typedef uint16_t ioport_size_t
IO port size on this device. IO port type used with ports

Enumeration Type Documentation

◆ ioport_cfg_options_t

enum ioport_cfg_options_t	
Options to configure pin functions	
Enumerator	
IOPORT_CFG_PORT_DIRECTION_INPUT	Sets the pin direction to input (default)
IOPORT_CFG_PORT_DIRECTION_OUTPUT	Sets the pin direction to output.
IOPORT_CFG_PORT_OUTPUT_LOW	Sets the pin level to low.
IOPORT_CFG_PORT_OUTPUT_HIGH	Sets the pin level to high.
IOPORT_CFG_PULLUP_ENABLE	Enables the pin's internal pull-up.
IOPORT_CFG_PIM_TTL	Enables the pin's input mode.
IOPORT_CFG_NMOS_ENABLE	Enables the pin's NMOS open-drain output.
IOPORT_CFG_PMOS_ENABLE	Enables the pin's PMOS open-drain ouput.
IOPORT_CFG_DRIVE_MID	Sets pin drive output to medium.
IOPORT_CFG_DRIVE_MID_IIC	Sets pin to drive output needed for IIC on a 20mA port.
IOPORT_CFG_DRIVE_HIGH	Sets pin drive output to high.
IOPORT_CFG_EVENT_RISING_EDGE	Sets pin event trigger to rising edge.
IOPORT_CFG_EVENT_FALLING_EDGE	Sets pin event trigger to falling edge.
IOPORT_CFG_EVENT_BOTH_EDGES	Sets pin event trigger to both edges.
IOPORT_CFG_IRQ_ENABLE	Sets pin as an IRQ pin.
IOPORT_CFG_ANALOG_ENABLE	Enables pin to operate as an analog pin.
IOPORT_CFG_PERIPHERAL_PIN	Enables pin to operate as a peripheral pin.

◆ ioport_direction_t

enum ioport_direction_t	
Direction of individual pins	
Enumerator	
IOPORT_DIRECTION_INPUT	Input.
IOPORT_DIRECTION_OUTPUT	Output.

◆ ioport_ethernet_channel_t

enum ioport_ethernet_channel_t	
Superset of Ethernet channels.	
Enumerator	
IOPORT_ETHERNET_CHANNEL_0	Used to select Ethernet channel 0.
IOPORT_ETHERNET_CHANNEL_1	Used to select Ethernet channel 1.
IOPORT_ETHERNET_CHANNEL_END	Marks end of enum - used by parameter checking.

◆ ioport_ethernet_mode_t

enum ioport_ethernet_mode_t	
Superset of Ethernet PHY modes.	
Enumerator	
IOPORT_ETHERNET_MODE_MII	Ethernet PHY mode set to MII.
IOPORT_ETHERNET_MODE_RMII	Ethernet PHY mode set to RMII.
IOPORT_ETHERNET_MODE_END	Marks end of enum - used by parameter checking.

◆ ioport_level_t

enum ioport_level_t	
Levels that can be set and read for individual pins	
Enumerator	
IOPORT_LEVEL_LOW	Low.
IOPORT_LEVEL_HIGH	High.

◆ ioport_peripheral_t

enum ioport_peripheral_t	
Superset of all peripheral functions.	
Enumerator	
IOPORT_PERIPHERAL_IO	Pin will functions as an IO pin.
IOPORT_PERIPHERAL_DEBUG	Pin will function as a DEBUG pin.
IOPORT_PERIPHERAL_AGT	Pin will function as an AGT.
IOPORT_PERIPHERAL_GPT0	Pin will function as a GPT.
IOPORT_PERIPHERAL_GPT1	Pin will function as a GPT.
IOPORT_PERIPHERAL_SCI0_2_4_6_8	Pin will function as an SCI.
IOPORT_PERIPHERAL_SCI1_3_5_7_9	Pin will function as an SCI.
IOPORT_PERIPHERAL_RSPI	Pin will function as a RSPI.
IOPORT_PERIPHERAL_RIIC	Pin will function as a RIIC.
IOPORT_PERIPHERAL_KEY	Pin will function as a KEY.
IOPORT_PERIPHERAL_CLKOUT_COMP_RTC	Pin will function as a.
IOPORT_PERIPHERAL_CAC_AD	Pin will function as a CAC/ADC.
IOPORT_PERIPHERAL_BUS	Pin will function as a BUS.
IOPORT_PERIPHERAL_CTSU	Pin will function as a CTSU.
IOPORT_PERIPHERAL_LCDC	Pin will function as a segment LCD.

IOPORT_PERIPHERAL_DALI	Pin will function as a DALI.
IOPORT_PERIPHERAL_CAN	Pin will function as a CAN.
IOPORT_PERIPHERAL_QSPI	Pin will function as a QSPI.
IOPORT_PERIPHERAL_SSI	Pin will function as an SSI.
IOPORT_PERIPHERAL_USB_FS	Pin will function as a USB.
IOPORT_PERIPHERAL_USB_HS	Pin will function as a USB.
IOPORT_PERIPHERAL_SDHI_MMC	Pin will function as an SD/MMC.
IOPORT_PERIPHERAL_ETHER_MII	Pin will function as an Ethernet.
IOPORT_PERIPHERAL_ETHER_RMII	Pin will function as an Ethernet.
IOPORT_PERIPHERAL_PDC	Pin will function as a PDC.
IOPORT_PERIPHERAL_LCD_GRAPHICS	Pin will function as a graphics.
IOPORT_PERIPHERAL_TRACE	Pin will function as a debug trace.
IOPORT_PERIPHERAL_END	Marks end of enum - used by.

◆ ioport_port_pin_t

enum ioport_port_pin_t	
Superset list of all possible IO port pins.	
Enumerator	
IOPORT_PORT_00_PIN_00	IO port 0 pin 0.
IOPORT_PORT_00_PIN_01	IO port 0 pin 1.
IOPORT_PORT_00_PIN_02	IO port 0 pin 2.
IOPORT_PORT_00_PIN_03	IO port 0 pin 3.
IOPORT_PORT_00_PIN_04	IO port 0 pin 4.
IOPORT_PORT_00_PIN_05	IO port 0 pin 5.
IOPORT_PORT_00_PIN_06	IO port 0 pin 6.

IOPORT_PORT_00_PIN_07	IO port 0 pin 7.
IOPORT_PORT_00_PIN_08	IO port 0 pin 8.
IOPORT_PORT_00_PIN_09	IO port 0 pin 9.
IOPORT_PORT_00_PIN_10	IO port 0 pin 10.
IOPORT_PORT_00_PIN_11	IO port 0 pin 11.
IOPORT_PORT_00_PIN_12	IO port 0 pin 12.
IOPORT_PORT_00_PIN_13	IO port 0 pin 13.
IOPORT_PORT_00_PIN_14	IO port 0 pin 14.
IOPORT_PORT_00_PIN_15	IO port 0 pin 15.
IOPORT_PORT_01_PIN_00	IO port 1 pin 0.
IOPORT_PORT_01_PIN_01	IO port 1 pin 1.
IOPORT_PORT_01_PIN_02	IO port 1 pin 2.
IOPORT_PORT_01_PIN_03	IO port 1 pin 3.
IOPORT_PORT_01_PIN_04	IO port 1 pin 4.
IOPORT_PORT_01_PIN_05	IO port 1 pin 5.
IOPORT_PORT_01_PIN_06	IO port 1 pin 6.
IOPORT_PORT_01_PIN_07	IO port 1 pin 7.
IOPORT_PORT_01_PIN_08	IO port 1 pin 8.
IOPORT_PORT_01_PIN_09	IO port 1 pin 9.
IOPORT_PORT_01_PIN_10	IO port 1 pin 10.
IOPORT_PORT_01_PIN_11	IO port 1 pin 11.
IOPORT_PORT_01_PIN_12	IO port 1 pin 12.
IOPORT_PORT_01_PIN_13	IO port 1 pin 13.
IOPORT_PORT_01_PIN_14	IO port 1 pin 14.

IOPORT_PORT_01_PIN_15	IO port 1 pin 15.
IOPORT_PORT_02_PIN_00	IO port 2 pin 0.
IOPORT_PORT_02_PIN_01	IO port 2 pin 1.
IOPORT_PORT_02_PIN_02	IO port 2 pin 2.
IOPORT_PORT_02_PIN_03	IO port 2 pin 3.
IOPORT_PORT_02_PIN_04	IO port 2 pin 4.
IOPORT_PORT_02_PIN_05	IO port 2 pin 5.
IOPORT_PORT_02_PIN_06	IO port 2 pin 6.
IOPORT_PORT_02_PIN_07	IO port 2 pin 7.
IOPORT_PORT_02_PIN_08	IO port 2 pin 8.
IOPORT_PORT_02_PIN_09	IO port 2 pin 9.
IOPORT_PORT_02_PIN_10	IO port 2 pin 10.
IOPORT_PORT_02_PIN_11	IO port 2 pin 11.
IOPORT_PORT_02_PIN_12	IO port 2 pin 12.
IOPORT_PORT_02_PIN_13	IO port 2 pin 13.
IOPORT_PORT_02_PIN_14	IO port 2 pin 14.
IOPORT_PORT_02_PIN_15	IO port 2 pin 15.
IOPORT_PORT_03_PIN_00	IO port 3 pin 0.
IOPORT_PORT_03_PIN_01	IO port 3 pin 1.
IOPORT_PORT_03_PIN_02	IO port 3 pin 2.
IOPORT_PORT_03_PIN_03	IO port 3 pin 3.
IOPORT_PORT_03_PIN_04	IO port 3 pin 4.
IOPORT_PORT_03_PIN_05	IO port 3 pin 5.
IOPORT_PORT_03_PIN_06	IO port 3 pin 6.

IOPORT_PORT_03_PIN_07	IO port 3 pin 7.
IOPORT_PORT_03_PIN_08	IO port 3 pin 8.
IOPORT_PORT_03_PIN_09	IO port 3 pin 9.
IOPORT_PORT_03_PIN_10	IO port 3 pin 10.
IOPORT_PORT_03_PIN_11	IO port 3 pin 11.
IOPORT_PORT_03_PIN_12	IO port 3 pin 12.
IOPORT_PORT_03_PIN_13	IO port 3 pin 13.
IOPORT_PORT_03_PIN_14	IO port 3 pin 14.
IOPORT_PORT_03_PIN_15	IO port 3 pin 15.
IOPORT_PORT_04_PIN_00	IO port 4 pin 0.
IOPORT_PORT_04_PIN_01	IO port 4 pin 1.

IOPORT_PORT_10_PIN_13	IO port 10 pin 13.
IOPORT_PORT_10_PIN_14	IO port 10 pin 14.

IOPORT_PORT_10_PIN_15	IO port 10 pin 15.
IOPORT_PORT_11_PIN_00	IO port 11 pin 0.
IOPORT_PORT_11_PIN_01	IO port 11 pin 1.
IOPORT_PORT_11_PIN_02	IO port 11 pin 2.
IOPORT_PORT_11_PIN_03	IO port 11 pin 3.
IOPORT_PORT_11_PIN_04	IO port 11 pin 4.
IOPORT_PORT_11_PIN_05	IO port 11 pin 5.
IOPORT_PORT_11_PIN_06	IO port 11 pin 6.
IOPORT_PORT_11_PIN_07	IO port 11 pin 7.
IOPORT_PORT_11_PIN_08	IO port 11 pin 8.
IOPORT_PORT_11_PIN_09	IO port 11 pin 9.
IOPORT_PORT_11_PIN_10	IO port 11 pin 10.
IOPORT_PORT_11_PIN_11	IO port 11 pin 11.
IOPORT_PORT_11_PIN_12	IO port 11 pin 12.
IOPORT_PORT_11_PIN_13	IO port 11 pin 13.
IOPORT_PORT_11_PIN_14	IO port 11 pin 14.
IOPORT_PORT_11_PIN_15	IO port 11 pin 15.

◆ ioport_port_t

enum ioport_port_t	
Superset list of all possible IO ports.	
Enumerator	
IOPORT_PORT_00	IO port 0.
IOPORT_PORT_01	IO port 1.
IOPORT_PORT_02	IO port 2.
IOPORT_PORT_03	IO port 3.
IOPORT_PORT_04	IO port 4.
IOPORT_PORT_05	IO port 5.
IOPORT_PORT_06	IO port 6.
IOPORT_PORT_07	IO port 7.
IOPORT_PORT_08	IO port 8.
IOPORT_PORT_09	IO port 9.
IOPORT_PORT_10	IO port 10.
IOPORT_PORT_11	IO port 11.

ioport_pin_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I/O Port Interface

#include <r_ioport_api.h>

Data Fields

uint32_t	pin_cfg Pin PFS configuration - Use ioport_cfg_options_t parameters to configure.

ioport_port_pin_t	pin Pin identifier.

Detailed Description

Pin identifier and pin PFS pin configuration value

The documentation for this struct was generated from the following file:

- r_ioport_api.h

ioport_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » I/O Port Interface

#include <r_ioport_api.h>

Data Fields

uint16_t	number_of_pins Number of pins for which there is configuration data.
ioport_pin_cfg_t const *	p_pin_cfg_data Pin configuration data.

Detailed Description

Multiple pin configuration data for loading into PFS registers by R_IOPORT_Init()

The documentation for this struct was generated from the following file:

Detailed Description

IOPort driver structure. IOPort functions implemented at the HAL layer will follow this API.

Field Documentation

◆ init

ssp_err_t(* ioport_api_t::init) (const ioport_cfg_t *p_cfg)

Initialize internal driver data and initial pin configurations. Called during startup. Do not call this API during runtime. Use ioport_api_t::pinsCfg for runtime reconfiguration of multiple pins.

Implemented as

- R_IOPORT_Init()

Parameters

[in]	p_cfg	Pointer to pin configuration data array.

◆ pinCfg

ssp_err_t(* ioport_api_t::pinCfg) (ioport_port_pin_t pin, uint32_t cfg)

Configure settings for an individual pin.

Implemented as

- R_IOPORT_PinCfg()

Parameters

[in]	pin	Pin to be read.
[in]	cfg	Configuration options for the pin.

◆ pinDirectionSet

ssp_err_t(* ioport_api_t::pinDirectionSet) (ioport_port_pin_t pin, ioport_direction_t direction)

Set the pin direction of a pin.

Implemented as

- R_IOPORT_PinDirectionSet()

Parameters

[in]	pin	Pin being configured.
[in]	direction	Direction to set pin to which is a member of ioport_direction_t.

◆ pinEthernetModeCfg

ssp_err_t(* ioport_api_t::pinEthernetModeCfg) (ioport_ethernet_channel_t channel, ioport_ethernet_mode_t mode)

Configure the PHY mode of the Ethernet channels.

Implemented as

- R_IOPORT_EthernetModeCfg()

Parameters

[in]	channel	Channel configuration will be set for.
[in]	mode	PHY mode to set the channel to.

◆ pinEventInputRead

ssp_err_t(* ioport_api_t::pinEventInputRead) (ioport_port_pin_t pin, ioport_level_t *p_pin_event)

Read the event input data of the specified pin and return the level.

Implemented as

- R_IOPORT_PinEventInputRead()

Parameters

[in]	pin	Pin to be read.
[in]	p_pin_event	Pointer to return the event data.

◆ pinEventOutputWrite

ssp_err_t(* ioport_api_t::pinEventOutputWrite) (ioport_port_pin_t pin, ioport_level_t pin_value)

Write pin event data.

Implemented as

- R_IOPORT_PinEventOutputWrite()

Parameters

[in]	pin	Pin event data is to be written to.
[in]	pin_value	Level to be written to pin output event.

◆ pinRead

ssp_err_t(* ioport_api_t::pinRead) (ioport_port_pin_t pin, ioport_level_t *p_pin_value)

Read level of a pin.

Implemented as

- R_IOPORT_PinRead()

Parameters

[in]	pin	Pin to be read.
[in]	p_pin_value	Pointer to return the pin level.

◆ pinsCfg

ssp_err_t(* ioport_api_t::pinsCfg) (const ioport_cfg_t *p_cfg)

Configure multiple pins.

Implemented as

- R_IOPORT_PinsCfg()

Parameters

[in]	p_cfg	Pointer to pin configuration data array.

◆ pinWrite

ssp_err_t(* ioport_api_t::pinWrite) (ioport_port_pin_t pin, ioport_level_t level)

Write specified level to a pin.

Implemented as

- R_IOPORT_PinWrite()

Parameters

[in]	pin	Pin to be written to.
[in]	level	State to be written to the pin.

◆ portDirectionSet

ssp_err_t(* ioport_api_t::portDirectionSet) (ioport_port_t port, ioport_size_t direction_values, ioport_size_t mask)

Set the direction of one or more pins on a port.

Implemented as

- R_IOPORT_PortDirectionSet()

Parameters

[in]	port	Port being configured.
[in]	direction_values	Value controlling direction of pins on port (1 - output, 0 - input).
[in]	mask	Mask controlling which pins on the port are to be configured.

◆ portEventInputRead

ssp_err_t(* ioport_api_t::portEventInputRead) (ioport_port_t port, ioport_size_t *p_event_data)

Read captured event data for a port.

Implemented as

- R_IOPORT_PortEventInputRead()

Parameters

[in]	port	Port to be read.
[in]	p_event_data	Pointer to return the event data.

◆ portEventOutputWrite

ssp_err_t(* ioport_api_t::portEventOutputWrite) (ioport_port_t port, ioport_size_t event_data, ioport_size_t mask_value)

Write event output data for a port.

Implemented as

- R_IOPORT_PortEventOutputWrite()

Parameters

[in]	port	Port event data will be written to.
[in]	event_data	Data to be written as event data to specified port.
[in]	mask_value	Each bit set to 1 in the mask corresponds to that bit's value in event data. being written to port.

◆ portRead

ssp_err_t(* ioport_api_t::portRead) (ioport_port_t port, ioport_size_t *p_port_value)

Read states of pins on the specified port.

Implemented as

- R_IOPORT_PortRead()

Parameters

[in]	port	Port to be read.
[in]	p_port_value	Pointer to return the port value.

◆ portWrite

ssp_err_t(* ioport_api_t::portWrite) (ioport_port_t port, ioport_size_t value, ioport_size_t mask)

Write to multiple pins on a port.

Implemented as

- R_IOPORT_PortWrite()

Parameters

[in]	port	Port to be written to.
[in]	value	Value to be written to the port.
[in]	mask	Mask controlling which pins on the port are written to.

◆ versionGet

ssp_err_t(* ioport_api_t::versionGet) (ssp_version_t *p_data)

Return the version of the IOPort driver.

Implemented as

- R_IOPORT_VersionGet()

Parameters

[out]	p_data	Memory address to return version information to.

JPEG DECODE Interface description: JPEG Decode Driver

Macro Definition Documentation

◆ JPEG_DECODE_API_VERSION_MAJOR

#define JPEG_DECODE_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes. Configuration for this module

Typedef Documentation

◆ jpeg_decode_ctrl_t

typedef void jpeg_decode_ctrl_t
JPEG decode control block. Allocate an instance specific control block to pass into the JPEG decode API calls. **Implemented as** ◦ jpeg_decode_instance_ctrl_t

Enumeration Type Documentation

◆ jpeg_decode_color_space_t

enum jpeg_decode_color_space_t	
Image color space definitions	
Enumerator	
JPEG_DECODE_COLOR_SPACE_YCBCR444	Color Space YCbCr 444.
JPEG_DECODE_COLOR_SPACE_YCBCR422	Color Space YCbCr 422.
JPEG_DECODE_COLOR_SPACE_YCBCR420	Color Space YCbCr 420.
JPEG_DECODE_COLOR_SPACE_YCBCR411	Color Space YCbCr 411.

◆ jpeg_decode_count_enable_t

enum jpeg_decode_count_enable_t	
Data type for decoding count mode enable.	
Enumerator	
JPEG_DECODE_COUNT_DISABLE	Count mode disable.
JPEG_DECODE_COUNT_ENABLE	Count mode enable.

◆ jpeg_decode_data_format_t

enum jpeg_decode_data_format_t	
Multi-byte Data Format	
Enumerator	
JPEG_DECODE_DATA_FORMAT_NORMAL	(1)(2)(3)(4)(5)(6)(7)(8) Normal byte order
JPEG_DECODE_DATA_FORMAT_BYTE_SWAP	(2)(1)(4)(3)(6)(5)(8)(7) Byte Swap
JPEG_DECODE_DATA_FORMAT_WORD_SWAP	(3)(4)(1)(2)(7)(8)(5)(6) Word Swap
JPEG_DECODE_DATA_FORMAT_WORD_BYTE_SWAP	(4)(3)(2)(1)(8)(7)(6)(5) Word-Byte Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_SWAP	(5)(6)(7)(8)(1)(2)(3)(4) Longword Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_BYTE_SWAP	(6)(5)(8)(7)(2)(1)(4)(3) Longword Byte Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_SWAP	(7)(8)(5)(6)(3)(4)(1)(2) Longword Word Swap
JPEG_DECODE_DATA_FORMAT_LONGWORD_WORD_BYTE_SWAP	(8)(7)(6)(5)(4)(3)(2)(1) Longword Word Byte Swap

◆ jpeg_decode_pixel_format_t

enum jpeg_decode_pixel_format_t	
Pixel Data Format	
Enumerator	
JPEG_DECODE_PIXEL_FORMAT_ARGB8888	Pixel Data ARGB8888 format.
JPEG_DECODE_PIXEL_FORMAT_RGB565	Pixel Data RGB565 format.

◆ jpeg_decode_resume_mode_t

enum jpeg_decode_resume_mode_t	
Data type for decoding count mode enable.	
Enumerator	
JPEG_DECODE_COUNT_MODE_ADDRESS_CONTINUE	The data buffer address will not be initialized when resuming image data lines.
JPEG_DECODE_COUNT_MODE_ADDRESS_REINITIALIZE	The data buffer address will be initialized when resuming image data lines.

◆ jpeg_decode_status_t

enum jpeg_decode_status_t	
JPEG HLD driver internal status information. The driver can simultaneously be in more than any one status at the same time. Parse the status bit-fields using the definitions in this enum to determine driver status	
Enumerator	
JPEG_DECODE_STATUS_FREE	JPEG codec module is not yet open.
JPEG_DECODE_STATUS_IDLE	JPEG Codec module is open, and is not operational.
JPEG_DECODE_STATUS_RUNNING	JPEG Codec is running.
JPEG_DECODE_STATUS_DONE	JPEG Codec has successfully finished the operation.
JPEG_DECODE_STATUS_INPUT_PAUSE	JPEG Codec paused waiting for more input data.
JPEG_DECODE_STATUS_OUTPUT_PAUSE	JPEG Codec paused after decoded the number of lines specified by user.
JPEG_DECODE_STATUS_IMAGE_SIZE_READY	JPEG decoding operation obtained image size, and paused.
JPEG_DECODE_STATUS_ERROR	JPEG Codec module encountered an error.
JPEG_DECODE_STATUS_HEADER_PROCESSING	JPEG Codec module is reading the JPEG header information.

◆ jpeg_decode_subsample_t

enum jpeg_decode_subsample_t	
Data type for horizontal and vertical subsample settings. This setting applies only to the decoding operation.	
Enumerator	
JPEG_DECODE_OUTPUT_NO_SUBSAMPLE	No subsample. The image is decoded with no reduction in size.
JPEG_DECODE_OUTPUT_SUBSAMPLE_HALF	The output image size is reduced by half.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_QUARTER	The output image size is reduced to one-quarter.
JPEG_DECODE_OUTPUT_SUBSAMPLE_ONE_EIGHTH	The output image size is reduced to one-eighth.

jpeg_decode_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » JPEG Decode Interface

#include <r_jpeg_decode_api.h>

Data Fields

jpeg_decode_status_t	status JPEG status.
void const *	p_context Pointer to user-provided context.

Detailed Description

Callback status structure

The documentation for this struct was generated from the following file:

- r_jpeg_decode_api.h

jpeg_decode_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » JPEG Decode Interface

#include <r_jpeg_decode_api.h>

Data Fields

jpeg_decode_color_space_t	color_space Color space.
jpeg_decode_data_format_t	input_data_format Input data stream byte order.
jpeg_decode_data_format_t	output_data_format Output data stream byte order.
jpeg_decode_pixel_format_t	pixel_format Pixel format.
uint8_t	alpha_value Alpha value to be applied to decoded pixel data. Only valid for ARGB888 format.
uint8_t	jdti_ipl Data transfer interrupt priority.
uint8_t	jedi_ipl Decompression interrupt priority.
void(*	p_callback)(jpeg_decode_callback_args_t *p_args) User-supplied callback functions.
void const *	p_context Placeholder for user data. Passed to user callback in

	jpeg_decode_callback_args_t.

Detailed Description

User configuration structure, used in open function.

ssp_err_t(*	versionGet)(ssp_version_t *p_version)
ssp_err_t(*	pixelFormatGet)(jpeg_decode_ctrl_t *const p_ctrl, jpeg_decode_color_space_t *const p_color_space)

Detailed Description

JPEG functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* jpeg_decode_api_t::close) (jpeg_decode_ctrl_t *const p_ctrl)

Cancel an outstanding operation.

Implemented as

- R_JPEG_Decode_Close()

Precondition

the JPEG codec module must have been opened properly.

Note

If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::Open call.

◆ horizontalStrideSet

ssp_err_t(* jpeg_decode_api_t::horizontalStrideSet) (jpeg_decode_ctrl_t *const p_ctrl, uint32_t horizontal_stride)

Configure the horizontal stride value.

Implemented as

- R_JPEG_Decode_HorizontalStrideSet()

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[in]	horizontal_stride	Horizontal stride value to be used for the decoded image data.
[in]	buffer_size	Size of the output buffer

◆ imageSizeGet

ssp_err_t(* jpeg_decode_api_t::imageSizeGet) (jpeg_decode_ctrl_t *const p_ctrl, uint16_t *p_horizontal_size, uint16_t *p_vertical_size)

Retrieve image size during decoding operation.

Implemented as

- R_JPEG_Decode_ImageSizeGet()

Precondition

the JPEG codec module must have been opened properly.

Note

If the encoding or the decoding operation is finished without errors, the HLD driver automatically closes the device. In this case, application does not need to explicitly close the JPEG device.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[out]	p_horizontal_size	Image horizontal size, in number of pixels.
[out]	p_vertical_size	Image vertical size, in number of pixels.

◆ imageSubsampleSet

ssp_err_t(* jpeg_decode_api_t::imageSubsampleSet) (jpeg_decode_ctrl_t *const p_ctrl, jpeg_decode_subsample_t horizontal_subsample, jpeg_decode_subsample_t vertical_subsample)

Configure the horizontal and vertical subsample settings.

Implemented as

- R_JPEG_Decode_ImageSubsampleSet()

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[in]	horizontal_subsample	Horizontal subsample value
[in]	vertical_subsample	Vertical subsample value

◆ inputBufferSet

ssp_err_t(* jpeg_decode_api_t::inputBufferSet) (jpeg_decode_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)

Assign input data buffer to JPEG codec.

Implemented as

- R_JPEG_Decode_InputBufferSet()

Precondition

the JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[in]	p_buffer	Pointer to the input buffer space
[in]	buffer_size	Size of the input buffer

◆ linesDecodedGet

ssp_err_t(* jpeg_decode_api_t::linesDecodedGet) (jpeg_decode_ctrl_t *const p_ctrl, uint32_t *const p_lines)

Return the number of lines decoded into the output buffer.

Implemented as

- R_JPEG_Decode_LinesDecodedGet()

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[out]	p_lines	Number of lines decoded

◆ open

ssp_err_t(* jpeg_decode_api_t::open) (jpeg_decode_ctrl_t *const p_ctrl, jpeg_decode_cfg_t const *const p_cfg)

Initial configuration

Implemented as

- R_JPEG_Decode_Open()

Precondition

none

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ outputBufferSet

ssp_err_t(* jpeg_decode_api_t::outputBufferSet) (jpeg_decode_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)

Assign output buffer to JPEG codec for storing output data.

Implemented as

- R_JPEG_Decode_OutputBufferSet()

Precondition

The JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned. For the decoding process, the HLD driver automatically computes the number of lines of the image to decoded so the output data fits into the given space. If the supplied output buffer is not able to hold the entire frame, the application should call the Output Full Callback function so it can be notified when additional buffer space is needed.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[in]	p_buffer	Pointer to the output buffer space
[in]	buffer_size	Size of the output buffer

◆ pixelFormatGet

ssp_err_t(* jpeg_decode_api_t::pixelFormatGet) (jpeg_decode_ctrl_t *const p_ctrl, jpeg_decode_color_space_t *const p_color_space)

Get the input pixel format.

Implemented as

- R_JPEG_Decode_PixelFormatGet()

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[out]	p_color_space	JPEG input format.

◆ statusGet

ssp_err_t(* jpeg_decode_api_t::statusGet) (jpeg_decode_ctrl_t *const p_ctrl, jpeg_decode_status_t *const p_status)

Retrieve current status of the JPEG codec module.

Implemented as

- R_JPEG_Decode_StatusGet()

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_decode_api_t::open call.
[out]	p_status	JPEG module status

◆ versionGet

ssp_err_t(* jpeg_decode_api_t::versionGet) (ssp_version_t *p_version)

Get version and store it in provided pointer p_version.

Implemented as

- R_JPEG_Decode_VersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_jpeg_decode_api.h

ssp_err_t(*	open)(jpeg_encode_ctrl_t *const p_ctrl, jpeg_encode_cfg_t const *const p_cfg)
ssp_err_t(*	imageParameterSet)(jpeg_encode_ctrl_t *const p_ctrl, jpeg_encode_raw_image_parameters *p_raw_image_parameters)

ssp_err_t(*	outputBufferSet)(jpeg_encode_ctrl_t *const p_ctrl, void *p_buffer)
ssp_err_t(*	inputBufferSet)(jpeg_encode_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)
ssp_err_t(*	statusGet)(jpeg_encode_ctrl_t *const p_ctrl, volatile jpeg_encode_status_t *p_status)
ssp_err_t(*	close)(jpeg_encode_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)

Detailed Description

JPEG functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* jpeg_encode_api_t::close) (jpeg_encode_ctrl_t *const p_ctrl)

Cancel an outstanding operation.

Implemented as

- R_JPEG_Encode_Close()

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_encode_api_t::Open call.

◆ imageParameterSet

ssp_err_t(* jpeg_encode_api_t::imageParameterSet) (jpeg_encode_ctrl_t *const p_ctrl, jpeg_encode_raw_image_parameters *p_raw_image_parameters)

Set image parameters to JPEG Codec

Implemented as

- R_JPEG_Encode_ImageParameterSet()

Precondition

The JPEG codec module must have been opened properly.

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_raw_image_parameters	Pointer to the RAW image parameters

◆ inputBufferSet

ssp_err_t(* jpeg_encode_api_t::inputBufferSet) (jpeg_encode_ctrl_t *const p_ctrl, void *p_buffer, uint32_t buffer_size)

Assign input data buffer to JPEG codec.

Implemented as

- R_JPEG_Encode_InputBufferSet()

Precondition

the JPEG codec module must have been opened properly, output buffer and image parameter must be set prior to call this function.

Note

The buffer starting address must be 8-byte aligned.

Parameters

[in]	p_ctrl	Control block set in jpeg_encode_api_t::open call.
[in]	p_buffer	Pointer to the input buffer space
[in]	buffer_size	Size of the input buffer

◆ open

ssp_err_t(* jpeg_encode_api_t::open) (jpeg_encode_ctrl_t *const p_ctrl, jpeg_encode_cfg_t const *const p_cfg)

Initial configuration

Implemented as

- R_JPEG_Encode_Open()

Precondition

none

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ outputBufferSet

ssp_err_t(* jpeg_encode_api_t::outputBufferSet) (jpeg_encode_ctrl_t *const p_ctrl, void *p_buffer)

Assign output buffer to JPEG codec for storing output data.

Implemented as

- R_JPEG_Encode_OutputBufferSet()

Precondition

The JPEG codec module must have been opened properly.

Note

The buffer starting address must be 8-byte aligned.

Parameters

[in]	p_ctrl	Control block set in jpeg_encode_api_t::open call.
[in]	p_buffer	Pointer to the output buffer space

◆ statusGet

ssp_err_t(* jpeg_encode_api_t::statusGet) (jpeg_encode_ctrl_t *const p_ctrl, volatile jpeg_encode_status_t *p_status)

Retrieve current status of the JPEG codec module.

Implemented as

- R_JPEG_Encode_StatusGet()

Precondition

the JPEG codec module must have been opened properly.

Parameters

[in]	p_ctrl	Control block set in jpeg_encode_api_t::open call.
[out]	p_status	JPEG module status

◆ versionGet

ssp_err_t(* jpeg_encode_api_t::versionGet) (ssp_version_t *p_version)

Get version and store it in provided pointer p_version.

Implemented as

- R_JPEG_Encode_VersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_jpeg_encode_api.h

jpeg_encode_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » JPEG Encode Interface

#include <r_jpeg_encode_api.h>

Data Fields

jpeg_encode_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
jpeg_encode_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
jpeg_encode_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

5.1.4.23 Key Matrix Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for key matrix functions. More...

Data Structures

struct	keymatrix_callback_args_t
struct	keymatrix_cfg_t
struct	keymatrix_api_t
struct	keymatrix_instance_t

Macros

#define	KEYMATRIX_API_VERSION_MAJOR (2U) KEY MATRIX API version number (Major)
#define	KEYMATRIX_API_VERSION_MINOR (0U)

	KEY MATRIX API version number (Minor)

Typedefs

typedef uint32_t	keymatrix_channels_t
typedef void	keymatrix_ctrl_t

Enumerations

enum	keymatrix_trigger_t { KEYMATRIX_TRIG_FALLING = 0, KEYMATRIX_TRIG_RISING = 1 }

Detailed Description

Interface for key matrix functions.

Summary

The KEYMATRIX interface provides standard KeyMatrix functionality including event generation on a rising or falling edge for one or more channels at the same time. The generated event indicates all channels that are active in that instant via a bit mask. This allows the interface to be used with a matrix configuration or a one-to-one hardware implementation that is triggered on either a rising or a falling edge.

ssp_err_t(*	close)(keymatrix_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Key Matrix driver structure. Key Matrix functions implemented at the HAL layer will use this API.

Field Documentation

◆ close

ssp_err_t(* keymatrix_api_t::close) (keymatrix_ctrl_t *const p_ctrl)

Allow driver to be reconfigured. May reduce power consumption.

Implemented as

- R_KINT_KEYMATRIX_Close()

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.

◆ disable

ssp_err_t(* keymatrix_api_t::disable) (keymatrix_ctrl_t *const p_ctrl)

Disable Key interrupt.

Implemented as

- R_KINT_KEYMATRIX_Disable()

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.

◆ enable

ssp_err_t(* keymatrix_api_t::enable) (keymatrix_ctrl_t *const p_ctrl)

Enable Key interrupt

Implemented as

- R_KINT_KEYMATRIX_Enable()

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.

◆ open

ssp_err_t(* keymatrix_api_t::open) (keymatrix_ctrl_t *const p_ctrl, keymatrix_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_KINT_KEYMATRIX_Open()

Parameters

[out]	p_ctrl	Pointer to control block. Must be declared by user. Value set in this function.
[in]	p_cfg	Pointer to configuration structure. All elements of the structure must be set by user.

◆ triggerSet

ssp_err_t(* keymatrix_api_t::triggerSet) (keymatrix_ctrl_t *const p_ctrl, keymatrix_trigger_t const trigger)

Set trigger for Key interrupt.

Implemented as

- R_KINT_KEYMATRIX_TriggerSet()

Parameters

[in]	p_ctrl	Control block pointer set in Open call for this Key interrupt.
[in]	trigger	Trigger source for key interrupt; defined in enumeration of keymatrix_trigger_t.

◆ versionGet

ssp_err_t(* keymatrix_api_t::versionGet) (ssp_version_t *const p_version)
Get version and store it in provided pointer p_version. **Implemented as** ◦ R_KINT_VersionGet() **Parameters** [out] p_version Code and API version used.

The documentation for this struct was generated from the following file:

- r_keymatrix_api.h

keymatrix_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Key Matrix Interface

#include <r_keymatrix_api.h>

5.1.4.24 Low Power Modes V2 Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for accessing low power modes. More...

Data Structures

struct	lpmv2_cfg_t
struct	lpmv2_api_t
struct	lpmv2_instance_t

Macros

#define	LPMV2_API_VERSION_MAJOR (3U)

Enumerations

enum	lpmv2_low_power_mode_t { LPMV2_LOW_POWER_MODE_SLEEP, LPMV2_LOW_POWER_MODE_STANDBY, LPMV2_LOW_POWER_MODE_STANDBY_SNOOZE, LPMV2_LOW_POWER_MODE_DEEP }

Detailed Description

Interface for accessing low power modes.

Summary

This section defines the API for the LPMV2 (Low Power Mode) Driver. The LPMV2 Driver provides functions for controlling power consumption by configuring and transitioning to a low power mode. The LPMV2 driver supports configuration of MCU low power modes using the LPMV2 hardware peripheral. The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCUs.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

#include <r_lpmv2_api.h>

Data Fields

ssp_err_t(*	init)(void)
ssp_err_t(*	lowPowerCfg)(lpmv2_cfg_t const *const p_cfg)
ssp_err_t(*	lowPowerModeEnter)(void)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)
ssp_err_t(*	clearIOKeep)(void)

Detailed Description

lpmv2 driver structure. General lpmv2 functions implemented at the HAL layer will follow this API.

Field Documentation

◆ clearIOKeep

ssp_err_t(* lpmv2_api_t::clearIOKeep) (void)

Clear the IOKEEP bit after deep software standby.

- **Implemented as**

- R_LPMV2_ClearIOKeep()

◆ init

ssp_err_t(* lpmv2_api_t::init) (void)

Initialization function

Implemented as

- R_LPMV2_Init()

◆ lowPowerCfg

ssp_err_t(* lpmv2_api_t::lowPowerCfg) (lpmv2_cfg_t const *const p_cfg)

Configure a low power mode.

Implemented as

- R_LPMV2_LowPowerConfigure()

Parameters

[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ lowPowerModeEnter

ssp_err_t(* lpmv2_api_t::lowPowerModeEnter) (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro. Function will return after waking from low power mode.

Implemented as

- R_LPMV2_LowPowerModeEnter()

◆ versionGet

ssp_err_t(* lpmv2_api_t::versionGet) (ssp_version_t *const p_version)		
Get the driver version based on compile time macros. **Implemented as** ◦ R_LPMV2_VersionGet() **Parameters**		
[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

enum	lvd_current_state_t { LVD_CURRENT_STATE_BELOW_THRESHOLD = 0, LVD_CURRENT_STATE_ABOVE_THRESHOLD = 1 }

Detailed Description

This section defines the API for the LVD (Low Voltage Detection) Driver.

The LVD driver provides functions for configuring the LVD hardware peripheral.

The process of configuring and enabling a Low Voltage Detection monitor has very specific timing constraints and register write ordering. Because of these constraints, the entire process of configuring and enabling a voltage monitor is most effectively performed by a single function. The API function configure performs configuration and enables the monitor in order to properly enforce the timing and register write ordering constraints.

The LVD driver configures all of the settings of the available configurable LVD monitors.

The settings include:

- voltage_threshold: Determines the voltage detection threshold (i.e. 2.99 Volts).
- sample_clock_divisor: Determines the sample clock rate of the digital filter, based on division of the LOCO clock. Also disables or enables the digital filter if available on the MCU.
- detection_response: Determines which event will occur, reset, interrupt, non-maskable interrupt, or no response, when the voltage threshold is crossed
- voltage_slope: Choose either rising or falling voltage as the trigger for a voltage detection interrupt.
- negation_delay: Determine whether timing of the negation of the voltage event is based upon the reset event or based on the voltage event itself.
- p_callback: Address of user defined function to be called when the voltage event interrupt occurs.

Note

Low Voltage Monitor 0 (LVD0) is not configurable at runtime but can be configured by changing the OFS1 register value on the BSP Properties tab of the Synergy Project Configurator in the e2 studio ISDE.
Digital filter is not to be used with standby modes. If software standby or deep standby mode is to be used, the

digital filter should be disabled.

For details about the implementation of the driver functions see section LVD.

Macro Definition Documentation

◆ LVD_API_VERSION_MAJOR

#define LVD_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

Typedef Documentation

◆ lvd_ctrl_t

typedef void lvd_ctrl_t
LVD control block. Allocate an instance specific control block to pass into the LVD API calls. **Implemented as** ◦ lvd_instance_ctrl_t

Enumeration Type Documentation

◆ lvd_current_state_t

enum lvd_current_state_t	
Instantaneous status of VCC (above or below threshold)	
Enumerator	
LVD_CURRENT_STATE_BELOW_THRESHOLD	VCC < threshold.
LVD_CURRENT_STATE_ABOVE_THRESHOLD	VCC >= threshold or monitor is disabled.

◆ lvd_response_t

enum lvd_response_t	
Response types to a threshold crossing event, interrupt, reset, NMI...	
Enumerator	
LVD_RESPONSE_NMI	Non-maskable interrupt.
LVD_RESPONSE_INTERRUPT	Maskable interrupt.
LVD_RESPONSE_RESET	Reset.
LVD_RESPONSE_NONE	No response, status must be requested via statusGet function.

◆ lvd_threshold_crossing_t

enum lvd_threshold_crossing_t	
Threshold crossing detection (latched)	
Enumerator	
LVD_THRESHOLD_CROSSING_NOT_DETECTED	Threshold crossing has not been detected.
LVD_THRESHOLD_CROSSING_DETECTED	Threshold crossing has been detected.

◆ lvd_threshold_t

enum lvd_threshold_t	
Voltage detection level The thresholds supported by each MCU is in the MCU User's Manual as well as in the r_lvd module description on the threads tab of the Synergy project.	
Enumerator	
LVD_THRESHOLD_MONITOR_1_LEVEL_0	4.29V (Vdet1_0)
LVD_THRESHOLD_MONITOR_1_LEVEL_1	4.14V (Vdet1_1)
LVD_THRESHOLD_MONITOR_1_LEVEL_2	4.02V (Vdet1_2)
LVD_THRESHOLD_MONITOR_1_LEVEL_3	3.84V (Vdet1_3)
LVD_THRESHOLD_MONITOR_1_LEVEL_4	3.10V (Vdet1_4)
LVD_THRESHOLD_MONITOR_1_LEVEL_5	3.00V (Vdet1_5)

LVD_THRESHOLD_MONITOR_1_LEVEL_6	2.90V (Vdet1_6)
LVD_THRESHOLD_MONITOR_1_LEVEL_7	2.79V (Vdet1_7)
LVD_THRESHOLD_MONITOR_1_LEVEL_8	2.68V (Vdet1_8)
LVD_THRESHOLD_MONITOR_1_LEVEL_9	2.58V (Vdet1_9)
LVD_THRESHOLD_MONITOR_1_LEVEL_A	2.48V (Vdet1_A)
LVD_THRESHOLD_MONITOR_1_LEVEL_B	2.20V (Vdet1_B)
LVD_THRESHOLD_MONITOR_1_LEVEL_C	1.96V (Vdet1_C)
LVD_THRESHOLD_MONITOR_1_LEVEL_D	1.86V (Vdet1_D)
LVD_THRESHOLD_MONITOR_1_LEVEL_E	1.75V (Vdet1_E)
LVD_THRESHOLD_MONITOR_1_LEVEL_F	1.65V (Vdet1_F)
LVD_THRESHOLD_MONITOR_1_LEVEL_11	2.99V (Vdet1_11)
LVD_THRESHOLD_MONITOR_1_LEVEL_12	2.92V (Vdet1_12)
LVD_THRESHOLD_MONITOR_1_LEVEL_13	2.85V (Vdet1_13)
LVD_THRESHOLD_MONITOR_2_LEVEL_0	4.29V (Vdet2_0)
LVD_THRESHOLD_MONITOR_2_LEVEL_1	4.14V (Vdet2_1)
LVD_THRESHOLD_MONITOR_2_LEVEL_2	4.02V (Vdet2_2)
LVD_THRESHOLD_MONITOR_2_LEVEL_3	3.84V (Vdet2_3)
LVD_THRESHOLD_MONITOR_2_LEVEL_5	2.99V (Vdet2_5)
LVD_THRESHOLD_MONITOR_2_LEVEL_6	2.92V (Vdet2_6)
LVD_THRESHOLD_MONITOR_2_LEVEL_7	2.85V (Vdet2_7)

◆ lvd_voltage_slope_t

enum lvd_voltage_slope_t	
Voltage slope, rising, falling, or both	
Enumerator	
LVD_VOLTAGE_SLOPE_RISING	When VCC >= Vdet2 (rise) is detected.
LVD_VOLTAGE_SLOPE_FALLING	When VCC < Vdet2 (drop) is detected.
LVD_VOLTAGE_SLOPE_BOTH	When drop and rise are detected.

lvd_status_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Low Voltage Detection Interface

#include <r_lvd_api.h>

Data Fields

lvd_threshold_crossing_t	crossing_detected
lvd_current_state_t	current_state

Detailed Description

Voltage monitor status structure, used with statusGet function and p_callback to provide current state of the monitor, (threshold crossing detected, vcc currently within range).

Field Documentation

◆ crossing_detected

lvd_threshold_crossing_t lvd_status_t::crossing_detected
Threshold crossing detection (latched)

◆ current_state

lvd_current_state_t lvd_status_t::current_state
Instantaneous status of monitored voltage (above or below threshold)

#include <r_lvd_api.h>

Data Fields

ssp_err_t(*	open)(lvd_ctrl_t *const p_ctrl, lvd_cfg_t const *const p_cfg)
ssp_err_t(*	statusGet)(lvd_ctrl_t *const p_ctrl, lvd_status_t *p_lvd_status)
ssp_err_t(*	statusClear)(lvd_ctrl_t *const p_ctrl)

ssp_err_t(*	close)(lvd_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

LVD driver API structure. LVD driver functions implemented at the HAL layer will adhere to this API.

Field Documentation

◆ close

ssp_err_t(* lvd_api_t::close) (lvd_ctrl_t *const p_ctrl)

Disables the LVD peripheral. Closes the driver instance.

Implemented as

- R_LVD_Close()

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance

◆ open

ssp_err_t(* lvd_api_t::open) (lvd_ctrl_t *const p_ctrl, lvd_cfg_t const *const p_cfg)

Initializes a low voltage detection driver according to the passed in configuration structure. Enables an LVD peripheral based on configuration structure.

Implemented as

- R_LVD_Open()

Parameters

[in]	p_ctrl	Pointer to monitor control structure for the driver instance
[in]	p_cfg	Pointer to the configuration structure for the driver instance

◆ statusClear

ssp_err_t(* lvd_api_t::statusClear) (lvd_ctrl_t *const p_ctrl)

Clears the latched status of the monitor. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.

Implemented as

- R_LVD_StatusClear()

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance

◆ statusGet

ssp_err_t(* lvd_api_t::statusGet) (lvd_ctrl_t *const p_ctrl, lvd_status_t *p_lvd_status)

Get the current state of the monitor, (threshold crossing detected, voltage currently within range) Can be used to poll the state of the LVD monitor at any time. Must be used if the peripheral was initialized with lvd_response_t set to LVD_RESPONSE_NONE.

Implemented as

- R_LVD_StatusGet()

Parameters

[in]	p_ctrl	Pointer to the control structure for the driver instance
[in,out]	p_lvd_status	Pointer to an lvd_status_t instance

◆ versionGet

ssp_err_t(* lvd_api_t::versionGet) (ssp_version_t *const p_version)

Returns the LVD driver version based on compile time macros.

Implemented as

- R_LVD_VersionGet()

Parameters

[in,out]	p_version	Pointer to version structure

The documentation for this struct was generated from the following file:

- r_lvd_api.h

lvd_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Low Voltage Detection Interface

#include <r_lvd_api.h>

Data Fields

lvd_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
lvd_cfg_t const *	p_cfg Pointer to the configuration structure for this interface instance.
lvd_api_t const *	p_api Pointer to the API structure for this interface instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_lvd_api.h

5.1.4.26 OPAMP Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for Operational Amplifiers. More...

Data Structures

struct	opamp_trim_args_t
struct	opamp_info_t
struct	opamp_status_t
struct	opamp_cfg_t
struct	opamp_api_t
struct	opamp_instance_t

Macros

#define	OPAMP_API_VERSION_MAJOR (2U)

Typedefs

typedef void	opamp_ctrl_t

Enumerations

enum	opamp_trim_cmd_t { OPAMP_TRIM_CMD_START, OPAMP_TRIM_CMD_NEXT_STEP, OPAMP_TRIM_CMD_CLEAR_BIT }
enum	opamp_trim_input_t { OPAMP_TRIM_INPUT_PCH = 0U, OPAMP_TRIM_INPUT_NCH = 1U }

Detailed Description

Interface for Operational Amplifiers.

Summary

The OPAMP interface provides standard operational amplifier functionality, including starting and stopping the amplifier.

Implemented by: Operational Amplifier (OPAMP)

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

OPAMP Interface description: OPAMP Driver

Macro Definition Documentation

◆ OPAMP_API_VERSION_MAJOR

#define OPAMP_API_VERSION_MAJOR (2U)
Includes board and MCU related header files. Version Number of API.

Typedef Documentation

◆ opamp_ctrl_t

typedef void opamp_ctrl_t
OPAMP control block. Allocate using driver instance control structure from driver instance header file.

Enumeration Type Documentation

◆ opamp_trim_cmd_t

enum opamp_trim_cmd_t	
Trim command.	
Enumerator	
OPAMP_TRIM_CMD_START	Initialize trim state machine.
OPAMP_TRIM_CMD_NEXT_STEP	Move to next step in state machine.
OPAMP_TRIM_CMD_CLEAR_BIT	Clear trim bit.

◆ opamp_trim_input_t

enum opamp_trim_input_t	
Trim input.	
Enumerator	
OPAMP_TRIM_INPUT_PCH	Trim non-inverting (+) input.
OPAMP_TRIM_INPUT_NCH	Trim inverting (-) input.

opamp_trim_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » OPAMP Interface

#include <r_opamp_api.h>

Data Fields

uint8_t	channel Channel.
opamp_trim_input_t	input Which input of the channel above.

Detailed Description

OPAMP trim arguments.

The documentation for this struct was generated from the following file:

- r_opamp_api.h

opamp_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » OPAMP Interface

#include <r_opamp_api.h>

Data Fields

uint32_t	min_stabilization_wait_us Minimum stabilization wait time in microseconds.

Detailed Description

OPAMP information.

The documentation for this struct was generated from the following file:

- r_opamp_api.h

opamp_status_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » OPAMP Interface

#include <r_opamp_api.h>

Data Fields

uint32_t	operating_channel_mask Bitmask of channels currently operating.

Detailed Description

OPAMP status.

ssp_err_t(*	statusGet)(opamp_ctrl_t *const p_ctrl, opamp_status_t *const p_status)
ssp_err_t(*	close)(opamp_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

OPAMP functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* opamp_api_t::close) (opamp_ctrl_t *const p_ctrl)

Close the specified OPAMP unit by ending any scan in progress, disabling interrupts, and removing power to the specified A/D unit.

Implemented as

- R_OPAMP_Close()

Parameters

[in]	p_ctrl	Pointer to instance control block

◆ infoGet

ssp_err_t(* opamp_api_t::infoGet) (opamp_ctrl_t *const p_ctrl, opamp_info_t *const p_info)

Provide information such as the recommended minimum stabilization wait time.

Implemented as

- R_OPAMP_InfoGet()

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_info	OPAMP information stored here

◆ open

ssp_err_t(* opamp_api_t::open) (opamp_ctrl_t *const p_ctrl, opamp_cfg_t const *const p_cfg)

Initialize the operational amplifier.

Implemented as

- R_OPAMP_Open()

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	p_cfg	Pointer to configuration

◆ start

ssp_err_t(* opamp_api_t::start) (opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)

Start the op-amp(s).

Implemented as

- R_OPAMP_Start()

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	channel_mask	Bitmask of channels to start

◆ statusGet

ssp_err_t(* opamp_api_t::statusGet) (opamp_ctrl_t *const p_ctrl, opamp_status_t *const p_status)

Provide status of each op-amp channel.

Implemented as

- R_OPAMP_StatusGet()

Parameters

[in]	p_ctrl	Pointer to instance control block
[out]	p_status	Status stored here

◆ stop

ssp_err_t(* opamp_api_t::stop) (opamp_ctrl_t *const p_ctrl, uint32_t const channel_mask)

Stop the op-amp(s).

Implemented as

- R_OPAMP_Stop()

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	channel_mask	Bitmask of channels to stop

◆ trim

ssp_err_t(* opamp_api_t::trim) (opamp_ctrl_t *const p_ctrl, opamp_trim_cmd_t const cmd, opamp_trim_args_t const *const p_args)

Trim the op-amp(s). Not supported on all MCUs. See implementation for procedure details.

Implemented as

- R_OPAMP_Trim()

Parameters

[in]	p_ctrl	Pointer to instance control block
[in]	cmd	Trim command
[in]	p_args	Pointer to arguments for the command

◆ versionGet

ssp_err_t(* opamp_api_t::versionGet) (ssp_version_t *const p_version)
Retrieve the API version. **Implemented as** ◦ R_OPAMP_VersionGet() **Precondition** This function retrieves the API version. **Parameters**

[in]	p_version	Pointer to version structure

The documentation for this struct was generated from the following file:

- r_opamp_api.h

opamp_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » OPAMP Interface

#include <r_opamp_api.h>

Data Fields

opamp_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
opamp_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
opamp_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

enum	pdc_hsync_state_t { PDC_HSYNC_STATE_LOW = 0u, PDC_HSYNC_STATE_HIGH = 1u }

Detailed Description

Interface for PDC functions.

Summary

The PDC interface provides the functionality for capturing an image from a camera. When a capture is complete a transfer complete interrupt is triggered.

Known Implementations

Macro Definition Documentation

◆ PDC_API_VERSION_MAJOR

#define PDC_API_VERSION_MAJOR (2U)
Register definitions, common services and error codes.

Typedef Documentation

◆ pdc_ctrl_t

typedef void pdc_ctrl_t
PDC control block. Allocate an instance specific control block to pass into the PDC API calls. **Implemented as** ◦ pdc_instance_ctrl_t

Enumeration Type Documentation

◆ pdc_clock_division_t

enum pdc_clock_division_t	
Clock divider applied to PDC clock to provide PCKO output frequency	
Enumerator	
PDC_CLOCK_DIVISION_2	CLK / 2.
PDC_CLOCK_DIVISION_4	CLK / 4.
PDC_CLOCK_DIVISION_6	CLK / 6.
PDC_CLOCK_DIVISION_8	CLK / 8.
PDC_CLOCK_DIVISION_10	CLK / 10.
PDC_CLOCK_DIVISION_12	CLK / 12.
PDC_CLOCK_DIVISION_14	CLK / 14.
PDC_CLOCK_DIVISION_16	CLK / 16.

◆ pdc_endian_t

enum pdc_endian_t	
Endian of captured data	
Enumerator	
PDC_ENDIAN_LITTLE	Data is in little endian format.
PDC_ENDIAN_BIG	Data is in big endian format.

◆ pdc_event_t

enum pdc_event_t	
PDC events	
Enumerator	
PDC_EVENT_TRANSFER_COMPLETE	Complete frame transferred by DMAC/DTC.
PDC_EVENT_RX_DATA_READY	Receive data ready interrupt.
PDC_EVENT_FRAME_END	Frame end interrupt.
PDC_EVENT_ERR_OVERRUN	Overrun interrupt.
PDC_EVENT_ERR_UNDERRUN	Underrun interrupt.
PDC_EVENT_ERR_V_SET	Vertical line setting error interrupt.
PDC_EVENT_ERR_H_SET	Horizontal byte number setting error interrupt.

◆ pdc_hsync_polarity_t

enum pdc_hsync_polarity_t	
Polarity of input HSYNC signal	
Enumerator	
PDC_HSYNC_POLARITY_HIGH	HSYNC signal is active high.
PDC_HSYNC_POLARITY_LOW	HSYNC signal is active low.

◆ pdc_hsync_state_t

enum pdc_hsync_state_t	
HSYNC signal state	
Enumerator	
PDC_HSYNC_STATE_LOW	HSYNC signal is low.
PDC_HSYNC_STATE_HIGH	HSYNC signal is high.

◆ pdc_vsync_polarity_t

enum pdc_vsync_polarity_t	
Polarity of input VSYNC signal	
Enumerator	
PDC_VSYNC_POLARITY_HIGH	VSYNC signal is active high.
PDC_VSYNC_POLARITY_LOW	VSYNC signal is active low.

◆ pdc_vsync_state_t

enum pdc_vsync_state_t	
VSYNC signal state	
Enumerator	
PDC_VSYNC_STATE_LOW	VSYNC signal is low.
PDC_VSYNC_STATE_HIGH	VSYNC signal is high.

pdc_state_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PDC Interface

#include <r_pdc_api.h>

Data Fields

pdc_vsync_state_t	vsync VSYNC signal state.
pdc_hsync_state_t	hsync HSYNC signal state.

Detailed Description

PDC VSYNC/HSYNC state

The documentation for this struct was generated from the following file:

pdc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PDC Interface

#include <r_pdc_api.h>

Data Fields

pdc_event_t	event Event causing the callback.
uint8_t *	p_buffer Pointer to buffer containing the captured data.
void const *	p_context Placeholder for user data. Set in pdc_api_t::open function in pdc_cfg_t.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_pdc_api.h

pdc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PDC Interface

#include <r_pdc_api.h>

Data Fields

uint16_t	x_capture_start_pixel Horizontal position to start capture.
uint16_t	x_capture_pixels Number of horizontal pixels to capture.
uint16_t	y_capture_start_pixel Vertical position to start capture.
uint16_t	y_capture_pixels Number of vertical lines/pixels to capture.
pdc_clock_division_t	clock_division Clock divider.
pdc_endian_t	endian Endian of capture data.
pdc_hsync_polarity_t	hsync_polarity Polarity of HSYNC input.
pdc_vsync_polarity_t	vsync_polarity Polarity of VSYNC input.
uint8_t *	p_buffer Pointer to buffer to write image into.
uint8_t	bytes_per_pixel Number of bytes per pixel.
uint8_t	frame_end_ipl Frame end interrupt priority.
uint8_t	irq_ipl

	PDC interrupt priority.
transfer_instance_t const *const	p_lower_lvl_transfer Pointer to the transfer instance the PDC should use.
void(*	p_callback)(pdc_callback_args_t *p_args) Callback provided when a PDC transfer ISR occurs.
void const *	p_context
void const *	p_extend

Detailed Description

PDC configuration parameters.

Field Documentation

◆ p_context

void const* pdc_cfg_t::p_context
Placeholder for user data. Passed to the user callback in pdc_callback_args_t.

◆ p_extend

void const* pdc_cfg_t::p_extend
Extension parameter for hardware specific settings.

The documentation for this struct was generated from the following file:

- r_pdc_api.h

pdc_api_t Struct Reference
Renesas Synergy Software Package Reference » HAL Interfaces » PDC Interface

#include <r_pdc_api.h>

Data Fields

ssp_err_t(*	open)(pdc_ctrl_t *const p_ctrl, pdc_cfg_t const *const p_cfg)
ssp_err_t(*	close)(pdc_ctrl_t *const p_ctrl)
ssp_err_t(*	captureStart)(pdc_ctrl_t *const p_ctrl, uint8_t *const p_buffer)
ssp_err_t(*	stateGet)(pdc_ctrl_t *const p_ctrl, pdc_state_t *p_state)
ssp_err_t(*	versionGet)(ssp_version_t *const p_data)

Detailed Description

PDC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ captureStart

ssp_err_t(* pdc_api_t::captureStart) (pdc_ctrl_t *const p_ctrl, uint8_t *const p_buffer)

Start a capture.

Implemented as

- R_PDC_CaptureStart()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_buffer	Pointer to store captured image data.

◆ close

ssp_err_t(* pdc_api_t::close) (pdc_ctrl_t *const p_ctrl)

Closes the driver and allows reconfiguration. May reduce power consumption.

Implemented as

- R_PDC_Close()

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ open

ssp_err_t(* pdc_api_t::open) (pdc_ctrl_t *const p_ctrl, pdc_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_PDC_Open()

Note

To reconfigure after calling this function, call pdc_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ stateGet

ssp_err_t(* pdc_api_t::stateGet) (pdc_ctrl_t *const p_ctrl, pdc_state_t *p_state)

Get the state of the VSYNC and HSYNC pins.

Implemented as

- R_PDC_StateGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_state	Pointer to store state data.

◆ versionGet

ssp_err_t(* pdc_api_t::versionGet) (ssp_version_t *const p_data)

Return the version of the driver.

Implemented as

- R_PDC_VersionGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_data	Memory address to return version information to.

The documentation for this struct was generated from the following file:

- r_pdc_api.h

pdc_instance_t Struct Reference

PTP Interface description: PTP Driver on r_ptp

Typedef Documentation

◆ ptp_ctrl_t

typedef void ptp_ctrl_t

PTP control block. Allocate an instance specific control block to pass into the PTP API calls.

Implemented as

- ptp_instance_ctrl_t

Enumeration Type Documentation

◆ ptp_delay_mechanism_t

enum ptp_delay_mechanism_t	
PTP Delay correction mechanism definitions	
Enumerator	
PTP_DELAY_MECHANISM_DISABLED	Unsupported.
PTP_DELAY_MECHANISM_P2P	Peer to peer delay mechanism.
PTP_DELAY_MECHANISM_E2E	End to end delay mechanism.

◆ ptp_device_t

enum ptp_device_t	
PTP Clock type definitions	
Enumerator	
PTP_DEVICE_DISABLED	Unsupported.
PTP_DEVICE_ORDINARY_CLOCK0	Ordinary Clock Port 0.
PTP_DEVICE_ORDINARY_CLOCK1	Ordinary Clock Port 1.
PTP_DEVICE_BOUNDARY_CLOCK	Boundary Clock.
PTP_DEVICE_TRANSPARENT_CLOCK	Transparent Clock.

◆ ptp_event_t

enum ptp_event_t	
MINT interrupt register definitions	
Enumerator	
PTP_EVENT_TIMER	Interrupt from Timer.
PTP_EVENT_STCA	Interrupt from STCA.
PTP_EVENT_PRCTC	Interrupt from PRC-TC.
PTP_EVENT_SYNFP0	Interrupt from SYNFP0.
PTP_EVENT_SYNFP1	Interrupt from SYNFP1.

◆ ptp_frame_format_t

enum ptp_frame_format_t	
PTP message frame format definitions	
Enumerator	
PTP_FRAME_FORMAT_DISABLED	Unsupported.
PTP_FRAME_FORMAT_ETH	Ethernet II frame format.
PTP_FRAME_FORMAT_ETH_8023	Ethernet 802.3 frame format.
PTP_FRAME_FORMAT_UDP4	Ethernet II over UDP4 frame format.
PTP_FRAME_FORMAT_UDP4_8023	Ethernet 802.3 over UDP4 frame format.

◆ ptp_state_t

enum ptp_state_t	
PTP clock state definitions	
Enumerator	
PTP_STATE_DISABLED	Unsupported.
PTP_STATE_MASTER	Master state.
PTP_STATE_SLAVE	Slave state.
PTP_STATE_LISTENING	Listening state.

◆ ptp_stca_mode_t

enum ptp_stca_mode_t	
STCA mode and gradient setting definitions	
Enumerator	
PTP_STCA_MODE_1	Mode1 (not use STCA)
PTP_STCA_MODE_2_HW	Mode2 (use STCA) and HW gradient setting.
PTP_STCA_MODE_2_SW	Mode2 (use STCA) and SW gradient setting.

◆ ptp_stca_timer_channel_t

enum ptp_stca_timer_channel_t	
STCA pulse output timer channel definitions	
Enumerator	
PTP_STCA_TIMER_CHANNEL_0	STCA pulse output timer 0.
PTP_STCA_TIMER_CHANNEL_1	STCA pulse output timer 1.
PTP_STCA_TIMER_CHANNEL_2	STCA pulse output timer 2.
PTP_STCA_TIMER_CHANNEL_3	STCA pulse output timer 3.
PTP_STCA_TIMER_CHANNEL_4	STCA pulse output timer 4.
PTP_STCA_TIMER_CHANNEL_5	STCA pulse output timer 5.

◆ ptp_stca_timer_pulse_edge_t

enum ptp_stca_timer_pulse_edge_t	
STCA pulse output timer edge definitions	
Enumerator	
PTP_STCA_TIMER_PULSE_EDGE_RISING	Rising edge.
PTP_STCA_TIMER_PULSE_EDGE_FALLING	Falling edge.

UInt64_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

PTP data type structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_timestamp_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

PTP message timestamp structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_address_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

PTP channel related structure (MAC address, IP address)

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_announce_flag_t Union Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

Announce flagField type structure

The documentation for this union was generated from the following file:

- r_ptp_api.h

ptp_clock_quality_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

PTP clock quality structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_announce_message_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

Announce message field type structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_message_reception_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Detailed Description

PTP message reception configuration field structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Data Fields

void const *	p_context Context provided to user during callback.
ptp_event_t	event The event can be used to identify what caused the callback.
ptp_stca_timer_channel_t	timer_channel STCA pulse output timer channel.

Detailed Description

PTP callback arguments definition

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Data Fields

ssp_err_t(*	p_callback)(ptp_callback_args_t *p_args) Pointer to interrupt callback function.
void const *	p_context User defined context passed into callback function.
uint8_t	irq_ipl MINT interrupt IRQ number.
ptp_device_t	device PTP clock type.
ptp_state_t	state [2] PTP clock state.
ptp_delay_mechanism_t	delay [2] Delay correction mechanism.
ptp_frame_format_t	frame_format [2] PTP message frame format.
ptp_stca_mode_t	stca_sync_mode STCA synchronous mode.
void const *	p_extend Extension parameter for hardware specific settings.

Detailed Description

PTP user configuration structure

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ssp_err_t(*	clearINFABTstatus)(ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

PTP functions implemented at the HAL layer follow this API.

Field Documentation

◆ autoClearEvent

ssp_err_t(* ptp_api_t::autoClearEvent) (ptp_ctrl_t *const p_ctrl, ptp_stca_timer_channel_t timer_channel, ptp_stca_timer_pulse_edge_t timer_pulse_edge, bool is_set)

Set/clear auto clear mode for enabling one time output of ELC event.

Implemented as

- R_PTP_AutoClearEvent()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	timer_channel	STCA pulse output timer channel
[in]	timer_pulse_edge	STCA pulse output timer edge
[in]	is_set	Enable or disable automatic clearing of event

◆ checkINFABTstatus

ssp_err_t(* ptp_api_t::checkINFABTstatus) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, uint8_t *p_status)

Checks the status of INFABT flag

Implemented as

- R_PTP_CheckINFABTstatus()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[out]	p_status	Returns status of INFABT flag

◆ checkWorst10Values

ssp_err_t(* ptp_api_t::checkWorst10Values) (ptp_ctrl_t *const p_ctrl, uint32_t wait_option)

Checks worst 10 values by hardware and set as gradient limits.

Implemented as

- R_PTP_CheckWorst10Values()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	wait_option	Timeout interval

◆ clearINFABTstatus

ssp_err_t(* ptp_api_t::clearINFABTstatus) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel)

Clear INFABT interrupt occurrence flag.

Implemented as

- R_PTP_ClearINFABTstatus()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel

◆ close

ssp_err_t(* ptp_api_t::close) (ptp_ctrl_t *const p_ctrl)

Close the PTP driver module.

Implemented as

- R_PTP_Close()

Parameters

[in]	p_ctrl	Pointer to the control structure

◆ configure

ssp_err_t(* ptp_api_t::configure) (ptp_ctrl_t *const p_ctrl, uint32_t *p_ip_address, uint32_t *p_physical_address_msw, uint32_t *p_physical_address_lsw)

Configures the PTP driver module.

Implemented as

- R_PTP_Configure()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	p_ip_address	Pointer to the IP address
[in]	p_physical_address_msw	Pointer to the higher bits of physical address
[in]	p_physical_address_lsw	Pointer to the lower bits of physical address

◆ disableINFABTnotification

ssp_err_t(* ptp_api_t::disableINFABTnotification) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel)

Disable EPTPC INFABT notification

Implemented as

- R_PTP_DisableINFABTnotification()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel

◆ disableTimer

ssp_err_t(* ptp_api_t::disableTimer) (ptp_ctrl_t *const p_ctrl, ptp_stca_timer_channel_t timer_channel)

Disable timer event interrupt.

Implemented as

- R_PTP_DisableTimer()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	timer_channel	STCA pulse output timer channel

◆ enableINFABTnotification

ssp_err_t(* ptp_api_t::enableINFABTnotification) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel)

Enable EPTPC INFABT notification

Implemented as

- R_PTP_EnableINFABTnotification()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel

◆ getLocalClock

ssp_err_t(* ptp_api_t::getLocalClock) (ptp_ctrl_t *const p_ctrl, ptp_timestamp_t *p_clock, uint32_t wait_option)

Gets local clock counter

Implemented as

- R_PTP_GetLocalClock()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	wait_option	Time out interval
[out]	p_clock	Pointer to local clock counter

◆ getMasterPortID

ssp_err_t(* ptp_api_t::getMasterPortID) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, uint32_t *p_clock, uint16_t *p_port)

Gets master port ID

Implemented as

- R_PTP_GetMasterPortID()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[out]	p_clock	Pointer to local clock counter
[out]	p_port	Pointer to master port

◆ getMessageReceptionConfig

ssp_err_t(* ptp_api_t::getMessageReceptionConfig) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, ptp_message_reception_t *p_ptp_message_reception)

Get message reception configuration

Implemented as

- R_PTP_GetMessageReceptionConfig()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[out]	p_ptp_message_reception	Pointer to SYNFP message reception configuration structure

◆ getSyncInfo

ssp_err_t(* ptp_api_t::getSyncInfo) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, ptp_timeInterval_t *p_master_offset, ptp_timeInterval_t *p_path_delay)

Get current offsetFromMaster and meanPathDelay.

Implemented as

- R_PTP_GetSyncInfo()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[out]	p_master_offset	Returns the offset from master
[out]	p_path_delay	Returns the mean path delay

◆ getWorst10Values

ssp_err_t(* ptp_api_t::getWorst10Values) (ptp_ctrl_t *const p_ctrl, uint32_t *p_positive_worst10, uint32_t *p_negative_worst10, uint32_t wait_option)

Get worst 10 values by software.

Implemented as

- R_PTP_GetWorst10Values()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	wait_option	Timeout interval
[out]	p_positive_worst10	Returns the positive worst 10 values
[out]	p_negative_worst10	Returns the negative worst 10 values

◆ indicateEvent

ssp_err_t(* ptp_api_t::indicateEvent) (ptp_ctrl_t *const p_ctrl, ptp_stca_timer_channel_t timer_channel, ptp_stca_timer_pulse_edge_t timer_pulse_edge, bool is_set)

Set/clear interrupt indication to ELC output on generation of pulse produced by pulse output timer.

Implemented as

- R_PTP_IndicateEvent()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	timer_channel	STCA pulse output timer channel
[in]	timer_pulse_edge	STCA pulse output timer pulse edge
[in]	is_set	Set or clear indication of

◆ open

ssp_err_t(* ptp_api_t::open) (ptp_ctrl_t *const p_ctrl, ptp_cfg_t const *const p_cfg)

Open the PTP driver module.

Implemented as

- R_PTP_Open()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	p_cfg	Pointer to a configuration structure

◆ setExtPromiscuous

ssp_err_t(* ptp_api_t::setExtPromiscuous) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, bool is_set)

Sets or clears the extended promiscuous mode

Implemented as

- R_PTP_SetExtPromiscuous()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	is_set	Set/clear extended promiscuous mode

◆ setGradientLimit

ssp_err_t(* ptp_api_t::setGradientLimit) (ptp_ctrl_t *const p_ctrl, uint32_t *p_positive_limit, uint32_t *p_negative_limit)

Set the gradient limits for positive and negative worst 10 values.

Implemented as

- R_PTP_SetGradientLimit()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	p_positive_limit	Positive limit of worst 10 values
[in]	p_negative_limit	Negative limit of worst 10 values

◆ setLocalClock

ssp_err_t(* ptp_api_t::setLocalClock) (ptp_ctrl_t *const p_ctrl, ptp_timestamp_t *p_clock)

Sets local clock counter

Implemented as

- R_PTP_SetLocalClock()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	p_clock	Pointer to local clock counter

◆ setMasterPortID

ssp_err_t(* ptp_api_t::setMasterPortID) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, uint32_t *p_clock, uint16_t *p_port)

Sets master port ID

Implemented as

- R_PTP_SetMasterPortID()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_clock	Pointer to local clock counter
[in]	p_port	Pointer to master port

◆ setMessageReceptionConfig

ssp_err_t(* ptp_api_t::setMessageReceptionConfig) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, ptp_message_reception_t *p_ptp_message_reception)

Set message reception configuration.

Implemented as

- R_PTP_SetMessageReceptionConfig()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_ptp_message_reception	Pointer to SYNFP message reception config structure

◆ setMINTevent

ssp_err_t(* ptp_api_t::setMINTevent) (ptp_ctrl_t *const p_ctrl, ptp_event_t ptp_reg, uint32_t event, bool is_set)

Set MINT interrupt event to enable notification for change in state of modules.

Implemented as

- R_PTP_SetMINTevent()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_reg	MINT interrupt register
[in]	event	Interrupt element
[in]	is_set	Set or clear MINT event

◆ setTimer

ssp_err_t(* ptp_api_t::setTimer) (ptp_ctrl_t *const p_ctrl, uint8_t timer_channel, UInt64_t event, uint32_t cycle, uint32_t pulse_width)

Sets start time, pulse period and pulse width for the pulse output timer.

Implemented as

- R_PTP_SetTimer()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	timer_channel	STCA pulse output timer channel
[in]	event	Timer event start time
[in]	cycle	Pulse output cycle interval
[in]	pulse_width	Width of the high level of the pulse signal

◆ setWorst10Values

ssp_err_t(* ptp_api_t::setWorst10Values) (ptp_ctrl_t *const p_ctrl, uint8_t interval)

Sets the time interval for collecting worst 10 values

Implemented as

- R_PTP_SetWorst10Values()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	interval	Time interval to collect worst 10 values

◆ start

ssp_err_t(* ptp_api_t::start) (ptp_ctrl_t *const p_ctrl, uint32_t wait_option)

Starts the time synchronization.

Implemented as

- R_PTP_Start()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	wait_option	Timeout interval

◆ stop

ssp_err_t(* ptp_api_t::stop) (ptp_ctrl_t *const p_ctrl, uint32_t wait_option)

Stops the time synchronization.

Implemented as

- R_PTP_Stop()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	wait_option	Timeout interval

◆ updateAnnounceFlags

ssp_err_t(* ptp_api_t::updateAnnounceFlags) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, ptp_announce_flag_t *p_flag)

Update the announce message's flag field.

Implemented as

- R_PTP_UpdateAnnounceFlags()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_flag	Pointer to announce message flag field

◆ updateAnnounceMsgs

ssp_err_t(* ptp_api_t::updateAnnounceMsgs) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, ptp_announce_message_t *p_message)

Update the announce message's message field.

Implemented as

- R_PTP_UpdateAnnounceMsgs()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_message	Pointer to announce message field

◆ updateClockID

ssp_err_t(* ptp_api_t::updateClockID) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, int8_t *p_clock_id)

Update the clock identity field.

Implemented as

- R_PTP_UpdateClockID()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_clock_id	Pointer to clock ID

◆ updateDelayMsgInterval

ssp_err_t(* ptp_api_t::updateDelayMsgInterval) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, int8_t *p_interval, uint32_t *p_timeout)

Update transmission interval, logMessageInterval and timeout values of Delay messages.

Implemented as

- R_PTP_UpdateDelayMsgInterval()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_interval	Case of master: Delay_Resp logMessageInterval Case of slave: Delay_Req/Pdelay_Req transmission interval
[in]	p_timeout	Delay_Resp/Pdelay_Resp receiving timeout

◆ updateDomainNumber

ssp_err_t(* ptp_api_t::updateDomainNumber) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, uint8_t domain_num)

Update the domain number field in the message header.

Implemented as

- R_PTP_UpdateDomainNumber()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	domain_num	Domain number

◆ updateSyncAnnounceMsgInterval

ssp_err_t(* ptp_api_t::updateSyncAnnounceMsgInterval) (ptp_ctrl_t *const p_ctrl, uint8_t ptp_channel, int8_t *p_sync_interval, int8_t *p_announce_interval)

Update transmission interval and logMessageInterval of Sync and Announce messages.

Implemented as

- R_PTP_UpdateSyncAnnounceMsgInterval()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	ptp_channel	EPTPC channel
[in]	p_sync_interval	Pointer to sync message interval
[in]	p_announce_interval	Pointer to announce message interval

◆ versionGet

ssp_err_t(* ptp_api_t::versionGet) (ssp_version_t *const p_version)
Get the driver version based on compile time macros. **Implemented as** ◦ R_PTP_VersionGet() **Parameters** [out] p_version — Code and API version used.

The documentation for this struct was generated from the following file:

- r_ptp_api.h

ptp_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTP driver Interface

#include <r_ptp_api.h>

Data Fields

ptp_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
ptp_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
ptp_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_ptp_api.h

5.1.4.29 PTPEDMAC driver Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for PTPEDMAC functions. More...

Data Structures

struct	ptpedmac_descriptor_t
struct	ptpedmac_callback_args_t
struct	ptpedmac_cfg_t
struct	ptpedmac_api_t
struct	ptpedmac_instance_t

Typedefs

typedef void	ptpedmac_ctrl_t

Enumerations

enum	ptpedmac_trans_t { PTPEDMAC_TRANS_FLAG_OFF = 0, PTPEDMAC_TRANS_FLAG_ON = 1 }

Detailed Description

Interface for PTPEDMAC functions.

Summary

The PTPEDMAC interface supports PTP host interface to receive PTP message.

The PTPEDMAC interface can be implemented by:

- PTPEDMAC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers

PTPEDMAC Interface description: PTPEDMAC Driver on r_ptpedmac

Typedef Documentation

◆ ptpedmac_ctrl_t

typedef void ptpedmac_ctrl_t
PTPEDMAC control block. Allocate an instance specific control block to pass into the PTPEDMAC API calls. **Implemented as** ◦ ptpedmac_instance_ctrl_t

Enumeration Type Documentation

◆ ptpedmac_event_t

enum ptpedmac_event_t	
PTPEDMAC interrupt event definitions	
Enumerator	
PTPEDMAC_EVENT_READ	Frame reception interrupt (FR)
PTPEDMAC_EVENT_WRITE	Frame transmission interrupt (TC)
PTPEDMAC_EVENT_ERR	Error interrupt (MACE, RFOF, RDE, TFUF, TDE, ADE and RFCOF)

◆ ptpedmac_trans_t

enum ptpedmac_trans_t	
Enumeration to specify the status of transfer flag	
Enumerator	
PTPEDMAC_TRANS_FLAG_OFF	Transfer disable.
PTPEDMAC_TRANS_FLAG_ON	Transfer enable.

ptpedmac_descriptor_t Struct Reference

ptpedmac_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTPEDMAC driver Interface

#include <r_ptpedmac_api.h>

Data Fields

ssp_err_t(*	p_callback)(ptpedmac_callback_args_t *p_args) Pointer to interrupt callback function.
void const *	p_context User defined context passed into callback function.
uint8_t	irq_ipl PINT interrupt IRQ number.

Detailed Description

PTPEDMAC configuration block. Allocate an instance specific control block to pass into the PTPEDMAC API calls.

The documentation for this struct was generated from the following file:

- r_ptpedmac_api.h

ptpedmac_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTPEDMAC driver Interface

#include <r_ptpedmac_api.h>

Data Fields

ssp_err_t(*	open)(ptpedmac_ctrl_t *const p_ctrl, ptpedmac_cfg_t const *const p_cfg)
ssp_err_t(*	linkProcess)(ptpedmac_ctrl_t *const p_api_ctrl)
ssp_err_t(*	linkCheck)(ptpedmac_ctrl_t *const p_ctrl)
ssp_err_t(*	read)(ptpedmac_ctrl_t *const p_ctrl, uint32_t *p_channel, void *const p_buffer, int32_t *p_num_received)
ssp_err_t(*	close)(ptpedmac_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

PTPEDMAC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* ptpedmac_api_t::close) (ptpedmac_ctrl_t *const p_ctrl)

Close the PTPEDMAC driver module.

Implemented as

- R_PTPEDMAC_Close()

Parameters

[in]	p_ctrl	Pointer to the control structure

◆ linkCheck

ssp_err_t(* ptpedmac_api_t::linkCheck) (ptpedmac_ctrl_t *const p_ctrl)

Checks host interface communication status

Implemented as

- R_PTPEDMAC_CheckLink()

Parameters

[in]	p_ctrl	Pointer to the control structure

◆ linkProcess

ssp_err_t(* ptpedmac_api_t::linkProcess) (ptpedmac_ctrl_t *const p_api_ctrl)

Sets host interface to transfer PTP messages

Implemented as

- R_PTPEDMAC_LinkProcess()

Parameters

[in]	p_ctrl	Pointer to the control structure

◆ open

ssp_err_t(* ptpedmac_api_t::open) (ptpedmac_ctrl_t *const p_ctrl, ptpedmac_cfg_t const *const p_cfg)

Open the PTPEDMAC driver module for reception of PTP messages.

Implemented as

- R_PTPEDMAC_Open()

Parameters

[in]	p_ctrl	Pointer to the control structure
[in]	p_cfg	Pointer to configuration structure

◆ read

ssp_err_t(* ptpedmac_api_t::read) (ptpedmac_ctrl_t *const p_ctrl, uint32_t *p_channel, void *const p_buffer, int32_t *p_num_received)

Receives PTP message

Implemented as

- R_PTPEDMAC_Read()

Parameters

[in]	p_ctrl	Pointer to the control structure
[out]	p_channel	Pointer to received channel
[out]	p_buffer	Pointer to received data buffer
[out]	p_num_received	Pointer to number of received data

◆ versionGet

ssp_err_t(* ptpedmac_api_t::versionGet) (ssp_version_t *const p_version)

Get the driver version based on compile time macros.

Implemented as

- R_PTPEDMAC_VersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_ptpedmac_api.h

ptpedmac_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » PTPEDMAC driver Interface

#include <r_ptpedmac_api.h>

Data Fields

ptpedmac_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
ptpedmac_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
ptpedmac_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

- r_ptpedmac_api.h

5.1.4.30 Quad SPI Flash Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for accessing external SPI flash devices. More...

Data Structures

struct	qspi_cfg_t
struct	qspi_info_t
struct	qspi_api_t
struct	qspi_instance_t

Typedefs

typedef void	qspi_ctrl_t

Enumerations

enum	qspi_address_mode_t

Detailed Description

Interface for accessing external SPI flash devices.

Summary

The QSPI module provides an interface that writes and erases sectors in quad SPI flash devices connected to the QSPI interface.

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

QSPI Interface description: QSPI Driver

Typedef Documentation

◆ qspi_ctrl_t

typedef void qspi_ctrl_t
QSPI control block. Allocate an instance specific control block to pass into the QSPI API calls. **Implemented as** ◦ qspi_instance_ctrl_t

Enumeration Type Documentation

◆ qspi_address_mode_t

enum qspi_address_mode_t
User configuration structure used for selecting addressing mode

qspi_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Quad SPI Flash Interface

#include <r_qspi_api.h>

Data Fields

void *	p_extend place holder for future development

Detailed Description

User configuration structure used by the open function

The documentation for this struct was generated from the following file:

- r_qspi_api.h

qspi_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Quad SPI Flash Interface

#include <r_qspi_api.h>

Data Fields

uint32_t	total_size_bytes Size of this QSPI in bytes.
uint32_t	min_program_size_bytes Minimum program size in bytes.
uint32_t *	p_erase_sizes_bytes Array of available erase sizes. Each entry is in bytes.
uint8_t	num_erase_sizes Number of available erase sizes.

Detailed Description

QSPI information structure to store information specific to the currently used QSPI.

The documentation for this struct was generated from the following file:

- r_qspi_api.h

qspi_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Quad SPI Flash Interface

#include <r_qspi_api.h>

Data Fields

ssp_err_t(*	open)(qspi_ctrl_t *p_ctrl, qspi_cfg_t const *const p_cfg)
ssp_err_t(*	close)(qspi_ctrl_t *p_ctrl)
ssp_err_t(*	read)(qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint8_t *p_memory_address, uint32_t byte_count)
ssp_err_t(*	pageProgram)(qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint8_t *p_memory_address, uint32_t byte_count)

ssp_err_t(*	bankSelect)(uint32_t bank)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

QSPI functions implemented at the HAL layer follow this API.

Field Documentation

◆ bankSelect

ssp_err_t(* qspi_api_t::bankSelect) (uint32_t bank)

Select the bank to access.

Implemented as

- R_QSPI_BankSelect()

Parameters

[in]	bank	The bank number

◆ close

ssp_err_t(* qspi_api_t::close) (qspi_ctrl_t *p_ctrl)

Close the QSPI driver module.

Implemented as

- R_QSPI_Close()

Parameters

[in]	p_ctrl	Pointer to a driver handle

◆ erase

ssp_err_t(* qspi_api_t::erase) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint32_t byte_count)

Erase a certain number of bytes of the flash.

Implemented as

- R_QSPI_Erase()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_device_address	The location in the flash device address space to start the erase from
[in]	byte_count	The number of bytes to erase

◆ infoGet

ssp_err_t(* qspi_api_t::infoGet) (qspi_ctrl_t *const p_ctrl, qspi_info_t *const p_info)

Get information about this specific QSPI flash.

Implemented as

- R_QSPI_InfoGet()

Parameters

[in]	p_ctrl	Control block set in qspi_api_t::open call for this timer.
[out]	p_info	Collection of information for this QSPI.

◆ open

ssp_err_t(* qspi_api_t::open) (qspi_ctrl_t *p_ctrl, qspi_cfg_t const *const p_cfg)

Open the QSPI driver module.

Implemented as

- R_QSPI_Open()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_cfg	Pointer to a configuration structure

◆ pageProgram

ssp_err_t(* qspi_api_t::pageProgram) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint8_t *p_memory_address, uint32_t byte_count)

Program a page of data to the flash.

Implemented as

- R_QSPI_PageProgram()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_device_address	The location in the flash device address space to write the data to
[in]	p_memory_address	The memory address of the data to write to the flash device
[in]	byte_count	The number of bytes to write

◆ read

ssp_err_t(* qspi_api_t::read) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address, uint8_t *p_memory_address, uint32_t byte_count)

Read a block of data from the flash.

Implemented as

- R_QSPI_Read()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_device_address	The location in the flash device address space to read
[in]	p_memory_address	The memory address of a buffer to place the read data in
[in]	byte_count	The number of bytes to read

◆ sectorErase

ssp_err_t(* qspi_api_t::sectorErase) (qspi_ctrl_t *p_ctrl, uint8_t *p_device_address)

Erase a sector of the flash.

Implemented as

- R_QSPI_SectorErase()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_device_address	The location in the flash device address space to start the erase from

◆ statusGet

ssp_err_t(* qspi_api_t::statusGet) (qspi_ctrl_t *p_ctrl, bool *p_write_in_progress)

Get the write or erase status of the flash.

Implemented as

- R_QSPI_StatusGet()

Parameters

[in]	p_ctrl	Pointer to a driver handle
[in]	p_write_in_progress	The write or erase status - TRUE = write/erase in progress

◆ versionGet

ssp_err_t(* qspi_api_t::versionGet) (ssp_version_t *const p_version)

Get the driver version based on compile time macros.

Implemented as

- R_QSPI_VersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_qspi_api.h

qspi_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Quad SPI Flash Interface

#include <r_qspi_api.h>

Data Fields

qspi_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
qspi_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
qspi_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

Macro Definition Documentation

◆ RTC_API_VERSION_MAJOR

```
#define RTC_API_VERSION_MAJOR   (2U)
```

Use of time structure, tm

Typedef Documentation

◆ rtc_ctrl_t

```
typedef void rtc_ctrl_t
```

RTC control block. Allocate an instance specific control block to pass into the RTC API calls.

Implemented as

- rtc_instance_ctrl_t

◆ rtc_time_t

```
typedef struct tm rtc_time_t
```

Date and time structure defined in C standard library <time.h>

Enumeration Type Documentation

◆ rtc_clock_source_t

enum rtc_clock_source_t	
Clock source for the RTC block	
Enumerator	
RTC_CLOCK_SOURCE_SUBCLK	Sub-clock oscillator.
RTC_CLOCK_SOURCE_LOCO	Low power On Chip Oscillator.

◆ rtc_error_adjustment_mode_t

enum rtc_error_adjustment_mode_t	
Time error adjustment mode settings	
Enumerator	
RTC_ERROR_ADJUSTMENT_MODE_MANUAL	Adjustment mode is set to manual.
RTC_ERROR_ADJUSTMENT_MODE_AUTOMATIC	Adjustment mode is set to automatic.

◆ rtc_error_adjustment_period_t

enum rtc_error_adjustment_period_t	
Time error adjustment period settings	
Enumerator	
RTC_ERROR_ADJUSTMENT_PERIOD_1_MINUTE	Adjustment period is set to every one minute.
RTC_ERROR_ADJUSTMENT_PERIOD_10_SECOND	Adjustment period is set to every ten second.
RTC_ERROR_ADJUSTMENT_PERIOD_NONE	Adjustment period not supported in manual mode.

◆ rtc_error_adjustment_t

enum rtc_error_adjustment_t	
Time error adjustment settings	
Enumerator	
RTC_ERROR_ADJUSTMENT_NONE	Adjustment is not performed.
RTC_ERROR_ADJUSTMENT_ADD_PRESCALER	Adjustment is performed by the addition to the prescaler.
RTC_ERROR_ADJUSTMENT_SUBTRACT_PRESCALER	Adjustment is performed by the subtraction from the prescaler.

◆ rtc_event_t

enum rtc_event_t	
Events that can trigger a callback function	
Enumerator	
RTC_EVENT_ALARM_IRQ	Real Time Clock ALARM IRQ.
RTC_EVENT_PERIODIC_IRQ	Real Time Clock PERIODIC IRQ.
RTC_EVENT_CARRY_IRQ	Real Time Clock CARRY IRQ.

◆ rtc_periodic_irq_select_t

enum rtc_periodic_irq_select_t	
Periodic Interrupt select	
Enumerator	
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_256_SECOND	A periodic irq is generated every 1/256 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_128_SECOND	A periodic irq is generated every 1/128 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_64_SECOND	A periodic irq is generated every 1/64 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_32_SECOND	A periodic irq is generated every 1/32 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_16_SECOND	A periodic irq is generated every 1/16 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_8_SECOND	A periodic irq is generated every 1/8 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_4_SECOND	A periodic irq is generated every 1/4 second.
RTC_PERIODIC_IRQ_SELECT_1_DIV_BY_2_SECOND	A periodic irq is generated every 1/2 second.
RTC_PERIODIC_IRQ_SELECT_1_SECOND	A periodic irq is generated every 1 second.
RTC_PERIODIC_IRQ_SELECT_2_SECONDS	A periodic irq is generated every 2 seconds.

◆ rtc_status_t

enum rtc_status_t	
RTC run state	
Enumerator	
RTC_STATUS_STOPPED	RTC counter is stopped.
RTC_STATUS_RUNNING	RTC counter is running.

rtc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_event_t	event The event can be used to identify what caused the callback (compare match or error).
void const *	p_context Placeholder for user data. Set in r_timer_t::open function in timer_cfg_t.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_rtc_api.h

rtc_error_adjustment_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_error_adjustment_t	adjustment_type Time error adjustment type setting.
uint8_t	adjustment_value Time error adjustment value.

Detailed Description

Time error adjustment value configuration

The documentation for this struct was generated from the following file:

- r_rtc_api.h

rtc_error_adjustment_mode_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_error_adjustment_mode_t	adjustment_mode Time error adjustment mode setting.
rtc_error_adjustment_period_t	adjustment_period Time error adjustment period setting.

Detailed Description

Time error adjustment mode and period configuration

The documentation for this struct was generated from the following file:

- r_rtc_api.h

rtc_alarm_time_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_time_t	time Time structure.

bool	sec_match Enable the alarm based on a match of the seconds field.
bool	min_match Enable the alarm based on a match of the minutes field.
bool	hour_match Enable the alarm based on a match of the hours field.
bool	mday_match Enable the alarm based on a match of the days field.
bool	mon_match Enable the alarm based on a match of the months field.
bool	year_match Enable the alarm based on a match of the years field.
bool	dayofweek_match Enable the alarm based on a match of the dayofweek field.

Detailed Description

Alarm time setting structure

The documentation for this struct was generated from the following file:

- r_rtc_api.h

rtc_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_clock_source_t	clock_source Clock source for the RTC block.
rtc_status_t	status RTC run status.

Detailed Description

RTC Information Structure for information returned by infoGet()

The documentation for this struct was generated from the following file:

- r_rtc_api.h

rtc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » RTC Interface

#include <r_rtc_api.h>

Data Fields

rtc_clock_source_t	clock_source Clock source for the RTC block.
bool	hw_cfg Initialize RTC in Open()
uint32_t	error_adjustment_value Value of the prescaler for error adjustment.
rtc_error_adjustment_t	error_adjustment_type How the prescaler value is applied.
uint8_t	alarm_ipl

	Alarm interrupt priority.
uint8_t	periodic_ipl Periodic interrupt priority.
uint8_t	carry_ipl Carry interrupt priority.
void(*	p_callback)(rtc_callback_args_t *p_args) Called from the ISR.
void const *	p_context Passed to the callback.
void const *	p_extend RTC hardware dependant configuration.

Detailed Description

User configuration structure, used in open function

Detailed Description

RTC driver structure. General RTC functions implemented at the HAL layer follow this API.

Field Documentation

◆ calendarAlarmGet

ssp_err_t(* rtc_api_t::calendarAlarmGet) (rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *p_alarm)

Get the calendar alarm time.

Implemented as

- R_RTC_CalendarAlarmGet()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[out]	p_alarm	Pointer to an alarm structure to fill up with the alarm time

◆ calendarAlarmSet

ssp_err_t(* rtc_api_t::calendarAlarmSet) (rtc_ctrl_t *const p_ctrl, rtc_alarm_time_t *p_alarm, bool irq_enable_flag)

Set the calendar alarm time.

Implemented as

- R_RTC_CalendarAlarmSet()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[in]	p_alarm	Pointer to an alarm structure that contains the alarm time to set
[in]	irq_enable_flag	Enable the ALARM irq if set

◆ calendarCounterStart

ssp_err_t(* rtc_api_t::calendarCounterStart) (rtc_ctrl_t *const p_ctrl)

Start the calendar counter.

Implemented as

- R_RTC_CalendarCounterStart()

Parameters

[in]	p_ctrl	Pointer to RTC device handle

◆ calendarCounterStop

ssp_err_t(* rtc_api_t::calendarCounterStop) (rtc_ctrl_t *const p_ctrl)

Stop the calendar counter.

Implemented as

- R_RTC_CalendarCounterStop()

Parameters

[in]	p_ctrl	Pointer to RTC device handle

◆ calendarTimeGet

ssp_err_t(* rtc_api_t::calendarTimeGet) (rtc_ctrl_t *const p_ctrl, rtc_time_t *p_time)

Get the calendar time.

Implemented as

- R_RTC_CalendarTimeGet()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[out]	p_time	Pointer to a time structure that contains the time to get

◆ calendarTimeSet

ssp_err_t(* rtc_api_t::calendarTimeSet) (rtc_ctrl_t *const p_ctrl, rtc_time_t *p_time, bool clock_start)

Set the calendar time.

Implemented as

- R_RTC_CalendarTimeSet()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[in]	p_time	Pointer to a time structure that contains the time to set
[in]	clock_start	Flag that starts the clock right after it is set

◆ close

ssp_err_t(* rtc_api_t::close) (rtc_ctrl_t *const p_ctrl)

Close the RTC driver.

Implemented as

- R_RTC_Close()

Parameters

[in]	p_ctrl	Pointer to RTC device handle.

◆ configure

ssp_err_t(* rtc_api_t::configure) (rtc_ctrl_t *const p_ctrl, void *const p_extend)

Configure the RTC driver.

Implemented as

- R_RTC_Configure()

Parameters

[in]	p_ctrl	Pointer to RTC device handle.
[in]	p_extend	Currently not implemented, pass NULL.

◆ errorAdjustmentModeSet

ssp_err_t(* rtc_api_t::errorAdjustmentModeSet) (rtc_ctrl_t *p_ctrl, rtc_error_adjustment_mode_cfg_t *p_error_adjustment_mode)

Set time error adjustment mode.

Implemented as

- R_RTC_ErrorAdjustmentModeSet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_error_adjustment_mode	Pointer to error adjustment mode configuration structure

◆ errorAdjustmentSet

ssp_err_t(* rtc_api_t::errorAdjustmentSet) (rtc_ctrl_t *p_ctrl, rtc_error_adjustment_cfg_t *p_error_adjustment_config)

Set time error adjustment.

Implemented as

- R_RTC_ErrorAdjustmentSet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[in]	p_error_adjustment_config	Pointer to error adjustment structure

◆ infoGet

ssp_err_t(* rtc_api_t::infoGet) (rtc_ctrl_t *p_ctrl, rtc_info_t *p_rtc_info)

Return the currently configure clock source for the RTC

Implemented as

- R_RTC_InfoGet()

Parameters

[in]	p_ctrl	Pointer to control handle structure
[out]	p_rtc_info	Pointer to RTC information structure

◆ irqDisable

ssp_err_t(* rtc_api_t::irqDisable) (rtc_ctrl_t *const p_ctrl, rtc_event_t irq)

Disable the alarm irq.

Implemented as

- R_RTC_IrqDisable()

Parameters

[in]	p_ctrl	Pointer to RTC device handle

◆ irqEnable

ssp_err_t(* rtc_api_t::irqEnable) (rtc_ctrl_t *const p_ctrl, rtc_event_t irq)

Enable the alarm irq.

Implemented as

- R_RTC_IrqEnable()

Parameters

[in]	p_ctrl	Pointer to RTC device handle

◆ open

ssp_err_t(* rtc_api_t::open) (rtc_ctrl_t *const p_ctrl, rtc_cfg_t const *const p_cfg)

Open the RTC driver.

Implemented as

- R_RTC_Open()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[in]	p_cfg	Pointer to the configuration structure

◆ periodicIrqRateSet

ssp_err_t(* rtc_api_t::periodicIrqRateSet) (rtc_ctrl_t *const p_ctrl, rtc_periodic_irq_select_t rate)

Set the periodic irq rate

Implemented as

- R_RTC_PeriodicIrqRateSet()

Parameters

[in]	p_ctrl	Pointer to RTC device handle
[in]	rate	Rate of periodic interrupts

◆ versionGet

ssp_err_t(* rtc_api_t::versionGet) (ssp_version_t *version)
Gets version and stores it in provided pointer p_version. **Implemented as** ◦ R_RTC_VersionGet() **Parameters** [out] p_version Code and API version used

---

Detailed Description

Interface for accessing SD, eMMC, and SDIO devices.

Summary

The r_sdmmc interface provides standard SD and eMMC media functionality. A complete file system can be implemented with FileX, sf_el_fx, sf_block_media_sdmmc and r_sdmmc modules. This driver also supports SDIO. The SD/MMC interface is implemented by:

- SDMMC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

SD/MMC description: SD/MMC Driver and SDIO Driver

Typedef Documentation

◆ sdmmc_ctrl_t

typedef void sdmmc_ctrl_t

SD/MMC control block. Allocate an instance specific control block to pass into the SD/MMC API calls.

Implemented as

- sdmmc_instance_ctrl_t

Enumeration Type Documentation

◆ sdmmc_bus_width_t

enum sdmmc_bus_width_t	
SD/MMC data bus is 1, 4 or 8 bits wide.	
Enumerator	
SDMMC_BUS_WIDTH_1_BIT	Data bus is 1 bit wide.
SDMMC_BUS_WIDTH_4_BITS	Data bus is 4 bits wide.
SDMMC_BUS_WIDTH_8_BITS	Data bus is 8 bits wide.

◆ sdmmc_card_type_t

enum sdmmc_card_type_t	
SD/MMC media uses SD protocol or MMC protocol.	
Enumerator	
SDMMC_CARD_TYPE_MMC	The media is an eMMC device.
SDMMC_CARD_TYPE_SD	The media is an SD card.

◆ sdmmc_event_t

enum sdmmc_event_t	
Events that can trigger a callback function	
Enumerator	
SDMMC_EVENT_CARD_REMOVED	Card removed event.
SDMMC_EVENT_CARD_INSERTED	Card inserted event.
SDMMC_EVENT_ACCESS	Access event.
SDMMC_EVENT_SDIO	IO event.
SDMMC_EVENT_TRANSFER_COMPLETE	Read or write complete.
SDMMC_EVENT_TRANSFER_ERROR	Read or write failed.
SDMMC_EVENT_NONE	No event.

◆ sdmmc_io_address_mode_t

enum sdmmc_io_address_mode_t	
SDIO address mode, configurable in SDIO read/write extended commands.	
Enumerator	
SDMMC_IO_ADDRESS_MODE_FIXED	Write all data to the same address.
SDMMC_IO_ADDRESS_MODE_INCREMENT	Increment destination address after each write.

◆ sdmmc_io_transfer_mode_t

enum sdmmc_io_transfer_mode_t	
SDIO transfer mode, configurable in SDIO read/write extended commands.	
Enumerator	
SDMMC_IO_MODE_TRANSFER_BYTE	SDIO byte transfer mode.
SDMMC_IO_MODE_TRANSFER_BLOCK	SDIO block transfer mode.

◆ sdmmc_io_write_mode_t

enum sdmmc_io_write_mode_t	
Controls the RAW (read after write) flag of CMD52. Used to read back the status after writing a control register.	
Enumerator	
SDMMC_IO_WRITE_MODE_NO_READ	Write only (do not read back)
SDMMC_IO_WRITE_READ_AFTER_WRITE	Read back the register after write.

◆ sdmmc_media_type_t

enum sdmmc_media_type_t	
SD/MMC media is embedded or it can be inserted and removed.	
Enumerator	
SDMMC_MEDIA_TYPE_EMBEDDED	The media is an embedded card, or eMMC device.
SDMMC_MEDIA_TYPE_CARD	The media is an pluggable card.

◆ sdmmc_ready_status_t

enum sdmmc_ready_status_t	
SD/MMC status	
Enumerator	
SDMMC_STATUS_CARD_NOT_READY	SD card or eMMC device has not been initialized.
SDMMC_STATUS_CARD_READY	SD card or eMMC device has been initialized and is ready to access.

sdmmc_hw_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SD/MMC Interface

#include <r_sdmmc_api.h>

Data Fields

uint8_t	channel Channel of SD/MMC host interface.
sdmmc_media_type_t	media_type Embedded or pluggable card.
sdmmc_bus_width_t	bus_width Device bus width is 1, 4 or 8 bits wide.

Detailed Description

Channel, media type, bus width defined by the hardware.

The documentation for this struct was generated from the following file:

- r_sdmmc_api.h

sdmmc_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SD/MMC Interface

#include <r_sdmmc_api.h>

Data Fields

sdmmc_card_type_t	card_type SD or eMMC.
bool	ready
bool	hc true = Card is High Capacity card
bool	sdio true = SDIO present
bool	write_protected true = Card is write protected
bool	transfer_in_progress true = Card is busy
uint8_t	csd_version CSD version.

uint8_t	device_type Speed and data rate (eMMC)
sdmmc_bus_width_t	bus_width Current media bus width.
uint8_t	hs_timing High Speed status.
uint32_t	sdhi_rca Relative Card Address.
uint32_t	max_clock_rate Maximum clock rate for media card.
uint32_t	clock_rate Current clock rate.
uint32_t	sector_size Sector size.
uint32_t	sector_count Sector count.
uint32_t	erase_sector_count Minimum erasable unit (in 512 byte sectors)

Detailed Description

Status and other information obtained from the media device.

Field Documentation

◆ ready

bool sdmmc_info_t::ready
False if card was removed (only applies if MCU supports card detection and SDnCD pin is connected). True otherwise. If ready is false, the driver must be closed, then reopened with a card inserted.

The documentation for this struct was generated from the following file:

- r_sdmmc_api.h

sdmmc_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SD/MMC Interface

#include <r_sdmmc_api.h>

Data Fields

sdmmc_event_t	event The event can be used to identify what caused the callback.
void const *	p_context Placeholder for user data.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_sdmmc_api.h

sdmmc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SD/MMC Interface

#include <r_sdmmc_api.h>

Data Fields

sdmmc_hw_t	hw Channel, media type, bus width defined by the hardware.
transfer_instance_t const *	p_lower_lvl_transfer Transfer instance used to move data with DMA or DTC.
void(*	p_callback)(sdmmc_callback_args_t *p_args) Pointer to callback function.
void const *	p_context User defined context passed into callback function.
void const *	p_extend SD/MMC hardware dependent configuration.
uint8_t	access_ipl Access interrupt priority.
uint8_t	sdio_ipl SDIO interrupt priority.
uint8_t	card_ipl Card interrupt priority.
uint8_t	dma_req_ipl DMA request interrupt priority.

ssp_err_t(*	erase)(sdmmc_ctrl_t *const p_ctrl, uint32_t const start_sector, uint32_t const sector_count)

Detailed Description

SD/MMC functions implemented at the HAL layer API.

Field Documentation

◆ close

ssp_err_t(* sdmmc_api_t::close) (sdmmc_ctrl_t *const p_ctrl)

Close open SD/MMC device.

Implemented as

R_SDMMC_Close()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.

◆ control

ssp_err_t(* sdmmc_api_t::control) (sdmmc_ctrl_t *const p_ctrl, ssp_command_t const command, void *p_data)

The Control function sends control commands to and receives info from the SD/MMC port.

Implemented as

R_SDMMC_Control()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in]	command	Command to execute. The list of supported commands is below.
[in,out]	p_data	Pointer to data in or out. For each command, this data should be cast as follows: • SSP_COMMAND_GET_SECTOR_COUNT : [out] (uint32_t *) p_data • SSP_COMMAND_GET_SECTOR_SIZE : [out] (uint32_t *) p_data • SSP_COMMAND_GET_WRITE_PROTECTED : [out] (bool *) p_data • SSP_COMMAND_SET_BLOCK_SIZE : [in] (uint32_t *) p_data

◆ erase

ssp_err_t(* sdmmc_api_t::erase) (sdmmc_ctrl_t *const p_ctrl, uint32_t const start_sector, uint32_t const sector_count)

Erase SD/MMC sectors. The sector size for erase is fixed at 512 bytes. This API is not supported for SDIO devices.

Implemented as

R_SDMMC_Erase

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in]	start_sector	First sector to erase. Must be a multiple of sdmmc_info_t::erase_sector_count.
[in]	sector_count	Number of sectors to erase. Must be a multiple of sdmmc_info_t::erase_sector_count. All sectors must be in the range of sdmmc_info_t::sector_count.

◆ infoGet

ssp_err_t(* sdmmc_api_t::infoGet) (sdmmc_ctrl_t *const p_ctrl, sdmmc_info_t *const p_info)

Get SD/MMC device info.

Implemented as

R_SDMMC_InfoGet()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[out]	p_info	Pointer to return device information to.

◆ IoIntEnable

ssp_err_t(* sdmmc_api_t::IoIntEnable) (sdmmc_ctrl_t *const p_ctrl, bool enable)

Enables SDIO interrupt for SD/MMC instance. This API is not supported for SD or eMMC memory devices.

Implemented as

R_SDMMC_IoIntEnable

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in]	enable	Interrupt enable = true, interrupt disable = false.

◆ open

ssp_err_t(* sdmmc_api_t::open) (sdmmc_ctrl_t *const p_ctrl, sdmmc_cfg_t const *const p_cfg)

Open an SD/MMC device. If the device is a card, the card must be plugged in prior to calling this API. This API blocks until the device initialization procedure is complete.

Implemented as

R_SDMMC_Open()

Parameters

[in]	p_ctrl	Pointer to SD/MMC instance control block.
[in]	p_cfg	Pointer to SD/MMC instance configuration structure.

◆ read

ssp_err_t(* sdmmc_api_t::read) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const start_sector, uint32_t const sector_count)

Read data from an SD/MMC channel. This API is not supported for SDIO devices.

Implemented as

R_SDMMC_Read()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[out]	p_dest	Pointer to data buffer to read data to.
[in]	start_sector	First sector address to read.
[in]	sector_count	Number of sectors to read. All sectors must be in the range of sdmmc_info_t::sector_count.

◆ readIo

ssp_err_t(* sdmmc_api_t::readIo) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t const function, uint32_t const address)

Read one byte of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented as

R_SDMMC_ReadIo()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[out]	p_data	Pointer to location to store data byte.
[in]	function	SDIO Function Number.
[in]	address	SDIO register address.

◆ readIoExt

ssp_err_t(* sdmmc_api_t::readIoExt) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const p_dest, uint32_t const function, uint32_t const address, uint32_t *const count, sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t address_mode)

Read multiple bytes or blocks of I/O data from an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented as

R_SDMMC_ReadIoExt()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[out]	p_dest	Pointer to data buffer to read data to.
[in]	function	SDIO Function Number.
[in]	address	SDIO register address.
[in]	count	Number of bytes or blocks to read, maximum 512 bytes or 511 blocks.
[in]	transfer_mode	Byte or block mode
[in]	address_mode	Fixed or incrementing address mode

◆ versionGet

ssp_err_t(* sdmmc_api_t::versionGet) (ssp_version_t *const p_version)

Returns the version of the SD/MMC driver.

Implemented as

R_SDMMC_VersionGet()

Parameters

[out]	p_version	Pointer to return version information to.

◆ write

ssp_err_t(* sdmmc_api_t::write) (sdmmc_ctrl_t *const p_ctrl, uint8_t const *const p_source, uint32_t const start_sector, uint32_t const sector_count)

Write data to SD/MMC channel. This API is not supported for SDIO devices.

Implemented as

R_SDMMC_Write()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in]	p_source	Pointer to data buffer to write data from.
[in]	start_sector	First sector address to write to.
[in]	sector_count	Number of sectors to write. All sectors must be in the range of sdmmc_info_t::sector_count.

◆ writeIo

ssp_err_t(* sdmmc_api_t::writeIo) (sdmmc_ctrl_t *const p_ctrl, uint8_t *const p_data, uint32_t const function, uint32_t const address, sdmmc_io_write_mode_t const read_after_write)

Write one byte of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented as

R_SDMMC_WriteIo()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in,out]	p_data	Pointer to data byte to write. Read data is also provided here if read_after_write is true.
[in]	function	SDIO Function Number.
[in]	address	SDIO register address.
[in]	read_after_write	Whether or not to read back the same register after writing

◆ writeIoExt

ssp_err_t(* sdmmc_api_t::writeIoExt) (sdmmc_ctrl_t *const p_ctrl, uint8_t const *const p_source, uint32_t const function, uint32_t const address, uint32_t const count, sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t address_mode)

Write multiple bytes or blocks of I/O data to an SDIO device. This API is not supported for SD or eMMC memory devices.

Implemented as

R_SDMMC_WriteIoExt()

Parameters

[in]	p_ctrl	Pointer to an open SD/MMC instance control block.
[in]	p_source	Pointer to data buffer to write data from.
[in]	function_number	SDIO Function Number.
[in]	address	SDIO register address.
[in]	count	Number of bytes or blocks to write, maximum 512 bytes or 511 blocks.
[in]	transfer_mode	Byte or block mode
[in]	address_mode	Fixed or incrementing address mode

Enumerator	
SLCDC_NOT_BLINKING	Alternately displaying A-pattern and B-pattern area data.
SLCDC_BLINKING	Displaying an A-pattern or B-pattern area data.

◆ slcdc_display_area_t

enum slcdc_display_area_t	
Display Area data	
Enumerator	
SLCDC_DISP_A	Displaying an A-pattern area data.
SLCDC_DISP_B	Displaying an B-pattern area data.
SLCDC_DISP_BLINK	Alternatively displaying A-pattern and B-pattern area data.

◆ slcdc_display_clock_t

enum slcdc_display_clock_t	
LCD Display clock selection	
Enumerator	
SLCDC_CLOCK_LOCO	Display clock source LOCO.
SLCDC_CLOCK_SOSC	Display clock source SOSC.
SLCDC_CLOCK_MOSC	Display clock source MOSC.
SLCDC_CLOCK_HOCO	Display clock source HOCO.

◆ slcdc_display_enable_disable_t

enum slcdc_display_enable_disable_t	
LCD Display output enable	
Enumerator	
SLCDC_DISP_DISABLE	Output ground level to segment/common pin.
SLCDC_DISP_ENABLE	Output enable.

◆ slcdc_display_on_off_t

enum slcdc_display_on_off_t	
LCD Display Enable/Disable	
Enumerator	
SLCDC_DISP_OFF	Display off.
SLCDC_DISP_ON	Display on.

◆ slcdc_display_state_t

enum slcdc_display_state_t	
Display interface operation state	
Enumerator	
SLCDC_DISPLAY_STATE_CLOSED	Display closed.
SLCDC_DISPLAY_STATE_OPENED	Display opened.

◆ slcdc_drive_volt_gen_t

enum slcdc_drive_volt_gen_t	
LCD Drive Voltage Generator Select.	
Enumerator	
SLCDC_VOLT_EXTERNAL	External resistance division method.
SLCDC_VOLT_INTERNAL	Internal voltage boosting method.
SLCDC_VOLT_CAPACITOR	Capacitor split method.

◆ slcdc_time_slice_t

enum slcdc_time_slice_t	
Time slice of LCD display.	
Enumerator	
SLCDC_STATIC	Static.
SLCDC_SLICE_2	2-time slice
SLCDC_SLICE_3	3-time slice
SLCDC_SLICE_4	4-time slice
SLCDC_SLICE_8	8-time slice

◆ slcdc_wave_form_t

enum slcdc_wave_form_t	
LCD display waveform select.	
Enumerator	
SLCDC_WAVE_A	Waveform A.
SLCDC_WAVE_B	Waveform B.

slcdc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SLCDC Interface

#include <r_slcdc_api.h>

Data Fields

slcdc_display_clock_t	slcdc_clock LCD clock source (LCDSCKSEL)
slcdc_clk_div_t	slcdc_clock_setting LCD clock setting (LCDC0)
slcdc_bias_method_t	bias_method LCD display bias method select (LBAS bit).
slcdc_time_slice_t	time_slice Time slice of LCD display select (LDTY bit)
slcdc_wave_form_t	wave_form LCD display waveform select (LWAVE bit).
slcdc_drive_volt_gen_t	drive_volt_gen LCD Drive Voltage Generator Select (MDSTET bit).

ssp_err_t(*	close)(slcdc_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)

Detailed Description

SLCDC functions implemented at the HAL layer will follow this API.

Field Documentation

◆ close

ssp_err_t(* slcdc_api_t::close) (slcdc_ctrl_t *const p_ctrl)

Close display device.

Implemented as

- R_SLCDC_Close()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ contrastDecrease

ssp_err_t(* slcdc_api_t::contrastDecrease) (slcdc_ctrl_t *const p_ctrl)

Decrease the display contrast. Decrease by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator

Implemented as

- R_SLCDC_ContrastDecrease()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ contrastIncrease

ssp_err_t(* slcdc_api_t::contrastIncrease) (slcdc_ctrl_t *const p_ctrl)

Increase the display contrast. Increase by 1 unit. This function can be selected when the internal voltage boosting method is used for the drive voltage generator

Implemented as

- R_SLCDC_ContrastIncrease()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ modify

ssp_err_t(* slcdc_api_t::modify) (slcdc_ctrl_t *const p_ctrl, slcdc_size_t const segment, slcdc_size_t const data_mask, slcdc_size_t const data)

Rewrite data in the SLCD segment. Rewrites the LCD display data in 1-bit units. If a bit is not specified for rewriting, the value stored in the bit is held as it is. Specifies the data to rewrite

Implemented as

- R_SLCDC_Modify()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	seg	Specify the segment to be written.
[in]	data_mask	Mask the data being displayed. Set 0 to the bit to be rewritten and set 1 to the other bits. Multiple bits can be rewritten. Setting value of data_mask, Bit 3 - 0xf7 Bit 2 - 0xfb Bit 1 - 0xfd Bit 0 - 0xfe
[in]	data	Specify display data to rewrite to the specified segment.

◆ open

ssp_err_t(* slcdc_api_t::open) (slcdc_ctrl_t *const p_ctrl, slcdc_cfg_t const *const p_cfg)

Open SLCD device.

Implemented as

- R_SLCDC_Open()

Parameters

[in,out]	p_ctrl	Pointer to display interface control block. Must be declared by user. Value set here.
[in]	p_cfg	Pointer to display configuration structure. All elements of this structure must be set by user.

◆ setdisplayArea

ssp_err_t(* slcdc_api_t::setdisplayArea) (slcdc_ctrl_t *const p_ctrl, slcdc_display_area_t const display_area)

Set LCD display area. This function sets a specified display area, A-pattern or B-pattern. This function can be used to set blink on where A-pattern and B-pattern area data will be alternately displayed.

When using blinking, the RTC is required to operate before this function is executed. To configure the RTC, follow the steps below. 1) Open RTC 2) Set Periodic interrupt request, 1/2 second 3) Start RTC counter 4) Enable IRQ, RTC_EVENT_PERIODIC_IRQ Refer to the User's Manual: Hardware for the detailed procedure.

Implemented as

- R_SLCDC_SetdisplayArea()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	display_area	Display area to be used, A-pattern or B-pattern area.

◆ start

ssp_err_t(* slcdc_api_t::start) (slcdc_ctrl_t *const p_ctrl)

Enable display on the SLCD. Displays the specified data on the LCD. Before that data should be written to the segments.

Implemented as

- R_SLCDC_Start()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ stop

ssp_err_t(* slcdc_api_t::stop) (slcdc_ctrl_t *const p_ctrl)

Disable display on the SLCD. Stops displaying data on the SLCD.

Implemented as

- R_SLCDC_Stop()

Parameters

[in]	p_ctrl	Pointer to display interface control block.

◆ versionGet

ssp_err_t(* slcdc_api_t::versionGet) (ssp_version_t *p_version)

Get version.

Implemented as

- R_SLCDC_VersionGet()

Parameters

[in]	p_version	Pointer to the memory to store the version information.

◆ write

ssp_err_t(* slcdc_api_t::write) (slcdc_ctrl_t *const p_ctrl, slcdc_size_t const start_segment, slcdc_size_t const *const p_data, slcdc_size_t const segment_count)

Write data to SLCD segment. Specifies the initial display data. Except for 8-time slice, store values in the lower 4 bits when writing to the A-pattern area, and in the upper 4 bits when writing to the B-pattern area. The display data is stored in the display data register.

Implemented as

- R_SLCDC_Write()

Parameters

[in]	p_ctrl	Pointer to display interface control block.
[in]	start_segment	Specify the start segment number to be written.
[in]	p_data	pointer to the display data to be written to the specified segments
[in]	segment_count	Number of segments to be written

SPI Interface description: SPI Driver

Typedef Documentation

◆ spi_ctrl_t

typedef void spi_ctrl_t
SPI control block. Allocate an instance specific control block to pass into the SPI API calls. **Implemented as** ◦ sci_spi_instance_ctrl_t ◦ rspi_instance_ctrl_t

Enumeration Type Documentation

◆ spi_bit_order_t

enum spi_bit_order_t	
Bit-order	
Enumerator	
SPI_BIT_ORDER_MSB_FIRST	Send MSB first in transmission.
SPI_BIT_ORDER_LSB_FIRST	Send LSB first in transmission.

◆ spi_bit_width_t

enum spi_bit_width_t	
Data bit width	
Enumerator	
SPI_BIT_WIDTH_8_BITS	Data bit width is 8 bits byte.
SPI_BIT_WIDTH_16_BITS	Data bit width is 16 bits word.
SPI_BIT_WIDTH_32_BITS	Data bit width is 32 bits long word.

◆ spi_clk_phase_t

enum spi_clk_phase_t	
Clock phase	
Enumerator	
SPI_CLK_PHASE_EDGE_ODD	0: Data sampling on odd edge, data variation on even edge
SPI_CLK_PHASE_EDGE_EVEN	1: Data variation on odd edge, data sampling on even edge

◆ spi_clk_polarity_t

enum spi_clk_polarity_t	
Clock polarity	
Enumerator	
SPI_CLK_POLARITY_LOW	0: Clock polarity is low when idle
SPI_CLK_POLARITY_HIGH	1: Clock polarity is high when idle

◆ spi_event_t

enum spi_event_t	
SPI events	
Enumerator	
SPI_EVENT_TRANSFER_COMPLETE	The data transfer was completed.
SPI_EVENT_TRANSFER_ABORTED	The data transfer was aborted.
SPI_EVENT_ERR_MODE_FAULT	Mode fault error.
SPI_EVENT_ERR_READ_OVERFLOW	Read overflow error.
SPI_EVENT_ERR_PARITY	Parity error.
SPI_EVENT_ERR_OVERRUN	Overrun error.
SPI_EVENT_ERR_FRAMING	Framing error.
SPI_EVENT_ERR_MODE_UNDERRUN	Underrun error.

◆ spi_mode_fault_t

enum spi_mode_fault_t	
Mode fault error flag. This error occurs when the device is setup as a master, but the SSLA line does not seem to be controlled by the master. This usually happens when the connecting device is also acting as master. A similar situation can also happen when configured as a slave.	
Enumerator	
SPI_MODE_FAULT_ERROR_ENABLE	Mode fault error flag on.
SPI_MODE_FAULT_ERROR_DISABLE	Mode fault error flag off.

◆ spi_mode_t

enum spi_mode_t	
Master or slave operating mode	
Enumerator	
SPI_MODE_MASTER	Channel operates as SPI master.
SPI_MODE_SLAVE	Channel operates as SPI slave.

◆ spi_operation_t

enum spi_operation_t	
Used by control block only.	
Enumerator	
SPI_OPERATION_DO_TX	perform SPI transmission operation
SPI_OPERATION_DO_RX	perform SPI reception operation
SPI_OPERATION_DO_TX_RX	perform SPI Transmission and reception operation

spi_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SPI Interface

#include <r_spi_api.h>

Data Fields

uint32_t	channel Device channel number.
spi_event_t	event Event code.
void const *	p_context Context provided to user during callback.

Detailed Description

Common callback parameter definition

The documentation for this struct was generated from the following file:

spi_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » SPI Interface

#include <r_spi_api.h>

Data Fields

uint8_t	channel Channel number to be used.
uint8_t	rxi_ipl Receive interrupt priority.
uint8_t	txi_ipl Transmit interrupt priority.
uint8_t	tei_ipl Transmit end interrupt priority.
uint8_t	eri_ipl Error interrupt priority.
spi_mode_t	operating_mode Select master or slave operating mode.
spi_clk_phase_t	clk_phase

	Data sampling on odd or even clock edge.
spi_clk_polarity_t	clk_polarity Clock level when idle.
spi_mode_fault_t	mode_fault Mode fault error (master/slave conflict) flag.
spi_bit_order_t	bit_order Select to transmit MSB/LSB first.
uint32_t	bitrate Bits Per Second.
transfer_instance_t const *	p_transfer_tx To use SPI DTC/DMA write transfer, link a DTC/DMA instance here. Set to NULL if unused.
transfer_instance_t const *	p_transfer_rx To use SPI DTC/DMA read transfer, link a DTC/DMA instance here. Set to NULL if unused.
void(*	p_callback)(spi_callback_args_t *p_args) Pointer to user callback function.
void const *	p_context User defined context passed to callback function.
void const *	p_extend Extended SPI hardware dependent configuration.

ssp_err_t(*	close)(spi_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)

Detailed Description

Shared Interface definition for SPI

Field Documentation

◆ close

ssp_err_t(* spi_api_t::close) (spi_ctrl_t *const p_ctrl)

Remove power to the SPI channel designated by the handle and disable the associated interrupts.

Implemented as

- R_RSPI_Close()
- R_SCI_SPI_Close()

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.

◆ open

ssp_err_t(* spi_api_t::open) (spi_ctrl_t *p_ctrl, spi_cfg_t const *const p_cfg)

Initialize a channel for SPI communication mode.

Implemented as

- R_RSPI_Open()
- R_SCI_SPI_Open()

Parameters

[in,out]	p_ctrl	Pointer to user-provided storage for the control block.
[in]	p_cfg	Pointer to SPI configuration structure.

◆ read

ssp_err_t(* spi_api_t::read) (spi_ctrl_t *const p_ctrl, void const *p_dest, uint32_t const length, spi_bit_width_t const bit_width)

Receive data from an SPI device.

Implemented as

- R_RSPI_Read()
- R_SCI_SPI_Read()

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.
[out]	p_dest	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count.

◆ versionGet

ssp_err_t(* spi_api_t::versionGet) (ssp_version_t *p_version)

Get the version information of the underlying driver.

Implemented as

- R_RSPI_VersionGet()
- R_SCI_SPI_VersionGet()

Parameters

[out]	p_version	pointer to memory location to return version number

◆ write

ssp_err_t(* spi_api_t::write) (spi_ctrl_t *const p_ctrl, void const *p_src, uint32_t const length, spi_bit_width_t const bit_width)

Transmit data to an SPI device.

Implemented as

- R_RSPI_Write()
- R_SCI_SPI_Write()

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[in]	p_src	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.

◆ writeRead

ssp_err_t(* spi_api_t::writeRead) (spi_ctrl_t *const p_ctrl, void const *p_src, void const *p_dest, uint32_t const length, spi_bit_width_t const bit_width)

Simultaneously transmit data to an SPI device while receiving data from a SPI device (full duplex).

Implemented as

- R_RSPI_WriteRead()
- R_SCI_SPI_WriteRead()

Parameters

[in]	p_ctrl	Pointer to the control block for the channel.
[in]	p_src	Pointer to a source data buffer from which data will be transmitted to a SPI device. The argument must not be NULL.
[out]	p_dest	Pointer to destination buffer into which data will be copied that is received from a SPI device. It is the responsibility of the caller to ensure that adequate space is available to hold the requested data count. The argument must not be NULL.
[in]	length	Number of units of data to be transferred (unit size specified by the bit_width).
[in]	bit_width	Data bit width to be transferred.

5.1.4.35 Timer Interface

Renesas Synergy Software Package Reference » HAL Interfaces

Interface for timer functions. More...

Data Structures

struct	timer_callback_args_t
struct	timer_info_t
struct	timer_cfg_t
struct	timer_api_t
struct	timer_instance_t

Typedefs

typedef uint32_t	timer_size_t
typedef void	timer_ctrl_t

typedef timer_size_t	timer_period_t

Enumerations

enum	timer_event_t { TIMER_EVENT_EXPIRED }
enum	timer_variant_t { TIMER_VARIANT_32_BIT, TIMER_VARIANT_16_BIT }
enum	timer_status_t { TIMER_STATUS_COUNTING, TIMER_STATUS_STOPPED }
enum	timer_mode_t { TIMER_MODE_PERIODIC, TIMER_MODE_ONE_SHOT, TIMER_MODE_PWM }
enum	timer_unit_t { TIMER_UNIT_PERIOD_RAW_COUNTS, TIMER_UNIT_PERIOD_NSEC, TIMER_UNIT_PERIOD_USEC, TIMER_UNIT_PERIOD_MSEC, TIMER_UNIT_PERIOD_SEC, TIMER_UNIT_FREQUENCY_HZ, TIMER_UNIT_FREQUENCY_KHZ }
enum	timer_pwm_unit_t { TIMER_PWM_UNIT_RAW_COUNTS, TIMER_PWM_UNIT_PERCENT, TIMER_PWM_UNIT_PERCENT_X_1000 }
enum	timer_direction_t { TIMER_DIRECTION_DOWN = 0, TIMER_DIRECTION_UP = 1 }

Detailed Description

Interface for timer functions.

Summary

The general timer interface provides standard timer functionality including periodic mode, one-shot mode, and free-running timer mode. After each timer cycle (overflow or underflow), an interrupt can be triggered.

If an instance supports output compare mode, it is provided in the extension configuration timer_on_<instance>_cfg_t defined in r_<instance>.h.

Implemented by:

- GPT
- AGT

Timer Interface description: Timer Driver on r_agt and Timer Driver on r_gpt

Typedef Documentation

◆ timer_ctrl_t

typedef void timer_ctrl_t
Timer control block. Allocate an instance specific control block to pass into the timer API calls. **Implemented as** ◦ gpt_instance_ctrl_t ◦ agt_instance_ctrl_t

◆ timer_period_t

typedef timer_size_t timer_period_t
DEPRECATED: Recommend using timer_size_t for period.

◆ timer_size_t

typedef uint32_t timer_size_t
Largest supported timer size. Currently up to 32-bit timers are supported. If a 16-bit timer is used, only the bottom 16 bits of any timer_size_t parameter can be used. Passing in values larger than 16 bits would result in an error.

Enumeration Type Documentation

◆ timer_direction_t

enum timer_direction_t	
Direction of timer count	
Enumerator	
TIMER_DIRECTION_DOWN	Timer count goes up.
TIMER_DIRECTION_UP	Timer count goes down.

◆ timer_event_t

enum timer_event_t	
Events that can trigger a callback function	
Enumerator	
TIMER_EVENT_EXPIRED	Requested timer delay has expired or timer has wrapped around.

◆ timer_mode_t

enum timer_mode_t	
Timer operational modes	
Enumerator	
TIMER_MODE_PERIODIC	Timer will restart after delay periods.
TIMER_MODE_ONE_SHOT	Timer will stop after delay periods.
TIMER_MODE_PWM	Timer generate PWM output.

◆ timer_pwm_unit_t

enum timer_pwm_unit_t	
Units of timer duty cycle value.	
Enumerator	
TIMER_PWM_UNIT_RAW_COUNTS	Period in clock counts.
TIMER_PWM_UNIT_PERCENT	Percent unit used for duty cycle.
TIMER_PWM_UNIT_PERCENT_X_1000	Percent multiplied by 1000 for extra resolution.

◆ timer_status_t

enum timer_status_t	
Possible status values returned by timer_api_t::infoGet.	
Enumerator	
TIMER_STATUS_COUNTING	Timer is running.
TIMER_STATUS_STOPPED	Timer is stopped.

◆ timer_unit_t

enum timer_unit_t	
Units of timer period value.	
Enumerator	
TIMER_UNIT_PERIOD_RAW_COUNTS	Period in clock counts.
TIMER_UNIT_PERIOD_NSEC	Period in nanoseconds.
TIMER_UNIT_PERIOD_USEC	Period in microseconds.
TIMER_UNIT_PERIOD_MSEC	Period in milliseconds.
TIMER_UNIT_PERIOD_SEC	Period in seconds.
TIMER_UNIT_FREQUENCY_HZ	Frequency in Hz.
TIMER_UNIT_FREQUENCY_KHZ	Frequency in kHz.

◆ timer_variant_t

enum timer_variant_t	
Timer variant types.	
Enumerator	
TIMER_VARIANT_32_BIT	32-bit timer
TIMER_VARIANT_16_BIT	16-bit timer

timer_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Timer Interface

#include <r_timer_api.h>

Data Fields

void const *	p_context
timer_event_t	event The event can be used to identify what caused the callback (overflow or error).

Detailed Description

Callback function parameter data

Field Documentation

◆ p_context

void const* timer_callback_args_t::p_context
Placeholder for user data. Set in timer_api_t::open function in timer_cfg_t.

The documentation for this struct was generated from the following file:

- r_timer_api.h

timer_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Timer Interface

#include <r_timer_api.h>

Data Fields

timer_direction_t	count_direction Clock counting direction of the timer resource.
uint32_t	clock_frequency

	Clock frequency of the timer resource.
timer_size_t	period_counts Time in clock counts until timer will expire.
elc_event_t	elc_event ELC event associated with the count operation of the timer resource.

Detailed Description

Timer information structure to store various information for a timer resource

---

The documentation for this struct was generated from the following file:

timer_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Timer Interface

#include <r_timer_api.h>

Data Fields

timer_mode_t	mode Select enumerated value from timer_mode_t.
uint32_t	period
timer_unit_t	unit Units of timer_cfg_t::period.
timer_size_t	duty_cycle Duty cycle in units timer_cfg_t::duty_cycle_unit.
timer_pwm_unit_t	duty_cycle_unit

	Units of timer_cfg_t::duty_cycle.
uint8_t	channel
uint8_t	irq_ipl Timer interrupt priority.
bool	autostart
void(*	p_callback)(timer_callback_args_t *p_args)
void const *	p_context
void const *	p_extend Extension parameter for hardware specific settings.

Detailed Description

User configuration structure, used in open function

Field Documentation

◆ autostart

bool timer_cfg_t::autostart
Whether to start during Open call or not. True: Start during open. False: Don't start during open.

◆ channel

uint8_t timer_cfg_t::channel
Select a channel corresponding to the channel number of the hardware.

◆ p_callback

void(* timer_cfg_t::p_callback) (timer_callback_args_t *p_args)
Callback provided when a timer ISR occurs. Set to NULL for no CPU interrupt.

◆ p_context

void const* timer_cfg_t::p_context
Placeholder for user data. Passed to the user callback in timer_callback_args_t.

◆ period

uint32_t timer_cfg_t::period
Defines when the timer should expire. For a free running counter, set to TIMER_MAX_CLOCK with unit TIMER_UNIT_PERIOD_RAW_COUNTS

The documentation for this struct was generated from the following file:

- r_timer_api.h

timer_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Timer Interface

#include <r_timer_api.h>

Data Fields

ssp_err_t(*	open)(timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg)
ssp_err_t(*	stop)(timer_ctrl_t *const p_ctrl)
ssp_err_t(*	start)(timer_ctrl_t *const p_ctrl)
ssp_err_t(*	reset)(timer_ctrl_t *const p_ctrl)
ssp_err_t(*	counterGet)(timer_ctrl_t *const p_ctrl, timer_size_t *const p_value)
ssp_err_t(*	periodSet)(timer_ctrl_t *const p_ctrl, timer_size_t const period, timer_unit_t const unit)
ssp_err_t(*	dutyCycleSet)(timer_ctrl_t *const p_ctrl, timer_size_t const duty_cycle, timer_pwm_unit_t const duty_cycle_unit, uint8_t const pin)
ssp_err_t(*	infoGet)(timer_ctrl_t *const p_ctrl, timer_info_t *const p_info)

ssp_err_t(*	close)(timer_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)

Detailed Description

Timer API structure. General timer functions implemented at the HAL layer follow this API.

Field Documentation

◆ close

ssp_err_t(* timer_api_t::close) (timer_ctrl_t *const p_ctrl)

Allows driver to be reconfigured and may reduce power consumption.

Implemented as

- R_GPT_Close()
- R_AGT_Close()

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.

◆ counterGet

ssp_err_t(* timer_api_t::counterGet) (timer_ctrl_t *const p_ctrl, timer_size_t *const p_value)

Get current counter value and store it in provided pointer p_value.

Implemented as

- R_GPT_CounterGet()
- R_AGT_CounterGet()

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.
[out]	p_value	Pointer to store current counter value.

◆ dutyCycleSet

ssp_err_t(* timer_api_t::dutyCycleSet) (timer_ctrl_t *const p_ctrl, timer_size_t const duty_cycle, timer_pwm_unit_t const duty_cycle_unit, uint8_t const pin)

Sets the time until the duty cycle expires.

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.
[in]	duty_cycle	Time until duty cycle should expire.
[in]	duty_cycle_unit	Units of duty_cycle parameter.
[in]	pin	Which output pin to update. Enter the pin number or if pins are identified by letters, enter 0 for A, 1 for B, 2 for C, etc.

◆ infoGet

ssp_err_t(* timer_api_t::infoGet) (timer_ctrl_t *const p_ctrl, timer_info_t *const p_info)

Get the time until the timer expires in clock counts and store it in provided pointer p_period_counts.

Implemented as

- R_GPT_InfoGet()
- R_AGT_InfoGet()

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.
[out]	p_info	Collection of information for this timer.

◆ open

ssp_err_t(* timer_api_t::open) (timer_ctrl_t *const p_ctrl, timer_cfg_t const *const p_cfg)

Initial configuration.

Implemented as

- R_GPT_TimerOpen()
- R_AGT_TimerOpen()

Note

To reconfigure after calling this function, call timer_api_t::close first.

Parameters

[in]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ periodSet

ssp_err_t(* timer_api_t::periodSet) (timer_ctrl_t *const p_ctrl, timer_size_t const period, timer_unit_t const unit)

Set the time until the timer expires.

Implemented as

- R_GPT_PeriodSet()
- R_AGT_PeriodSet()

Note

Timer expiration may or may not generate a CPU interrupt based on how the timer is configured in timer_api_t::open.

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.
[in]	period	Time until timer should expire.
[in]	unit	Units of period parameter.

◆ reset

ssp_err_t(* timer_api_t::reset) (timer_ctrl_t *const p_ctrl)

Reset the counter to the initial value.

Implemented as

- R_GPT_Reset()
- R_AGT_Reset()

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.

◆ start

ssp_err_t(* timer_api_t::start) (timer_ctrl_t *const p_ctrl)

Start the counter.

Implemented as

- R_GPT_Start()
- R_AGT_Start()

Note

The counter can also be started in the timer_api_t::open function if timer_cfg_t::autostart is true.

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.

◆ stop

ssp_err_t(* timer_api_t::stop) (timer_ctrl_t *const p_ctrl)

Stop the counter.

Implemented as

- R_GPT_Stop()
- R_AGT_Stop()

Parameters

[in]	p_ctrl	Control block set in timer_api_t::open call for this timer.

◆ versionGet

ssp_err_t(* timer_api_t::versionGet) (ssp_version_t *const p_version)
Get version and store it in provided pointer p_version. **Implemented as** ◦ R_GPT_VersionGet() ◦ R_AGT_VersionGet() **Parameters** [out] p_version Code and API version used.

The documentation for this struct was generated from the following file:

- r_timer_api.h

timer_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Timer Interface

#include <r_timer_api.h>

Data Fields

timer_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
timer_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
timer_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

The documentation for this struct was generated from the following file:

enum	transfer_chain_mode_t { TRANSFER_CHAIN_MODE_DISABLED = 0, TRANSFER_CHAIN_MODE_EACH = 2, TRANSFER_CHAIN_MODE_END = 3 }

enum	transfer_irq_t { TRANSFER_IRQ_END = 0, TRANSFER_IRQ_EACH = 1 }
enum	transfer_start_mode_t { TRANSFER_START_MODE_SINGLE = 0, TRANSFER_START_MODE_REPEAT = 1 }

Detailed Description

Interface for data transfer functions.

Summary

The transfer interface supports background data transfer (no CPU intervention).

The transfer interface can be implemented by:

- DTC
- DMAC

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Transfer Interface description: Transfer Driver on r_dtc and Transfer Driver on r_dmac

Typedef Documentation

◆ transfer_ctrl_t

typedef void transfer_ctrl_t

Transfer control block. Allocate an instance specific control block to pass into the transfer API calls.

Implemented as

- dtc_instance_ctrl_t
- dmac_instance_ctrl_t

Enumeration Type Documentation

◆ transfer_addr_mode_t

enum transfer_addr_mode_t	
Address mode specifies whether to modify (increment or decrement) pointer after each transfer.	
Enumerator	
TRANSFER_ADDR_MODE_FIXED	Address pointer remains fixed after each transfer.
TRANSFER_ADDR_MODE_OFFSET	Address pointer changes as per the configured value of offset_byte.
TRANSFER_ADDR_MODE_INCREMENTED	Address pointer is incremented by associated transfer_size_t after each transfer.
TRANSFER_ADDR_MODE_DECREMENTED	Address pointer is decremented by associated transfer_size_t after each transfer.

◆ transfer_chain_mode_t

enum transfer_chain_mode_t	
Chain transfer mode options. ***Note*** *Only applies for DTC.*	
Enumerator	
TRANSFER_CHAIN_MODE_DISABLED	Chain mode not used.
TRANSFER_CHAIN_MODE_EACH	Switch to next transfer after a single transfer from this transfer_info_t.
TRANSFER_CHAIN_MODE_END	Complete the entire transfer defined in this transfer_info_t before chaining to next transfer.

◆ transfer_irq_t

enum transfer_irq_t	
Interrupt options.	
Enumerator	
TRANSFER_IRQ_END	Interrupt occurs only after last transfer. If this transfer is chained to a subsequent transfer, the interrupt will occur only after subsequent chained transfer(s) are complete. Warning DTC triggers the interrupt of the activation source. Choosing TRANSFER_IRQ_END with DTC will prevent activation source interrupts until the transfer is complete.
TRANSFER_IRQ_EACH	Interrupt occurs after each transfer. *Note* *Not available in all HAL drivers. See HAL driver for details.* Warning This will prevent chained transfers that would have happened after this one until the next activation source.

◆ transfer_mode_t

enum transfer_mode_t	
Transfer mode describes what will happen when a transfer request occurs.	
Enumerator	
TRANSFER_MODE_NORMAL	In normal mode, each transfer request causes a transfer of transfer_size_t from the source pointer to the destination pointer. The transfer length is decremented and the source and address pointers are updated according to transfer_addr_mode_t. After the transfer length reaches 0, transfer requests will not cause any further transfers.
TRANSFER_MODE_REPEAT	Repeat mode is like normal mode, except that when the transfer length reaches 0, the pointer to the repeat area and the transfer length will be reset to their initial values. If DMAC is used, the transfer repeats only transfer_info_t::num_blocks times. After the transfer repeats transfer_info_t::num_blocks times, transfer requests will not cause any further transfers. If DTC is used, the transfer repeats continuously (no limit to the number of repeat transfers).
TRANSFER_MODE_BLOCK	In block mode, each transfer request causes transfer_info_t::length transfers of transfer_size_t. After each individual transfer, the source and destination pointers are updated according to transfer_addr_mode_t. After the block transfer is complete, transfer_info_t::num_blocks is decremented. After the transfer_info_t::num_blocks reaches 0, transfer requests will not cause any further transfers.

◆ transfer_repeat_area_t

enum transfer_repeat_area_t	
Repeat area options (source or destination). In TRANSFER_MODE_REPEAT, the selected pointer returns to its original value after transfer_info_t::length transfers. In TRANSFER_MODE_BLOCK, the selected pointer returns to its original value after each transfer.	
Enumerator	
TRANSFER_REPEAT_AREA_DESTINATION	Destination area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK.
TRANSFER_REPEAT_AREA_SOURCE	Source area repeated in TRANSFER_MODE_REPEAT or TRANSFER_MODE_BLOCK.

◆ transfer_size_t

enum transfer_size_t	
Transfer size specifies the size of each individual transfer. Total transfer length = transfer_size_t * transfer_length_t	
Enumerator	
TRANSFER_SIZE_1_BYTE	Each transfer transfers an 8-bit value.
TRANSFER_SIZE_2_BYTE	Address pointer is incremented after each transfer.
TRANSFER_SIZE_4_BYTE	Address pointer is incremented after each transfer.

◆ transfer_start_mode_t

enum transfer_start_mode_t	
Select whether to start single or repeated transfer with software start.	
Enumerator	
TRANSFER_START_MODE_SINGLE	Software start triggers single transfer.
TRANSFER_START_MODE_REPEAT	Software start transfer continues until transfer is complete.

transfer_properties_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Transfer Interface

#include <r_transfer_api.h>

Data Fields

uint32_t	transfer_length_max Maximum number of transfers.
uint16_t	transfer_length_remaining Number of transfers remaining.
bool	in_progress Whether or not this transfer is in progress.

Detailed Description

Driver specific information.

The documentation for this struct was generated from the following file:

- r_transfer_api.h

transfer_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Transfer Interface

#include <r_transfer_api.h>

Data Fields

transfer_addr_mode_t	dest_addr_mode: 2
transfer_repeat_area_t	repeat_area: 1
transfer_irq_t	irq: 1
transfer_chain_mode_t	chain_mode: 2

transfer_addr_mode_t	src_addr_mode: 2
transfer_size_t	size: 2
transfer_mode_t	mode: 2
void const *volatile	p_src Source pointer.
void *volatile	p_dest Destination pointer.
volatile uint16_t	num_blocks
volatile uint16_t	length

Detailed Description

This structure specifies the properties of the transfer.

Warning

When using DTC, this structure corresponds to the descriptor block registers required by the DTC. The following components may be modified by the driver: p_src, p_dest, num_blocks, and length.
When using DTC, do NOT reuse this structure to configure multiple transfers. Each transfer must have a unique transfer_info_t.
When using DTC, this structure must not be allocated in a temporary location. Any instance of this structure must remain in scope until the transfer it is used for is closed.

Note

When using DTC, consider placing instances of this structure in a protected section of memory.

Field Documentation

◆ chain_mode

transfer_chain_mode_t transfer_info_t::chain_mode
Select when the chain transfer ends.

◆ dest_addr_mode

transfer_addr_mode_t transfer_info_t::dest_addr_mode
Select what happens to destination pointer after each transfer.

◆ irq

transfer_irq_t transfer_info_t::irq
Select if interrupts should occur after each individual transfer or after the completion of all planned transfers.

◆ length

volatile uint16_t transfer_info_t::length
Length of each transfer. Range limited for TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT, see HAL driver for details.

◆ mode

transfer_mode_t transfer_info_t::mode
Select mode from transfer_mode_t.

◆ num_blocks

volatile uint16_t transfer_info_t::num_blocks
Number of blocks to transfer when using TRANSFER_MODE_BLOCK (both DTC an DMAC) and TRANSFER_MODE_REPEAT (DMAC only), unused in other modes.

◆ repeat_area

transfer_repeat_area_t transfer_info_t::repeat_area
Select to repeat source or destination area, unused in TRANSFER_MODE_NORMAL.

◆ size

transfer_size_t transfer_info_t::size
Select number of bytes to transfer at once. **See also** transfer_info_t::length.

◆ src_addr_mode

transfer_addr_mode_t transfer_info_t::src_addr_mode
Select what happens to source pointer after each transfer.

The documentation for this struct was generated from the following file:

- r_transfer_api.h

transfer_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Transfer Interface

#include <r_transfer_api.h>

Data Fields

void const *	p_context Placeholder for user data. Set in r_transfer_t::open function in transfer_cfg_t.

Detailed Description

Callback function parameter data.

The documentation for this struct was generated from the following file:

- r_transfer_api.h

transfer_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Transfer Interface

#include <r_transfer_api.h>

Data Fields

transfer_info_t *	p_info

elc_event_t	activation_source
bool	auto_enable
uint8_t	irq_ipl
void(*	p_callback)(transfer_callback_args_t *p_args)
void const *	p_context
void const *	p_extend Extension parameter for hardware specific settings.

Detailed Description

Driver configuration set in transfer_api_t::open. All elements except p_extend are required and must be initialized.

Field Documentation

◆ activation_source

elc_event_t transfer_cfg_t::activation_source

Select which event will trigger the transfer.

Note

Select ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 for software activation. When using DTC, these events may only be used once each. DMAC uses internal software start when either of these events are selected.

◆ auto_enable

bool transfer_cfg_t::auto_enable

Select whether the transfer should be enabled after open.

◆ irq_ipl

uint8_t transfer_cfg_t::irq_ipl

Interrupt priority level.

Warning

Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

◆ p_callback

void(* transfer_cfg_t::p_callback) (transfer_callback_args_t *p_args)
Callback for transfer end interrupt. Set to NULL for no CPU interrupt. **Warning** Unsupported for DTC except when ELC software events are used. DTC transfers trigger the interrupt associated with the activation source.

◆ p_context

void const* transfer_cfg_t::p_context
Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

◆ p_info

transfer_info_t* transfer_cfg_t::p_info
Pointer to transfer configuration options. If using chain transfer (DTC only), this can be a pointer to an array of chained transfers that will be completed in order.

The documentation for this struct was generated from the following file:

- r_transfer_api.h

transfer_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » Transfer Interface

#include <r_transfer_api.h>

Data Fields

ssp_err_t(*	open)(transfer_ctrl_t *const p_ctrl, transfer_cfg_t const *const p_cfg)
ssp_err_t(*	reset)(transfer_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint16_t const num_transfers)
ssp_err_t(*	enable)(transfer_ctrl_t *const p_ctrl)
ssp_err_t(*	disable)(transfer_ctrl_t *const p_ctrl)

ssp_err_t(*	start)(transfer_ctrl_t *const p_ctrl, transfer_start_mode_t mode)
ssp_err_t(*	stop)(transfer_ctrl_t *const p_ctrl)
ssp_err_t(*	infoGet)(transfer_ctrl_t *const p_ctrl, transfer_properties_t *const p_info)
ssp_err_t(*	close)(transfer_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *const p_version)
ssp_err_t(*	blockReset)(transfer_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint16_t const length, transfer_size_t size, uint16_t const num_transfers)
ssp_err_t(*	Stop_ActivationRequest)(transfer_ctrl_t *const p_ctrl)

Detailed Description

Transfer functions implemented at the HAL layer will follow this API.

Field Documentation

◆ blockReset

ssp_err_t(* transfer_api_t::blockReset) (transfer_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint16_t const length, transfer_size_t size, uint16_t const num_transfers)

Reset source address pointer, destination address pointer, and/or length, for block transfer keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid.

Implemented as

- R_DMAC_BlockReset()
- R_DTC_BlockReset()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.
[in]	p_src	Pointer to source. Set to NULL if source pointer should not change.
[in]	p_dest	Pointer to destination. Set to NULL if destination pointer should not change.
[in]	length	Transfer length in block mode.In DMAC only.
[in]	size	Transfer size in block mode. In DMAC only.
[in]	num_transfers	number of blocks in block mode. In DMAC only.

◆ close

ssp_err_t(* transfer_api_t::close) (transfer_ctrl_t *const p_ctrl)

Releases hardware lock. This allows a transfer to be reconfigured using transfer_api_t::open.

Implemented as

- R_DTC_Close()
- R_DMAC_Close()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.

◆ disable

ssp_err_t(* transfer_api_t::disable) (transfer_ctrl_t *const p_ctrl)

Disable transfer. Transfers do not occur after the transfer_info_t::activation source event (or when transfer_api_t::start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source).

Note

If a transfer is in progress, it will be completed. Subsequent transfer requests do not cause a transfer.

Implemented as

- R_DMAC_Disable()
- R_DTC_Disable()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.

◆ enable

ssp_err_t(* transfer_api_t::enable) (transfer_ctrl_t *const p_ctrl)

Enable transfer. Transfers occur after the activation source event (or when transfer_api_t::start is called if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as activation source).

Implemented as

- R_DMAC_Enable()
- R_DTC_Enable()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.

◆ infoGet

ssp_err_t(* transfer_api_t::infoGet) (transfer_ctrl_t *const p_ctrl, transfer_properties_t *const p_info)

Provides information about this transfer.

Implemented as

- R_DTC_InfoGet()
- R_DMAC_InfoGet()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.
[out]	p_info	Driver specific information.

◆ open

ssp_err_t(* transfer_api_t::open) (transfer_ctrl_t *const p_ctrl, transfer_cfg_t const *const p_cfg)

Initial configuration. Enables the transfer if auto_enable is true and p_src, p_dest, and length are valid. Transfers can also be enabled using transfer_api_t::enable or transfer_api_t::reset.

Implemented as

- R_DTC_Open()
- R_DMAC_Open()

Parameters

[in,out]	p_ctrl	Pointer to control block. Must be declared by user. Elements set here.
[in]	p_cfg	Pointer to configuration structure. All elements of this structure must be set by user.

◆ reset

ssp_err_t(* transfer_api_t::reset) (transfer_ctrl_t *const p_ctrl, void const *p_src, void *p_dest, uint16_t const num_transfers)

Reset source address pointer, destination address pointer, and/or length, keeping all other settings the same. Enable the transfer if p_src, p_dest, and length are valid.

Implemented as

- R_DTC_Reset()
- R_DMAC_Reset()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.
[in]	p_src	Pointer to source. Set to NULL if source pointer should not change.
[in]	p_dest	Pointer to destination. Set to NULL if destination pointer should not change.
[in]	num_transfers	Transfer length in normal mode or number of blocks in block mode. In DMAC only, resets number of repeats (initially stored in transfer_info_t::num_blocks) in repeat mode. Not used in repeat mode for DTC.

◆ start

ssp_err_t(* transfer_api_t::start) (transfer_ctrl_t *const p_ctrl, transfer_start_mode_t mode)

Start transfer in software.

Warning

Only works if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source.

Note

DTC only supports TRANSFER_START_MODE_SINGLE. DTC does not support TRANSFER_START_MODE_REPEAT.

Implemented as

- R_DMAC_Start()
- R_DTC_Start()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.
[in]	mode	Select mode from transfer_start_mode_t.

◆ stop

ssp_err_t(* transfer_api_t::stop) (transfer_ctrl_t *const p_ctrl)

Stop transfer in software. The transfer will stop after completion of the current transfer.

Note

Not supported for DTC.
Only applies for transfers started with TRANSFER_START_MODE_REPEAT.

Warning

Only works if ELC_EVENT_ELC_SOFTWARE_EVENT_0 or ELC_EVENT_ELC_SOFTWARE_EVENT_0 is chosen as transfer_info_t::activation_source.

Implemented as

- R_DMAC_Stop()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.

◆ Stop_ActivationRequest

ssp_err_t(* transfer_api_t::Stop_ActivationRequest) (transfer_ctrl_t *const p_ctrl)

Clears the DMA activation request with a DMA dummy transfer as per flowchart in the hardware manual. Implements transfer_api_t::Stop_ActivationRequest.

Note

This function to be used only in scenario when a DMA activation request source might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMA activation request is held in DMAC.

Implemented as

- R_DMAC_Stop_ActivationRequest()
- R_DTC_Stop_ActivationRequest()

Parameters

[in]	p_ctrl	Control block set in transfer_api_t::open call for this transfer.

◆ versionGet

ssp_err_t(* transfer_api_t::versionGet) (ssp_version_t *const p_version)

Gets version and stores it in provided pointer p_version.

Implemented as

- R_DTC_VersionGet()
- R_DMAC_VersionGet()

Parameters

[out]	p_version	Code and API version used.

The documentation for this struct was generated from the following file:

- r_transfer_api.h

enum	uart_rs485_type_t { UART_RS485_HD = 0U, UART_RS485_FD = 1U }

Detailed Description

Interface for UART communications.

Summary

The UART interface provides common APIs for UART HAL drivers. The UART interface supports the following features:

- Full-duplex UART communication
- Generic UART parameter setting
- Interrupt driven transmit/receive processing
- Callback function with returned event code
- Runtime baud-rate change
- Hardware resource locking during a transaction
- CTS/RTS hardware flow control support (with an associated IOPORT pin)
- Circular buffer support
- Runtime Transmit/Receive circular buffer flushing

Implemented by:

- UART on SCI

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

◆ uart_ctrl_t

typedef void uart_ctrl_t
UART control block. Allocate an instance specific control block to pass into the UART API calls. **Implemented as** ◦ sci_uart_instance_ctrl_t

Enumeration Type Documentation

◆ uart_data_bits_t

enum uart_data_bits_t	
UART Data bit length definition	
Enumerator	
UART_DATA_BITS_8	Data bits 8-bit.
UART_DATA_BITS_7	Data bits 7-bit.
UART_DATA_BITS_9	Data bits 9-bit.

◆ uart_dir_t

enum uart_dir_t	
UART transaction definition	
Enumerator	
UART_DIR_RX_TX	Both RX and TX.
UART_DIR_RX	Only RX.
UART_DIR_TX	Only TX.

◆ uart_event_t

enum uart_event_t	
UART Event codes	
Enumerator	
UART_EVENT_RX_COMPLETE	Receive complete event.
UART_EVENT_TX_COMPLETE	Transmit complete event.
UART_EVENT_ERR_PARITY	Parity error event.
UART_EVENT_ERR_FRAMING	Mode fault error event.
UART_EVENT_BREAK_DETECT	Break detect error event.
UART_EVENT_ERR_OVERFLOW	FIFO Overflow error event.
UART_EVENT_ERR_RXBUF_OVERFLOW	DEPRECATED: Receive buffer overflow error event.
UART_EVENT_RX_CHAR	Character received.
UART_EVENT_TX_DATA_EMPTY	Last byte is transmitting, ready for more data.

◆ uart_mode_t

enum uart_mode_t	
UART communication mode definition	
Enumerator	
UART_MODE_RS232	Enables RS232 communication mode.
UART_MODE_RS485	Enables RS485 communication mode.

◆ uart_parity_t

enum uart_parity_t	
UART Parity definition	
Enumerator	
UART_PARITY_OFF	No parity.
UART_PARITY_EVEN	Even parity.
UART_PARITY_ODD	Odd parity.

◆ uart_rs485_type_t

enum uart_rs485_type_t	
UART RS485 communication channel type definition	
Enumerator	
UART_RS485_HD	Uses RS485 half duplex communication channel.
UART_RS485_FD	Uses RS485 full duplex communication channel.

◆ uart_stop_bits_t

enum uart_stop_bits_t	
UART Stop bits definition	
Enumerator	
UART_STOP_BITS_1	Stop bit 1-bit.
UART_STOP_BITS_2	Stop bits 2-bit.

uart_info_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » UART Interface

#include <r_uart_api.h>

Data Fields

uint32_t	write_bytes_max
uint32_t	read_bytes_max

Detailed Description

UART driver specific information

Field Documentation

◆ read_bytes_max

uint32_t uart_info_t::read_bytes_max

Maximum bytes that are available to read at one time. Only applies if uart_cfg_t::p_transfer_rx is not NULL.

◆ write_bytes_max

uint32_t uart_info_t::write_bytes_max

Maximum bytes that can be written at this time. Only applies if uart_cfg_t::p_transfer_tx is not NULL.

The documentation for this struct was generated from the following file:

- r_uart_api.h

uart_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » UART Interface

#include <r_uart_api.h>

Data Fields

uint32_t	channel Device channel number.
uart_event_t	event Event code.

uint32_t	data
void const *	p_context Context provided to user during callback.

Detailed Description

UART Callback parameter definition

Field Documentation

◆ data

uint32_t uart_callback_args_t::data
Contains the next character received for the events UART_EVENT_RX_CHAR, UART_EVENT_ERR_PARITY, UART_EVENT_ERR_FRAMING, or UART_EVENT_ERR_OVERFLOW. Otherwise unused.

The documentation for this struct was generated from the following file:

- r_uart_api.h

uart_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » UART Interface

#include <r_uart_api.h>

Data Fields

uint8_t	channel Select a channel corresponding to the channel number of the hardware.
uint32_t	baud_rate Baud rate, i.e. 9600, 19200, 115200.
uart_data_bits_t	data_bits

	Data bit length (8 or 7 or 9)
uart_parity_t	parity Parity type (none or odd or even)
uart_stop_bits_t	stop_bits Stop bit length (1 or 2)
bool	ctsrts_en CTS/RTS hardware flow control enable.
uint8_t	rxi_ipl Receive interrupt priority.
uint8_t	txi_ipl Transmit interrupt priority.
uint8_t	tei_ipl Transmit end interrupt priority.
uint8_t	eri_ipl Error interrupt priority.
transfer_instance_t const *	p_transfer_rx
transfer_instance_t const *	p_transfer_tx
void(*	p_callback)(uart_callback_args_t *p_args) Pointer to callback function.
void const *	p_context User defined context passed into callback function.
void const *	p_extend UART hardware dependent configuration.

Detailed Description

UART Configuration

Field Documentation

◆ p_transfer_rx

transfer_instance_t const* uart_cfg_t::p_transfer_rx
Optional transfer instance used to receive multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the read API is limited to one byte at a time.

◆ p_transfer_tx

transfer_instance_t const* uart_cfg_t::p_transfer_tx
Optional transfer instance used to send multiple bytes without interrupts. Set to NULL if unused. If NULL, the number of bytes allowed in the write APIs is limited to one byte at a time.

The documentation for this struct was generated from the following file:

- r_uart_api.h

uart_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » UART Interface

#include <r_uart_api.h>

Data Fields

ssp_err_t(*	open)(uart_ctrl_t *const p_ctrl, uart_cfg_t const *const p_cfg)
ssp_err_t(*	read)(uart_ctrl_t *const p_ctrl, uint8_t const *const p_dest, uint32_t const bytes)
ssp_err_t(*	write)(uart_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)
ssp_err_t(*	baudSet)(uart_ctrl_t *const p_ctrl, uint32_t const baudrate)
ssp_err_t(*	infoGet)(uart_ctrl_t *const p_ctrl, uart_info_t *const p_info)

ssp_err_t(*	close)(uart_ctrl_t *const p_ctrl)
ssp_err_t(*	versionGet)(ssp_version_t *p_version)
ssp_err_t(*	communicationAbort)(uart_ctrl_t *const p_ctrl, uart_dir_t communication_to_abort)

Detailed Description

Shared Interface definition for UART

Field Documentation

◆ baudSet

ssp_err_t(* uart_api_t::baudSet) (uart_ctrl_t *const p_ctrl, uint32_t const baudrate)

Change baud rate.

Warning

Calling this API aborts any in-progress transmission and disables reception until the new baud settings have been applied.

Implemented as

- R_SCI_UartBaudSet()

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	baudrate	Baud rate in bps.

◆ close

ssp_err_t(* uart_api_t::close) (uart_ctrl_t *const p_ctrl)

Close UART device.

Implemented as

- R_SCI_UartClose()

Parameters

[in]	p_ctrl	Pointer to the UART control block.

◆ communicationAbort

ssp_err_t(* uart_api_t::communicationAbort) (uart_ctrl_t *const p_ctrl, uart_dir_t communication_to_abort)

Abort ongoing transfer.

Implemented as

- R_SCI_UartAbort()

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	communication_to_abort	Type of abort request.

◆ infoGet

ssp_err_t(* uart_api_t::infoGet) (uart_ctrl_t *const p_ctrl, uart_info_t *const p_info)

Get the driver specific information.

Implemented as

- R_SCI_UartInfoGet()

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	baudrate	Baud rate in bps.

◆ open

ssp_err_t(* uart_api_t::open) (uart_ctrl_t *const p_ctrl, uart_cfg_t const *const p_cfg)

Open UART device.

Implemented as

- R_SCI_UartOpen()

Parameters

[in,out]	p_ctrl	Pointer to the UART control block Must be declared by user. Value set here.
[in]	uart_cfg_t	Pointer to UART configuration structure. All elements of this structure must be set by user.

◆ read

ssp_err_t(* uart_api_t::read) (uart_ctrl_t *const p_ctrl, uint8_t const *const p_dest, uint32_t const bytes)

Read from UART device. If a transfer instance is used for reception, the received bytes are stored directly in the read input buffer. When a transfer is complete, the callback is called with event UART_EVENT_RX_COMPLETE. Bytes received outside an active transfer are received in the callback function with event UART_EVENT_RX_CHAR. The maximum transfer size is reported by infoGet().

Implemented as

- R_SCI_UartRead()

Parameters

[in]	p_ctrl	Pointer to the UART control block for the channel.
[in]	p_dest	Destination address to read data from.
[in]	bytes	Read data length. Only applicable if uart_cfg_t::p_transfer_rx is not NULL. Otherwise all read bytes will be provided through the callback set in uart_cfg_t::p_callback.

◆ versionGet

ssp_err_t(* uart_api_t::versionGet) (ssp_version_t *p_version)

Get version.

Implemented as

- R_SCI_UartVersionGet()

Parameters

[in]	p_version	Pointer to the memory to store the version information.

◆ write

ssp_err_t(* uart_api_t::write) (uart_ctrl_t *const p_ctrl, uint8_t const *const p_src, uint32_t const bytes)

Write to UART device. The write buffer is used until write is complete. Do not overwrite write buffer contents until the write is finished. When the write is complete (all bytes are fully transmitted on the wire), the callback called with event UART_EVENT_TX_COMPLETE. The maximum transfer size is reported by infoGet().

Implemented as

- R_SCI_UartWrite()

Parameters

[in]	p_ctrl	Pointer to the UART control block.
[in]	p_src	Source address to write data to.
[in]	bytes	Write data length.

The documentation for this struct was generated from the following file:

- r_uart_api.h

uart_instance_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » UART Interface

#include <r_uart_api.h>

Data Fields

uart_ctrl_t *	p_ctrl Pointer to the control structure for this instance.
uart_cfg_t const *	p_cfg Pointer to the configuration structure for this instance.
uart_api_t const *	p_api Pointer to the API structure for this instance.

Detailed Description

This structure encompasses everything that is needed to use an instance of this interface.

Detailed Description

Interface for watch dog timer functions.

Summary

The WDT interface for the Watchdog Timer (WDT) peripheral provides watchdog functionality including resetting the device or generating an interrupt.

See Also WDT Interface and Thread Monitor Framework Interface

The watchdog timer interface can be implemented by:

- WDT
- IWDT

Related SSP architecture topics:

- SSP Interfaces
- SSP Predefined Layers
- Using SSP Modules

Typedef Documentation

◆ wdt_ctrl_t

typedef void wdt_ctrl_t
WDT control block. Allocate an instance specific control block to pass into the WDT API calls. **Implemented as** ◦ wdt_instance_ctrl_t ◦ iwdt_instance_ctrl_t

Enumeration Type Documentation

◆ wdt_clock_division_t

enum wdt_clock_division_t	
WDT clock division ratio.	
Enumerator	
WDT_CLOCK_DIVISION_1	CLK/1.
WDT_CLOCK_DIVISION_4	CLK/4.
WDT_CLOCK_DIVISION_16	CLK/16.
WDT_CLOCK_DIVISION_32	CLK/32.
WDT_CLOCK_DIVISION_64	CLK/64.
WDT_CLOCK_DIVISION_128	CLK/128.
WDT_CLOCK_DIVISION_256	CLK/256.
WDT_CLOCK_DIVISION_512	CLK/512.
WDT_CLOCK_DIVISION_2048	CLK/2048.
WDT_CLOCK_DIVISION_8192	CLK/8192.

◆ wdt_reset_control_t

enum wdt_reset_control_t	
WDT Counter underflow and refresh error control.	
Enumerator	
WDT_RESET_CONTROL_NMI	NMI request when counter underflows.
WDT_RESET_CONTROL_RESET	Reset request when counter underflows.

◆ wdt_start_mode_t

enum wdt_start_mode_t	
WDT start mode. Used to check the WDT is configured correctly.	
Enumerator	
WDT_START_MODE_REGISTER	WDT is to be configured using the WDT registers.
WDT_START_MODE_AUTO	WDT is to be configured using OFS0 hardware register.
WDT_START_MODE_DISABLED	WDT is disabled.

◆ wdt_status_t

enum wdt_status_t	
WDT status	
Enumerator	
WDT_STATUS_NO_ERROR	No status flags set.
WDT_STATUS_UNDERFLOW_ERROR	Underflow flag set.
WDT_STATUS_REFRESH_ERROR	Refresh error flag set. Refresh outside of permitted.
WDT_STATUS_UNDERFLOW_AND_REFRESH_ERROR	Underflow and refresh error flags set.

◆ wdt_stop_control_t

enum wdt_stop_control_t	
WDT Counter operation in sleep mode.	
Enumerator	
WDT_STOP_CONTROL_DISABLE	Count will not stop when device enters sleep mode.
WDT_STOP_CONTROL_ENABLE	Count will automatically stop when device enters sleep mode.

◆ wdt_timeout_t

enum wdt_timeout_t	
WDT time-out periods.	
Enumerator	
WDT_TIMEOUT_128	128 clock cycles
WDT_TIMEOUT_512	512 clock cycles
WDT_TIMEOUT_1024	1024 clock cycles
WDT_TIMEOUT_2048	2048 clock cycles
WDT_TIMEOUT_4096	4096 clock cycles
WDT_TIMEOUT_8192	8192 clock cycles
WDT_TIMEOUT_16384	16384 clock cycles

◆ wdt_window_end_t

enum wdt_window_end_t	
WDT refresh permitted period window end position.	
Enumerator	
WDT_WINDOW_END_75	End position = 75%.
WDT_WINDOW_END_50	End position = 50%.
WDT_WINDOW_END_25	End position = 25%.
WDT_WINDOW_END_0	End position = 0%.

◆ wdt_window_start_t

enum wdt_window_start_t	
WDT refresh permitted period window start position.	
Enumerator	
WDT_WINDOW_START_25	Start position = 25%.
WDT_WINDOW_START_50	Start position = 50%.
WDT_WINDOW_START_75	Start position = 75%.
WDT_WINDOW_START_100	Start position = 100%.

wdt_callback_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » WDT Interface

#include <r_wdt_api.h>

Data Fields

void const *	p_context Placeholder for user data. Set in wdt_api_t::open function in wdt_cfg_t.

Detailed Description

Callback function parameter data

The documentation for this struct was generated from the following file:

- r_wdt_api.h

wdt_timeout_values_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » WDT Interface

#include <r_wdt_api.h>

Data Fields

uint32_t	clock_frequency_hz Frequency of watchdog clock after divider.
uint32_t	timeout_clocks Timeout period in units of watchdog clock ticks.

Detailed Description

WDT timeout data. Used to return frequency of WDT clock and timeout period

---

The documentation for this struct was generated from the following file:

- r_wdt_api.h

wdt_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » WDT Interface

#include <r_wdt_api.h>

Data Fields

wdt_start_mode_t	start_mode The expected start mode for the WDT.
bool	autostart
wdt_timeout_t	timeout Timeout period.
wdt_clock_division_t	clock_division Clock divider.
wdt_window_start_t	window_start

	Refresh permitted window start position.
wdt_window_end_t	window_end Refresh permitted window end position.
wdt_reset_control_t	reset_control Select NMI or reset generated on underflow.
wdt_stop_control_t	stop_control Select whether counter operates in sleep mode.
void(*	p_callback)(wdt_callback_args_t *p_args) Callback provided when a WDT NMI ISR occurs.
void const *	p_context
void const *	p_extend Placeholder for user extension.

Detailed Description

WDT configuration parameters.

Field Documentation

◆ autostart

bool wdt_cfg_t::autostart
When true the WDT is started as part of its configuration (register start mode). If false the WDT needs to be started manually by calling the refresh API.

◆ p_context

void const* wdt_cfg_t::p_context
Placeholder for user data. Passed to the user callback in wdt_callback_args_t.

The documentation for this struct was generated from the following file:

- r_wdt_api.h

wdt_api_t Struct Reference

Renesas Synergy Software Package Reference » HAL Interfaces » WDT Interface

#include <r_wdt_api.h>

Data Fields

ssp_err_t(*	cfgGet)(wdt_ctrl_t *const p_ctrl, wdt_cfg_t *const p_cfg)
ssp_err_t(*	open)(wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg)
ssp_err_t(*	refresh)(wdt_ctrl_t *const p_ctrl)
ssp_err_t(*	statusGet)(wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status)
ssp_err_t(*	statusClear)(wdt_ctrl_t *const p_ctrl, const wdt_status_t status)
ssp_err_t(*	counterGet)(wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)
ssp_err_t(*	timeoutGet)(wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout)
ssp_err_t(*	versionGet)(ssp_version_t *const p_data)

Detailed Description

WDT functions implemented at the HAL layer will follow this API.

Field Documentation

◆ cfgGet

ssp_err_t(* wdt_api_t::cfgGet) (wdt_ctrl_t *const p_ctrl, wdt_cfg_t *const p_cfg)

Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback.

Implemented as

- R_WDT_CfgGet()
- R_IWDT_CfgGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_cfg	Pointer to pin configuration structure for reading WDT configuration.

◆ counterGet

ssp_err_t(* wdt_api_t::counterGet) (wdt_ctrl_t *const p_ctrl, uint32_t *const p_count)

Read the current WDT counter value.

Implemented as

- R_WDT_CounterGet()
- R_IWDT_CounterGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_count	Pointer to variable to return current WDT counter value.

◆ open

ssp_err_t(* wdt_api_t::open) (wdt_ctrl_t *const p_ctrl, wdt_cfg_t const *const p_cfg)

Initialize the WDT in register start mode. In auto-start mode with NMI output it registers the NMI callback.

Implemented as

- R_WDT_Open()
- R_IWDT_Open()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	p_cfg	Pointer to pin configuration structure.

◆ refresh

ssp_err_t(* wdt_api_t::refresh) (wdt_ctrl_t *const p_ctrl)

Refresh the watchdog timer.

Implemented as

- R_WDT_Refresh()
- R_IWDT_Refresh()

Precondition

If the WDT is in auto-start mode ensure the OFS0 register is configured before using this function.

Warning

Calling this function in register-start mode before calling R_WDT_Open will start the WDT in it's default state and further changes to the configuration will not be possible.

Parameters

[in]	p_ctrl	Pointer to control structure.

◆ statusClear

ssp_err_t(* wdt_api_t::statusClear) (wdt_ctrl_t *const p_ctrl, const wdt_status_t status)

Clear the status flags of the WDT.

Implemented as

- R_WDT_StatusClear()
- R_IWDT_StatusClear()

Parameters

[in]	p_ctrl	Pointer to control structure.
[in]	status	Status condition(s) to clear.

◆ statusGet

ssp_err_t(* wdt_api_t::statusGet) (wdt_ctrl_t *const p_ctrl, wdt_status_t *const p_status)

Read the status of the WDT.

Implemented as

- R_WDT_StatusGet()
- R_IWDT_StatusGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_status	Pointer to variable to return status information through.

◆ timeoutGet

ssp_err_t(* wdt_api_t::timeoutGet) (wdt_ctrl_t *const p_ctrl, wdt_timeout_values_t *const p_timeout)

Read the watchdog timeout values.

Implemented as

- R_WDT_TimeoutGet()
- R_IWDT_TimeoutGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_timeout	Pointer to structure to return timeout values.

◆ versionGet

ssp_err_t(* wdt_api_t::versionGet) (ssp_version_t *const p_data)

Return the version of the IOPort driver.

Implemented as

- R_WDT_VersionGet()
- R_IWDT_VersionGet()

Parameters

[in]	p_ctrl	Pointer to control structure.
[out]	p_data	Memory address to return version information to.

Renesas Synergy Software Package Reference

Modules

	High-Speed Analog Comparator Driver for the High-Speed Analog Comparator.
	Low Power Analog Comparator Driver for the Low Power Analog Comparator.
	ADC Driver for the 14-Bit A/D Converter (ADC14) and 12-bit A/D Converter (ADC12).
	AGT Driver for the Asynchronous General Purpose Timer (AGT).
	AGT Input Capture Driver for the Asynchronous General-Purpose Timer (AGT) with Input Capture.
	Analog Connections Driver for internal analog connections.
	CAC Driver for the Clock Frequency Accuracy Measurement Circuit (CAC).
	CAN Driver for CAN, Controller Area Network.

	CGC Driver for the Clock Generation Circuit.
	CRC Driver for the CRC Calculator (CRC).
	CTSU v2 Driver for the Capacitive Touch Sensing Unit (CTSU).
	DAC Driver for the 12-Bit D/C Converter (DAC12).
	DAC8 Driver for the 8-Bit D/C Converter (DAC8).
	DMAC DMA Controller (DMAC).
	DOC Driver for the Data Operation Circuit (DOC).
	DTC Driver for the Data Transfer Controller (DTC).
	ELC Driver for the Event Link Controller (ELC).
	High-performance Flash Driver for the High-performance Flash Memory (S7G2 and S5D9).
	Low Power Flash Driver for the Low power Flash Memory (S3A7 and S124).

	FMI Driver for accessing Factory MCU Information (FMI).
	GLCDC Driver for the Graphics LCD Controller (GLCDC).
	GPT Driver for the General PWM Timer (GPT).
	GPT Input Capture Driver for the General PWM Timer (GPT) with Input Capture.
	ICU Driver for the Interrupt Controller Unit (ICU) External pin interrupts function.
	IOPORT Driver for the I/O Ports.
	IWDT Driver for the Independent Watchdog Timer (IWDT).
	JPEG CODEC Driver for the JPEG CODEC.
	JPEG ENCODE Driver for the JPEG CODEC.
	Key Interrupts Driver for the Key Interrupt Function.
	LPMV2 S124 Driver for Low Power Modes.

	LPMV2 S128 Driver for Low Power Modes.
	LPMV2 S1JA Driver for Low Power Modes.
	LPMV2 S3A1 Driver for Low Power Modes.
	LPMV2 S3A3 Driver for Low Power Modes.
	LPMV2 S3A6 Driver for Low Power Modes.
	LPMV2 S3A7 Driver for Low Power Modes.
	LPMV2 S5D3 Driver for Low Power Modes.
	LPMV2 S5D5 Driver for Low Power Modes.
	LPMV2 S5D9 Driver for Low Power Modes.
	LPMV2 S7G2 Driver for Low Power Modes.
	LVD Driver for Low Voltage Detection.
	Operational Amplifier (OPAMP)

	Driver for the Operational Amplifier (OPAMP).
	PDC Driver for the Parallel Data Capture Unit (PDC).
	PTP Driver for the Precision time protocol(PTP).
	PTPEDMAC DMA controller for PTP driver.
	QSPI Driver for the Quad Serial Peripheral Interface (QSPI).
	IIC Driver for the I2C Bus Interface (IIC).
	IIC Slave Driver for the I2C Bus Slave Interface (IIC Slave).
	SPI Driver for the Serial Peripheral Interface (SPI).
	RTC Driver for the Realtime Clock (RTC).
	Simple I2C on SCI Driver for the Simple IIC on SCI.
	Simple SPI on SCI Driver for the Simple SPI on SCI.
	UART on SCI Driver for the UART on SCI.

	Sigma Delta ADC (SDADC) Driver for the 24-bit Sigma Delta A/D Converter (SDADC).
	SDMMC Driver for the SD/MMC Host Interface (SDHI).
	SLCDC Driver for the Segment LCD Controller (SLCDC).
	SSI Driver for the Serial Sound Interface (SSI).
	WDT Driver for the Watchdog Timer (WDT).
	SCE Module Primitive cryptographic functions.

Detailed Description

The hardware abstraction layer provides drivers for Renesas peripherals. HAL drivers typically implement Interfaces and provide additional hardware specific APIs.

Detailed Description

Driver for the High-Speed Analog Comparator.

Summary

Extends COMPARATOR Interface.

This module implements the COMPARATOR Interface using the high-speed analog comparator.

Function Documentation

◆ R_ACMPHS_Close()

ssp_err_t R_ACMPHS_Close (comparator_ctrl_t * *p_api_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

Return values

SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

Mark driver as closed

Disable interrupts.

Stop the comparator and disable output to VCOUT.

Enter the module-stop state.

Release the hardware lock

◆ R_ACMPHS_InfoGet()

ssp_err_t R_ACMPHS_InfoGet (comparator_ctrl_t *const *p_api_ctrl*, comparator_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

Return values

SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

Get the base stabilization time.

Add 4 filter clocks if the filter is enabled.

◆ R_ACMPHS_Open()

ssp_err_t R_ACMPHS_Open (comparator_ctrl_t *const *p_api_ctrl*, comparator_cfg_t const *const *p_cfg*)

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

Return values

SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	An input pointer is NULL
SSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
SSP_ERR_IN_USE	The control block is already open or the hardware lock is taken.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Verify the control block has not already been initialized.

Configure interrupt priority. The interrupt is disabled until comparator_api_t::outputEnable() is called.

Enable clocks to the ACMPHS hardware.

Set registers controlled by this driver to their default values.

Configure the output polarity.

Configure the trigger edge.

Configure the hardware debounce filter.

Enable the comparator.

◆ R_ACMPHS_OutputEnable()

ssp_err_t R_ACMPHS_OutputEnable (comparator_ctrl_t *const *p_api_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

Return values

SSP_SUCCESS	Comparator output is enabled.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Enable the ACMPHS output.

Set the VCOUT output setting for this channel (enabled or disabled).

Enable interrupts for this channel.

◆ R_ACMPHS_StatusGet()

ssp_err_t R_ACMPHS_StatusGet (comparator_ctrl_t *const *p_api_ctrl*, comparator_status_t *const *p_status*)

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

Return values

SSP_SUCCESS	Operating status of the comparator is provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_TIMEOUT	The debounce filter is off and 2 consecutive matching values were not read within 1024 attempts.

Read the operating status of the comparator.

◆ R_ACMPHS_VersionGet()

ssp_err_t R_ACMPHS_VersionGet (ssp_version_t *const *p_version*)
Gets the API and code version. Implements comparator_api_t::versionGet().

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

acmphs_instance_ctrl_t Struct Reference

Detailed Description

Driver for the Low Power Analog Comparator.

Summary

Extends COMPARATOR Interface.

This module implements the COMPARATOR Interface using the low power analog comparator.

Function Documentation

◆ R_ACMPLP_Close()

ssp_err_t R_ACMPLP_Close (comparator_ctrl_t * *p_api_ctrl*)

Stops the comparator. Implements comparator_api_t::close().

Return values

SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

Mark driver as closed

Disable interrupts.

Stop the comparator and disable output to VCOUT.

Enter the module-stop state.

Release the hardware lock

◆ R_ACMPLP_InfoGet()

ssp_err_t R_ACMPLP_InfoGet (comparator_ctrl_t *const *p_api_ctrl*, comparator_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements comparator_api_t::infoGet().

Return values

SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

◆ R_ACMPLP_Open()

ssp_err_t R_ACMPLP_Open (comparator_ctrl_t *const *p_api_ctrl*, comparator_cfg_t const *const *p_cfg*)

Configures the comparator and starts operation. Callbacks and pin output are not active until outputEnable() is called. comparator_api_t::outputEnable() should be called after the output has stabilized. Implements comparator_api_t::open().

Comparator inputs must be configured in the application code prior to calling this function.

Return values

SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	An input pointer is NULL
SSP_ERR_INVALID_ARGUMENT	An argument is invalid. Window mode (COMPARATOR_MODE_WINDOW) and filter of 1 (COMPARATOR_FILTER_1) are not supported in this implementation.
SSP_ERR_IN_USE	The control block is already open or the hardware lock is taken.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Verify the control block has not already been initialized.

Configure interrupt priority. The interrupt is disabled until comparator_api_t::outputEnable() is called.

Enable clocks to the ACMPLP hardware.

Set registers controlled by this channel to their default values.

Set the mode.

Configure the output polarity.

Configure the trigger edge.

Configure the hardware debounce filter.

Enable the comparator.

◆ R_ACMPLP_OutputEnable()

ssp_err_t R_ACMPLP_OutputEnable (comparator_ctrl_t *const *p_api_ctrl*)

Enables the comparator output, which can be polled using comparator_api_t::statusGet(). Also enables pin output and interrupts as configured during comparator_api_t::open(). Implements comparator_api_t::outputEnable().

Return values

SSP_SUCCESS	Comparator output is enabled.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Set the VCOUT output setting for this channel (enabled or disabled).

Enable interrupts for this channel.

◆ R_ACMPLP_StatusGet()

ssp_err_t R_ACMPLP_StatusGet (comparator_ctrl_t *const *p_api_ctrl*, comparator_status_t *const *p_status*)

Provides the operating status of the comparator. Implements comparator_api_t::statusGet().

Return values

SSP_SUCCESS	Operating status of the comparator is provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Read the operating status of the comparator.

◆ R_ACMPLP_VersionGet()

ssp_err_t R_ACMPLP_VersionGet (ssp_version_t *const *p_version*)

Gets the API and code version. Implements comparator_api_t::versionGet().

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

acmplp_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Low Power Analog Comparator

#include <r_acmplp.h>

Detailed Description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs in comparator_api_t::open.

The documentation for this struct was generated from the following file:

- r_acmplp.h

5.1.5.3 ADC

Renesas Synergy Software Package Reference » HAL Layer

Driver for the 14-Bit A/D Converter (ADC14) and 12-bit A/D Converter (ADC12). More...

Data Structures

struct	adc_instance_ctrl_t

Macros

#define	ADC_CODE_VERSION_MAJOR (2U)
#define	ADC_SAMPLE_STATE_COUNT_MIN (7U)
#define	ADC_SAMPLE_STATE_HOLD_COUNT_MIN (4U)
#define	ADC_SAMPLE_STATE_HOLD_COUNT_DEFAULT (24U)
#define	ADC_MASK_CHANNEL_0 (1U<<0U)
#define	ADC_SAMPLE_HOLD_CHANNELS (0x07U)

Functions

ssp_err_t	R_ADC_Open (adc_ctrl_t *p_api_ctrl, adc_cfg_t const *const p_cfg) The Open function applies power to the A/D peripheral, sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt priority is

	non-zero in BSP_IRQ_Cfg.h, the function takes a callback function pointer for notifying the user at interrupt level whenever a scan has completed. On MCUs where calibration is possible, this function will only return after calibration is completed if enabled in the user configuration. The calibration times vary depending on PCLKB and ADCLK. More...
ssp_err_t	R_ADC_SetSampleStateCount (adc_ctrl_t *p_api_ctrl, adc_sample_state_t *p_sample) Set the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of Reset. More...
ssp_err_t	R_ADC_ScanConfigure (adc_ctrl_t *p_api_ctrl, adc_channel_cfg_t const *const p_channel_cfg) Configure the ADC scan parameters. Channel specific settings are set in this function. More...
ssp_err_t	R_ADC_InfoGet (adc_ctrl_t *p_api_ctrl, adc_info_t *p_adc_info) This function returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned. This function retrieves the temperature sensor slope. It also returns the calibration data for the sensor if available on this MCU otherwise an invalid calibration data of 0xFFFFFFFF will be returned. More...
ssp_err_t	R_ADC_ScanStart (adc_ctrl_t *p_api_ctrl) This function starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the Open() call. If the Unit was configured for hardware triggering, then this function simply allows the trigger signal (hardware or software) to get to the ADC Unit. The function is not able to control the generation of the trigger itself. If the Unit was configured for software triggering, then this function starts the software triggered scan. More...
ssp_err_t	R_ADC_ScanStop (adc_ctrl_t *p_api_ctrl) This function stops the software scan or disables the Unit from being triggered by the hardware trigger (internal or external) based on what type of trigger the unit was configured for in the Open() function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan. More...

ssp_err_t	R_ADC_CheckScanDone (adc_ctrl_t *p_api_ctrl) This function returns the status of any scan process that was started. On supported MCUs, the status of the ADC calibration is returned. More...
ssp_err_t	R_ADC_Read (adc_ctrl_t *p_api_ctrl, adc_register_t const reg_id, adc_data_size_t *const p_data) This function reads conversion results from a single channel or sensor register. More...
ssp_err_t	R_ADC_Read32 (adc_ctrl_t *p_api_ctrl, adc_register_t const reg_id, uint32_t *const p_data) This function reads conversion results from a single channel or sensor register into a 32-bit result. More...
ssp_err_t	R_ADC_Close (adc_ctrl_t *p_api_ctrl) This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral. More...
ssp_err_t	R_ADC_VersionGet (ssp_version_t *const p_version) Retrieve the API version number. More...
ssp_err_t	R_ADC_Calibrate (adc_ctrl_t *const p_api_ctrl, void *const p_extend) This function initiates calibration of the ADC on supported MCUs. Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. If ADC interrupts are enabled, a notification is provided via callback when calibration is complete. Otherwise, if the ADC interrupts are disabled then no notification will be provided and the application must check calibration status using infoGet() to determine if the calibration is complete before using the ADC API.Interrupts are enabled in adc_api_t::scanStatusGet(). More...
ssp_err_t	R_ADC_OffsetSet (adc_ctrl_t *const p_api_ctrl, adc_register_t const reg_id, int32_t offset)

Detailed Description

Driver for the 14-Bit A/D Converter (ADC14) and 12-bit A/D Converter (ADC12).

This module supports the ADC14 and ADC12 peripherals. It implements the following interfaces:

- ADC Interface

Macro Definition Documentation

◆ ADC_CODE_VERSION_MAJOR

#define ADC_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ ADC_MASK_CHANNEL_0

#define ADC_MASK_CHANNEL_0 (1U<<0U)
For ADC Scan configuration adc_channel_cfg_t::scan_mask, scan_mask_group_b, add_mask and sample_hold_mask Use bitwise OR to combine these masks for desired channels and sensors.

◆ ADC_SAMPLE_HOLD_CHANNELS

#define ADC_SAMPLE_HOLD_CHANNELS (0x07U)
Sample and hold Channel mask. Sample and hold is only available for channel 0,1,2

◆ ADC_SAMPLE_STATE_COUNT_MIN

#define ADC_SAMPLE_STATE_COUNT_MIN (7U)
Typical values that can be used to modify the sample states. The minimum sample state count value is either 6 or 7 depending on the clock ratios. It is fixed to 7 based on the fact that at the lowest ADC conversion clock supported (1 MHz) this extra state will lead to at worst a "1 microsecond" increase in conversion time. At 60 MHz the extra sample state will add 16.7 ns to the conversion time.

◆ ADC_SAMPLE_STATE_HOLD_COUNT_DEFAULT

#define ADC_SAMPLE_STATE_HOLD_COUNT_DEFAULT (24U)
Default sample and hold states

◆ ADC_SAMPLE_STATE_HOLD_COUNT_MIN

#define ADC_SAMPLE_STATE_HOLD_COUNT_MIN (4U)
Typical values that can be used for the sample and hold counts for the channels 0-2 Minimum sample and hold states

Function Documentation

◆ R_ADC_Calibrate()

ssp_err_t R_ADC_Calibrate (adc_ctrl_t *const *p_api_ctrl*, void *const *p_extend*)

This function initiates calibration of the ADC on supported MCUs. Calibration will take a minimum of 24 milliseconds at 32 MHz PCLKB and ADCLK. If ADC interrupts are enabled, a notification is provided via callback when calibration is complete. Otherwise, if the ADC interrupts are disabled then no notification will be provided and the application must check calibration status using infoGet() to determine if the calibration is complete before using the ADC API.Interrupts are enabled in adc_api_t::scanStatusGet().

Parameters

[in]	p_api_ctrl	Pointer to control handle structure
[in]	p_extend	Unused argument. Pass NULL.

Return values

SSP_SUCCESS	Calibration successfully initiated.
SSP_ERR_INVALID_HW_CONDITION	Hardware is in invalid state to perform calibration due to ongoing scan or scan trigger is enabled.
SSP_ERR_UNSUPPORTED	Calibration not supported on this MCU.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.

Perform parameter checking

ADC Calibration can only happen if there is no ongoing scan and if the scan trigger is disabled

Set the normal mode interrupt request to occur when calibration is complete

Initiate calibration

Return the unsupported error.

◆ R_ADC_CheckScanDone()

ssp_err_t R_ADC_CheckScanDone (adc_ctrl_t * *p_api_ctrl*)

This function returns the status of any scan process that was started. On supported MCUs, the status of the ADC calibration is returned.

Return values

SSP_SUCCESS	Successful; the scan is complete.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_IN_USE	Running scan or calibration is still in progress.

Note

If the peripheral was configured in single scan mode, then the return value of this function is an indication of the scan status. However, if the peripheral was configured in group mode, then the return value of this function could be an indication of either the group A or group B scan state. This is because the ADST bit is set when a scan is ongoing and cleared when the scan is done. This function should normally only be used when using software trigger in single scan mode.

Perform parameter checking

Ensure ADC Unit is already open

Read status of ADC calibration and return busy status if calibration is ongoing

Read the status of the ADST bit

Return the error code

◆ R_ADC_Close()

ssp_err_t R_ADC_Close (adc_ctrl_t * *p_api_ctrl*)

This function ends any scan in progress, disables interrupts, and removes power to the A/D peripheral.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.

Perform parameter checking

Verify that the ADC is already open

Mark driver as closed

Perform hardware stop for the specific unit

Release the lock

Return the error code

◆ R_ADC_InfoGet()

ssp_err_t R_ADC_InfoGet (adc_ctrl_t * *p_api_ctrl*, adc_info_t * *p_adc_info*)

This function returns the address of the lowest number configured channel and the total number of bytes to be read in order to read the results of the configured channels and return the ELC Event name. If no channels are configured, then a length of 0 is returned. This function retrieves the temperature sensor slope. It also returns the calibration data for the sensor if available on this MCU otherwise an invalid calibration data of 0xFFFFFFFF will be returned.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::eventInfoGet

Note

: Currently this function call does not support Group Mode operation.

Verify the parameters are valid

Return an error if the parameter check failed

Get a pointer to the base register for the current unit

Retrieve the scan mask of active channels from the control structure

If at least one channel is configured, determine the highest and lowest configured channels

Determine the lowest channel that is configured

Determine the highest channel that is configured

Determine the size of data that must be read to read all the channels between and including the highest and lowest channels.

If no channels are configured, set the return length 0

Specify the peripheral name in the ELC list

Verify the return value from fmi event information

Set Temp Sensor calibration data to invalid value

If calibration register is available, retrieve it from the MCU

Provide the previously retrieved slope information

◆ R_ADC_OffsetSet()

ssp_err_t R_ADC_OffsetSet (adc_ctrl_t *const *p_api_ctrl*, adc_register_t const *reg_id*, int32_t *offset*)
adc_api_t::offsetSet is not supported on the ADC. Return the unsupported error.

◆ R_ADC_Open()

ssp_err_t R_ADC_Open (adc_ctrl_t * *p_api_ctrl*, adc_cfg_t const *const *p_cfg*)
The Open function applies power to the A/D peripheral, sets the operational mode, trigger sources, interrupt priority, and configurations for the peripheral as a whole. If interrupt priority is non-zero in BSP_IRQ_Cfg.h, the function takes a callback function pointer for notifying the user at interrupt level whenever a scan has completed. On MCUs where calibration is possible, this function will only return after calibration is completed if enabled in the user configuration. The calibration times vary depending on PCLKB and ADCLK.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_cfg is NULL.
SSP_ERR_INVALID_ARGUMENT	Mode or element of p_cfg structure has invalid value or is illegal based on mode.
SSP_ERR_IN_USE	Calibration timed out.

Perform parameter checking

Verify this unit has not already been initialized

Set all p_ctrl fields prior to using it in any functions

Save callback function pointer

Store the Unit number into the control structure

Store the user context into the control structure

Store the mode into the control structure

Store the alignment into the control structure

Save the regular mode/Group A trigger in the internal control block

Save the context

Store the voltage reference into the control structure

Store the over_current into the control structure

pga0 setting

pga1 setting

pga2 setting

Confirm the requested unit exists on this MCU and record available channels.

Lock specified ADC channel

Retrieve temperature sensor information into control block

Set ADC and Temperature sensors to a stop state

Initialize the hardware based on the configuration

Set ADC and Temperature sensors to a stop state

Configure PGA for the supported MCU's

Invalid scan mask (initialized for later).

Mark driver as opened by initializing it to "RADC" in its ASCII equivalent for this unit.

Return the error code

◆ R_ADC_Read()

ssp_err_t R_ADC_Read (adc_ctrl_t * *p_api_ctrl*, adc_register_t const *reg_id*, adc_data_size_t *const *p_data*)

This function reads conversion results from a single channel or sensor register.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

Perform parameter checking

Verify that the ADC is already open

Get pointer to appropriate base address. This is repeated here in case parameter checking is disabled.

Read the data from the requested ADC conversion register and return it

Return the error code

◆ R_ADC_Read32()

ssp_err_t R_ADC_Read32 (adc_ctrl_t * *p_api_ctrl*, adc_register_t const *reg_id*, uint32_t *const *p_data*)

This function reads conversion results from a single channel or sensor register into a 32-bit result.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_INVALID_POINTER	The parameter p_data is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

Read the 16-bit result.

Left shift the result into the upper 16 bits if the unit is configured for left alignment.

◆ R_ADC_ScanConfigure()

ssp_err_t R_ADC_ScanConfigure (adc_ctrl_t * *p_api_ctrl*, adc_channel_cfg_t const *const *p_channel_cfg*)

Configure the ADC scan parameters. Channel specific settings are set in this function.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_channel_cfg is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

Note

If the Group Mode Priority configuration is set to ADC_GROUP_A_GROUP_B_CONTINUOUS_SCAN, then since Group B will be scanning continuously, Group B Interrupts are disabled and the application will not receive a callback for Group B scan completion even if a callback is provided. The application will still receive a callback for Group A scan completion if a callback is provided.
If the ADC conversion clock is faster than 50 MHz, the Temperature and Voltage sensor will not be accurate across the operating temperature range, so an error is returned.

Perform parameter checking

Ensure ADC Unit is already open

Configure the hardware based on the configuration

Save the scan mask locally; this is required for the infoGet function

Return the error code

◆ R_ADC_ScanStart()

ssp_err_t R_ADC_ScanStart (adc_ctrl_t * *p_api_ctrl*)

This function starts a software scan or enables the hardware trigger for a scan depending on how the triggers were configured in the Open() call. If the Unit was configured for hardware triggering, then this function simply allows the trigger signal (hardware or software) to get to the ADC Unit. The function is not able to control the generation of the trigger itself. If the Unit was configured for software triggering, then this function starts the software triggered scan.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_IN_USE	Running scan is still in progress

Perform parameter checking

Ensure ADC Unit is already open

If the the normal/GroupA trigger is not set to software, then that the Unit is configured for hardware triggering

Otherwise, enable software triggering

Check to see if there is an ongoing scan else start the scan

Return the error code

◆ R_ADC_ScanStop()

ssp_err_t R_ADC_ScanStop (adc_ctrl_t * *p_api_ctrl*)

This function stops the software scan or disables the Unit from being triggered by the hardware trigger (internal or external) based on what type of trigger the unit was configured for in the Open() function. Stopping a hardware triggered scan via this function does not abort an ongoing scan, but prevents the next scan from occurring. Stopping a software triggered scan aborts an ongoing scan.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.

Note

Stopping a software scan results in immediate stoppage of the scan irrespective of current state of of the scan. Stopping the hardware scan results in disabling the trigger to prevent future scans from starting but does not affect the current scan.

Perform parameter checking

Ensure ADC Unit is already open

If the trigger is not software scan, then disallow hardware triggering

Otherwise, disable software triggering

Return the error code

◆ R_ADC_SetSampleStateCount()

ssp_err_t R_ADC_SetSampleStateCount (adc_ctrl_t * *p_api_ctrl*, adc_sample_state_t * *p_sample*)

Set the sample state count for individual channels. This only needs to be set for special use cases. Normally, use the default values out of Reset.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_sample is NULL.
SSP_ERR_NOT_OPEN	Unit is not open.
SSP_ERR_INVALID_ARGUMENT	Parameter has invalid value.

Perform parameter checking

Ensure ADC Unit is already open

Set the sample state count for the specified register

Return the error code

◆ R_ADC_VersionGet()

ssp_err_t R_ADC_VersionGet (ssp_version_t *const *p_version*)
Retrieve the API version number. **Return values** SSP_SUCCESS — Successful return. SSP_ERR_ASSERTION — The parameter p_version is NULL. Return the version number

adc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » ADC

#include <r_adc.h>

Data Fields

uint16_t	unit ADC Unit in use.
int16_t	slope_microvolts Temperature sensor slope in microvolts/°C.
adc_mode_t	mode operational mode
adc_alignment_t	alignment alignment
uint8_t	max_resolution ADC max resolution: 8, 10, 12, or 14-bit.
uint8_t	pga_available PGA available or not on MCU.

uint8_t	tsn_ctrl_available Availability of TSN control register.
uint8_t	tsn_calib_available Availability of TSn calibration register.
uint8_t	adc_calib_available Availability of ADC calibration feature.
R_TSN_Control_Type *	p_tsn_ctrl_regs Pointer to temperature control register.
R_TSN_Calibration_Type *	p_tsn_calib_regs Pointer to temperature calibration register.
void const *	p_context Placeholder for user data.
void *	p_reg Base register for this unit.
void(*	callback)(adc_callback_args_t *p_args) User callback pointer.
adc_trigger_t	trigger Trigger defined for normal mode.
uint32_t	opened Boolean to verify that the Unit has been initialized.
uint32_t	scan_mask Scan mask used for Normal scan.

IRQn_Type	scan_end_irq Scan end IRQ number.
IRQn_Type	scan_end_b_irq Scan end group B IRQ number.
adc_voltage_reference_t	voltage_ref ADC reference voltage selection. Default is VREF.
adc_over_current_t	over_current ADC reference voltage selection. Default is Over current.
adc_pga_t	pga0 PGA0 setting.
adc_pga_t	pga1 PGA1 setting.
adc_pga_t	pga2 PGA2 setting.

Detailed Description

ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().

The documentation for this struct was generated from the following file:

ssp_err_t	R_AGT_VersionGet (ssp_version_t *const p_version)

Detailed Description

Driver for the Asynchronous General Purpose Timer (AGT).

Summary

Extends Timer Interface.

HAL High-Level Driver for accessing and configuring AGT timer modes.

The AGT timer functions are used by the Timer to provide timer services.

Enumeration Type Documentation

◆ agt_count_source_t

enum agt_count_source_t	
Count source	
Enumerator	
AGT_CLOCK_PCLKB	Counter clock source is PCLKB when AGT_CLOCK_PCLKB, AGT_CLOCK_PCLKB_DIV_2, or AGT_CLOCK_PCLKB_DIV_8 is selected. The PCLKB divisor is selected automatically at runtime to the optimal value of PCLKB/1, PCLKB/2, or PCLKB/8. If the timer_cfg_t::unit is TIMER_UNIT_PERIOD_RAW_COUNTS, the timer_cfg_t::period should be the desired value in PCLKB counts, even if the value would exceed 16 bits. For example, if a period of 0x30000 counts is requested, a divisor of PCLKB/8 is be selected and the counter underflows after 0x6000 counts.
AGT_CLOCK_PCLKB_DIV_8	Superseded: See AGT_CLOCK_PCLKB.
AGT_CLOCK_PCLKB_DIV_2	Superseded: See AGT_CLOCK_PCLKB.
AGT_CLOCK_LOCO	Divided clock LOCO specified y bits CKS[2:0] in the AGTMR2 register.
AGT_CLOCK_AGT0_UNDERFLOW	Underflow event signal from AGT0.
AGT_CLOCK_FSUB	Divided clock fSUB specified by bits CKS[2:0] in the AGTMR2 register.

Function Documentation

◆ R_AGT_Close()

ssp_err_t R_AGT_Close (timer_ctrl_t *const *p_api_ctrl*)

Stops counter, disables interrupts, disables output pins, and clears internal driver data. Implements timer_api_t::close.

Return values

SSP_SUCCESS	The AGT Timer channel is successfully closed.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The AGT channel is not opened.

Cleanup the device: Stop counter, disable interrupts, and power down if no other channels are in use.

Clear the TOE (output enable) bit

Clear the TEDGSEL bit

Unlock channel

◆ R_AGT_CounterGet()

ssp_err_t R_AGT_CounterGet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t *const *p_value*)

Retrieve and store counter value in provided p_value pointer. Implements timer_api_t::counterGet.

Return values

SSP_SUCCESS	Counter value read, p_value is valid.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null
SSP_ERR_NOT_OPEN	The channel is not opened.

Read counter value

Increment retrieved counter value by one, as counter counts till zero

◆ R_AGT_DutyCycleSet()

ssp_err_t R_AGT_DutyCycleSet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t const *duty_cycle*, timer_pwm_unit_t const *unit*, uint8_t const *pin*)

Setting duty cycle is not supported by this driver. Implements timer_api_t::dutyCycleSet.

Return values

SSP_SUCCESS	Once duty cycle set successfully.
SSP_ERR_INVALID_ARGUMENT	If any of the argument is invalid
SSP_ERR_NOT_OPEN	The channel is not opened.

Set duty cycle.

◆ R_AGT_InfoGet()

ssp_err_t R_AGT_InfoGet (timer_ctrl_t *const *p_api_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Return values

SSP_SUCCESS	Period, status, count direction, frequency value written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_period_counts parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INVALID_HW_CONDITION	Invalid hardware setting is detected.

Get and store period

Get and store clock frequency

AGT supports only counting down direction

◆ R_AGT_PeriodSet()

ssp_err_t R_AGT_PeriodSet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t const *period*, timer_unit_t const *unit*)

Sets period value provided. Implements timer_api_t::periodSet.

Return values

SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARG	One of the following is invalid: • p_period->unit: must be one of the options from timer_size_t::unit • p_period->value: must result in a period supported by the clock source specified during the Open call.
SSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- fmi_api_t::productFeatureGet
- cgc_api_t::systemClockFreqGet

Make sure period is valid, then set period

◆ R_AGT_Reset()

ssp_err_t R_AGT_Reset (timer_ctrl_t *const *p_api_ctrl*)

Resets the counter value to the period that was originally set. Implements timer_api_t::reset.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Save running status for restart, if already running.

Set AGT counter for given period value.

Restart the AGT channel if it was running.

◆ R_AGT_Start()

ssp_err_t R_AGT_Start (timer_ctrl_t *const *p_api_ctrl*)

Starts timer. Implements timer_api_t::start.

Return values

SSP_SUCCESS	Timer successfully started.
SSP_ERR_ASSERTION	The p_ctrl parameter is null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Start timer

◆ R_AGT_Stop()

ssp_err_t R_AGT_Stop (timer_ctrl_t *const *p_api_ctrl*)

Stops the AGT channel specified by the handle (control block). This API implements timer_api_t::stop. This API does not reset the channel or power it down.

Return values

SSP_SUCCESS	Timer successfully stopped.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

◆ R_AGT_TimerOpen()

ssp_err_t R_AGT_TimerOpen (timer_ctrl_t *const *p_api_ctrl*, timer_cfg_t const *const *p_cfg*)

Open the AGT channel as a timer, handles required initialization described in hardware manual. Implements timer_api_t::open.

The Timer Open function configures a single AGT channel for timer mode with parameters specified in the timer Configuration structure. It also sets up the control block for use with subsequent AGT Timer APIs.

This function must be called once prior to calling any other AGT API functions. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

The AGT hardware does not support one-shot functionality natively. The one-shot feature is therefore implemented in the AGT HAL layer. For a timer configured as a one-shot timer, the timer is stopped upon the first timer expiration.

The AGT implementation of the general timer can accept an optional timer_on_agt_cfg_t extension parameter. For AGT, the extension specifies the clock to be used as timer source and the output pin configurations. If the extension parameter is not specified (NULL), the default clock PCLKB is

used and the output pins are disabled.

The clock divider is selected based on the source clock frequency and the timer period supplied by the caller.

Return values

SSP_SUCCESS	Initialization was successful and timer has started.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, p_ctrl, or the configuration channel ID exceeds AGT_MAX_CH, or the configuration mode is invalid.
SSP_ERR_IN_USE	The channel specified has already been opened.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt has not been enabled in the BSP.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- cgc_api_t::systemClockFreqGet
- cgc_api_t::clockCheck

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Check agt count source to throw an error.

Verify channel is not already used

Power on the AGT channel.

Wait for counter to stop.

Clear AGTO output

Clear TEDGSEL bit to normal output.

Set the AGT mode based on agt_mode value.

Make sure period is valid, then set period

Start the timer if requested by user

All done.

◆ R_AGT_VersionGet()

ssp_err_t R_AGT_VersionGet (ssp_version_t *const *p_version*)
Sets driver version based on compile time macros. Implements timer_api_t::versionGet. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — The parameter p_version is NULL.

agt_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » AGT

#include <r_agt.h>

Data Fields

void(*	p_callback)(timer_callback_args_t *p_args)
void const *	p_context
void *	p_reg Base register for this channel.
uint32_t	open Whether or not channel is open.
uint16_t	period Current timer period (counts)
uint8_t	channel Channel number.
IRQn_Type	irq Counter overflow IRQ number.

timer_mode_t	mode Timer mode.

Detailed Description

Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

Field Documentation

◆ p_callback

void(* agt_instance_ctrl_t::p_callback) (timer_callback_args_t *p_args)
Callback provided when a timer ISR occurs. NULL indicates no CPU interrupt.

◆ p_context

void const* agt_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in timer_callback_args_t.

The documentation for this struct was generated from the following file:

- r_agt.h

timer_on_agt_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » AGT

#include <r_agt.h>

Data Fields

agt_count_source_t	count_source AGT channel clock source. Valid values are: AGT_CLOCK_PCLKB, AGT_CLOCK_LOCO, AGT_CLOCK_FSUB.
bool	agto_output_enabled AGTO pin is enabled for output compare (true, false)

bool	agtio_output_enabled AGTIO pin is enabled for output compare (true, false)
bool	output_inverted Output inverted (true, false)
bool	agtoa_output_enable Enable comparator A output pin (true, false)
bool	agtob_output_enable Enable comparator B output pin (true, false)

Detailed Description

Optional AGT extension data structure.

Detailed Description

Driver for the Asynchronous General-Purpose Timer (AGT) with Input Capture.

Summary

Extends Input Capture Interface.

This module implements the Input Capture Interface for the Asynchronous General-Purpose Timer (AGT) peripherals.

Enumeration Type Documentation

◆ agt_input_capture_clock_divider_t

enum agt_input_capture_clock_divider_t	
AGT Input capture AGT LOCO or AGT FSUB divider.	
Enumerator	
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_1	/ 1
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_2	/ 2
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_4	/ 4
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_8	/ 8
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_16	/ 16
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_32	/ 32
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_64	/ 64
AGT_INPUT_CAPTURE_CLOCK_DIVIDER_128	/ 128

◆ agt_input_capture_count_edges_t

enum agt_input_capture_count_edges_t	
AGT Input capture signal edge polarity for event counter mode	
Enumerator	
INPUT_CAPTURE_SIGNAL_SINGLE_EDGE	Counts only one edge of the pulse.
INPUT_CAPTURE_SIGNAL_BOTH_EDGE	Counts both edges of the pulse.

◆ agt_input_capture_count_source_t

enum agt_input_capture_count_source_t	
Count source	
Enumerator	
AGT_INPUT_CAPTURE_CLOCK_PCLKB	Clock AGT_CLOCK_PCLKB.
AGT_INPUT_CAPTURE_CLOCK_PCLKB_DIV_8	Superseded: See AGT_CLOCK_PCLKB.
AGT_INPUT_CAPTURE_CLOCK_PCLKB_DIV_2	Superseded: See AGT_CLOCK_PCLKB.
AGT_INPUT_CAPTURE_CLOCK_LOCO	Divided clock LOCO specified by bits CKS[2:0] in the AGTMR2 register.
AGT_CLOCK_INPUT_CAPTURE_FSUB	Divided clock fSUB specified by bits CKS[2:0] in the AGTMR2 register.

◆ agt_input_capture_event_flag_t

enum agt_input_capture_event_flag_t	
AGT Input capture Event flags.	
Enumerator	
AGT_INPUT_CAPTURE_ACTIVE_EDGE_FLAG	Measurement event flag.
AGT_INPUT_CAPTURE_UNDERFLOW_FLAG	Underflow event flag.
AGT_INPUT_CAPTURE_COMPARE_A_FLAG	Compare match A event flag.
AGT_INPUT_CAPTURE_COMPARE_B_FLAG	Compare match B event flag.

◆ agt_input_capture_mode_t

enum agt_input_capture_mode_t	
AGT Input capture modes.	
Enumerator	
AGT_INPUT_CAPTURE_MODE_PULSE_WIDTH	Measure a signal pulse width.
AGT_INPUT_CAPTURE_MODE_PERIOD	Measure a signal cycle period.
AGT_INPUT_CAPTURE_MODE_PULSE_COUNT	Measure a signal event count.

◆ agt_input_capture_pin_select_t

enum agt_input_capture_pin_select_t	
AGT Input capture AGTIO Pin Select.	
Enumerator	
AGT_INPUT_CAPTURE_PIN_AGTIO_A	Selects the pin AGTIO_A for input capture.
AGT_INPUT_CAPTURE_PIN_AGTIO_B	Selects the pin AGTIO_B for input capture.
AGT_INPUT_CAPTURE_PIN_AGTIO_C	Selects the pin AGTIO_C for input capture.

◆ agt_input_capture_signal_filter_t

enum agt_input_capture_signal_filter_t	
Input capture signal noise filter (debounce) setting. Only available for input signals in AGTIO pins. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, AGT section.	
Enumerator	
AGT_INPUT_CAPTURE_SIGNAL_FILTER_NONE	NO FILTER.
AGT_INPUT_CAPTURE_SIGNAL_FILTER_1	PCLK/1.
AGT_INPUT_CAPTURE_SIGNAL_FILTER_8	PCLK/8.
AGT_INPUT_CAPTURE_SIGNAL_FILTER_32	PCLK/32.

Function Documentation

◆ R_AGT_InputCaptureClose()

ssp_err_t R_AGT_InputCaptureClose (input_capture_ctrl_t *const *p_api_ctrl*)

Close a AGT Timer Channel for Input Capture. Implements input_capture_api_t::close.

Clears Timer settings, disables interrupts, and clears internal driver data.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

Cleanup. Disable interrupts and stop measurements.

Unlock channel

Clear stored internal driver data

◆ R_AGT_InputCaptureDisable()

ssp_err_t R_AGT_InputCaptureDisable (input_capture_ctrl_t const *const *p_api_ctrl*)

Stops the Input capture and disables its interrupts for specified channel at NVIC. Implements input_capture_api_t::disable.

Return values

SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Disable interrupts

◆ R_AGT_InputCaptureEnable()

ssp_err_t R_AGT_InputCaptureEnable (input_capture_ctrl_t const *const *p_api_ctrl*)

Enables its interrupts for specified channel at NVIC, and starts the Input capture. Implements input_capture_api_t::enable.

Return values

SSP_SUCCESS	Interrupt enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Enabling the measurement overflow and compare match interrupt.

◆ R_AGT_InputCaptureInfoGet()

ssp_err_t R_AGT_InputCaptureInfoGet (input_capture_ctrl_t const *const *p_api_ctrl*, input_capture_info_t *const *p_info*)

Gets status into provided p_info pointer. Implements input_capture_api_t::infoGet.

Return values

SSP_SUCCESS	Success.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Gets the input capture status.

◆ R_AGT_InputCaptureLastCaptureGet()

ssp_err_t R_AGT_InputCaptureLastCaptureGet (input_capture_ctrl_t const *const *p_api_ctrl*, input_capture_capture_t *const *p_capture*)

Update the last captured value and overflow count, in provided p_capture pointer. Implements input_capture_api_t::lastCaptureGet.

Return values

SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Gets the captured value

◆ R_AGT_InputCaptureOpen()

ssp_err_t R_AGT_InputCaptureOpen (input_capture_ctrl_t *const *p_api_ctrl*, input_capture_cfg_t const *const *p_cfg*)

Open an AGT Timer for Input Capture. Implements input_capture_api_t::open.

The Open function configures a single AGT channel for input capture and provides a handle for use with the other Input Capture API functions. This function must be called once prior to calling any other Input Capture API function. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the parameters is NULL: p_cfg, p_ctrl, p_extend.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Get fmi feature information for AGT.

If count source clock is not operational, return error.

Verify channel is not already used

Get fmi measurement and overflow event information for AGT.

Set measurement and overflow event interrupt priority and vector info.

Get fmi compare match event information for AGT.

Set compare match event interrupt priority and vector info.

Initialize control block.

Perform hardware initializations based on configuration.

Mark channel as open, by initializing it to R_AIC ASCII equivalent.

◆ R_AGT_InputCaptureVersionGet()

ssp_err_t R_AGT_InputCaptureVersionGet (ssp_version_t *const *p_version*)
Gets driver version based on compile time macros. Implements input_capture_api_t::versionGet. **Return values** SSP_SUCCESS — Success. SSP_ERR_ASSERTION — The parameter p_version is NULL.

agt_input_capture_extend_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » AGT Input Capture

Extension configuration struct for AGT Input Capture. More...

#include <r_agt_input_capture.h>

Data Fields

uint16_t	pulse_count_value Selects the pulse count value for pulse count capture.
agt_input_capture_signal_filter_t	signal_filter Selects the input signal filter.
agt_input_capture_count_source_t	count_source Selects the input count clock source.
agt_input_capture_clock_divider_t	clock_divider Selects the AGT LOCO or AGT FSUB divider.
agt_input_capture_count_edges_t	count_edge Selects the count edge for pulse count capture.

agt_input_capture_pin_select_t	pin_select Selects the pin for agt input capture.

Detailed Description

Extension configuration struct for AGT Input Capture.

Pointed to by input_capture_cfg_t.p_extend

The documentation for this struct was generated from the following file:

- r_agt_input_capture.h

agt_input_capture_instance_ctrl_t Struct Reference

#include <r_agt_input_capture.h>

Data Fields

uint32_t	open Whether or not channel is open.
uint8_t	channel The channel in use.
uint8_t	flags Input capture Event flags.
input_capture_mode_t	mode The mode of measurement being performed.
input_capture_repetition_t	repetition One-shot or periodic measurement.

volatile uint32_t	capture_count The value of the timer captured at the time of interrupt.
volatile uint32_t	overflows_current Running count of overflows in current measurement.
void(*	p_callback)(input_capture_callback_args_t *p_args) Pointer to user callback.
void const *	p_context Pointer to user's context data, to be passed to the callback function.
void *	p_reg AGT base register for this channel.
IRQn_Type	capture_irq Capture IRQ number.
IRQn_Type	overflow_irq Overflow IRQ number.
volatile bool	pulse_period_first_edge Whether the first edge in period has received.

Detailed Description

Channel control block. DO NOT INITIALIZE. Initialization occurs when input_capture_api_t::open is called.

The documentation for this struct was generated from the following file:

- r_agt_input_capture.h

5.1.5.6 Analog Connections

Renesas Synergy Software Package Reference » HAL Layer

Driver for internal analog connections. More...

Functions

ssp_err_t	R_ANALOG_CONNECT_Init (analog_connect_cfg_t const *const p_cfg)
ssp_err_t	R_ANALOG_CONNECT_Connect (analog_connect_t const connection)
ssp_err_t	R_ANALOG_CONNECT_ConnectMultiple (analog_connect_table_t const *const p_table)
ssp_err_t	R_ANALOG_CONNECT_VersionGet (ssp_version_t *const p_version)

Detailed Description

Driver for internal analog connections.

Summary

Extends Analog Connect Interface.

This module implements the Analog Connect Interface.

Function Documentation

◆ R_ANALOG_CONNECT_Connect()

ssp_err_t R_ANALOG_CONNECT_Connect (analog_connect_t const *connection*)

Makes an internal analog connection.

For ACMPHS connections, output and interrupts are disabled while the connection is configured, then the output and interrupts are restored to their original state. Since this function enables output if it was enabled before, R_ACMPHS_Close() should not be called during this function.

ACMPLP connections must be made prior to enabling output.

OPAMP connections can be reconfigured while the OPAMP is operating. If an OPAMP connection is already set and a new connection is made, the new connection overwrites the existing connection. OPAMP connections can be OR'd together if they are for the same signal:

- Valid example: ANALOG_CONNECT_OPAMP0_PLUS_TO_PIN_AMP0_PLUS | ANALOG_CONNECT_OPAMP0_PLUS_TO_PIN_AMP1_PLUS
  - Both start with ANALOG_CONNECT_OPAMP0_PLUS
- Invalid example: ANALOG_CONNECT_OPAMP0_PLUS_TO_PIN_AMP0_PLUS | ANALOG_CONNECT_OPAMP0_MINUS_TO_PIN_AMP0_MINUS
  - Do not mix PLUS and MINUS
- Invalid example: ANALOG_CONNECT_OPAMP0_PLUS_TO_PIN_AMP0_PLUS | ANALOG_CONNECT_OPAMP1_PLUS_TO_PIN_AMP1_PLUS
  - Do not mix channels 0 and 1

If AVCC0 < 2.7 V, MOCO must be enabled to make OPAMP connections because the internal OPAMP switches require a charge pump, and the MOCO is required for charge pump operation. When using the charge pump for the amplifier:

- Turn on no more than a total of 5 connections for OPAMP0.
- Turn on no more than a total of 5 connections for OPAMP1.
- Turn on no more than a total of 2 connections for OPAMP2.

Return values

SSP_SUCCESS	Connection made.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- fmi_api_t::productFeatureGet

◆ R_ANALOG_CONNECT_ConnectMultiple()

ssp_err_t R_ANALOG_CONNECT_ConnectMultiple (analog_connect_table_t const *const *p_table*)

Makes all connections in the table.

See R_ANALOG_CONNECT_Connect() for modules specific usage notes regarding connections.

Return values

SSP_SUCCESS	All connections made.
SSP_ERR_ASSERTION	Data table pointer is NULL or size is 0.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

◆ R_ANALOG_CONNECT_Init()

ssp_err_t R_ANALOG_CONNECT_Init (analog_connect_cfg_t const *const *p_cfg*)

Placeholder function for analog connection initialization code. Currently unused.

Return values

SSP_SUCCESS	Init successful.

◆ R_ANALOG_CONNECT_VersionGet()

ssp_err_t R_ANALOG_CONNECT_VersionGet (ssp_version_t *const *p_version*)

Gets the API and code version. Implements analog_connect_api_t::versionGet().

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

Detailed Description

Driver for the Clock Frequency Accuracy Measurement Circuit (CAC).

Summary

This module supports the CAC peripheral.

Function Documentation

◆ R_CAC_Close()

ssp_err_t R_CAC_Close (cac_ctrl_t *const *p_ctrl*)

Release any resources that were allocated by the Open() or any subsequent CAC operations. Implements r_cac_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Define a control block structure used in the API calls.
cac_ctrl_t ctrl;
err = R_CAC_Close(&ctrl);
```

Eliminate warning if parameter checking is disabled.

Disable interrupts in the peripheral and NVIC

Disable interrupts in NVIC.

Disable the CAC ints.

Stop measuring.

Power down peripheral.

Return the hardware lock for the CAC.

◆ R_CAC_Open()

ssp_err_t R_CAC_Open (cac_ctrl_t *const *p_ctrl*, cac_cfg_t const *const *p_cfg*)

Initialize the CAC peripheral.

The Open function applies power to the CAC peripheral, checks/sets the interrupt priority, and configures the CAC based on the provided user configuration settings. If a user defined callback function has been provided in the configuration, then the CAC interrupt(s) will be enabled and the user callback function called accordingly. Implements r_cac_t::open.

Return values

SSP_SUCCESS	CAC is available and available for measurement(s).
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options are invalid.
SSP_ERR_HW_LOCKED	Hardware lock for CAC peripheral is already taken.
SSP_ERR_INVALID_CAC_REF_CLOCK	Measured clock rate smaller than reference clock rate.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

There is only a single CAC peripheral. It is not reentrant.

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Define a control block structure used in the API calls.
cac_ctrl_t ctrl;
// Define a configuration structure used in the API calls.
cac_cfg_t g_cac_example_cfg;
// Init the CGC and start the HOCO and LOCO clocks.
err = R_CGC_Init();
err = R_CGC_ClockStart(CGC_CLOCK_HOCO, &clock_config);
err = R_CGC_ClockStart(CGC_CLOCK_LOCO, &clock_config);

// Specify the parameters we are using
g_cac_example_cfg.callback = NULL,
```

```
g_cac_example_cfg.p_context = 0,
g_cac_example_cfg.p_extend = NULL,
g_cac_example_cfg.continuous_mode = false,       // measurement does not continuously
restart after completing.
g_cac_example_cfg.mei_interrupt_enabled = false; // Measurement complete interrupt
disabled
g_cac_example_cfg.ovf_interrupt_enabled = false; // Overflow interrupt is disabled
g_cac_example_cfg.ferr_interrupt_enabled = false; // Frequency Error interrupt is
disabled
g_cac_example_cfg.cac_ref_clock.digfilter = CAC_REF_DIGF_OFF; // No digital filter
g_cac_example_cfg.cac_ref_clock.edge = CAC_REF_EDGE_RISE;      // Rising edge detect
g_cac_example_cfg.cac_meas_clock.clock = CAC_CLOCK_SOURCE_HOCO; // We want to measure
HOCO (24 MHz)
g_cac_example_cfg.cac_meas_clock.divider = CAC_MEAS_DIV_1;       // No divisor on the
measurement clock
g_cac_example_cfg.cac_ref_clock.clock = CAC_CLOCK_SOURCE_LOCO;   // Our reference
clock will LOCO (32.768 kHz)
g_cac_example_cfg.cac_ref_clock.divider = CAC_REF_DIV_32;       // Minimum divider is
32, so effective freq = 1024 Hz
 err = R_CAC_Open(&ctrl, &g_cac_example_cfg);
```

g_cac_version is accessed by the ASSERT macro only and so compiler toolchain can issue a warning that they are not accessed. The code below eliminates this warning and also ensures these data structures are not optimised away.

Eliminate warning if parameter checking is disabled.

Take the hardware lock for the CAC.

Setup the interrupt vectors and priorities

Return the hardware lock for the CAC.

Apply power to the peripheral

Configure the CAC per the configuration.

Store the callback and context information

Mark driver as open by initializing it to "CAC" - its ASCII equivalent.

◆ R_CAC_Read()

ssp_err_t R_CAC_Read (cac_ctrl_t *const *p_ctrl*, uint8_t *const *p_status*, uint16_t *const *p_counter*)

Read and return the CAC status and counter registers. Implements r_cac_t::read.

Return values

SSP_SUCCESS	CAC read successful.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

```
// Example code
// Create a variable for the error and storage for the CAC count and status
ssp_err_t err;
uint8_t   cac_status;
uint16_t cac_counter;
// Define a control block structure used in the API calls.
cac_ctrl_t ctrl;
err = R_CAC_Read(&ctrl, &cac_status, &cac_counter);
```

Eliminate warning if parameter checking is disabled.

◆ R_CAC_Reset()

ssp_err_t R_CAC_Reset (cac_ctrl_t *const *p_ctrl*)

Resets the Overflow, Measurement End and Frequency Error interrupt flags. This will clear any of the CASTR status bits that have been set, but only if the CFME bit is off (Not measuring). Implements r_cac_t::reset.

Return values

SSP_SUCCESS	CAC reset completed.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Define a control block structure used in the API calls.
 cac_ctrl_t ctrl;
// Start the measurement process
err = R_CAC_Reset(&ctrl);
```

Eliminate warning if parameter checking is disabled.

Reset the CAC.

◆ R_CAC_StartMeasurement()

ssp_err_t R_CAC_StartMeasurement (cac_ctrl_t *const *p_ctrl*)

Start the CAC measurement process. Implements r_cac_t::startMeasurement.

Return values

SSP_SUCCESS	CAC measurement started.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.
SSP_ERR_CLOCK_INACTIVE	Either the provided Measurement or Reference clock is not running

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- cgc_api_t::clockCheck

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Define a control block structure used in the API calls.
 cac_ctrl_t ctrl;
// Start the measurement process
err = R_CAC_StartMeasurement(&ctrl);
```

Eliminate warnings if parameter checking is disabled.

Start measuring.

◆ R_CAC_StopMeasurement()

ssp_err_t R_CAC_StopMeasurement (cac_ctrl_t *const *p_ctrl*)

Stop the CAC measurement process. Implements r_cac_t::stopMeasurement.

Return values

SSP_SUCCESS	CAC measuring has been stopped.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.
SSP_ERR_NOT_OPEN	R_CAC_Open() has not been successfully called.

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Define a control block structure used in the API calls.
 cac_ctrl_t ctrl;
// Stop the measurement process
err = R_CAC_StopMeasurement(&ctrl);
```

Eliminate warning if parameter checking is disabled.

Stop measuring.

◆ R_CAC_VersionGet()

ssp_err_t R_CAC_VersionGet (ssp_version_t *const *p_version*)
Get the API and code version information. **Return values** SSP_SUCCESS — Version info returned. ***Note*** *This function is reentrant.*

```
// Example code
// Create a variable for the error
ssp_err_t err;
// Create a variable for the version information
ssp_version_t version;
// Get the current counter value
err = R_CAC_VersionGet(&version);
```

cac_instance_ctrl_t Struct Reference

Detailed Description

Driver for CAN, Controller Area Network.

This module supports the Controller Area Network peripheral. It implements the following interfaces:

- CAN Interface

Function Documentation

◆ R_CAN_Close()

ssp_err_t R_CAN_Close (can_ctrl_t *const *p_ctrl*)

Close the CAN channel. Implements can_api_t::close()

Return values

SSP_SUCCESS	Channel closed successfully.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_ASSERTION	Null pointer presented.

Mark the channel not open so other APIs cannot use it.

Disable transmit, receive and error interrupts

Enable module stop for the CAN channel

Unlock the CAN channel

◆ R_CAN_Control()

ssp_err_t R_CAN_Control (can_ctrl_t *const *p_ctrl*, can_command_t const *command*, void * *p_data*)

CAN Control is used to control extended features. Implements can_api_t::control()

Return values

SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_INVALID_ARGUMENT	Invalid command.
SSP_ERR_ASSERTION	Null pointer presented
SSP_ERR_CAN_MODE_SWITCH_FAILED	Switching modes failed.

Verify command is CAN_COMMAND_MODE_SWITCH

Change operating mode. Returns false if invalid mode or mode switch failed.

Save mode for diagnostic purposes.

◆ R_CAN_InfoGet()

ssp_err_t R_CAN_InfoGet (can_ctrl_t *const *p_ctrl*, can_info_t *const *p_info*)

Get CAN state and status information for the channel. Implements can_api_t::infoGet()

Return values

SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_DATA_UNAVAILABLE	Channel failed to return info.
SSP_ERR_ASSERTION	Null pointer presented

Get status for channel.

Error encountered when retrieving info.

Save the operation mode

◆ R_CAN_Open()

ssp_err_t R_CAN_Open (can_ctrl_t *const *p_ctrl*, can_cfg_t const *const *p_cfg*)

Open and configure the CAN channel for operation. Implements can_api_t::open()

Return values

SSP_SUCCESS	Channel opened successfully
SSP_ERR_INVALID_ARGUMENT	Invalid channel passed as argument.
SSP_ERR_HW_LOCKED	Lock already owned by another user.
SSP_ERR_CAN_MODE_SWITCH_FAILED	Channel failed to switch modes.
SSP_ERR_CAN_INIT_FAILED	Channel failed to initialize.
SSP_ERR_ASSERTION	Null pointer presented.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- cgc_api_t::clockCheck

Check for valid parameters.

Make sure the feature exists on this MCU.

Return if failed to get feature information.

Try to get channel lock.

Return if channel is already open so return error

Enter module start state.

Disable interrupts while initializing

Initialize and configure CAN module to run.

Set channel, callback function, context, id mode, mailbox count, message mode, op mode and opened status.

If successful, Lookup and store IRQ numbers. Enable interrupts.

If successful, Mark the control block as open

If the device failed to initialize, disable interrupts, stop and unlock the hardware and mark the control block as closed.

Process errors before returning.

Log error or assertion.

◆ R_CAN_Read()

ssp_err_t R_CAN_Read (can_ctrl_t *const *p_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame*)

Read data from the CAN channel. Return up to eight bytes read from the channel mailbox. Implements can_api_t::read()

Return values

SSP_SUCCESS	Data successfully read.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_DATA_UNAVAILABLE	No data available.
SSP_ERR_CAN_TRANSMIT_MAILBOX	Mailbox is not setup for receive.
SSP_ERR_ASSERTION	Null pointer presented.

Check for receive data

Get frame data.

Check for other mailboxes in an overrun state.

Check for other mailboxes with received messages pending.

◆ R_CAN_VersionGet()

ssp_err_t R_CAN_VersionGet (ssp_version_t *const *p_version*)

Get CAN module code and API versions. Implements can_api_t::versionGet()

Return values

SSP_SUCCESS	Operation succeeded.
SSP_ERR_ASSERTION	Null pointer presented note This function is reentrant.

Return module version information.

◆ R_CAN_Write()

ssp_err_t R_CAN_Write (can_ctrl_t *const *p_ctrl*, uint32_t *mailbox*, can_frame_t *const *p_frame*)

Write data to the CAN channel. Write up to eight bytes to the channel mailbox. Implements can_api_t::write()

Return values

SSP_SUCCESS	Operation succeeded.
SSP_ERR_NOT_OPEN	Control block not open.
SSP_ERR_CAN_TRANSMIT_NOT_READY	Transmit in progress, cannot write data at this time.
SSP_ERR_CAN_RECEIVE_MAILBOX	Mailbox is setup for receive and cannot send.
SSP_ERR_INVALID_ARGUMENT	Data length or frame type invalid.
SSP_ERR_ASSERTION	Null pointer presented

Check transmit ready flag.

Transmit ready flag is not set, return error/status.

Transmit ready flag set, so clear it.

Send transmit frame.

Function Documentation

◆ R_CGC_BusClockOutCfg()

ssp_err_t R_CGC_BusClockOutCfg (cgc_bclockout_dividers_t *divider*)

Configure the secondary dividers for BCLKOUT. The primary divider is set using the bsp clock configuration and the R_CGC_SystemClockSet function.

Return values

SSP_SUCCESS	Operation performed successfully.

◆ R_CGC_BusClockOutDisable()

ssp_err_t R_CGC_BusClockOutDisable (void)

Disable the BCLKOUT output.

Return values

SSP_SUCCESS	Operation performed successfully.

◆ R_CGC_BusClockOutEnable()

ssp_err_t R_CGC_BusClockOutEnable (void)

Enable the BCLKOUT output.

Return values

SSP_SUCCESS	Operation performed successfully.

◆ r_cgc_clock_run_state_get()

bool r_cgc_clock_run_state_get (R_SYSTEM_Type * *p_system_reg*, cgc_clock_t *clock*)

This function returns the run state of the selected clock.

Parameters

[in]	clock	the clock to check
[in]	p_system_reg	pointer to system register structure
[in]	clock	- the clock to check

Return values

bool	true if clock is running, false if stopped

◆ R_CGC_ClockCheck()

ssp_err_t R_CGC_ClockCheck (cgc_clock_t *clock_source*)

Check the specified clock for stability.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_NOT_STABILIZED	Clock not stabilized.
SSP_ERR_CLOCK_ACTIVE	Clock active but not able to check for stability.
SSP_ERR_CLOCK_INACTIVE	Clock not turned on.
SSP_ERR_INVALID_ARGUMENT	Illegal parameter passed.
SSP_ERR_STABILIZED	Clock stabilized.

◆ R_CGC_ClockOutCfg()

ssp_err_t R_CGC_ClockOutCfg (cgc_clock_t *clock*, cgc_clockout_dividers_t *divider*)

Configure the dividers for CLKOUT.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	return error if PLL is used as source for clock out
SSP_ERR_CLOCK_INACTIVE	return error if sub clock is not started prior to using it for clock out

◆ R_CGC_ClockOutDisable()

ssp_err_t R_CGC_ClockOutDisable (void)

Disable the CLKOUT output.

Return values

SSP_SUCCESS	Operation performed successfully.

◆ R_CGC_ClockOutEnable()

ssp_err_t R_CGC_ClockOutEnable (void)

Enable the CLKOUT output.

Return values

SSP_SUCCESS	Operation performed successfully.

◆ R_CGC_ClocksCfg()

ssp_err_t R_CGC_ClocksCfg (cgc_clocks_cfg_t const *const *p_clock_cfg*)

Reconfigure all main system clocks.

Return values

SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_MAIN_OSC_INACTIVE	PLL Initialization attempted with Main OCO turned off/unstable.
SSP_ERR_CLOCK_ACTIVE	Active clock source specified for modification. This applies specifically to the PLL dividers/multipliers which cannot be modified if the PLL is active. It has to be stopped first before modification.
SSP_ERR_NOT_STABILIZED	The Clock source is not stabilized after being turned off.
SSP_ERR_CLKOUT_EXCEEDED	The main oscillator can be only 8 or 16 MHz.
SSP_ERR_ASSERTION	A NULL is passed for configuration data when PLL is the clock_source.
SSP_ERR_INVALID_MODE	Attempt to start a clock in a restricted operating power control mode.

◆ R_CGC_ClockStart()

ssp_err_t R_CGC_ClockStart (cgc_clock_t *clock_source*, cgc_clock_cfg_t * *p_clock_cfg*)

Start the specified clock if it is not currently active.

Configures the following when starting the Main Clock Oscillator:

- MainClock drive capacity (Configured based on external clock frequency)
- MainClock stabilization wait time (Compile time configurable: CGC_CFG_MAIN_OSC_WAIT)
- To update the subclock driven capacity, stop the subclock first before calling this function.

Return values

SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_MAIN_OSC_INACTIVE	PLL Initialization attempted with Main OCO turned off/unstable.
SSP_ERR_CLOCK_ACTIVE	Active clock source specified for modification. This applies specifically to the PLL dividers/multipliers which cannot be modified if the PLL is active. It has to be stopped first before modification.
SSP_ERR_NOT_STABILIZED	The Clock source is not stabilized after being turned off.
SSP_ERR_CLKOUT_EXCEEDED	The main oscillator can be only 8 or 16 MHz.
SSP_ERR_ASSERTION	A NULL is passed for configuration data when PLL is the clock_source.
SSP_ERR_INVALID_MODE	Attempt to start a clock in a restricted operating power control mode.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

◆ R_CGC_ClockStop()

ssp_err_t R_CGC_ClockStop (cgc_clock_t *clock_source*)

Stop the specified clock if it is active and not configured as the system clock.

Return values

SSP_SUCCESS	Clock stopped successfully.
SSP_ERR_CLOCK_ACTIVE	Current System clock source specified for stopping. This is not allowed.
SSP_ERR_OSC_STOP_DET_ENABLED	Illegal attempt to stop MOCO when Oscillation stop is enabled.
SSP_ERR_NOT_STABILIZED	Clock not stabilized after starting. A finite stabilization time after starting the clock has to elapse before it can be stopped.
SSP_ERR_INVALID_ARGUMENT	Invalid argument used.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

◆ r_cgc_hoco_wait_control_set()

void r_cgc_hoco_wait_control_set (R_SYSTEM_Type * *p_system_reg*, uint8_t *hoco_wait*)

This function sets the HOCO wait time register.

Parameters

[in]	hoco_wait	HOCOWTCR HSTS setting
[in]	p_system_reg	pointer to system register structure

Return values

none	

◆ R_CGC_Init()

ssp_err_t R_CGC_Init (void)

Initialize the CGC API.

Configures the following for the clock generator module -If CGC_CFG_SUBCLOCK_AT_RESET_ENABLE is set to true:

- SubClock drive capacity (Compile time configurable: CGC_CFG_SUBCLOCK_DRIVE)
- Initial setting for the SubClock

THIS FUNCTION MUST BE EXECUTED ONCE AT STARTUP BEFORE ANY OF THE OTHER CGC FUNCTIONS CAN BE USED OR THE CLOCK SOURCE IS CHANGED FROM THE MOCO.

Return values

SSP_SUCCESS	Clock initialized successfully.
SSP_ERR_HARDWARE_TIMEOUT	Hardware timed out.

SubClock will stop only if configurable setting is Enabled

◆ R_CGC_LCDClockCfg()

ssp_err_t R_CGC_LCDClockCfg (cgc_clock_t *clock*)

Configure the source for the segment LCDCLK.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.
SSP_ERR_INVALID_ARGUMENT	lcd_clock settings are invalid
SSP_ERR_UNSUPPORTED	lcd_clock configuration is not supported on this device

◆ R_CGC_LCDClockDisable()

ssp_err_t R_CGC_LCDClockDisable (void)

Disable the segment LCDCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.
SSP_ERR_UNSUPPORTED	lcd_clock is not supported on this device

◆ R_CGC_LCDClockEnable()

ssp_err_t R_CGC_LCDClockEnable (void)

Enable the segment LCDCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_TIMEOUT	Timed out.
SSP_ERR_UNSUPPORTED	lcd_clock is not supported on this device

◆ r_cgc_operating_hw_modeset()

void r_cgc_operating_hw_modeset (R_SYSTEM_Type * *p_system_reg*, cgc_operating_modes_t *operating_mode*)

This function changes the operating power control mode.

Parameters

[in]	p_system_reg	pointer to system register structure
[in]	operating_mode	Operating power control mode

Enable writing to OPCCR and SOPCCR registers.

Wait for transition to complete.

Disable writing to OPCCR and SOPCCR registers.

The Sub-osc bit has to be cleared first.

Wait for transition to complete.

Set OPCCR.

Wait for transition to complete.

Set SOPCCR.

Wait for transition to complete.

Disable writing to OPCCR and SOPCCR registers.

◆ r_cgc_operating_mode_get()

cgc_operating_modes_t r_cgc_operating_mode_get (R_SYSTEM_Type * *p_system_reg*)

This function checks the MCU for High Speed Mode.

Parameters

[in]	p_system_reg	pointer to system register structure

Return values

operating_mode	current mode of operation read from OPCCR register

◆ R_CGC_OscStopDetect()

ssp_err_t R_CGC_OscStopDetect (void(*)(cgc_callback_args_t *p_args) *p_callback*, bool *enable*)

Enable or disable the oscillation stop detection for the main clock. The MCU will automatically switch the system clock to MOCO when a stop is detected if Main Clock is the system clock. If the system clock is the PLL, then the clock source will not be changed and the PLL free running frequency will be the system clock frequency.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_OSC_STOP_DETECTED	The Oscillation stop detect status flag is set. Under this condition it is not possible to disable the Oscillation stop detection function.
SSP_ERR_ASSERTION	Null pointer passed for callback function when the second argument is "true".
SSP_ERR_ASSERTION	Cannot enable oscillator stop detect in sub-osc speed mode
SSP_ERR_ASSERTION	Invalid peripheral clock divisions for oscillator stop detect
SSP_ERR_INVALID_MODE	Invalid peripheral clock divider setting. Frequencies of peripherals should follow certain conditions.

add callback function to BSP

◆ R_CGC_OscStopStatusClear()

ssp_err_t R_CGC_OscStopStatusClear (void)

Clear the Oscillation Stop Detection Status register.

This register is not cleared automatically if the stopped clock is restarted. This function blocks for about 3 ICLK cycles until the status register is cleared.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_OSC_STOP_CLOCK_ACTIVE	The Oscillation Detect Status flag cannot be cleared if the Main Osc or PLL is set as the system clock. Change the system clock before attempting to clear this bit.

◆ R_CGC_SDADCClockCfg()

ssp_err_t R_CGC_SDADCClockCfg (cgc_clock_t *clock*)

Configure the source for the SDADCCLK.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_UNSUPPORTED	sdadc_clock configuration is not supported on this device
SSP_ERR_INVALID_ARGUMENT	Invalid clock used

◆ R_CGC_SDADCClockDisable()

ssp_err_t R_CGC_SDADCClockDisable (void)

Disable the SDADCCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_UNSUPPORTED	sdadc_clock is not supported on this device

◆ R_CGC_SDADCClockEnable()

ssp_err_t R_CGC_SDADCClockEnable (void)

Enable the SDADCCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_UNSUPPORTED	sdadc_clock is not supported on this device

◆ R_CGC_SDRAMClockOutDisable()

ssp_err_t R_CGC_SDRAMClockOutDisable (void)

Disable the SDCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_UNSUPPORTED	sdram_clock is not supported on this device

◆ R_CGC_SDRAMClockOutEnable()

ssp_err_t R_CGC_SDRAMClockOutEnable (void)

Enable the SDCLK output.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_UNSUPPORTED	sdram_clock is not supported on this device

◆ R_CGC_SystemClockFreqGet()

ssp_err_t R_CGC_SystemClockFreqGet (cgc_system_clocks_t *clock*, uint32_t * *p_freq_hz*)

Return the requested internal clock frequency in Hz.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid clock specified.
SSP_ERR_ASSERTION	A NULL is passed for frequency data.

◆ R_CGC_SystemClockGet()

ssp_err_t R_CGC_SystemClockGet (cgc_clock_t * *clock_source*, cgc_system_clock_cfg_t * *p_set_clock_cfg*)

Return the current system clock source and configuration.

Return values

SSP_SUCCESS	Parameters returned successfully.
SSP_ERR_ASSERTION	A NULL is passed for configuration data.
SSP_ERR_ASSERTION	A NULL is passed for clock source.

◆ R_CGC_SystemClockSet()

ssp_err_t R_CGC_SystemClockSet (cgc_clock_t *clock_source*, cgc_system_clock_cfg_t const *const *p_clock_cfg*)

Set the specified clock as the system clock and configure the internal dividers for ICLK, PCLKA, PCLKB, PCLKC, PCLKD and FCLK.

THIS FUNCTION DOES NOT CHECK TO SEE IF THE OPERATING MODE SUPPORTS THE SPECIFIED CLOCK SOURCE AND DIVIDER VALUES. SETTING A CLOCK SOURCE AND DVIDER OUTSIDE THE RANGE SUPPORTED BY THE CURRENT OPERATING MODE WILL RESULT IN UNDEFINED OPERATION.

IF THE LOCO MOCO OR SUBCLOCK ARE CHOSEN AS THE SYSTEM CLOCK, THIS FUNCTION WILL SET THOSE AS THE SYSTEM CLOCK WITHOUT CHECKING FOR STABILIZATION. IT IS UP TO THE USER TO ENSURE THAT LOCO, MOCO OR SUBCLOCK ARE STABLE BEFORE USING THEM AS THE SYSTEM CLOCK.

Additionally this function sets the RAM and ROM wait states for the MCU. For the S7 MCU the ROMWT register controls ROM wait states. For the S3 MCU the MEMWAIT register controls ROM wait states.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_CLOCK_INACTIVE	The specified clock source is inactive.
SSP_ERR_ASSERTION	The p_clock_cfg parameter is NULL.
SSP_ERR_NOT_STABILIZED	The clock source has not stabilized
SSP_ERR_INVALID_ARGUMENT	Invalid argument used. ICLK is not set as the fastest clock.
SSP_ERR_INVALID_MODE	Peripheral divisions are not valid in sub-osc mode
SSP_ERR_INVALID_MODE	Oscillator stop detect not allowed in sub-osc mode

In order to correctly set the ROM and RAM wait state registers we need to know the current (S3A7 only) and requested iclk frequencies.

◆ R_CGC_SystickUpdate()

ssp_err_t R_CGC_SystickUpdate (uint32_t *period_count*, cgc_systick_period_units_t *units*)

Re-Configure the systick based on the provided period and current system clock frequency.

Parameters

[in]	period_count	The duration for the systick period.
[in]	units	The units for the provided period.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid period specified.
SSP_ERR_ABORTED	Attempt to update systick timer failed.

◆ R_CGC_USBClockCfg()

ssp_err_t R_CGC_USBClockCfg (cgc_usb_clock_div_t *divider*)

Configure the dividers for UCLK.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_INVALID_ARGUMENT	Invalid usb_clock divider specified

◆ R_CGC_VersionGet()

ssp_err_t R_CGC_VersionGet (ssp_version_t *const *p_version*)

Return the driver version.

Return values

SSP_SUCCESS	Operation performed successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL..

Detailed Description

Driver for the CRC Calculator (CRC).

This module supports the CRC Calculator (CRC). It implements the following interface:

- CRC Interface

Function Documentation

◆ R_CRC_Calculate()

ssp_err_t R_CRC_Calculate (crc_ctrl_t *const *p_api_ctrl*, void * *inputBuffer*, uint32_t *length*, uint32_t *crc_seed*, uint32_t * *calculatedValue*)

Perform a CRC calculation on a block of 8-bit/32-bit(for 32-bit polynomial) data.

Implements crc_api_t::calculate

This function performs a CRC calculation on an array of 8-bit/32-bit(for 32-bit polynomial) values and returns an 8-bit/32-bit(for 32-bit polynomial) calculated value

Return values

SSP_SUCCESS	Calculation successful.
SSP_ERR_ASSERTION	Either p_ctrl, inputBuffer, or calculatedValue is NULL.
SSP_ERR_INVALID_ARGUMENT	length value is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.
SSP_ERR_IN_USE	CRC peripheral is currently in use by another instance of the driver.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Lock the peripheral during calculation

Set the bit order

Set CRC polynomial

Calculate CRC value for the input buffer

Release the hardware lock

◆ R_CRC_CalculatedValueGet()

ssp_err_t R_CRC_CalculatedValueGet (crc_ctrl_t *const *p_api_ctrl*, uint32_t * *calculatedValue*)

Return the current calculated value.

Implements crc_api_t::crcResultGet

CRC calculation operates on a running value. This function returns the current calculated value.

Return values

SSP_SUCCESS	Return of calculated value successful.
SSP_ERR_ASSERTION	Either p_ctrl or calculatedValue is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

Based on the selected polynomial, return the calculated CRC value

◆ R_CRC_Close()

ssp_err_t R_CRC_Close (crc_ctrl_t *const *p_api_ctrl*)

Close the CRC module driver.

Implements crc_api_t::close

Return values

SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

Release the CRC Hardware Resource

Mark driver as closed

◆ R_CRC_Open()

ssp_err_t R_CRC_Open (crc_ctrl_t *const *p_api_ctrl*, crc_cfg_t const *const *p_cfg*)

Open the CRC driver module.

Implements crc_api_t::open

Open the CRC driver module and initialize the driver control block according to the passed-in configuration structure.

Return values

SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	p_ctrl or p_cfg is NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Mark driver as initialized by setting the open value to the ASCII equivalent of "CRC"

Enable clocks to the CRC peripheral.

◆ R_CRC_SnoopCfg()

ssp_err_t R_CRC_SnoopCfg (crc_ctrl_t *const *p_api_ctrl*, crc_snoop_cfg_t *const *p_snoop_cfg*)

Configure the snoop channel and direction.

Implements crc_api_t::snoopCfg

The CRC calculator can operate on reads and writes over any of the first ten SCI channels. For example, if set to channel 0, transmit, every byte written out SCI channel 0 is also sent to the CRC calculator as if the value was explicitly written directly to the CRC calculator.

Return values

SSP_SUCCESS	Snoop configured successfully.
SSP_ERR_ASSERTION	- This is due to below conditions • Either p_ctrl or p_snoop_cfg is NULL • snoop_channel is greater than or equal to CRC_SNOOP_MAX_CHANNEL.
SSP_ERR_NOT_OPEN	The driver is not opened.

Set the bit order

Set CRC polynomial

Set CRC snoop channel and direction

◆ R_CRC_SnoopDisable()

ssp_err_t R_CRC_SnoopDisable (crc_ctrl_t *const *p_api_ctrl*)

Disable snooping.

Implements crc_api_t::snoopDisable

Return values

SSP_SUCCESS	Snoop disabled.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

Disable the snoop operation

◆ R_CRC_SnoopEnable()

ssp_err_t R_CRC_SnoopEnable (crc_ctrl_t *const *p_api_ctrl*, uint32_t *crc_seed*)

Enable snooping.

Implements crc_api_t::snoopEnable

Return values

SSP_SUCCESS	Snoop enabled.
SSP_ERR_ASSERTION	Either p_ctrl or crc_seed is NULL.
SSP_ERR_NOT_OPEN	The driver is not opened.

Based on the selected polynomial, set the initial CRC seed value

Enable the snoop operation

◆ R_CRC_VersionGet()

ssp_err_t R_CRC_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Implements crc_api_t::versionGet

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

crc_instance_ctrl_t Struct Reference

Detailed Description

Driver for the Capacitive Touch Sensing Unit (CTSU).

Enumeration Type Documentation

◆ ctsu_correction_status_t

enum ctsu_correction_status_t	
CTSU Correction status	
Enumerator	
CTSU_CORRECTION_INIT	Correction initial status.
CTSU_CORRECTION_RUN	Correction scan running.
CTSU_CORRECTION_COMPLETE	Correction complete.
CTSU_CORRECTION_ERROR	Correction error.

◆ ctsu_state_t

enum ctsu_state_t	
CTSU run state	
Enumerator	
CTSU_STATE_INIT	Not open.
CTSU_STATE_IDLE	Opened.
CTSU_STATE_SCANNING	Scanning now.
CTSU_STATE_SCANNED	Scan end.

◆ ctsu_tuning_t

enum ctsu_tuning_t	
CTSU Initial offset tuning status	
Enumerator	
CTSU_TUNING_INCOMPLETE	Initial offset tuning incomplete.
CTSU_TUNING_COMPLETE	Initial offset tuning complete.

Function Documentation

◆ R_CTSU_CallbackSet()

ssp_err_t R_CTSU_CallbackSet (ctsu_ctrl_t *const *p_api_ctrl*, void(*)(ctsu_callback_args_t *) *p_callback*, void const *const *p_context*, ctsu_callback_args_t *const *p_callback_memory*)

Updates the user callback and has option of providing memory for callback structure. Implements ctsu_api_t::callbackSet

Return values

SSP_SUCCESS	Callback updated successfully.
SSP_ERR_ASSERTION	A required pointer is NULL.
SSP_ERR_NOT_OPEN	The control block has not been opened.

◆ R_CTSU_Close()

ssp_err_t R_CTSU_Close (ctsu_ctrl_t *const *p_ctrl*)

Disables specified CTSU control block. Implements ctsu_api_t::close.

Return values

SSP_SUCCESS	CTSU successfully configured.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.

Stops peripheral and clears any internal state to allow driver to be reconfigured.

◆ R_CTSU_DataGet()

ssp_err_t R_CTSU_DataGet (ctsu_ctrl_t *const *p_ctrl*, uint16_t * *p_data*)

This function gets the sensor values as scanned by the CTSU. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Implements ctsu_api_t::dataGet.

Return values

SSP_SUCCESS	CTSU successfully configured.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.
SSP_ERR_CTSU_SCANNING	Scanning this instance.
SSP_ERR_CTSU_INCOMPLETE_TUNING	Incomplete initial offset tuning.
SSP_ERR_CTSU_DIAG_NOT_YET	Diagnosis of data collected no yet.

◆ R_CTSU_Diagnosis()

ssp_err_t R_CTSU_Diagnosis (ctsu_ctrl_t *const *p_ctrl*)

Diagnosis the CTSU peripheral. Implements ctsu_api_t::diagnosis.

Return values

SSP_SUCCESS	CTSU successfully configured.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.
SSP_ERR_NOT_ENABLED	Diagnosis is not enabled in S7 Series
SSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.
SSP_ERR_CTSU_DIAG_LDO_OVER_VOLTAGE	Diagnosis of LDO over voltage failed.
SSP_ERR_CTSU_DIAG_CCO_HIGH	Diagnosis of CCO into 19.2uA failed.
SSP_ERR_CTSU_DIAG_CCO_LOW	Diagnosis of CCO into 2.4uA failed.
SSP_ERR_CTSU_DIAG_SSCG	Diagnosis of SSCG frequency failed.
SSP_ERR_CTSU_DIAG_DAC	Diagnosis of non-touch count value failed.

◆ R_CTSU_Open()

ssp_err_t R_CTSU_Open (ctsu_ctrl_t *const *p_ctrl*, ctsu_cfg_t const *const *p_cfg*)

Opens and configures the CTSU driver module. Implements ctsu_api_t::open.

Return values

SSP_SUCCESS	CTSU successfully configured.
SSP_ERR_ASSERTION	Null pointer, or one or more configuration options is invalid.
SSP_ERR_ALREADY_OPEN	Module is already open. This module can only be opened once.
SSP_ERR_INVALID_ARGUMENT	Configuration parameter error.
SSP_ERR_IN_USE	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- cgc_api_t::systemClockFreqGet
- transfer_api_t::open

Note

In the first Open, measurement for correction works, and it takes several tens of milliseconds.

◆ R_CTSU_ScanStart()

ssp_err_t R_CTSU_ScanStart (ctsu_ctrl_t *const *p_ctrl*)

This function should be called each time a periodic timer expires. If initial offset tuning is enabled, The first several calls are used to tuning for the sensors. Before starting the next scan, first get the data with R_CTSU_DataGet(). If a different control block scan should be run, check the scan is complete before executing. Implements ctsu_api_t::scanStart.

Return values

SSP_SUCCESS	CTSU successfully configured.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Module is not open.
SSP_ERR_CTSU_SCANNING	Scanning this instance or other.
SSP_ERR_CTSU_NOT_GET_DATA	The previous data has not been retrieved by DataGet.

< CTSU_STRT

◆ R_CTSU_VersionGet()

ssp_err_t R_CTSU_VersionGet (ssp_version_t *const *p_version*)

Return CTSU HAL driver version. Implements ctsu_api_t::versionGet.

Return values

SSP_SUCCESS	Version information successfully read.
SSP_ERR_ASSERTION	Null pointer passed as a parameter

ctsu_ctsuwr_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » CTSU v2

#include <r_ctsuv2.h>

Data Fields

uint16_t	ctsussc Copy from (ssdiv << 8) by Open API.

uint16_t	ctsuso0 Copy from ((snum << 10) | so) by Open API.
uint16_t	ctsuso1 Copy from (sdpa << 8) by Open API. ICOG and RICOA is set recommend value.

Detailed Description

CTSUWR write register value

ssp_err_t	R_DAC_VersionGet (ssp_version_t *p_version) Get version and store it in provided pointer p_version. More...
ssp_err_t	R_DAC_InfoGet (dac_info_t *const p_info) Get information about DAC Resolution and store it in provided pointer p_info. More...

Detailed Description

Driver for the 12-Bit D/C Converter (DAC12).

Summary

This module implements the following interface: DAC Interface.

Name of module used by error logger macro

Function Documentation

◆ R_DAC_Close()

ssp_err_t R_DAC_Close (dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

SSP_SUCCESS	The channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Validate that the channel is opened.

Stop the channel

Update the channel state information.

Unlock the DAC Hardware Resource

Power down the DAC device.

Unlock the DAC Hardware Resource

◆ R_DAC_InfoGet()

ssp_err_t R_DAC_InfoGet (dac_info_t *const *p_info*)

Get information about DAC Resolution and store it in provided pointer p_info.

Return values

SSP_SUCCESS	Value of DAC resolution written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_info parameter was null.

Assigning DAC bit resolution as 12bit.

◆ R_DAC_Open()

ssp_err_t R_DAC_Open (dac_ctrl_t * *p_api_ctrl*, dac_cfg_t const *const *p_cfg*)

Perform required initialization described in hardware manual. Implements dac_api_t::open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

SSP_SUCCESS	The channel was successfully opened.
SSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_api_ctrl or p_cfg Channel ID requested in p_cfg may not available on the device selected in r_bsp_config.h data_format value in p_cfg is out of range. ad_da_synchronized value in p_cfg is out of range.
SSP_ERR_IN_USE	DAC resource is locked.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Validate the input parameter.

Make sure the peripheral exists.

Lock the DAC Hardware Resource.

Power on the DAC device.

Stop the channel.

Configure data format: left or right justified.

Configure D/A-A/D Synchronous Start Control Register(DAADSCR).

Set output amplifier configuration for the channel.

Set the reference voltage.

If charge pump has supported by MCU, configures the register(DAPC)

Initialize the channel state information.

All done. Return.

◆ R_DAC_Start()

ssp_err_t R_DAC_Start (dac_ctrl_t * *p_api_ctrl*)

Start the D/A conversion output if it has not been started.

Return values

SSP_SUCCESS	The channel is started successfully.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Validate that the channel is opened.

Enable the output.

Update the internal state.

◆ R_DAC_Stop()

ssp_err_t R_DAC_Stop (dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion and disable the output signal.

Return values

SSP_SUCCESS	The control is successfully stopped.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Validate that the channel is opened.

Disable the output.

Mark the internal state.

◆ R_DAC_VersionGet()

ssp_err_t R_DAC_VersionGet (ssp_version_t * *p_version*)

Get version and store it in provided pointer p_version.

Return values

SSP_SUCCESS	Successfully retrieved version information.
SSP_ERR_ASSERTION	p_version is NULL.

◆ R_DAC_Write()

ssp_err_t R_DAC_Write (dac_ctrl_t * *p_api_ctrl*, dac_size_t *value*)

Write data to the D/A converter and enable the output if it has not been enabled.

Return values

SSP_SUCCESS	Data is successfully written to the D/A Converter.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Note

Write function automatically starts the D/A conversion after data is successfully written to the channel.

Validate that the channel is opened.

Write the value to D/A converter.

Start the converter if it has been idle.

Start the channel

dac_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DAC

#include <r_dac.h>

Data Fields

void *	p_reg Pointer to DAC base register.
uint8_t	channel ID associated with this DAC channel.
uint8_t	channel_started DAC operation on channel started.
uint8_t	channel_opened DAC channel open.

Detailed Description

DAC instance control block. DO NOT INITIALIZE.

Detailed Description

Driver for the 8-Bit D/C Converter (DAC8).

Summary

This module implements the following interface: DAC Interface.

Name of module used by error logger macro

Enumeration Type Documentation

◆ dac8_mode_t

enum dac8_mode_t	
DAC8 mode	
Enumerator	
DAC8_MODE_NORMAL	DAC Normal mode.
DAC8_MODE_REAL_TIME	DAC Real-time (event link) mode.

Function Documentation

◆ R_DAC8_Close()

ssp_err_t R_DAC8_Close (dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion, stop output, and close the DAC channel.

Return values

SSP_SUCCESS	The channel is successfully closed.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Stop the channel

Update the channel state information.

Update DAC Hardware Resource information.

Unlock the DAC Hardware Resource

◆ R_DAC8_InfoGet()

ssp_err_t R_DAC8_InfoGet (dac_info_t *const *p_info*)

Get information about DAC Resolution and store it in provided pointer p_info.

Return values

SSP_SUCCESS	Value of DAC resolution written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_info parameter was null.

Update DAC resolution as 8-bit

◆ R_DAC8_Open()

ssp_err_t R_DAC8_Open (dac_ctrl_t * *p_api_ctrl*, dac_cfg_t const *const *p_cfg*)

Perform required initialization described in hardware manual. Implements dac_api_t::open. Configures a single DAC channel, starts the channel, and provides a handle for use with the DAC API Write and Close functions. Must be called once prior to calling any other DAC API functions. After a channel is opened, Open should not be called again for the same channel without calling Close first.

Return values

SSP_SUCCESS	The channel was successfully opened.
SSP_ERR_ASSERTION	One or both of the following parameters may be NULL: p_api_ctrl or p_cfg
SSP_ERR_IN_USE	DAC8 resource is locked.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	An invalid channel was requested.
SSP_ERR_UNSUPPORTED	Output amplifier is not supported. Real time mode is not supported. Charge pump is not supported. A/D - D/A synchronization is not supported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Validate the input parameter.

Make sure the peripheral exists.

Lock the DAC Hardware Resource.

Power on the DAC device.

Stop the channel.

Set defaults.

Configure the charge pump.

Configure the DAC mode.

Configure DA/AD mode.

Initialize the channel state information.

All done. Return.

◆ R_DAC8_Start()

ssp_err_t R_DAC8_Start (dac_ctrl_t * *p_api_ctrl*)

Start the D/A conversion output.

Return values

SSP_SUCCESS	The channel is started successfully.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Enable the output.

Update the internal state.

◆ R_DAC8_Stop()

ssp_err_t R_DAC8_Stop (dac_ctrl_t * *p_api_ctrl*)

Stop the D/A conversion and disable the output signal.

Return values

SSP_SUCCESS	The control is successfully stopped.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.

Disable the output.

Mark the internal state.

◆ R_DAC8_VersionGet()

ssp_err_t R_DAC8_VersionGet (ssp_version_t * *p_version*)

Get version and store it in provided pointer p_version.

Return values

SSP_SUCCESS	Successfully retrieved version information.
SSP_ERR_ASSERTION	p_version is NULL.

Return the version number

◆ R_DAC8_Write()

ssp_err_t R_DAC8_Write (dac_ctrl_t * *p_api_ctrl*, dac_size_t *value*)

Write data to the D/A converter and enable the output if it has not been enabled.

Return values

SSP_SUCCESS	Data is successfully written to the D/A Converter.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	Channel associated with p_ctrl has not been opened.
SSP_ERR_OVERFLOW	Data overflow when data value exceeds 8-bit limit.

Note

Write function automatically starts the D/A conversion after data is successfully written to the channel.

Handle data format.

Convert to 8 bits.

Write the value to D/A converter.

Start the converter if it has been idle.

Start the channel

dac8_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DAC8

ssp_err_t	R_DMAC_Stop_ActivationRequest (transfer_ctrl_t *const p_api_ctrl) Clears the DMA activation request with a DMA dummy transfer as per flowchart in the hardware manual. Implements transfer_api_t::Stop_ActivationRequest. This function to be used only in scenario when a DMA activation request source might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMA activation request is held in DMAC. More...

Detailed Description

DMA Controller (DMAC).

Summary

Extends the Transfer Interface.

The Direct Memory Access (DMA) Controller allows data transfers to occur in place of or in addition to any interrupt. It also supports data transfers using software start.

Note

The transfer length is limited to 1024 (10 bits) in TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT.

This driver supports only TRANSFER_IRQ_END from transfer_irq_t.

Macro Definition Documentation

◆ DMAC_NORMAL_MAX_LENGTH

#define DMAC_NORMAL_MAX_LENGTH (0xFFFF)
Length limited to 65535 transfers for normal mode

◆ DMAC_REPEAT_BLOCK_MAX_LENGTH

#define DMAC_REPEAT_BLOCK_MAX_LENGTH (0x400)
Length limited to 1024 transfers for repeat and block mode

◆ DUMMY_ADDRESS

#define DUMMY_ADDRESS ((void *) 0x40005500)
Reserved memory area for dummy write transfer as per Hardware user manual

Function Documentation

◆ R_DMAC_BlockReset()

ssp_err_t R_DMAC_BlockReset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *length*, transfer_size_t *size*, uint16_t const *num_transfers*)

Reset transfer source, destination, length and number of transfers for block transfer.

Return values

SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.
SSP_ERR_NOT_ENABLED	DMAC is not enabled. A valid source and destination must be provided in either open() or blockReset().

Enables transfers on this activation source.

◆ R_DMAC_Close()

ssp_err_t R_DMAC_Close (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfer and clean up internal data. Implements transfer_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.

Disable DMAC transfers, disable DMAC interrupts, and remove DMAC trigger from ICU register.

Clear ID so control block can be reused.

Release BSP hardware lock on this channel

◆ R_DMAC_Disable()

ssp_err_t R_DMAC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfer. Implements transfer_api_t::disable.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

Disable transfer.

◆ R_DMAC_Enable()

ssp_err_t R_DMAC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfer. Implements transfer_api_t::enable.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

Enable transfer.

◆ R_DMAC_InfoGet()

ssp_err_t R_DMAC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_info*)

Set driver specific information in provided pointer. Implements transfer_api_t::infoGet.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_ASSERTION	An input parameter is invalid.

If a transfer is active, store it in p_in_progress.

Store maximum transfer length.

Store remaining transfer length.

◆ R_DMAC_Open()

ssp_err_t R_DMAC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Initialize transfer and enables transfer in ICU. Implements transfer_api_t::open.

Return values

SSP_SUCCESS	Successful open. Transfer is configured and will start when trigger occurs.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_ENABLED	Auto-enable was requested, but enable failed.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
SSP_ERR_INVALID_SIZE	Invalid offset value.
SSP_ERR_IN_USE	The BSP hardware lock for the DMAC is not available.

Returns

See Common Error Codes for other possible return codes.This function calls

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Get the IRQ vectors, event info and set the NVIC priority for dmac.

Acquire BSP hardware lock for channel used.

Configure the DMAC according to the flowchart "Activating the DMAC" in chapter 16.3.7 of hardware manual NoSecurity_r01uh0488ej0040_sc32.pdf.

Set the offset value in offset addressing mode.

Configure DMA transfer and sources

Note

Transfer escape interrupts not supported.

Update internal variables.

Mark driver as open by initializing "DMAC" in its ASCII equivalent.

If auto_enable is true, enable transfer and ELC events if software start is used.

◆ R_DMAC_Reset()

ssp_err_t R_DMAC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers.

Return values

SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_ENABLED	DMAC is not enabled. A valid source and destination must be provided in either open() or reset().
SSP_ERR_IN_USE	Transfer is in progress. Wait for transfer to complete.

Enables transfers on this activation source.

◆ R_DMAC_Start()

ssp_err_t R_DMAC_Start (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

Start transfer. Implements transfer_api_t::start.

Return values

SSP_SUCCESS	Transfer started written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	Handle was not configured for software activation.

Set autoclear bit and software start bit.

◆ R_DMAC_Stop()

ssp_err_t R_DMAC_Stop (transfer_ctrl_t *const *p_api_ctrl*)

Stop transfer. Implements transfer_api_t::stop.

Return values

SSP_SUCCESS	Transfer stopped written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

Reset auto clear bit and clear software transfer request.

◆ R_DMAC_Stop_ActivationRequest()

ssp_err_t R_DMAC_Stop_ActivationRequest (transfer_ctrl_t *const *p_api_ctrl*)

Clears the DMA activation request with a DMA dummy transfer as per flowchart in the hardware manual. Implements transfer_api_t::Stop_ActivationRequest. This function to be used only in scenario when a DMA activation request source might occur in the next request after a DMA transfer completes. If this happens, the DMA transfer starts and the DMA activation request is held in DMAC.

Return values

SSP_SUCCESS	Successful transfer.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.

Clear the DMA activation request with a DMA dummy transfer as per flowchart in the hardware manual.

Disable DMAC transfer.

Disable the IRQ pin as a DMACm request source

Set the DMAC transfer size

Set source and destination address to 4000_5500 as per hardware manual.

Set number of transfer operations

Disable DMAC transfer.

Wait for the DMAC transfer end

◆ R_DMAC_VersionGet()

ssp_err_t R_DMAC_VersionGet (ssp_version_t *const *p_version*)
Set driver version based on compile time macros. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — An input parameter is invalid.

dmac_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DMAC

#include <r_dmac.h>

Data Fields

uint32_t	id Driver ID.
elc_event_t	trigger Transfer activation event. Matches event returned by transfer_api_t::infoGet.
IRQn_Type	irq Transfer activation IRQ.
uint8_t	channel Channel number.
uint8_t	ir_flag_stat Status of IR bit in DELSR register.
int32_t	offset_byte Value of offset in bytes for offset addressing mode.

void(*	p_callback)(transfer_callback_args_t *cb_data)
void const *	p_context
void *	p_reg

Detailed Description

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

Field Documentation

◆ p_callback

void(* dmac_instance_ctrl_t::p_callback) (transfer_callback_args_t *cb_data)
Callback for transfer end interrupt.

◆ p_context

void const* dmac_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

◆ p_reg

void* dmac_instance_ctrl_t::p_reg
Pointer to base register.

The documentation for this struct was generated from the following file:

- r_dmac.h

transfer_on_dmac_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DMAC

#include <r_dmac.h>

Data Fields

uint8_t	channel Channel number, does not apply to all HAL drivers.
int32_t	offset_byte Value of offset in bytes for offset addressing mode.

Detailed Description

DMAC transfer configuration extension. This extension is required.

The documentation for this struct was generated from the following file:

- r_dmac.h

ssp_err_t	R_DOC_VersionGet (ssp_version_t *const p_version) Return DOC HAL driver version. Implements doc_api_t::versionGet. More...

Detailed Description

Driver for the Data Operation Circuit (DOC).

Summary

This module implements the DOC Interface using the Data Operation Circuit (DOC).

Function Documentation

◆ R_DOC_Close()

ssp_err_t R_DOC_Close (doc_ctrl_t *const *p_api_ctrl*)

Close the module driver. Enable module stop mode. Implements doc_api_t::close.

To close the DOC it must have been opened via the open API. When opened a control structure of type doc_ctrl_t is passed to the open API. The same control structure must be passed to the close API.

Return values

SSP_SUCCESS	Module successfully closed.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::eventInfoGet

Note

This function is reentrant.
This function will disable the DOC interrupt in the NVIC.

Validate the parameter and check if the module is initialized

Disable the IRQ in the NVIC in case it has been left enabled.

Clear DOPCF in DOCR

Mark driver as closed.

Unlock the DOC Hardware Resource

◆ R_DOC_InputRegisterWrite()

ssp_err_t R_DOC_InputRegisterWrite (doc_ctrl_t *const *p_api_ctrl*, doc_size_t *data*)

Write to the DODIR register. Implements doc_api_t::inputRegisterWrite,.

Writes to the DODIR register only.

Return values

SSP_SUCCESS	Value successfully written to the DODIR register.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.

Note

This function is reentrant.

Validate the parameter and check if the module is intialized

Writes the user supplied data to the DODIR register for data operation in Comparison, Addition and subtraction modes

◆ R_DOC_Open()

ssp_err_t R_DOC_Open (doc_ctrl_t *const *p_api_ctrl*, doc_cfg_t const *const *p_cfg*)

Configure the Data Operation Circuit (DOC) in comparison, addition or subtraction mode. Implements doc_api_t::open.

If callback is not NULL in the configuration structure the DOC IRQ will be enabled.

Return values

SSP_SUCCESS	DOC successfully configured.
SSP_ERR_IN_USE	Module already open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.
SSP_ERR_INVALID_ARGUMENT	ISR is not enabled. Enable the ISR in bsp_irq_cfg.h.
SSP_ERR_HW_LOCKED	DOC resource is locked.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is reentrant.

Validate the parameters and check if the module is initialized

Make sure the DOC exists on this part.

Lock the DOC Hardware Resource

Configure the DOC via DOCR register.

If callback parameter is not NULL configure the IRQ

Mark driver as open by initializing it to "DOCO" in its ASCII equivalent.

◆ R_DOC_StatusClear()

ssp_err_t R_DOC_StatusClear (doc_ctrl_t *const *p_api_ctrl*)

Clear the DOPCF status flag at the hardware layer. This flag indicates the result of a DOC operation. Implements doc_api_t::statusClear.

Return values

SSP_SUCCESS	Interrupt successfully cleared.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function is reentrant.

Validate the parameter and check if the module is initialized

Clear the hardware status flag

◆ R_DOC_StatusGet()

ssp_err_t R_DOC_StatusGet (doc_ctrl_t *const *p_api_ctrl*, doc_status_t * *p_status*)

Return the comparison/addition/subtraction status. Implements doc_api_t::statusGet.

The status is read from the Data Operation Circuit Flag (DOPCF).

Return values

SSP_SUCCESS	Status successfully read.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.

Note

This function is reentrant.

Validate the parameters and check if the module is intialized

Read the comparison or addition or subtraction status from the register and store in the user supplied location

◆ R_DOC_VersionGet()

ssp_err_t R_DOC_VersionGet (ssp_version_t *const *p_version*)

Return DOC HAL driver version. Implements doc_api_t::versionGet.

Return values

SSP_SUCCESS	Version information successfully read.
SSP_ERR_ASSERTION	Pointer pointing to NULL.

Note

This function is reentrant.

Validate the parameter

Store the version id from version data structure to the user supplied location

◆ R_DOC_Write()

ssp_err_t R_DOC_Write (doc_ctrl_t *const *p_api_ctrl*, doc_data_t *const *p_data*)

Write to the DODIR and DODSR registers. Implements doc_api_t::write,.

In comparison mode the 16-bit reference data is written to the DODSR register and the data for the comparison written to the DODIR. In addition mode the initial data is written to the DODSR and the data to be added to the DODIR. In subtraction mode the initial data is written to the DODSR and the data to be subtracted to the DODIR.

When changing both the DODSR and DODIR the DODSR should be updated first.

Return values

SSP_SUCCESS	Values successfully written to the registers.
SSP_ERR_NOT_OPEN	Driver not open.
SSP_ERR_ASSERTION	One or more pointers point to NULL.

Note

This function is reentrant.

Validate the parameters and check if the module is initialized

Writes the user supplied data to the DODIR(DOC Data Input Register) and DODSR(DOC Data Setting Register) registers

doc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DOC

#include <r_doc.h>

Data Fields

uint32_t	open Used by driver to check if the control structure is valid.
void(*	p_callback)(doc_callback_args_t *p_args)
doc_event_t	event The event DOC is configured for. Passed in ISR callback.
void const *	p_context
void *	p_reg Base register.

Detailed Description

DOC instance control block. Do not initialize. Initialization occurs when the doc_api_t::open function is called.

Field Documentation

◆ p_callback

void(* doc_instance_ctrl_t::p_callback) (doc_callback_args_t *p_args)
Callback provided when a DOC ISR occurs. NULL indicates no CPU interrupt.

◆ p_context

void const* doc_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in doc_callback_args_t.

The documentation for this struct was generated from the following file:

- r_doc.h

Implements transfer_api_t::blockReset. More...
ssp_err_t	R_DTC_Stop_ActivationRequest (transfer_ctrl_t *const p_api_ctrl) Placeholder for unsupported DummyTransfer function. Implements transfer_api_t::Stop_ActivationRequest. More...

Detailed Description

Driver for the Data Transfer Controller (DTC).

Summary

Extends Transfer Interface.

The Data Transfer Controller allows data transfers to occur in place of or in addition to any interrupt. It does not support data transfers using software start.

Note

The transfer length is limited to 256 (8 bits) in TRANSFER_MODE_BLOCK and TRANSFER_MODE_REPEAT.

Macro Definition Documentation

◆ DTC_NORMAL_MAX_LENGTH

#define DTC_NORMAL_MAX_LENGTH (0x10000)
Length limited to 65536 transfers for normal mode

◆ DTC_REPEAT_BLOCK_MAX_LENGTH

#define DTC_REPEAT_BLOCK_MAX_LENGTH (0x100)
Length limited to 256 transfers for repeat and block mode

Function Documentation

◆ R_DTC_BlockReset()

ssp_err_t R_DTC_BlockReset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *length*, transfer_size_t *size*, uint16_t const *num_transfers*)

BlockReset transfer source, destination, length and number of transfers. Implements transfer_api_t::blockReset.

Return values

SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	If mode is other than Block Transfer Mode.
SSP_ERR_NOT_ENABLED	Enable failed due to an invalid input parameter: • Transfer source must not be NULL. • Transfer destination must not be NULL.

Disable transfers on this activation source.

Disable read skip prior to modifying settings. It will be enabled later.

Reset transfer based on input parameters.

Enables transfers on this activation source.

Enable read skip after all settings are complete.

◆ R_DTC_Close()

ssp_err_t R_DTC_Close (transfer_ctrl_t *const *p_api_ctrl*)

Disables transfer in the ICU, then clears transfer data from the DTC vector table. Implements transfer_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the p_ctrl is not enabled in the BSP.

Clear DTC enable bit in ICU.

Clear pointer in vector table.

◆ R_DTC_Disable()

ssp_err_t R_DTC_Disable (transfer_ctrl_t *const *p_api_ctrl*)

Disable transfer. Implements transfer_api_t::disable.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

Disable transfer.

◆ R_DTC_Enable()

ssp_err_t R_DTC_Enable (transfer_ctrl_t *const *p_api_ctrl*)

Enable transfer and ELC events if they are used for software start. Implements transfer_api_t::enable.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the p_ctrl is not enabled in the BSP.

Enable transfer.

◆ R_DTC_InfoGet()

ssp_err_t R_DTC_InfoGet (transfer_ctrl_t *const *p_api_ctrl*, transfer_properties_t *const *p_info*)

Set driver specific information. Implements transfer_api_t::infoGet.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.

If a transfer is active, store it in p_in_progress.

Transfer information for the activation source is taken from DTC vector table.

Mask out the high byte in case of repeat transfer.

Store maximum transfer length.

◆ R_DTC_Open()

ssp_err_t R_DTC_Open (transfer_ctrl_t *const *p_api_ctrl*, transfer_cfg_t const *const *p_cfg*)

Set transfer data in the vector table and enable transfer in ICU. Implements transfer_api_t::open.

Return values

SSP_SUCCESS	Successful open. Transfer is configured and will start when trigger occurs.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_IN_USE	The BSP hardware lock for the DTC is not available, or the index for this IRQ in the DTC vector table is already configured.
SSP_ERR_HW_LOCKED	DTC hardware resource is locked.
SSP_ERR_IRQ_BSP_DISABLED	The IRQ associated with the activation source is not enabled in the BSP.
SSP_ERR_NOT_ENABLED	Auto-enable was requested, but enable failed due to an invalid input parameter.

Make sure the activation source is mapped in the ICU.

Make sure the activation source is not already being used by the DTC.

Configure the DTC transfer. See the hardware manual for details.

Update internal variables.

Mark driver as open by initializing it to "DTC" in its ASCII equivalent.

If auto_enable is true, enable transfer and ELC events if software start is used.

Enable read skip after all settings are complete.

◆ R_DTC_Reset()

ssp_err_t R_DTC_Reset (transfer_ctrl_t *const *p_api_ctrl*, void const *volatile *p_src*, void *volatile *p_dest*, uint16_t const *num_transfers*)

Reset transfer source, destination, and number of transfers. Implements transfer_api_t::reset.

Return values

SSP_SUCCESS	Transfer reset successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DTC_Open to initialize the control block.
SSP_ERR_NOT_ENABLED	Transfer length must not be 0 for repeat and block mode, or enable failed due to an invalid input parameter: • Transfer source must not be NULL. • Transfer destination must not be NULL.

Disable transfers on this activation source.

Disable read skip prior to modifying settings. It will be enabled later.

Reset transfer based on input parameters.

Enables transfers on this activation source.

Enable read skip after all settings are complete.

◆ R_DTC_Start()

ssp_err_t R_DTC_Start (transfer_ctrl_t *const *p_api_ctrl*, transfer_start_mode_t *mode*)

Start transfer. Implements transfer_api_t::start.

Return values

SSP_SUCCESS	Transfer started successfully.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_NOT_OPEN	Handle is not initialized. Call R_DMAC_Open to initialize the control block.
SSP_ERR_UNSUPPORTED	One of the following is invalid: • Handle was not configured for software activation. • Mode not set to TRANSFER_START_MODE_SINGLE. • DTC_SOFTWARE_START_ENABLE set to 0 (disabled) in ssp_cfg/driver/r_dtc_cfg.h.

◆ R_DTC_Stop()

ssp_err_t R_DTC_Stop (transfer_ctrl_t *const *p_ctrl*)

Placeholder for unsupported stop function. Implements transfer_api_t::stop.

Return values

SSP_ERR_UNSUPPORTED	DTC software start is not supported.

Mark the input parameter as unused since this function isn't supported.

◆ R_DTC_Stop_ActivationRequest()

ssp_err_t R_DTC_Stop_ActivationRequest (transfer_ctrl_t *const *p_api_ctrl*)

Placeholder for unsupported DummyTransfer function. Implements transfer_api_t::Stop_ActivationRequest.

Return values

SSP_ERR_UNSUPPORTED	R_DTC_Stop_ActivationRequest function is not implemented, Its just a placeholder .

Mark the input parameter as unused since this function isn't supported.

◆ R_DTC_VersionGet()

ssp_err_t R_DTC_VersionGet (ssp_version_t *const *p_version*)
Set driver version based on compile time macros. Implements transfer_api_t::versionGet. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — An input parameter is invalid. Set driver version based on compile time macros

dtc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » DTC

#include <r_dtc.h>

Data Fields

uint32_t	id Driver ID.
elc_event_t	trigger Transfer activation event. Matches event returned by transfer_api_t::infoGet.
IRQn_Type	irq Transfer activation IRQ, does not apply to all HAL drivers.
void(*	p_callback)(transfer_callback_args_t *cb_data)
void const *	p_context

Detailed Description

Control block used by driver. DO NOT INITIALIZE - this structure will be initialized in transfer_api_t::open.

Field Documentation

◆ p_callback

void(* dtc_instance_ctrl_t::p_callback) (transfer_callback_args_t *cb_data)
Callback for transfer end interrupt used for ELC software trigger.

◆ p_context

void const* dtc_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user p_callback in transfer_callback_args_t.

Detailed Description

Driver for the Event Link Controller (ELC).

This module supports the Event Link Controller (ELC). It implements the following interface: events and peripheral definitions

Function Documentation

◆ R_ELC_Disable()

ssp_err_t R_ELC_Disable (void)

Disable the operation of the Event Link Controller.

Implements elc_api_t::disable

Return values

SSP_SUCCESS	ELC disabled.

Disable the Event Link Controller block.

◆ R_ELC_Enable()

ssp_err_t R_ELC_Enable (void)

Enable the operation of the Event Link Controller.

Implements elc_api_t::enable

Return values

SSP_SUCCESS	ELC enabled.

Enable the Event Link Controller block.

◆ R_ELC_Init()

ssp_err_t R_ELC_Init (elc_cfg_t const *const *p_cfg*)

Initialize all the links in the Event Link Controller.

Implements elc_api_t::init

The configuration structure passed in to this function includes links for every event source included in the ELC and sets them all at once. To set an individual link use R_ELC_LinkSet()

Return values

SSP_SUCCESS	Initialization was successful
SSP_ERR_ASSERTION	p_config was NULL

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Power on ELC

Enable the operation of the Event Link Controller

◆ R_ELC_LinkBreak()

ssp_err_t R_ELC_LinkBreak (elc_peripheral_t *peripheral*)

Break an event link.

Implements elc_api_t::linkBreak

Return values

SSP_SUCCESS	Event link broken

Break a link between a signal and a peripheral.

◆ R_ELC_LinkSet()

ssp_err_t R_ELC_LinkSet (elc_peripheral_t *peripheral*, elc_event_t *signal*)

Create a single event link.

Implements elc_api_t::linkSet

Return values

SSP_SUCCESS	Initialization was successful

Make a link between a signal and a peripheral.

◆ R_ELC_SoftwareEventGenerate()

ssp_err_t R_ELC_SoftwareEventGenerate (elc_software_event_t *event_number*)

Generate a software event in the Event Link Controller.

Implements elc_api_t::softwareEventGenerate

Return values

SSP_SUCCESS	Initialization was successful
SSP_ERR_ASSERTION	Invalid event number

Generate a software event in the Event Link Controller.

◆ R_ELC_VersionGet()

ssp_err_t R_ELC_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Implements elc_api_t::versionGet

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

5.1.5.18 High-performance Flash

Detailed Description

Driver for the High-performance Flash Memory (S7G2 and S5D9).

This module supports the Flash interface for the High Performance FLASH peripheral.

Function Documentation

◆ R_FLASH_HP_AccessWindowClear()

ssp_err_t R_FLASH_HP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is currently configured in the Code Flash. Subsequent to this call all Code Flash is writable. Implements flash_api_t::accessWindowClear.

Return values

SSP_SUCCESS	Access window successfully removed.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_INVALID_HW_CONDITION	The configuration area cannot be written while DTC/DMAC, EDMAC, LCDC/2DG/JPEG are enabled. This is to prevent prohibited memory accesses while the flash sequencer is running. Refer to the technical update number TN-SY*-A033A/E. This check can be disabled by defining R_FLASH_HP_CHECK_MODULE_STOP_BITS to 0. To disable DMAC/DTC, close all modules using DMAC/DTC and call the following: ssp_err_t err; ssp_feature_t ssp_feature = {{(ssp_ip_t) 0U}}; ssp_feature.id = SSP_IP_DTC; err = R_BSP_ModuleStopAlways(&ssp_feature);
SSP_ERR_INVALID_LINKED_ADDRESS	HW_FLASH_HP_configurationSet is linked to an invalid region of memory. This function must not reside in prohibited regions of memory. It is recommended that the following changes be made to the linker script. For information about prohibited regions refer to the S5 series flash technical update. Technical Update number TN-SY*-A033A/E Recommended Changes: For GCC: Add the following immediately after "__data_start__ = .": . = ALIGN(4); __Code_In_RAM_Start = .; KEEP(*(.code_in_ram*)) __Code_In_RAM_End = .; For IAR: Change: place at start of RAM_region { block START_OF_RAM }; To: define block START_OF_RAM with fixed order { rw section .ssp_dtc_vector_table, block RAM_CODE }; place at start of RAM_region { block START_OF_RAM };

< For consistency with _LP API we return error if Code Flash not enabled

◆ R_FLASH_HP_AccessWindowSet()

ssp_err_t R_FLASH_HP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory using the provided start and end address. An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_HP_AccessWindowClear().

Implements flash_api_t::accessWindowSet.

Return values

SSP_SUCCESS	Access window successfully configured.
SSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_INVALID_HW_CONDITION	The configuration area cannot be written while DTC/DMAC, EDMAC, LCDC/2DG/JPEG are enabled. This is to prevent prohibited memory accesses while the flash sequencer is running. Refer to the technical update number TN-SY*-A033A/E. This check can be disabled by defining R_FLASH_HP_CHECK_MODULE_STOP_BITS to 0. To disable DMAC/DTC, close all modules using DMAC/DTC and call the following: ssp_err_t err; ssp_feature_t ssp_feature = {{(ssp_ip_t) 0U}}; ssp_feature.id = SSP_IP_DTC; err = R_BSP_ModuleStopAlways(&ssp_feature);
SSP_ERR_INVALID_LINKED_ADDRESS	HW_FLASH_HP_configurationSet is linked to an invalid region of memory. This function must not reside in prohibited regions of memory. It is recommended that the following changes be made to the linker script. For information about prohibited regions refer to the S5 series flash technical update. Technical Update number TN-SY*-A033A/E Recommended Changes: For

	GCC: Add the following immediately after "__data_start__ = .": . = ALIGN(4); __Code_In_RAM_Start = .; KEEP(*(.code_in_ram*)) __Code_In_RAM_End = .; For IAR: Change: place at start of RAM_region { block START_OF_RAM }; To: define block START_OF_RAM with fixed order { rw section .ssp_dtc_vector_table, block RAM_CODE }; place at start of RAM_region { block START_OF_RAM };

< For consistency with _LP API we return error if Code Flash not enabled

Return status.

◆ R_FLASH_HP_BlankCheck()

ssp_err_t R_FLASH_HP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Performs a blank check on the specified address area. Implements flash_api_t::blankCheck.

Return values

SSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
SSP_ERR_INVALID_ADDRESS	Invalid data flash address was input.
SSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
SSP_ERR_IN_USE	Other flash operation in progress or API not initialized.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

Get the block information for this address. If failure return error.

Setup blank check. If failure return error.

Initiate the Blank Check operation

Complete the flash operation.

◆ R_FLASH_HP_Close()

ssp_err_t R_FLASH_HP_Close (flash_ctrl_t *const *p_api_ctrl*)

Releases any resources that were allocated by the Open() or any subsequent Flash operations.
Implements flash_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

Return the hardware lock for the Flash

Disable interrupts

Release the lock

Close the API

◆ R_FLASH_HP_Erase()

ssp_err_t R_FLASH_HP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erases the specified Code or Data Flash blocks. Implements flash_api_t::erase by the block_erase_address.

Return values

SSP_SUCCESS	Successful open.
SSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
SSP_ERR_INVALID_ADDRESS	Invalid address specified
SSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to erase CF was requested.

Get the block information for this address. If failure return error.

Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE. If failure return error.

Configure current operation parameters based on user input.

Erase the Blocks. If not a DF BGO erase then exit PE mode and return status.

Complete the flash operation.

◆ R_FLASH_HP_IdCodeSet()

ssp_err_t R_FLASH_HP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Implements flash_api_t::idCodeSet.

Return values

SSP_SUCCESS	ID Code successfully configured.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_INVALID_HW_CONDITION	The configuration area cannot be written while DTC/DMAC, EDMAC, LCDC/2DG/JPEG are enabled. This is to prevent prohibited memory accesses while the flash sequencer is running. Refer to the technical update number TN-SY*-A033A/E. This check can be disabled by defining R_FLASH_HP_CHECK_MODULE_STOP_BITS to 0. To disable DMAC/DTC, close all modules using DMAC/DTC and call the following: ssp_err_t err; ssp_feature_t ssp_feature = {{(ssp_ip_t) 0U}}; ssp_feature.id = SSP_IP_DTC; err = R_BSP_ModuleStopAlways(&ssp_feature);
SSP_ERR_INVALID_LINKED_ADDRESS	HW_FLASH_HP_configurationSet is linked to an invalid region of memory. This function must not reside in prohibited regions of memory. It is recommended that the following changes be made to the linker script. For information about prohibited regions refer to the S5 series flash technical update. Technical Update number TN-SY*-A033A/E Recommended Changes: For GCC: Add the following immediately after "__data_start__ = .": . = ALIGN(4); __Code_In_RAM_Start = .; KEEP(*(.code_in_ram*)) __Code_In_RAM_End = .; For IAR: Change: place at start of RAM_region { block START_OF_RAM }; To: define block START_OF_RAM with fixed order { rw section .ssp_dtc_vector_table, block RAM_CODE }; place at start of RAM_region { block START_OF_RAM };

Return status.

◆ R_FLASH_HP_InfoGet()

ssp_err_t R_FLASH_HP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

SSP_SUCCESS	Successful retrieved the request information.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

Eliminate warning if parameter checking is disabled.

Copy information about the code and data flash to the user structure.

◆ R_FLASH_HP_Open()

ssp_err_t R_FLASH_HP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initializes the flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash. It first copies the FCU firmware to FCURAM and sets the FCU Clock based on the current FCLK frequency. In addition, if Code Flash programming is enabled, the API code responsible for Code Flash programming will be copied to RAM.

This function must be called once prior to calling any other FLASH API functions. If a user supplied callback function is supplied, then the Flash Ready and Error interrupts will be configured to call the users callback routine with an Event type describing the source of the interrupt.

Note

Providing a callback function in the supplied p_cfg->callback field, automatically configures the Flash for Data Flash to operate in non-blocking (BGO) mode.

Subsequent to a successful Open(), the Flash is ready to process additional Flash commands.

Return values

SSP_SUCCESS	Initialization was successful and timer has started.
SSP_FLASH_ERR_FAILURE	Failed to successfully enter Programming/Erase mode.
SSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg or problem getting FMI info.
SSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
SSP_ERR_FCLK	FCLK must be a minimum of 4 MHz for Flash operations.
SSP_ERR_HW_LOCKED	FLASH peripheral has already been initialized and is in use.

Setup the flash FMI and acquire the hardware lock. If failure return error.

Allow Initialization if not initialized or if no operation is ongoing and re-initialization is desired

Acquire the flash hp software lock.

Set the parameters struct based on the user supplied settings

If BGO is enabled for data flash configure the callback and enable flash iterrupts. Otherwise disable interrupts.

Flash open setup.

Save callback function pointer

◆ R_FLASH_HP_Read()

ssp_err_t R_FLASH_HP_Read (flash_ctrl_t *const *p_api_ctrl*, uint8_t * *p_dest_address*, uint32_t const *flash_address*, uint32_t const *num_bytes*)

Reads the requested number of bytes from the supplied Data or Code Flash memory address. Implements flash_api_t::read.

Note

This function is provided simply for the purposes of maintaining a complete interface. It is possible (and recommended), to read Flash memory directly.

Return values

SSP_SUCCESS	Operation successful.
SSP_ERR_INVALID_ADDRESS	Invalid Flash address was supplied.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_dest_address

Eliminate warning if parameter checking is disabled.

Copy data to the destination buffer.

◆ R_FLASH_HP_Reset()

ssp_err_t R_FLASH_HP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Resets the FLASH peripheral. Implements flash_api_t::reset. No attempt is made to grab the Flash software lock before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

SSP_SUCCESS	Flash circuit successfully reset.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

Reset the flash.

Release the flash.

◆ R_FLASH_HP_StartUpAreaSelect()

ssp_err_t R_FLASH_HP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window. Implements flash_api_t::startupAreaSelect.

Return values

SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_HW_CONDITION	The configuration area cannot be written while DTC/DMAC, EDMAC, LCDC/2DG/JPEG are enabled. This is to prevent prohibited memory accesses while the flash sequencer is running. Refer to the technical update number TN-SY*-A033A/E. This check can be disabled by defining R_FLASH_HP_CHECK_MODULE_STOP_BITS to 0. To disable DMAC/DTC, close all modules using DMAC/DTC and call the following: ssp_err_t err; ssp_feature_t ssp_feature = {{(ssp_ip_t) 0U}}; ssp_feature.id = SSP_IP_DTC; err = R_BSP_ModuleStopAlways(&ssp_feature);
SSP_ERR_INVALID_LINKED_ADDRESS	HW_FLASH_HP_configurationSet is linked to an invalid region of memory. This function must not reside in prohibited regions of memory. It is recommended that the following changes be made to the linker script. For information about prohibited regions refer to the S5 series flash technical update. Technical Update number TN-SY*-A033A/E Recommended Changes: For GCC: Add the following immediately after "__data_start__ = .": . = ALIGN(4); __Code_In_RAM_Start = .; KEEP(*(.code_in_ram*)) __Code_In_RAM_End = .; For IAR: Change: place at start of RAM_region { block START_OF_RAM }; To: define block START_OF_RAM with fixed order { rw section .ssp_dtc_vector_table, block RAM_CODE }; place at start of RAM_region { block START_OF_RAM };

Enter PE Mode.

Swap the block temporarily or permantly based on caller.

If failure reset the flash.

Release the flash and return status.

◆ R_FLASH_HP_StatusGet()

ssp_err_t R_FLASH_HP_StatusGet (flash_ctrl_t *const *p_api_ctrl*)

Query the FLASH peripheral for its status. Implements flash_api_t::statusGet.

Return values

SSP_SUCCESS	FLASH peripheral is ready to use.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.

Eliminate warning if parameter checking is disabled.

Return flash status

◆ R_FLASH_HP_UpdateFlashClockFreq()

ssp_err_t R_FLASH_HP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API, that the FCLK has changed since the Open(). This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro. This function uses R_CGC_SystemClockFreqGet() to get the current FCLK frequency. Implements flash_api_t::updateFlashClockFreq.

Return values

SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

Lock the flash state. If failure return error.

Flash Setup

Release the flash.

◆ R_FLASH_HP_VersionGet()

ssp_err_t R_FLASH_HP_VersionGet (ssp_version_t *const *p_version*)

This function gets FLASH HAL driver version.

Return values

SSP_SUCCESS	- operation performed successfully

Note

This function is reentrant.

Copy the version information.

◆ R_FLASH_HP_Write()

ssp_err_t R_FLASH_HP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Writes to the specified Code or Data Flash memory area. Implements flash_api_t::write.

Return values

SSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
SSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
SSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
SSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
SSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
SSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to write CF was requested.

Get the block information for this address. If failure return error.

Initiate the write operation, may return SSP_ERR_IN_USE via setup_for_pe_mode()

Execute a reset if any error, release the state if not BGO

flash_hp_instance_ctrl_t Struct Reference

Detailed Description

Driver for the Low power Flash Memory (S3A7 and S124).

This module supports the Flash interface for the Low-power FLASH peripheral.

Function Documentation

◆ R_FLASH_LP_AccessWindowClear()

ssp_err_t R_FLASH_LP_AccessWindowClear (flash_ctrl_t *const *p_api_ctrl*)

Remove any access window that is configured in the Code Flash. Implements flash_api_t::accessWindowClear. On successful return from this call all Code Flash is writable.

Return values

SSP_SUCCESS	Access window successfully removed.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

< Return error if Code Flash not enabled

◆ R_FLASH_LP_AccessWindowSet()

ssp_err_t R_FLASH_LP_AccessWindowSet (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *start_addr*, uint32_t const *end_addr*)

Configure an access window for the Code Flash memory. Implements flash_api_t::accessWindowSet .

An access window defines a contiguous area in Code Flash for which programming/erase is enabled. This area is on block boundaries. The block containing start_addr is the first block. The block containing end_addr is the last block. The access window then becomes first block –> last block inclusive. Anything outside this range of Code Flash is then write protected. As an example, if you wanted to place an accesswindow on Code Flash Blocks 0 and 1, such that only those two blocks were writable, you would need to specify (address in block 0, address in block 2) as the respective start and end address.

Note

If the start address and end address are set to the same value, then the access window is effectively removed. This accomplishes the same functionality as R_FLASH_LP_AccessWindowClear().

The invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Return values

SSP_SUCCESS	Access window successfully configured.
SSP_ERR_INVALID_ADDRESS	Invalid settings for start_addr and/or end_addr.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

If not code flash return error.

◆ R_FLASH_LP_BlankCheck()

ssp_err_t R_FLASH_LP_BlankCheck (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t *num_bytes*, flash_result_t * *p_blank_check_result*)

Perform a blank check on the specified address area. Implements flash_api_t::blankCheck.

The minimum/maximum number of bytes, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information. The number of bytes for Data Flash blank checking must be between (1 and FLASH_DATA_BLANK_CHECK_MAX). The number of bytes for Code Flash blank checking must be between (1 and FLASH_CODE_BLANK_CHECK_MAX).

Return values

SSP_SUCCESS	Blankcheck operation completed with result in p_blank_check_result, or blankcheck started and in-progess (BGO mode).
SSP_ERR_INVALID_ADDRESS	Invalid data flash address was input
SSP_ERR_INVALID_SIZE	'num_bytes' was either too large or not aligned for the CF/DF boundary size.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to Blank Check CF was requested.

Get the block information for this address. If failure return error.

Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE

Initiate the Blank Check operation

If failure reset the flash.

If the current operation is not a BGO blank check release the flash.

◆ R_FLASH_LP_Close()

ssp_err_t R_FLASH_LP_Close (flash_ctrl_t *const *p_api_ctrl*)

Release any resources that were allocated by the Flash API. Implements flash_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg.

Unlock the flash hardware.

Disable the flash interrupt.

Mark the control block as closed.

Release the lock

◆ R_FLASH_LP_Erase()

ssp_err_t R_FLASH_LP_Erase (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *address*, uint32_t const *num_blocks*)

Erase the specified Code or Data Flash blocks. Implements flash_api_t::erase.

The minimum/maximum number of blocks, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Return values

SSP_SUCCESS	Successful open.
SSP_ERR_INVALID_BLOCKS	Invalid number of blocks specified
SSP_ERR_INVALID_ADDRESS	Invalid address specified
SSP_ERR_IN_USE	Other flash operation in progress, or API not initialized
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Erase an area that is protected by an Access Window.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to erase CF was requested.

Get the block information for this address. If failure return error.

Update Flash state and enter the respective Code or Data Flash P/E mode, may return SSP_ERR_IN_USE

If successful

Configure the current parameters based on if the operation is for code flash or data flash.

If this is a request to erase Data Flash configure BGO mode if it is enabled.

Initiate the flash erase.

If in non-BGO mode, the current operation is complete. Exit PE mode and return status

Complete the flash operation.

◆ R_FLASH_LP_IdCodeSet()

ssp_err_t R_FLASH_LP_IdCodeSet (flash_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_id_code*, flash_id_code_mode_t *mode*)

Write the ID code provided to the id code registers. Implements flash_api_t::idCodeSet.

Return values

SSP_SUCCESS	ID code successfully configured.
SSP_ERR_IN_USE	FLASH peripheral is busy with a prior operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled.
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.
SSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation.
SSP_ERR_TIMEOUT	Timed out waiting for completion of extra command.

Return status.

◆ R_FLASH_LP_InfoGet()

ssp_err_t R_FLASH_LP_InfoGet (flash_ctrl_t *const *p_api_ctrl*, flash_info_t *const *p_info*)

Returns the information about the flash regions. Implements flash_api_t::infoGet.

Return values

SSP_SUCCESS	Successful retrieved the request information.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_info.

Copy the region data to the info structure.

◆ R_FLASH_LP_Open()

ssp_err_t R_FLASH_LP_Open (flash_ctrl_t *const *p_api_ctrl*, flash_cfg_t const *const *p_cfg*)

Initialize the Low Power flash peripheral. Implements flash_api_t::open.

The Open function initializes the Flash. It first copies the FCU firmware to FCURAM and sets the FCU Clock based on the current FCLK frequency. In addition, if Code Flash programming is enabled, the API code responsible for Code Flash programming will be copied to RAM.

This function must be called once prior to calling any other FLASH API functions. If a user supplied

callback function is supplied, then the Flash Ready interrupt will be configured to call the users callback routine with an Event type describing the source of the interrupt for Data Flash operations. Subsequent to successfully completing this call p_ctrl->opened will be true.

Note

Providing a callback function in the supplied p_cfg->callback field, automatically configures the Flash for Data Flash to operate in non-blocking (BGO) mode.

Subsequent to a successful Open(), the Flash is ready to process additional Flash commands.

Return values

SSP_SUCCESS	Initialization was successful and timer has started.
SSP_FLASH_ERR_FAILURE	Failed to successfully enter Programming/Erase mode.
SSP_ERR_TIMEOUT	Timed out waiting for FCU to be ready.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_cfg or problem getting FMI info.
SSP_ERR_IRQ_BSP_DISABLED	Caller is requesting BGO but the Flash interrupts are not enabled.
SSP_ERR_FCLK	FCLK must be a minimum of 1 MHz for Flash operations.
SSP_ERR_IN_USE	Flash Open() has already been called.
SSP_ERR_HW_LOCKED	Flash module unable to get the Hardware lock for the Flash LP Periperhal.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

If null pointers return error.

If open return error.

Setup flash FMI. If failure return error.

Allow Initialization if not initialized or if no operation is ongoing and re-initialization is desired

Acquire the software lock. If failure return error.

Set the parameters struct based on the user supplied settings

Setup the Flash interrupt callback based on the caller's info. If the Flash interrupt is not enabled in the BSP then this will return SSP_ERR_IRQ_BSP_DISABLED

Make sure Flash interrupts are disabled, they are only used in BGO mode

Setup the flash.

Save callback function pointer

◆ R_FLASH_LP_Read()

ssp_err_t R_FLASH_LP_Read (flash_ctrl_t *const *p_api_ctrl*, uint8_t * *p_dest_address*, uint32_t const *flash_address*, uint32_t const *num_bytes*)

Read the requested number of bytes from the supplied Data or Code Flash address. Implements flash_api_t::read.

The minimum/maximum number of blocks, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Note

This function is provided simply for the purposes of maintaining a complete interface. It is possible (and recommended), to read Flash memory directly.

Return values

SSP_SUCCESS	Operation successful.
SSP_ERR_INVALID_ADDRESS	Invalid Flash address was supplied.
SSP_ERR_ASSERTION	NULL provided for p_ctrl or p_dest_address
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

Copy the data to the destination buffer.

◆ R_FLASH_LP_Reset()

ssp_err_t R_FLASH_LP_Reset (flash_ctrl_t *const *p_api_ctrl*)

Reset the FLASH peripheral. Implements flash_api_t::reset.

No attempt is made to grab the Flash software lock before executing the reset since the assumption is that a reset will terminate any existing operation.

Return values

SSP_SUCCESS	Flash circuit successfully reset.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

Reset the flash.

Release the flash.

◆ R_FLASH_LP_StartUpAreaSelect()

ssp_err_t R_FLASH_LP_StartUpAreaSelect (flash_ctrl_t *const *p_api_ctrl*, flash_startup_area_swap_t *swap_type*, bool *is_temporary*)

Select which block is used as the startup area block. Implements flash_api_t::startupAreaSelect.

Selects which block - Default (Block 0) or Alternate (Block 1) is used as the startup area block. The provided parameters determine which block will become the active startup block and whether that action will be immediate (but temporary), or permanent subsequent to the next reset. Doing a temporary switch might appear to have limited usefulness. If there is an access window in place such that Block 0 is write protected, then one could do a temporary switch, update the block and switch them back without having to touch the access window.

Return values

SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

If the swap type is BTFLG and the operation is temporary there's nothing to do. Return success.

Update Flash state and enter the respective Code or Data Flash P/E mode.

If successful call the temporary or boot startup area set functions depending on the users flag.

If successful return to read mode otherwise reset the flash.

Release the flash.

◆ R_FLASH_LP_StatusGet()

ssp_err_t R_FLASH_LP_StatusGet (flash_ctrl_t *const *p_api_ctrl*)

Query the FLASH for its status. Implements flash_api_t::statusGet.

Return values

SSP_SUCCESS	Flash is ready and available to accept commands.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

Return flash status

◆ R_FLASH_LP_UpdateFlashClockFreq()

ssp_err_t R_FLASH_LP_UpdateFlashClockFreq (flash_ctrl_t *const *p_api_ctrl*)

Indicate to the already open Flash API that the FCLK has changed. Implements r_flash_t::updateFlashClockFreq.

This could be the case if the application has changed the system clock, and therefore the FCLK. Failure to call this function subsequent to changing the FCLK could result in damage to the flash macro. This function uses R_CGC_SystemClockFreqGet() to get the current FCLK frequency.

Return values

SSP_SUCCESS	Start-up area successfully toggled.
SSP_ERR_IN_USE	Flash is busy with an on-going operation.
SSP_ERR_ASSERTION	NULL provided for p_ctrl
SSP_ERR_NOT_OPEN	Flash API has not yet been opened.

Lock the flash state. If failure return error.

Setup the Flash.

Release the flash.

◆ R_FLASH_LP_VersionGet()

ssp_err_t R_FLASH_LP_VersionGet (ssp_version_t *const *p_version*)

Get FLASH HAL driver version.

Return values

SSP_SUCCESS	- operation performed successfully

Note

This function is reentrant.

Return the version id of the flash lp module.

◆ R_FLASH_LP_Write()

ssp_err_t R_FLASH_LP_Write (flash_ctrl_t *const *p_api_ctrl*, uint32_t const *src_address*, uint32_t *flash_address*, uint32_t const *num_bytes*)

Write to the specified Code or Data Flash memory area. Implements flash_api_t::write.

The minimum/maximum number of bytes, as well as the invalid address and programming boundaries supported and enforced by this function are dependent on the MCU in use as well as the part package size. Please see the User manual and/or requirements document for additional information.

Return values

SSP_SUCCESS	Operation successful. If BGO is enabled this means the operation was started successfully.
SSP_ERR_IN_USE	The Flash peripheral is busy with a prior on-going transaction.
SSP_ERR_NOT_OPEN	The Flash API is not Open.
SSP_ERR_CMD_LOCKED	FCU is in locked state, typically as a result of attempting to Write an area that is protected by an Access Window.
SSP_ERR_WRITE_FAILED	Status is indicating a Programming error for the requested operation. This may be returned if the requested Flash area is not blank.
SSP_ERR_TIMEOUT	Timed out waiting for FCU operation to complete.
SSP_ERR_INVALID_SIZE	Number of bytes provided was not a multiple of the programming size or exceeded the maximum range.
SSP_ERR_INVALID_ADDRESS	Invalid address was input or address not on programming boundary.
SSP_ERR_ASSERTION	NULL provided for p_ctrl.
SSP_ERR_INVALID_ARGUMENT	Code Flash Programming is not enabled and a request to write CF was requested.

Get the block information for this address. If failure return error.

Initiate the write operation.

Return status.

flash_lp_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Low Power Flash

#include <r_flash_lp.h>

Data Fields

uint32_t	opened To check whether api has been opened or not.
void *	p_reg Base address of flash registers.
bsp_cache_state_t	cache_state Used to disable and then restore Flash Cache while API is open.
IRQn_Type	irq Flash ready interrupt number.

Detailed Description

Flash instance control block. DO NOT INITIALIZE.

Detailed Description

Driver for the Graphics LCD Controller (GLCDC).

Summary

Implements Display Interface. This module supports the Graphics LCD Controller (GLCDC). It implements the display interface and drives LCD panels connected to the GLCDC pins.

Enumeration Type Documentation

◆ glcd_bus_arbitration_t

enum glcd_bus_arbitration_t	
Bus Arbitration setting	
Enumerator	
GLCD_BUS_ARBITRATION_ROUNDROBIN	Round robin.
GLCD_BUS_ARBITRATION_FIX_PRIORITY	Fixed.

◆ glcd_clk_src_t

enum glcd_clk_src_t	
Clock source select	
Enumerator	
GLCD_CLK_SRC_INTERNAL	Internal.
GLCD_CLK_SRC_EXTERNAL	External.

◆ glcd_clut_plane_t

enum glcd_clut_plane_t	
Clock phase adjustment for serial RGB output	
Enumerator	
GLCD_CLUT_PLANE_0	GLCD CLUT plane 0.
GLCD_CLUT_PLANE_1	GLCD CLUT plane 1.

◆ glcd_correction_proc_order_t

enum glcd_correction_proc_order_t	
Correction circuit sequence control	
Enumerator	
GLCD_CORRECTION_PROC_ORDER_BRIGHTNESS_CONTRAST2GAMMA	Brightness -> contrast -> gamma correction.
GLCD_CORRECTION_PROC_ORDER_GAMMA2BRIGHTNESS_CONTRAST	Gamma correction -> brightness -> contrast.

◆ glcd_dithering_mode_t

enum glcd_dithering_mode_t	
Dithering mode	
Enumerator	
GLCD_DITHERING_MODE_TRUNCATE	No dithering (truncate)
GLCD_DITHERING_MODE_ROUND_OFF	Dithering with round off.
GLCD_DITHERING_MODE_2X2PATTERN	Dithering with 2x2 pattern.
GLCD_DITHERING_MODE_SETTING_MAX	Setting prohibited.

◆ glcd_dithering_output_format_t

enum glcd_dithering_output_format_t	
Dithering output format	
Enumerator	
GLCD_DITHERING_OUTPUT_FORMAT_RGB888	Dithering output format RGB888.
GLCD_DITHERING_OUTPUT_FORMAT_RGB666	Dithering output format RGB666.
GLCD_DITHERING_OUTPUT_FORMAT_RGB565	Dithering output format RGB565.

◆ glcd_dithering_pattern_t

enum glcd_dithering_pattern_t	
Dithering mode	
Enumerator	
GLCD_DITHERING_PATTERN_00	2x2 pattern '00'
GLCD_DITHERING_PATTERN_01	2x2 pattern '01'
GLCD_DITHERING_PATTERN_10	2x2 pattern '10'
GLCD_DITHERING_PATTERN_11	2x2 pattern '11'

◆ glcd_input_interface_format_t

enum glcd_input_interface_format_t	
Output interface format	
Enumerator	
GLCD_INPUT_INTERFACE_FORMAT_RGB565	Input interface format RGB565.
GLCD_INPUT_INTERFACE_FORMAT_RGB888	Input interface format RGB888.
GLCD_INPUT_INTERFACE_FORMAT_ARGB1555	Input interface format ARGB1555.
GLCD_INPUT_INTERFACE_FORMAT_ARGB4444	Input interface format ARGB4444.
GLCD_INPUT_INTERFACE_FORMAT_ARGB8888	Input interface format ARGB8888.
GLCD_INPUT_INTERFACE_FORMAT_CLUT8	Input interface format CLUT8.
GLCD_INPUT_INTERFACE_FORMAT_CLUT4	Input interface format CLUT4.
GLCD_INPUT_INTERFACE_FORMAT_CLUT1	Input interface format CLUT1.

◆ glcd_output_interface_format_t

enum glcd_output_interface_format_t	
Output interface format	
Enumerator	
GLCD_OUTPUT_INTERFACE_FORMAT_RGB888	Output interface format RGB888.
GLCD_OUTPUT_INTERFACE_FORMAT_RGB666	Output interface format RGB666.
GLCD_OUTPUT_INTERFACE_FORMAT_RGB565	Output interface format RGB565.
GLCD_OUTPUT_INTERFACE_FORMAT_SERIAL_RGB	Output interface format Serial RGB.

◆ glcd_panel_clk_div_t

enum glcd_panel_clk_div_t	
Clock frequency division ratio	
Enumerator	
GLCD_PANEL_CLK_DIVISOR_1	Division Ratio 1/1.
GLCD_PANEL_CLK_DIVISOR_2	Division Ratio 1/2.
GLCD_PANEL_CLK_DIVISOR_3	Division Ratio 1/3.
GLCD_PANEL_CLK_DIVISOR_4	Division Ratio 1/4.
GLCD_PANEL_CLK_DIVISOR_5	Division Ratio 1/5.
GLCD_PANEL_CLK_DIVISOR_6	Division Ratio 1/6.
GLCD_PANEL_CLK_DIVISOR_7	Division Ratio 1/7.
GLCD_PANEL_CLK_DIVISOR_8	Division Ratio 1/8.
GLCD_PANEL_CLK_DIVISOR_9	Division Ratio 1/9.
GLCD_PANEL_CLK_DIVISOR_12	Division Ratio 1/12.
GLCD_PANEL_CLK_DIVISOR_16	Division Ratio 1/16.
GLCD_PANEL_CLK_DIVISOR_24	Division Ratio 1/24.
GLCD_PANEL_CLK_DIVISOR_32	Division Ratio 1/32.

◆ glcd_tcon_pin_t

enum glcd_tcon_pin_t	
LCD TCON output pin select	
Enumerator	
GLCD_TCON_PIN_NONE	No output.
GLCD_TCON_PIN_0	LCD_TCON0.
GLCD_TCON_PIN_1	LCD_TCON1.
GLCD_TCON_PIN_2	LCD_TCON2.
GLCD_TCON_PIN_3	LCD_TCON3.

◆ glcd_tcon_signal_select_t

enum glcd_tcon_signal_select_t	
Timing signals for driving the LCD panel	
Enumerator	
GLCD_TCON_SIGNAL_SELECT_STVA_VS	STVA/VS.
GLCD_TCON_SIGNAL_SELECT_STVB_VE	STVB/VE.
GLCD_TCON_SIGNAL_SELECT_STHA_HS	STH/SP/HS.
GLCD_TCON_SIGNAL_SELECT_STHB_HE	STB/LP/HE.
GLCD_TCON_SIGNAL_SELECT_DE	DE.

Function Documentation

◆ R_GLCD_Close()

ssp_err_t R_GLCD_Close (display_ctrl_t *const *p_api_ctrl*)

Close GLCDC module.

Implements

- display_api_t::close.

Return values

SSP_SUCCESS	Device was closed successfully.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	The function call is performed when the driver state is not equal to DISPLAY_STATE_CLOSED.
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed when the GLCD is updating register values internally.

Note

This API can be called when the driver is not in DISPLAY_STATE_CLOSED state. It returns an error if the register update operation for the background screen generation block is being held.

Disable the GLCD interrupts

Reset the GLCD hardware

Halt the peripheral clock to the GLCD module

Unlock the GLCD resource

◆ R_GLCD_ClutUpdate()

ssp_err_t R_GLCD_ClutUpdate (display_ctrl_t const *const *p_api_ctrl*, display_clut_cfg_t const *const *p_clut_cfg*, display_frame_layer_t *frame*)

Update Color Look Up Table of GLCDC module.

Implements

- display_api_t::clut.

Return values

SSP_SUCCESS	CLUT updated successfully.
SSP_ERR_ASSERTION	Pointer to the control block or CLUT source data is NULL.
SSP_ERR_INVALID_CLUT_ACCESS	Illegal CLUT entry or size is specified.

Note

This API can be called any time.

Check the CLUT table current used

Copy the new CLUT data on the source memory to the CLUT SRAM in the GLCD module

Make the GLCD module read the new CLUT table data from the next frame

◆ R_GLCD_ColorCorrection()

ssp_err_t R_GLCD_ColorCorrection (display_ctrl_t const *const *p_api_ctrl*, display_correction_t const *const *p_correction*)

Perform color correction by GLCDC module.

Implements

- display_api_t::correction.

Return values

SSP_SUCCESS	Color correction by GLCDC module was performed successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the display correction structure is NULL.
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCDC is updating registers internally.

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the output control block is being held.

Configure the brightness and contrast correction register setting.

Update the Output block register setting.

◆ R_GLCD_LayerChange()

ssp_err_t R_GLCD_LayerChange (display_ctrl_t const *const *p_api_ctrl*, display_runtime_cfg_t const *const *p_cfg*, display_frame_layer_t *frame*)

Change layer parameters of GLCDC module at runtime.

Implements

- display_api_t::layerChange.

Return values

SSP_SUCCESS	Changed layer parameters of GLCDC module successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_INVALID_MODE	A function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_ARGUMENT	An invalid parameter is found in the argument.
SSP_ERR_INVALID_UPDATE_TIMING	A function call is performed while the GLCD is updating register values internally.

Note

This API can be called when the driver is in DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks or the graphics data I/F block is being held.

Configure the graphics plane layers

Reflect the graphics module register value to the GLCD internal operations (at the timing of the next Vsync assertion)

◆ R_GLCD_Open()

ssp_err_t R_GLCD_Open (display_ctrl_t *const *p_api_ctrl*, display_cfg_t const *const *p_cfg*)

Open GLCDC module.

Implements

- display_api_t::open.

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
SSP_ERR_HW_LOCKED	GLCDC resource is locked.
SSP_ERR_CLOCK_GENERATION	Dot clock cannot be generated from clock

	source.
SSP_ERR_INVALID_TIMING_SETTING	Invalid panel timing parameter.
SSP_ERR_INVALID_LAYER_SETTING	Invalid layer setting found.
SSP_ERR_INVALID_LAYER_FORMAT	Invalid format is specified.
SSP_ERR_INVALID_GAMMA_SETTING	Invalid gamma correction setting found.

Note

PCLKA must be supplied to Graphics LCD Controller (GLCDC) and GLCDC pins must be set in IOPORT before calling this API.

Lock the GLCD resource

Supply the peripheral clock to the GLCD module

Release GLCD from a SW reset status.

Set the dot clock frequency

Set the panel signal timing

Configure the background screen

Store back poach position to the control block (needed to define the layer blending position later)

Configure the graphics plane layers

Configure the output control block

Configure the color correction setting (brightness, brightness and gamma correction)

Change GLCD driver state

Save callback function

Save user defined context

Save the display interface context into GLCD HAL control block

Set the line number which is suppose to happen the line detect interrupt

◆ R_GLCD_Start()

ssp_err_t R_GLCD_Start (display_ctrl_t *const *p_api_ctrl*)

Start GLCDC module.

Implements

- display_api_t::start.

Return values

SSP_SUCCESS	Device was started successfully.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_OPENED.

Note

This API can be called when the driver is not in DISPLAY_STATE_OPENED status.

Start to output the vertical and horizontal synchronization signals and screen data.

Enable Line detect function

◆ R_GLCD_StatusGet()

ssp_err_t R_GLCD_StatusGet (display_ctrl_t const *const *p_api_ctrl*, display_status_t *const *p_status*)

Get status of GLCDC module.

Implements

- display_api_t::statusGet.

Return values

SSP_SUCCESS	Got status successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the status structure is NULL.

Note

The GLCD hardware starts the fading processing at the first Vsync after the previous LayerChange() call is held. Due to this behavior of the hardware, this API may not return DISPLAY_FADE_STATUS_FADING_UNDERWAY as the fading status, if it is called before the first Vsync after LayerChange() is called. In this case, the API returns DISPLAY_FADE_STATUS_UNCERTAIN, instead of DISPLAY_FADE_STATUS_NOT_UNDERWAY.

Return the GLCD HAL driver state

Return the fading status for the layers

◆ R_GLCD_Stop()

ssp_err_t R_GLCD_Stop (display_ctrl_t *const *p_api_ctrl*)

Stop GLCDC module.

Implements

- display_api_t::stop.

Return values

SSP_SUCCESS	Device was stopped successfully
SSP_ERR_ASSERTION	Pointer to the control block is NULL
SSP_ERR_INVALID_MODE	Function call is performed when the driver state is not DISPLAY_STATE_DISPLAYING.
SSP_ERR_INVALID_UPDATE_TIMING	The function call is performed while the GLCD is updating register values internally.

Note

This API can be called when the driver is in the DISPLAY_STATE_DISPLAYING state. It returns an error if the register update operation for the background screen generation blocks, the graphics data I/F blocks, or the output control block is being held.

Stop outputting the vertical and horizontal synchronization signals and screen data.

◆ R_GLCD_VersionGet()

ssp_err_t R_GLCD_VersionGet (ssp_version_t * *p_version*)

Get version of R_GLCDC module.

Implements

- display_api_t::versionGet.

Parameters

p_version	The version number

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	NULL pointer is passed to function.

Note

This function is re-entrant.

glcd_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » GLCDC

#include <r_glcd.h>

Data Fields

display_state_t	state Status of GLCD module.
void(*	p_callback)(display_callback_args_t *p_args) Pointer to callback function.
void const *	p_context Pointer to the higher level device context.
R_GLCDC_Type *	p_reg Base register address.

Detailed Description

Display control block. DO NOT INITIALIZE.

Detailed Description

Driver for the General PWM Timer (GPT).

Summary

Extends Timer Interface.

This module implements the Timer Interface using the General PWM Timer (GPT) peripherals GPT32EH, GPT32E, GPT32. It also provides an output compare extension to output the timer signal to the GTIOC pin.

Enumeration Type Documentation

◆ gpt_output_t

enum gpt_output_t	
Output level used when selecting what happens at compare match or cycle end.	
Enumerator	
GPT_OUTPUT_RETAINED	Output retained.
GPT_OUTPUT_LOW	Output low.
GPT_OUTPUT_HIGH	Output high.
GPT_OUTPUT_TOGGLED	Output toggled.

◆ gpt_pin_level_t

enum gpt_pin_level_t	
Level of GPT pin	
Enumerator	
GPT_PIN_LEVEL_LOW	Pin level low.
GPT_PIN_LEVEL_HIGH	Pin level high.
GPT_PIN_LEVEL_RETAINED	Pin level retained.

◆ gpt_shortest_level_t

enum gpt_shortest_level_t	
GPT PWM shortest pin level	
Enumerator	
GPT_SHORTEST_LEVEL_OFF	1 extra PCLK in ON time. Minimum ON time will be limited to 2 PCLK raw counts.
GPT_SHORTEST_LEVEL_ON	1 extra PCLK in OFF time. Minimum ON time will be limited to 1 PCLK raw counts.

◆ gpt_trigger_t

enum gpt_trigger_t	
Sources can be used to start the timer, stop the timer, count up, or count down.	
Enumerator	
GPT_TRIGGER_NONE	No action performed.
GPT_TRIGGER_GTIOCA_RISING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input rises while GTIOCB is low.
GPT_TRIGGER_GTIOCA_RISING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input rises while GTIOCB is high.
GPT_TRIGGER_GTIOCA_FALLING_WHILE_GTIOCB_LOW	Action performed when GTIOCA input falls while GTIOCB is low.
GPT_TRIGGER_GTIOCA_FALLING_WHILE_GTIOCB_HIGH	Action performed when GTIOCA input falls while GTIOCB is high.
GPT_TRIGGER_GTIOCB_RISING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input rises while GTIOCA is low.
GPT_TRIGGER_GTIOCB_RISING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input rises while GTIOCA is high.
GPT_TRIGGER_GTIOCB_FALLING_WHILE_GTIOCA_LOW	Action performed when GTIOCB input falls while GTIOCA is low.
GPT_TRIGGER_GTIOCB_FALLING_WHILE_GTIOCA_HIGH	Action performed when GTIOCB input falls while GTIOCA is high.
GPT_TRIGGER_SOURCE_REGISTER_ENABLE	Enables settings in the Source Select Register.

Function Documentation

◆ R_GPT_Close()

ssp_err_t R_GPT_Close (timer_ctrl_t *const *p_api_ctrl*)

Stops counter, disables output pins, and clears internal driver data.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

Cleanup. Stop counter and disable output.

Unlock channel

Clear stored internal driver data

◆ R_GPT_CounterGet()

ssp_err_t R_GPT_CounterGet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t *const *p_value*)

Sets counter value in provided p_value pointer. Implements timer_api_t::counterGet.

Return values

SSP_SUCCESS	Counter value read, p_value is valid.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Read counter value

◆ R_GPT_DutyCycleSet()

ssp_err_t R_GPT_DutyCycleSet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t const *duty_cycle*, timer_pwm_unit_t const *unit*, uint8_t const *pin*)

Sets status in provided p_status pointer. Implements pwm_api_t::dutyCycleSet.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INVALID_ARGUMENT	The pin value is out of range; Should be either 0 (for GTIOCA) or 1 (for GTIOCB).

Converted duty cycle to PCLK counts before it can be set in registers

Set duty cycle.

◆ R_GPT_InfoGet()

ssp_err_t R_GPT_InfoGet (timer_ctrl_t *const *p_api_ctrl*, timer_info_t *const *p_info*)

Get timer information and store it in provided pointer p_info. Implements timer_api_t::infoGet.

Return values

SSP_SUCCESS	Period, count direction, frequency, and status value written to caller's structure successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_info parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Get and store period

Get and store clock frequency

Get and store clock counting direction

◆ R_GPT_PeriodSet()

ssp_err_t R_GPT_PeriodSet (timer_ctrl_t *const *p_api_ctrl*, timer_size_t const *period*, timer_unit_t const *unit*)

Sets period value provided. Implements timer_api_t::periodSet.

Return values

SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARGUMENT	One of the following is invalid: • p_period->unit: must be one of the options from timer_unit_t • p_period->value: must result in a period in the following range: ◦ Lower bound: (1 / (PCLK frequency)) ◦ Upper bound: (0xFFFFFFFF * 1024 / (PCLK frequency))
SSP_ERR_NOT_OPEN	The channel is not opened.

Delay must be converted to PCLK counts before it can be set in registers

Make sure period is valid.

Store current status, then stop timer before setting divisor register

Reset counter in case new cycle is less than current count value, then restore state (counting or stopped).

◆ R_GPT_Reset()

ssp_err_t R_GPT_Reset (timer_ctrl_t *const *p_api_ctrl*)

Resets the counter value to 0. Implements timer_api_t::reset.

Return values

SSP_SUCCESS	Counter value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Write the counter value

◆ R_GPT_Start()

ssp_err_t R_GPT_Start (timer_ctrl_t *const *p_api_ctrl*)

Starts timer. Implements timer_api_t::start.

Return values

SSP_SUCCESS	Timer successfully started.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Start timer

◆ R_GPT_Stop()

ssp_err_t R_GPT_Stop (timer_ctrl_t *const *p_api_ctrl*)

Stops timer. Implements timer_api_t::stop.

Return values

SSP_SUCCESS	Timer successfully stopped.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Stop timer

◆ R_GPT_TimerOpen()

ssp_err_t R_GPT_TimerOpen (timer_ctrl_t *const *p_api_ctrl*, timer_cfg_t const *const *p_cfg*)

Powers on GPT, handles required initialization described in hardware manual. Implements timer_api_t::open.

The Open function configures a single GPT channel, starts the channel, and provides a handle for use with the GPT API Control and Close functions. This function must be called once prior to calling any other GPT API functions. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

GPT hardware does not support one-shot functionality natively. When using one-shot mode, the timer will be stopped in an ISR after the requested period has elapsed.

The GPT implementation of the general timer can accept a timer_on_gpt_cfg_t extension parameter.

Return values

SSP_SUCCESS	Initialization was successful and timer has started.

SSP_ERR_ASSERTION	One of the following parameters is incorrect. Either • p_cfg is NULL, OR • p_ctrl is NULL, OR
SSP_ERR_INVALID_ARGUMENT	One of the following parameters is invalid: • p_cfg->period: must be in the following range: ◦ Lower bound: (1 / (PCLK frequency) ◦ Upper bound: (0xFFFFFFFF * 1024 / (PCLK frequency)) • p_cfg->p_callback not NULL, but ISR is not enabled. ISR must be enabled to use callback function. Enable channel's overflow ISR in bsp_irq_cfg.h.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.
SSP_ERR_IRQ_BSP_DISABLED	- p_cfg->mode is TIMER_MODE_ONE_SHOT, but ISR is not enabled. ISR must be enabled to use one-shot mode.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	- The channel requested in the p_cfg parameter is not available on this device.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Calculate period and store internal variables

Save the configuration

Calculate duty cycle

Verify channel is not already used

Power on GPT before setting any hardware registers. Make sure the counter is stopped before setting mode register, PCLK divisor register, and counter register.

◆ R_GPT_VersionGet()

ssp_err_t R_GPT_VersionGet (ssp_version_t *const *p_version*)
Sets driver version based on compile time macros. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — The parameter p_version is NULL.

gpt_output_pin_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » GPT

#include <r_gpt.h>

Data Fields

bool	output_enabled Set to true to enable output, false to disable output.
gpt_pin_level_t	stop_level Select a stop level from gpt_pin_level_t.

Detailed Description

Configurations for output pins.

The documentation for this struct was generated from the following file:

- r_gpt.h

gpt_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » GPT

#include <r_gpt.h>

Data Fields

void(*	p_callback)(timer_callback_args_t *p_args)
void const *	p_context
void *	p_reg Base register for this channel.
uint32_t	open Whether or not channel is open.
uint8_t	channel Channel number.
bool	one_shot Whether or not timer is in one shot mode.
bool	gtioca_output_enabled Set to true to enable gtioca pin output.
bool	gtiocb_output_enabled Set to true to enable gtiocb pin output.
IRQn_Type	irq Counter overflow IRQ number.
timer_variant_t	variant Timer variant.
gpt_shortest_level_t	shortest_pwm_signal Shortest PWM signal level.

Detailed Description

Channel control block. DO NOT INITIALIZE. Initialization occurs when timer_api_t::open is called.

Field Documentation

◆ p_callback

void(* gpt_instance_ctrl_t::p_callback) (timer_callback_args_t *p_args)
Callback provided when a timer ISR occurs. NULL indicates no CPU interrupt.

◆ p_context

void const* gpt_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in timer_callback_args_t.

Detailed Description

Driver for the General PWM Timer (GPT) with Input Capture.

Summary

Extends Input Capture Interface.

This module implements the Input Capture Interface for the General PWM Timer (GPT) peripherals GPT32EH, GPT32E, GPT32.

Macro Definition Documentation

◆ GPT_INPUT_CAPTURE_CODE_VERSION_MAJOR

#define GPT_INPUT_CAPTURE_CODE_VERSION_MAJOR (2U)
Includes

Enumeration Type Documentation

◆ gpt_input_capture_clock_divider_t

enum gpt_input_capture_clock_divider_t	
Input capture PCLK divider. Used to scale the timer counter.	
Enumerator	
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_1	/ 1
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_4	/ 4
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_16	/ 16
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_64	/ 64
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_256	/ 256
GPT_INPUT_CAPTURE_CLOCK_DIVIDER_1024	/ 1024

◆ gpt_input_capture_signal_filter_t

enum gpt_input_capture_signal_filter_t	
Input capture signal noise filter (debounce) setting. Only available for input signals GTIOCxA and GTIOCxB. The noise filter samples the external signal at intervals of the PCLK divided by one of the values. When 3 consecutive samples are at the same level (high or low), then that level is passed on as the observed state of the signal. See "Noise Filter Function" in the hardware manual, GPT section.	
Enumerator	
GPT_INPUT_CAPTURE_SIGNAL_FILTER_1	PCLK/1 - fast sampling.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_4	PCLK/4.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_16	PCLK/16.
GPT_INPUT_CAPTURE_SIGNAL_FILTER_64	PCLK/64 - slow sampling.

◆ gpt_input_capture_signal_t

enum gpt_input_capture_signal_t	
Input capture signal selection	
Enumerator	
GPT_INPUT_CAPTURE_SIGNAL_PIN_GTIOCA	GTIOCxA pin, where x is channel number.
GPT_INPUT_CAPTURE_SIGNAL_PIN_GTIOCB	GTIOCxB pin, where x is channel number.

Function Documentation

◆ R_GPT_InputCaptureClose()

ssp_err_t R_GPT_InputCaptureClose (input_capture_ctrl_t *const *p_api_ctrl*)

Close a GPT Timer Channel for Input Capture. Implements input_capture_api_t::close.

Clears Timer settings, disables interrupts, and clears internal driver data.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

Cleanup. Disable interrupts and stop measurements.

Unlock channel

Clear stored internal driver data

◆ R_GPT_InputCaptureDisable()

ssp_err_t R_GPT_InputCaptureDisable (input_capture_ctrl_t const *const *p_api_ctrl*)

Disables GPT Input Capture RegA interrupt for specified channel at NVIC. Implements input_capture_api_t::disable.

Return values

SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Disable interrupts

Clearing the input capture source select registers.

◆ R_GPT_InputCaptureEnable()

ssp_err_t R_GPT_InputCaptureEnable (input_capture_ctrl_t const *const *p_api_ctrl*)

Enables GPT Input Capture RegA interrupt for specified channel at NVIC. Implements input_capture_api_t::enable.

Return values

SSP_SUCCESS	Interrupt enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Configuring the input capture source select registers.

Enabling the overflow and capture registers.

◆ R_GPT_InputCaptureInfoGet()

ssp_err_t R_GPT_InputCaptureInfoGet (input_capture_ctrl_t const *const *p_api_ctrl*, input_capture_info_t *const *p_info*)

Gets status into provided p_info pointer. Implements input_capture_api_t::infoGet.

Return values

SSP_SUCCESS	Success.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

◆ R_GPT_InputCaptureLastCaptureGet()

ssp_err_t R_GPT_InputCaptureLastCaptureGet (input_capture_ctrl_t const *const *p_api_ctrl*, input_capture_capture_t *const *p_capture*)

Update the last captured value and overflow count, in provided p_capture pointer. Implements input_capture_api_t::lastCaptureGet.

Return values

SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_value parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Set capture value

◆ R_GPT_InputCaptureOpen()

ssp_err_t R_GPT_InputCaptureOpen (input_capture_ctrl_t *const *p_api_ctrl*, input_capture_cfg_t const *const *p_cfg*)

Open a GPT Timer for Input Capture. Implements input_capture_api_t::open.

The Open function configures a single GPT channel for input capture and provides a handle for use with the other Input Capture API functions. This function must be called once prior to calling any other Input Capture API function. After a channel is opened, the Open function should not be called again for the same channel without first calling the associated Close function.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the parameters is NULL: p_cfg, p_ctrl, p_extend.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function or use associated Control commands to reconfigure the channel.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Verify channel is not already used

◆ R_GPT_InputCaptureVersionGet()

ssp_err_t R_GPT_InputCaptureVersionGet (ssp_version_t *const *p_version*)

Gets driver version based on compile time macros. Implements input_capture_api_t::versionGet.

Return values

SSP_SUCCESS	Success.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

gpt_input_capture_extend_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » GPT Input Capture

Extension configuration struct for TU Input Capture. More...

gpt_input_capture_clock_divider_t	clock_divider One of gpt_input_capture_clock_divider_t.
input_capture_signal_level_t	enable_level
bool	enable_filter One of gpt_input_capture_signal_filter_t.

Detailed Description

Extension configuration struct for TU Input Capture.

Pointed to by input_capture_cfg_t.p_extend

Field Documentation

◆ enable_level

input_capture_signal_level_t gpt_input_capture_extend_t::enable_level
The unused GTIOCx pin can be used as an enable signal to enable captures. If the Input Capture Signal Pin is GTIOCA, then the enable pin is GTIOCB. The enable level is set here if used.

The documentation for this struct was generated from the following file:

- r_gpt_input_capture.h

gpt_input_capture_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » GPT Input Capture

#include <r_gpt_input_capture.h>

Data Fields

uint32_t	open Whether or not channel is open.
uint8_t	channel The channel in use.
input_capture_mode_t	mode The mode of measurement being performed.
input_capture_repetition_t	repetition One-shot or periodic measurement.
uint32_t	capture_count The value of the timer captured at the time of interrupt.
uint32_t	overflows_last Overflow count that occurred during last measurement.
uint32_t	overflows_current Running count of overflows in current measurement.
void(*	p_callback)(input_capture_callback_args_t *p_args) Pointer to user callback.
void const *	p_context

	Pointer to user's context data, to be passed to the callback function.
void *	p_reg GPT base register for this channel.
IRQn_Type	capture_irq Capture IRQ number.
IRQn_Type	overflow_irq Overflow IRQ number.
input_capture_variant_t	variant Timer variant.
uint32_t	start_bitmask Start and Clear bitmask for input capture.
uint32_t	stop_bitmask Stop and capture bitmask for input capture.

Detailed Description

Channel control block. DO NOT INITIALIZE. Initialization occurs when input_capture_api_t::open is called.

The documentation for this struct was generated from the following file:

- r_gpt_input_capture.h

Detailed Description

Driver for the Interrupt Controller Unit (ICU) External pin interrupts function.

Summary

Extends External IRQ Interface.

This module implements the External IRQ Interface using the external input pins in the Interrupt Controller Unit (ICU).

Function Documentation

◆ R_ICU_ExternalIrqClose()

ssp_err_t R_ICU_ExternalIrqClose (external_irq_ctrl_t *const *p_api_ctrl*)

Disable external interrupt. Implements external_irq_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

Cleanup. Disable interrupt

Disable the interrupt, and then clear the interrupt pending bits and interrupt status.

Release BSP hardware lock

◆ R_ICU_ExternalIrqDisable()

ssp_err_t R_ICU_ExternalIrqDisable (external_irq_ctrl_t *const *p_api_ctrl*)

Disable external interrupt for specified channel at NVIC. Implements external_irq_api_t::disable.

Return values

SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	Requested IRQ is not defined in this system

Disable the interrupt, and then clear the interrupt pending bits and interrupt status.

◆ R_ICU_ExternalIrqEnable()

ssp_err_t R_ICU_ExternalIrqEnable (external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt for specified channel at NVIC. Implements external_irq_api_t::enable.

Return values

SSP_SUCCESS	Interrupt Enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_INTERNAL	Requested IRQ is not defined in this system

Clear the interrupt status and Pending bits, before the interrupt is enabled.

◆ R_ICU_ExternalIrqFilterDisable()

ssp_err_t R_ICU_ExternalIrqFilterDisable (external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt digital filter for specified channel. Implements external_irq_api_t::filterDisable.

Return values

SSP_SUCCESS	External interrupt digital filter disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Disable external interrupt digital filter

◆ R_ICU_ExternalIrqFilterEnable()

ssp_err_t R_ICU_ExternalIrqFilterEnable (external_irq_ctrl_t *const *p_api_ctrl*)

Enable external interrupt digital filter for specified channel. Implements external_irq_api_t::filterEnable.

Return values

SSP_SUCCESS	External interrupt digital filter enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Enable external interrupt digital filter

◆ R_ICU_ExternalIrqOpen()

ssp_err_t R_ICU_ExternalIrqOpen (external_irq_ctrl_t *const *p_api_ctrl*, external_irq_cfg_t const *const *p_cfg*)

Configure an external input pin for use with the button interface. Implements external_irq_api_t::open.

The Open function is responsible for preparing an external input pin for operation. After completion of the Open function the external input pin shall be enabled and ready to service interrupts. This function must be called once prior to calling any other external input pin API functions. Once successfully completed, the status of the selected external input pin will be set to "open". After that this function should not be called again for the same external input pin without first performing a "close" by calling R_ICU_ExternalIrqClose().

Return values

SSP_SUCCESS	Open successful.
SSP_ERR_ASSERTION	One of the following is invalid: • p_ctrl or p_cfg is NULL • The channel requested in p_cfg is not available on the device selected in r_bsp_cfg.h.
SSP_ERR_INVALID_ARGUMENT	p_cfg->p_callback is not NULL, but ISR is not enabled. ISR must be enabled to use callback function. Enable channel's overflow ISR in bsp_irq_cfg.h.
SSP_ERR_IN_USE	The channel specified has already been opened. No configurations were changed. Call the associated Close function to reconfigure the channel.
SSP_ERR_IP_CHANNEL_NOT_PRESENT	Requested channel does not exist on this device.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Get fmi feature information for ICU.

Acquire hardware lock for this specific external IRQ channel of the ICU

Initialize control block.

Configure interrupt if enabled

Perform hardware initializations based on configuration.

Mark the control block as open

◆ R_ICU_ExternalIrqTriggerSet()

ssp_err_t R_ICU_ExternalIrqTriggerSet (external_irq_ctrl_t *const *p_api_ctrl*, external_irq_trigger_t *hw_trigger*)

Set trigger value provided. Implements external_irq_api_t::triggerSet.

Return values

SSP_SUCCESS	Period value written successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_period parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Set trigger value provided

◆ R_ICU_ExternalIrqVersionGet()

ssp_err_t R_ICU_ExternalIrqVersionGet (ssp_version_t *const *p_version*)

Set driver version based on compile time macros. Implements external_irq_api_t::versionGet.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Read the driver version

icu_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » ICU

#include <r_icu.h>

Data Fields

uint32_t	open Used to determine if channel control block is in use.
R_ICU_Type *	p_reg Pointer to register base address.

void(*	p_callback)(external_irq_callback_args_t *p_args)
void const *	p_context
IRQn_Type	irq NVIC interrupt number.
uint8_t	channel Channel.

Detailed Description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs in external_irq_api_t::open.

Field Documentation

◆ p_callback

void(* icu_instance_ctrl_t::p_callback) (external_irq_callback_args_t *p_args)
Callback provided when a external IRQ ISR occurs. Set to NULL for no CPU interrupt.

◆ p_context

void const* icu_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in external_irq_callback_args_t.

The documentation for this struct was generated from the following file:

Detailed Description

Driver for the I/O Ports.

The IOPort HAL drivers provide the ability to access the I/O Ports of a device at both bit and port level. Port and pin direction can be changed. In addition a number of configuration APIs are provided to change the functionality of individual pins.

Function Documentation

◆ R_IOPORT_EthernetModeCfg()

ssp_err_t R_IOPORT_EthernetModeCfg (ioport_ethernet_channel_t *channel*, ioport_ethernet_mode_t *mode*)

Configures Ethernet channel PHY mode. Implements ioport_api_t::ethModeCfg.

Return values

SSP_SUCCESS	Ethernet PHY mode set.
SSP_ERR_INVALID_ARGUMENT	Channel or mode not valid.
SSP_ERR_UNSUPPORTED	Ethernet configuration not supported on this device.

Note

This function is not re-entrant.

◆ R_IOPORT_Init()

ssp_err_t R_IOPORT_Init (const ioport_cfg_t * *p_cfg*)

Initializes internal driver data, then calls R_IOPORT_PinsCfg to configure pins.

Return values

SSP_SUCCESS	Pin configuration data written to PFS register(s)
SSP_ERR_ASSERTION	NULL pointer

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

◆ R_IOPORT_PinCfg()

ssp_err_t R_IOPORT_PinCfg (ioport_port_pin_t *pin*, uint32_t *cfg*)

Configures the settings of a pin. Implements ioport_api_t::pinCfg.

Return values

SSP_SUCCESS	Pin configured.
SSP_ERR_INVALID_ARGUMENT	Invalid pin

Note

This function is re-entrant for different pins. This function will change the configuration of the pin with the new configuration. For example it is not possible with this function to change the drive strength of a pin while leaving all the other pin settings unchanged. To achieve this the original settings with the required change will need to be written using this function.

◆ R_IOPORT_PinDirectionSet()

ssp_err_t R_IOPORT_PinDirectionSet (ioport_port_pin_t *pin*, ioport_direction_t *direction*)

Sets the direction of an individual pin on a port. Implements ioport_api_t::pinDirectionSet.

Return values

SSP_SUCCESS	Pin direction updated.
SSP_ERR_INVALID_ARGUMENT	The pin and/or direction not valid.

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PinEventInputRead()

ssp_err_t R_IOPORT_PinEventInputRead (ioport_port_pin_t *pin*, ioport_level_t * *p_pin_event*)

Reads the value of the event input data of a specific pin. Implements ioport_api_t::pinEventInputRead.

The pin event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

SSP_SUCCESS	Pin read.
SSP_ERR_INVALID_ARGUMENT	Pin not valid.
SSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant.

◆ R_IOPORT_PinEventOutputWrite()

ssp_err_t R_IOPORT_PinEventOutputWrite (ioport_port_pin_t *pin*, ioport_level_t *pin_value*)

This function writes the event output data value to a pin. Implements ioport_api_t::pinEventOutputWrite.

Using the event system enables a pin state to be stored by this function in advance of being output on the pin. The output to the pin will occur when the ELC event occurs.

Return values

SSP_SUCCESS	Pin event data written.
SSP_ERR_INVALID_ARGUMENT	Pin or value not valid.

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PinRead()

ssp_err_t R_IOPORT_PinRead (ioport_port_pin_t *pin*, ioport_level_t * *p_pin_value*)

Reads the level on a pin. Implements ioport_api_t::pinRead.

Return values

SSP_SUCCESS	Pin read.
SSP_ERR_INVALID_ARGUMENT	Invalid argument
SSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different pins.

◆ R_IOPORT_PinsCfg()

ssp_err_t R_IOPORT_PinsCfg (const ioport_cfg_t * *p_cfg*)

Configures the functions of multiple pins by loading configuration data into pin PFS registers. Implements ioport_api_t::pinsCfg.

This function initializes the supplied list of PmnPFS registers with the supplied values. This data can be generated by the ISDE pin configurator or manually by the developer. Different pin configurations can be loaded for different situations such as low power modes and test.*

Return values

SSP_SUCCESS	Pin configuration data written to PFS register(s)
SSP_ERR_ASSERTION	NULL pointer

◆ R_IOPORT_PinWrite()

ssp_err_t R_IOPORT_PinWrite (ioport_port_pin_t *pin*, ioport_level_t *level*)

Sets a pin's output either high or low. Implements ioport_api_t::pinWrite.

Return values

SSP_SUCCESS	Pin written to.
SSP_ERR_INVALID_ARGUMENT	The pin and/or level not valid.

Note

This function is re-entrant for different pins. This function makes use of the PCNTR3 register to atomically modify the level on the specified pin on a port.

◆ R_IOPORT_PortDirectionSet()

ssp_err_t R_IOPORT_PortDirectionSet (ioport_port_t *port*, ioport_size_t *direction_values*, ioport_size_t *mask*)

Sets the direction of individual pins on a port. Implements ioport_api_t::portDirectionSet().

Multiple pins on a port can be set to inputs or outputs at once. Each bit in the mask parameter corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. If a bit is set to 1 then the corresponding pin will be changed to an input or an output as specified by the direction values. If a mask bit is set to 0 then the direction of the pin will not be changed.

Return values

SSP_SUCCESS	Port direction updated.
SSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid.

Note

This function is re-entrant for different ports.

High bits

Low bits

New value to write to port direction register

◆ R_IOPORT_PortEventInputRead()

ssp_err_t R_IOPORT_PortEventInputRead (ioport_port_t *port*, ioport_size_t * *p_event_data*)

Reads the value of the event input data. Implements ioport_api_t::portEventInputRead().

The event input data for the port will be read. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on.

The port event data is captured in response to a trigger from the ELC. This function enables this data to be read. Using the event system allows the captured data to be stored when it occurs and then read back at a later time.

Return values

SSP_SUCCESS	Port read.
SSP_ERR_INVALID_ARGUMENT	Port not valid.
SSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortEventOutputWrite()

ssp_err_t R_IOPORT_PortEventOutputWrite (ioport_port_t *port*, ioport_size_t *event_data*, ioport_size_t *mask_value*)

This function writes the set and reset event output data for a port. Implements ioport_api_t::portEventOutputWrite.

Using the event system enables a port state to be stored by this function in advance of being output on the port. The output to the port will occur when the ELC event occurs.

The input value will be written to the specified port when an ELC event configured for that port occurs. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Return values

SSP_SUCCESS	Port event data written.
SSP_ERR_INVALID_ARGUMENT	Port and/or mask not valid. •

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortRead()

ssp_err_t R_IOPORT_PortRead (ioport_port_t *port*, ioport_size_t * *p_port_value*)

Reads the value on an IO port. Implements ioport_api_t::portRead.

The specified port will be read, and the levels for all the pins will be returned. Each bit in the returned value corresponds to a pin on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. *

Return values

SSP_SUCCESS	Port read.
SSP_ERR_INVALID_ARGUMENT	Port not valid.
SSP_ERR_ASSERTION	NULL pointer

Note

This function is re-entrant for different ports.

◆ R_IOPORT_PortWrite()

ssp_err_t R_IOPORT_PortWrite (ioport_port_t *port*, ioport_size_t *value*, ioport_size_t *mask*)

Writes to multiple pins on a port. Implements ioport_api_t::portWrite.

The input value will be written to the specified port. Each bit in the value parameter corresponds to a bit on the port. For example, bit 7 corresponds to pin 7, bit 6 to pin 6, and so on. Each bit in the mask parameter corresponds to a pin on the port.

Only the bits with the corresponding bit in the mask value set will be updated. e.g. value = 0xFFFF, mask = 0x0003 results in only bits 0 and 1 being updated.

Return values

SSP_SUCCESS	Port written to.
SSP_ERR_INVALID_ARGUMENT	The port and/or mask not valid.

Note

This function is re-entrant for different ports. This function makes use of the PCNTR3 register to atomically modify the levels on the specified pins on a port.

High bits

Low bits

◆ R_IOPORT_VersionGet()

ssp_err_t R_IOPORT_VersionGet (ssp_version_t * *p_data*)
Returns IOPort HAL driver version. Implements ioport_api_t::versionGet.

Return values

SSP_SUCCESS	Version information read.
SSP_ERR_ASSERTION	The parameter p_data is NULL.

Note

This function is reentrant.

Detailed Description

Driver for the Independent Watchdog Timer (IWDT).

Summary

This module supports the Independent Watchdog Timer (IWDT). It implements the WDT Interface. Extends WDT_API HAL layer drivers for interfacing with the Independent Watchdog Timer (IWDT) peripheral.

The IWDT HAL APIs provide the ability to refresh the independent watchdog, read the timer value and read and clear status flags. When used in NMI output mode the callback to be called by the NMI ISR can be registered.

Function Documentation

◆ R_IWDT_CfgGet()

ssp_err_t R_IWDT_CfgGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t *const *p_cfg*)

Read the configuration of the IWDT. Implements wdt_api_t::cfgGet.

Return values

SSP_SUCCESS	IWDT configuration successfully read.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_ARGUMENT	One or more configuration options is invalid.

Note

This function is reentrant.

Get timeout value from OFS0 register.

◆ R_IWDT_CounterGet()

ssp_err_t R_IWDT_CounterGet (wdt_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_count*)

Read the current count value of the IWDT. Implements wdt_api_t::counterGet.

Return values

SSP_SUCCESS	IWDT current count successfully read.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

Note

This function is reentrant.

◆ R_IWDT_Open()

ssp_err_t R_IWDT_Open (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t const *const *p_cfg*)

Register the IWDT NMI callback.

Return values

SSP_SUCCESS	IWDT NMI callback successfully configured.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_MODE	An attempt to open the IWDT when the OFS0 register is not configured for auto-start mode.
SSP_ERR_HW_LOCKED	IWDT module has already been called.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Note

This function is not reentrant.

g_iwdt_version is accessed by the ASSERT macro only and so compiler toolchain can issue a warning that it is not accessed. The code below eliminates this warning and also ensures these data structures are not optimized away.

Eliminate toolchain warning when NMI output is not being used.

Lock the IWDT Hardware Resource

Initialize global pointer to WDT for NMI callback use.

Check for NMI output mode

NMI output mode

Enable the IWDT underflow/refresh error interrupt (will generate an NMI).

◆ R_IWDT_Refresh()

ssp_err_t R_IWDT_Refresh (wdt_ctrl_t *const *p_api_ctrl*)

Refresh the Independent Watchdog Timer. Implements wdt_api_t::refresh.

Return values

SSP_SUCCESS	IWDT successfully refreshed.
SSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

Note

This function is reentrant. This function only returns SSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run.

◆ R_IWDT_StatusClear()

ssp_err_t R_IWDT_StatusClear (wdt_ctrl_t *const *p_api_ctrl*, const wdt_status_t *status*)

Clear the IWDT status and error flags. Implements wdt_api_t::statusClear.

Return values

SSP_SUCCESS	IWDT flag(s) successfully cleared.
SSP_ERR_ASSERTION	Null pointer as a parameter.
SSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

Note

This function is reentrant.

Write zero to clear flags

◆ R_IWDT_StatusGet()

ssp_err_t R_IWDT_StatusGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_status_t *const *p_status*)

Read the IWDT status flags.

Indicates both status and error conditions.

Return values

SSP_SUCCESS	IWDT status successfully read.
SSP_ERR_ASSERTION	Null pointer as a parameter.
SSP_ERR_NOT_OPEN	The driver has not been opened. Perform R_IWDT_Open() first.

Note

This function is reentrant. When the IWDT is configured to output a reset on underflow or refresh error reading the status and error flags can be read after reset to establish if the IWDT caused the reset. Reading the status and error flags in NMI output mode indicates whether the IWDT generated the NMI interrupt.

◆ R_IWDT_TimeoutGet()

ssp_err_t R_IWDT_TimeoutGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

SSP_SUCCESS	WDT successfully refreshed.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_ABORTED	Invalid clock divider for this watchdog

Note

This function is reentrant. This function must not be called before calling R_WDT_Open().

◆ R_IWDT_VersionGet()

ssp_err_t R_IWDT_VersionGet (ssp_version_t *const *p_data*)

Return IWDT HAL driver version. Implements wdt_api_t::versionGet.

Return values

SSP_SUCCESS	Call successful.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.

Note

This function is reentrant.

iwdt_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » IWDT

#include <r_iwdt.h>

Data Fields

uint32_t	iwdt_open
void const *	p_context
R_IWDT_Type *	p_reg Pointer to register base address.

void(*	p_callback)(wdt_callback_args_t *p_args) Callback provided when a WDT NMI ISR occurs.

Detailed Description

WDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called.

Field Documentation

◆ iwdt_open

uint32_t iwdt_instance_ctrl_t::iwdt_open
Indicates whether the open() API has been successfully called.

◆ p_context

void const* iwdt_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in wdt_callback_args_t.

Detailed Description

Driver for the JPEG CODEC.

Function Documentation

◆ R_JPEG_Decode_Close()

ssp_err_t R_JPEG_Decode_Close (jpeg_decode_ctrl_t * *p_api_ctrl*)

Cancel an outstanding JPEG codec operation and close the device.

Return values

SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG not opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::eventInfoGet

Clear JPEG JINTE0 interrupt and JINTE1 interrupt.

Disable JEDI and JDTI at NVIC

Power off the JPEG codec.

Reset the jpeg status flag in the driver.

Unlock module at BSP level.

◆ R_JPEG_Decode_HorizontalStrideSet()

ssp_err_t R_JPEG_Decode_HorizontalStrideSet (jpeg_decode_ctrl_t * *p_api_ctrl*, uint32_t *horizontal_stride*)

Configure horizontal stride setting.

Note

Use when the horizontal stride needs to match the image width and the image size is unknown when opening the JPEG driver. (If the image size is known prior to the open call, pass the horizontal stride value in the jpef_cfg_t structure.) After the image size becomes available, use this function to update the horizontal stride value. If the driver must decode one line at a time, the horizontal stride can be set to zero.

Return values

SSP_SUCCESS	Horizontal Stride value is properly configured.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is zero or not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.

Record the horizontal stride value in the control block

Set the horizontal stride.

If the parameters all are set, resume the core to decode.

For the given buffer size, compute number of lines to decode.

◆ R_JPEG_Decode_ImageSizeGet()

ssp_err_t R_JPEG_Decode_ImageSizeGet (jpeg_decode_ctrl_t * *p_api_ctrl*, uint16_t * *p_horizontal_size*, uint16_t * *p_vertical_size*)

Obtain the size of the image. This operation is valid during JPEG decoding operation.

Return values

SSP_SUCCESS	The image size is available and the horizontal and vertical values are stored in the memory pointed to by p_horizontal_size and p_vertical_size.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_IMAGE_SIZE_UNKNOWN	The image size is unknown. More input data may be needed.
SSP_ERR_INVALID_MODE	JPEG Codec module is not decoding.
SSP_ERR_NOT_OPEN	JPEG is not opened.

◆ R_JPEG_Decode_ImageSubsampleSet()

ssp_err_t R_JPEG_Decode_ImageSubsampleSet (jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_subsample_t *horizontal_subsample*, jpeg_decode_subsample_t *vertical_subsample*)

Configure horizontal and vertical subsample.

Note

Use for scaling the decoded image.

Return values

SSP_SUCCESS	Horizontal Stride value is properly configured.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_ARGUMENT	Sub-sample setting is invalid.
SSP_ERR_NOT_OPEN	JPEG not opened.

Update horizontal sub-sample setting.

◆ R_JPEG_Decode_InputBufferSet()

ssp_err_t R_JPEG_Decode_InputBufferSet (jpeg_decode_ctrl_t *const *p_api_ctrl*, void * *p_data_buffer*, uint32_t *data_buffer_size*)

Assign input data buffer to JPEG codec for processing.

Note

After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so JPEG decoding can resume.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least one line of decoded image data.

Return values

SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the input_buffer is NULL, or the input_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.

Configure the input buffer address.

If the system is idle, start the JPEG engine. This allows the system to obtain image information (image size and input pixel format). This information is needed to drive the decode process later on.

Based on buffer size, detect the in count mode setting. The driver is able to read input data in chunks. However the size of each chunk is limited to BUFFER_MAX_SIZE. Therefore, if the input data size is larger than BUFFER_MAX_SIZE, the driver assumes the entire input data is present, and can be decoded without additional input data. Otherwise, the driver enables input stream feature. This works even if the entire input size is smaller than BUFFER_MAX_SIZE.

◆ R_JPEG_Decode_LinesDecodedGet()

ssp_err_t R_JPEG_Decode_LinesDecodedGet (jpeg_decode_ctrl_t * *p_api_ctrl*, uint32_t * *p_lines*)

Returns the number of lines decoded into the output buffer.

Note

Use this function to retrieve number of image lines written to the output buffer after JPEG decoded a partial image. Combined with the horizontal stride settings and the output pixel format, the application can compute the amount of data to read from the output buffer.

Return values

SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_NOT_OPEN	JPEG not opened.

◆ R_JPEG_Decode_Open()

ssp_err_t R_JPEG_Decode_Open (jpeg_decode_ctrl_t *const *p_api_ctrl*, jpeg_decode_cfg_t const *const *p_cfg*)

Initialize the JPEG Codec module. This function configures the JPEG Codec for decoding operation, sets up the registers for data format and pixel format based on user-supplied configuration parameters. Interrupts are enabled to support image size read operation and callback functions.

Return values

SSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
SSP_ERR_IN_USE	JPEG Codec is already in use.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_HW_LOCKED	JPEG Codec resource is locked.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Verify JPEG Codec is not already used.

Update the common control parameter with the control and JEDI and JDTI callback handler for JPEG decode, the handlers will be called from r_jpeg_common, which implements JPEG JDTI and JEDI ISR for r_jpeg_decode and r_jpeg_encode driver.

Record the configuration settings.

Initialize horizontal stride value.

Initialize output buffer size.

Initialize total_lines_decoded

Initialize horizontal sub-sample setting.

Provide power to the JPEG module.

Clear the image horizontal and vertical size, before starting the JPEG decode

Perform bus reset

Reset the destination buffer address.

Reset the source buffer address.

Reset the horizontal stride.

Configure the JPEG module for decode operation.

Set image format for the decoded image.

If the output pixel format is ARGB8888, also configure the alpha value.

Set the alpha value for the decoded image.

Set the output data format.

The following interrupts are enabled: Interrupt on all errors Interrupt on Image Size

Record user supplied callback routine.

Set the driver status.

All done. Return success.

◆ R_JPEG_Decode_OutputBufferSet()

ssp_err_t R_JPEG_Decode_OutputBufferSet (jpeg_decode_ctrl_t * *p_api_ctrl*, void * *p_output_buffer*, uint32_t *output_buffer_size*)

Assign output buffer to the JPEG Codec for storing output data.

Note

The number of image lines to be decoded depends on the size of the buffer and the horizontal stride settings. Once the output buffer size is known, the horizontal stride value is known, and the input pixel format is known (the input pixel format is obtained by the JPEG decoder from the JPEG headers), the driver automatically computes the number of lines that can be decoded into the output buffer. After these lines are decoded, the JPEG engine pauses and a callback function is triggered, so the application is able to provide the next buffer for the JPEG module to resume the operation.

The JPEG decoding operation automatically starts after both the input buffer and the output buffer are set, and the output buffer is big enough to hold at least eight lines of decoded image data.

Return values

SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_JPEG_BUFFERSIZE_NOT_ENOUGH	Invalid buffer size

Set the decoding destination address.

Record the size of the output buffer.

If the image size is not ready yet, the driver does not know the input pixel format. Without that information, the driver is unable to compute the number of lines of image to decode. In this case, the driver would record the output buffer size. Once all the information is ready, the driver would attempt to start the decoding process.

For a given buffer size, compute number of lines to decode if the image size acquisition is known.

If the driver status is IMAGE_SIZE_READY with no other flags, that means the driver just received IMAGE_SIZE. It has not started the decoding process yet.

If Input buffer is set, output buffer is set, and horizontal stride is set, the driver is able to determine the number of lines to decode, and start the decoding operation.

If the current status is OUTPUT_PAUSE, the driver needs to resume the operation.

◆ R_JPEG_Decode_PixelFormatGet()

ssp_err_t R_JPEG_Decode_PixelFormatGet (jpeg_decode_ctrl_t * *p_api_ctrl*, jpeg_decode_color_space_t * *p_color_space*)

Get the input pixel format.

Return values

SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG is not opened.

HW does not report error. Return internal status information.

◆ R_JPEG_Decode_StatusGet()

ssp_err_t R_JPEG_Decode_StatusGet (jpeg_decode_ctrl_t * *p_api_ctrl*, jpeg_decode_status_t * *p_status*)

Get the status of the JPEG codec. This function can also be used to poll the device.

Return values

SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG is not opened.

HW does not report error. Return internal status information.

◆ R_JPEG_Decode_VersionGet()

ssp_err_t R_JPEG_Decode_VersionGet (ssp_version_t * *p_version*)

Get version of the display interface and GLCD HAL code.

Return values

SSP_SUCCESS	Version number
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Note

This function is reentrant.

Detailed Description

Driver for the JPEG CODEC.

Macro Definition Documentation

◆ JPEG_ENCODE_CODE_VERSION_MAJOR

#define JPEG_ENCODE_CODE_VERSION_MAJOR (2U)
Configuration for this module

Function Documentation

◆ R_JPEG_Encode_Close()

ssp_err_t R_JPEG_Encode_Close (jpeg_encode_ctrl_t * *p_api_ctrl*)

Cancel an outstanding JPEG codec operation and close the device.

Return values

SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	JPEG not opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::eventInfoGet

Clear JPEG JINTE0 interrupt and JINTE1 interrupt.

Disable JEDI and JDTI at NVIC

Power off the JPEG codec.

Reset the jpeg status flag in the driver.

Unlock module at BSP level.

◆ R_JPEG_Encode_ImageParameterSet()

ssp_err_t R_JPEG_Encode_ImageParameterSet (jpeg_encode_ctrl_t *const *p_api_ctrl*, jpeg_encode_raw_image_parameters * *p_image_parameters*)

Setup the image parameters to JPEG Codec device.

Note

Image parameters needs to be set before the setting the input buffer.DO NOT call this function during the JPEG Codec operation.

Return values

SSP_SUCCESS	Image parameter is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL,
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.
SSP_ERR_INVALID_ARGUMENT	Horizontal and Vertical resolution is invalid or zero.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made.

Do not change the JPEG Codec image setting while JPEG Codec is in progress

Record the horizontal stride and vertical size value in the control block

Set the horizontal stride.

Set the image horizontal and vertical size.

◆ R_JPEG_Encode_InputBufferSet()

ssp_err_t R_JPEG_Encode_InputBufferSet (jpeg_encode_ctrl_t *const *p_api_ctrl*, void * *p_data_buffer*, uint32_t *data_buffer_size*)

Assign input data buffer to JPEG codec for processing.

Note

1.After the amount of data is processed, the JPEG driver triggers a callback function with the flag JPEG_OPERATION_INPUT_PAUSE set. The application supplies the next chunk of data to the driver so JPEG encoding can resume. 2.Image size should be greater or equal to minimum coded unit (MCU) for YCbCr422 (only supported color space) the MCU is 8 lines by 16 pixel (where 1 pixel = 2 bytes) hence size can not be less than 8x16x2 = 256

The JPEG encoding operation automatically starts after setting the input buffer.

Return values

SSP_SUCCESS	The input data buffer is properly assigned to JPEG Codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the

	pointer to the p_data_buffer is NULL.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address or image line to encode or size of buffer is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made, set output buffer first
SSP_ERR_JPEG_IMAGE_SIZE_ERROR	Image size is not supported by JPEG Codec

Validate the the size : JPEG Codec can process minimum up to 8 lines by 16 pixel for YCbCr422 meaning 8x16x2 = 256

Calculate the number of lines to be encode

JPEG Codec required Lines to be byte aligned

Check, If output image buffer is set or not

Configure the input buffer address.

if JPEG is just opened or completed one image, make DONE and IDLE status flag zero to encode next image

Remove the Done and IDLE status flag

Set the driver status to JPEG_ENCODE_STATUS_RUNNING.

Start the encoder

JPEG is PAUSE for next chunk of image

Clear internal status information.

Set RUNNING status

Resume the count mode

JPEG is running Notify the user, return error

◆ R_JPEG_Encode_Open()

ssp_err_t R_JPEG_Encode_Open (jpeg_encode_ctrl_t *const *p_api_ctrl*, jpeg_encode_cfg_t const *const *p_cfg*)

Initialize the JPEG Codec module. This function configures the JPEG Codec for encoding operation, sets up the registers for data format, pixel format, vertical and horizontal resolution stride based on user-supplied configuration parameters.

Return values

SSP_SUCCESS	JPEG Codec module is properly configured and is ready to take input data.
SSP_ERR_IN_USE	JPEG Codec is already in use.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_HW_LOCKED	JPEG Codec resource is locked.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter is passed.
SSP_ERR_INVALID_ALIGNMENT	Horizontal stride is not 8-byte aligned.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Verify JPEG Codec is not already used.

Update the common control parameter with the control and JDEI and JDTI callback handler for JPEG encode, the handlers will be called from r_jpeg_common, which implements JPEG JDTI and JDEI ISR for r_jpeg_decode and r_jpeg_encode driver.

Get the JDTI event information from FMI

Get the vector table information of JDTI event

Record the JPEG Encoder ctrl and internal ISR callback handler to JDTI event vector table

Get the JEDI event information from FMI

Get the vector table information of JEDI event

Record the JPEG Encoder ctrl and internal ISR callback handler to JEDI event vector table

Provide power to the JPEG module.

Perform bus reset

Reset the destination buffer address.

Reset the source buffer address.

Set the horizontal stride.

Set the image horizontal and vertical size.

Configure the JPEG module for encode operation.

Set the output data format.

Set input pixel format for JPEG Encoder NOTE : only ycbcr422 is valid for encoder

Quantization table setting NOTE: Table 0(zero) is used for Luminance and Table 1(one) is used for Chrominance - Cr and Cb component

Upload Luminance and Chrominance table to JPEG Codec

Huffman table setting

Upload the Huffman table to JPEG Codec

Reset Marker setting

Record image parameters to ctrl

Set the driver status.

Record the user context information

Record user supplied callback routine.

Enabled JPEG Compression data transfer complete interrupt and Count mode Interrupt

Enable the JDTI and JDEI interrupts

All done. Return success.

◆ R_JPEG_Encode_OutputBufferSet()

ssp_err_t R_JPEG_Encode_OutputBufferSet (jpeg_encode_ctrl_t * *p_api_ctrl*, void * *p_output_buffer*)

Assign output buffer to the JPEG Codec for storing output data.

Note

Buffer size should be sufficient to hold the encoded jpeg image.

Return values

SSP_SUCCESS	The output buffer is properly assigned to JPEG codec device.
SSP_ERR_ASSERTION	Pointer to the control block is NULL, or the pointer to the output_buffer. is NULL, or the output_buffer_size is 0.
SSP_ERR_INVALID_ALIGNMENT	Buffer starting address is not 8-byte aligned.
SSP_ERR_NOT_OPEN	JPEG not opened.
SSP_ERR_INVALID_CALL	An invalid call has been made, Codec output buffer address is attempted to changed during codec operation

Output buffer cannot be change during codec operation

Set the encoding destination address.

◆ R_JPEG_Encode_StatusGet()

ssp_err_t R_JPEG_Encode_StatusGet (jpeg_encode_ctrl_t * *p_api_ctrl*, volatile jpeg_encode_status_t * *p_status*)

Get the status of the JPEG codec. This function can also be used to poll the device.

Return values

SSP_SUCCESS	The status information is successfully retrieved.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

HW does not report error. Return internal status information.

◆ R_JPEG_Encode_VersionGet()

ssp_err_t R_JPEG_Encode_VersionGet (ssp_version_t * *p_version*)

Get version of the display interface and GLCD HAL code.

Return values

SSP_SUCCESS	Version number
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Note

This function is reentrant.

jpeg_encode_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » JPEG ENCODE

#include <r_jpeg_encode.h>

Data Fields

volatile jpeg_encode_status_t	status JPEG Codec module status.
void(*	p_callback)(jpeg_encode_callback_args_t *p_args) User-supplied callback functions.

void const *	p_extend JPEG Codec hardware dependent configuration */.
void const *	p_context Placeholder for user data. Passed to user callback in jpeg_encode_callback_args_t.
R_JPEG_Type *	p_reg Pointer to register base address.
uint32_t	horizontal_stride Horizontal Stride settings (Line offset).
uint32_t	output_buffer_size out buffer size
uint16_t	lines_to_encoded Number of lines to encode.
uint16_t	vertical_resolution vertical size
uint16_t	encoded_lines Number of lines encoded.

Detailed Description

JPEG Codec module control block. DO NOT INITIALIZE. Initialization occurs when jpep_api_t::open is called.

The documentation for this struct was generated from the following file:

Detailed Description

Driver for the Key Interrupt Function.

The Key input driver can be used for one to eight channels or in a matrix format. This module implements the following interface: Key Matrix Interface.

Function Documentation

◆ R_KINT_KEYMATRIX_Close()

ssp_err_t R_KINT_KEYMATRIX_Close (keymatrix_ctrl_t *const *p_api_ctrl*)

Disable KINT. Implements keymatrix_api_t::close.

End of function R_KINT_KEYMATRIX_Open The Close function disables the interrupts in the peripheral and the NVIC and clears any pending interrupt requests. It also releases the hardware lock on the API.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel is not opened.

Disable interrupt in ICU

Disable interrupts in the KINT peripheral

Clear any pending interrupt requests in the KINT peripheral

Clear the Interrupt Request bit

Clear stored internal driver data

Release the lock

◆ R_KINT_KEYMATRIX_Disable()

ssp_err_t R_KINT_KEYMATRIX_Disable (keymatrix_ctrl_t *const *p_api_ctrl*)

Disable external irq for all the specified channel by R_KINT_KEYMATRIX_Open. Implements keymatrix_api_t::disable.

This function disables interrupts for the KINT peripheral both at the interrupt level and in the NVIC. All the channels specified by R_KINT_KEYMATRIX_Open are disabled.

Return values

SSP_SUCCESS	Interrupt disabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Disable interrupts in the KINT peripheral

Clear any pending interrupt requests in the KINT peripheral

Disable interrupt in the ICU

◆ R_KINT_KEYMATRIX_Enable()

ssp_err_t R_KINT_KEYMATRIX_Enable (keymatrix_ctrl_t *const *p_api_ctrl*)

Enable external irq for all the specified channel by R_KINT_KEYMATRIX_Open. Implements keymatrix_api_t::enable.

This function enables interrupts for the KINT peripheral both at the interrupt level and in the NVIC after clearing any pending requests in the KINT and ICU peripheral. All the channels specified by R_KINT_KEYMATRIX_Open are enabled.

Return values

SSP_SUCCESS	Interrupt enabled successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_NOT_OPEN	The peripheral is not opened.

Clear any pending interrupt requests in the KINT peripheral

Clear the Interrupt Request Flag in the ICU

Enable interrupt for the selected channels after casting since KRM is an 8 bit register

Enable interrupt

◆ R_KINT_KEYMATRIX_Open()

ssp_err_t R_KINT_KEYMATRIX_Open (keymatrix_ctrl_t *const *p_api_ctrl*, keymatrix_cfg_t const *const *p_cfg*)

Power on KINT, handle required initialization described in hardware manual. Implements keymatrix_api_t::open.

The Open function configures all the Key Input (KINT) channels and provides a handle for use with the rest of the KINT API functions. This function must be called at least once prior to calling any other KINT API functions. After the peripheral is initialized, the Open function should not be called again without first calling the Close function.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters may be NULL: p_cfg, or p_ctrl or the callback.
SSP_ERR_INVALID_ARGUMENT	One of the following may be invalid: • p_cfg->channel: must be between 0 and KINT_MAX_NUM_CHANNELS • p_cfg->trigger not a valid value.
SSP_ERR_HW_LOCKED	The API has already been opened. It must be closed before it can be opened again.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is not reentrant.

Check to see that the arguments passed are not null pointers

Grab the hardware lock. If successful this indicates that the open was not previously called.

Disable interrupts in the KINT peripheral

Clear any pending interrupt requests in the KINT peripheral

Clear the Interrupt Request in the ICU

Configure the trigger edge. The trigger edge can be modified in the TriggerSet function later if desired

KEYMATRIX_TRIG_RISING condition

Configure the usage of key interrupt flags

Store the callback and context information

If interrupts are to be enabled now, set it up for the selected channels. The channels can be changed later in the enable function but to modify the callback and context, the API has to be closed and reopened with the new callback and context.

Note

The KINT hardware only supports a single interrupt for all channels

Enable interrupt for the selected channels after casting since KRM is an 8 bit register

Enable interrupt

Store number of channels for use to the control block to use it later

Mark driver as open by initializing it to "KINT" in its ASCII equivalent.

◆ R_KINT_KEYMATRIX_TriggerSet()

ssp_err_t R_KINT_KEYMATRIX_TriggerSet (keymatrix_ctrl_t *const *p_api_ctrl*, keymatrix_trigger_t *hw_trigger*)

Set trigger edge (falling or rising) provided. Implements keymatrix_api_t::triggerSet.

This function changes trigger sense at run-time. The change is applied to all the channels specified by R_KINT_KEYMATRIX_Open.

Return values

SSP_SUCCESS	Trigger value written successfully.
SSP_ERR_ASSERTION	The p_ctrl parameter was null.
SSP_ERR_INVALID_ARGUMENT	Trigger input invalid. hw_trigger must be one of the options from button_trigger_t.
SSP_ERR_NOT_OPEN	The channel is not opened.

Note

This function expects to be called when the driver is disabled (the driver state before R_KINT_KEYMATRIX_Enable is called if the driver is opened in the non-auto start mode, or after R_KINT_KEYMATRIX_Disable is called if the driver is opened in the auto start mode). The driver does not restrict to call this API when the driver is enabled but users need to make sure the edge detection sense is instantly changed by this API call.

Configure the trigger edge

KEYMATRIX_TRIG_RISING condition

Configure the usage of key interrupt flags

◆ R_KINT_VersionGet()

ssp_err_t R_KINT_VersionGet (ssp_version_t *const *p_version*)

Set driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful return.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

kint_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Key Interrupts

#include <r_kint.h>

Data Fields

R_KINT_Type *	p_reg Pointer to register base address.
keymatrix_channels_t	channels Channel bitmask.
IRQn_Type	irq Interrupt priority number.
uint32_t	open Flag to determine if the device is open.

Detailed Description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when keymatrix_api_t::open is called.

The documentation for this struct was generated from the following file:

- r_kint.h

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t

Snooze cancel control

Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfully applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S124

Macros

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ LPMV2_CFG_PARAM_CHECKING_ENABLE

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)
Specify whether to include code for API parameter checking. Valid settings include: • BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h • 1 : Includes parameter checking • 0 : Compiles out parameter checking

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfully applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S128

Macros

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ LPMV2_CFG_PARAM_CHECKING_ENABLE

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)
Specify whether to include code for API parameter checking. Valid settings include: • BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h • 1 : Includes parameter checking • 0 : Compiles out parameter checking

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfully applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S1JA

Macros

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ LPMV2_CFG_PARAM_CHECKING_ENABLE

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)
Specify whether to include code for API parameter checking. Valid settings include: • BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h • 1 : Includes parameter checking • 0 : Compiles out parameter checking

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfully applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S3A1

Macros

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ LPMV2_CFG_PARAM_CHECKING_ENABLE

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)
Specify whether to include code for API parameter checking. Valid settings include: • BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h • 1 : Includes parameter checking • 0 : Compiles out parameter checking

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S3A3

Macros

#define	LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ **LPMV2_CFG_PARAM_CHECKING_ENABLE**

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Specify whether to include code for API parameter checking. Valid settings include:

- BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h
- 1 : Includes parameter checking
- 0 : Compiles out parameter checking

5.1.5.35 LPMV2 S3A6

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

5.1.5.36 LPMV2 S3A7

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S3A7

Macros

#define	LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ **LPMV2_CFG_PARAM_CHECKING_ENABLE**

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Specify whether to include code for API parameter checking. Valid settings include:

- BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h
- 1 : Includes parameter checking
- 0 : Compiles out parameter checking

5.1.5.37 LPMV2 S5D3

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_deep_standby_cancel_edge_t

enum lpmv2_deep_standby_cancel_edge_t	
Deep Standby Interrupt Edge	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_RISING	IRQ4-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_FALLING	IRQ4-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_RISING	IRQ5-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_FALLING	IRQ5-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_RISING	IRQ6-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_FALLING	IRQ6-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_	IRQ7-DS Pin Rising Edge (S5D3, S5D5, S5D9,

RISING	S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_FALLING	IRQ7-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_RISING	IRQ8-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_FALLING	IRQ8-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_RISING	IRQ9-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_RISING	IRQ15-DS Pin Rising Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_	

RISING	LVD1 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_deep_standby_cancel_source_t

enum lpmv2_deep_standby_cancel_source_t	
Deep Standby cancel sources	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7	IRQ7 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8	IRQ8 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11 (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14 (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15 (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_io_port_t

enum lpmv2_io_port_t	
I/O port state after Deep Software Standby mode (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state.
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_power_supply_t

enum lpmv2_power_supply_t	
Power supply control (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

◆ deep_standby_cancel_edge

lpmv2_deep_standby_cancel_edge_bits_t lpmv2_mcu_cfg_t::deep_standby_cancel_edge
Signal edges for the sources that can trigger exit from deep standby (S5D3, S5D5, S5D9, S7G2).

◆ deep_standby_cancel_source

lpmv2_deep_standby_cancel_source_bits_t lpmv2_mcu_cfg_t::deep_standby_cancel_source
Sources that can trigger exit from deep standby (S5D3, S5D5, S5D9, S7G2).

◆ dtc_state_in_snooze

lpmv2_snooze_dtc_t lpmv2_mcu_cfg_t::dtc_state_in_snooze
State of DTC in snooze mode, enabled or disabled (all Synergy MCUs).

◆ io_port_state

lpmv2_io_port_t lpmv2_mcu_cfg_t::io_port_state
IO port state in deep standby (maintained or reset) (S5D3, S5D5, S5D9, S7G2).

◆ output_port_enable

lpmv2_output_port_enable_t lpmv2_mcu_cfg_t::output_port_enable
Output port enabled/disabled in standby and deep standby (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).

◆ power_supply_state

lpmv2_power_supply_t lpmv2_mcu_cfg_t::power_supply_state
Internal power supply state in standby and deep standby (deepcut) (S5D3, S5D5, S5D9, S7G2).

◆ snooze_cancel_sources

lpmv2_snooze_cancel_t lpmv2_mcu_cfg_t::snooze_cancel_sources
list of snooze cancel sources (all Synergy MCUs).

◆ snooze_end_sources

lpmv2_snooze_end_bits_t lpmv2_mcu_cfg_t::snooze_end_sources
Bitwise list of snooze end sources (all Synergy MCUs).

◆ snooze_request_source

lpmv2_snooze_request_t lpmv2_mcu_cfg_t::snooze_request_source
Snooze request source (all Synergy MCUs).

◆ standby_wake_sources

lpmv2_standby_wake_source_bits_t lpmv2_mcu_cfg_t::standby_wake_sources
Bitwise list of sources to wake from standby (all Synergy MCUs).

Functions

ssp_err_t	R_LPMV2_VersionGet (ssp_version_t *const p_version) Get the driver version based on compile time macros. More...
ssp_err_t	R_LPMV2_Init (void) Perform any necessary initialization. More...
ssp_err_t	R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const p_cfg) Configure a low power mode. More...
ssp_err_t	R_LPMV2_LowPowerModeEnter (void) Enter low power mode (sleep/standby/deep standby) using WFI macro. More...
ssp_err_t	R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by. More...

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_deep_standby_cancel_edge_t

enum lpmv2_deep_standby_cancel_edge_t

Deep Standby Interrupt Edge

Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_RISING	IRQ4-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_FALLING	IRQ4-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_RISING	IRQ5-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_FALLING	IRQ5-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_RISING	IRQ6-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_FALLING	IRQ6-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_RISING	IRQ7-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_FALLING	IRQ7-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_RISING	IRQ8-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_FALLING	IRQ8-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_RISING	IRQ9-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge (S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_RISING	IRQ15-DS Pin Rising Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_RISING	LVD1 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_deep_standby_cancel_source_t

enum lpmv2_deep_standby_cancel_source_t	
Deep Standby cancel sources	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4 (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6 (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14 (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15 (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_io_port_t

enum lpmv2_io_port_t	
I/O port state after Deep Software Standby mode (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state.
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_power_supply_t

enum lpmv2_power_supply_t	
Power supply control (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S5D5

Macros

#define	LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ **LPMV2_CFG_PARAM_CHECKING_ENABLE**

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Specify whether to include code for API parameter checking. Valid settings include:

- BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h
- 1 : Includes parameter checking
- 0 : Compiles out parameter checking

5.1.5.39 LPMV2 S5D9

Functions

ssp_err_t	R_LPMV2_VersionGet (ssp_version_t *const p_version) Get the driver version based on compile time macros. More...
ssp_err_t	R_LPMV2_Init (void) Perform any necessary initialization. More...
ssp_err_t	R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const p_cfg) Configure a low power mode. More...
ssp_err_t	R_LPMV2_LowPowerModeEnter (void) Enter low power mode (sleep/standby/deep standby) using WFI macro. More...
ssp_err_t	R_LPMV2_ClearIOKeep (void) Clear the IOKEEP bit after deep software stand by. More...

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_deep_standby_cancel_edge_t

enum lpmv2_deep_standby_cancel_edge_t	
Deep Standby Interrupt Edge	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_RISING	IRQ4-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4_FALLING	IRQ4-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_RISING	IRQ5-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5_FALLING	IRQ5-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_RISING	IRQ6-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6_FALLING	IRQ6-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_RISING	IRQ7-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7_FALLING	IRQ7-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_RISING	IRQ8-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8_FALLING	IRQ8-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_RISING	IRQ9-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15-DS Pin Rising Edge (S7G2).

_RISING	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_RISING	LVD1 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_deep_standby_cancel_source_t

enum lpmv2_deep_standby_cancel_source_t	
Deep Standby cancel sources	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7	IRQ7 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8	IRQ8 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9 (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14 (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15 (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_io_port_t

enum lpmv2_io_port_t	
I/O port state after Deep Software Standby mode (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state.
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_power_supply_t

enum lpmv2_power_supply_t	
Power supply control (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfuly applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configures MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S5D9

Macros

#define	LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ **LPMV2_CFG_PARAM_CHECKING_ENABLE**

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Specify whether to include code for API parameter checking. Valid settings include:

- BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h
- 1 : Includes parameter checking
- 0 : Compiles out parameter checking

5.1.5.40 LPMV2 S7G2

Detailed Description

Driver for Low Power Modes.

The LPMV2 driver supports low power modes deep standby, standby, sleep, and snooze.

Note

Not all low power modes are available on all MCU's.

Enumeration Type Documentation

◆ lpmv2_deep_standby_cancel_edge_t

enum lpmv2_deep_standby_cancel_edge_t	
Deep Standby Interrupt Edge	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_EDGE_NONE	No options for a deep standby cancel source (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_RISING	IRQ0-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0_FALLING	IRQ0-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_RISING	IRQ1-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1_FALLING	IRQ1-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_RISING	IRQ2-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2_FALLING	IRQ2-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_RISING	IRQ3-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3_FALLING	IRQ3-DS Pin Falling Edge (S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9_FALLING	IRQ9-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_RISING	IRQ10-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10_FALLING	IRQ10-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_RISING	IRQ11-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11_FALLING	IRQ11-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_RISING	IRQ12-DS Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12_FALLING	IRQ12-DS Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_RISING	IRQ13-DS Pin Rising Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13_FALLING	IRQ13-DS Pin Falling Edge (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_RISING	IRQ14-DS Pin Rising Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14_FALLING	IRQ14-DS Pin Falling Edge (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15-DS Pin Rising Edge (S7G2).

_RISING	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15_FALLING	IRQ15-DS Pin Falling Edge (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_RISING	LVD1 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1_FALLING	LVD1 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_RISING	LVD2 Rising Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2_FALLING	LVD2 Falling Slope (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_RISING	NMI Pin Rising Edge (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI_FALLING	NMI Pin Falling Edge (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_deep_standby_cancel_source_t

enum lpmv2_deep_standby_cancel_source_t	
Deep Standby cancel sources	
Enumerator	
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RESET_ONLY	Cancel deep standby only by reset (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ0	IRQ0 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ1	IRQ1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ2	IRQ2 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ3	IRQ3 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ4	IRQ4 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ5	IRQ5 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ6	IRQ6 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ7	IRQ7 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ8	IRQ8 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ9	IRQ9 (S5D3, S5D5, S5D9, S7G2).

LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ10	IRQ10 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ11	IRQ11 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ12	IRQ12 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ13	IRQ13 (S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ14	IRQ14 (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_IRQ15	IRQ15 (S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD1	LVD1 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_LVD2	LVD2 (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_INTERVAL	RTC Interval Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_RTC_ALARM	RTC Alarm Interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_NMI	NMI (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBFS	USBFS Suspend/Resume (S5D3, S5D5, S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_USBHS	USBHS Suspend/Resume (S5D9, S7G2).
LPMV2_DEEP_STANDBY_CANCEL_SOURCE_AGT1	AGT1 Underflow (S5D3, S5D5, S5D9, S7G2).

◆ lpmv2_io_port_t

enum lpmv2_io_port_t	
I/O port state after Deep Software Standby mode (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_IO_PORT_RESET	When the Deep Software Standby mode is canceled, the I/O ports are in the reset state.
LPMV2_IO_PORT_NO_CHANGE	When the Deep Software Standby mode is canceled, the I/O ports are in the same state as in the Deep Software Standby mode.

◆ lpmv2_output_port_enable_t

enum lpmv2_output_port_enable_t	
Output port enable (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_OUTPUT_PORT_ENABLE_HIGH_IMPEDANCE	0: In Software Standby Mode or Deep Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins are set to the high-impedance state. In Snooze, the status of the address bus and bus control signals are same as before entering Software Standby Mode.
LPMV2_OUTPUT_PORT_ENABLE_RETAIN	1: In Software Standby Mode, the address output pins, data output pins, and other bus control signal output pins retain the output state.

◆ lpmv2_power_supply_t

enum lpmv2_power_supply_t	
Power supply control (S5D3, S5D5, S5D9, S7G2)	
Enumerator	
LPMV2_POWER_SUPPLY_DEEPCUT0	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT1	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode.
LPMV2_POWER_SUPPLY_DEEPCUT3	Power to the standby RAM, Low-speed on-chip oscillator, AGTn, and USBFS/HS resume detecting unit is not supplied in deep software standby mode. In addition, LVD is disabled and the low power function in a poweron reset circuit is enabled.

◆ lpmv2_snooze_cancel_t

enum lpmv2_snooze_cancel_t	
Snooze cancel control	
Enumerator	
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPM	ADC Channel 0 window compare match (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC0_WCMPUM	ADC Channel 0 window compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPM	ADC Channel 1 window compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_ADC1_WCMPUM	ADC Channel 1 window compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_AM	SCI0 address match event (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_SCI0_RXI_OR_ERI	SCI0 receive error (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DTC_COMPLETE	DTC transfer completion (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_DOC_DOPCI	Data operation circuit interrupt (all Synergy MCUs).
LPMV2_SNOOZE_CANCEL_SOURCE_CTSU_CTSUFN	CTSU measurement end interrupt (all Synergy MCUs).

◆ lpmv2_snooze_dtc_t

enum lpmv2_snooze_dtc_t	
DTC Enable in Snooze Mode	
Enumerator	
LPMV2_SNOOZE_DTC_DISABLE	Disable DTC operation (all Synergy MCUs).
LPMV2_SNOOZE_DTC_ENABLE	Enable DTC operation (all Synergy MCUs).

◆ lpmv2_snooze_end_t

enum lpmv2_snooze_end_t	
Snooze end control	
Enumerator	
LPMV2_SNOOZE_END_SCI0_ADDRESS_MISMATCH	SCI0 address mismatch (S5D3)
LPMV2_SNOOZE_END_STANDBY_WAKE_SOURCES	Transition from Snooze to Normal mode directly (all Synergy MCUs).
LPMV2_SNOOZE_END_AGT1_UNDERFLOW	AGT1 underflow (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE	Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_DTC_TRANS_COMPLETE_NEGATED	Not Last DTC transmission completion (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MATCH	ADC Channel 0 compare match (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC0_COMPARE_MISMATCH	ADC Channel 0 compare mismatch (all Synergy MCUs).
LPMV2_SNOOZE_END_ADC1_COMPARE_MATCH	ADC 1 compare match (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_ADC1_COMPARE_MISMATCH	ADC 1 compare mismatch (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_END_SCI0_ADDRESS_MATCH	SCI0 address mismatch (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2)

◆ lpmv2_snooze_request_t

enum lpmv2_snooze_request_t	
Snooze request sources	
Enumerator	
LPMV2_SNOOZE_REQUEST_ACMPLP	Enable Low-speed analog comparator snooze request (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_SNOOZE_REQUEST_RXD0_FALLING	Enable RXD0 falling edge snooze request (S124, S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2). Enable RXD0/DALI falling edge snooze request (S128, S1JA).
LPMV2_SNOOZE_REQUEST_IRQ0	Enable IRQ0 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ1	Enable IRQ1 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ2	Enable IRQ2 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ3	Enable IRQ3 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ4	Enable IRQ4 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ5	Enable IRQ5 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ6	Enable IRQ6 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ7	Enable IRQ7 pin snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_IRQ8	Enable IRQ8 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ9	Enable IRQ9 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ10	Enable IRQ10 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).

LPMV2_SNOOZE_REQUEST_IRQ11	Enable IRQ11 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ12	Enable IRQ12 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ13	Enable IRQ13 pin snooze request (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ14	Enable IRQ14 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_IRQ15	Enable IRQ15 pin snooze request (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_KEY	Enable KR snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_ACMPHS0	Enable High-speed analog comparator 0 snooze request (S5D3, S5D5, S5D9, S7G2).
LPMV2_SNOOZE_REQUEST_RTC_ALARM	Enable RTC alarm snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_RTC_PERIOD	Enable RTC period snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_UNDERFLOW	Enable AGT1 underflow snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_A	Enable AGT1 compare match A snooze request (all Synergy MCUs).
LPMV2_SNOOZE_REQUEST_AGT1_COMPARE_B	Enable AGT1 compare match B snooze request (all Synergy MCUs).

◆ lpmv2_standby_wake_source_t

enum lpmv2_standby_wake_source_t	
Wake from standby mode sources, does not apply to sleep or deep standby modes	
Enumerator	
LPMV2_STANDBY_WAKE_SOURCE_ACMPLP0	Analog Comparator Low-speed 0 interrupt (S124, S128, S1JA, S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_VBATT	VBATT Monitor interrupt (S3A1, S3A3, S3A6, S3A7).
LPMV2_STANDBY_WAKE_SOURCE_IRQ0	IRQ0 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ1	IRQ1 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ2	IRQ2 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ3	IRQ3 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ4	IRQ4 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ5	IRQ5 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ6	IRQ6 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ7	IRQ7 (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IRQ8	IRQ8 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ9	IRQ9 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ10	IRQ10 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ11	IRQ11 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ12	IRQ12 (S3A1, S3A3, S3A6, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ13	IRQ13 (S3A1, S3A3, S3A7, S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IRQ14	IRQ14 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).

LPMV2_STANDBY_WAKE_SOURCE_IRQ15	IRQ15 (S3A1, S3A3, S3A6, S3A7, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_IWDT	Independent watchdog interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_KEY	Key interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD1	Low Voltage Detection 1 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_LVD2	Low Voltage Detection 2 interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_ACMPHS0	Analog Comparator High-speed 0 interrupt (S5D3, S5D5, S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_RTCALM	RTC Alarm interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_RTCPRD	RTC Period interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_USBHS	USB High-speed interrupt (S5D9, S7G2).
LPMV2_STANDBY_WAKE_SOURCE_USBFS	USB Full-speed interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1UD	AGT1 underflow interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CA	AGT1 compare match A interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_AGT1CB	AGT1 compare match B interrupt (all Synergy MCUs).
LPMV2_STANDBY_WAKE_SOURCE_IIC0	I2C 0 interrupt (all Synergy MCUs).

Function Documentation

◆ R_LPMV2_ClearIOKeep()

ssp_err_t R_LPMV2_ClearIOKeep (void)

Clear the IOKEEP bit after deep software stand by.

Return values

SSP_SUCCESS	DSPBYCR_b.IOKEEP bit cleared Successfully.
SSP_ERR_UNSUPPORTED	Deep stand by mode not supported on this MCU.

◆ R_LPMV2_Init()

ssp_err_t R_LPMV2_Init (void)

Perform any necessary initialization.

Return values

SSP_SUCCESS	LPMV2 Software lock initialized

◆ R_LPMV2_LowPowerConfigure()

ssp_err_t R_LPMV2_LowPowerConfigure (lpmv2_cfg_t const *const *p_cfg*)

Configure a low power mode.

NOTE: This function does not enter the low power mode, it only configures parameters of the mode. Execution of the WFI instruction is what causes the low power mode to be entered.

Return values

SSP_SUCCESS	Low power mode successfully applied
SSP_ERR_INVALID_POINTER	p_cfg is NULL
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_INVALID_HW_CONDITION	Operating mode change transition was detected (OPCMTSF, SOPCMTSF bits)

Get hardware lock

Unlock LPMV2 registers

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Configure MCU specific settings related to low power modes

Lock LPMV2 registers

Release hardware lock.

◆ R_LPMV2_LowPowerModeEnter()

ssp_err_t R_LPMV2_LowPowerModeEnter (void)

Enter low power mode (sleep/standby/deep standby) using WFI macro.

Function will return after waking from low power mode.

Return values

SSP_SUCCESS	Successful.
SSP_ERR_INVALID_HW_CONDITION	HOCO was unstable during attempt to revert operating mode.

Get hardware lock

Check for ongoing operating mode transition (OPCMTSF, SOPCMTSF)

Enter low power mode

Release hardware lock.

◆ R_LPMV2_VersionGet()

ssp_err_t R_LPMV2_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_INVALID_POINTER	p_version is NULL.

Build Time Configurations

Renesas Synergy Software Package Reference » HAL Layer » LPMV2 S7G2

Macros

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)

Detailed Description

Macro Definition Documentation

◆ LPMV2_CFG_PARAM_CHECKING_ENABLE

#define LPMV2_CFG_PARAM_CHECKING_ENABLE (BSP_CFG_PARAM_CHECKING_ENABLE)
Specify whether to include code for API parameter checking. Valid settings include: • BSP_CFG_PARAM_CHECKING_ENABLE : Utilizes the system default setting from bsp_cfg.h • 1 : Includes parameter checking • 0 : Compiles out parameter checking

5.1.5.41 LVD

Detailed Description

Driver for Low Voltage Detection.

Implementation of the LVD API.For a detailed description see the Low Voltage Detection Interface.

Summary

This module implements the following interface: Low Voltage Detection Interface.

Enumeration Type Documentation

◆ lvd_negation_delay_t

enum lvd_negation_delay_t	
Negation of LVD signal follows reset or voltage in range	
Enumerator	
LVD_NEGATION_DELAY_FROM_VOLTAGE	Negation follows a stabilization time (tLVDn) after VCC > Vdet1 is detected. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE
LVD_NEGATION_DELAY_FROM_RESET	Negation follows a stabilization time (tLVDn) after assertion of the LVDn reset. If a transition to software standby or deep software standby is to be made, the only possible value for the RN bit is LVD_NEGATION_DELAY_FROM_VOLTAGE

◆ lvd_sample_clock_t

enum lvd_sample_clock_t	
Sample clock divider, use LVD_SAMPLE_CLOCK_DISABLED to disable digital filtering	
Enumerator	
LVD_SAMPLE_CLOCK_LOCO_DIV_2	Digital filter sample clock is LOCO divided by 2.
LVD_SAMPLE_CLOCK_LOCO_DIV_4	Digital filter sample clock is LOCO divided by 4.
LVD_SAMPLE_CLOCK_LOCO_DIV_8	Digital filter sample clock is LOCO divided by 8.
LVD_SAMPLE_CLOCK_LOCO_DIV_16	Digital filter sample clock is LOCO divided by 16.
LVD_SAMPLE_CLOCK_DISABLED	Digital filter is disabled.

Function Documentation

◆ R_LVD_Close()

ssp_err_t R_LVD_Close (lvd_ctrl_t *const *p_api_ctrl*)

Disables the LVD peripheral. Closes the driver instance.

Implements

- lvd_api_t::close.

Return values

SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	Pointers passed as function argument is NULL or the monitor number is invalid.
SSP_ERR_NOT_OPEN	Driver is not open.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::eventInfoGet

Disable voltage monitor comparison result output

Disable reset/interrupt event

Clear low voltage detection flag LVDnSR.DET = 0

Disable digital filtering

Disable voltage monitor

◆ R_LVD_Open()

ssp_err_t R_LVD_Open (lvd_ctrl_t *const *p_api_ctrl*, lvd_cfg_t const *const *p_cfg*)

Initializes a low voltage detection driver according to the passed in configuration structure. Enables an LVD peripheral based on configuration structure.

Implements

- lvd_api_t::open.

Note

Digital filter is not to be used with standby modes

Return values

SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	One or more pointers passed as function argument point to NULL or the Requested configuration, detection, voltage, monitor number or sample clock configuration of a voltage monitor is invalid.
SSP_ERR_IN_USE	Unable to acquire the hardware lock.
SSP_ERR_INVALID_MODE	MOCO must be running for LVD_NEGATION_DELAY_FROM_RESET negation delay option

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Verify channel is not already used

Select the detection voltage by setting the LVDLVLR.LVDnLVL[m:0] bits.

Enable voltage detection LVCMPCR.LVDnE = 1

Configure the digital filter.

Configure LVD monitor detection response.

Enable output of the results of comparison by voltage monitor LVDnCR0.CMPE = 1

Mark driver as opened by initializing it to "LVD" in its ASCII equivalent.

◆ R_LVD_StatusClear()

ssp_err_t R_LVD_StatusClear (lvd_ctrl_t *const *p_api_ctrl*)

Clears the latched status of the monitor.

Implements

- lvd_api_t::statusClear.

Return values

SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	Pointers passed as function argument point to NULL, invalid LVD monitor number
SSP_ERR_NOT_OPEN	Driver is not open, status will not be valid

Clears the latched status of the monitor

◆ R_LVD_StatusGet()

ssp_err_t R_LVD_StatusGet (lvd_ctrl_t *const *p_api_ctrl*, lvd_status_t * *p_lvd_status*)

Get the current state of the monitor, (threshold crossing detected, voltage currently within range)

Implements

- lvd_api_t::statusGet.

Return values

SSP_SUCCESS	Successful
SSP_ERR_ASSERTION	One or more pointers passed as function argument point to NULL, invalid LVD monitor number
SSP_ERR_NOT_OPEN	Driver is not open, status will not be valid

Get the current state of the monitor

◆ R_LVD_VersionGet()

ssp_err_t R_LVD_VersionGet (ssp_version_t *const *p_version*)
Returns the LVD driver version based on compile time macros. **Implements** ◦ lvd_api_t::versionGet. **Return values** SSP_SUCCESS — Successful SSP_ERR_ASSERTION — p_version was NULL

lvd_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » LVD

#include <r_lvd.h>

Data Fields

uint32_t	monitor_number Monitor number. More...
R_SYSTEM_Type *	p_reg Pointer to LVD register base address.
void(*	p_callback)(lvd_callback_args_t *p_args) Pointer to user callback.
lvd_callback_args_t	lvd_callback_args LVD callback parameters arguments.
uint32_t	opened Whether or not channel is open.

Detailed Description

LVD instance control structure

Field Documentation

◆ monitor_number

uint32_t lvd_instance_ctrl_t::monitor_number
Monitor number. Monitor number, 1, 2, ...

The documentation for this struct was generated from the following file:

Variables

const opamp_api_t	g_opamp_on_opamp

Detailed Description

Driver for the Operational Amplifier (OPAMP).

This module supports the OPAMP peripheral. It implements the following interfaces:

- OPAMP Interface

Macro Definition Documentation

◆ OPAMP_CODE_VERSION_MAJOR

#define OPAMP_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

◆ OPAMP_ERROR_RETURN

#define OPAMP_ERROR_RETURN (a, err) SSP_ERROR_RETURN((a), (err), &g_module_name[0], &g_opamp_version)
Macro for error logger.

Enumeration Type Documentation

◆ opamp_agt_link_t

enum opamp_agt_link_t	
Which AGT timer starts the op-amp. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel. If OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP is selected for a channel, then no AGT compare match event will start that op-amp channel.	
Enumerator	
OPAMP_AGT_LINK_AGT1_OPAMP_0_2_AGT0_OPAMP_1_3	OPAMP channel 0 and 2 are started by AGT1 compare match. OPAMP channel 1 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_AGT0_OPAMP_2_3	OPAMP channel 0 and 1 are started by AGT1 compare match. OPAMP channel 2 and 3 are started by AGT0 compare match.
OPAMP_AGT_LINK_AGT1_OPAMP_0_1_2_3	All OPAMP channels are started by AGT1 compare match.

◆ opamp_mode_t

enum opamp_mode_t	
Op-amp mode.	
Enumerator	
OPAMP_MODE_LOW_POWER	Low power mode.
OPAMP_MODE_MIDDLE_SPEED	Middle speed mode (not supported on all MCUs)
OPAMP_MODE_HIGH_SPEED	High speed mode.

◆ opamp_priv_trim_state_t

enum opamp_priv_trim_state_t	
Op-amp trim state.	
Enumerator	
OPAMP_PRIV_TRIM_STATE_INVALID	Trim state invalid.
OPAMP_PRIV_TRIM_STATE_END	Trim state end.
OPAMP_PRIV_TRIM_STATE_BIT_0	Trim state bit 0.
OPAMP_PRIV_TRIM_STATE_BIT_1	Trim state bit 1.
OPAMP_PRIV_TRIM_STATE_BIT_2	Trim state bit 2.
OPAMP_PRIV_TRIM_STATE_BIT_3	Trim state bit 3.
OPAMP_PRIV_TRIM_STATE_BIT_4	Trim state bit 4.
OPAMP_PRIV_TRIM_STATE_BEGIN	Trim state begin.

◆ opamp_trigger_t

enum opamp_trigger_t	
Start and stop trigger for the op-amp.	
Enumerator	
OPAMP_TRIGGER_SOFTWARE_START_SOFTWARE_STOP	Start and stop with APIs.
OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP	Start by AGT compare match and stop with API.
OPAMP_TRIGGER_AGT_START_ADC_STOP	Start by AGT compare match and stop after ADC conversion.

Function Documentation

◆ R_OPAMP_Close()

ssp_err_t R_OPAMP_Close (opamp_ctrl_t *const *p_api_ctrl*)

Stops the op-amps. Implements opamp_api_t::close().

Return values

SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

Set all OPAMP units and the reference current generator to be stopped.

Mark driver as closed

Enter the module-stop state.

Release the hardware lock

Return the error code

◆ R_OPAMP_InfoGet()

ssp_err_t R_OPAMP_InfoGet (opamp_ctrl_t *const *p_api_ctrl*, opamp_info_t *const *p_info*)

Provides the minimum stabilization wait time in microseconds. Implements opamp_api_t::infoGet().

Return values

SSP_SUCCESS	Information stored in p_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

◆ R_OPAMP_Open()

ssp_err_t R_OPAMP_Open (opamp_ctrl_t *const *p_api_ctrl*, opamp_cfg_t const *const *p_cfg*)

Applies power to the OPAMP and initializes the hardware based on the user configuration. Implements opamp_api_t::open().

The op-amp is not operational until the opamp_api_t::start() is called. If the op-amp is configured to start after AGT compare match, the op-amp is not operational until opamp_api_t::start() and the associated AGT compare match event occurs.

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open() and before opamp_api_t::start().

Return values

SSP_SUCCESS	Configuration successful.
SSP_ERR_ASSERTION	An input pointer is NULL.
SSP_ERR_INVALID_ARGUMENT	An input argument is invalid.
SSP_ERR_IN_USE	Control block is already opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Verify the control block has not already been initialized.

Confirm the OPAMP exists on this MCU.

Lock the OPAMP

Initialize the hardware based on the configuration.

Stop operation of all op-amps.

Initialize trim registers to factory trim values.

◆ R_OPAMP_Start()

ssp_err_t R_OPAMP_Start (opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask*)

If the OPAMP is configured for hardware triggers, enables hardware triggers. Otherwise, starts the op-amp. Implements opamp_api_t::start().

Some MCUs have switches that must be set before starting the op-amp. These switches must be set in the application code after opamp_api_t::open() and before opamp_api_t::start().

Return values

SSP_SUCCESS	Op-amp started or hardware triggers enabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

Enable AGT start and ADC conversion end triggers or start the op-amp channel(s).

Return the error code

◆ R_OPAMP_StatusGet()

ssp_err_t R_OPAMP_StatusGet (opamp_ctrl_t *const *p_api_ctrl*, opamp_status_t *const *p_status*)

Provides the operating status for each op-amp in a bitmask. This bit is set when operation begins, before the stabilization wait time has elapsed. Implements opamp_api_t::statusGet().

Return values

SSP_SUCCESS	Operating status of each op-amp provided in p_status.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Read the operating status of the op-amps.

◆ R_OPAMP_Stop()

ssp_err_t R_OPAMP_Stop (opamp_ctrl_t *const *p_api_ctrl*, uint32_t const *channel_mask*)

Stops the op-amp. If the OPAMP is configured for hardware triggers, disables hardware triggers. Implements opamp_api_t::stop().

Return values

SSP_SUCCESS	Op-amp stopped or hardware triggers disabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_INVALID_ARGUMENT	channel_mask includes a channel that does not exist on this MCU.

Disable AGT start and ADC conversion end triggers and stop the op-amp channel(s).

Return the error code

◆ R_OPAMP_Trim()

ssp_err_t R_OPAMP_Trim (opamp_ctrl_t *const *p_api_ctrl*, opamp_trim_cmd_t const *cmd*, opamp_trim_args_t const *const *p_args*)

On MCUs that support trimming, the op-amp trim register is set to the factory default after open(). This function allows the application to trim the operational amplifier to a user setting, which overwrites the factory default factory trim values.

Not supported on all MCUs. See hardware manual for details. Not supported if configured for low power mode (OPAMP_MODE_LOW_POWER).

This function is not reentrant. Only one side of one op-amp can be trimmed at a time. Complete the procedure for one side of one channel before calling trim() with command OPAMP_TRIM_CMD_START again.

Implements opamp_api_t::trim().

The trim procedure works as follows:

1. Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
2. Connect a fixed voltage to the Pch (+) input.
3. Connect the Nch (-) input to the op-amp output to create a voltage follower.
4. Ensure the op-amp is operating and stabilized.
5. Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_START.
6. Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
7. Iterate over the following loop 5 times:
    a. Call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    b. Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    c. If A <= B, call trim() for the Pch (+) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

8. Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_START.
9. Measure the fixed voltage connected to the Pch (+) input using the SAR ADC and save the value (referred to as A later in this procedure).
10. Iterate over the following loop 5 times:
    a. Call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_NEXT_STEP.
    b. Measure the op-amp output using the SAR ADC (referred to as B in the next step).
    c. If A <= B, call trim() for the Nch (-) side input with command OPAMP_TRIM_CMD_CLEAR_BIT.

Return values

SSP_SUCCESS	Conversion result in p_data.
SSP_ERR_UNSUPPORTED	Trimming is not supported on this MCU.
SSP_ERR_INVALID_STATE	The command is not valid in the current state of the trim state machine.
SSP_ERR_INVALID_ARGUMENT	The requested channel is not operating or the trim procedure is not in progress for this channel/input combination.
SSP_ERR_INVALID_MODE	Trim is not allowed in low power mode.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Initialize the trim register to 0 during OPAMP_TRIM_CMD_START.

Set the next trim bit during OPAMP_TRIM_CMD_NEXT_STEP.

Clear the current trim bit during OPAMP_TRIM_CMD_CLEAR_BIT.

◆ R_OPAMP_VersionGet()

ssp_err_t R_OPAMP_VersionGet (ssp_version_t *const *p_version*)

Gets the API and code version. Implements opamp_api_t::versionGet().

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

Variable Documentation

◆ g_opamp_on_opamp

const opamp_api_t g_opamp_on_opamp

```
=
{
    .open                = R_OPAMP_Open,
    .start               = R_OPAMP_Start,
    .stop                = R_OPAMP_Stop,
    .trim                = R_OPAMP_Trim,
    .infoGet             = R_OPAMP_InfoGet,
    .statusGet           = R_OPAMP_StatusGet,
    .close               = R_OPAMP_Close,
    .versionGet          = R_OPAMP_VersionGet
}
```

Name of module used by error logger macro OPAMP Implementation of OPAMP interface.

opamp_on_opamp_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Operational Amplifier (OPAMP)

#include <r_opamp.h>

Data Fields

opamp_agt_link_t	agt_link
opamp_mode_t	mode Low power, middle speed, or high speed mode.
opamp_trigger_t	trigger_channel_0 Start and stop triggers for channel 0.
opamp_trigger_t	trigger_channel_1 Start and stop triggers for channel 1.

opamp_trigger_t	trigger_channel_2 Start and stop triggers for channel 2.
opamp_trigger_t	trigger_channel_3 Start and stop triggers for channel 3.

Detailed Description

OPAMP configuration extension. This extension is required and must be provided in opamp_cfg_t::p_extend.

Field Documentation

◆ agt_link

opamp_agt_link_t opamp_on_opamp_cfg_t::agt_link
Configure which AGT links are paired to which channel. Only applies to channels if OPAMP_TRIGGER_AGT_START_SOFTWARE_STOP or OPAMP_TRIGGER_AGT_START_ADC_STOP is selected for the channel.

The documentation for this struct was generated from the following file:

- r_opamp.h

opamp_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Operational Amplifier (OPAMP)

#include <r_opamp.h>

Data Fields

R_OPAMP_Type *	p_reg Base register for this unit.
uint32_t	opened Boolean to verify that the Unit has been initialized.

uint8_t	trim_capable OPAMP has trim registers.
uint8_t	switches OPAMP has switches.
uint32_t	valid_opamps Mask of valid op-amps.
opamp_priv_trim_state_t	trim_state Trim state for each op-amp.
uint8_t	trim_channel Channel.
opamp_trim_input_t	trim_input Which input of the channel above.

Detailed Description

OPAMP instance control block. DO NOT INITIALIZE. Initialized in opamp_api_t::open().

The documentation for this struct was generated from the following file:

ssp_err_t	R_PDC_VersionGet (ssp_version_t *const p_data) Return PDC HAL driver version. Implements pdc_api_t::versionGet. More...

Detailed Description

Driver for the Parallel Data Capture Unit (PDC).

Summary

extends PDC Interface The PDC interface allows the capturing of an image from a camera module.

Function Documentation

◆ R_PDC_CaptureStart()

ssp_err_t R_PDC_CaptureStart (pdc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_buffer*)

Starts a capture. Enables interrupts. Implements pdc_api_t::captureStart.

Sets up the transfer interface to transfer data from the PDC into the specified buffer. Configures the PDC settings as previously set by the pdc_api_t::open API. These settings are configured here as the PIXCLK input must be active for the PDC reset operation. When a capture is complete the callback registered during pdc_api_t::open API call will be called.

Return values

SSP_SUCCESS	Capture start successful.
SSP_ERR_ASSERTION	One of the following parameters is incorrect. Either • p_api_ctrl is NULL, OR • low level transfer is not assigned, OR • low level transfer APIs are not assigned • buffer is not assigned, assign buffer
SSP_ERR_NOT_OPEN	Open has not been successfully called.
SSP_ERR_IN_USE	Pdc transfer is already in progress, wait for transfer to complete.
SSP_ERR_TIMEOUT	Reset operation timed out.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- transfer_api_t::open
- transfer_api_t::enable

Note

If the PIXCLK is being generated by a camera module the camera must be configured after the call to pdc_api_t::open and before the call to pdc_api_t::captureStart. This function is not reentrant.

The user is responsible to ensuring that the memory pointed to by p_buffer is both valid and large enough to store a complete image. The amount of space required, in bytes can be calculated as shown:

size (bytes) = image width (pixels) * image height (lines) * number of bytes per pixel

Set up transfer interface

Configure the transfer interface

Open transfer interface

Wait for reset to complete

Set horizontal capture range

Set horizontal capture size

Set vertical capture range

Set vertical capture size

Set VSYNC polarity

Set HSYNC polarity

Set endianess of capture data

Enable interrupts: Receive data ready interrupt, Underrun interrupt, Overrun interrupt, Frame end interrupt, Vertical line number setting error interrupt, Horizontal byte number setting error interrupt

◆ R_PDC_Close()

ssp_err_t R_PDC_Close (pdc_ctrl_t *const *p_api_ctrl*)

Stops and closes the transfer interface, disables the PDC, powers off the PDC, clears internal driver data and disables interrupts. Implements pdc_api_t::close.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	One of the following parameters is incorrect. Either • p_api_ctrl is NULL, OR • low level transfer is not assigned, OR • low level transfer APIs are not assigned
SSP_ERR_NOT_OPEN	Open has not been successfully called.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:
- transfer_api_t::disable
- transfer_api_t::close

Note

This API will close the PDC driver. If a capture is in progress it will be stopped. This function is reentrant.

Disable all interrupts.

Enable module stop mode for PDC

Unlock the PDC Hardware Resource

◆ R_PDC_Open()

ssp_err_t R_PDC_Open (pdc_ctrl_t *const *p_api_ctrl*, pdc_cfg_t const *const *p_cfg*)

Powers on PDC, handles required initialization described in the hardware manual. Implements pdc_api_t::open.

The Open function provides initial configuration for the PDC module. It powers on the module and enables the PCLKO output and the PIXCLK input. Further initialization requires the PIXCLK input to be running in order to be able to reset the PDC as part of its initialization. This clock is input from a camera module and so the reset and further initialization is performed in pdc_api_t::captureStart. This function should be called once prior to calling any other PDC API functions. After the PDC is opened the Open function should not be called again without first calling the Close function.

Return values

SSP_SUCCESS	Initialization was successful.
SSP_ERR_ASSERTION	One of the following parameters is incorrect. Either

	• p_cfg is NULL, OR • p_api_ctrl is NULL, OR • The pointer to the transfer interface in the p_cfg parameter is NULL
SSP_ERR_INVALID_ARGUMENT	One of the following configuration parameters is incorrect. Either • bytes_per_pixel is zero, OR • x_capture_pixels is zero, OR • y_capture_pixels is zero, OR • x_capture_start_pixel + x_capture_pixels is greater than 4095, OR • y_capture_start_pixel + y_capture_pixels is greater than 4095
SSP_ERR_HW_LOCKED	Unable to reserve BSP hardware lock for this module.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is not reentrant.

Lock the PDC Hardware Resource

Disable module stop mode for PDC

Set PCLKB divider

Enable PCLKO output

Enable the PIXCLK input

Mark driver as open by initializing it to "PDC" in its ASCII equivalent

◆ R_PDC_StateGet()

ssp_err_t R_PDC_StateGet (pdc_ctrl_t *const *p_api_ctrl*, pdc_state_t * *p_state*)

Returns the state of the VSYNC and HSYNC pins.Implements pdc_api_t::stateGet.

Return values

SSP_SUCCESS	State read successful.
SSP_ERR_ASSERTION	p_api_ctrl is NULL OR p_state is NULL
SSP_ERR_NOT_OPEN	Open has not been successfully called.

Note

This function is reentrant.

Check if the driver is open

Get the contents of PCMONR register

Update vsync signal state

Update hsync signal state

◆ R_PDC_VersionGet()

ssp_err_t R_PDC_VersionGet (ssp_version_t *const *p_data*)

Return PDC HAL driver version. Implements pdc_api_t::versionGet.

Return values

SSP_SUCCESS	Version information successfully read.
SSP_ERR_ASSERTION	Null pointer passed as a parameter

Note

This function is reentrant.

pdc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » PDC

#include <r_pdc.h>

Data Fields

R_PDC_Type *	p_reg Pointer to PDC base address.

uint32_t	open
uint8_t	bytes_per_pixel Number of bytes per pixel.
uint16_t	x_resolution_pixels Total number of horizontal pixels input to PDC.
uint16_t	y_resolution_pixels Total number of lines input to the PDC.
uint16_t	x_capture_start_pixel Horizontal position to start capture.
uint16_t	x_capture_pixels Number of horizontal pixels to capture.
uint16_t	y_capture_start_pixel Vertical position to start capture.
uint16_t	y_capture_pixels Number of vertical lines/pixels to capture.
pdc_endian_t	endian Endian of capture data.
pdc_hsync_polarity_t	hsync_polarity Polarity of HSYNC input.
pdc_vsync_polarity_t	vsync_polarity Polarity of VSYNC input.
uint8_t *	p_current_buffer Pointer to buffer currently in use.

bool	transfer_in_progress Indicates if a PDC transfer is already in progress.
transfer_instance_t const *	p_lower_lvl_transfer Pointer to the transfer instance the PDC should use.
transfer_info_t	info_transfer Transfer info structure for low level Transfer interface.
void const *	p_context
void(*	p_callback)(pdc_callback_args_t *p_args) Callback provided when a PDC transfer ISR occurs.
IRQn_Type	frame_end_irq Frame end interrupt number.
IRQn_Type	irq PDC interrupt number.

Detailed Description

PDC instance control block. DO NOT INITIALIZE. Initialization occurs when pdc_api_t::open is called.

Field Documentation

◆ open

uint32_t pdc_instance_ctrl_t::open
Indicates whether or not the driver is open called.

◆ p_context

void const* pdc_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in pdc_callback_args_t.

The documentation for this struct was generated from the following file:

struct	ptp_instance_ctrl_t

Functions

ssp_err_t	R_PTP_Open (ptp_ctrl_t *const p_api_ctrl, ptp_cfg_t const *const p_cfg) Open the PTP driver, handles required initialization described in hardware manual. Implements ptp_api_t::open. More...
ssp_err_t	R_PTP_Close (ptp_ctrl_t *const p_api_ctrl) Closes the PTP driver. Implements ptp_api_t::close. More...
ssp_err_t	R_PTP_Configure (ptp_ctrl_t *const p_api_ctrl, uint32_t *p_ip_address, uint32_t *p_physical_address_msw, uint32_t *p_physical_address_lsw) Configures the PTP driver with IP and MAC address. Implements ptp_api_t::configure. More...
ssp_err_t	R_PTP_SetExtPromiscuous (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, bool is_set) Sets or clear the extended promiscuous mode of the specified PTP channel. Implements ptp_api_t::setExtPromiscuous. More...
ssp_err_t	R_PTP_GetLocalClock (ptp_ctrl_t *const p_api_ctrl, ptp_timestamp_t *p_clock, uint32_t wait_option) Gets the current local clock counter value in Timestamp format(UNIX time) when configured as slave. Implements ptp_api_t::getLocalClock . More...

ssp_err_t	R_PTP_SetLocalClock (ptp_ctrl_t *const p_api_ctrl, ptp_timestamp_t *p_clock) Sets local clock counter value with Timestamp (UNIX time). Master clock set the master time. Implements ptp_api_t::setLocalClock. More...
ssp_err_t	R_PTP_GetMasterPortID (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, uint32_t *p_clock, uint16_t *p_port) Gets master clock ID and master port number fields of the specified PTP channel. Note: If the argument (p_clock or p_port) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getMasterPortID. More...
ssp_err_t	R_PTP_SetMasterPortID (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, uint32_t *p_clock, uint16_t *p_port) Sets master clock ID and master port number fields of the specified PTP channel. Note: If the argument (p_clock or p_port) is NULL pointer, the value will not be updated. Implements ptp_api_t::setMasterPortID. More...
ssp_err_t	R_PTP_GetSyncInfo (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, ptp_timeInterval_t *p_master_offset, ptp_timeInterval_t *p_path_delay) Gets the current offset from master and mean path delay of the specified PTP channel when configured as slave. Note: If the argument (p_master_offset or p_path_delay) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getSyncInfo. More...
ssp_err_t	R_PTP_Start (ptp_ctrl_t *const p_api_ctrl, uint32_t wait_option) Starts time synchronization. Implements ptp_api_t::start. More...
ssp_err_t	R_PTP_Stop (ptp_ctrl_t *const p_api_ctrl, uint32_t wait_option) Stops time synchronization. Implements ptp_api_t::stop. More...
ssp_err_t	R_PTP_SetWorst10Values (ptp_ctrl_t *const p_api_ctrl, uint8_t interval) Sets the interval for collecting worst 10 values. Implements ptp_api_t::setWorst10Values. More...
ssp_err_t	R_PTP_CheckWorst10Values (ptp_ctrl_t *const p_api_ctrl, uint32_t

	wait_option) Checks if worst 10 values are acquired and set as gradient limits when configured as slave. Implements ptp_api_t::checkWorst10Values. More...
ssp_err_t	R_PTP_GetWorst10Values (ptp_ctrl_t *const p_api_ctrl, uint32_t *p_positive_worst10, uint32_t *p_negative_worst10, uint32_t wait_option) Gets positive and negative worst 10 values by software. Note: If the argument (p_positive_worst10 or p_negative_worst10) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getWorst10Values. More...
ssp_err_t	R_PTP_SetGradientLimit (ptp_ctrl_t *const p_api_ctrl, uint32_t *p_positive_limit, uint32_t *p_negative_limit) Sets the gradient limits for positive and negative worst 10 values. Note: If the argument (p_positive_limit or p_negative_limit) is NULL pointer, the value will not be acquired. Implements ptp_api_t::setGradientLimit. More...
ssp_err_t	R_PTP_UpdateClockID (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, int8_t *p_clock_id) Updates clock identity field. Implements ptp_api_t::updateClockID. More...
ssp_err_t	R_PTP_UpdateDomainNumber (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, uint8_t domain_num) Updates domain number field in the message header. Implements ptp_api_t::updateDomainNumber. More...
ssp_err_t	R_PTP_UpdateAnnounceFlags (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, ptp_announce_flag_t *p_flag) Updates announce message's flag field. Implements ptp_api_t::updateAnnounceFlags. More...
ssp_err_t	R_PTP_UpdateAnnounceMsgs (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, ptp_announce_message_t *p_message) Updates announce message's message field. Implements ptp_api_t::updateAnnounceMsgs. More...
ssp_err_t	R_PTP_UpdateSyncAnnounceMsgInterval (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, int8_t *p_sync_interval, int8_t

	*p_announce_interval) Updates transmission interval and logMessageInterval of Sync and Announce messages. Note: If the argument (p_sync_interval or p_announce_interval) is NULL pointer, the value will not be acquired. Implements ptp_api_t::updateSyncAnnounceMsgInterval. More...
ssp_err_t	R_PTP_UpdateDelayMsgInterval (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, int8_t *p_interval, uint32_t *p_timeout) Updates transmission interval, logMessageInterval and timeout values of Delay message. Note: If the argument (p_interval or p_timeout) is NULL pointer, the value will not be updated. Implements ptp_api_t::updateDelayMsgInterval. More...
ssp_err_t	R_PTP_GetMessageReceptionConfig (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, ptp_message_reception_t *p_ptp_message_reception) Gets PTP message reception synchronous configuration. Implements ptp_api_t::getMessageReceptionConfig. More...
ssp_err_t	R_PTP_SetMessageReceptionConfig (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, ptp_message_reception_t *p_ptp_message_reception) Sets PTP message reception synchronous configuration. Implements ptp_api_t::setMessageReceptionConfig. More...
ssp_err_t	R_PTP_DisableTimer (ptp_ctrl_t *const p_api_ctrl, ptp_stca_timer_channel_t timer_channel) Disables the specified timer event interrupt. Implements ptp_api_t::disableTimer. More...
ssp_err_t	R_PTP_IndicateEvent (ptp_ctrl_t *const p_api_ctrl, ptp_stca_timer_channel_t timer_channel, ptp_stca_timer_pulse_edge_t timer_pulse_edge, bool is_set) Set/clear interrupt indication to ELC output on generation of pulse produced by pulse output timer. Implements ptp_api_t::indicateEvent . More...
ssp_err_t	R_PTP_AutoClearEvent (ptp_ctrl_t *const p_api_ctrl, ptp_stca_timer_channel_t timer_channel, ptp_stca_timer_pulse_edge_t timer_pulse_edge, bool is_set) Set/clear auto clear mode for enabling one time output of ELC event. Implements ptp_api_t::autoClearEvent. More...

ssp_err_t	R_PTP_SetTimer (ptp_ctrl_t *const p_api_ctrl, uint8_t timer_channel, UInt64_t event_time, uint32_t cycle, uint32_t pulse_width) Sets start time, pulse period and pulse width for the pulse output timer. Implements ptp_api_t::setTimer. More...
ssp_err_t	R_PTP_SetMINTevent (ptp_ctrl_t *const p_api_ctrl, ptp_event_t ptp_reg, uint32_t event, bool is_set) Sets MINT interrupt event to enable notification for change in state of modules Implements ptp_api_t::setMINTevent. More...
ssp_err_t	R_PTP_EnableINFABTnotification (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel) Enables EPTPC INFABT notification of the specified PTP channel. Implements ptp_api_t::enableINFABTnotification. More...
ssp_err_t	R_PTP_DisableINFABTnotification (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel) Disables EPTPC INFABT notification of the specified PTP channel. Implements ptp_api_t::disableINFABTnotification. More...
ssp_err_t	R_PTP_CheckINFABTstatus (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel, uint8_t *p_status) Checks the status of INFABT flag of the specified PTP channel. Implements ptp_api_t::checkINFABTstatus. More...
ssp_err_t	R_PTP_ClearINFABTstatus (ptp_ctrl_t *const p_api_ctrl, uint8_t ptp_channel) Clears INFABT interrupt occurrence flag of the specified PTP channel. Implements ptp_api_t::clearINFABTstatus. More...
ssp_err_t	R_PTP_VersionGet (ssp_version_t *const p_version) Gets version information and stores it in the provided version struct. Implements ptp_api_t::versionGet. More...

Detailed Description

Driver for the Precision time protocol(PTP).

Summary

This module supports the PTP time synchronization functionality.

Extends PTP driver Interface.

Function Documentation

◆ R_PTP_AutoClearEvent()

ssp_err_t R_PTP_AutoClearEvent (ptp_ctrl_t *const *p_api_ctrl*, ptp_stca_timer_channel_t *timer_channel*, ptp_stca_timer_pulse_edge_t *timer_pulse_edge*, bool *is_set*)

Set/clear auto clear mode for enabling one time output of ELC event. Implements ptp_api_t::autoClearEvent.

Return values

SSP_SUCCESS	ELC interrupt auto clear mode set or clear is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Get IPLS Interrupt Permission Automatic clearing register status

If set, enable automatic clearing for specified pulse output timer channel

Set IPLS Interrupt Permission Automatic clearing register status

◆ R_PTP_CheckINFABTstatus()

ssp_err_t R_PTP_CheckINFABTstatus (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, uint8_t * *p_status*)

Checks the status of INFABT flag of the specified PTP channel. Implements ptp_api_t::checkINFABTstatus.

Return values

SSP_SUCCESS	INFABT flag status check is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Gets the current status of INFABT notification flag of the specified PTP channel

◆ R_PTP_CheckWorst10Values()

ssp_err_t R_PTP_CheckWorst10Values (ptp_ctrl_t *const *p_api_ctrl*, uint32_t *wait_option*)

Checks if worst 10 values are acquired and set as gradient limits when configured as slave. Implements ptp_api_t::checkWorst10Values.

Return values

SSP_SUCCESS	Gradient values are set based on worst 10 values successfully.
SSP_ERR_TIMEOUT	Gradient values are not set before timeout.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Wait till worst10 values are acquired by hardware and set as gradient limits

◆ R_PTP_ClearINFABTstatus()

ssp_err_t R_PTP_ClearINFABTstatus (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*)

Clears INFABT interrupt occurrence flag of the specified PTP channel. Implements ptp_api_t::clearINFABTstatus.

Return values

SSP_SUCCESS	INFABT status flag clear is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Clear the status of INFABT notification flag of the specified PTP channel

◆ R_PTP_Close()

ssp_err_t R_PTP_Close (ptp_ctrl_t *const *p_api_ctrl*)

Closes the PTP driver. Implements ptp_api_t::close.

Return values

SSP_SUCCESS	The PTP driver is successfully closed.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Disable PTP MINT interrupt

Release hardware lock

Mark driver as closed

◆ R_PTP_Configure()

ssp_err_t R_PTP_Configure (ptp_ctrl_t *const *p_api_ctrl*, uint32_t * *p_ip_address*, uint32_t * *p_physical_address_msw*, uint32_t * *p_physical_address_lsw*)

Configures the PTP driver with IP and MAC address. Implements ptp_api_t::configure.

Return values

SSP_SUCCESS	The PTP driver is successfully configured with IP and MAC address.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block or passed argument is NULL.

Initialize Synchronization Frame Processing unit (SYNFP)

Initialize Packet Relation Controller (PRC-TC) and Statistical Time Correction Algorithm (STCA) units

◆ R_PTP_DisableINFABTnotification()

ssp_err_t R_PTP_DisableINFABTnotification (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*)

Disables EPTPC INFABT notification of the specified PTP channel. Implements ptp_api_t::disableINFABTnotification.

Return values

SSP_SUCCESS	INFABT notification disable is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Disable INFABT detection flag of the specified PTP channel

◆ R_PTP_DisableTimer()

ssp_err_t R_PTP_DisableTimer (ptp_ctrl_t *const *p_api_ctrl*, ptp_stca_timer_channel_t *timer_channel*)

Disables the specified timer event interrupt. Implements ptp_api_t::disableTimer.

Return values

SSP_SUCCESS	Timer event interrupt disable is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Get MINT interrupt request status

Disable the timer event of specified pulse output channel

◆ R_PTP_EnableINFABTnotification()

ssp_err_t R_PTP_EnableINFABTnotification (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*)

Enables EPTPC INFABT notification of the specified PTP channel. Implements ptp_api_t::enableINFABTnotification.

Return values

SSP_SUCCESS	INFABT notification enable is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Initially clear the status of INFABT detection flag of the specified PTP channel

Enable generation of ETHER_MINT interrupt by SYNFP0 status flag

Enable generation of ETHER_MINT interrupt by SYNFP1 status flag

Enable the INFABT detection flag of specified PTP channel

◆ R_PTP_GetLocalClock()

ssp_err_t R_PTP_GetLocalClock (ptp_ctrl_t *const *p_api_ctrl*, ptp_timestamp_t * *p_clock*, uint32_t *wait_option*)

Gets the current local clock counter value in Timestamp format(UNIX time) when configured as slave. Implements ptp_api_t::getLocalClock.

Return values

SSP_SUCCESS	Local clock counter get is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_TIMEOUT	Clock info is not acquired before timeout.
SSP_ERR_ASSERTION	Pointer to the control block or p_clock parameter is NULL.

Request the current local clock counter information

Wait till local clock counter value is loaded with current local time

Save current local clock counter value

◆ R_PTP_GetMasterPortID()

ssp_err_t R_PTP_GetMasterPortID (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, uint32_t * *p_clock*, uint16_t * *p_port*)

Gets master clock ID and master port number fields of the specified PTP channel. Note: If the argument (p_clock or p_port) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getMasterPortID.

Return values

SSP_SUCCESS	Master port ID get is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block, p_clock or p_port parameter is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Get master clock ID high and low fields

Get master port number field

◆ R_PTP_GetMessageReceptionConfig()

ssp_err_t R_PTP_GetMessageReceptionConfig (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, ptp_message_reception_t * *p_ptp_message_reception*)

Gets PTP message reception synchronous configuration. Implements ptp_api_t::getMessageReceptionConfig.

Return values

SSP_SUCCESS	Synchronous configuration get is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Get SYNFP Reception Filter Register 1

Get SYNFP Reception Filter Register 2

Get SYNFP Transmission Enable Register

Get SYNFP Operation Setting Register

◆ R_PTP_GetSyncInfo()

ssp_err_t R_PTP_GetSyncInfo (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, ptp_timeInterval_t * *p_master_offset*, ptp_timeInterval_t * *p_path_delay*)

Gets the current offset from master and mean path delay of the specified PTP channel when configured as slave. Note: If the argument (p_master_offset or p_path_delay) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getSyncInfo.

Return values

SSP_SUCCESS	Offset from master and mean path delay get is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block, p_master_offset or p_path_delay is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Request offset from master from the specified PTP channel

Get the offset from master in nano-seconds format

Request mean path delay from the specified PTP channel

Get the mean path delay in nano-seconds format

◆ R_PTP_GetWorst10Values()

ssp_err_t R_PTP_GetWorst10Values (ptp_ctrl_t *const *p_api_ctrl*, uint32_t * *p_positive_worst10*, uint32_t * *p_negative_worst10*, uint32_t *wait_option*)

Gets positive and negative worst 10 values by software. Note: If the argument (p_positive_worst10 or p_negative_worst10) is NULL pointer, the value will not be acquired. Implements ptp_api_t::getWorst10Values.

Return values

SSP_SUCCESS	Positive and negative worst 10 values get is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Request current worst10 values acquired

Wait till gradient worst10 values are acquired by software

Get positive gradient values

Get negative gradient values

◆ R_PTP_IndicateEvent()

ssp_err_t R_PTP_IndicateEvent (ptp_ctrl_t *const *p_api_ctrl*, ptp_stca_timer_channel_t *timer_channel*, ptp_stca_timer_pulse_edge_t *timer_pulse_edge*, bool *is_set*)

Set/clear interrupt indication to ELC output on generation of pulse produced by pulse output timer. Implements ptp_api_t::indicateEvent.

Return values

SSP_SUCCESS	ELC interrupt indication set or clear is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Get IPLS Interrupt Permission Register status

If set, enable output from pulse output timer channel

Set IPLS Interrupt Permission Register status

◆ R_PTP_Open()

ssp_err_t R_PTP_Open (ptp_ctrl_t *const *p_api_ctrl*, ptp_cfg_t const *const *p_cfg*)

Open the PTP driver, handles required initialization described in hardware manual. Implements ptp_api_t::open.

Return values

SSP_SUCCESS	PTP driver has opened successfully and initialization was successful.
SSP_ERR_IN_USE	The channel specified has already been opened.
SSP_ERR_ASSERTION	The p_ctrl or p_cfg parameter was NULL.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Verify if this unit has not already been initialized

Make sure the peripheral exists

Lock EPTPC channel

Power on the PTP module.

Configure MINT interrupt

Reset PTP driver

Wait at least 64 cycles of PCLKA to reset the PTPEDMAC and EPTPC. PCLKA must be at least 12.5 MHz to use Ethernet, so wait at least 5.12 us.

Initialize the channel state information

Select synchronization frame processing unit (SYNFP0 or SYNFP1)

Initialize EPTPC MINT interrupt requests

Initialize SYNFP reception status

Enable MINT interrupt

Disable bypassing of EPTPC module

Mark driver as opened by initializing it to "PTP" in its ASCII equivalent for this unit

◆ R_PTP_SetExtPromiscuous()

ssp_err_t R_PTP_SetExtPromiscuous (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, bool *is_set*)

Sets or clear the extended promiscuous mode of the specified PTP channel. Implements ptp_api_t::setExtPromiscuous.

Return values

SSP_SUCCESS	Extended promiscuous mode is set/cleared successfully.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Set or clear extended promiscuous mode of the specified PTP channel

◆ R_PTP_SetGradientLimit()

ssp_err_t R_PTP_SetGradientLimit (ptp_ctrl_t *const *p_api_ctrl*, uint32_t * *p_positive_limit*, uint32_t * *p_negative_limit*)

Sets the gradient limits for positive and negative worst 10 values. Note: If the argument (p_positive_limit or p_negative_limit) is NULL pointer, the value will not be acquired. Implements ptp_api_t::setGradientLimit.

Return values

SSP_SUCCESS	Positive and negative gradient values set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Set positive gradient values

Set negative gradient values

◆ R_PTP_SetLocalClock()

ssp_err_t R_PTP_SetLocalClock (ptp_ctrl_t *const *p_api_ctrl*, ptp_timestamp_t * *p_clock*)

Sets local clock counter value with Timestamp (UNIX time). Master clock set the master time. Implements ptp_api_t::setLocalClock.

Return values

SSP_SUCCESS	Local clock counter set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block or p_clock parameter is NULL.

Set local clock counter value with the specified time information

◆ R_PTP_SetMasterPortID()

ssp_err_t R_PTP_SetMasterPortID (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, uint32_t * *p_clock*, uint16_t * *p_port*)

Sets master clock ID and master port number fields of the specified PTP channel. Note: If the argument (p_clock or p_port) is NULL pointer, the value will not be updated. Implements ptp_api_t::setMasterPortID.

Return values

SSP_SUCCESS	Master port ID is updated successfully.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block, p_clock or p_port is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Set master clock ID high and low fields

Set master port number field

◆ R_PTP_SetMessageReceptionConfig()

ssp_err_t R_PTP_SetMessageReceptionConfig (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, ptp_message_reception_t * *p_ptp_message_reception*)

Sets PTP message reception synchronous configuration. Implements ptp_api_t::setMessageReceptionConfig.

Return values

SSP_SUCCESS	Synchronous configuration set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Set SYNFP Reception Filter Register 1

Set SYNFP Reception Filter Register 2

Set SYNFP Transmission Enable Register

Set SYNFP Operation Setting Register

◆ R_PTP_SetMINTevent()

ssp_err_t R_PTP_SetMINTevent (ptp_ctrl_t *const *p_api_ctrl*, ptp_event_t *ptp_reg*, uint32_t *event*, bool *is_set*)

Sets MINT interrupt event to enable notification for change in state of modules Implements ptp_api_t::setMINTevent.

Return values

SSP_SUCCESS	MINT interrupt event set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Enable notification of STCA status

Enable notification of PRC-TC status

Enable notification of SYNFP0 status

Enable notification of SYNFP1 status

◆ R_PTP_SetTimer()

ssp_err_t R_PTP_SetTimer (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *timer_channel*, UInt64_t *event_time*, uint32_t *cycle*, uint32_t *pulse_width*)

Sets start time, pulse period and pulse width for the pulse output timer. Implements ptp_api_t::setTimer.

Return values

SSP_SUCCESS	Timer event set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Set event time, PWM cycle interval and PWM pulse width to specified timer channel

Start the specified pulse output timer

◆ R_PTP_SetWorst10Values()

ssp_err_t R_PTP_SetWorst10Values (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *interval*)

Sets the interval for collecting worst 10 values. Implements ptp_api_t::setWorst10Values.

Return values

SSP_SUCCESS	Worst 10 values are recorded successfully.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Sets interval to get worst 10 values

◆ R_PTP_Start()

ssp_err_t R_PTP_Start (ptp_ctrl_t *const *p_api_ctrl*, uint32_t *wait_option*)

Starts time synchronization. Implements ptp_api_t::start.

Return values

SSP_SUCCESS	Time synchronization started successfully.
SSP_ERR_TIMEOUT	Time synchronization did not start before timeout.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_MODE	Invalid PTP mode.

Starts time synchronization

◆ R_PTP_Stop()

ssp_err_t R_PTP_Stop (ptp_ctrl_t *const *p_api_ctrl*, uint32_t *wait_option*)

Stops time synchronization. Implements ptp_api_t::stop.

Return values

SSP_SUCCESS	Time synchronization stopped successfully.
SSP_ERR_TIMEOUT	Time synchronization did not stop before timeout.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_MODE	Invalid PTP mode.

Stops the time synchronization

◆ R_PTP_UpdateAnnounceFlags()

ssp_err_t R_PTP_UpdateAnnounceFlags (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, ptp_announce_flag_t * *p_flag*)

Updates announce message's flag field. Implements ptp_api_t::updateAnnounceFlags.

Return values

SSP_SUCCESS	Announce message flag field set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Update announce message's flag field

◆ R_PTP_UpdateAnnounceMsgs()

ssp_err_t R_PTP_UpdateAnnounceMsgs (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, ptp_announce_message_t * *p_message*)

Updates announce message's message field. Implements ptp_api_t::updateAnnounceMsgs.

Return values

SSP_SUCCESS	Announce message field set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Update grandmasterPriority1 and grandmasterPriority2 fields

Update grandmasterClockQuality fields

Update grandmasterIdentity fields of Announce messages

◆ R_PTP_UpdateClockID()

ssp_err_t R_PTP_UpdateClockID (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, int8_t * *p_clock_id*)

Updates clock identity field. Implements ptp_api_t::updateClockID.

Return values

SSP_SUCCESS	Clock identity field set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Update local clockIdentity field of the specified EPTPC port

◆ R_PTP_UpdateDelayMsgInterval()

ssp_err_t R_PTP_UpdateDelayMsgInterval (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, int8_t * *p_interval*, uint32_t * *p_timeout*)

Updates transmission interval, logMessageInterval and timeout values of Delay message. Note: If the argument (p_interval or p_timeout) is NULL pointer, the value will not be updated. Implements ptp_api_t::updateDelayMsgInterval.

Return values

SSP_SUCCESS	Transmission interval, logMessage interval and timeout set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

If clock state is master, update Delay_Response logMessageInterval value

If clock state is slave, update Delay_Request /Pdelay_Request transmission interval value

Update Delay_Response/Pdelay_Response receiving timeout value

◆ R_PTP_UpdateDomainNumber()

ssp_err_t R_PTP_UpdateDomainNumber (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, uint8_t *domain_num*)

Updates domain number field in the message header. Implements ptp_api_t::updateDomainNumber.

Return values

SSP_SUCCESS	Domain number field set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Update domainNumber field of the PTP message header

◆ R_PTP_UpdateSyncAnnounceMsgInterval()

ssp_err_t R_PTP_UpdateSyncAnnounceMsgInterval (ptp_ctrl_t *const *p_api_ctrl*, uint8_t *ptp_channel*, int8_t * *p_sync_interval*, int8_t * *p_announce_interval*)

Updates transmission interval and logMessageInterval of Sync and Announce messages. Note: If the argument (p_sync_interval or p_announce_interval) is NULL pointer, the value will not be acquired. Implements ptp_api_t::updateSyncAnnounceMsgInterval.

Return values

SSP_SUCCESS	Transmission interval and logMessage interval set is successful.
SSP_ERR_NOT_OPEN	The PTP driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_INVALID_CHANNEL	Invalid EPTPC channel.

Update SYNFP Sync message transmission interval

Update SYNFP announce message Transmission Interval

◆ R_PTP_VersionGet()

ssp_err_t R_PTP_VersionGet (ssp_version_t *const *p_version*)

Gets version information and stores it in the provided version struct. Implements ptp_api_t::versionGet.

Return values

SSP_SUCCESS	Version returned successfully.
SSP_ERR_ASSERTION	Parameter p_version was NULL.

Return the version number

ptp_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » PTP

#include <r_ptp.h>

Data Fields

ssp_err_t(*	p_callback)(ptp_callback_args_t *p_args)
IRQn_Type	mint_irq MINT interrupt IRQ number.
ptp_device_t	device PTP clock type.
ptp_state_t	state [2] PTP clock state.
ptp_delay_mechanism_t	delay [2] PTP delay correction mechanism.
ptp_frame_format_t	frame_format [2] PTP message frame format.

ptp_stca_mode_t	stca_mode STCA synchronous mode.
ptp_address_t	address [2] IP and MAC address.
uint32_t	open Flag to determine if the device is open.
uint8_t	eptpc_flag [2] Flag to check the EPTPC channel.
uint8_t	infabt_flag [2] Flag to check INFABT status.
void *	p_reg_gen Pointer to R_EPTPC_GEN_Type base register.
void *	p_reg_cfg Pointer to R_EPTPC_CFG_Type base register.
void *	p_reg [2] Pointer to R_EPTPC0_Type base register.
void const *	p_context Placeholder for user data.
void const *	p_extend Extension parameter for hardware specific settings.

Detailed Description

PTP instance control block. DO NOT INITIALIZE. Initialized in ptp_api_t::open().

Field Documentation

◆ p_callback

ssp_err_t(* ptp_instance_ctrl_t::p_callback) (ptp_callback_args_t *p_args)
Callback provided when a PTP message is received. NULL indicates no CPU interrupt.

Detailed Description

DMA controller for PTP driver.

Summary

This module implements the following interface: PTPEDMAC driver Interface.

Function Documentation

◆ R_PTPEDMAC_CheckLink()

ssp_err_t R_PTPEDMAC_CheckLink (ptpedmac_ctrl_t *const *p_api_ctrl*)

Checks PTP host interface communication link. Implements ptpedmac_api_t::checkLink.

Return values

SSP_SUCCESS	PTP host interface link status is verified successfully
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	PTPEDMAC driver is not opened.
SSP_ERR_NOT_ENABLED	PTP host interface is not enabled

Check the current status of PTP message transfer

◆ R_PTPEDMAC_Close()

ssp_err_t R_PTPEDMAC_Close (ptpedmac_ctrl_t *const *p_api_ctrl*)

Disable PTP host interface. Implements ptpedmac_api_t::close.

Return values

SSP_SUCCESS	PTP host interface is closed successfully
SSP_ERR_NOT_OPEN	PTPEDMAC driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.

Clear PTPEDMAC interrupt

Set PTP Host interface transfer flag to disable

The device is now considered closed

◆ R_PTPEDMAC_LinkProcess()

ssp_err_t R_PTPEDMAC_LinkProcess (ptpedmac_ctrl_t *const *p_api_ctrl*)

Sets PTP host interface to transfer PTP messages. Implements ptpedmac_api_t::linkProcess.

Return values

SSP_SUCCESS	PTP host interface has linked successfully to transfer PTP messages
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_OPEN	PTPEDMAC driver is not opened.

Initialize the receive descriptor

Initialize and configure PTPEDMAC

Set PTP Host interface transfer flag to enable

◆ R_PTPEDMAC_Open()

ssp_err_t R_PTPEDMAC_Open (ptpedmac_ctrl_t *const *p_api_ctrl*, ptpedmac_cfg_t const *const *p_cfg*)

Open the PTP host interface (PTPEDMAC), handles required initialization described in hardware manual. Implements ptpedmac_api_t::open.

Return values

SSP_SUCCESS	PTP host interface has opened successfully and initialization was successful.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Reset PTPEDMAC

Wait at least 64 cycles of PCLKA to reset the PTPEDMAC and EPTPC. PCLKA must be at least 12.5 MHz to use Ethernet, so wait at least 5.12 us.

Make sure the peripheral exists.

Initialize the channel state information.

If interrupt is registered in the vector table, disable interrupts, set priority, and store control block in the vector information so it can be accessed from the callback.

Enable PINT interrupt

Initialize frame transfer status flag

Mark driver as opened by initializing it to "DMAC" in its ASCII equivalent for this unit.

◆ R_PTPEDMAC_Read()

ssp_err_t R_PTPEDMAC_Read (ptpedmac_ctrl_t *const *p_api_ctrl*, uint32_t * *p_channel*, void * *p_buffer*, int32_t * *p_num_received*)

Receive PTP message. Implements ptpedmac_api_t::read.

Return values

SSP_SUCCESS	PTP message received successfully
SSP_ERR_TIMEOUT	No data received
SSP_ERR_NOT_OPEN	PTPEDMAC driver is not opened.
SSP_ERR_ASSERTION	Pointer to the control block is NULL.
SSP_ERR_NOT_ENABLED	PTP host interface is not enabled

Set the allocated buffer pointer for received data

◆ R_PTPEDMAC_VersionGet()

ssp_err_t R_PTPEDMAC_VersionGet (ssp_version_t *const *p_version*)

This function returns the API version. Implements ptpedmac_api_t::versionGet.

Parameters

[in]	p_version	Pointer to the API version block

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

Detailed Description

Driver for the Quad Serial Peripheral Interface (QSPI).

This is a driver for the Quad-SPI module (QSPI) which is a memory controller for connecting a serial ROM (non-volatile memory such as a serial flash memory, serial EEPROM, or serial FeRAM) that has an SPI-compatible interface.

Summary

Extends Quad SPI Flash Interface.

Function Documentation

◆ R_QSPI_BankSelect()

ssp_err_t R_QSPI_BankSelect (uint32_t *bank*)

Select the bank to access.

A bank is a 64MB sliding access window into the flash memory space. This function sets the current bank.

Return values

SSP_SUCCESS	Bank successfully selected.

Return back to ROM access mode

◆ R_QSPI_Close()

ssp_err_t R_QSPI_Close (qspi_ctrl_t * *p_api_ctrl*)

Close the QSPI driver module.

Return the QSPI module back to ROM access mode.

Return values

SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check if the device is open

Re-enter XIP mode if it was running in this mode before entering opening the driver

Clearing the manufacturing_id, memory_type and memory_capacity

◆ R_QSPI_Erase()

ssp_err_t R_QSPI_Erase (qspi_ctrl_t * *p_api_ctrl*, uint8_t * *p_device_address*, uint32_t *byte_count*)

Erase a number of byte from the flash.

Return values

SSP_SUCCESS	The command to erase the flash was executed successfully.
SSP_ERR_UNSUPPORTED	The device address is invalid.
SSP_ERR_ASSERTION	p_ctrl or p_device_address is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid byte_count entered.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check if the device is open

Check whether the device address is valid

Get the information of underlying flash

If requested byte_count is supported by underlying flash, assign the value of size_index to cmd_index for searching the command

Send command to enable writing

Get the erase command

Send command to erase

If the command is not a chip erase command then send the start address

Send command to write data

Send command to disable writing

◆ R_QSPI_InfoGet()

ssp_err_t R_QSPI_InfoGet (qspi_ctrl_t * *p_api_ctrl*, qspi_info_t *const *p_info*)

Returns the information about the flash.

Return values

SSP_SUCCESS	Operation was successful.
SSP_ERR_ASSERTION	p_ctrl or p_info is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check if the device is open

Get the information of underlying flash

◆ R_QSPI_Open()

ssp_err_t R_QSPI_Open (qspi_ctrl_t * *p_api_ctrl*, qspi_cfg_t const *const *p_cfg*)

Open the QSPI driver module.

Open the QSPI module driver in direct communication mode for the purposes of reading and writing flash memory via SPI protocols.

Return values

SSP_SUCCESS	Configuration was successful.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
SSP_ERR_UNSUPPORTED	Driver not able to query the following information from the flash manufacturer id,memory capacity and memory type.
SSP_ERR_IN_USE	QSPI resource is locked.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Set the default bank to the first bank

Get the configuration of the quad SPI flash device and remember it for subsequent operations

If populated flash is 16MB & address mode configured as 4-byte,returns an unsupported error

A zero in the manufacturer_id mean the flash device is broken, misconfigured, or not populated

Mark driver as opened by initializing it to "RQSP" in its ASCII equivalent for this unit.

Exit XIP mode while the driver is open

◆ R_QSPI_PageProgram()

ssp_err_t R_QSPI_PageProgram (qspi_ctrl_t * *p_api_ctrl*, uint8_t * *p_device_address*, uint8_t * *p_memory_address*, uint32_t *byte_count*)

Program a page of data to the flash.

Return values

SSP_SUCCESS	The flash was programmed successfully.
SSP_ERR_UNSUPPORTED	The device address is invalid.
SSP_ERR_ASSERTION	p_ctrl, p_device_address or p_memory_address is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter is passed.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check whether the device address is valid

Send command to enable writing

If the peripheral is in extended SPI mode, and the configuration provided in the BSP allows for programming on multiple data lines, and a unique command is provided for the required mode, update the SPI protocol to send data on multiple lines.

Send command to write data

Write the address.

Write the data.

If the SPI protocol was modified in this function, restore it.

Send command to disable writing

◆ R_QSPI_Read()

ssp_err_t R_QSPI_Read (qspi_ctrl_t * *p_api_ctrl*, uint8_t * *p_device_address*, uint8_t * *p_memory_address*, uint32_t *byte_count*)

Read data from the flash.

Read a block of data from a particular address on the SPI flash device.

Return values

SSP_SUCCESS	The flash was programmed successfully.
SSP_ERR_UNSUPPORTED	The device address is invalid.
SSP_ERR_ASSERTION	p_ctrl,p_device_address or p_memory_address is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.
SSP_ERR_TRANSFER_BUSY	Another serial communications transfer is in progress.

Check if the device is open

Check whether the device address is valid

Make sure no other communication is in progress.

◆ R_QSPI_SectorErase()

ssp_err_t R_QSPI_SectorErase (qspi_ctrl_t * *p_api_ctrl*, uint8_t * *p_device_address*)

Erase a sector on the flash.

Erase one sector on the SPI flash device. Any passed in address within the sector to be erased is acceptable.

Return values

SSP_SUCCESS	The command to erase the sector of flash was executed successfully.
SSP_ERR_UNSUPPORTED	The device address is invalid.
SSP_ERR_ASSERTION	p_ctrl or p_device_address is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check whether the device address is valid

Check if the device is open

Place the QSPI block into Direct Communication mode

Send command to enable writing

Close the SPI bus cycle

Send command to erase

Send command to write data

Send command to erase

Close the SPI bus cycle

Send command to disable writing

Close the SPI bus cycle

Return to ROM access mode

◆ R_QSPI_StatusGet()

ssp_err_t R_QSPI_StatusGet (qspi_ctrl_t * *p_api_ctrl*, bool * *p_write_in_progress*)

Get the write or erase status of the flash.

Return the write status of the flash. This is most useful for determining if erases are complete.

Return values

SSP_SUCCESS	The write status is correct.
SSP_ERR_ASSERTION	p_ctrl or p_write_in_progress is NULL.
SSP_ERR_NOT_OPEN	Driver is not opened.

Check if the device is open

Place the QSPI block into Direct Communication mode

Get the write status from the device

Return to ROM access mode

◆ R_QSPI_VersionGet()

ssp_err_t R_QSPI_VersionGet (ssp_version_t *const *p_version*)

Get the driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_version is NULL.

qspi_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » QSPI

#include <r_qspi.h>

Data Fields

R_QSPI_Type *	p_reg Pointer to QSPI base register.
uint32_t	max_eraseable_size

uint32_t	num_address_bytes Number of bytes used to represent the address.
uint32_t	spi_mode SPI mode - 0 = Extended, 1 = Dual, 2 = Quad.
uint32_t	page_size Number of bytes in a programmable page.
uint8_t	data_lines data lines - 0 = 1 line, 1 = 2 lines, 2 = 4 lines
uint8_t	manufacturer_id Manufacturer ID.
uint8_t	memory_type Memory type.
uint8_t	memory_capacity Memory capacity (in MByte)
bool	xip_mode 0 = run in read mode, 1 = run in XIP mode
uint32_t	total_size_bytes Total size of the flash in bytes.
uint32_t	open Flag to determine if the device is open.

Detailed Description

Instance control block. DO NOT INITIALIZE. Initialization occurs when qspi_api_t::open is called

Field Documentation

◆ max_eraseable_size

uint32_t qspi_instance_ctrl_t::max_eraseable_size
Largest eraseable sector size in kbytes. Used to determine buffer size for partial sector erases.

The documentation for this struct was generated from the following file:

- r_qspi.h

Detailed Description

Driver for the I2C Bus Interface (IIC).

This module supports the Renesas Inter-Integrated Circuit (IIC) peripheral. It implements the following interfaces:

- I2C Interface r_i2c_api.h

Macro Definition Documentation

◆ RIIC_ERROR_RETURN

#define RIIC_ERROR_RETURN (a, err) SSP_ERROR_RETURN((a), (err), &g_module_name[0], &g_riic_master_version)
Macro for error logger.

◆ RIIC_OPEN

#define RIIC_OPEN (0x52494943ULL)
"RIIC" in ASCII, used to determine if channel is open.

Enumeration Type Documentation

◆ riic_timeout_mode_t

enum riic_timeout_mode_t	
I2C Timeout mode parameter definition	
Enumerator	
RIIC_TIMEOUT_MODE_LONG	Timeout Detection Time Select: Long Mode -> TMOS = 0.
RIIC_TIMEOUT_MODE_SHORT	Timeout Detection Time Select: Short Mode -> TMOS = 1.

Function Documentation

◆ R_RIIC_MasterClose()

ssp_err_t R_RIIC_MasterClose (i2c_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. May power down IIC peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

SSP_SUCCESS	Device closed without issue.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_ABORTED	Device was closed while a transfer was in progress.

Check if the device is even open, return an error if not

Abort an in-progress transfer with this device only

Close the DTC transfer interfaces if configured

Disable the interrupt sources for I2C peripheral

◆ R_RIIC_MasterOpen()

ssp_err_t R_RIIC_MasterOpen (i2c_ctrl_t *const *p_api_ctrl*, i2c_cfg_t const *const *p_cfg*)

Opens the I2C device. May power on IIC peripheral and perform initialization described in hardware manual.

This function will reconfigure the clock settings of the peripheral when a device with a lower rate than previously configured is opened.

Return values

SSP_SUCCESS	Requested clock rate was set exactly.
SSP_ERR_ASSERTION	The parameter p_api_ctrl or p_cfg is NULL or clock rate is greater than 1MHz. or the extended parameter is NULL
SSP_ERR_IN_USE	Attempted to open an already open device instance.
SSP_ERR_INVALID_ARGUMENT	If fast mode plus is configured and the channel does not support it
SSP_ERR_INVALID_RATE	The requested rate cannot be set.

Returns

See Common Error Codes for other possible return codes. This function calls
- fmi_api_t::productFeatureGet
- g_cgc_on_cgc.systemClockFreqGet

If rate is configured as Fast mode plus, check whether the channel supports it

set valid interrupts with user provided priority

Open the hardware in master mode

Open the RIIC DTC transfer interface if enabled

Initialize control block

◆ R_RIIC_MasterRead()

ssp_err_t R_RIIC_MasterRead (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C read operation will begin. When no callback is provided by the user, this function performs a blocking read. Otherwise, the read operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_RX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue, if no callback was provided, the process was kicked off.
SSP_ERR_ASSERTION	p_api_ctrl, p_dest or bytes is NULL.
SSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size(65535) while DTC is used for data transfer.
SSP_ERR_IN_USE	Another transfer was in progress.
SSP_ERR_HW_LOCKED	Driver busy doing RIIC operation
SSP_ERR_ABORTED	The transfer failed.

Check if the device is even open, return an error if not

Attempt to acquire lock for this transfer operation. Prevents re-entrance conflict.

Record the new information about this transfer

Kickoff the read operation as a master

◆ R_RIIC_MasterReset()

ssp_err_t R_RIIC_MasterReset (i2c_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the IIC peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

SSP_SUCCESS	Channel was reset without issue.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_ABORTED	A transfer was aborted while resetting the hardware.

Check if the device is even open, return an error if not

Abort any on-going transfer on the channel

◆ R_RIIC_MasterSlaveAddressSet()

ssp_err_t R_RIIC_MasterSlaveAddressSet (i2c_ctrl_t *const *p_api_ctrl*, uint16_t const *slave_address*, i2c_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

SSP_SUCCESS	Address of the slave is set correctly.
SSP_ERR_ASSERTION	Pointer to control structure is NULL.
SSP_ERR_HW_LOCKED	Driver busy doing RIIC operation.
SSP_ERR_NOT_OPEN	Device was not even opened.

Check if the device is open, return an error if not

Attempt to acquire lock for configuring the slave address. Prevents re-entrance conflict.

Return failure if there is already a transfer in progress

Sets the address of the slave device

Sets the mode of addressing

◆ R_RIIC_MasterVersionGet()

ssp_err_t R_RIIC_MasterVersionGet (ssp_version_t *const *p_version*)

Gets version information and stores it in the provided version struct.

Return values

SSP_SUCCESS	Successful version get.
SSP_ERR_ASSERTION	p_version is NULL.

◆ R_RIIC_MasterWrite()

ssp_err_t R_RIIC_MasterWrite (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue, if no callback was provided, the process was kicked off.
SSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
SSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size(65535) while DTC is used for data transfer.
SSP_ERR_IN_USE	Another transfer was in progress.
SSP_ERR_HW_LOCKED	Driver busy doing RIIC operation
SSP_ERR_ABORTED	The transfer failed.

Check if the device is even open, return an error if not

Attempt to acquire lock for this transfer operation. Prevents re-entrance conflict.

Record the new information about this transfer

Kickoff the write operation as a master

volatile bool	address_restarted
volatile bsp_lock_t	resource_lock_tx_rx

riic_timeout_mode_t	timeout_mode
i2c_hw_err_event_t	actual_hwErr_event

Detailed Description

I2C control structure. DO NOT INITIALIZE.

Field Documentation

◆ activation_on_rxi

volatile bool riic_instance_ctrl_t::activation_on_rxi

Tracks whether the transfer is activated on RXI interrupt

◆ activation_on_txi

volatile bool riic_instance_ctrl_t::activation_on_txi

Tracks whether the transfer is activated on TXI interrupt

◆ actual_hwErr_event

i2c_hw_err_event_t riic_instance_ctrl_t::actual_hwErr_event

Holds error event value obtained through hardware

◆ addr_high

uint8_t riic_instance_ctrl_t::addr_high

Holds the first address byte to issue in 10-bit mode

◆ addr_loaded

uint8_t riic_instance_ctrl_t::addr_loaded

Tracks the number of address bytes written to the register

◆ addr_low

uint8_t riic_instance_ctrl_t::addr_low

Holds the last address byte to issue

◆ addr_remain

uint8_t riic_instance_ctrl_t::addr_remain
Tracks the remaining address bytes to transfer

◆ addr_total

uint8_t riic_instance_ctrl_t::addr_total
Holds the total number of address bytes to transfer

◆ address_restarted

volatile bool riic_instance_ctrl_t::address_restarted
Tracks whether the restart condition is send on 10 bit read

◆ dummy_read_completed

volatile bool riic_instance_ctrl_t::dummy_read_completed
Tracks whether the dummy read is performed

◆ err

volatile bool riic_instance_ctrl_t::err
Tracks whether or not an error occurred during processing

◆ loaded

uint32_t riic_instance_ctrl_t::loaded
Tracks the number of data bytes written to the register

◆ p_buff

uint8_t* riic_instance_ctrl_t::p_buff
Holds the data associated with the transfer

◆ read

volatile bool riic_instance_ctrl_t::read
Holds the direction of the data byte transfer

◆ remain

uint32_t riic_instance_ctrl_t::remain
Tracks the remaining data bytes to transfer

◆ resource_lock_tx_rx

volatile bsp_lock_t riic_instance_ctrl_t::resource_lock_tx_rx
Resource lock for transmission/reception

◆ restart

volatile bool riic_instance_ctrl_t::restart
Holds whether or not the restart should be issued when done

◆ restarted

volatile bool riic_instance_ctrl_t::restarted
Tracks whether or not a restart was issued during the previous transfer

◆ timeout_mode

riic_timeout_mode_t riic_instance_ctrl_t::timeout_mode
Holds the timeout mode value. i.e short mode or long mode

◆ total

uint32_t riic_instance_ctrl_t::total
Holds the total number of data bytes to transfer

Variables

i2c_api_slave_t const	g_i2c_slave_on_riic

Detailed Description

Driver for the I2C Bus Slave Interface (IIC Slave).

This module supports the Renesas Inter-Integrated Circuit (IIC) peripheral. It implements the following interfaces:

- I2C Interface r_i2c_api.h

Macro Definition Documentation

◆ RIIC_SLAVE_ERROR_RETURN

#define RIIC_SLAVE_ERROR_RETURN (a, err) SSP_ERROR_RETURN((a), (err), &g_module_name[0], &g_riic_slave_version)
Macro for error logger.

◆ RIIC_SLAVE_OPEN

#define RIIC_SLAVE_OPEN (0x49324353ULL)
"I2CS" in ASCII, used to determine if channel is open.

Function Documentation

◆ R_RIIC_MasterReadSlaveWrite()

ssp_err_t R_RIIC_MasterReadSlaveWrite (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*)

Performs a write to the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue; if no callback was provided, the process was kicked off
SSP_ERR_ASSERTION	p_api_ctrl or p_src is NULL.
SSP_ERR_IN_USE	Another transfer was in progress.
SSP_ERR_NOT_OPEN	device is not open.
SSP_ERR_ABORTED	If transaction encounter an error.

Check if the device is open, return an error if not

Return an error if transfer is in progress

Record the new information about this transfer

Start the write operation as a slave

◆ R_RIIC_MasterWriteSlaveRead()

ssp_err_t R_RIIC_MasterWriteSlaveRead (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*)

Performs a read from the I2C Master device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C read operation will begin. When no callback is provided by the user, this function performs a blocking read. Otherwise, the read operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_RX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue; if no callback was provided, the process was kicked off
SSP_ERR_ASSERTION	p_api_ctrl, bytes or p_dest is NULL.
SSP_ERR_IN_USE	Another transfer was in progress.
SSP_ERR_NOT_OPEN	device is not open.
SSP_ERR_ABORTED	If transaction encounter an error.

Check if the device is open, return an error if not

Return an error if transfer is in progress.

Record the new information about this transfer

Start the read operation as a slave

◆ R_RIIC_SlaveClose()

ssp_err_t R_RIIC_SlaveClose (i2c_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down IIC peripheral.

Return values

SSP_SUCCESS	Device closed without issue.
SSP_ERR_NOT_OPEN	Device not opened.
SSP_ERR_ASSERTION	p_api_ctrl is NULL.
SSP_ERR_ABORTED	Device was closed while a transfer was in progress.

Check if the device is even open, return an error if not

De-configure everything.

◆ R_RIIC_SlaveOpen()

ssp_err_t R_RIIC_SlaveOpen (i2c_ctrl_t *const *p_api_ctrl*, i2c_cfg_t const *const *p_cfg*)

Opens the I2C device. May power on IIC peripheral and perform initialization described in hardware manual.

Return values

SSP_SUCCESS	Opened identical configuration of already open instance.
SSP_ERR_ASSERTION	p_api_ctrl or p_cfg is NULL.
SSP_ERR_IN_USE	Attempted to open an already open device instance.
SSP_ERR_IRQ_BSP_DISABLED	Interrupt does not exist in the vector table.
SSP_ERR_INVALID_ARGUMENT	If fast mode plus is configured and the channel does not support it

Returns

See Common Error Codes for other possible return codes. This function calls
- fmi_api_t::productFeatureGet
- g_cgc_on_cgc.systemClockFreqGet

If rate is configured as Fast mode plus, check whether the channel supports it

Attempt to acquire hardware lock

Open the hardware in slave mode

Clear all interrupt bits

Enable both TXI and RXI interrupt sources

Set ACK as slave is now ready to serve requests from master

Enable all RIIC interrupts in NVIC, that need to be serviced

Release hardware lock on failure

◆ R_RIIC_SlaveVersionGet()

ssp_err_t R_RIIC_SlaveVersionGet (ssp_version_t *const *p_version*)

Gets version information and stores it in the provided version struct.

Return values

SSP_SUCCESS	Successful version get.
SSP_ERR_ASSERTION	p_version is NULL.

Variable Documentation

◆ g_i2c_slave_on_riic

i2c_api_slave_t const g_i2c_slave_on_riic

```
=
{
    .open                       = R_RIIC_SlaveOpen,
    .close                       = R_RIIC_SlaveClose,
    .masterWriteSlaveRead       = R_RIIC_MasterWriteSlaveRead,
    .masterReadSlaveWrite       = R_RIIC_MasterReadSlaveWrite,
    .versionGet                 = R_RIIC_SlaveVersionGet
}
```

RIIC Implementation of I2C device slave interface

volatile bool	read
volatile bool	err
volatile bool	slave_busy
volatile bool	start_interrupt_enabled

Detailed Description

I2C control structure. DO NOT INITIALIZE.

Field Documentation

◆ err

volatile bool riic_slave_instance_ctrl_t::err
Tracks whether or not an error occurred during processing

◆ loaded

uint32_t riic_slave_instance_ctrl_t::loaded
Tracks the number of data bytes written to the register

◆ notify_request

volatile bool riic_slave_instance_ctrl_t::notify_request
Track whether the master request is notified to the application

◆ p_buff

uint8_t* riic_slave_instance_ctrl_t::p_buff
Holds the data associated with the transfer

◆ read

volatile bool riic_slave_instance_ctrl_t::read
Holds the direction of the data byte transfer

◆ remain

uint32_t riic_slave_instance_ctrl_t::remain
Tracks the remaining data bytes to transfer

◆ slave_busy

volatile bool riic_slave_instance_ctrl_t::slave_busy
Tracks if the slave is busy performing a transaction

◆ start_interrupt_enabled

volatile bool riic_slave_instance_ctrl_t::start_interrupt_enabled
<< Tracks whether a dummy read is issued on the first RX < Tracks whether the start interrupt is enabled

◆ total

uint32_t riic_slave_instance_ctrl_t::total
Holds the total number of data bytes to transfer

◆ transaction_count

uint32_t riic_slave_instance_ctrl_t::transaction_count
Tracks the actual number of transactions

Detailed Description

Driver for the Serial Peripheral Interface (SPI).

This module supports SPI serial communication for the SPI module. The SPI Interface is defined in r_spi_api.h

Enumeration Type Documentation

◆ rspi_byte_swap_t

enum rspi_byte_swap_t	
SPDCR2 (RSPI Data Control Register 2) – Byte swapping operation enable/disable	
Enumerator	
RSPI_BYTE_SWAP_DISABLE	Disable Byte swap
RSPI_BYTE_SWAP_ENABLE	Enable Byte swap

◆ rspi_clock_delay_count_t

enum rspi_clock_delay_count_t	
SPCKD (RSPI Clock Delay) Register – Clock Delay Count select	
Enumerator	
RSPI_CLOCK_DELAY_COUNT_1	Set RSPCK Clock delay to 1 RSPCK
RSPI_CLOCK_DELAY_COUNT_2	Set RSPCK Clock delay to 2 RSPCK
RSPI_CLOCK_DELAY_COUNT_3	Set RSPCK Clock delay to 3 RSPCK
RSPI_CLOCK_DELAY_COUNT_4	Set RSPCK Clock delay to 4 RSPCK
RSPI_CLOCK_DELAY_COUNT_5	Set RSPCK Clock delay to 5 RSPCK
RSPI_CLOCK_DELAY_COUNT_6	Set RSPCK Clock delay to 6 RSPCK
RSPI_CLOCK_DELAY_COUNT_7	Set RSPCK Clock delay to 7 RSPCK
RSPI_CLOCK_DELAY_COUNT_8	Set RSPCK Clock delay to 8 RSPCK

◆ rspi_clock_delay_state_t

enum rspi_clock_delay_state_t	
SPCMD (RSPI Command) Register – RSPCK Delay Enable/Disable select – SCKDEN	
Enumerator	
RSPI_CLOCK_DELAY_STATE_DISABLE	RSPCK delay=1 RSPCK
RSPI_CLOCK_DELAY_STATE_ENABLE	RSPCK delay=SPCKD register setting

◆ rspi_communication_t

enum rspi_communication_t	
SPCR (RSPI Control register) – TXMD (communication operating mode) select	
Enumerator	
RSPI_COMMUNICATION_FULL_DUPLEX	Full-Duplex synchronous serial communication
RSPI_COMMUNICATION_TRANSMIT_ONLY	Transit only serial communication

◆ rspi_loopback1_t

enum rspi_loopback1_t	
SPPCR (RSPI Pin Control Register) – Loopback1 select	
Enumerator	
RSPI_LOOPBACK1_NORMAL_DATA	Loopback1 normal mode
RSPI_LOOPBACK1_INVERTED_DATA	Loopback1 with inverted data

◆ rspi_loopback2_t

enum rspi_loopback2_t	
SPPCR (RSPI Pin Control Register) – Loopback2 select	
Enumerator	
RSPI_LOOPBACK2_NORMAL_DATA	Loopback2 normal mode
RSPI_LOOPBACK2_NOT_INVERTED_DATA	Loopback2 with not inverted data

◆ rspi_mosi_idle_fixed_val_t

enum rspi_mosi_idle_fixed_val_t	
SPPCR (RSPI Pin Control Register) – MOIFV select	
Enumerator	
RSPI_MOSI_IDLE_FIXED_VAL_LOW	MOSIn level low during MOSI idling
RSPI_MOSI_IDLE_FIXED_VAL_HIGH	MOSIn level high during MOSI idling

◆ rspi_mosi_idle_val_fixing_t

enum rspi_mosi_idle_val_fixing_t	
SPPCR (RSPI Pin Control Register) – MOIFE (MOSI idle value fixing) select	
Enumerator	
RSPI_MOSI_IDLE_VAL_FIXING_ENABLE	MOSI output value=final data from previous transfer
RSPI_MOSI_IDLE_VAL_FIXING_DISABLE	MOSI output value=value set in MOIFV bit

◆ rspi_next_access_delay_count_t

enum rspi_next_access_delay_count_t	
SPND (RSPI Next-Access Delay) Register – Next Access Delay Count select	
Enumerator	
RSPI_NEXT_ACCESS_DELAY_COUNT_1	Set next access delay to 1 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_2	Set next access delay to 2 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_3	Set next access delay to 3 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_4	Set next access delay to 4 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_5	Set next access delay to 5 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_6	Set next access delay to 6 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_7	Set next access delay to 7 RSPCK+2PCLK
RSPI_NEXT_ACCESS_DELAY_COUNT_8	Set next access delay to 8 RSPCK+2PCLK

◆ rspi_next_access_delay_state_t

enum rspi_next_access_delay_state_t	
SPCMD (RSPI Command) Register – Next Access Delay select – SPNDEN	
Enumerator	
RSPI_NEXT_ACCESS_DELAY_STATE_DISABLE	Next access delay=1 RSPCK + 2 PCLK
RSPI_NEXT_ACCESS_DELAY_STATE_ENABLE	Next access delay=SPND register setting

◆ rspi_operation_t

enum rspi_operation_t	
SPCR (RSPI Control register) – SPMS (RSPI mode) select	
Enumerator	
RSPI_OPERATION_SPI	SPI operation (4-wire method)
RSPI_OPERATION_CLK_SYN	Clock Synchronous operation (3-wire method)

◆ rspi_parity_mode_t

enum rspi_parity_mode_t	
SPCR2 (RSPI Control Register 2) – Parity select	
Enumerator	
RSPI_PARITY_MODE_ODD	Select even parity
RSPI_PARITY_MODE_EVEN	Select odd parity

◆ rspi_parity_state_t

enum rspi_parity_state_t	
SPCR2 (RSPI Control Register 2) – Parity Enable select	
Enumerator	
RSPI_PARITY_STATE_DISABLE	Disable parity
RSPI_PARITY_STATE_ENABLE	Enable parity

◆ rspi_spcmd_assert_ssl_t

enum rspi_spcmd_assert_ssl_t	
Slave select to be asserted during transfer operation.	
Enumerator	
RSPI_SPCMD_ASSERT_SSL0	Select SSL0
RSPI_SPCMD_ASSERT_SSL1	Select SSL1
RSPI_SPCMD_ASSERT_SSL2	Select SSL2
RSPI_SPCMD_ASSERT_SSL3	Select SSL3

◆ rspi_spcmd_bit_length_t

enum rspi_spcmd_bit_length_t	
Frame data length	
Enumerator	
RSPI_SPCMD_BIT_LENGTH_8	0100 to 0111 = 8 bits data length
RSPI_SPCMD_BIT_LENGTH_16	1111 = 16 bits data length
RSPI_SPCMD_BIT_LENGTH_32	0011 = 32 bits data length

◆ rspi_spcmd_br_div_t

enum rspi_spcmd_br_div_t	
Clock base rate division	
Enumerator	
RSPI_SPCMD_BR_DIV_1	Select the base bit rate
RSPI_SPCMD_BR_DIV_2	Select the base bit rate divided by 2
RSPI_SPCMD_BR_DIV_4	Select the base bit rate divided by 4
RSPI_SPCMD_BR_DIV_8	Select the base bit rate divided by 8

◆ rspi_ssl_level_keep_t

enum rspi_ssl_level_keep_t	
SPCMD (RSPI Command) Register – SSL Signal Level Keeping select	
Enumerator	
RSPI_SSL_LEVEL_KEEP_NOT	Negates all SSL signals upon transfer completion
RSPI_SSL_LEVEL_KEEP	Keeps the SSL level upon transfer completion

◆ rspi_ssl_negation_delay_count_t

enum rspi_ssl_negation_delay_count_t	
SSLND (RSPI Slave Select Negation Delay) Register – Slave Select Negation Delay Count select	
Enumerator	
RSPI_SSL_NEGATION_DELAY_1	Set SSL negation delay to 1 RSPCK
RSPI_SSL_NEGATION_DELAY_2	Set SSL negation delay to 2 RSPCK
RSPI_SSL_NEGATION_DELAY_3	Set SSL negation delay to 3 RSPCK
RSPI_SSL_NEGATION_DELAY_4	Set SSL negation delay to 4 RSPCK
RSPI_SSL_NEGATION_DELAY_5	Set SSL negation delay to 5 RSPCK
RSPI_SSL_NEGATION_DELAY_6	Set SSL negation delay to 6 RSPCK
RSPI_SSL_NEGATION_DELAY_7	Set SSL negation delay to 7 RSPCK
RSPI_SSL_NEGATION_DELAY_8	Set SSL negation delay to 8 RSPCK

◆ rspi_ssl_negation_delay_state_t

enum rspi_ssl_negation_delay_state_t	
SPCMD (RSPI Command) Register – SSL Negation Delay select – SLNDEN	
Enumerator	
RSPI_SSL_NEGATION_DELAY_DISABLE	SSL negation delay=1 RSPCK
RSPI_SSL_NEGATION_DELAY_ENABLE	SSL negation delay=SSLND register setting

◆ rspi_ssl_select_t

enum rspi_ssl_select_t	
SPCMD (RSPI Command) Register – SSL Signal Assertion select	
Enumerator	
RSPI_SSL_SELECT_SSL0	Select SSL0 as slave
RSPI_SSL_SELECT_SSL1	Select SSL1 as slave
RSPI_SSL_SELECT_SSL2	Select SSL2 as slave
RSPI_SSL_SELECT_SSL3	Select SSL3 as slave

◆ rspi_sslp_t

enum rspi_sslp_t	
Definition for SSLP (RSPI Slave Select Polarity register) select	
Enumerator	
RSPI_SSLP_LOW	SSLP signal polarity active low
RSPI_SSLP_HIGH	SSLP signal polarity active high

Function Documentation

◆ R_RSPI_Close()

ssp_err_t R_RSPI_Close (spi_ctrl_t *const *p_api_ctrl*)

This function manages the closing of a channel by the following task.

Implements spi_api_t::close Disables SPI operations by disabling the SPI bus. Power off the channel. Disables all the associated interrupts. Update channel status.

Return values

SSP_SUCCESS	Channel successfully closed.
SSP_ERR_ASSERTION	A required pointer argument is NULL.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

Note

This function is reentrant.

◆ R_RSPI_Open()

ssp_err_t R_RSPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

This functions initializes a channel for SPI communication mode.

Implements spi_api_t::open This function performs the following tasks: Performs parameter checking and processes error conditions. Applies power to the SPI channel. Disables interrupts. Initializes the associated registers with some default value and the user-configurable options. Provides the channel control for use with other API functions. Updates user-configurable file if necessary.

Return values

SSP_SUCCESS	Channel initialized successfully.
SSP_ERR_ASSERTION	NULL pointer to following parameters p_ctrl, p_cfg, p_cfg::p_transfer_rx::p_api, p_cfg::p_transfer_rx::p_ctrl, p_cfg::p_transfer_rx::p_cfg, p_cfg::p_transfer_rx::p_cfg::p_info. or failed to set the baud rate,
SSP_ERR_INVALID_ARGUMENT	An element of the r_spi_cfg_t structure contains an invalid value. The parameters is out of range. Both transfer modules need to be present or absent.
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::open
- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Note

This function is reentrant.

◆ R_RSPI_Read()

ssp_err_t R_RSPI_Read (spi_ctrl_t *const *p_api_ctrl*, void const * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function receives data from a SPI device.

Implements spi_api_t::read The function performs the following tasks: Performs parameter checking and processes error conditions. Disable Interrupts. Disable the SPI bus. Setup data bit width per user request. Enable the SPI bus. Enable interrupts. Start data transmission with dummy data via transmit buffer empty interrupt. Copy data from source buffer to the SPI data register for transmission. Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination. Complete data reception via receive buffer full interrupt and transmitting dummy data.

Return values

SSP_SUCCESS	Read operation successfully completed.
SSP_ERR_ASSERTION	NULL pointer to control or destination parameters or transfer length is zero.
SSP_ERR_UNSUPPORTED	With DTC transfer mode, bit_width must match configured DTC transfer width
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open channel first.
SSP_ERR_INVALID_HW_CONDITION	Failed to clear errors in the module

Note

This function is reentrant.

◆ R_RSPI_VersionGet()

ssp_err_t R_RSPI_VersionGet (ssp_version_t * *p_version*)

This function gets the version information of the underlying driver.

Implements spi_api_t::versionget

Return values

void	
SSP_SUCCESS	Successful version get.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Note

This function is reentrant.

◆ R_RSPI_Write()

ssp_err_t R_RSPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function transmits data to a SPI device using the TX Only Communications Operation Mode.

Implements spi_api_t::write The function performs the following tasks: Performs parameter checking and processes error conditions. Disable Interrupts. Disable the SPI bus. Setup data bit width per user request. Enable the SPI bus. Enable interrupts. Start data transmission with dummy data via transmit buffer empty interrupt. Copy data from source buffer to the SPI data register for transmission. Receive data from receive buffer full interrupt occurs and do nothing with the received data. Complete data transmission via receive buffer full interrupt.

Return values

SSP_SUCCESS	Write operation successfully completed.
SSP_ERR_ASSERTION	NULL pointer to control or source parameters or transfer length is zero.
SSP_ERR_UNSUPPORTED	With DTC transfer mode, bit_width must match configured DTC transfer width
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
SSP_ERR_INVALID_HW_CONDITION	Failed to clear errors in the module

Note

This function is reentrant.

◆ R_RSPI_WriteRead()

ssp_err_t R_RSPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void const * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

This function simultaneously transmits data to a SPI device while receiving data from a SPI device (full duplex).

Implements spi_api_t::writeread The function performs the following tasks: Performs parameter checking and processes error conditions. Disable Interrupts. Disable the SPI bus. Setup data bit width per user request. Enable the SPI bus. Enable interrupts. Start data transmission using transmit buffer empty interrupt. Copy data from source buffer to the SPI data register for transmission. Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination. Complete data transmission and reception via receive buffer full interrupt.

Return values

SSP_SUCCESS	Write operation successfully completed.
SSP_ERR_ASSERTION	NULL pointer to control, source or destination parameters or transfer length is zero.
SSP_ERR_UNSUPPORTED	With DTC transfer mode, bit_width must match configured DTC transfer width
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.
SSP_ERR_INVALID_HW_CONDITION	Failed to clear errors in the module

Note

This function is reentrant.

Data Fields

rspi_operation_t	rspi_clksyn
rspi_communication_t	rspi_comm
rspi_ssl_polarity_t	ssl_polarity
rspi_loopback_t	loopback
rspi_mosi_idle_t	mosi_idle
rspi_parity_t	parity
rspi_ssl_select_t	ssl_select
rspi_ssl_level_keep_t	ssl_level_keep
rspi_clock_delay_t	clock_delay
rspi_ssl_negation_delay_t	ssl_neg_delay
rspi_access_delay_t	access_delay
rspi_byte_swap_t	byte_swap

Detailed Description

Extended SPI interface configuration

Field Documentation

◆ access_delay

rspi_access_delay_t spi_on_rspi_cfg_t::access_delay
Select next access delay from 0 to 7

◆ byte_swap

rspi_byte_swap_t spi_on_rspi_cfg_t::byte_swap
Feature for byte swapping

◆ clock_delay

rspi_clock_delay_t spi_on_rspi_cfg_t::clock_delay
Select clock delay from 0 to 7

◆ loopback

rspi_loopback_t spi_on_rspi_cfg_t::loopback
Select loopback1 and loopback2

◆ mosi_idle

rspi_mosi_idle_t spi_on_rspi_cfg_t::mosi_idle
Select mosi idle fixed value and selection

◆ parity

rspi_parity_t spi_on_rspi_cfg_t::parity
Select parity and enable/disable parity

◆ rspi_clksyn

rspi_operation_t spi_on_rspi_cfg_t::rspi_clksyn
Select spi or clock syn mode operation

◆ rspi_comm

rspi_communication_t spi_on_rspi_cfg_t::rspi_comm
Select full-duplex or transmit-only communication

◆ ssl_level_keep

rspi_ssl_level_keep_t spi_on_rspi_cfg_t::ssl_level_keep
Select SSL level after transfer completion;0-negate;1-keeps

◆ ssl_neg_delay

rspi_ssl_negation_delay_t spi_on_rspi_cfg_t::ssl_neg_delay
Select Slave elect negation delay from 0 to 7

◆ ssl_polarity

rspi_ssl_polarity_t spi_on_rspi_cfg_t::ssl_polarity
Select SSLn signal polarity

◆ ssl_select

rspi_ssl_select_t spi_on_rspi_cfg_t::ssl_select
Select which slave to use;0-SSL0;1-SSL1;2-SSL2;3-SSL3

The documentation for this struct was generated from the following file:

- r_rspi.h

rspi_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » SPI

#include <r_rspi.h>

Data Fields

uint8_t	channel Channel number to be used.
uint8_t	current_slave Number of the currently assigned slave.
uint32_t	channel_opened Internal flag to indicate the peripheral was initialized.
transfer_instance_t const *	p_transfer_tx To use SPI DTC/DMA write transfer.
transfer_instance_t const *	p_transfer_rx To use SPI DTC/DMA read transfer.
void(*	p_callback)(spi_callback_args_t *p_args) Pointer to user callback function.
void const *	p_context Pointer to the higher level device context.
void *	p_reg Base register for this channel.
IRQn_Type	rxi_irq Receive IRQ number.
IRQn_Type	txi_irq Transmit IRQ number.
IRQn_Type	tei_irq Transmit end IRQ number.
IRQn_Type	eri_irq

	Error IRQ number.

Detailed Description

SPI instance control block. DO NOT INITIALIZE.

Detailed Description

Driver for the Realtime Clock (RTC).

This module supports the Real Time Clock (RTC). It implements the following interfaces:

- RTC Interface

Enumeration Type Documentation

◆ rtc_count_mode_t

enum rtc_count_mode_t	
Counting mode	
Enumerator	
RTC_CALENDAR_MODE	Calender count mode.
RTC_BINARY_MODE	Binary count mode.

Function Documentation

◆ R_RTC_CalendarAlarmGet()

ssp_err_t R_RTC_CalendarAlarmGet (rtc_ctrl_t *const *p_api_ctrl*, rtc_alarm_time_t * *p_alarm*)

Get the calendar alarm time.

Implements rtc_api_t::calendarAlarmGet

Return values

SSP_SUCCESS	Calendar alarm time get operation was successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl, p_alarm or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

Get the alarm time

◆ R_RTC_CalendarAlarmSet()

ssp_err_t R_RTC_CalendarAlarmSet (rtc_ctrl_t *const *p_api_ctrl*, rtc_alarm_time_t * *p_alarm*, bool *interrupt_enable_flag*)

Set the calendar alarm time.

Implements rtc_api_t::calendarAlarmSet.

Precondition

The calendar counter must be running before the alarm can be set.

Return values

SSP_SUCCESS	Calendar alarm time set operation was successful.
SSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
SSP_ERR_ASSERTION	Invalid p_api_ctrl, p_alarm or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

Disable the ICU alarm interrupt request

Set alarm time

◆ R_RTC_CalendarCounterStart()

ssp_err_t R_RTC_CalendarCounterStart (rtc_ctrl_t *const *p_api_ctrl*)

Start the calendar counter.

Implements rtc_api_t::calendarCounterStart.

Return values

SSP_SUCCESS	Calendar counter started.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.
SSP_ERR_TIMEOUT	Start bit not set.

Set the start bit.

◆ R_RTC_CalendarCounterStop()

ssp_err_t R_RTC_CalendarCounterStop (rtc_ctrl_t *const *p_api_ctrl*)

Stop the calendar counter.

Implements rtc_api_t::calendarCounterStop.

Return values

SSP_SUCCESS	Calendar counter stopped.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.
SSP_ERR_TIMEOUT	Start bit not cleared.

Clear the start bit.

◆ R_RTC_CalendarTimeGet()

ssp_err_t R_RTC_CalendarTimeGet (rtc_ctrl_t *const *p_api_ctrl*, rtc_time_t * *p_time*)

Get the calendar time. (Should not be called from critical section as it may return incorrect time)

Implements rtc_api_t::calendarTimeGet

Return values

SSP_SUCCESS	Calendar time get operation was successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl, p_time or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.
SSP_ERR_TIMEOUT	IRQ enable operation timed out.

Read all the time registers, if a carry irq occurred in-between read again

This flag will be set to 'true' in the carry ISR

Restore the state of carry IRQ.

◆ R_RTC_CalendarTimeSet()

ssp_err_t R_RTC_CalendarTimeSet (rtc_ctrl_t *const *p_api_ctrl*, rtc_time_t * *p_time*, bool *clock_start*)

Set the calendar time.

Implements rtc_api_t::calendarTimeSet.

Return values

SSP_SUCCESS	Calendar time set operation was successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl, p_time or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.
SSP_ERR_INVALID_ARGUMENT	Invalid time parameter field.
SSP_ERR_TIMEOUT	Software reset status check failed.

◆ R_RTC_Close()

ssp_err_t R_RTC_Close (rtc_ctrl_t *const *p_api_ctrl*)

Close the RTC driver.

Implements rtc_api_t::close

Return values

SSP_SUCCESS	De-Initialization was successful and RTC driver closed.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for close.

Disable the periodic interrupt, alarm interrupt, carry interrupts, and disable there interrupt priority and vector info.

◆ R_RTC_Configure()

ssp_err_t R_RTC_Configure (rtc_ctrl_t *const *p_api_ctrl*, void *const *p_extend*)

Configure the RTC driver.

Implements rtc_api_t::configure

Return values

SSP_SUCCESS	RTC was successful configured.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.
SSP_ERR_TIMEOUT	Status check for counter mode or reset timed out

Parameter checking

p_extend is currently not used, reserved for future use

Set the clock source of the RTC block according to the UM

◆ R_RTC_ErrorAdjustmentModeSet()

ssp_err_t R_RTC_ErrorAdjustmentModeSet (rtc_ctrl_t * *p_api_ctrl*, rtc_error_adjustment_mode_cfg_t * *p_error_adjustment_mode*)

This function sets time error adjustment mode.

Implements rtc_api_t::errorAdjustmentModeSet

Return values

SSP_SUCCESS	Time error adjustment mode set successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or error_adjustment_mode pointer.
SSP_ERR_NOT_OPEN	Driver not open for operation.
SSP_ERR_UNSUPPORTED	The clock source is not SubClock.
SSP_ERR_INVALID_ARGUMENT	Invalid error adjustment period.
SSP_ERR_TIMEOUT	Time error adjustment get query timed out.

◆ R_RTC_ErrorAdjustmentSet()

ssp_err_t R_RTC_ErrorAdjustmentSet (rtc_ctrl_t * *p_api_ctrl*, rtc_error_adjustment_cfg_t * *p_error_adjustment_config*)

This function sets time error adjustment.

Implements rtc_api_t::errorAdjustmentSet

Return values

SSP_SUCCESS	Time error adjustment successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_error_adjustment_config pointer.
SSP_ERR_NOT_OPEN	Driver not open for operation.
SSP_ERR_UNSUPPORTED	The clock source is not SubClock.
SSP_ERR_INVALID_ARGUMENT	Invalid error adjustment value.
SSP_ERR_TIMEOUT	Time error adjustment get query timed out.

◆ R_RTC_InfoGet()

ssp_err_t R_RTC_InfoGet (rtc_ctrl_t * *p_api_ctrl*, rtc_info_t * *p_rtc_info*)

This function returns information about the driver clock source.

Implements rtc_api_t::infoGet

Return values

SSP_SUCCESS	Get information Successful.
SSP_ERR_ASSERTION	Invalid p_api_ctrl, p_rtc_info or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_IrqDisable()

ssp_err_t R_RTC_IrqDisable (rtc_ctrl_t *const *p_api_ctrl*, rtc_event_t *event*)

Disable the alarm interrupt.

Implements rtc_api_t::interruptDisable.

Return values

SSP_SUCCESS	Alarm interrupt disabled.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid
SSP_ERR_INVALID_ARGUMENT	Invalid IRQ event
SSP_ERR_TIMEOUT	IRQ disable operation timed out.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_IrqEnable()

ssp_err_t R_RTC_IrqEnable (rtc_ctrl_t *const *p_api_ctrl*, rtc_event_t *event*)

Enable the alarm interrupt.

Implements rtc_api_t::interruptEnable.

Return values

SSP_SUCCESS	Alarm interrupt enabled.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_IRQ_BSP_DISABLED	User IRQ parameter not valid.
SSP_ERR_INVALID_ARGUMENT	Invalid IRQ event.
SSP_ERR_TIMEOUT	IRQ enable operation timed out.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_Open()

ssp_err_t R_RTC_Open (rtc_ctrl_t *const *p_api_ctrl*, rtc_cfg_t const *const *p_cfg*)

Open the RTC driver.

Implements rtc_api_t::open.

Opens and configures the RTC driver module. Configuration includes clock source, and interrupt callback function. If the sub-clock oscillator is the clock source it is started in this function.

Return values

SSP_SUCCESS	Initialization was successful and RTC has started.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_cfg pointer.
SSP_ERR_HW_LOCKED	Hardware in use
SSP_ERR_TIMEOUT	Status check for counter mode or reset timed out

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Mark driver as open by initializing it to "RTC" in its ASCII equivalent.

◆ R_RTC_PeriodicIrqRateSet()

ssp_err_t R_RTC_PeriodicIrqRateSet (rtc_ctrl_t *const *p_api_ctrl*, rtc_periodic_irq_select_t *rate*)

Set the periodic interrupt rate.

Implements rtc_api_t::periodicInterruptRateSet.

Return values

SSP_SUCCESS	The periodic interrupt rate was successfully set.
SSP_ERR_ASSERTION	Invalid p_api_ctrl or p_ctrl->p_reg member pointed by p_api_ctrl pointer.
SSP_ERR_TIMEOUT	Periodic interrupt rate get query timed out.
SSP_ERR_NOT_OPEN	Driver not open already for operation.

◆ R_RTC_VersionGet()

ssp_err_t R_RTC_VersionGet (ssp_version_t * *p_version*)

Get driver version based on compile time macros.

Implements rtc_api_t::versionGet

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

rtc_instance_ctrl_t Struct Reference

uint32_t	open Whether or not driver is open.
IRQn_Type	alarm_irq Alarm IRQ number.
IRQn_Type	periodic_irq Periodic IRQ number.
IRQn_Type	carry_irq Carry IRQ number.
rtc_clock_source_t	clock_source Clock source for the RTC block.
bool	suppress_carry_event_callback carry event callback will be suppressed if set
volatile bool	carry_isr_triggered Was the carry isr triggered.

Detailed Description

Channel control block. DO NOT INITIALIZE. Initialization occurs when rtc_api_t::open is called

Detailed Description

Driver for the Simple IIC on SCI.

This module supports the SCI in I2C mode. It implements the following interfaces:

- I2C Interface r_i2c_api.h

Function Documentation

◆ R_SCI_SIIC_MasterClose()

ssp_err_t R_SCI_SIIC_MasterClose (i2c_ctrl_t *const *p_api_ctrl*)

Closes the I2C device. Power down I2C peripheral.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

SSP_SUCCESS	Device closed without issue.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_ABORTED	Device was closed while a transfer was in-progress.
SSP_ERR_NOT_OPEN	Device was not even opened.

Abort an in-progress transfer with this device only

The device is now considered closed

De-configure everything.

◆ R_SCI_SIIC_MasterOpen()

ssp_err_t R_SCI_SIIC_MasterOpen (i2c_ctrl_t *const *p_api_ctrl*, i2c_cfg_t const *const *p_cfg*)

Opens the I2C device. Power on I2C peripheral and perform initialization described in hardware manual.

This function will reconfigure the clock settings of the peripheral when a device with a lower rate than previously configured is opened.

Return values

SSP_SUCCESS	Requested baud rate was valid.
SSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL or if clock rate greater than 400KHz.
SSP_ERR_INVALID_RATE	The requested rate cannot be set.
SSP_ERR_IN_USE	Lock was not acquired
SSP_ERR_IRQ_BSP_DISABLED	Event information could not be found.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet

Disable, clear and configure interrupts

Open the hardware in master mode

◆ R_SCI_SIIC_MasterRead()

ssp_err_t R_SCI_SIIC_MasterRead (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *bytes*, bool const *restart*)

Performs a read from the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C read operation will begin. When no callback is provided by the user, this function performs a blocking read. Otherwise, the read operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_RX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue.
SSP_ERR_ASSERTION	The parameter p_ctrl, p_dest is NULL, bytes is 0.
SSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size(65535) while DTC is used for data transfer.
SSP_ERR_IN_USE	Another transfer was in-progress.
SSP_ERR_NOT_OPEN	Device was not even opened.

Record the new information about this transfer

Handle the different addressing modes

Kickoff the read operation as a master

◆ R_SCI_SIIC_MasterReset()

ssp_err_t R_SCI_SIIC_MasterReset (i2c_ctrl_t *const *p_api_ctrl*)

Aborts any in-progress transfer and forces the I2C peripheral into a ready state.

This function will safely terminate any in-progress I2C transfer with the device. If a transfer is aborted, the user will be notified via callback with an abort event. Since the callback is optional, this function will also return a specific error code in this situation.

Return values

SSP_SUCCESS	Channel was reset without issue.
SSP_ERR_ASSERTION	p_ctrl is NULL.
SSP_ERR_ABORTED	A transfer was aborted while resetting the hardware.
SSP_ERR_NOT_OPEN	Device was not even opened.

Abort any transfer happening on the channel

◆ R_SCI_SIIC_MasterSlaveAddressSet()

ssp_err_t R_SCI_SIIC_MasterSlaveAddressSet (i2c_ctrl_t *const *p_api_ctrl*, uint16_t const *slave*, i2c_addr_mode_t const *addr_mode*)

Sets address and addressing mode of the slave device.

This function is used to set the device address and addressing mode of the slave without reconfiguring the entire bus.

Return values

SSP_SUCCESS	Address of the slave is set correctly.
SSP_ERR_ASSERTION	p_ctrl or address is NULL.
SSP_ERR_IN_USE	Another transfer was in-progress.
SSP_ERR_NOT_OPEN	Device was not even opened.

Sets the address of the slave device

Sets the mode of addressing

◆ R_SCI_SIIC_MasterVersionGet()

ssp_err_t R_SCI_SIIC_MasterVersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful version get.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Verify parameter is valid

◆ R_SCI_SIIC_MasterWrite()

ssp_err_t R_SCI_SIIC_MasterWrite (i2c_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_src*, uint32_t const *bytes*, bool const *restart*)

Performs a write to the I2C device.

This function will fail if there is already an in-progress I2C transfer on the associated channel. Otherwise, the I2C write operation will begin. When no callback is provided by the user, this function performs a blocking write. Otherwise, the write operation is non-blocking and the caller will be notified when the operation has finished by an I2C_EVENT_TX_COMPLETE in the callback.

Return values

SSP_SUCCESS	Function executed without issue.
SSP_ERR_ASSERTION	p_ctrl, p_src is NULL.
SSP_ERR_INVALID_SIZE	Provided number of bytes more than uint16_t size(65535) while DTC is used for data transfer.
SSP_ERR_IN_USE	Another transfer was in-progress.
SSP_ERR_NOT_OPEN	Device was not even opened.

Record the new information about this transfer

Handle the different addressing modes

Kickoff the write operation as a master

volatile bool	restarted
volatile bool	transaction_completed
volatile bool	activation_on_rxi
volatile bool	activation_on_txi

Detailed Description

I2C control structure. DO NOT INITIALIZE.

Field Documentation

◆ activation_on_rxi

volatile bool sci_i2c_instance_ctrl_t::activation_on_rxi

<< Tracks whether a dummy read is issued on the first RX < Tracks whether the transfer is activated on RXI interrupt

◆ activation_on_txi

volatile bool sci_i2c_instance_ctrl_t::activation_on_txi

< Tracks whether the transfer is activated on TXI interrupt

◆ addr_high

uint8_t sci_i2c_instance_ctrl_t::addr_high

Holds the first address byte to issue in 10-bit mode

◆ addr_loaded

uint8_t sci_i2c_instance_ctrl_t::addr_loaded

Tracks the number of address bytes written to the register

◆ addr_low

uint8_t sci_i2c_instance_ctrl_t::addr_low

Holds the last address byte to issue

◆ addr_remain

uint8_t sci_i2c_instance_ctrl_t::addr_remain
Tracks the remaining address bytes to transfer

◆ addr_total

uint8_t sci_i2c_instance_ctrl_t::addr_total
Holds the total number of address bytes to transfer

◆ err

volatile bool sci_i2c_instance_ctrl_t::err
Tracks whether or not an error occurred during processing

◆ loaded

uint32_t sci_i2c_instance_ctrl_t::loaded
Tracks the number of data bytes written to the register

◆ p_buff

uint8_t* sci_i2c_instance_ctrl_t::p_buff
Holds the data associated with the transfer

◆ p_transfer_tx

transfer_instance_t const* sci_i2c_instance_ctrl_t::p_transfer_tx
DTC instance for I2C transmit.Set to NULL if unused. DTC/DMA support

◆ read

volatile bool sci_i2c_instance_ctrl_t::read
Holds the direction of the data byte transfer

◆ remain

uint32_t sci_i2c_instance_ctrl_t::remain
Tracks the remaining data bytes to transfer

◆ restart

volatile bool sci_i2c_instance_ctrl_t::restart
Holds whether or not the restart should be issued when done

◆ restarted

volatile bool sci_i2c_instance_ctrl_t::restarted
Tracks whether or not a restart was issued during the previous transfer

◆ total

uint32_t sci_i2c_instance_ctrl_t::total
Holds the total number of data bytes to transfer

◆ transaction_completed

volatile bool sci_i2c_instance_ctrl_t::transaction_completed
Tracks if the transaction started earlier was completed

Variables

const spi_api_t	g_spi_on_sci

Detailed Description

Driver for the Simple SPI on SCI.

This module supports simple SPI serial communication using the microcontroller's SCI peripheral. The Interface is defined in r_spi_api.h. This module implements SPI Interface.

Function Documentation

◆ R_SCI_SPI_Close()

ssp_err_t R_SCI_SPI_Close (spi_ctrl_t *const *p_api_ctrl*)

Handle the closing of a channel by the following task. Implements spi_api_t::close Power off the channel. Disables all the associated interrupts. Update channel status.

Return values

SSP_SUCCESS	Channel successfully closed.
SSP_ERR_ASSERTION	The parameter p_api_ctrl is NULL.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

Note

This function is reentrant.

Check to see if the channel is currently initialized.

Turn off power.

Close transfer block.

Release lock for this channel.

◆ R_SCI_SPI_Open()

ssp_err_t R_SCI_SPI_Open (spi_ctrl_t * *p_api_ctrl*, spi_cfg_t const *const *p_cfg*)

Initialize a channel for SPI communication mode. Implements spi_api_t::open. This function performs the following tasks: Performs parameter checking and processes error conditions. Applies power to the SPI channel. Disables interrupts. Initializes the associated registers with default value and the user-configurable options. Provides the channel handle for use with other API functions. Updates user-configurable file if necessary.

Return values

SSP_SUCCESS	Channel initialized successfully.
SSP_ERR_ASSERTION	One of the following invalid parameter passed. • Pointer p_api_ctrl is NULL • Pointer p_cfg is NULL
SSP_ERR_IN_USE	Channel currently in operation; Close channel first.
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Note

This function is reentrant.
The bit-rate argument in p_cfg ranges from 2500 to 7.5m for Simple SPI at PCLK=120 MHz. For RSPI, BRDV is fixed at 0 to get the maximum bit rate. The range is 10.0 mbps to 30.0 mbps at PCLK=120.0 MHz.

Attempt to acquire lock for this SCI SPI channel. Prevents re-entrancy conflict.

set valid interrupts with user provided priority.

Turn on power.

Don't use FIFO mode – set FCRL_b.FM = 0.

Select SPI mode - set SCMR.SMIF=0, SIMR1.IICM=0, SMR.CM=1, SPMR.SSE=1.

Set baud rate in SCI channel for the SPI channel.

Open the SCI SPI transfer interface if available.

Peripheral Initialized.

Set control block for SCI channel to SPI mode operation.

◆ R_SCI_SPI_Read()

ssp_err_t R_SCI_SPI_Read (spi_ctrl_t *const *p_api_ctrl*, void const * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Receive data from an SPI device. Implements spi_api_t::read. The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Disable Interrupts.
- Set-up data bit width per user request.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission with dummy data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data reception via receive buffer full interrupt and transmitting dummy data.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Return values

SSP_SUCCESS	Read operation successfully completed.
SSP_ERR_ASSERTION	One of the following invalid parameters passed • Pointer p_api_ctrl is NULL • Bit width is not 8 bits • Length is equal to 0 • Pointer to destination is NULL
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

This function is reentrant.

Configure module to receive data from a SPI device.

◆ R_SCI_SPI_VersionGet()

ssp_err_t R_SCI_SPI_VersionGet (ssp_version_t * *p_version*)

Get the version information of the underlying driver. Implements spi_api_t::versionGet.

Return values

SSP_SUCCESS	Successful version get.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Note

This function is reentrant.

◆ R_SCI_SPI_Write()

ssp_err_t R_SCI_SPI_Write (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Transmit data to a SPI device. Implements spi_api_t::write.

- The function performs the following tasks:
- Performs parameter checking and processes error conditions.
- Disable Interrupts.
- Setup data bit width per user request.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission with data via transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt occurs and do nothing with the received data.
- Complete data transmission via receive buffer full interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Return values

SSP_SUCCESS	Write operation successfully completed.
SSP_ERR_ASSERTION	One of the following invalid parameters passed • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

This function is reentrant.

Configure module to transmit data to a SPI device.

◆ R_SCI_SPI_WriteRead()

ssp_err_t R_SCI_SPI_WriteRead (spi_ctrl_t *const *p_api_ctrl*, void const * *p_src*, void const * *p_dest*, uint32_t const *length*, spi_bit_width_t const *bit_width*)

Simultaneously transmit data to SPI device while receiving data from SPI device (full duplex). Implements spi_api_t::writeRead. The function performs the following tasks:

- Performs parameter checking and processes error conditions.
- Disable Interrupts.
- Setup data bit width per user request.
- Enable transmitter.
- Enable receiver.
- Enable interrupts.
- Start data transmission using transmit buffer empty interrupt.
- Copy data from source buffer to the SPI data register for transmission.
- Receive data from receive buffer full interrupt occurs and copy data to the buffer of destination.
- Complete data transmission and reception via receive buffer full interrupt.
- Disable transmitter.
- Disable receiver.
- Disable interrupts.

Return values

SSP_SUCCESS	Write operation successfully completed.
SSP_ERR_ASSERTION	One of the following invalid parameters passed • Pointer p_api_ctrl is NULL • Pointer to source is NULL • Pointer to destination is NULL • Length is equal to 0 • Bit width is not equal to 8 bits
SSP_ERR_HW_LOCKED	The lock could not be acquired. The channel is busy.
SSP_ERR_NOT_OPEN	The channel has not been opened. Open the channel first.

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

This function is reentrant.

Configure module for full duplex operation.

Detailed Description

Driver for the UART on SCI.

Summary

This module supports the UART on SCI. It implements the UART interface and drives SCI as a full-duplex UART communication port. This module can drive all SCI channels as UART ports.

Extends UART Interface.

Note

This module can use either the 16-stage hardware FIFO or a DTC transfer implementation to write multiple bytes.

Enumeration Type Documentation

◆ sci_clk_src_t

enum sci_clk_src_t	
Enumeration for SCI clock source	
Enumerator	
SCI_CLK_SRC_INT	Use internal clock for baud generation.
SCI_CLK_SRC_EXT	Use external clock for baud generation.
SCI_CLK_SRC_EXT8X	Use external clock 8x baud rate.
SCI_CLK_SRC_EXT16X	Use external clock 16x baud rate.

◆ sci_uart_rx_fifo_trigger_t

enum sci_uart_rx_fifo_trigger_t	
Receive FIFO trigger configuration.	
Enumerator	
SCI_UART_RX_FIFO_TRIGGER_1	Callback after each byte is received without buffering.
SCI_UART_RX_FIFO_TRIGGER_MAX	Callback when FIFO is full or after 15 bit times with no data (fewer interrupts)

Function Documentation

◆ R_SCI_UartAbort()

ssp_err_t R_SCI_UartAbort (uart_ctrl_t *const *p_api_ctrl*, uart_dir_t *communication_to_abort*)

Provides API to abort ongoing transfer. Transmission is aborted after the current character is transmitted. Reception is still enabled after abort(). Any characters received after abort() and before the transfer is reset in the next call to read(), will arrive via the callback function with event UART_EVENT_RX_CHAR.

Return values

SSP_SUCCESS	UART transaction aborted successfully.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	The control block has not been opened.
SSP_ERR_UNSUPPORTED	The requested Abort direction is unsupported.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::disable

◆ R_SCI_UartBaudSet()

ssp_err_t R_SCI_UartBaudSet (uart_ctrl_t *const *p_api_ctrl*, uint32_t const *baudrate*)

Updates the baud rate.

Warning

This terminates any in-progress transmission.

Return values

SSP_SUCCESS	Baud rate was successfully changed.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL or the UART is not configured to use the internal clock.
SSP_ERR_INVALID_ARGUMENT	Illegal baud rate value is specified.
SSP_ERR_NOT_OPEN	The control block has not been opened

Calculate new baud rate register settings.

Disables transmitter and receiver. This terminates any in-progress transmission.

Apply new baud rate register settings.

Enable receiver.

If the channel has no FIFO, enable transmitter.

◆ R_SCI_UartClose()

ssp_err_t R_SCI_UartClose (uart_ctrl_t *const *p_api_ctrl*)

Disables interrupts, receiver, and transmitter. Closes lower level transfer drivers if used. Removes power and releases hardware lock.

Return values

SSP_SUCCESS	Channel successfully closed.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	The control block has not been opened

Mark the channel not open so other APIs cannot use it.

Disable interrupts, receiver, and transmitter.

If reception is enabled at build time, disable reception irqs.

If transmission is enabled at build time, disable transmission irqs.

Disable baud clock output.

Close the lower level transfer instances.

Clear control block parameters.

Remove power to the channel.

Unlock the SCI channel.

◆ R_SCI_UartInfoGet()

ssp_err_t R_SCI_UartInfoGet (uart_ctrl_t *const *p_api_ctrl*, uart_info_t *const *p_info*)

Provides the driver information, including the maximum number of bytes that can be received or transmitted at a time.

Return values

SSP_SUCCESS	Information stored in provided p_info.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL.
SSP_ERR_NOT_OPEN	The control block has not been opened

Store number of bytes that can be read at a time.

Store number of bytes that can be written at a time.

◆ R_SCI_UartOpen()

ssp_err_t R_SCI_UartOpen (uart_ctrl_t *const *p_api_ctrl*, uart_cfg_t const *const *p_cfg*)

Configures the UART driver based on the input configurations. If reception is enabled at compile time, reception is enabled at the end of this function.

Return values

SSP_SUCCESS	Channel opened successfully.
SSP_ERR_ASSERTION	Pointer to UART control block or configuration structure is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter setting found in the configuration structure.
SSP_ERR_IN_USE	Control block has already been opened or channel is being used by another instance. Call close() then open() to reconfigure.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt does not exist in the vector table

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- cgc_api_t::systemClockFreqGet
- transfer_api_t::open

Make sure this channel exists.

Reserve the hardware lock.

Determine if this channel has a FIFO.

Calculate the baud rate register settings.

Configure the interrupts.

Configure the transfer interface for transmission and reception if provided.

Configuration of driver enable pin for rs485 communication mode.

Enable the SCI channel and reset the registers to their initial state.

Set the default level of the TX pin to 1.

Set the baud rate registers.

Set the UART configuration settings provided in uart_cfg_t and uart_on_sci_cfg_t.

If reception is enabled at build time, enable reception.

◆ R_SCI_UartRead()

ssp_err_t R_SCI_UartRead (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_dest*, uint32_t const *bytes*)

Receives user specified number of bytes into destination buffer pointer.

Return values

SSP_SUCCESS	Data reception successfully ends.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
SSP_ERR_INVALID_ARGUMENT	Destination address or data size is not valid for 9-bit mode.
SSP_ERR_NOT_OPEN	The control block has not been opened
SSP_ERR_IN_USE	A previous read operation is still in progress.
SSP_ERR_UNSUPPORTED	SCI_UART_CFG_RX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

This API is only valid when SCI_UART_CFG_RX_ENABLE is enabled. If 9-bit data length is specified at R_SCI_UartOpen call, p_dest must be aligned 16-bit boundary.

Configure transfer instance to receive the requested number of bytes if transfer is used for reception.

◆ R_SCI_UartVersionGet()

ssp_err_t R_SCI_UartVersionGet (ssp_version_t * *p_version*)

Provides API and code version in the user provided pointer.

Parameters

[in]	p_version	Version number set here

Return values

SSP_SUCCESS	Version information stored in provided p_version.
SSP_ERR_ASSERTION	p_version is NULL.

◆ R_SCI_UartWrite()

ssp_err_t R_SCI_UartWrite (uart_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint32_t const *bytes*)

Transmits user specified number of bytes from the source buffer pointer.

Return values

SSP_SUCCESS	Data transmission finished successfully.
SSP_ERR_ASSERTION	Pointer to UART control block is NULL. Number of transfers outside the max or min boundary when transfer instance used
SSP_ERR_INVALID_ARGUMENT	Source address or data size is not valid for 9-bit mode.
SSP_ERR_NOT_OPEN	The control block has not been opened
SSP_ERR_IN_USE	A UART transmission is in progress
SSP_ERR_UNSUPPORTED	SCI_UART_CFG_TX_ENABLE is set to 0

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset

Note

This API is only valid when SCI_UART_CFG_TX_ENABLE is enabled. If 9-bit data length is specified at R_SCI_UartOpen call, p_src must be aligned on a 16-bit boundary.

Set the Driver Enable pin in RS485 half duplex mode to enable transmission.

Transmit interrupts must be disabled to start with.

Save data to transmit to the control block. It will be transmitted in the TXI ISR.

If a transfer instance is used for transmission, reset the transfer instance to transmit the requested data.

Clear the Driver Enable pin in RS485 half duplex mode to enable reception in error conditions

Trigger a TXI interrupt. This triggers the transfer instance or a TXI interrupt if the transfer instance is not used.

sci_uart_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » UART on SCI

#include <r_sci_uart.h>

Data Fields

uint8_t	channel Channel number.
uint8_t	fifo_depth FIFO depth of the UART channel.
uint8_t	rx_transfer_in_progress Set to 1 if a receive transfer is in progress, 0 otherwise.
uint8_t	data_bytes:2 1 byte for 7 or 8 bit data, 2 bytes for 9 bit data
uint8_t	bitrate_modulation:1 1 if bit rate modulation is enabled, 0 otherwise
uint32_t	open Used to determine if the channel is configured.
transfer_instance_t const *	p_transfer_rx
transfer_instance_t const *	p_transfer_tx
uint8_t const *	p_tx_src
uint32_t	tx_src_bytes
IRQn_Type	rxi_irq Receive IRQ number.
IRQn_Type	txi_irq Transmit IRQ number.
IRQn_Type	tei_irq Transmit end IRQ number.
IRQn_Type	eri_irq

	Error IRQ number.
void(*	p_callback)(uart_callback_args_t *p_args) Pointer to callback function.
void const *	p_context Pointer to user interrupt context data.
void *	p_reg Base register for this channel.
void(*	p_extpin_ctrl)(uint32_t channel, uint32_t level) External pin control.
uint32_t	baud_rate_error_x_1000 Baud rate <Maximum percent error> x 1000. baud_rate_error must be greater than 0 and less than 15000.
uint8_t *	p_rx_dst Destination buffer initialized by read() API.
uint32_t	rx_dst_bytes Number of bytes expected by the read() API.
volatile uint32_t	rx_bytes_count Number of bytes received since the last read()
uart_mode_t	uart_comm_mode UART communication mode selection.
uart_rs485_type_t	uart_rs485_mode UART RS485 communication channel type selection.
ioport_port_pin_t	rs485_de_pin

	UART Driver Enable pin.

Detailed Description

UART instance control block.

Field Documentation

◆ p_transfer_rx

transfer_instance_t const* sci_uart_instance_ctrl_t::p_transfer_rx
Optional transfer instance used to send or receive multiple bytes without interrupts.

◆ p_transfer_tx

transfer_instance_t const* sci_uart_instance_ctrl_t::p_transfer_tx
Optional transfer instance used to send or receive multiple bytes without interrupts.

◆ p_tx_src

uint8_t const* sci_uart_instance_ctrl_t::p_tx_src
Source buffer pointer used to fill hardware FIFO from transmit ISR.

◆ tx_src_bytes

uint32_t sci_uart_instance_ctrl_t::tx_src_bytes
Size of source buffer pointer used to fill hardware FIFO from transmit ISR.

Data Fields

sci_clk_src_t	clk_src Use SCI_CLK_SRC_INT/EXT8X/EXT16X.
bool	baudclk_out Baud rate clock output enable.
bool	rx_edge_start Start reception on falling edge.
bool	noisecancel_en Noise cancel enable.
sci_uart_rx_fifo_trigger_t	rx_fifo_trigger
void(*	p_extpin_ctrl)(uint32_t channel, uint32_t level)
bool	bitrate_modulation Bitrate Modulation Function enable or disable.
uint32_t	baud_rate_error_x_1000 Baud rate <Maximum percent error> x 1000. baud_rate_error must be greater than 0 and less than 15000.
uart_mode_t	uart_comm_mode UART communication mode selection.
uart_rs485_type_t	uart_rs485_mode UART RS485 communication channel type selection.
ioport_port_pin_t	rs485_de_pin UART Driver Enable pin.

Detailed Description

UART on SCI device Configuration

Field Documentation

◆ p_extpin_ctrl

void(* uart_on_sci_cfg_t::p_extpin_ctrl) (uint32_t channel, uint32_t level)
Pointer to the user callback function to control external GPIO pin control used as RTS signal. **Parameters** [in] channel — The UART channel used. [in] level — When level is 0, assert RTS. When level is 1, deassert RTS.

◆ rx_fifo_trigger

sci_uart_rx_fifo_trigger_t uart_on_sci_cfg_t::rx_fifo_trigger
Receive FIFO trigger level, unused if channel has no FIFO or if DTC is used.

Detailed Description

Driver for the 24-bit Sigma Delta A/D Converter (SDADC).

This module supports the SDADC peripheral. It implements the following interfaces:

- ADC Interface

Macro Definition Documentation

◆ SDADC_CODE_VERSION_MAJOR

#define SDADC_CODE_VERSION_MAJOR (2U)
Version of code that implements the API defined in this file

Enumeration Type Documentation

◆ sdadc_calibration_t

enum sdadc_calibration_t	
Calibration mode.	
Enumerator	
SDADC_CALIBRATION_INTERNAL_GAIN_OFFSET	Use internal reference to calibrate offset and gain.
SDADC_CALIBRATION_EXTERNAL_OFFSET	Use external reference to calibrate offset.
SDADC_CALIBRATION_EXTERNAL_GAIN	Use external reference to calibrate gain.

◆ sdadc_channel_average_t

enum sdadc_channel_average_t	
Per channel number of conversions to average before conversion end callback.	
Enumerator	
SDADC_CHANNEL_AVERAGE_NONE	Do not average (callback for each conversion)
SDADC_CHANNEL_AVERAGE_8	Average 8 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_16	Average 16 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_32	Average 32 samples for each conversion end callback.
SDADC_CHANNEL_AVERAGE_64	Average 64 samples for each conversion end callback.

◆ sdadc_channel_count_formula_t

enum sdadc_channel_count_formula_t	
Select a formula to specify the number of conversions. The following symbols are used in the formulas: • N: Number of conversions • n: sdadc_channel_cfg_t::coefficient_n, do not set to 0 if m is 0 • m: sdadc_channel_cfg_t::coefficient_m, do not set to 0 if n is 0 Either m or n must be non-zero.	
Enumerator	
SDADC_CHANNEL_COUNT_FORMULA_EXPONENTIAL	N = 32 * (2 ^ n - 1) + m * 2 ^ n.
SDADC_CHANNEL_COUNT_FORMULA_LINEAR	N = (32 * n) + m.

◆ sdadc_channel_input_t

enum sdadc_channel_input_t	
Per channel input mode.	
Enumerator	
SDADC_CHANNEL_INPUT_DIFFERENTIAL	Differential input.
SDADC_CHANNEL_INPUT_SINGLE_ENDED	Single-ended input.

◆ sdadc_channel_inversion_t

enum sdadc_channel_inversion_t	
Per channel polarity, valid for negative-side single-ended input only.	
Enumerator	
SDADC_CHANNEL_INVERSION_OFF	Do not invert conversion result.
SDADC_CHANNEL_INVERSION_ON	Invert conversion result.

◆ sdadc_channel_oversampling_t

enum sdadc_channel_oversampling_t	
Per channel oversampling ratio.	
Enumerator	
SDADC_CHANNEL_OVERSAMPLING_64	Oversampling ratio of 64.
SDADC_CHANNEL_OVERSAMPLING_128	Oversampling ratio of 128.
SDADC_CHANNEL_OVERSAMPLING_256	Oversampling ratio of 256.
SDADC_CHANNEL_OVERSAMPLING_512	Oversampling ratio of 512.
SDADC_CHANNEL_OVERSAMPLING_1024	Oversampling ratio of 1024.
SDADC_CHANNEL_OVERSAMPLING_2048	Oversampling ratio of 2048.

◆ sdadc_channel_polarity_t

enum sdadc_channel_polarity_t	
Per channel polarity, valid for single-ended input only.	
Enumerator	
SDADC_CHANNEL_POLARITY_POSITIVE	Positive-side single-ended input.
SDADC_CHANNEL_POLARITY_NEGATIVE	Negative-side single-ended input.

◆ sdadc_channel_stage_1_gain_t

enum sdadc_channel_stage_1_gain_t	
Per channel stage 1 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_1_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_1_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_1_GAIN_3	Gain of 3 (only valid for stage 1)
SDADC_CHANNEL_STAGE_1_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_1_GAIN_8	Gain of 8.

◆ sdadc_channel_stage_2_gain_t

enum sdadc_channel_stage_2_gain_t	
Per channel stage 2 gain options.	
Enumerator	
SDADC_CHANNEL_STAGE_2_GAIN_1	Gain of 1.
SDADC_CHANNEL_STAGE_2_GAIN_2	Gain of 2.
SDADC_CHANNEL_STAGE_2_GAIN_4	Gain of 4.
SDADC_CHANNEL_STAGE_2_GAIN_8	Gain of 8.

◆ sdadc_vref_src_t

enum sdadc_vref_src_t	
Source of Vref.	
Enumerator	
SDADC_VREF_SRC_INTERNAL	Vref is internally sourced, can be output as SBIAS.
SDADC_VREF_SRC_EXTERNAL	Vref is externally sourced from the VREFI pin.

◆ sdadc_vref_voltage_t

enum sdadc_vref_voltage_t	
Voltage of Vref.	
Enumerator	
SDADC_VREF_VOLTAGE_800_MV	Vref is 0.8 V.
SDADC_VREF_VOLTAGE_1000_MV	Vref is 1.0 V.
SDADC_VREF_VOLTAGE_1200_MV	Vref is 1.2 V.
SDADC_VREF_VOLTAGE_1400_MV	Vref is 1.4 V.
SDADC_VREF_VOLTAGE_1600_MV	Vref is 1.6 V.
SDADC_VREF_VOLTAGE_1800_MV	Vref is 1.8 V.
SDADC_VREF_VOLTAGE_2000_MV	Vref is 2.0 V.
SDADC_VREF_VOLTAGE_2200_MV	Vref is 2.2 V.
SDADC_VREF_VOLTAGE_2400_MV	Vref is 2.4 V (only valid for external Vref)

Function Documentation

◆ R_SDADC_Calibrate()

ssp_err_t R_SDADC_Calibrate (adc_ctrl_t *const *p_api_ctrl*, void *const *p_extend*)

Requires sdadc_calibrate_args_t passed to p_extend. Calibrates the specified channel. Calibration is not required or supported for single-ended mode. Internal calibration is automatically done during open() unless it is disabled in the user configuration. This API is provided primarily for external calibration. A callback with the event ADC_EVENT_CALIBRATION_COMPLETE is called when calibration completes. The calibration status can also be monitored using adc_api_t::statusGet(). Implements adc_api_t::calibrate().

During external offset calibration, apply a differential voltage of 0 to ANSDnP - ANSDnN, where n is the input channel and ANSDnP is OPAMP0 for channel 4 and ANSDnN is OPAMP1 for channel 4. Complete external offset calibration before external gain calibration.

During external gain calibration apply a voltage between 0.4 V / total_gain and 0.8 V / total_gain. The differential voltage applied during calibration is corrected to a conversion result of 0x7FFFFF, which is the maximum possible positive differential measurement.

This function clears the offset value. If offset is required after calibration, it must be reapplied after calibration is complete using adc_api_t::offsetSet.

Return values

SSP_SUCCESS	Calibration began successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_IN_USE	A conversion or calibration is in progress.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Calibration cannot be performed if conversion or calibration is already in progress.

Select software trigger.

Select single scan mode.

Enable calibration.

Set the offset voltage to 0 mV.

Set the calibration mode.

Start calibration.

Confirm that calibration started.

Return the error code

◆ R_SDADC_CheckScanDone()

ssp_err_t R_SDADC_CheckScanDone (adc_ctrl_t * *p_api_ctrl*)

Returns the status of a scan started by software, including calibration scans. It is not possible to determine the status of a scan started by a hardware trigger. Implements adc_api_t::scanStatusGet().

Return values

SSP_SUCCESS	No software scan or calibration is in progress.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_IN_USE	A conversion or calibration is in progress.
SSP_ERR_NOT_OPEN	Instance control block is not open.

If calibration is in progress, return an error.

Return the scan status of a scan triggered by software.

◆ R_SDADC_Close()

ssp_err_t R_SDADC_Close (adc_ctrl_t * *p_api_ctrl*)

Stops any scan in progress, disables interrupts, and powers down the SDADC peripheral.
Implements adc_api_t::close().

Return values

SSP_SUCCESS	Instance control block closed successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Perform parameter checking

Mark driver as closed

Disable hardware triggers.

Stop A/D conversion.

Disable interrupts.

Wait 3 us in normal mode as required by the hardware manual.

Turn off the power of VBIAS, channel, and sigma-delta A/D converter.

Turn off the power of ADBGR, SBIAS, and ADREG.

Stop the input clock for the 24-bit sigma-delta A/D converter (SDADCCLK).

Enter the module-stop state.

Release the hardware lock

Return the error code

◆ R_SDADC_InfoGet()

ssp_err_t R_SDADC_InfoGet (adc_ctrl_t * *p_api_ctrl*, adc_info_t * *p_adc_info*)

Returns the address of the lowest number configured channel, the total number of results to be read in order to read the results of all configured channels, the size of each result, and the ELC event enumerations. Implements adc_api_t::infoGet().

Return values

SSP_SUCCESS	Information stored in p_adc_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Retrieve the scan mask of active channels from the control block

Determine the lowest channel that is configured.

Determine the highest channel that is configured.

Determine the size of data that must be read to read all the channels between and including the highest and lowest channels.

Determine the base address and transfer size.

Specify the peripheral name in the ELC list

Set sensor information to invalid value

◆ R_SDADC_OffsetSet()

ssp_err_t R_SDADC_OffsetSet (adc_ctrl_t *const *p_api_ctrl*, adc_register_t const *reg_id*, int32_t const *offset*)

Sets the offset. Offset is applied after stage 1 of the input channel. Offset can only be applied when the channel is configured for differential input. Implements adc_api_t::offsetSet().

Note: The offset is cleared if adc_api_t::calibrate() is called. The offset can be re-applied if necessary after the the callback with event ADC_EVENT_CALIBRATION_COMPLETE is called.

Parameters

[in]	p_api_ctrl	See p_ctrl in adc_api_t::offsetSet().
[in]	reg_id	See reg_id in adc_api_t::offsetSet().
[in]	offset	Must be between -15 and 15, offset (mV) = 10.9376 mV * offset_steps / stage 1 gain.

Return values

SSP_SUCCESS	Offset updated successfully.
SSP_ERR_INVALID_ARGUMENT	An input argument was outside the valid range.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_IN_USE	A conversion or calibration is in progress.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Offset cannot be updated if conversion or calibration is in progress.

Set the offset.

◆ R_SDADC_Open()

ssp_err_t R_SDADC_Open (adc_ctrl_t * *p_api_ctrl*, adc_cfg_t const *const *p_cfg*)

Applies power to the SDADC and initializes the hardware based on the user configuration. As part of this initialization, the SDADC clock is configured and enabled. If an interrupt priority is non-zero, enables an interrupt which will call a callback to notify the user when a conversion, scan, or calibration is complete. For all channels that are configured in differential mode, calibration is performed unless it is disabled in the user configuration. Implements adc_api_t::open().

Return values

SSP_SUCCESS	Configuration and calibration successful.
SSP_ERR_CALIBRATE_FAILED	Calibration failed.
SSP_ERR_ASSERTION	An input pointer is NULL.
SSP_ERR_INVALID_ARGUMENT	An input argument is invalid.
SSP_ERR_IN_USE	Control block is already open.
SSP_ERR_IRQ_BSP_DISABLED	A required interrupt is disabled

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Ensure the SDADC exists on the hardware, enable interrupts, and reserve the SDADC hardware lock.

Initialize the hardware based on the configuration.

Start the SDADC.

Configure the SDADC clock source and divisor to the clock source selected in the clock configuration.

Set the reference voltage for sensors (internal or external VREF mode).

Set the A/D conversion operation mode (normal or low power mode).

Supply the 24-bit sigma-delta A/D converter clock (SDADCCLK).

Turn on the power of ADBGR, SBIAS, and ADREG.

Stabilization wait time of 2 ms is required between power on of ADBGR/SBIAS/ADREG and VBIAS/channel/SDADC.

Turn on the power of VBIAS, channel, and sigma-delta A/D converter.

For each channel:

1. Set the oversampling ratio.
2. Set the gain.
3. Select single-end input/differential input.
4. If differential mode is used and calibration during open is not skipped, enable calibration on this channel.
5. Select the polarity of single-end input (only for single-end mode).

Set the A/D conversion count.

1. Select the averaging operation. Select the average data count.
    a. Select whether to reverse the A/D conversion results of single-end input (only for negative-side single end mode).
2. Enable conversion for the channel.

Configure enabled channels and autoscan mode.

If the A/D conversion trigger is ELC hardware events, the hardware events are enabled in adc_api_t::scanStart().

Mark driver as open by initializing it to "SDAD" - its ASCII equivalent.

If at least one channel is configured for differential mode and calibration is not disabled in the user configuration, calibrate all PGAs configured for differential mode.

The calibration takes approximately 3.4 ms per channel in normal mode or 27 ms in low power mode. The open() API blocks waiting for calibration to complete unless calibration is skipped. Calibration during open can be skipped and handled in at the application level by setting adc_on_sdadc_cfg_t::skip_internal_calibration to true, then calling adc_api_t::calibrate().

◆ R_SDADC_Read()

ssp_err_t R_SDADC_Read (adc_ctrl_t * *p_api_ctrl*, adc_register_t const *reg_id*, uint16_t *const *p_data*)

Reads the most recent conversion result from a channel. Truncates 24-bit results to the upper 16 bits. Implements adc_api_t::read().

Return values

SSP_SUCCESS	Conversion result in p_data.
SSP_ERR_INVALID_ARGUMENT	An input argument was outside the valid range.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Read the most recent conversion value into a 16-bit result.

◆ R_SDADC_Read32()

ssp_err_t R_SDADC_Read32 (adc_ctrl_t * *p_api_ctrl*, adc_register_t const *reg_id*, uint32_t *const *p_data*)

Reads the most recent conversion result from a channel. Implements adc_api_t::read32().

Return values

SSP_SUCCESS	Conversion result in p_data.
SSP_ERR_INVALID_ARGUMENT	An input argument was outside the valid range.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

Read the most recent conversion value into a 32-bit result.

◆ R_SDADC_SampleStateCountSet()

ssp_err_t R_SDADC_SampleStateCountSet (adc_ctrl_t * *p_api_ctrl*, adc_sample_state_t * *p_sample*)

adc_api_t::sampleStateCountSet is not supported on the SDADC.

Return values

SSP_ERR_UNSUPPORTED	This API is not supported.

Return the unsupported error.

◆ R_SDADC_ScanConfigure()

ssp_err_t R_SDADC_ScanConfigure (adc_ctrl_t * *p_api_ctrl*, adc_channel_cfg_t const *const *p_channel_cfg*)

Configures the enabled channels of the ADC. Only adc_channel_cfg_t::scan_mask is used. Implements adc_api_t::scanCfg().

Return values

SSP_SUCCESS	Information stored in p_adc_info.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_INVALID_ARGUMENT	An input argument is invalid.

Update the enabled channels.

◆ R_SDADC_ScanStart()

ssp_err_t R_SDADC_ScanStart (adc_ctrl_t * *p_api_ctrl*)

If the SDADC is configured for hardware triggers, enables hardware triggers. Otherwise, starts a scan. Implements adc_api_t::scanStart().

Return values

SSP_SUCCESS	Scan started or hardware triggers enabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.
SSP_ERR_IN_USE	A conversion or calibration is in progress.

Conversion cannot be performed if conversion or calibration is already in progress.

If the unit is configured for software triggering, trigger a scan.

Otherwise, enable hardware triggers.

Return the error code

◆ R_SDADC_ScanStop()

ssp_err_t R_SDADC_ScanStop (adc_ctrl_t * *p_api_ctrl*)

If the SDADC is configured for hardware triggers, disables hardware triggers. Otherwise, stops any in-progress scan started by software. Implements adc_api_t::scanStop().

Return values

SSP_SUCCESS	Scan stopped or hardware triggers disabled successfully.
SSP_ERR_ASSERTION	An input pointer was NULL.
SSP_ERR_NOT_OPEN	Instance control block is not open.

If the unit is configured for software triggering, stop the scan.

Otherwise, disable hardware triggers.

Return the error code

◆ R_SDADC_VersionGet()

ssp_err_t R_SDADC_VersionGet (ssp_version_t *const *p_version*)
Gets the API and code version. Implements adc_api_t::versionGet().

Return values

SSP_SUCCESS	Version information available in p_version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Return the version number

sdadc_calibrate_args_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Sigma Delta ADC (SDADC)

#include <r_sdadc.h>

Data Fields

adc_register_t	channel Which channel to calibrate.
sdadc_calibration_t	mode Calibration mode.

Detailed Description

Structure to pass to the adc_api_t::calibrate p_extend argument.

The documentation for this struct was generated from the following file:

- r_sdadc.h

sdadc_channel_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Sigma Delta ADC (SDADC)

#include <r_sdadc.h>

Data Fields

sdadc_channel_stage_2_gain_t	stage_2_gain:2 Gain of PGA stage 2, must be 1 for single-ended input.
sdadc_channel_stage_1_gain_t	stage_1_gain:3 Gain of PGA stage 1, must be 1 for single-ended input.
sdadc_channel_oversampling_t	oversampling:3 Oversampling ratio, must be 256 in single-ended input.
sdadc_channel_polarity_t	polarity:1 Polarity, valid for single-ended mode only.
sdadc_channel_input_t	input:1 Single-ended or differential input.
uint32_t	coefficient_m:5 See sdadc_channel_count_formula_t.
uint32_t	coefficient_n:3 See sdadc_channel_count_formula_t.
sdadc_channel_average_t	average:4 Number of samples to average for each conversion result.
sdadc_channel_inversion_t	invert:1 Whether to invert negative single-ended input.
sdadc_channel_count_formula_t	count_formula:1 Linear or exponential formula used for number of conversions.

Detailed Description

SDADC per channel configuration.

The documentation for this struct was generated from the following file:

- r_sdadc.h

adc_on_sdadc_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Sigma Delta ADC (SDADC)

#include <r_sdadc.h>

Data Fields

uint8_t	calibration_end_ipl Calibration end interrupt priority.
uint8_t	conversion_end_ipl Conversion end interrupt priority.
bool	skip_internal_calibration Whether to skip internal calibration of of the PGA during open.
sdadc_vref_src_t	vref_src Source of Vref (internal or external)
sdadc_vref_voltage_t	vref_voltage
sdadc_channel_cfg_t const *	p_channel_cfgs [SDADC_MAX_NUM_CHANNELS] Configuration for each channel, set to NULL if unused.

Detailed Description

SDADC configuration extension. This extension is required and must be provided in adc_cfg_t::p_extend.

Field Documentation

◆ vref_voltage

sdadc_vref_voltage_t adc_on_sdadc_cfg_t::vref_voltage
Voltage of Vref, required for both internal and external Vref. If Vref is from an external source, the voltage must match the specified voltage within 3%.

The documentation for this struct was generated from the following file:

- r_sdadc.h

sdadc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » Sigma Delta ADC (SDADC)

#include <r_sdadc.h>

Data Fields

adc_mode_t	mode Single scan or continuous mode.
adc_resolution_t	resolution 16 or 24 bit resolution
adc_alignment_t	alignment Left or right alignment.
void const *	p_context Placeholder for user data.
R_SDADC0_Type *	p_reg Base register for this unit.
void(*	p_callback)(adc_callback_args_t *p_args) User callback pointer.

adc_trigger_t	trigger Software or hardware trigger.
uint32_t	trigger_enabled If set, hardware trigger was enabled before calibration.
uint32_t	opened Boolean to verify that the Unit has been initialized.
uint32_t	scan_mask Scan mask of enabled channels.
uint32_t	scan_cfg_mask Scan mask of configured channels.
uint16_t	unit SDADC Unit in use.
volatile uint8_t	calib_status Calibration in progress if set.
IRQn_Type	scan_end_irq Scan end IRQ number.
IRQn_Type	calib_end_irq Calibration end IRQ number.
IRQn_Type	conv_end_irq Conversion end IRQ number.

Detailed Description

ADC instance control block. DO NOT INITIALIZE. Initialized in adc_api_t::open().

The documentation for this struct was generated from the following file:

- r_sdadc.h

5.1.5.55 SDMMC

Renesas Synergy Software Package Reference » HAL Layer

Driver for the SD/MMC Host Interface (SDHI). More...

Data Structures

struct	sdmmc_instance_ctrl_t
struct	sdmmc_extended_cfg_t

Enumerations

enum	sdmmc_card_detect_t { SDMMC_CARD_DETECT_NONE, SDMMC_CARD_DETECT_CD }

ssp_err_t	R_SDMMC_Control (sdmmc_ctrl_t *const p_api_ctrl, ssp_command_t const command, void *p_data)
ssp_err_t	R_SDMMC_ReadIo (sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const function, uint32_t const address)
ssp_err_t	R_SDMMC_WriteIo (sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const p_data, uint32_t const function, uint32_t const address, sdmmc_io_write_mode_t const read_after_write)
ssp_err_t	R_SDMMC_ReadIoExt (sdmmc_ctrl_t *const p_api_ctrl, uint8_t *const

	p_dest, uint32_t const function, uint32_t const address, uint32_t *const count, sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t address_mode)
ssp_err_t	R_SDMMC_WriteIoExt (sdmmc_ctrl_t *const p_api_ctrl, uint8_t const *const p_source, uint32_t const function, uint32_t const address, uint32_t const count, sdmmc_io_transfer_mode_t transfer_mode, sdmmc_io_address_mode_t address_mode)
ssp_err_t	R_SDMMC_IoIntEnable (sdmmc_ctrl_t *const p_api_ctrl, bool enable)
ssp_err_t	R_SDMMC_VersionGet (ssp_version_t *const p_version)
ssp_err_t	R_SDMMC_InfoGet (sdmmc_ctrl_t *const p_api_ctrl, sdmmc_info_t *const p_info)
ssp_err_t	R_SDMMC_Erase (sdmmc_ctrl_t *const p_api_ctrl, uint32_t const start_sector, uint32_t const sector_count)

Detailed Description

Driver for the SD/MMC Host Interface (SDHI).

SD/MMC driver to access SD, eMMC, and SDIO devices.

Enumeration Type Documentation

◆ sdmmc_card_detect_t

enum sdmmc_card_detect_t	
Card detection configuration options.	
Enumerator	
SDMMC_CARD_DETECT_NONE	Card detection unused.
SDMMC_CARD_DETECT_CD	Card detection using the SDnCD pin.

◆ sdmmc_write_protect_t

enum sdmmc_write_protect_t	
Write protection configuration option	
Enumerator	
SDMMC_WRITE_PROTECT_NONE	Write protection unused.
SDMMC_WRITE_PROTECT_WP	write protection using SDnWP pin

Function Documentation

◆ R_SDMMC_Close()

ssp_err_t R_SDMMC_Close (sdmmc_ctrl_t *const *p_api_ctrl*)

Closes an open SD/MMC device. Implements sdmmc_api_t::close().

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.
SSP_ERR_NOT_OPEN	Driver has not been initialized.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Disable SDHI interrupts.

Close the transfer driver.

Turn on module stop bit (turn module off).

Release hardware lock.

◆ R_SDMMC_Control()

ssp_err_t R_SDMMC_Control (sdmmc_ctrl_t *const *p_api_ctrl*, ssp_command_t const *command*, void * *p_data*)

Sends control commands to and receives the status of the SD/MMC device. Implements sdmmc_api_t::control().

Return values

SSP_SUCCESS	Command executed successfully.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_INVALID_ARGUMENT	Command is invalid.
SSP_ERR_INVALID_SIZE	Block size not in valid range of 1-512 for SDIO or 512 only for SD cards and eMMC.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Get the command status and return to called function.

◆ R_SDMMC_Erase()

ssp_err_t R_SDMMC_Erase (sdmmc_ctrl_t *const *p_api_ctrl*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Erases sectors of an SD card or eMMC device. Implements sdmmc_api_t::erase().

This function blocks until erase is complete.

Return values

SSP_SUCCESS	Erase operation requested.
SSP_ERR_ASSERTION	A required pointer is NULL.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_WRITE_PROTECTED	SD card is Write Protected.
SSP_ERR_ERASE_FAILED	Erase operation unsuccessful.

Note

This function is reentrant for different channels.

Send command to set start erase address (CMD35 for eMMC, CMD32 for SD).

Send command to set end erase address (CMD36 for eMMC, CMD33 for SD).

Send erase command (CMD38).

◆ R_SDMMC_InfoGet()

ssp_err_t R_SDMMC_InfoGet (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_info_t *const *p_info*)

Provides information about the connected device and driver status. Implements sdmmc_api_t::infoGet().

Return values

SSP_SUCCESS	Function executed successfully.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_NOT_OPEN	Driver has not been initialized.

Note

This function is reentrant.

Copy information stored during open.

Check if the card is busy.

◆ R_SDMMC_IoIntEnable()

ssp_err_t R_SDMMC_IoIntEnable (sdmmc_ctrl_t *const *p_api_ctrl*, bool *enable*)

Enables or disables the SDIO Interrupt. Implements sdmmc_api_t::ioIntEnable().

Return values

SSP_SUCCESS	Card enabled or disabled SDIO interrupts successfully.
SSP_ERR_ASSERTION	NULL pointer.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.

Note

This function is reentrant for different channels.

Make sure the card is not busy.

Enable or disable interrupt.

◆ R_SDMMC_Open()

ssp_err_t R_SDMMC_Open (sdmmc_ctrl_t *const *p_api_ctrl*, sdmmc_cfg_t const *const *p_cfg*)

Initializes the SDHI hardware and completes identification and configuration for the SD or eMMC device. This procedure requires several sequential commands. This API blocks until all identification and configuration commands are complete.

For SDIO, SDIO interrupts are enabled after card identification is complete. SDIO interrupts can be disabled using sdmmc_api_t::ioIntEnable().

Implements sdmmc_api_t::open().

Return values

SSP_SUCCESS	Port is available and is now open for read/write/control access.
SSP_ERR_ASSERTION	Null Pointer or block size is not in the valid range of 1-512.
SSP_ERR_INVALID_ARGUMENT	Block size must be 512 bytes for SD cards and eMMC devices. It is configurable for SDIO only.
SSP_ERR_ALREADY_OPEN	Driver has already been opened with this instance of the control structure.
SSP_ERR_HW_LOCKED	The channel specified has already been opened.
SSP_ERR_CARD_INIT_FAILED	Hardware related failure occurred, with the MCU or with the card itself.
SSP_ERR_IRQ_BSP_DISABLED	Access interrupt is not enabled.

SSP_ERR_CARD_NOT_INSERTED	Card detection is enabled and no card is plugged in.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- cgc_api_t::systemClockFreqGet

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Verify the requested hardware channel exists on the MCU.

Configure interrupts.

Acquire lock before changing vector table or p_ctrl.

Turn off module stop bit (turn module on).

Perform the identification procedure for SD card or eMMC device.

Configure bus clock, block size, and bus width.

Check to see if the card is write protected (SD cards only).

◆ R_SDMMC_Read()

ssp_err_t R_SDMMC_Read (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Reads data from an SD or eMMC device. Up to 0x10000 sectors can be read at a time. Implements sdmmc_api_t::read().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Return values

SSP_SUCCESS	Data read successfully.
SSP_ERR_ASSERTION	NULL pointer.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_READ_FAILED	Read operation failed.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Configure the transfer interface for reading.

Read data from SD or eMMC device.

◆ R_SDMMC_ReadIo()

ssp_err_t R_SDMMC_ReadIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*)

The Read function reads a one byte register from an SDIO card. Implements sdmmc_api_t::readIo().

This function blocks until the command is sent and the response is received. p_data contains the register value read when this function returns.

Return values

SSP_SUCCESS	Data read successfully.
SSP_ERR_ASSERTION	NULL pointer.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_READ_FAILED	Read operation failed.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Call SDMMC protocol read function

◆ R_SDMMC_ReadIoExt()

ssp_err_t R_SDMMC_ReadIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint32_t const *function*, uint32_t const *address*, uint32_t *const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Reads data from an SDIO card function. Implements sdmmc_api_t::readIoExt().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the read data is available.

Return values

SSP_SUCCESS	Data read successfully.
SSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_READ_FAILED	Read operation failed.

Note

This function is reentrant for different channels. It is not reentrant for the same channel.

Configure the transfer interface for reading.

Read data from SDIO device.

◆ R_SDMMC_VersionGet()

ssp_err_t R_SDMMC_VersionGet (ssp_version_t *const *p_version*)

Returns the version of the firmware and API. Implements sdmmc_api_t::versionGet().

Return values

SSP_SUCCESS	Function executed successfully.
SSP_ERR_ASSERTION	Null Pointer.

Note

This function is reentrant.

◆ R_SDMMC_Write()

ssp_err_t R_SDMMC_Write (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *start_sector*, uint32_t const *sector_count*)

Writes data to an SD or eMMC device. Up to 0x10000 sectors can be written at a time. Implements sdmmc_api_t::write().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written.

Return values

SSP_SUCCESS	Card write finished successfully.
SSP_ERR_ASSERTION	Handle or Source address is NULL.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_WRITE_PROTECTED	SD card is Write Protected.
SSP_ERR_WRITE_FAILED	Write operation failed.

Note

This function is reentrant for different channels.

Configure the transfer interface for writing.

Call SDMMC protocol write function

Write data to SD or eMMC device.

◆ R_SDMMC_WriteIo()

ssp_err_t R_SDMMC_WriteIo (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_data*, uint32_t const *function*, uint32_t const *address*, sdmmc_io_write_mode_t const *read_after_write*)

Writes a one byte register to an SDIO card. Implements sdmmc_api_t::writeIo().

This function blocks until the command is sent and the response is received. The register has been written when this function returns. If read_after_write is true, p_data contains the register value read when this function returns.

Return values

SSP_SUCCESS	Card write finished successfully.
SSP_ERR_ASSERTION	Handle or Source address is NULL.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_WRITE_FAILED	Write operation failed.

Note

This function is reentrant for different channels.

Call SDMMC protocol write function with valid parameters

◆ R_SDMMC_WriteIoExt()

ssp_err_t R_SDMMC_WriteIoExt (sdmmc_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_source*, uint32_t const *function*, uint32_t const *address*, uint32_t const *count*, sdmmc_io_transfer_mode_t *transfer_mode*, sdmmc_io_address_mode_t *address_mode*)

Writes data to an SDIO card function. Implements sdmmc_api_t::writeIoExt().

This function blocks until the command is sent and the response is received. A callback with the event SDMMC_EVENT_TRANSFER_COMPLETE is called when the all data has been written.

Return values

SSP_SUCCESS	Card write finished successfully.
SSP_ERR_ASSERTION	NULL pointer, or count is not in the valid range of 1-512 for byte mode or 1-511 for block mode.
SSP_ERR_NOT_OPEN	Driver has not been initialized.
SSP_ERR_CARD_NOT_READY	Card was unplugged.
SSP_ERR_TRANSFER_BUSY	Driver is busy with a previous operation.
SSP_ERR_WRITE_FAILED	Write operation failed.

Note

This function is reentrant for different channels.

Configure the transfer interface for writing.

Write data to SDIO device.

sdmmc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » SDMMC

#include <r_sdmmc.h>

Data Fields

uint32_t	open used to determine if channel is open
sdmmc_hw_t	hw Temporary storage for channel, media type and bus width.
transfer_instance_t const *	p_lower_lvl_transfer

	Transfer instance used to transfer data with DMA or DTC.
sdmmc_info_t	status To load various status information.
bool	transfer_in_progress Flag to detect transfer status.
bool	write_protect write protect status
void(*	p_callback)(sdmmc_callback_args_t *p_args) User callback pointer.
void const *	p_context Placeholder for user data.
R_SDHI0_Type *	p_reg Base register information.
volatile sdhi_event_t	sdhi_event Update event status.
IRQn_Type	transfer_irq Scan end IRQ number.
sdmmc_transfer_dir_t	transfer_dir Info on read or write operation in progress.
uint8_t *	p_transfer_data Temporary storage for transfer data.
uint32_t	transfer_blocks_total Total transfer block count.

uint32_t	transfer_block_current Transfer current block.
uint32_t	transfer_block_size Transfer block size.
uint32_t	aligned_buff [SDMMC_MAX_BLOCK_SIZE/sizeof(uint32_t)] Aligned buffer.

Detailed Description

SDMMC instance control block. This is private to the SSP and should not be used or modified by the application.

The documentation for this struct was generated from the following file:

- r_sdmmc.h

sdmmc_extended_cfg_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » SDMMC

#include <r_sdmmc.h>

Data Fields

uint32_t	block_size
sdmmc_card_detect_t	card_detect
sdmmc_write_protect_t	write_protect

Detailed Description

Extended SDMMC configuration, to be pointed to p_extend.

Field Documentation

◆ block_size

uint32_t sdmmc_extended_cfg_t::block_size
Block size in bytes. Block size must be 512 bytes for SD cards and eMMC devices. Block size can be 1-512 bytes for SDIO.

◆ card_detect

sdmmc_card_detect_t sdmmc_extended_cfg_t::card_detect
Whether or not card detection is used.

◆ write_protect

sdmmc_write_protect_t sdmmc_extended_cfg_t::write_protect
Select whether or not to use the write protect pin. Select Not Used if the MCU or device does not have a write protect pin.

The documentation for this struct was generated from the following file:

- r_sdmmc.h

Detailed Description

Driver for the Segment LCD Controller (SLCDC).

Summary

Extends SLCDC Interface.

Function Documentation

◆ R_SLCDC_Close()

ssp_err_t R_SLCDC_Close (slcdc_ctrl_t *const *p_api_ctrl*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_NOT_OPEN	Device is not opened or initialized

Clear all the data segment registers.

Disable the LCD display area. Segment pin outputs de-select signal

Disable voltage circuit

Set voltage generator to External

Protect OFF of CGC.

Disable LCD clock

Protect ON of CGC.

Release hardware lock for SLCD

SLCDC Power off - enter module-stop state for the SLCDC

Mark control block close.

◆ R_SLCDC_ContrastDecrease()

ssp_err_t R_SLCDC_ContrastDecrease (slcdc_ctrl_t *const *p_api_ctrl*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_NOT_OPEN	Device is not opened or initialized
SSP_ERR_UNSUPPORTED	Unsupported operation

The VLCD setting is valid only when the voltage boost circuit is operating

Verify the new volt is within the range.

Stop the internal voltage boost/capacitor split circuit.

Set new voltage value.

Wait 5ms minimum as per HW manual

Enable the voltage boost circuit or capacitor split circuit.

◆ R_SLCDC_ContrastIncrease()

ssp_err_t R_SLCDC_ContrastIncrease (slcdc_ctrl_t *const *p_api_ctrl*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_NOT_OPEN	Device is not opened or initialized
SSP_ERR_UNSUPPORTED	Unsupported operation

The VLCD setting is valid only when the voltage boost circuit is operating

Verify the new volt is within the range.

Stop the internal voltage boost/capacitor split circuit.

Set new voltage value.

Wait 5ms minimum as per HW manual

Enable the voltage boost circuit or capacitor split circuit.

◆ R_SLCDC_Modify()

ssp_err_t R_SLCDC_Modify (slcdc_ctrl_t *const *p_api_ctrl*, slcdc_size_t const *segment_number*, slcdc_size_t const *data*, slcdc_size_t const *data_mask*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
SSP_ERR_NOT_OPEN	Device is not opened or initialized

Masks the data being displayed.

Specifies the data to rewrite.

◆ R_SLCDC_Open()

ssp_err_t R_SLCDC_Open (slcdc_ctrl_t *const *p_api_ctrl*, slcdc_cfg_t const *const *p_cfg*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block or the configuration structure is NULL.
SSP_ERR_HW_LOCKED	SLCDC resource is locked.

Returns

See Common Error Codes for other possible return codes. This function calls
- fmi_api_t::productFeatureGet

Configure the SLCDC driver

Record the configuration on the device for later use

Mark control block state open so subsequent calls know the device is open.

◆ R_SLCDC_SetDisplayArea()

ssp_err_t R_SLCDC_SetDisplayArea (slcdc_ctrl_t *const *p_api_ctrl*, slcdc_display_area_t const *display_area*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_UNSUPPORTED	Unsupported operation
SSP_ERR_NOT_OPEN	Device is not opened or initialized
SSP_ERR_NOT_ENABLED	RTC not enabled for blink operation

Returns

See Common Error Codes for other possible return codes. This function calls
- fmi_api_t::productFeatureGet

When the number of time slices is eight, LCD display data registers (A-pattern, B-pattern, or blinking display) cannot be selected.

Set the LCD display data area.

◆ R_SLCDC_Start()

ssp_err_t R_SLCDC_Start (slcdc_ctrl_t *const *p_api_ctrl*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_NOT_OPEN	Device is not opened or initialized

Enable the voltage boost circuit or capacitor split circuit.

Enable the LCD display.

◆ R_SLCDC_Stop()

ssp_err_t R_SLCDC_Stop (slcdc_ctrl_t *const *p_api_ctrl*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure is NULL.
SSP_ERR_NOT_OPEN	Device is not opened or initialized

Disable the LCD display

Disable the voltage boost circuit or capacitor split circuit.

◆ R_SLCDC_VersionGet()

ssp_err_t R_SLCDC_VersionGet (ssp_version_t *const *p_version*)

Retrieve the API version number.

Return values

SSP_SUCCESS	Successful return.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ R_SLCDC_Write()

ssp_err_t R_SLCDC_Write (slcdc_ctrl_t *const *p_api_ctrl*, slcdc_size_t const *start_segment*, slcdc_size_t const *const *p_data*, slcdc_size_t const *segment_count*)

Return values

SSP_SUCCESS	Device was opened successfully.
SSP_ERR_ASSERTION	Pointer to the control block structure and display data is NULL
SSP_ERR_INVALID_ARGUMENT	Invalid parameter in the argument.
SSP_ERR_NOT_OPEN	Device is not opened or initialized

Get the register address of the specified segment and write data to it.

slcdc_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » SLCDC

#include <r_slcdc.h>

Data Fields

slcdc_display_state_t	state Status of SLCD module.
slcdc_cfg_t	info SLCDC config info.
void const *	p_context Pointer to the higher level device context.
R_LCD_Type *	p_reg Pointer to register base address.

Detailed Description

SLCDC control block. DO NOT INITIALIZE. Initialization occurs when slcdc_api_t::open is called

Detailed Description

Driver for the Serial Sound Interface (SSI).

Summary

Extends I2S Interface.

Enumeration Type Documentation

◆ ssi_audio_clock_t

enum ssi_audio_clock_t	
Clock source. Selects GPT channel 1 or AUDIO_CLK input pin.	
Enumerator	
SSI_AUDIO_CLOCK_EXTERNAL	Audio clock source is the AUDIO_CLK input pin.
SSI_AUDIO_CLOCK_GTIOC1A	Audio clock source is internal connection to GPT channel 1 output.

Function Documentation

◆ R_SSI_Close()

ssp_err_t R_SSI_Close (i2s_ctrl_t *const *p_api_ctrl*)

Closes SSI. Implements i2s_api_t::close.

This function powers down the SSI and closes the lower level timer and transfer drivers if they are used.

Return values

SSP_SUCCESS	Device closed successfully.
SSP_ERR_ASSERTION	The pointer to p_ctrl null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Stop feeding clock to SSI peripheral to deactivate it.

If a timer instance is provided, close the timer instance.

If a transfer instance is provided for write, close the transfer instance.

If a transfer instance is provided for read, close the transfer instance.

Release HW lock.

◆ R_SSI_InfoGet()

ssp_err_t R_SSI_InfoGet (i2s_ctrl_t *const *p_api_ctrl*, i2s_info_t *const *p_info*)

Get I2S information and store it in provided pointer p_info. Implements i2s_api_t::infoGet.

Return values

SSP_SUCCESS	Information stored successfully.
SSP_ERR_ASSERTION	The p_ctrl or p_info parameter was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Get the SSI hardware status information.

If SSI hardware status is idle, set status to stopped. Otherwise, set status to in use.

Get the sampling frequency information.

◆ R_SSI_Mute()

ssp_err_t R_SSI_Mute (i2s_ctrl_t *const *p_api_ctrl*, i2s_mute_t const *mute_enable*)

Mutes SSI. Implements i2s_api_t::mute.

Data is still written while mute is enabled, but the transmit line outputs zeros.

Return values

SSP_SUCCESS	Transmission is muted.
SSP_ERR_ASSERTION	The pointer to p_ctrl was null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Enables the mute if MUTE_ON is set. Otherwise, disables the mute.

◆ R_SSI_Open()

ssp_err_t R_SSI_Open (i2s_ctrl_t *const *p_api_ctrl*, i2s_cfg_t const *const *p_cfg*)

Opens the SSI. Implements i2s_api_t::open.

This function calculates the clock divisor based on the input audio clock frequency and the requested sampling frequency. It sets this clock divisor and the configurations specified in i2s_cfg_t . It also opens the timer and transfer interfaces if they are provided.

Return values

SSP_SUCCESS	Ready for I2S communication.
SSP_ERR_ASSERTION	The pointer to p_ctrl or p_cfg is null.
SSP_ERR_IN_USE	The requested channel has already been opened or hardware has been locked.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet
- fmi_api_t::eventInfoGet
- transfer_api_t::open
- timer_api_t::open

Configure dependent timer and transfer drivers.

Configure interrupts.

Mark driver as open by initializing it to "SSI" in its ASCII equivalent.

◆ R_SSI_Read()

ssp_err_t R_SSI_Read (i2s_ctrl_t *const *p_api_ctrl*, uint8_t *const *p_dest*, uint16_t const *bytes*)

Reads data into provided buffer. Implements i2s_api_t::read.

This function resets the transfer if the transfer interface is used, or reads the length of data available in the FIFO then stores the remaining read buffer in the control block to be filled in the ISR.

Read() cannot be called if another write(), read() or writeRead() operation is in progress. Read can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

SSP_SUCCESS	Read initiated successfully.
SSP_ERR_ASSERTION	The pointer to p_ctrl or p_dest was null, or bytes requested was 0.
SSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset
- timer_api_t::start

If a transfer instance is provided for read, reset the transfer. Otherwise unload the receive FIFO.

Make sure reception is enabled.

◆ R_SSI_Stop()

ssp_err_t R_SSI_Stop (i2s_ctrl_t *const *p_api_ctrl*, i2s_dir_t const *dir*)

Stops SSI. Implements i2s_api_t::stop.

This function disables the transfer if the transfer interface is used, or sends a stop signal to stop writing data in the ISR if interrupt driven mode is used.

Return values

SSP_SUCCESS	I2S communication stop request issued.
SSP_ERR_ASSERTION	The pointer to p_ctrl null.
SSP_ERR_NOT_OPEN	The channel is not opened.

Returns

See Common Error Codes or lower level drivers for other possible return codes.

Stop is complete after an I2S_EVENT_IDLE interrupt.

◆ R_SSI_VersionGet()

ssp_err_t R_SSI_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ R_SSI_Write()

ssp_err_t R_SSI_Write (i2s_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint16_t const *bytes*)

Writes data buffer to SSI. Implements i2s_api_t::write.

This function resets the transfer if the transfer interface is used, or writes the length of data that fits in the FIFO then stores the remaining write buffer in the control block to be written in the ISR.

Write() cannot be called if another write(), read() or writeRead() operation is in progress. Write can be called when the SSI is idle, or after the I2S_EVENT_TX_EMPTY event.

Return values

SSP_SUCCESS	Write initiated successfully.
SSP_ERR_ASSERTION	The pointer to p_ctrl or p_src was null, or bytes requested was 0.
SSP_ERR_IN_USE	Another transfer is in progress, data was not written.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_UNDERFLOW	The transmit FIFO underflowed before it was reloaded.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset
- timer_api_t::start

If a transfer instance is provided for write, reset the transfer. Otherwise load the transmit FIFO.

Make sure transmission is enabled.

◆ R_SSI_WriteRead()

ssp_err_t R_SSI_WriteRead (i2s_ctrl_t *const *p_api_ctrl*, uint8_t const *const *p_src*, uint8_t *const *p_dest*, uint16_t const *bytes*)

Writes from source buffer and reads data into destination buffer. Implements i2s_api_t::writeRead.

This function calls R_SSI_Write and R_SSI_Read.

writeRead() cannot be called if another write(), read() or writeRead() operation is in progress. writeRead() can be called when the SSI is idle, or after the I2S_EVENT_RX_FULL event.

Return values

SSP_SUCCESS	Write and read initiated successfully.
SSP_ERR_ASSERTION	The pointer to p_ctrl, p_src, or p_dest was null, or bytes requested was 0.
SSP_ERR_NOT_OPEN	The channel is not opened.
SSP_ERR_UNDERFLOW	The transmit FIFO underflowed before it was reloaded.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- transfer_api_t::reset
- timer_api_t::start

If a transfer instance is provided for read, reset the transfer.

If a transfer instance is provided for write, reset the transfer.

Make sure transmission is enabled.

ssi_instance_ctrl_t Struct Reference

	Transmit IRQ number.
IRQn_Type	rxi_irq Receive IRQ number.
IRQn_Type	int_irq Idle/Error IRQ number.
uint32_t	open Whether or not this control block is initialized.

Detailed Description

Channel instance control block. DO NOT INITIALIZE. Initialization occurs when i2s_api_t::open is called.

Field Documentation

◆ p_callback

void(* ssi_instance_ctrl_t::p_callback) (i2s_callback_args_t *p_args)
Callback provided when an I2S ISR occurs. NULL indicates no CPU interrupt.

◆ p_context

void const* ssi_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in i2s_callback_args_t.

◆ p_rx_dest

uint32_t* ssi_instance_ctrl_t::p_rx_dest
Destination buffer pointer used to fill from hardware FIFO in receive ISR.

◆ p_tx_src

uint32_t const* ssi_instance_ctrl_t::p_tx_src
Source buffer pointer used to fill hardware FIFO from transmit ISR.

◆ rx_dest_bytes

uint32_t ssi_instance_ctrl_t::rx_dest_bytes
Size of destination buffer used to fill from hardware FIFO in receive ISR.

◆ tx_src_bytes

uint32_t ssi_instance_ctrl_t::tx_src_bytes
Size of source buffer used to fill hardware FIFO from transmit ISR.

More...

Detailed Description

Driver for the Watchdog Timer (WDT).

Summary

This module supports the Watchdog Timer (WDT). It implements the WDT Interface. The WDT HAL APIs provide the ability to configure the operation of the WDT (when used in register start mode), refresh the watchdog, read the timer value and read and clear status flags.

Function Documentation

◆ R_WDT_CfgGet()

ssp_err_t R_WDT_CfgGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t *const *p_cfg*)

Read the configuration of the WDT in both register-start and auto-start modes. Implements wdt_api_t::cfgGet.

Return values

SSP_SUCCESS	WDT successfully configured.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function is reentrant.

Register-start mode.

Get timeout value from WDTCR register.

◆ R_WDT_CounterGet()

ssp_err_t R_WDT_CounterGet (wdt_ctrl_t *const *p_api_ctrl*, uint32_t *const *p_count*)

Read the current count value of the WDT. Implements wdt_api_t::counterGet.

Return values

SSP_SUCCESS	WDT current count successfully read.
SSP_ERR_ASSERTION	Null pointer passed as a parameter.
SSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function is reentrant.

Read the WDT status

Get WDT down counter value

◆ R_WDT_Open()

ssp_err_t R_WDT_Open (wdt_ctrl_t *const *p_api_ctrl*, wdt_cfg_t const *const *p_cfg*)

Configure the WDT in register start mode. In auto-start_mode the NMI callback can be registered. Implements wdt_api_t::open.

This function should only be called once as WDT configuration registers can only be written to once so subsequent calls will have no effect.

Return values

SSP_SUCCESS	WDT successfully configured.
SSP_ERR_ASSERTION	Null Pointer(s).
SSP_ERR_INVALID_ARGUMENT	One or more configuration options is invalid.
SSP_ERR_INVALID_MODE	An attempt to open the WDT in register-start mode when the OFS0 register is configured for auto-start mode. Or to open the WDT in auto-start mode when the OSF0 is configured for register start mode.

Returns

See Common Error Codes or functions called by this function for other possible return codes. This function calls:

- fmi_api_t::productFeatureGet

Note

This function is reentrant. In auto-start mode the only valid configuration option is for registering the callback for the NMI ISR if NMI output has been selected.

g_wdt_version is accessed by the ASSERT macro only and so compiler toolchain can issue a warning that it is not accessed. The code below eliminates this warning and also ensures this data structure is not optimised away.

Eliminate toolchain warning when NMI output is not being used.

Check the expected start mode matches the OSF0 configuration.

Lock the IWDT Hardware Resource

Initialize global pointer to WDT for NMI callback use.

Configuration only valid when WDT operating in register-start mode.

Register-start mode.

Register callback with BSP NMI ISR.

Enable the WDT underflow/refresh error interrupt (will generate an NMI).

Start the timer by performing a refresh.

◆ R_WDT_Refresh()

ssp_err_t R_WDT_Refresh (wdt_ctrl_t *const *p_api_ctrl*)

Refresh the watchdog timer. Implements wdt_api_t::refresh.

In addition to refreshing the watchdog counter this function can be used, in register start mode to start the counter.

Return values

SSP_SUCCESS	WDT successfully refreshed.
SSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function is reentrant. This function only returns SSP_SUCCESS. If the refresh fails due to being performed outside of the permitted refresh period the device will either reset or trigger an NMI ISR to run. This function must not be called before calling R_WDT_Open().

Refresh the WDT Down counter

◆ R_WDT_StatusClear()

ssp_err_t R_WDT_StatusClear (wdt_ctrl_t *const *p_api_ctrl*, const wdt_status_t *status*)

Clear the WDT status and error flags. Implements wdt_api_t::statusClear.

Return values

SSP_SUCCESS	WDT flag(s) successfully cleared.
SSP_ERR_ASSERTION	Null pointer as a parameter.
SSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function is reentrant.

Write zero to clear flags.

◆ R_WDT_StatusGet()

ssp_err_t R_WDT_StatusGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_status_t *const *p_status*)

Read the WDT status flags. Implements wdt_api_t::statusGet.

Indicates both status and error conditions.

Return values

SSP_SUCCESS	WDT status successfully read.
SSP_ERR_ASSERTION	Null pointer as a parameter.
SSP_ERR_NOT_OPEN	Instance control block is not initialized.

Note

This function is reentrant. When the WDT is configured to output a reset on underflow or refresh error reading the status and error flags serves no purpose as they will always indicate that no underflow has occurred and there is no refresh error. Reading the status and error flags is only valid when interrupt request output is enabled.

Read the WDT status

Get the value of refresh or underflow error flag

◆ R_WDT_TimeoutGet()

ssp_err_t R_WDT_TimeoutGet (wdt_ctrl_t *const *p_api_ctrl*, wdt_timeout_values_t *const *p_timeout*)

Read timeout information for the watchdog timer. Implements wdt_api_t::timeoutGet.

Return values

SSP_SUCCESS	WDT timeout value successfully read.
SSP_ERR_ASSERTION	Null Pointer.
SSP_ERR_ABORTED	Invalid clock divider for this watchdog

Note

This function is reentrant. This function must not be called before calling R_WDT_Open().

Read the configuration of the WDT

Get the frequency of the clock supplying the WDT

◆ R_WDT_VersionGet()

ssp_err_t R_WDT_VersionGet (ssp_version_t *const *p_data*)
Return WDT HAL driver version. Implements wdt_api_t::versionGet. **Return values** SSP_SUCCESS — Version information successfully read. SSP_ERR_ASSERTION — Null pointer passed as a parameter ***Note*** *This function is reentrant.*

wdt_instance_ctrl_t Struct Reference

Renesas Synergy Software Package Reference » HAL Layer » WDT

#include <r_wdt.h>

Data Fields

uint32_t	wdt_open
void const *	p_context
R_WDT_Type *	p_reg Pointer to register base address.
void(*	p_callback)(wdt_callback_args_t *p_args) Callback provided when a WDT NMI ISR occurs.

Detailed Description

WDT control block. DO NOT INITIALIZE. Initialization occurs when wdt_api_t::open is called.

Field Documentation

◆ p_context

void const* wdt_instance_ctrl_t::p_context
Placeholder for user data. Passed to the user callback in wdt_callback_args_t.

◆ wdt_open

uint32_t wdt_instance_ctrl_t::wdt_open
Indicates whether the open() API has been successfully called.

uint32_t	R_SCE_Close (crypto_ctrl_t *const p_ctrl) Close SCE driver. Close R_SCE driver by setting driver status to CRYPTO_SCE_COMMON_MODULE_CLOSED. More...

Detailed Description

Primitive cryptographic functions.

Initializes the SCE module cryptographic operations.

Crypto API interface on SCE

Function Documentation

◆ R_SCE_Close()

uint32_t R_SCE_Close (crypto_ctrl_t *const *p_ctrl*)

Close SCE driver. Close R_SCE driver by setting driver status to CRYPTO_SCE_COMMON_MODULE_CLOSED.

Parameters

[in]	p_ctrl	control structure for SCE block

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	p_ctrl input parameter is NULL.

◆ R_SCE_Open()

uint32_t R_SCE_Open (crypto_ctrl_t *const *p_ctrl*, crypto_cfg_t const *const *p_cfg*)

SCE Initialization - Opens the module and initializes the SCE.

Parameters

[in,out]	p_ctrl	control structure for the SCE module
[in]	p_cfg	configuration structure for the SCE module

Returns an uint32_t integer indicating:

Return values

SF_CRYPTO_SUCCESS	if the initialization is successful.
SSP_ERR_CRYPTO_SCE_FAIL	if the initialization failed.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	if the SCE hardware resource is busy.
SSP_ERR_CRYPTO_SCE_ALREADY_OPEN	if the module is already open.
SSP_ERR_ASSERTION	NULL input parameter(s).

Get the list of API interfaces available to interfaceGet API.

◆ R_SCE_StatusGet()

uint32_t R_SCE_StatusGet (uint32_t * *p_status*)

This function indicates if the SCE has been initialized or not. The status returned is as follows:
CRYPTO_SCE_COMMON_MODULE_CLOSED = 0 when the module is closed.
CRYPTO_SCE_COMMON_MODULE_OPENED = 1 when the module is opened.

Parameters

[in]	p_status	pointer to uint32_t. This memory location is updated with the SCE module initialization status.

Return values

SF_CRYPTO_SUCCESS	API returned Successfully.
SSP_ERR_ASSERTION	The parameter p_status is NULL.

◆ R_SCE_VersionGet()

uint32_t R_SCE_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Parameters

[out]	p_version	version info for the SCE implementation

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Detailed Description

Primitive cryptographic functions.

AES key generation, encryption and decryption functions for plain-text / raw keys.

AES encryption and decryption functions

AES 256-bit CBC mode implementation for encryption and decryption functions

AES 256-bit CTR mode implementation for encryption and decryption functions

AES 256-bit ECB mode implementation for encryption and decryption functions

AES 256-bit XTS mode implementation for encryption and decryption functions

Function Documentation

◆ R_SCE_AES_128CbcDecrypt()

uint32_t R_SCE_AES_128CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_128CbcEncrypt()

uint32_t R_SCE_AES_128CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit CBC mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_128CtrEncrypt()

uint32_t R_SCE_AES_128CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit CTR mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_128EcbDecrypt()

uint32_t R_SCE_AES_128EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit ECB mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_128EcbEncrypt()

uint32_t R_SCE_AES_128EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit ECB mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_128GcmDecrypt()

uint32_t R_SCE_AES_128GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_128GcmEncrypt()

uint32_t R_SCE_AES_128GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_128GcmGetGcmTag()

uint32_t R_SCE_AES_128GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 128-bit GCM Authentication Tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_128GcmOpen()

uint32_t R_SCE_AES_128GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES GCM 128-bit Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_AES_128GcmSetGcmTag()

uint32_t R_SCE_AES_128GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM Decryption related functions. Copies the provided tag value to the corresponding internal control structure member.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_128GcmZeroPaddingDecrypt()

uint32_t R_SCE_AES_128GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_128GcmZeroPaddingEncrypt()

uint32_t R_SCE_AES_128GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

*p_dest must have space to hold at least (num_bytes/16+1)*16 bytes of data.*
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
this function is not thread safe.

◆ R_SCE_AES_128XtsDecrypt()

uint32_t R_SCE_AES_128XtsDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit XTS mode implementation for decrypt interface API Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_128XtsEncrypt()

uint32_t R_SCE_AES_128XtsEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 128-bit XTS mode implementation for encrypt interface API Encrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_192CbcDecrypt()

uint32_t R_SCE_AES_192CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 192-bit CBC mode implementation for decrypt interface API Decrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 24 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_192CbcEncrypt()

uint32_t R_SCE_AES_192CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 192-bit CBC mode implementation for encrypt interface API Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 24 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_192CtrEncrypt()

uint32_t R_SCE_AES_192CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 192-bit CTR mode implementation for encrypt and decrypt interface APIs Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 24 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_192EcbDecrypt()

uint32_t R_SCE_AES_192EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 192-bit ECB mode implementation for decrypt interface API Decrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 24 bytes of AES key data and
The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_192EcbEncrypt()

uint32_t R_SCE_AES_192EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 192-bit ECB mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 24 bytes of AES key data and
The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_192GcmDecrypt()

uint32_t R_SCE_AES_192GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_192GcmEncrypt()

uint32_t R_SCE_AES_192GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_192GcmGetGcmTag()

uint32_t R_SCE_AES_192GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 192-bit GCM Authentication Tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_192GcmOpen()

uint32_t R_SCE_AES_192GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES GCM 192-bit Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_AES_192GcmSetGcmTag()

uint32_t R_SCE_AES_192GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_192GcmZeroPaddingDecrypt()

uint32_t R_SCE_AES_192GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_192GcmZeroPaddingEncrypt()

uint32_t R_SCE_AES_192GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data
this function is not thread safe.

◆ R_SCE_AES_256CbcDecrypt()

uint32_t R_SCE_AES_256CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit CBC mode implementation for decrypt interface API Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_256CbcEncrypt()

uint32_t R_SCE_AES_256CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit CBC mode implementation for encrypt interface API Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_256CtrEncrypt()

uint32_t R_SCE_AES_256CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit CTR mode implementation for encrypt and decrypt interface APIs Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_256EcbDecrypt()

uint32_t R_SCE_AES_256EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Note

The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_256EcbEncrypt()

uint32_t R_SCE_AES_256EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit ECB mode implementation for encrypt interface API Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Note

The contents of p_iv buffer are ignored in ECB chaining mode. NULL value is acceptable.

◆ R_SCE_AES_256GcmDecrypt()

uint32_t R_SCE_AES_256GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_256GcmEncrypt()

uint32_t R_SCE_AES_256GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 256-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_256GcmGetGcmTag()

uint32_t R_SCE_AES_256GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 256-bit GCM Authentication Tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_256GcmOpen()

uint32_t R_SCE_AES_256GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES GCM 256-bit Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_AES_256GcmSetGcmTag()

uint32_t R_SCE_AES_256GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_AES_256GcmZeroPaddingDecrypt()

uint32_t R_SCE_AES_256GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes bytes of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
For description of memcpy, memcmp and memset functions refer to C Standard library <string.h>

◆ R_SCE_AES_256GcmZeroPaddingEncrypt()

uint32_t R_SCE_AES_256GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
this function is not thread safe.

◆ R_SCE_AES_256XtsDecrypt()

uint32_t R_SCE_AES_256XtsDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit XTS mode implementation for decrypt interface API Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_256XtsEncrypt()

uint32_t R_SCE_AES_256XtsEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES 256-bit XTS mode implementation for encrypt interface API Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_AES_Close()

uint32_t R_SCE_AES_Close (aes_ctrl_t *const *p_ctrl*)

AES Close function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

◆ R_SCE_AES_EImpl_AddAdditionalAuthenticationData()

uint32_t R_SCE_AES_EImpl_AddAdditionalAuthenticationData (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*)

AES Adding additional authentication data function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	p_key	pointer to the AES plain-text key
[in]	p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	num_words	data buffer size in words. Each work is 4-bytes and multiples of 4.
[in]	p_source	input data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_CreateKey()

uint32_t R_SCE_AES_EImpl_CreateKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

AES Create Key function, which is not implemented.

SCE/AES implementation of AES API.

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_EncryptFinal()

uint32_t R_SCE_AES_EImpl_EncryptFinal (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *input_num_words*, uint32_t * *p_source*, uint32_t *output_num_words*, uint32_t * *p_dest*)

AES Encrypt input Key Final function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	p_key	pointer to the AES plain-text key
[in]	p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	input_num_words	input data buffer size in words. Each word is 4-bytes and multiples of 4.
[in]	p_source	input data buffer
[out]	output_num_words	output data buffer size in words. Each word is 4-bytes and multiples of 4.
[in,out]	p_dest	output data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_GetGcmTag()

uint32_t R_SCE_AES_EImpl_GetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

AES Get GCM Tag function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	num_words	data buffer size in words. Each work is 4-bytes and multiples of 4.
[in,out]	p_dest	output data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_SetGcmTag()

uint32_t R_SCE_AES_EImpl_SetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

AES Set GCM Tag function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	num_words	data buffer size in words. Each work is 4-bytes and multiples of 4.
[in]	p_source	input data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_ZeroPaddingDecrypt()

uint32_t R_SCE_AES_EImpl_ZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES Zero padding decrypt function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	p_key	pointer to the AES plain-text key
[in]	p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	num_bytes	data buffer size in bytes.
[in]	p_source	input data buffer
[in,out]	p_dest	output data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_EImpl_ZeroPaddingEncrypt()

uint32_t R_SCE_AES_EImpl_ZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

AES Zero padding encrypt function, which is not implemented.

Parameters

[in]	p_ctrl	pointer to the control structure
[in]	p_key	pointer to the AES plain-text key
[in]	p_iv	is a pointer to initialization vector. For ECB mode this parameter is unused. NULL value is acceptable.
[in]	num_bytes	data buffer size in bytes.
[in]	p_source	input data buffer
[in,out]	p_dest	output data buffer

Return values

SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_AES_Open()

uint32_t R_SCE_AES_Open (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_AES_VersionGet()

uint32_t R_SCE_AES_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

AES 256-bit XTS mode implementation

SCE HRK AES

Renesas Synergy Software Package Reference » HAL Layer » SCE Module

Primitive cryptographic functions. More...

Functions

uint32_t	R_SCE_HRK_AES_Open (aes_ctrl_t *const p_ctrl, aes_cfg_t const *const p_cfg) AES Open function. More...
uint32_t	R_SCE_HRK_AES_Close (aes_ctrl_t *const p_ctrl) AES Close function. More...

uint32_t	R_SCE_HRK_AES_128CreateEncryptedKey (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_key) Encrypted Wrapped key creation for AES 128-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data. More...
uint32_t	R_SCE_HRK_AES_192CreateEncryptedKey (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_key) Encrypted Wrapped key creation for AES 192-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data. More...
uint32_t	R_SCE_HRK_AES_256CreateEncryptedKey (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_key) Encrypted Wrapped key creation for AES 256-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data. More...
uint32_t	R_SCE_HRK_AES_128CbcEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit CBC mode implementation for encrypt interface API. More...
uint32_t	R_SCE_HRK_AES_128CbcDecrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit CBC mode implementation for decrypt interface API. More...
uint32_t	R_SCE_HRK_AES_128CtrEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit CTR mode implementation for encrypt interface API. More...

uint32_t	R_SCE_HRK_AES_128EcbEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit ECB mode implementation for encrypt interface API. More...
uint32_t	R_SCE_HRK_AES_128EcbDecrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit ECB mode implementation for decrypt interface API. More...
uint32_t	R_SCE_HRK_AES_128GcmOpen (aes_ctrl_t *const p_ctrl, aes_cfg_t const *const p_cfg) AES Open function. More...
uint32_t	R_SCE_HRK_AES_128GcmEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypt num_words words of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data. More...
uint32_t	R_SCE_HRK_AES_128GcmZeroPaddingEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t *p_dest) Encrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block. More...
uint32_t	R_SCE_HRK_AES_128GcmGetGcmTag (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_dest) Get AES 128-bit GCM authentication tag data. More...
uint32_t	R_SCE_HRK_AES_128GcmSetGcmTag (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_source) Sets the expected authentication tag value for the AES-GCM-HRK

	Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success. More...
uint32_t	R_SCE_HRK_AES_128GcmDecrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data. More...
uint32_t	R_SCE_HRK_AES_128GcmZeroPaddingDecrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_bytes, uint32_t *p_source, uint32_t *p_dest) Decrypt num_bytes of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block. More...
uint32_t	R_SCE_HRK_AES_128XtsCreateEncryptedKey (aes_ctrl_t *const p_ctrl, uint32_t num_words, uint32_t *p_key) Encrypted Wrapped key creation for AES 1286-bit XTS mode implementation. More...
uint32_t	R_SCE_HRK_AES_128XtsEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit XTS mode implementation for encrypt interface API. More...
uint32_t	R_SCE_HRK_AES_128XtsDecrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted Key AES 128-bit XTS mode implementation for decrypt interface API. More...
uint32_t	R_SCE_HRK_AES_192CbcEncrypt (aes_ctrl_t *const p_ctrl, const uint32_t *p_key, uint32_t *p_iv, uint32_t num_words, uint32_t *p_source, uint32_t *p_dest) Encrypted key AES 192-bit CBC mode implementation for encrypt

	interface API. More...

Detailed Description

Primitive cryptographic functions.

AES key generation, encryption and decryption functions for wrapped keys.

SCE HRK Encrypted Key AES Cipher implementation functions

Function Documentation

◆ R_SCE_HRK_AES_128CbcDecrypt()

uint32_t R_SCE_HRK_AES_128CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit CBC mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using the wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().

◆ R_SCE_HRK_AES_128CbcEncrypt()

uint32_t R_SCE_HRK_AES_128CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit CBC mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().

◆ R_SCE_HRK_AES_128CreateEncryptedKey()

uint32_t R_SCE_HRK_AES_128CreateEncryptedKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

Encrypted Wrapped key creation for AES 128-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_INVALID_SIZE	Insufficient buffer size to accommodate created key
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_ctrl parameter is not used

◆ R_SCE_HRK_AES_128CtrEncrypt()

uint32_t R_SCE_HRK_AES_128CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit CTR mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using a wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().

◆ R_SCE_HRK_AES_128EcbDecrypt()

uint32_t R_SCE_HRK_AES_128EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit ECB mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using the wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_128EcbEncrypt()

uint32_t R_SCE_HRK_AES_128EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit ECB mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_128GcmDecrypt()

uint32_t R_SCE_HRK_AES_128GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_128GcmEncrypt()

uint32_t R_SCE_HRK_AES_128GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_128GcmGetGcmTag()

uint32_t R_SCE_HRK_AES_128GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 128-bit GCM authentication tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_128GcmOpen()

uint32_t R_SCE_HRK_AES_128GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_HRK_AES_128GcmSetGcmTag()

uint32_t R_SCE_HRK_AES_128GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM-HRK Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_128GcmZeroPaddingDecrypt()

uint32_t R_SCE_HRK_AES_128GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_128GcmZeroPaddingEncrypt()

uint32_t R_SCE_HRK_AES_128GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 128-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_128XtsCreateEncryptedKey()

uint32_t R_SCE_HRK_AES_128XtsCreateEncryptedKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

Encrypted Wrapped key creation for AES 1286-bit XTS mode implementation.

Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_INVALID_SIZE	Insufficient buffer size to accommodate created key
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4 and must be less than 128M

◆ R_SCE_HRK_AES_128XtsDecrypt()

uint32_t R_SCE_HRK_AES_128XtsDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit XTS mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using a wrapped 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid Key
SSP_ERR_INVALID_SIZE	Invalid size
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4 and must be less than 128M
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128CreateEncryptedKey().

Verify the upper-limit of num_words

HW_SCE_AES_128XtsDecryptUsingEncryptedKey takes a pointer (InData_Len) whose value is in number of bits

◆ R_SCE_HRK_AES_128XtsEncrypt()

uint32_t R_SCE_HRK_AES_128XtsEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted Key AES 128-bit XTS mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 128-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid Key
SSP_ERR_INVALID_SIZE	Invalid size
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4 and must be less than 128M
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 128-bit AES key generated using the R_SCE_HRK_AES_128XtsCreateEncryptedKey().

Verify the upper-limit of num_words

HW_SCE_AES_128XtsEncryptUsingEncryptedKey takes a pointer (InData_Len) whose value is in number of bits

◆ R_SCE_HRK_AES_192CbcDecrypt()

uint32_t R_SCE_HRK_AES_192CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 192-bit CBC mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using a wrapped 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 192-bit AES key generated using the R_SCE_HRK_AES_192CreateEncryptedKey().

◆ R_SCE_HRK_AES_192CbcEncrypt()

uint32_t R_SCE_HRK_AES_192CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 192-bit CBC mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 192-bit AES key generated using R_SCE_HRK_AES_192CreateEncryptedKey().

◆ R_SCE_HRK_AES_192CreateEncryptedKey()

uint32_t R_SCE_HRK_AES_192CreateEncryptedKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

Encrypted Wrapped key creation for AES 192-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_INVALID_SIZE	Insufficient buffer size to accommodate created key
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_ctrl parameter is not used

◆ R_SCE_HRK_AES_192CtrEncrypt()

uint32_t R_SCE_HRK_AES_192CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 192-bit CTR mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using a wrapped 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 192-bit AES key generated using the R_SCE_HRK_AES_192CreateEncryptedKey().

◆ R_SCE_HRK_AES_192EcbDecrypt()

uint32_t R_SCE_HRK_AES_192EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 192-bit ECB mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using a wrapped 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 192-bit AES key generated using the R_SCE_HRK_AES_192CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_192EcbEncrypt()

uint32_t R_SCE_HRK_AES_192EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 192-bit ECB mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 192-bit AES key generated using the R_SCE_HRK_AES_192CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_192GcmDecrypt()

uint32_t R_SCE_HRK_AES_192GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_192GcmEncrypt()

uint32_t R_SCE_HRK_AES_192GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 192-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_192GcmGetGcmTag()

uint32_t R_SCE_HRK_AES_192GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 192-bit GCM authentication tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_192GcmOpen()

uint32_t R_SCE_HRK_AES_192GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_HRK_AES_192GcmSetGcmTag()

uint32_t R_SCE_HRK_AES_192GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM-HRK Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_192GcmZeroPaddingDecrypt()

uint32_t R_SCE_HRK_AES_192GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes bytes of input data from buffer p_source using the 192-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_192GcmZeroPaddingEncrypt()

uint32_t R_SCE_HRK_AES_192GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 192-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_256CbcDecrypt()

uint32_t R_SCE_HRK_AES_256CbcDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted AES 256-bit ECB mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using a wrapped 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256CreateEncryptedKey().

◆ R_SCE_HRK_AES_256CbcEncrypt()

uint32_t R_SCE_HRK_AES_256CbcEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted AES 256-bit CBC mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256CreateEncryptedKey().

◆ R_SCE_HRK_AES_256CreateEncryptedKey()

uint32_t R_SCE_HRK_AES_256CreateEncryptedKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

Encrypted Wrapped key creation for AES 256-bit applies for CBC, ECB, CTR, GCM chaining mode implementations. Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_INVALID_SIZE	Insufficient buffer size to accommodate created key
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_ctrl parameter is not used

◆ R_SCE_HRK_AES_256CtrEncrypt()

uint32_t R_SCE_HRK_AES_256CtrEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 256-bit CTR mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using a wrapped 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256CreateEncryptedKey().

◆ R_SCE_HRK_AES_256EcbDecrypt()

uint32_t R_SCE_HRK_AES_256EcbDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 256-bit ECB mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_256EcbEncrypt()

uint32_t R_SCE_HRK_AES_256EcbEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 256-bit ECB mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using a wrapped 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256CreateEncryptedKey().
The contents of p_iv buffer are ignored and can be NULL in ECB chaining mode.

◆ R_SCE_HRK_AES_256GcmDecrypt()

uint32_t R_SCE_HRK_AES_256GcmDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_256GcmEncrypt()

uint32_t R_SCE_HRK_AES_256GcmEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_words words of input data from buffer p_source using the 256-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.

◆ R_SCE_HRK_AES_256GcmGetGcmTag()

uint32_t R_SCE_HRK_AES_256GcmGetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_dest*)

Get AES 256-bit GCM authentication tag data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_256GcmOpen()

uint32_t R_SCE_HRK_AES_256GcmOpen (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_HRK_AES_256GcmSetGcmTag()

uint32_t R_SCE_HRK_AES_256GcmSetGcmTag (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_source*)

Sets the expected authentication tag value for the AES-GCM-HRK Decryption related functions. Copies the provided tag value to the corresponding internal control structure member return success.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

◆ R_SCE_HRK_AES_256GcmZeroPaddingDecrypt()

uint32_t R_SCE_HRK_AES_256GcmZeroPaddingDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt num_bytes bytes of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.
SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_256GcmZeroPaddingEncrypt()

uint32_t R_SCE_HRK_AES_256GcmZeroPaddingEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_bytes*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt num_bytes bytes of input data from buffer p_source using the 256-bit AES p_key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_bytes bytes of data and padded with 0's to make 16-byte block.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Plain text key is passed
SSP_ERR_ASSERTION	An input parameter is NULL.
SSP_ERR_CRYPTO_NOT_IMPLEMENTED	This function is not implemented.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least num_bytes bytes of data.
The p_key buffer must contain 16 bytes of AES key data and
the p_iv buffer must have at least 16 bytes of random data.
p_dest to be padded with '0's to make 16-byte block.

◆ R_SCE_HRK_AES_256XtsCreateEncryptedKey()

uint32_t R_SCE_HRK_AES_256XtsCreateEncryptedKey (aes_ctrl_t *const *p_ctrl*, uint32_t *num_words*, uint32_t * *p_key*)

Encrypted Wrapped key creation for AES 256-bit XTS mode implementation.

Create a num_words words of wrapped key for AES XTS chaining mode. The result will be written to the output buffer p_key. The p_key array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_INVALID_SIZE	Insufficient buffer size to accommodate created key
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4

◆ R_SCE_HRK_AES_256XtsDecrypt()

uint32_t R_SCE_HRK_AES_256XtsDecrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 256-bit XTS mode implementation for decrypt interface API.

Decrypt num_words words of input data from buffer p_source using a wrapped 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid Key
SSP_ERR_INVALID_SIZE	Invalid size
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4 and must be less than 128M
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256XtsCreateEncryptedKey().

Verify the upper-limit of num_words

HW_SCE_AES_256XtsDecryptUsingEncryptedKey takes a pointer (InData_Len) whose value is in number of bits

◆ R_SCE_HRK_AES_256XtsEncrypt()

uint32_t R_SCE_HRK_AES_256XtsEncrypt (aes_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, uint32_t * *p_iv*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypted key AES 256-bit XTS mode implementation for encrypt interface API.

Encrypt num_words words of input data from buffer p_source using the 256-bit AES key from buffer p_key and initialization vector from buffer p_iv. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred
SSP_ERR_CRYPTO_SCE_HRK_INVALID_INDEX	Invalid Key
SSP_ERR_INVALID_SIZE	Invalid size
SSP_ERR_ASSERTION	An input parameter is NULL.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

num_words must be a multiple of 4 and must be less than 128M
p_dest must have space to hold at least num_words words of data.
The p_key is a wrapped/encrypted 256-bit AES key generated using the R_SCE_HRK_AES_256XtsCreateEncryptedKey().

Verify the upper-limit of num_words

HW_SCE_AES_256XtsEncryptUsingEncryptedKey takes a pointer (InData_Len) whose value is in number of bits

◆ R_SCE_HRK_AES_Close()

uint32_t R_SCE_HRK_AES_Close (aes_ctrl_t *const *p_ctrl*)

AES Close function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

◆ R_SCE_HRK_AES_Open()

uint32_t R_SCE_HRK_AES_Open (aes_ctrl_t *const *p_ctrl*, aes_cfg_t const *const *p_cfg*)

AES Open function.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

Detailed Description

Primitive cryptographic functions.

ARC4 encryption and decryption functions

Function Documentation

◆ R_SCE_ARC4_Close()

uint32_t R_SCE_ARC4_Close (arc4_ctrl_t *const *p_ctrl*)

ARC4 Finalization

Return values

SF_CRYPTO_SUCCESS	successful

◆ R_SCE_ARC4_KeySet()

uint32_t R_SCE_ARC4_KeySet (arc4_ctrl_t *const *p_ctrl*, uint32_t *length*, uint8_t const * *p_key*)

Sets user provided for use with subsequent encryptions.

Return values

SF_CRYPTO_SUCCESS	KeySet successful
SSP_ERR_NOT_OPEN	Module not opened.
SSP_ERR_ASSERTION	One of input parameter is NULL.

◆ R_SCE_ARC4_Open()

uint32_t R_SCE_ARC4_Open (arc4_ctrl_t *const *p_ctrl*, arc4_cfg_t const *const *p_cfg*)

ARC4 Initialization

Return values

SF_CRYPTO_SUCCESS	successful.
SSP_ERR_CRYPTO_SCE_ALREADY_OPEN	ARC4 module is already in open state and is usable for the given p_ctrl parameter.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_ARC4_Process()

uint32_t R_SCE_ARC4_Process (arc4_ctrl_t *const *p_ctrl*, uint32_t *num_bytes*, uint8_t * *p_source*, uint8_t * *p_dest*)

ARC4 Encrypt or decrypt source data and output result to destination buffer.

Return values

SSP_ERR_CRYPTO_INVALID_STATE	Invalid state, ensure that key data is configured either using the open() or using the keyset() function.
SSP_ERR_CRYPTO_INVALID_SIZE	invalid num_bytes passed. Should be a multiple of 16.
SF_CRYPTO_SUCCESS	successful.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	An internal error has occurred.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Hardware is busy, unable to encrypt at this time.

Encrypt or decrypt input data using the previously configured key data

◆ R_SCE_ARC4_VersionGet()

uint32_t R_SCE_ARC4_VersionGet (ssp_version_t *const *p_version*)
Sets driver version based on compile time macros. **Return values** SSP_SUCCESS — Successful close. SSP_ERR_ASSERTION — The parameter p_version is NULL.

Detailed Description

Primitive cryptographic functions.

Primitive cryptographic functions (L=2048,N=256) DSA.

DSA signature generation and verification functions

DSA signature generation and verification functions (L=1024,N=160) DSA

DSA signature generation and verification functions (L=2048,N=224) DSA

Function Documentation

◆ R_SCE_DSA_1024_160HashSignatureGenerate()

uint32_t R_SCE_DSA_1024_160HashSignatureGenerate (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (1024-bit,160-bit) DSA private key.

Sign imaxcnt words of input data from buffer p_source using the (L=1024,N=160)-bit DSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast 2*imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The p_key buffer must contain a valid DSA private key data and p_domain should contain DSA domain parameters in the order (Q || P || G) where Q is 5 words, P is 32 words and G is 32 words.

◆ R_SCE_DSA_1024_160HashSignatureVerify()

uint32_t R_SCE_DSA_1024_160HashSignatureVerify (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (1024-bit,160-bit) DSA public key.

Verify DSA signature data from buffer p_signature of length 2*imaxcnt words using (L=1024,N=160) DSA public key from buffer p_key. The buffer p_paddedHash indicates the message buffer from which the DSA signature should have been generated.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Incorrect signature
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 32 words of DSA public key data
The p_domain buffer must contain (20+128+128) bytes of data in the format (Q || P || G) where Q is 5 words, P is 32 words and G is 32 words.

◆ R_SCE_DSA_1024_160SignatureGenerate()

uint32_t R_SCE_DSA_1024_160SignatureGenerate (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (1024-bit,160-bit) DSA private key.

Sign imaxcnt words of input data from buffer p_source using the (L=1024,N=160)-bit DSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast 2*imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The p_key buffer must contain a valid DSA private key data and p_domain should contain DSA domain parameters in the order (Q || P || G) where Q is 5 words, P is 32 words and G is 32 words.

◆ R_SCE_DSA_1024_160SignatureVerify()

uint32_t R_SCE_DSA_1024_160SignatureVerify (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (1024-bit,160-bit) DSA public key.

Verify DSA signature data from buffer p_signature of length 2*imaxcnt words using (L=1024,N=160) DSA public key from buffer p_key. The buffer p_paddedHash indicates the message buffer from which the DSA signature should have been generated.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Incorrect signature
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 32 words of DSA public key data
The p_domain buffer must contain (20+128+128) bytes of data in the format (Q || P || G) where Q is 5 words, P is 32 words and G is 32 words.

◆ R_SCE_DSA_2048_224HashSignatureGenerate()

uint32_t R_SCE_DSA_2048_224HashSignatureGenerate (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (2048-bit,224-bit) DSA private key.

Sign imaxcnt words of input data from buffer p_source using the (L=2048,N=224)-bit DSA private key from buffer key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The key buffer must contain 7 words of DSA private key data
p_domain must contain valid DSA domain parameters

◆ R_SCE_DSA_2048_224HashSignatureVerify()

uint32_t R_SCE_DSA_2048_224HashSignatureVerify (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (2048-bit,224-bit) DSA public key.

Verify DSA signature from buffer p_signature using the given DSA public key p_key with domain parameters from p_domain for the input message hash p_paddedHash

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Signature verification failed.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 64 words of DSA public key data
The p_domain buffer must contain (28+256+256) bytes of data in the format (Q || P || G) where Q is 7 words, P is 64 words and G is 64 words.

◆ R_SCE_DSA_2048_224SignatureGenerate()

uint32_t R_SCE_DSA_2048_224SignatureGenerate (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (2048-bit,224-bit) DSA private key.

Sign imaxcnt words of input data from buffer p_source using the (L=2048,N=224)-bit DSA private key from buffer key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The key buffer must contain 7 words of DSA private key data
p_domain must contain valid DSA domain parameters

◆ R_SCE_DSA_2048_224SignatureVerify()

uint32_t R_SCE_DSA_2048_224SignatureVerify (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (2048-bit,224-bit) DSA public key.

Verify DSA signature data from buffer p_signature of length (2 * 'imaxcnt' words) using (L=2048,N=224) DSA public key. from buffer p_key. The buffer p_paddedHash indicates the message buffer from which the DSA signature should have been generated.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Signature verification failed.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 256 bytes of DSA public key data.
The p_domain buffer must contain (28+256+256) bytes of data in the format (Q || P || G).

◆ R_SCE_DSA_2048_256HashSignatureGenerate()

uint32_t R_SCE_DSA_2048_256HashSignatureGenerate (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (2048-bit,256-bit) DSA private key.

Generate signature for the buffer p_paddedHash with the given DSA private key p_key for the domain parameters p_domain. The result will be written to the buffer p_dest

Sign imaxcnt words of input data from buffer p_source using the (L=2048,N=256)-bit DSA private key from buffer key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The key buffer must contain 8 words of DSA private key data

◆ R_SCE_DSA_2048_256HashSignatureVerify()

uint32_t R_SCE_DSA_2048_256HashSignatureVerify (dsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (2048-bit,256-bit) DSA public key.

Verify DSA signature from buffer p_signature using the given DSA public key p_key with domain parameters from p_domain for the input message hash p_paddedHash

Return values

SF_CRYPTO_SUCCESS	Call successful.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Signature verification failed.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 256 bytes of DSA public key data
The p_domain buffer must contain (32+256+256) bytes of data in the format (Q || P || G).

◆ R_SCE_DSA_2048_256SignatureGenerate()

uint32_t R_SCE_DSA_2048_256SignatureGenerate (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using (2048-bit,256-bit) DSA private key.

Generate signature for the buffer p_paddedHash with the given DSA private key p_key for the domain parameters p_domain. The result will be written to the buffer p_dest

Sign imaxcnt words of input data from buffer p_source using the (L=2048,N=256)-bit DSA private key from buffer key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

*p_dest must have space to hold at least 2*imaxcnt words of data.*
The key buffer must contain 8 words of DSA private key data

◆ R_SCE_DSA_2048_256SignatureVerify()

uint32_t R_SCE_DSA_2048_256SignatureVerify (const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature verification using (2048-bit,256-bit) DSA public key.

Verify DSA signature data from buffer p_signature of length (2 * 'imaxcnt' words) using (L=2048,N=224) DSA public key. from buffer p_key. The buffer p_paddedHash indicates the message buffer from which the DSA signature should have been generated.

Return values

SF_CRYPTO_SUCCESS	Call successful.
SSP_ERR_ASSERTION	An input parameter is invalid.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Signature verification failed.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE DSA module must have been initialized by calling dsa_api_t::open

Note

The p_key buffer must contain 256 bytes of DSA public key data
The p_domain buffer must contain (32+256+256) bytes of data in the format (Q || P || G).

◆ R_SCE_DSA_Close()

uint32_t R_SCE_DSA_Close (dsa_ctrl_t *const *p_ctrl*)

Close DSA driver

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

◆ R_SCE_DSA_Open()

uint32_t R_SCE_DSA_Open (dsa_ctrl_t *const *p_ctrl*, dsa_cfg_t const *const *p_cfg*)

DSA Initialization

Return values

SF_CRYPTO_SUCCESS	Call successful
SSP_ERR_ASSERTION	The parameter p_ctrl or p_cfg is NULL.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_DSA_VersionGet()

uint32_t R_SCE_DSA_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_SUCCESS	Successful close.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Variable Documentation

◆ g_dsa1024_160_on_sce

```
const dsa_api_t g_dsa1024_160_on_sce
=

Detailed Description

Primitive cryptographic functions.

HASH functions

message hashing/digest functions

message hasing/digest functions

Function Documentation

◆ R_SCE_HASH_VersionGet()

uint32_t R_SCE_HASH_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

SCE HASH Get Version

Parameters

[in]	p_version	pointer to ssp_version_t structure where the version info will be stored

Return values

SF_CRYPTO_SUCCESS	Version information is returned successfully.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ R_SCE_MD5_Close()

uint32_t R_SCE_MD5_Close (hash_ctrl_t *const *p_ctrl*)

SCE MD5 Close function.

Return values

SF_CRYPTO_SUCCESS	Module closed successfully.
SSP_ERR_ASSERTION	The input parameter is NULL.

◆ R_SCE_MD5_HashUpdate()

uint32_t R_SCE_MD5_HashUpdate (hash_ctrl_t *const *p_ctrl*, const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

MD5 HashUpdate Function.

Compute the MD5 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the content of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value given in buffer p_digest will be used and this buffer will be updated with the computed MD5 message digest value.

Return values

SF_CRYPTO_SUCCESS	Function completed successfully.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_ASSERTION	Input parameter p_digest is NULL.

Note

: The final message digest has to be byte swapped / the order of the bytes have to be
: reversed (the output of the intermediate updates do not have to be swapped).
: The message length has to be byte swapped (the endianness has to be reversed).

◆ R_SCE_MD5_Open()

uint32_t R_SCE_MD5_Open (hash_ctrl_t *const *p_ctrl*, hash_cfg_t const *const *p_cfg*)

SCE MD5 open function.

Return values

SF_CRYPTO_SUCCESS	Module opened successfully.
SSP_ERR_ASSERTION	At least one of the input parameters is NULL.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_MD5_UpdateHash()

uint32_t R_SCE_MD5_UpdateHash (const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

MD5 Update Hash function.

Compute the MD5 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the content of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value given in buffer p_digest will be used and this buffer will be updated with the computed MD5 message digest value.

Return values

SF_CRYPTO_SUCCESS	Function completed successfully.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_ASSERTION	At least one of the input parameters is NULL.

Note

: The final message digest has to be byte swapped / the order of the bytes have to be
: reversed (the output of the intermediate updates do not have to be swapped).
: The message length has to be byte swapped (the endianness has to be reversed).

◆ R_SCE_SHA1_Close()

uint32_t R_SCE_SHA1_Close (hash_ctrl_t *const *p_ctrl*)

SCE SHA1 Close function.

Return values

SF_CRYPTO_SUCCESS	Module is closed successfully.
SSP_ERR_ASSERTION	The input parameter is NULL.

◆ R_SCE_SHA1_HashUpdate()

uint32_t R_SCE_SHA1_HashUpdate (hash_ctrl_t *const *p_ctrl*, const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

Computes the SHA1 message digest of the input message.

Compute the SHA1 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the content of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value given in buffer p_digest will be used and this buffer will be updated with the computed SHA1 message digest value.

Return values

SSP_ERR_ASSERTION	Input parameter p_digest is NULL.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

◆ R_SCE_SHA1_Open()

uint32_t R_SCE_SHA1_Open (hash_ctrl_t *const *p_ctrl*, hash_cfg_t const *const *p_cfg*)

SCE SHA1 open function using the SCE block.

SHA1 HASH Initialization

Return values

SF_CRYPTO_SUCCESS	open successful
SSP_ERR_ASSERTION	At least one of the input parameters is NULL.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_SHA1_UpdateHash()

uint32_t R_SCE_SHA1_UpdateHash (const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

Computes the SHA1 message digest of the input message.

Compute the SHA1 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the content of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value given in buffer p_digest will be used and this buffer will be updated with the computed SHA1 message digest value.

Return values

SSP_ERR_ASSERTION	At least one of the input parameters is NULL.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

◆ R_SCE_SHA256_Close()

uint32_t R_SCE_SHA256_Close (hash_ctrl_t *const *p_ctrl*)

SCE SHA256 Close function.

Return values

SSP_ERR_ASSERTION	The input parameter is NULL.
SF_CRYPTO_SUCCESS	Module closed successfully.

◆ R_SCE_SHA256_HashUpdate()

uint32_t R_SCE_SHA256_HashUpdate (hash_ctrl_t *const *p_ctrl*, const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

Update hash value using the given input message from buffer p_source of num_words words, write the result to p_digest

Compute the SHA256 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the contents of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value as given in buffer p_digest will be used and this buffer will be updated with the computed SHA256 message digest value.

Return values

SSP_ERR_ASSERTION	Input parameter p_digest is NULL.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

◆ R_SCE_SHA256_Open()

uint32_t R_SCE_SHA256_Open (hash_ctrl_t *const *p_ctrl*, hash_cfg_t const *const *p_cfg*)

SCE SHA256 HASH Initialization.

Return values

SSP_ERR_ASSERTION	At least one of the input parameters is NULL.
SF_CRYPTO_SUCCESS	successful completion.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_SHA256_UpdateHash()

uint32_t R_SCE_SHA256_UpdateHash (const uint32_t * *p_msg*, uint32_t *num_words*, uint32_t * *p_digest*)

Update hash value using the given input message from buffer p_source of num_words words, write the result to p_digest

Compute the SHA256 message digest for the given input message buffer p_msg of length num_words words. The length of the message buffer needs to be a multiple of 64 bytes. Generally the contents of the message buffer are the padded value as given by Message||stopbit||zero padding||Message length.

The initial hash value as given in buffer p_digest will be used and this buffer will be updated with the computed SHA256 message digest value.

Return values

SSP_ERR_ASSERTION	At least one of the input parameters is NULL.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Variable Documentation

◆ g_md5_hash_on_sce

const hash_api_t g_md5_hash_on_sce

```
=
{
    .open       = R_SCE_MD5_Open,
    .updateHash = R_SCE_MD5_UpdateHash,
    .close      = R_SCE_MD5_Close,
    .versionGet = R_SCE_HASH_VersionGet,
    .hashUpdate = R_SCE_MD5_HashUpdate
}
```

MD5 implementation of HASH API.

◆ g_sha1_hash_on_sce

```
const hash_api_t g_sha1_hash_on_sce
=
{
    .open       = R_SCE_SHA1_Open,
    .updateHash = R_SCE_SHA1_UpdateHash,
    .close      = R_SCE_SHA1_Close,
    .versionGet = R_SCE_HASH_VersionGet,
    .hashUpdate = R_SCE_SHA1_HashUpdate
}
```

SHA1 implementation of HASH API.

◆ g_sha256_hash_on_sce

```
const hash_api_t g_sha256_hash_on_sce
=
{
    .open       = R_SCE_SHA256_Open,
    .updateHash = R_SCE_SHA256_UpdateHash,
    .close      = R_SCE_SHA256_Close,
    .versionGet = R_SCE_HASH_VersionGet,
    .hashUpdate = R_SCE_SHA256_HashUpdate
}
```

SHA256 implementation of HASH API.

Detailed Description

Primitive cryptographic functions.

ECC 192-bit implementation for scalar multiplication, key generation, signature generation and signature verification functions

ECC 224-bit implementation for scalar multiplication, key generation, signature generation and signature verification functions

ECC 256-bit implementation for scalar multiplication, key generation, signature generation and signature verification functions

ECC 384-bit implementation for scalar multiplication, key generation, signature generation and signature verification functions

Function Documentation

◆ R_SCE_ECC_192KeyCreate()

ssp_err_t R_SCE_ECC_192KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *p_key_public*)

Generate public and private key pair for elliptic curve cryptography on 192 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (24 words). (a||b||p||n - 6 words each)
p_generator_point must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_key_private must have space to hold at least ECC_192_PRIVATE_KEY_LENGTH_WORDS (6 words) of output data.
p_key_public must have space to hold at least ECC_192_PUBLIC_KEY_LENGTH_WORDS (12 words) of output data.

◆ R_SCE_ECC_192PrivateKeySign()

ssp_err_t R_SCE_ECC_192PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 192 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (24 words). (a||b||p||n - 6 words each)
p_generator_point must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_key_private must be of size ECC_192_PRIVATE_KEY_LENGTH_WORDS (6 words).
msg_digest must be of size ECC_192_MESSAGE_DIGEST_LENGTH_WORDS (6 words).
signature_r must have space to hold at least ECC_192_SIGNATURE_R_LENGTH_WORDS (6 words) of output data.
signature_s must have space to hold at least ECC_192_SIGNATURE_S_LENGTH_WORDS (6 words) of output data.

◆ R_SCE_ECC_192PublicKeyVerify()

ssp_err_t R_SCE_ECC_192PublicKeyVerify (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_public*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Signature verification of ECDSA on 192 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verification failure.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (24 words). (a||b||p||n - 6 words each)
p_generator_point must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_key_public must be of size ECC_192_PUBLIC_KEY_LENGTH_WORDS (12 words).
msg_digest must be of size ECC_192_MESSAGE_DIGEST_LENGTH_WORDS (6 words).
signature_r must be of size ECC_192_SIGNATURE_R_LENGTH_WORDS (6 words).
signature_s must be of size ECC_192_SIGNATURE_S_LENGTH_WORDS (6 words).

◆ R_SCE_ECC_192ScalarMultiplication()

ssp_err_t R_SCE_ECC_192ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_k*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of a scalar pointed by p_k (k) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (18 words). (a||b||p - 6 words each)
p_k must be of size ECC_192_PRIVATE_KEY_LENGTH_WORDS (6 words).
p_p must be of size ECC_192_POINT_ON_CURVE_LENGTH_WORDS (12 words).
p_r must have space to hold at least ECC_192_POINT_ON_CURVE_LENGTH_WORDS (12 words) of output data.

◆ R_SCE_ECC_224KeyCreate()

ssp_err_t R_SCE_ECC_224KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *p_key_public*)

Generate public and private key pair for elliptic curve cryptography on 224 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (28 words). (a||b||p||n - 7 words each)
p_generator_point must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_key_private must have space to hold at least ECC_224_PRIVATE_KEY_LENGTH_WORDS (7 words) of output data.
p_key_public must have space to hold at least ECC_224_PUBLIC_KEY_LENGTH_WORDS (14 words) of output data.

◆ R_SCE_ECC_224PrivateKeySign()

ssp_err_t R_SCE_ECC_224PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 224 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (28 words). (a||b||p||n - 7 words each)
p_generator_point must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_key_private must be of size ECC_224_PRIVATE_KEY_LENGTH_WORDS (7 words).
msg_digest must be of size ECC_224_MESSAGE_DIGEST_LENGTH_WORDS (7 words).
signature_r must have space to hold at least ECC_224_SIGNATURE_R_LENGTH_WORDS (7 words) of output data.
signature_s must have space to hold at least ECC_224_SIGNATURE_S_LENGTH_WORDS (7 words) of output data.

◆ R_SCE_ECC_224PublicKeyVerify()

ssp_err_t R_SCE_ECC_224PublicKeyVerify (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_public*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Signature verification of ECDSA on 224 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verification failure.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (28 words). (a||b||p||n - 7 words each)
p_generator_point must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_key_public must be of size ECC_224_PUBLIC_KEY_LENGTH_WORDS (14 words).
msg_digest must be of size ECC_224_MESSAGE_DIGEST_LENGTH_WORDS (7 words).
signature_r must be of size ECC_224_SIGNATURE_R_LENGTH_WORDS (7 words).
signature_s must be of size ECC_224_SIGNATURE_S_LENGTH_WORDS (7 words).

◆ R_SCE_ECC_224ScalarMultiplication()

ssp_err_t R_SCE_ECC_224ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_k*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of a scalar pointed by p_k (k) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (21 words). (a||b||p - 7 words each)
p_k must be of size ECC_224_PRIVATE_KEY_LENGTH_WORDS (7 words).
p_p must be of size ECC_224_POINT_ON_CURVE_LENGTH_WORDS (14 words).
p_r must have space to hold at least ECC_224_POINT_ON_CURVE_LENGTH_WORDS (14 words) of output data.

◆ R_SCE_ECC_256KeyCreate()

ssp_err_t R_SCE_ECC_256KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *p_key_public*)

Generate public and private key pair for elliptic curve cryptography on 256 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words). (a||b||p||n - 8 words each)
p_generator_point must be of size ECC_256_GENERATOR_POINT_LENGTH_WORDS (16 words).
p_key_private must have space to hold at least ECC_256_PRIVATE_KEY_LENGTH_WORDS (8 words) of output data.
p_key_public must have space to hold at least ECC_256_PUBLIC_KEY_LENGTH_WORDS (16 words) of output data.

◆ R_SCE_ECC_256PrivateKeySign()

ssp_err_t R_SCE_ECC_256PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 256 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words). (a||b||p||n - 8 words each)
p_generator_point must be of size ECC_256_GENERATOR_POINT_LENGTH_WORDS (16 words).
p_key_private must be of size ECC_256_PRIVATE_KEY_LENGTH_WORDS (8 words).
msg_digest must be of size ECC_256_MESSAGE_DIGEST_LENGTH_WORDS (8 words).
signature_r must have space to hold at least ECC_256_SIGNATURE_R_LENGTH_WORDS (8 words) of output data.
signature_s must have space to hold at least ECC_256_SIGNATURE_S_LENGTH_WORDS (8 words) of output data.

◆ R_SCE_ECC_256PublicKeyVerify()

ssp_err_t R_SCE_ECC_256PublicKeyVerify (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_public*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Signature verification of ECDSA on 256 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verification failure.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words). (a||b||p||n - 8 words each)
p_generator_point must be of size ECC_256_GENERATOR_POINT_LENGTH_WORDS (16 words).
p_key_public must be of size ECC_256_PUBLIC_KEY_LENGTH_WORDS (16 words).
msg_digest must be of size ECC_256_MESSAGE_DIGEST_LENGTH_WORDS (8 words).
signature_r must be of size ECC_256_SIGNATURE_R_LENGTH_WORDS (8 words).
signature_s must be of size ECC_256_SIGNATURE_S_LENGTH_WORDS (8 words).

◆ R_SCE_ECC_256ScalarMultiplication()

ssp_err_t R_SCE_ECC_256ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_k*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of a scalar pointed by p_k (k) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (24 words). (a||b||p - 8 words each)
p_k must be of size ECC_256_PRIVATE_KEY_LENGTH_WORDS (8 words).
p_p must be of size ECC_256_POINT_ON_CURVE_LENGTH_WORDS (16 words).
p_r must have space to hold at least ECC_256_POINT_ON_CURVE_LENGTH_WORDS (16 words) of output data.

◆ R_SCE_ECC_384KeyCreate()

ssp_err_t R_SCE_ECC_384KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *p_key_public*)

Generate public and private key pair for elliptic curve cryptography on 384 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words). (a||b||p||n - 12 words each)
p_generator_point must be of size ECC_384_GENERATOR_POINT_LENGTH_WORDS (24 words).
p_key_private must have space to hold at least ECC_384_PRIVATE_KEY_LENGTH_WORDS (12 words) of output data.
p_key_public must have space to hold at least ECC_384_PUBLIC_KEY_LENGTH_WORDS (24 words) of output data.

◆ R_SCE_ECC_384PrivateKeySign()

ssp_err_t R_SCE_ECC_384PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_private*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 384 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words). (a||b||p||n - 12 words each)
p_generator_point must be of size ECC_384_GENERATOR_POINT_LENGTH_WORDS (24 words).
p_key_private must be of size ECC_384_PRIVATE_KEY_LENGTH_WORDS (12 words).
msg_digest must be of size ECC_384_MESSAGE_DIGEST_LENGTH_WORDS (12 words).
signature_r must have space to hold at least ECC_384_SIGNATURE_R_LENGTH_WORDS (12 words) of output data.
signature_s must have space to hold at least ECC_384_SIGNATURE_S_LENGTH_WORDS (12 words) of output data.

◆ R_SCE_ECC_384PublicKeyVerify()

ssp_err_t R_SCE_ECC_384PublicKeyVerify (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_public*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Signature verification of ECDSA on 384 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	Verification failure.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words). (a||b||p||n - 12 words each)
p_generator_point must be of size ECC_384_GENERATOR_POINT_LENGTH_WORDS (24 words).
p_key_public must be of size ECC_384_PUBLIC_KEY_LENGTH_WORDS (24 words).
msg_digest must be of size ECC_384_MESSAGE_DIGEST_LENGTH_WORDS (12 words).
signature_r must be of size ECC_384_SIGNATURE_R_LENGTH_WORDS (12 words).
signature_s must be of size ECC_384_SIGNATURE_S_LENGTH_WORDS (12 words).

◆ R_SCE_ECC_384ScalarMultiplication()

ssp_err_t R_SCE_ECC_384ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_k*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of a scalar pointed by p_k (k) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (36 words). (a||b||p - 12 words each)
p_k must be of size ECC_384_PRIVATE_KEY_LENGTH_WORDS (12 words).
p_p must be of size ECC_384_POINT_ON_CURVE_LENGTH_WORDS (24 words).
p_r must have space to hold at least ECC_384_POINT_ON_CURVE_LENGTH_WORDS (24 words) of output data.

◆ R_SCE_ECC_Close()

ssp_err_t R_SCE_ECC_Close (ecc_ctrl_t *const *p_ctrl*)

ECC Close function.

Return values

SSP_SUCCESS	Normal end
SSP_ERR_ASSERTION	The parameter p_ctrl is NULL.

◆ R_SCE_ECC_Open()

ssp_err_t R_SCE_ECC_Open (ecc_ctrl_t *const *p_ctrl*, ecc_cfg_t const *const *p_cfg*)

ECC Initialization.

Name of module used by error logger macro

Return values

SSP_SUCCESS	Normal end
SSP_ERR_ASSERTION	Any of the input parameters are NULL.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_ECC_VersionGet()

ssp_err_t R_SCE_ECC_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_SUCCESS	Normal end
SSP_ERR_ASSERTION	The parameter p_version is NULL.

◆ R_SCE_HRK_ECC_192KeyCreate()

ssp_err_t R_SCE_HRK_ECC_192KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_key_public*)

Generate public key and wrapped key for elliptic curve cryptography on 192 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (24 words). (a||b||p||n - 6 words each)
p_generator_point must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_key_index must have space to hold at least ECC_192_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words) of output data.
p_key_public must have space to hold at least ECC_192_PUBLIC_KEY_LENGTH_WORDS (12 words) of output data.

◆ R_SCE_HRK_ECC_192PrivateKeySign()

ssp_err_t R_SCE_HRK_ECC_192PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 192 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_192_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (24 words). (a||b||p||n - 6 words each)
p_generator_point must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_key_index must be of size ECC_192_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
msg_digest must be of size ECC_192_MESSAGE_DIGEST_LENGTH_WORDS (6 words).
signature_r must have space to hold at least ECC_192_SIGNATURE_R_LENGTH_WORDS (6 words) of output data.
signature_s must have space to hold at least ECC_192_SIGNATURE_R_LENGTH_WORDS (6 words) of output data.

◆ R_SCE_HRK_ECC_192ScalarMultiplication()

ssp_err_t R_SCE_HRK_ECC_192ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of p_key_index (k) (wrapped key) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

It is optional to concatenate the Order - 'n' to the 'p_domain' input buffer, i.e. both (a||b||p) and (a||b||p||n) are supported.
p_domain must be either of size ECC_192_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (24 words) - (a||b||p||n - 6 words each) OR of size ECC_192_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (18 words) - (a||b||p - 6 words each).
p_key_index must be of size ECC_192_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
p_p must be of size ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words).
p_r must have space to hold at least ECC_192_GENERATOR_POINT_LENGTH_WORDS (12 words) of output data.
p_key_index is generated using generateKey API.

◆ R_SCE_HRK_ECC_224KeyCreate()

ssp_err_t R_SCE_HRK_ECC_224KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_key_public*)

Generate public key and wrapped key for elliptic curve cryptography on 224 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (28 words). (a||b||p||n - 7 words each)
p_generator_point must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_key_index must have space to hold at least ECC_224_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words) of output data.
p_key_public must have space to hold at least ECC_224_PUBLIC_KEY_LENGTH_WORDS (14 words) of output data.

◆ R_SCE_HRK_ECC_224PrivateKeySign()

ssp_err_t R_SCE_HRK_ECC_224PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 224 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_224_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (28 words). (a||b||p||n - 7 words each)
p_generator_point must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_key_index must be of size ECC_224_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
msg_digest must be of size ECC_224_MESSAGE_DIGEST_LENGTH_WORDS (7 words).
signature_r must have space to hold at least ECC_224_SIGNATURE_R_LENGTH_WORDS (7 words) of output data.
signature_s must have space to hold at least ECC_224_SIGNATURE_R_LENGTH_WORDS (7 words) of output data.

◆ R_SCE_HRK_ECC_224ScalarMultiplication()

ssp_err_t R_SCE_HRK_ECC_224ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of p_key_index (k) (wrapped key) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

It is optional to concatenate the Order - 'n' to the 'p_domain' input buffer, i.e. both (a||b||p) and (a||b||p||n) are supported.
p_domain must be either of size ECC_224_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (28 words) - (a||b||p||n - 7 words each) OR of size ECC_224_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (21 words) - (a||b||p - 7 words each).
p_key_index must be of size ECC_224_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
p_p must be of size ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words).
p_r must have space to hold at least ECC_224_GENERATOR_POINT_LENGTH_WORDS (14 words) of output data.
p_key_index is generated using generateKey API.

◆ R_SCE_HRK_ECC_256KeyCreate()

ssp_err_t R_SCE_HRK_ECC_256KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_key_public*)

Generate public key and wrapped key for elliptic curve cryptography on 256 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words). (a||b||p||n - 8 words each)
p_generator_point must be of size ECC_256_GENERATOR_POINT_LENGTH_WORDS (16 words).
p_key_index must have space to hold at least ECC_256_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words) of output data.
p_key_public must have space to hold at least ECC_256_PUBLIC_KEY_LENGTH_WORDS (16 words) of output data.

◆ R_SCE_HRK_ECC_256PrivateKeySign()

ssp_err_t R_SCE_HRK_ECC_256PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 256 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words). (a||b||p||n - 8 words each)
p_generator_point must be of size ECC_256_GENERATOR_POINT_LENGTH_WORDS (16 words).
p_key_index must be of size ECC_256_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
msg_digest must be of size ECC_256_MESSAGE_DIGEST_LENGTH_WORDS (8 words).
signature_r must have space to hold at least ECC_256_SIGNATURE_S_LENGTH_WORDS (8 words) of output data.
signature_s must have space to hold at least ECC_256_SIGNATURE_S_LENGTH_WORDS (8 words) of output data.

◆ R_SCE_HRK_ECC_256ScalarMultiplication()

ssp_err_t R_SCE_HRK_ECC_256ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of p_key_index (k) (wrapped key) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

It is optional to concatenate the Order - 'n' to the 'p_domain' input buffer, i.e. both (a||b||p) and (a||b||p||n) are supported.
p_domain must be either of size ECC_256_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (32 words) - (a||b||p||n - 8 words each) OR of size ECC_256_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (24 words) - (a||b||p - 8 words each).
p_key_index must be of size ECC_256_PRIVATE_KEY_HRK_LENGTH_WORDS (13 words).
p_p must be of size ECC_256_POINT_ON_CURVE_LENGTH_WORDS (16 words).
p_r must have space to hold at least ECC_256_POINT_ON_CURVE_LENGTH_WORDS (16 words) of output data.
p_key_index is generated using generateKey API.

◆ R_SCE_HRK_ECC_384KeyCreate()

ssp_err_t R_SCE_HRK_ECC_384KeyCreate (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_key_public*)

Generate public key and wrapped key for elliptic curve cryptography on 384 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words). (a||b||p||n - 12 words each)
p_generator_point must be of size ECC_384_GENERATOR_POINT_LENGTH_WORDS (24 words).
p_key_index must have space to hold at least ECC_384_PRIVATE_KEY_HRK_LENGTH_WORDS (17 words) of output data.
p_key_public must have space to hold at least ECC_384_PUBLIC_KEY_LENGTH_WORDS (24 words) of output data.

◆ R_SCE_HRK_ECC_384PrivateKeySign()

ssp_err_t R_SCE_HRK_ECC_384PrivateKeySign (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_generator_point*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *msg_digest*, r_crypto_data_handle_t *const *signature_r*, r_crypto_data_handle_t *const *signature_s*)

Generate signature of ECDSA on 384 bit of prime field. Ensure the domain parameter, p_domain, exists and is valid. Ensure the p_generator point, generator_point, exists and is valid. p_key_index is the wrapped key.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

p_domain must be of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words). (a||b||p||n - 12 words each)
p_generator_point must be of size ECC_384_GENERATOR_POINT_LENGTH_WORDS (24 words).
p_key_index must be of size ECC_384_PRIVATE_KEY_HRK_LENGTH_WORDS (17 words).
msg_digest must be of size ECC_384_MESSAGE_DIGEST_LENGTH_WORDS (12 words).
signature_r must have space to hold at least ECC_384_SIGNATURE_S_LENGTH_WORDS (12 words) of output data.
signature_s must have space to hold at least ECC_384_SIGNATURE_S_LENGTH_WORDS (12 words) of output data.

◆ R_SCE_HRK_ECC_384ScalarMultiplication()

ssp_err_t R_SCE_HRK_ECC_384ScalarMultiplication (ecc_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t *const *p_domain*, r_crypto_data_handle_t *const *p_key_index*, r_crypto_data_handle_t *const *p_p*, r_crypto_data_handle_t *const *p_r*)

Perform scalar multiplication of p_key_index (k) (wrapped key) with a point pointed by p_p (P) and return the result at location pointed by p_r (R=kP). Ensure the domain parameter, p_domain, exists and is valid.

Return values

SSP_SUCCESS	Normal end.
SSP_ERR_ASSERTION	NULL input parameter(s).
SSP_ERR_CRYPTO_INVALID_SIZE	invalid input buffer length(s).
SSP_ERR_CRYPTO_SCE_FAIL	Internal Error.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred.

Note

In case of failure, output buffer(s) may get partially updated. Data length field of output data handle(s) will not be updated to the expected return buffer size and will be unchanged in case the API fails. The caller must check the return status before using the output data.

Precondition

SCE module must have been initialized by calling the functions R_SCE_Open()

Note

It is optional to concatenate the Order - 'n' to the 'p_domain' input buffer, i.e. both (a||b||p) and (a||b||p||n) are supported.
p_domain must be either of size ECC_384_DOMAIN_PARAMETER_WITH_ORDER_LENGTH_WORDS (48 words) - (a||b||p||n - 12 words each) OR of size ECC_384_DOMAIN_PARAMETER_WITHOUT_ORDER_LENGTH_WORDS (36 words) - (a||b||p - 12 words each).
p_key_index must be of size ECC_384_PRIVATE_KEY_HRK_LENGTH_WORDS (17 words).
p_p must be of size ECC_384_POINT_ON_CURVE_LENGTH_WORDS (24 words).
p_r must have space to hold at least ECC_384_POINT_ON_CURVE_LENGTH_WORDS (24 words) of output data.
p_key_index is generated using generateKey API.

Detailed Description

Primitive cryptographic functions.

key installation functions

Function Documentation

◆ r_sce_key_installation_aes()

ssp_err_t r_sce_key_installation_aes (key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Sub-routine to install user's AES encrypted key which is generated outside of the Synergy platform and processed using the DLM Service.

Parameters

[in]	p_user_key	Pointer to a user provided AES encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed AES key.

Return values

SSP_SUCCESS	AES Key Installation is successful.
SSP_ERR_INVALID_ARGUMENT	Input key size is invalid.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	Input key buffer lengths are invalid.

◆ r_sce_key_installation_aes_128_and_256_bits()

ssp_err_t r_sce_key_installation_aes_128_and_256_bits (key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Sub-routine to install AES 128/256-bit encrypted user provided key which is generated outside of Synergy platform with the DLM Service, applies to ECB, GCM, CTR, CBC and XTS chaining modes.

Parameters

[in]	p_user_key	Pointer to a user provided AES encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed AES key.

Return values

SSP_SUCCESS	AES Key Installation is successful.
SSP_ERR_INVALID_ARGUMENT	Input key size is invalid.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	Input key buffer lengths are invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

◆ r_sce_key_installation_aes_192_bits()

ssp_err_t r_sce_key_installation_aes_192_bits (key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Sub-routine to install AES 192-bit encrypted user provided key which is generated outside of Synergy platform using the DLM Service, applies to ECB, GCM, CTR, CBC chaining modes.

Parameters

[in]	p_user_key	Pointer to a user provided AES encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed AES key.

Return values

SSP_SUCCESS	AES Key Installation is successful.
SSP_ERR_INVALID_ARGUMENT	Input key size is invalid.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	Input key buffer lengths are invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

◆ r_sce_key_installation_aes_fill_wrapped_key_out_length()

void r_sce_key_installation_aes_fill_wrapped_key_out_length (key_installation_key_size_t *key_size*, uint32_t * *data_length*)

Private helper function to fill the output wrapped key length.

Parameters

[in]	key_size	Indicates users encrypted AES key sizes - 128/192/256-bit.
[in,out]	data_length	Pointer to the length of the wrapped key data in the buffer in WORDS, filled by this routine.

Note

The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_aes_verify_key_lengths()

ssp_err_t r_sce_key_installation_aes_verify_key_lengths (key_installation_key_t const *const *p_user_key*, key_installation_key_t const *const *p_session_key*, key_installation_key_t *const *p_key_data*)

Subroutine to verify that the key_size and key lengths provided for the AES key, are valid to proceed with the Key Install API.

Parameters

[in]	p_user_key	Indicates AES key sizes - 128/192/256-bits, supported chaining modes CBC, ECB, GCM, CTR. 128/256-bits, supported chaining modes - XTS.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service.
[in]	p_key_data	Pointer to wrapped installed AES key.

Return values

SSP_SUCCESS	Key lengths (user provided encrypted input key and output wrapped buffer which holds installed key) are sufficient, and can proceed with key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided key_size is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	Either Input key buffer lengths or Output key buffer length is not valid for AES Key installation API operation.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed key buffer lengths are sufficient for Key Installation API call.

◆ r_sce_key_installation_aes_verify_out_wrapped_key_length()

ssp_err_t r_sce_key_installation_aes_verify_out_wrapped_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the Output buffer installed key buffer length.

Parameters

[in]	key_size	Indicates user's encrypted AES key sizes - 128/192/256-bits.
[in]	data_length	Length of output wrapped key data in the buffer in WORDS.

Return values

SSP_SUCCESS	Output wrapped Key buffer length is sufficient and can proceed with Key installation API call.
SSP_ERR_CRYPTO_INVALID_SIZE	Output wrapped key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call. The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_aes_verify_out_wrapped_xtskey_length()

ssp_err_t r_sce_key_installation_aes_verify_out_wrapped_xtskey_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the Output buffer installed key buffer length.

Parameters

[in]	key_size	Indicates user's encrypted AES key sizes - 128/256-bit XTS key.
[in]	data_length	Length of wrapped key data in the buffer in WORDS.

Return values

SSP_SUCCESS	Output wrapped Key buffer length is sufficient and can proceed with Key installation API call.
SSP_ERR_CRYPTO_INVALID_SIZE	Output wrapped key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call. The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_aes_verify_user_encrypted_key_length()

ssp_err_t r_sce_key_installation_aes_verify_user_encrypted_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the user provided (input) encrypted AES key size and buffer length.

Parameters

[in]	key_size	Indicates AES key sizes - 128/192/256-bits.
[in]	data_length	Length of AES encrypted key data buffer in WORDS..

Return values

SSP_SUCCESS	User provided encrypted input Key length is sufficient and can proceed with Key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided Input encrypted key size argument is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call.

◆ r_sce_key_installation_aes_verify_user_encrypted_key_length_helper()

ssp_err_t r_sce_key_installation_aes_verify_user_encrypted_key_length_helper (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Helper function to verify the user provided (input) encrypted AES key buffer length.

Parameters

[in]	key_size	Indicates AES key sizes - 128/192/256-bits.
[in]	data_length	Length of AES encrypted key data buffer in WORDS.

Return values

SSP_SUCCESS	User provided encrypted input Key buffer length is sufficient and can proceed with Key installation API call.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is invalid.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call. The user key_size should be validated before this private function is called. The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_aes_verify_user_encrypted_xts_key_length()

ssp_err_t r_sce_key_installation_aes_verify_user_encrypted_xts_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the user provided (input) encrypted AES key buffer length.

Parameters

[in]	key_size	Indicates AES key sizes - 128/256-bit XTS.
[in]	data_length	Length of AES encrypted key data buffer in WORDS.

Return values

SSP_SUCCESS	User provided encrypted input Key length is sufficient and can proceed with Key installation API call.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is invalid.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call. The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_aes_xts()

ssp_err_t r_sce_key_installation_aes_xts (key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Subroutine to call AES Key installation hardware procedures for XTS chaining mode.

Parameters

[in]	p_user_key	Pointer to a user provided AES encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed AES key.

Return values

SSP_SUCCESS	AES Key Installation is successful.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	Input key buffer lengths are invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

◆ R_SCE_KEY_INSTALLATION_Close()

ssp_err_t R_SCE_KEY_INSTALLATION_Close (key_installation_ctrl_t *const *p_ctrl*)

Function to close the Key Installation module.

Return values

SSP_SUCCESS	Normal end
SSP_ERR_ASSERTION	NULL input parameter(s).

Note

This API must be called once Key Installation is done.

◆ r_sce_key_installation_ecc()

ssp_err_t r_sce_key_installation_ecc (key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Sub-routine to install ECC 192/256-bit encrypted user provided key which is generated outside of Synergy platform.

Parameters

[in]	p_user_key	Pointer to a user provided ECC encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed ECC key.

Return values

SF_CRYPTO_SUCCESS	ECC Key Installation is successful.
SSP_ERR_INVALID_ARGUMENT	Input key size is invalid.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	Input key buffer lengths are invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

◆ r_sce_key_installation_ecc_fill_wrapped_key_out_length()

void r_sce_key_installation_ecc_fill_wrapped_key_out_length (key_installation_key_size_t *key_size*, uint32_t * *data_length*)

Private helper function to fill the output wrapped key length.

Parameters

[in]	key_size	Indicates users encrypted ECC key sizes - 192/256-bit.
[in,out]	data_length	Pointer to the length of the wrapped key data in the buffer in WORDS, filled by this routine.

Note

The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_ecc_verify_key_lengths()

ssp_err_t r_sce_key_installation_ecc_verify_key_lengths (key_installation_key_t const *const *p_user_key*, key_installation_key_t const *const *p_session_key*, key_installation_key_t *const *p_key_data*)

Subroutine to verify that the provided key lengths are sufficient or not, before proceeding with key Installation API call.

Parameters

[in]	p_user_key	Indicates ECC key sizes - 192/224/256/384-bits.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service.
[in]	p_key_data	Pointer to wrapped installed ECC key.

Return values

SF_CRYPTO_SUCCESS	Key lengths (user provided encrypted input key, Renesas provided install key, and output wrapped buffer which holds installed key) are sufficient, and can proceed with key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided Input encrypted key size argument is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	Either Input key buffer lengths or Output key buffer length is not valid for ECC Key installation API operation.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed key buffer lengths are sufficient for Key Installation API call.

◆ r_sce_key_installation_ecc_verify_out_wrapped_key_length()

ssp_err_t r_sce_key_installation_ecc_verify_out_wrapped_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the Output buffer installed key buffer length.

Parameters

[in]	key_size	Indicates user's encrypted ECC key sizes - 192/256-bit.
[in]	data_length	The length of the output wrapped key data in the buffer in WORDS.

Return values

SF_CRYPTO_SUCCESS	Output wrapped Key buffer length is sufficient and can proceed with Key installation API call.
SSP_ERR_CRYPTO_INVALID_SIZE	Output wrapped key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call. The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_ecc_verify_user_encrypted_key_length()

ssp_err_t r_sce_key_installation_ecc_verify_user_encrypted_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the user provided (input) encrypted ECC key size and buffer length.

Parameters

[in]	key_size	Indicates ECC key sizes.
[in]	data_length	The length of the encrypted ECC key data in the buffer in WORDS.

Return values

SF_CRYPTO_SUCCESS	User provided encrypted input Key size and buffer length is valid and can proceed with Key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided Input encrypted key size argument is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is invalid.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call.

◆ R_SCE_KEY_INSTALLATION_KeyInstall()

ssp_err_t R_SCE_KEY_INSTALLATION_KeyInstall (key_installation_ctrl_t *const *p_ctrl*, r_crypto_data_handle_t const *const *p_user_key_rsa_modulus*, key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Key Installation function accepts the user's encrypted key, a shared index, session key, and IV then returns the wrapped key.

Return values

SSP_SUCCESS	Successful Key install.
SSP_ERR_ASSERTION	The parameters p_ctrl or p_user_key or p_session_key or p_iv or p_key_data is NULL.
SSP_ERR_INVALID_ARGUMENT	If one or more conditions below are true - 1. Input key_size of user provided encrypted key 2. In case of RSA key installation, p_user_key_rsa_modulus is set to NULL. 3. In case of RSA key installation, p_data field of p_user_key_rsa_modulus is set to NULL.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_NOT_IMPLEMENTED	RSA/ ECC execution is not yet available.
SSP_ERR_CRYPTO_INVALID_SIZE	Incoming buffer length (user provided encrypted key or session key or output key data) is invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

Note

It is the responsibility of the caller to store the key.
For key installations other than RSA, p_user_key_rsa_modulus should be set to NULL.

◆ R_SCE_KEY_INSTALLATION_Open()

ssp_err_t R_SCE_KEY_INSTALLATION_Open (key_installation_ctrl_t *const *p_ctrl*, key_installation_cfg_t const *const *p_cfg*)

Function to open the Key Installation module.

Parameters

[in,out]	p_ctrl	Pointer to Key Installation control block.
[in]	p_cfg	Pointer to Key Installation configuration structure.

Return values

SSP_SUCCESS	Normal end
SSP_ERR_ASSERTION	NULL input parameter(s).

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ r_sce_key_installation_rsa()

ssp_err_t r_sce_key_installation_rsa (r_crypto_data_handle_t const *const *p_user_key_rsa_modulus*, key_installation_key_t const *const *p_user_key*, key_installation_key_shared_index_t const *shared_index*, key_installation_key_t const *const *p_session_key*, uint32_t const *const *p_iv*, key_installation_key_t *const *p_key_data*)

Sub-routine to install RSA 1024/2048-bit encrypted user provided key which is generated outside of Synergy platform.

Parameters

[in]	p_user_key_rsa_modulus	RSA key modulus.
[in]	p_user_key	Pointer to a user provided RSA encrypted key.
[in]	shared_index	Shared Key Index that is returned by the DLM Service, accompanied by the Session Key that follows.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service, accompanied by the previous Shared Key Index parameter.
[in]	p_iv	Pointer to the IV used to encrypt the User Key.
[in,out]	p_key_data	Pointer to wrapped installed RSA key.

Return values

SSP_SUCCESS	RSA Key Installation is successful.
SSP_ERR_INVALID_ARGUMENT	Input key size is invalid.
SSP_ERR_UNSUPPORTED	Input key formats are not supported.
SSP_ERR_CRYPTO_INVALID_SIZE	RSA modulus or input key buffer lengths are invalid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_SCE_FAIL	Key Installation failed.

◆ r_sce_key_installation_rsa_fill_wrapped_key_out_length()

void r_sce_key_installation_rsa_fill_wrapped_key_out_length (key_installation_key_size_t *key_size*, uint32_t * *data_length*)

Private helper function to fill the output wrapped key length.

Parameters

[in]	key_size	Indicates users encrypted RSA key sizes - 1024/2048-bit.
[in,out]	data_length	Pointer to the length of the wrapped key data in the buffer in WORDS, filled by this routine.

Note

The user key_size should be validated before this private function is called.

◆ r_sce_key_installation_rsa_verify_key_lengths()

ssp_err_t r_sce_key_installation_rsa_verify_key_lengths (r_crypto_data_handle_t const *const *p_user_key_rsa_modulus*, key_installation_key_t const *const *p_user_key*, key_installation_key_t const *const *p_session_key*, key_installation_key_t *const *p_key_data*)

Subroutine to verify that the provided key lengths are sufficient or not, before proceeding with key Installation API call.

Parameters

[in]	p_user_key_rsa_modulus	RSA key modulus.
[in]	p_user_key	Indicates RSA key sizes - 1024/2048-bits.
[in]	p_session_key	Pointer to the Session Key returned by the DLM Service.
[in]	p_key_data	Pointer to wrapped installed RSA key.

Return values

SSP_SUCCESS	Key lengths (user provided encrypted input key, Renesas provided install key, and output wrapped buffer which holds installed key) are sufficient, and can proceed with key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided key_size is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	Either Input key buffer lengths or Output key buffer length is not valid for RSA Key installation API operation.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed key buffer lengths are sufficient for Key Installation API call.

◆ r_sce_key_installation_rsa_verify_modulus()

ssp_err_t r_sce_key_installation_rsa_verify_modulus (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the modulus of RSA key.

Parameters

[in]	key_size	Size of user key to be installed.
[in]	data_length	Length of user's input RSA modulus, 1024/2048-bit

Return values

SSP_ERR_CRYPTO_INVALID_SIZE	Invalid modulus length.
SSP_ERR_INVALID_ARGUMENT	This is the return code for one or more cases below - 1. Invalid Key Size is provided.
SSP_SUCCESS	Valid modulus length.

◆ r_sce_key_installation_rsa_verify_out_wrapped_key_length_including_modulus()

ssp_err_t r_sce_key_installation_rsa_verify_out_wrapped_key_length_including_modulus (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the length of (output buffer) installed key buffer. This length includes exponent, modulus and extra space for key wrapping.

Parameters

[in]	key_size	Size of user key to be installed.
[in]	data_length	Length of user's input RSA modulus, 1024/2048-bit.

Return values

SSP_ERR_CRYPTO_INVALID_SIZE	Output wrapped key buffer length is not sufficient.
SSP_ERR_INVALID_ARGUMENT	Invalid Key Size is provided.
SSP_SUCCESS	Output wrapped key buffer length has sufficient space to store the returned key.

◆ r_sce_key_installation_rsa_verify_user_encrypted_key_length()

ssp_err_t r_sce_key_installation_rsa_verify_user_encrypted_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the user provided (input) encrypted RSA key buffer length.

Parameters

[in]	key_size	Indicates RSA key sizes - 1024/2048-bits.
[in]	data_length	The length of the encrypted RSA key data in the buffer in WORDS.

Return values

SSP_SUCCESS	User provided encrypted input Key length is sufficient and can proceed with Key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided Input encrypted key size argument is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call.

◆ r_sce_key_installation_verify_session_key_length()

ssp_err_t r_sce_key_installation_verify_session_key_length (key_installation_key_size_t *key_size*, uint32_t *data_length*)

Subroutine to verify the user provided (input) session key size and buffer length.

Parameters

[in]	key_size	Indicates the expected session key size for all operations.
[in]	data_length	Length of session key data buffer in WORDS.

Return values

SSP_SUCCESS	User provided encrypted input Key length is sufficient and can proceed with Key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided Input encrypted key size argument is invalid.
SSP_ERR_CRYPTO_INVALID_SIZE	User provided Input encrypted key buffer length is not sufficient.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed user key buffer length is sufficient for Key Installation API call.

◆ r_sce_key_installation_verify_shared_index()

ssp_err_t r_sce_key_installation_verify_shared_index (uint32_t const *const *p_shared_index*)

Subroutine to verify that the shared index is using a valid enumeration for the Key Install API.

Parameters

[in]	p_shared_index	Shared Key Index that is returned by the DLM Service.

Return values

SSP_SUCCESS	Shared Index is sufficient, can proceed with key installation API call.
SSP_ERR_INVALID_ARGUMENT	User provided an invalid shared_index value.

Note

This function is not a user API but an internal function for "keyInstallation" API to verify whether passed shared index is sufficient for Key Installation API call.

◆ R_SCE_KEY_INSTALLATION_VersionGet()

ssp_err_t R_SCE_KEY_INSTALLATION_VersionGet (ssp_version_t *const *p_version*)

Gets Key Installation Driver API and Code version based on compile time macros.

Return values

SSP_SUCCESS	Successful in getting the module version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.

Variable Documentation

◆ g_key_installation_on_sce

const key_installation_api_t g_key_installation_on_sce

```
=
{
    .open            = R_SCE_KEY_INSTALLATION_Open,
    .close          = R_SCE_KEY_INSTALLATION_Close,
    .versionGet      = R_SCE_KEY_INSTALLATION_VersionGet,
    .keyInstall      = R_SCE_KEY_INSTALLATION_KeyInstall
}
```

SCE/Key_Installation API implementation.

key_installation_instance_ctrl_t Struct Reference

Detailed Description

Primitive cryptographic functions.

RSA 1024-bit implementation for key generation, encryption, decryption, signature generation and signature verification functions for wrapped keys.

RSA 2048-bit implementation for key generation, encryption, decryption, signature generation and signature verification functions for wrapped keys.

RSA 1024-bit implementation for key generation, encryption, decryption, signature generation and signature verification functions for plain-text/ raw keys.

RSA 2048-bit implementation for key generation, encryption, decryption, signature generation and signature verification functions for plain-text/ raw keys.

RSA common functions

Macro Definition Documentation

◆ RSA_KEYLENGTH [1/2]

#define RSA_KEYLENGTH (1024U)
RSA Keylength in bits

◆ RSA_KEYLENGTH [2/2]

#define RSA_KEYLENGTH (2048U)
RSA Keylength in bits

◆ RSA_MODULUS_SIZE [1/2]

#define RSA_MODULUS_SIZE ((RSA_KEYLENGTH)/(UINT32_BITS))
rsa modulus data size in words

◆ RSA_MODULUS_SIZE [2/2]

#define RSA_MODULUS_SIZE ((RSA_KEYLENGTH)/(UINT32_BITS))
rsa modulus data size in words

◆ RSA_PRIVATE_CRT_KEYSIZE [1/2]

#define RSA_PRIVATE_CRT_KEYSIZE ((5*(RSA_MODULUS_SIZE))/2)
RSA private key in CRT format size in words

◆ RSA_PRIVATE_CRT_KEYSIZE [2/2]

#define RSA_PRIVATE_CRT_KEYSIZE ((5*(RSA_MODULUS_SIZE))/2)
RSA private key in CRT format size in words

◆ RSA_PRIVATE_EXPONENT_SIZE [1/2]

#define RSA_PRIVATE_EXPONENT_SIZE (RSA_MODULUS_SIZE)
rsa private exponent data size in words

◆ RSA_PRIVATE_EXPONENT_SIZE [2/2]

#define RSA_PRIVATE_EXPONENT_SIZE (RSA_MODULUS_SIZE)
rsa private exponent data size in words

◆ RSA_PRIVATE_KEYSIZE [1/2]

#define RSA_PRIVATE_KEYSIZE ((RSA_PRIVATE_EXPONENT_SIZE)+(RSA_MODULUS_SIZE))
rsa private key size in words

◆ RSA_PRIVATE_KEYSIZE [2/2]

#define RSA_PRIVATE_KEYSIZE ((RSA_PRIVATE_EXPONENT_SIZE)+(RSA_MODULUS_SIZE))
rsa private key size in words

◆ RSA_PUBLIC_EXPONENT_SIZE [1/2]

```
#define RSA_PUBLIC_EXPONENT_SIZE  (1)
```

rsa public exponent data size in words

◆ RSA_PUBLIC_EXPONENT_SIZE [2/2]

```
#define RSA_PUBLIC_EXPONENT_SIZE  (1)
```

rsa public exponent data size in words

◆ RSA_PUBLIC_KEYSIZE [1/2]

```
#define RSA_PUBLIC_KEYSIZE  ((RSA_PUBLIC_EXPONENT_SIZE)+(RSA_MODULUS_SIZE))
```

rsa public key size in words

◆ RSA_PUBLIC_KEYSIZE [2/2]

```
#define RSA_PUBLIC_KEYSIZE  ((RSA_PUBLIC_EXPONENT_SIZE)+(RSA_MODULUS_SIZE))
```

rsa public key size in words

◆ UINT32_BITS [1/2]

```
#define UINT32_BITS  (32)
```

uint32_t word size in bits

◆ UINT32_BITS [2/2]

```
#define UINT32_BITS  (32)
```

uint32_t word size in bits

◆ UINT32_BYTES [1/2]

```
#define UINT32_BYTES  (4)
```

uint32_t word size in bytes

◆ UINT32_BYTES [2/2]

#define UINT32_BYTES (4)
uint32_t word size in bytes

Function Documentation

◆ R_SCE_HRK_RSA_1024KeyCreate()

uint32_t R_SCE_HRK_RSA_1024KeyCreate (rsa_ctrl_t *const *p_ctrl*, rsa_key_t * *p_private_key*, rsa_key_t * *p_public_key*)

Creation of 1024-bit RSA Key pair in with private key in wrapped format.

RSA private key is created based on the key_format specified by p_private_key.
RSA_KEY_FORMAT_WRAPPED_PRIVATE_KEY specifies a wrapped standard format key.
RSA_KEY_FORMAT_WRAPPED_PRIVATE_CRT_KEY specifies a wrapped CRT format key.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Key creation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer may not be empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_INVALID_SIZE	An input parameter of invalid size.
SSP_ERR_CRYPTO_UNKNOWN	An input parameter is of unknown type.

Note

The buffers to hold the keys must be adequate for the key formats requested.

◆ R_SCE_HRK_RSA_1024PrivateCrtKeyDecrypt()

uint32_t R_SCE_HRK_RSA_1024PrivateCrtKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 1024-bit RSA wrapped private key in CRT format.

Decrypt imaxcnt words of input data from buffer p_source using the 1024-bit RSA wrapped private key in CRT format, from buffer key . The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format/size.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
'p_domain' is unused and can be passed as NULL.
The p_key pointer to 85-word buffer with Wrapped 1024-bit RSA key CRT parameters.
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_HRK_RSA_1024PrivateCrtKeySign()

uint32_t R_SCE_HRK_RSA_1024PrivateCrtKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 1024-bit RSA wrapped private key represented in CRT format.

Sign imaxcnt words of input data from buffer p_source using the 1024-bit RSA wrapped private key in CRT format, from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
'p_domain' is unused and can be passed as NULL.
The p_key pointer to 85-word buffer with 1024-bit RSA key CRT parameters
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_HRK_RSA_1024PrivateKeyDecrypt()

uint32_t R_SCE_HRK_RSA_1024PrivateKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 1024-bit RSA private key in wrapped format.

Decrypt imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Decrypt operation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit Public key = 1024/32 = 32 words.

◆ R_SCE_HRK_RSA_1024PrivateKeySign()

uint32_t R_SCE_HRK_RSA_1024PrivateKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 1024-bit RSA private key in wrapped format.

Sign imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Signature generation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit Public key = 1024/32 = 32 words.

◆ R_SCE_HRK_RSA_1024PublicKeyEncrypt()

uint32_t R_SCE_HRK_RSA_1024PublicKeyEncrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt using 1024-bit RSA public key.

Encrypt num_words words of input data from buffer p_source using the 1024-bit RSA public key from buffer p_key and domain parameters from p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 132 bytes of RSA public key data in the format (public_exponent || public_modulus), where public_exponent is 1 words of data and public_modulus is 32 words of data
num_words must be equal to RSA MODULUS size in bytes (RSA Public Key_size / bits per byte). For example, RSA MODULUS size for RSA 1024-bit Public key = 1024/8 = 128 bytes or 32 words.

◆ R_SCE_HRK_RSA_1024PublicKeyVerify()

uint32_t R_SCE_HRK_RSA_1024PublicKeyVerify (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_signature*, uint32_t * *p_padded_hash*)

Signature Verification using 1024-bit RSA public key.

Verify RSA signature data from buffer p_signature of length num_words using 1024-bit RSA public key. The buffer p_padded_hash indicates the message buffer from which the RSA signature should have been generated.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end, valid signature
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	incorrect signature or/and Input parameter p_padded_hash is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

The p_key buffer must contain 132 bytes of RSA public key data in the format (public_exponent || public_modulus) where public_exponent is 1 word and public_modulus is 32 words.
Length of the p_key, p_signature and p_padded_hash must each be equal to num_words. For RSA 1024-bit key, num_words should be equal to 32.
num_words must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit Public key = 1024/32 = 32 words.

◆ R_SCE_HRK_RSA_2048KeyCreate()

uint32_t R_SCE_HRK_RSA_2048KeyCreate (rsa_ctrl_t *const *p_ctrl*, rsa_key_t * *p_private_key*, rsa_key_t * *p_public_key*)

Creation of 2048-bit RSA Key pair in with private key in wrapped format.

RSA private key is created based on the key_format specified by p_private_key.
RSA_KEY_FORMAT_WRAPPED_PRIVATE_KEY specifies a wrapped standard format key.
RSA_KEY_FORMAT_PLAIN_TEXT_CRT_KEY specifies the CRT parameters to be created.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Key creation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer may not be empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_INVALID_SIZE	An input parameter of invalid size.
SSP_ERR_CRYPTO_UNKNOWN	An input parameter is of unknown type.

Note

The buffers to hold the keys must be adequate for the key formats requested.

◆ R_SCE_HRK_RSA_2048PrivateCrtKeyDecrypt()

uint32_t R_SCE_HRK_RSA_2048PrivateCrtKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 2048-bit RSA wrapped private key in CRT format.

Decrypt imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key in Wrapped CRT format, from buffer key . The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format/size.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
'p_domain' is unused and can be passed as NULL.
The p_key pointer to 165-word buffer with Wrapped 1024-bit RSA key CRT parameters.
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 2048/32 = 64 words.

◆ R_SCE_HRK_RSA_2048PrivateCrtKeySign()

uint32_t R_SCE_HRK_RSA_2048PrivateCrtKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 2048-bit RSA wrapped private key represented in CRT format.

Sign imaxcnt words of input data from buffer p_source using the 2048-bit RSA wrapped private key in CRT format, from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for at least imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
'p_domain' is unused and can be passed as NULL.
The p_key pointer to 165-word buffer with 2048-bit RSA key CRT parameters
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 2048/32 = 64 words.

◆ R_SCE_HRK_RSA_2048PrivateKeyDecrypt()

uint32_t R_SCE_HRK_RSA_2048PrivateKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 2048-bit RSA private key in wrapped format.

Decrypt imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Decrypt operation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data

◆ R_SCE_HRK_RSA_2048PrivateKeySign()

uint32_t R_SCE_HRK_RSA_2048PrivateKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 2048-bit RSA private key in wrapped format.

Sign imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Signature generation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data

◆ R_SCE_HRK_RSA_2048PublicKeyEncrypt()

uint32_t R_SCE_HRK_RSA_2048PublicKeyEncrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt using 2048-bit RSA public key.

Encrypt num_words words of input data from buffer p_source using the 2048-bit RSA public key from buffer p_key and domain parameters from p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 260 bytes of RSA public key data in the format (public_exponent || public_modulus), where public_exponent is 1 words of data and public_modulus is 64 words of data
num_words must be equal to RSA MODULUS size in bytes (RSA Public Key_size / bits per byte). For example, RSA MODULUS size for RSA 2048-bit Public key = 2048/8 = 256 bytes or 64 words.

◆ R_SCE_HRK_RSA_2048PublicKeyVerify()

uint32_t R_SCE_HRK_RSA_2048PublicKeyVerify (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_signature*, uint32_t * *p_padded_hash*)

Signature Verification using 2048-bit RSA public key.

Verify RSA signature data from buffer p_signature of length num_words using 2048-bit RSA public key. The buffer p_padded_hash indicates the message buffer from which the RSA signature should have been generated.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end, valid signature
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	incorrect signature or/and Input parameter p_padded_hash is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

The p_key buffer must contain 260 bytes of RSA public key data in the format (public_exponent || public_modulus) where public_exponent is 1 word and public_modulus is 64 words.
Length of the p_key, p_signature and p_padded_hash must each be equal to num_words. For RSA 2048-bit key, num_words should be equal to 64.
num_words must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit Public key = 2048/32 = 64 words.

◆ R_SCE_RSA_1024KeyCreate()

uint32_t R_SCE_RSA_1024KeyCreate (rsa_ctrl_t *const *p_ctrl*, rsa_key_t * *p_private_key*, rsa_key_t * *p_public_key*)

Creation of 1024-bit RSA Key pair in plain text format.

RSA private key is created based on the key_format specified by p_private_key.
RSA_KEY_FORMAT_PLAIN_TEXT_PRIVATE_KEY specifies a standard format private key.
RSA_KEY_FORMAT_PLAIN_TEXT_CRT_KEY specifies the CRT parameters to be created.

Return values

SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SF_CRYPTO_SUCCESS	Key creation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer may not be empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_INVALID_SIZE	An input parameter of invalid size.
SSP_ERR_CRYPTO_UNKNOWN	An input parameter is of unknown type.

Note

The buffers to hold the keys must be adequate for the key formats requested.
The RSA CRT key consists of the exponent2 || prime2 || exponent1 || prime1 || coefficient, in that order.

◆ R_SCE_RSA_1024PrivateCrtKeyDecrypt()

uint32_t R_SCE_RSA_1024PrivateCrtKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 1024-bit RSA private key (CRT format)

Decrypt imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key pointer to 80-word buffer with 1024-bit RSA key CRT parameters (d mod (q-1) || q || d mod (p-1) || p || q^-1 mod p)
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_RSA_1024PrivateCrtKeySign()

uint32_t R_SCE_RSA_1024PrivateCrtKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 1024-bit RSA private key represented in CRT format.

Sign imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key pointer to 80-word buffer with 1024-bit RSA key CRT parameters (d mod (q-1) || q || d mod (p-1) || p || q^-1 mod p)
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_RSA_1024PrivateKeyDecrypt()

uint32_t R_SCE_RSA_1024PrivateKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 1024-bit RSA private key (standard format)

Decrypt imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 32 words of RSA private key data followed by 32 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_RSA_1024PrivateKeySign()

uint32_t R_SCE_RSA_1024PrivateKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 1024-bit RSA private key.

Sign imaxcnt words of input data from buffer p_source using the 1024-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 32 words of RSA private key data followed by 32 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Private Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit private key = 1024/32 = 32 words.

◆ R_SCE_RSA_1024PublicKeyEncrypt()

uint32_t R_SCE_RSA_1024PublicKeyEncrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encryption using 1024-bit RSA public key.

Encrypt num_words words of input data from buffer p_source using the 1024-bit RSA public key from buffer p_key and domain parameters from p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast num_words words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Note

p_dest must have space to hold at least num_words words of data.
The p_key buffer must contain 132 bytes of RSA public key data in the format (public_exponent || public_modulus), where public_exponent is 1 words of data and public_modulus is 32 words of data
num_words must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit Public key = 1024/32 = 32 words.

◆ R_SCE_RSA_1024PublicKeyVerify()

uint32_t R_SCE_RSA_1024PublicKeyVerify (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *num_words*, uint32_t * *p_signature*, uint32_t * *p_padded_hash*)

Signature Verification using 1024-bit RSA public key.

Verify RSA signature data from buffer p_signature of length num_words using 1024-bit RSA public key. The buffer p_padded_hash indicates the message buffer from which the RSA signature should have been generated.

Return values

SF_CRYPTO_SUCCESS	Normal end, valid signature
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	incorrect signature or/and Input parameter p_padded_hash is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

The p_key buffer must contain 132 bytes of RSA public key data in the format (public_exponent || public_modulus) where public_exponent is 1 word and public_modulus is 32 words.
Length of the p_key, p_signature and p_padded_hash must each be equal to num_words. For RSA 1024-bit key, num_words should be equal to 32.
num_words must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 1024-bit Pubic key = 1024/32 = 32 words.

◆ R_SCE_RSA_2048KeyCreate()

uint32_t R_SCE_RSA_2048KeyCreate (rsa_ctrl_t *const *p_ctrl*, rsa_key_t * *p_private_key*, rsa_key_t * *p_public_key*)

Creation of 2048-bit RSA Key pair in plain text format.

RSA private key is created based on the key_format specified by p_private_key.
RSA_KEY_FORMAT_PLAIN_TEXT_PRIVATE_KEY specifies a standard format private key.
RSA_KEY_FORMAT_PLAIN_TEXT_CRT_KEY specifies the CRT parameters to be created.

Return values

SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SF_CRYPTO_SUCCESS	Key creation was successful.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer may not be empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	Resource conflict occurred.
SSP_ERR_CRYPTO_INVALID_SIZE	An input parameter of invalid size.
SSP_ERR_CRYPTO_UNKNOWN	An input parameter is of unknown type.

Note

The buffers to hold the keys must be adequate for the key formats requested.
The RSA CRT key consists of the exponent2 || prime2 || exponent1 || prime1 || coefficient, in that order.

◆ R_SCE_RSA_2048PrivateCrtKeyDecrypt()

uint32_t R_SCE_RSA_2048PrivateCrtKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 2048-bit RSA private key (CRT format)

Decrypt imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain pointer to 160-word buffer with 2048-bit RSA key CRT parameters (d mod (q-1) || q || d mod (p-1) || p || q^-1 mod p)
imaxcnt must be equal to RSA MODULUS size (RSA Key private size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit private key = 2048/32 = 64 words.

◆ R_SCE_RSA_2048PrivateCrtKeySign()

uint32_t R_SCE_RSA_2048PrivateCrtKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 2048-bit RSA private key represented in CRT format.

Sign imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter may be NULL or of invalid format.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain pointer to 160-word buffer with 2048-bit RSA key CRT parameters (d mod (q-1) || q || d mod (p-1) || p || q^-1 mod p)
imaxcnt must be equal to RSA MODULUS size (RSA Key private size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit private key = 2048/32 = 64 words.

◆ R_SCE_RSA_2048PrivateKeyDecrypt()

uint32_t R_SCE_RSA_2048PrivateKeyDecrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Decrypt using 2048-bit RSA private key (standard format)

Decrypt imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Key private size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit private key = 2048/32 = 64 words.

◆ R_SCE_RSA_2048PrivateKeySign()

uint32_t R_SCE_RSA_2048PrivateKeySign (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Signature generation using 2048-bit RSA private key.

Sign imaxcnt words of input data from buffer p_source using the 2048-bit RSA private key from buffer p_key and domain parameters from buffer p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 64 words of RSA private key data followed by 64 words of RSA key modulus data
imaxcnt must be equal to RSA MODULUS size (RSA Key private size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit private key = 2048/32 = 64 words.

◆ R_SCE_RSA_2048PublicKeyEncrypt()

uint32_t R_SCE_RSA_2048PublicKeyEncrypt (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_source*, uint32_t * *p_dest*)

Encrypt using 2048-bit RSA public key.

Encrypt imaxcnt words of input data from buffer p_source using the 2048-bit RSA public key from buffer p_key and domain parameters from p_domain. The result will be written to the output buffer from p_dest. The p_dest array is assumed to have space for atleast imaxcnt words of data.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty or/and Input parameter is not valid.
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open

Note

p_dest must have space to hold at least imaxcnt words of data.
The p_key buffer must contain 260 bytes of RSA public key data in the format (public_exponent || public_modulus), where public_exponent is 1 words of data and public_modulus is 64 words of data
imaxcnt must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit Public key = 2048/32 = 64 words.

◆ R_SCE_RSA_2048PublicKeyVerify()

uint32_t R_SCE_RSA_2048PublicKeyVerify (rsa_ctrl_t *const *p_ctrl*, const uint32_t * *p_key*, const uint32_t * *p_domain*, uint32_t *imaxcnt*, uint32_t * *p_signature*, uint32_t * *p_paddedHash*)

Signature Verification using 2048-bit RSA public key.

Verify RSA signature data from buffer p_signature of length imaxcnt using 2048-bit RSA public key. The buffer p_padded_hash indicates the message buffer from which the RSA signature should have been generated.

Return values

SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SF_CRYPTO_SUCCESS	Normal end, valid signature
SSP_ERR_CRYPTO_SCE_VERIFY_FAIL	incorrect signature or/and Input parameter p_padded_hash is invalid.
SSP_ERR_CRYPTO_SCE_FAIL	Internal I/O buffer is not empty
SSP_ERR_CRYPTO_SCE_RESOURCE_CONFLICT	resource conflict occurred

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Note

The p_key buffer must contain 260 bytes of RSA public key data in the format (public_exponent || public_modulus) where public_exponent is 1 word and public_modulus is 64 words.
Length of the p_key, p_signature and p_padded_hash must each be equal to num_words. For RSA 2048-bit key, num_words should be equal to 64.
imaxcnt must be equal to RSA MODULUS size (RSA Public Key_size / number of bits per word). For example, RSA MODULUS size for RSA 2048-bit Public key = 2048/32 = 64 words.

◆ R_SCE_RSA_Close()

uint32_t R_SCE_RSA_Close (rsa_ctrl_t *const *p_ctrl*)

Close RSA driver

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.

◆ R_SCE_RSA_Open()

uint32_t R_SCE_RSA_Open (rsa_ctrl_t *const *p_ctrl*, rsa_cfg_t const *const *p_cfg*)

RSA Initialization

Return values

SF_CRYPTO_SUCCESS	Normal end
SSP_ERR_ASSERTION	An input parameter is NULL or of invalid format.
SSP_ERR_CRYPTO_NOT_OPEN	Crypto HAL Common module is not Opened.

Precondition

SCE module must have been initialized by calling crypto_api_t::open.

Get status of Crypto HAL common module

Return error code of Crypto HAL common module is not open

◆ R_SCE_RSA_VersionGet()

uint32_t R_SCE_RSA_VersionGet (ssp_version_t *const *p_version*)

Sets driver version based on compile time macros.

Return values

SSP_CRYPTO_SUCCESS	Successful in getting the module version.
SSP_ERR_ASSERTION	The parameter p_version is NULL.
