ISL73847SEHDEMO5Z

The ISL73847SEHDEMO5Z demonstration board demonstrates the performance of the ISL73847SEH dual-phase buck controller in single-phase mode. The board is optimized for a 4.5V to 15V input operation to generate a 25A max, 1V output.

Features

- Power-Good LED indicator
- Integrated LDO (VCC)
- Droop regulation set by a single resistor

Specifications

- Input voltage supply (V_{IN}): 4.5V to 15V
- Preset output voltage (V_{OUT}): 1V
- Preset switching frequency: 500kHz
- Maximum load current: 25A
- Preset droop regulation

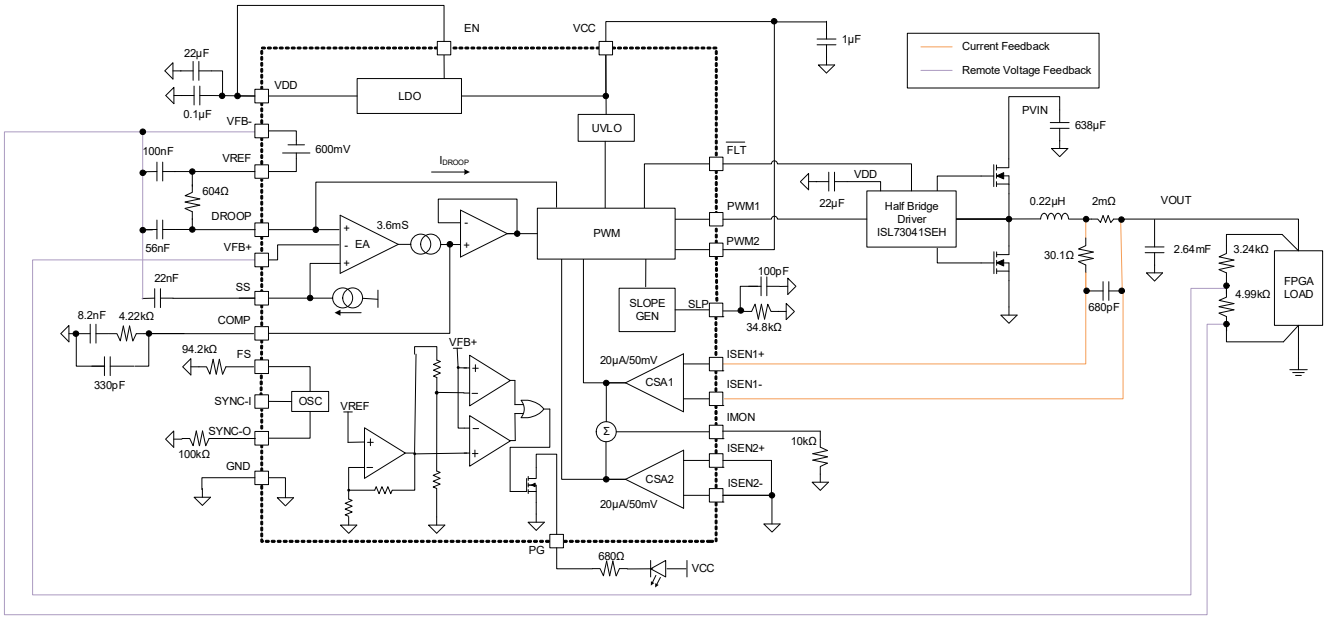

Figure 1. Block Diagram

Contents

1. Functional Description

1.1 Operating Range

The ISL73847SEHDEMO5Z board requires one input supply (V_{IN}) to operate properly. This supply powers the ISL73847SEH controller analog supply input, plus additional supporting circuitry and the onboard buck power supply input. The user can set the V_{IN} supply from 4.5V to 15V. The buck regulator circuit is preset for a 1V output voltage and a switching frequency 500kHz with a 0.22µH output inductor and 2.64mF output capacitance.

1.2 Before Starting

The board does not come with any connectors. To properly use the board, solder connectors to the VIN, GND, and VOUT solder pads.

1.3 Quick-Start Guide

1. Apply a 4.5V to 15V voltage to VIN connectors, as shown in Figure 2. To use 4w sense lines from a power supply or a voltmeter to monitor the input voltage, solder a jumper to TP1.
2. If required, a resistor or electronic load can be connected to the VOUT connectors, as shown in Figure 2. To use 4w sense lines from an electronic load, solder a jumper to TP2.

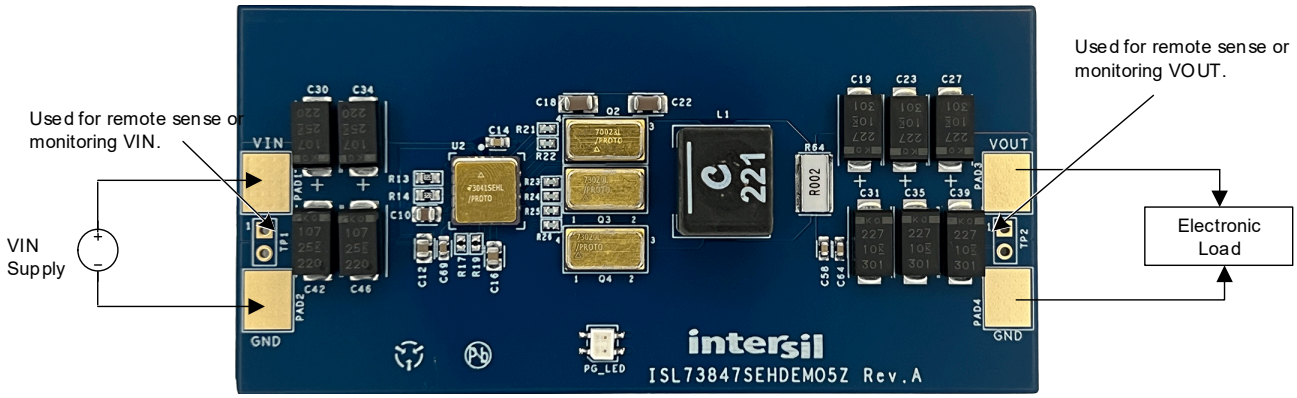

Figure 2. ISL73847SEHDEMO5Z Board Setup

1.4 Changing the Switching Frequency

The ISL73847SEHDEMO5Z is configured for a 500kHz switching frequency by a 94.2kΩ pull-down resistor (R_2) on the FS pin. The demonstration board includes a 0.22µH inductor and an array of output bypass capacitors for a 2.64mF output capacitance, which makes up the LC filter. If a different switching frequency is needed, see Figure 3 for choosing the appropriate R_2 value on FS. For more information about the FS pin, refer to the *ISL73847SEH datasheet*.

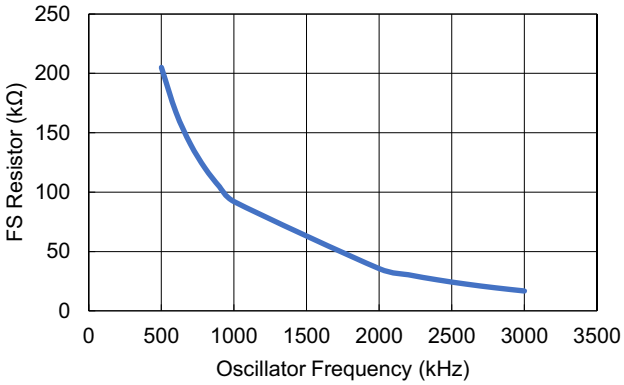

Figure 3. R_{FS} vs Frequency

1.5 Soft-Start Adjustment

The ISL73847SEHDEMO5Z is configured for a 2ms soft-start (SS) time by a 22nF bypass capacitor (C_2) connected to the SS pin. The SS time can be adjusted from 2ms to 200ms by changing the C_2 capacitor. If a different soft-start time is needed, use the CSS equation in the *ISL73847SEH datasheet* to calculate the capacitance given the required soft-start time. For more information on SS, refer to the *ISL73847SEH datasheet*.

1.6 Droop Regulation

The ISL73847SEHDEMO5Z minimizes peak-to-peak transient response excursions using a 604Ω resistor (R_1) connected between the VREF and DROOP pins. If droop regulation is unnecessary, replace the 604Ω with a 0Ω resistor to short the VREF and DROOP pins together. For more information about the droop regulation, refer to the *ISL73847SEH datasheet*.

1.7 Enabling/Disabling

The ISL73847SEHDEMO5Z automatically enables when VDD reaches a certain voltage on power-up by a 4.99kΩ resistor (R_6) connected between EN and VDD. For more information about enabling and disabling the controller, refer to the *ISL73847SEH datasheet*.
