Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall be responsible for determining what licenses are required from any third parties, and obtaining such licenses for the lawful import, export, manufacture, sales, utilization, distribution or other disposal of any products incorporating Renesas Electronics products, if required.
5. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
6. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

7. No semiconductor product is absolutely secure. Notwithstanding any security measures or features that may be implemented in Renesas Electronics hardware or software products, Renesas Electronics shall have absolutely no liability arising out of any vulnerability or security breach, including but not limited to any unauthorized access to or use of a Renesas Electronics product or a system that uses a Renesas Electronics product. RENESAS ELECTRONICS DOES NOT WARRANT OR GUARANTEE THAT RENESAS ELECTRONICS PRODUCTS, OR ANY SYSTEMS CREATED USING RENESAS ELECTRONICS PRODUCTS WILL BE INVULNERABLE OR FREE FROM CORRUPTION, ATTACK, VIRUSES, INTERFERENCE, HACKING, DATA LOSS OR THEFT, OR OTHER SECURITY INTRUSION ("Vulnerability Issues"). RENESAS ELECTRONICS DISCLAIMS ANY AND ALL RESPONSIBILITY OR LIABILITY ARISING FROM OR RELATED TO ANY VULNERABILITY ISSUES. FURTHERMORE, TO THE EXTENT PERMITTED BY APPLICABLE LAW, RENESAS ELECTRONICS DISCLAIMS ANY AND ALL WARRANTIES, EXPRESS OR IMPLIED, WITH RESPECT TO THIS DOCUMENT AND ANY RELATED OR ACCOMPANYING SOFTWARE OR HARDWARE, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY, OR FITNESS FOR A PARTICULAR PURPOSE.
8. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
12. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
13. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
14. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions in the Handling of Microprocessing Unit and Microcontroller Unit Products

The following usage notes are applicable to all Microprocessing unit and Microcontroller unit products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Precaution against Electrostatic Discharge (ESD)

A strong electrical field, when exposed to a CMOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop the generation of static electricity as much as possible, and quickly dissipate it when it occurs. Environmental control must be adequate. When it is dry, a humidifier should be used. This is recommended to avoid using insulators that can easily build up static electricity.

Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors must be grounded. The operator must also be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions must be taken for printed circuit boards with mounted semiconductor devices.

2. Processing at power-on

The state of the product is undefined at the time when power is supplied. The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the time when power is supplied. In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the time when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the time when power is supplied until the power reaches the level at which resetting is specified.

3. Input of signal during power-off state

Do not input signals or an I/O pull-up power supply while the device is powered off. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Follow the guideline for input signal during power-off state as described in your product documentation.

4. Handling of unused pins

Handle unused pins in accordance with the directions given under handling of unused pins in the manual. The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of the LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible.

5. Clock signals

After applying a reset, only release the reset line after the operating clock signal becomes stable. When switching the clock signal during program execution, wait until the target clock signal is stabilized. When the clock signal is generated with an external resonator or from an external oscillator during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Additionally, when switching to a clock signal produced with an external resonator or by an external oscillator while program execution is in progress, wait until the target clock signal is stable.

6. Voltage application waveform at input pin

Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between V_{IL} (Max.) and V_{IH} (Min.) due to noise, for example, the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between V_{IL} (Max.) and V_{IH} (Min.).

7. Prohibition of access to reserved addresses

Access to reserved addresses is prohibited. The reserved addresses are provided for possible future expansion of functions. Do not access these addresses as the correct operation of the LSI is not guaranteed.

8. Differences between products

Before changing from one product to another, for example to a product with a different part number, confirm that the change will not lead to problems.

The characteristics of a microprocessing unit or microcontroller unit products in the same group but having a different part number might differ in terms of internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.

1. Introduction

The 'RH850/U2B Starter Kit' serves as a simple and easy to use platform for evaluating the features and performance of Renesas Electronics' 32-bit RH850/U2B microcontrollers.

Notes

1. This document describes the functionality of the communication board and guides the user through its operation.
For details regarding the operation of the microcontroller, refer to the device's Hardware User's Manual.
2. In this document active low signals are marked by an appended 'Z' or '#' to the pin or signal name. E.g. the reset pin is named RESETZ or RESET#.
3. In this document following abbreviations are used:
 - H level, L level: high or low signal level of a digital signal, the absolute voltage value depends on the signal

1.1 Package Components Y-ASK-RH850U2Bx(-JP)

The Y-ASK-RH850U2Bx(-JP) product package consists of the items listed in Table 1.1.

The difference between the boards Y-ASK-RH850U2B6(-JP) and Y-ASK-RH850U2B10(-JP) is the RH850/U2B processor that is mounted on the PCB. Refer to chapter 1.5 *Used Device* for details.

After you have unpacked the box, check if your Y-ASK-RH850U2Bx(-JP) package contains all of these items. *Table 1.1 Package Components for the Y-ASK-RH850U2Bx(-JP)* shows the packing components of the Y-ASK-RH850U2B6(-JP) and the Y-ASK-RH850U2B10(-JP) package.

Table 1.1 Package Components for the Y-ASK-RH850U2Bx(-JP)

Item	Description	Quantity
D019567	RH850/U2Bx starter kit board	1
D017765-11	RH850 starter kit license information document	1
D019988-24	Product contents list Y-ASK-RH850U2B6(-JP)	1
D019989-24	Product contents list Y-ASK-RH850U2B10(-JP)	1
226-000210-01	Renesas E2 emulator unit	1
228-000078-01	USB Cable, Type A to Type-C, 0.5m	1
230-000109-01	Parallel Cable [1x D-SUB connector 9-pin - 1x DIL connector 10-pin]	3
230-000110-01	Sub-D male to male gender changer, 9-pin	3
236-000009-05	Power supply unit, 12V/1A Incl. 4 international AC-plugs	1 (not included in starter kits with *-JP in the order code)

Note

Please keep the Y-ASK-RH850U2Bx(-JP) packing box at hand for later reuse in sending the product for repairs or for other purposes. Always use the original packing box when transporting the Y-ASK-RH850U2Bx(-JP). If packing of your product is not complete, it may be damaged during transportation.

1.2 Main Features

- Supports RH850/U2B processor
- Connection for on-chip debugging and flash memory programming
- Pin headers for direct access to all microcontroller pins
- Board configuration via PC based GUI
- External power supply (12V DC input)
- Debugging and programming interface:
14-pin LPD/JTAG Debug Connector (e. g. for using E2 OCD Emulator or PG-FP6 Flash Programmer)
- Reset switch
- External clock circuit with a 20 MHz ceramic resonator
- Four general purpose signaling LEDs
- 16 circular LEDs
- Rotary encoder with RGB LED illuminated shaft
- Two analog signal inputs using potentiometer
- Two switches for external interrupt signal input
- Two motor control signal outputs
- Two Inputs for resolver signals for motor control
- Onboard interface connectors for :
 - Ethernet port (10BASE-T / 100BASE-TX)
 - LIN Master / SENT
 - UART via USB (VCP)
 - CAN
 - RHSB / MSPI
 - Pmod™
- Operating temperature from 0 °C to +40 °C

1.3 Starter Kit Versions

The following versions of the Starter Kit are available:

Table 1.2 Y-ASK-RH850U2Bx(-JP) board versions

Board version	Schematic version
D019567_06_V0200	D019567_04_V0203
D019567_06_V0300	D019567_04_V0300

Table 1.3 shows the differences of the board versions.

Table 1.3 Y-ASK-RH850U2Bx(-JP) board version differences

No.	Modified Function	Detailed Description of Changes	D019567_06_V0200			D019567_06_V0300		
1	Flash programming of RL78	Add switch to enable or disable RL78 programming via USB interface	RL78 programming via USB is always possible.			Added switch SW4.		
2	Ports used for Pmod™ signal #1 in Pmod™ modes 1A, 3A and 6A and Pmod™ signal #4 in Pmod™ mode 1A and 3A.	Used different ports on RH850/U2B.	Ports being used:			Ports being used:		
			Mode	Pin	RH850 Port	Mode	Pin	RH850 Port
			1A, 3A, 6A	1	AN02_0	1A, 3A, 6A	1	P22_4 (IRQ2)
			1A, 3A	4	AN22_0	1A, 3A	4	P12_1
3	FTDI	Changed power mode	Powered from VBUS on the USB connection.			Powered by 3.3V domain on the starter kit.		
4	Power test connector	Changed connector type.	Used connector AMP_20021321-00014C4LF, connector assembled.			Provides footprint for connector TAG_TC2070_FP_14PIN, not assembled.		

1.4 Starter Kit Board View

Below pictures show the starter kit (Figure 1.1) and the accessories included in the starter kit (Figure 1.2).

Figure 1.1 Starter kit

Figure 1.2 Starter kit accessories

The following figures provide the drawing of top and bottom views of the starter kit board including the solder pads.

Figure 1.3 Starter kit board top view for board version D019567_06_V0200

Figure 1.4 Starter kit board top view for board version D019567_06_V0200

Figure 1.5 Starter kit board bottom view for board version D019567_06_V0300

Figure 1.6 Starter kit board bottom view for board version D019567_06_V0300

1.5 Used Device

The board is designed for use with the following devices.

Table 1.4 Type names for FCC and MP devices

	FCC device	MP device	Comments
RH850/U2B6	R7F702Z2*EDBB	R7F70255*FABB-C R7F70255*AFABB-C R7F70255*BFABB-C	FCC: Sixth through ninth characters of the part name indicate U2Bx-FCC(BGA292)
RH850/U2B10	R7F702Z2*EDBB	R7F70254*FABB-C R7F70254*AFABB-C	PKG: The last 2 characters of the part name indicate BGA292.

By default the starter kit is equipped with mass production device RH850/U2B6 (R5F702556BFABB-C, Y-ASK-RH850U2B6(-JP)) or RH850/U2B10 (R5F702546AFABB-C, Y-ASK-RH850U2B10(-JP)).

The device is soldered to the PCB.

2. Connectors, Switches and LEDs

This section provides complete lists of all connectors, switches, and LEDs.

The placement of these components on the board is depicted in the figure below.

Figure 2.1 Placement of connectors and LEDs on top side of the starter for board version D019567_06_V0200

Figure 2.2 Placement of connectors on bottom side of the starter kit for board version
D019567_06_V0200

Figure 2.3 Placement of connectors and LEDs on top side of the starter for board version D019567_06_V0300

Figure 2.4 Placement of connectors on bottom side of the starter kit for board version D019567_06_V0300

2.1 Switch Overview

The following table provides an overview of all switches.

Table 2.1 Switch overview

Connector	Function	Remark
SW1	RESET switch	refer to 7.1 RESET Circuit
SW2	External interrupt signal EX_INT1	refer to 7.2 External Interrupt Signal
SW3	External interrupt signal EX_INT0	refer to 7.2 External Interrupt Signal
SW4	Enable RESET for RL78 reprogramming	refer to 6.2.4 Starter Kit Configurator Firmware Programming only board version D019567_06_V0300 and later

2.2 Connector Overview

The following table provides an overview of all connectors.

Table 2.2 Connector overview

Connector	Function	Remark
CN1	Connector for external Resolver 1	refer to 7.15.1 Resolver Circuits
CN2	+12.0 V external power supply	refer to 3.1 Power Management IC (PMIC)
CN3	Test connector for power supplies	refer to 3.3 Power Supply Test Connector
CN4	Connector for programming the RL78 board configurator IC	refer to 6.2.4 Starter Kit Configurator Firmware Programming
CN5	Connector for external Resolver 0	refer to 7.15.1 Resolver Circuits
CN6	USB C connector for UART1	refer to 7.10 UART Interface
CN7	Debug and programming interface	refer to 5 Debug and Flash Programming Interfaces
CN8	Display connector	refer to 7.6 OLED Graphic Display
CN9	RHSB1/MSPI6 interface connector	refer to 7.14 RHSB1 / MSPI6 Interface
CN10	Ethernet interface connector	refer to 7.11 Ethernet Interface
CN11	LIN / SENT monitor connector	refer to 7.8 LIN and SENT Interfaces
CN12	LIN / SENT interface connector	
CN13	CAN0 / CAN1 monitor connector	refer to 7.7 CAN Interfaces
CN14	CAN0 interface connector	
CN15	CAN1 interface connector	
CN16	UART1 monitor connector	refer to 7.10 UART Interface
CN17	Device port connectors	refer to 10.17 Device Port Connector CN17
CN18		refer to 10.18 Device Port Connector CN18

3. Power Supply

The starter kit board is powered by a single 12V supply (V_BAT), which is connected to connector CN2.

Power control on the starter kit board is split to 2 parts.

One part is used for the power supply to RH850/U2B. This part uses the Renesas power management IC RAA271084.

The other part is the 3.3 V and 5.0 V power supply to the onboard peripheral hardware. This part consists of 2 Renesas buck regulators ISL85410.

3.1 Power Management IC (PMIC)

All voltages required to operate RH850/U2B are generated by the Renesas power management IC RAA271084. For more information about this device, please refer to the RAA271084 datasheet.

The power management IC has 4 LDO regulators, each of which can be fuse programmed to 3.3V or 5.0V.

The power management IC has also a buck-boost regulator DCDC1 and a buck regulator DCDC2.

The buck-boost regulator reduces the supply voltage V_BAT to 5.7V (V_5V7).

The buck regulator then generates the RH850 core voltage of 1.09V (VDD) from the 5.7V output by DCDC1.

The power management IC on the target board is programmed to provide the following voltages for RH850:

Table 3.1 RAA271084 Power Connections

RAA271084 Regulator	Output Voltage	Max. Output Current	Usage
DCDC1	5.7 V	-	RAA271084's VIN2, LDOVIN1/2 and LDOVIN3/4
DCDC2	1.09 V	-	RH850/U2B's VDDn
VCC (LDO0)	5 V	130 mA	RH850/U2B's SYSVCC, SVRAVCC & SCRDRVCC
LDO1	3.3 V	350 mA	RH850/U2B's VCC, J0VCC & OSCVCC
LDO2	3.3 V	350 mA	RH850/U2B's E0VCC, E1VCC, E2VCC & LVDVCC
LDO3	3.3 V	200 mA	Unused (EMUVCC if FCC device of RH850/U2B is used)
LDO4	5 V	200 mA	RH850/U2B's A0VCC, A1VCC, A2VCC, A0VREFH, A1VREFH, A2VREFH, ADSVCC, ADSVREFH & AFCVCC GreenPAK IC's (SLG) VDD

The power management IC has an SPI interface. This is connected to the MSPI5 interface of RH850. This interface can be used by the user application to program the configuration registers in the PMIC.

LED1 on the starter kit board is system status LED for the PMIC. If all system self-tests at power on are passed successfully this LED will be switched on.

Figure 3.1 shows the schematic of the PMIC circuit on the starter kit.

Table 3.2 lists the IO ports on the PMIC and shows what they are connected to.

Figure 3.2 shows the RAA271084 (OTP-1F.12) connections to RH850/U2B.

3.2 Buck Regulators

The starter kit has 2 voltage regulator circuits to generate the supply voltages for the onboard peripheral circuits. Each of these circuits uses a Renesas ISL85410 buck regulator.

The first one generates 5.0 V from the 12V board supply, the second one uses this 5.0 V and generates 3.3 V of it.

Figure 3.3 shows the circuit diagram of these buck regulators.

Figure 3.3 Power supply circuit for the peripherals on the starter kit board

3.3 Power Supply Test Connector

The starter kit has a possibility to easily measure all voltage levels that are available on the starter kit board.

All voltages are connected to the footprint of connector CN3.

On board version D019567_06_V0200 connector CN3 is assembled.

On board version D019567_06_V0300 connector CN3 is not assembled.

Figure 3.4 shows which voltage can be found on each pin on CN3.

Figure 3.4 Monitor voltage levels

3.4 Power Supply LEDs

The green LEDs LED1 – LED9 indicate the availability of various voltages on the starter kit board:

- LED1 for 5.0 V LVDO0 output
- LED2 for 12.0 V power supply V_BAT
- LED3 for 5.7 V LDO input voltage V_5V7
- LED4 for 3.3 V LVDO1 output
- LED5 for 3.3 V LVDO2 output
- LED6 for 3.3 V LVDO3 output
- LED7 for 5.0 V LVDO4 output
- LED8 for 5.0 V power rail VCC5V0
- LED9 for 3.3 V power rail VCC3V3

Figure 3.5 Power supply LEDs on the starter kit board

4. Clock Supply

The board has a soldered oscillator of 20MHz that can be used for device clock generation.

The RH850/U2B starter kit does not provide a possibility to input an external clock signal to the starter kit. The starter kit has 2 test points TP16 and TP17. These can, sufficient technical skills provided, be used to input an external clock signal to RH850/U2B.

Figure 4.1 Oscillator circuit

5. Debug and Flash Programming Interfaces

For debugging and flash programming purposes debug or flash programming tools can be connected to connector CN7.

Figure 5.1 shows the circuit diagram of connector CN7.

Figure 5.1 Debug and flash programming interface

The Renesas standard emulator for RH850/U2B is the E2 emulator. This can be used as emulator for debugging or as flash programmer.

To connect the E2 emulator to CN7 it is necessary to use the target connector included with the E2. To use the target connector for RH850 devices make sure switch SW1 on the is set to position [1-2].

Figure 5.2 E2 target connector

The configurator software can either be used with a graphical user interface or as command line tool.

Figure 6.4 GUI Error: No starter kit found

6.2.2 Graphical User Interface (GUI) for Configurator Software

When the starter kit configurator starts with the GUI it shows such a start screen.

Figure 6.5 Start screen of board configurator GUI

The start screen shows various information.

- The version number for the board configurator GUI.
- The name and the version of the PCB.
- The release date for the board configurator software (ASK shell) running on RL78.
- The board serial number
- Information about the 2 COM ports provided on the USB-C interface.
 - COM port ChA is an interface to RH850/U2B
 - COM port ChB is an interface to RL78

The buttons in the upper part are for general board operation.

- Group “Update board settings”
 - Button “Write to board (volatile)” – This writes the current configuration to the connected starter kit board.
 - Button “Read from board” – This reads the current settings from the connected starter kit board and shows the settings in the configurator.
 - Button “Set to defaults” – This sets the peripherals to a pre-defined value. All peripherals will be switched on.
- Group “Configuration file”
 - The GUI supports the function to save the configuration to an external file or to load the configuration from an external file. This makes it easy to distribute configurations between colleagues.

- Group “Reset RH850”
The GUI provides 2 buttons to reset the starter kit.
The “RESET” button performs a warm start of the starter kit by only applying a RESET to the RH850/U2B processor.
The “Powercycle” button performs a cold start of RH850/U2B. It controls the power management IC RAA271084 to switch RH850/U2B power supply off and on again.
- Group “Rescan for hardware”
The “Rescan” button allows to search for a starter kit, that is connected to the PC if an earlier start of the GUI did not find the starter kit and the software has been started without a starter kit board connection.
- “Quit” exits the board configurator.

Below the buttons is a line of tabs for board control:

- “Y-ASK-RH850-U2B”
This gives a short summary of the starter kit including software versions and hardware information on the connected board.
- “Non-volatile settings”
This allows to save and erase configurations on the starter kit and to define which of these configurations should be used. At the time of saving a configuration it is possible to define it as “bootable” so it will be automatically reloaded at power on.
- “HMI”
The starter kit offers several means for user interaction, for example potentiometers, various LED, switches as interrupt inputs, the rotary encoder and the display for OLED display.
- “Interfaces”
This tab is used to enable and configure communication interfaces included in the starter kit board. These include for example LIN, CAN, SENT, UART and Ethernet interfaces.
- “Module slots”
In addition to the built-in interfaces the starter kit also includes some connectors providing additional functions like Pmod™ interfaces, high-speed interfaces RHSB1 and MSPI6, and connectors for motor control boards.

6.2.3 Command Line Interface for Configurator Software

It is possible to use the configurator as simple command line tool. It offers several options to control the starter kit board. *Table 6.1* lists all available command line options.

Several options show a “does not submit” in the description. This means the option has been sent to the starter kit but is not yet active. It is necessary to send also the option “CfgScanOut” to make the change active.

The functions on the starter kit are not addressed by name but by the bit position in the configuration data. The attached file “List of configuration bits.xls” gives an overview of all configuration bits.

Table 6.1 Command line interface options

Option	Description
SNnnnnnn	Select hardware by serial number, starts GUI
COMn	Select hardware by COM port number, starts GUI
Offline	Start GUI without connecting to actual hardware, starts GUI
GetCOMA	Return main COM port number of detected hardware as exit code
GetCOMB	Return configuration COM port number of detected hardware as exit code
RESET	Reset the starter kit
PowerCycle	Power-cycle the starter kit
CfgSetBit:bitno:val	Set/clear a specific configuration bit (does not submit)
CfgSetByte:byteno:val[:mask]	Write to a specific configuration byte, mask is optional (does not submit)
CfgSetDefault	Restore board-default values (does not submit)

Table 6.1 Command line interface options (cont'd)

Option	Description
CfgScanOut	Make configuration effective
CfgLoad:slotno	Restores a setting from non-volatile memory (does not submit)
CfgLoadFile:filename	Restores a setting from a local file (does not submit)
CfgSet:feature:value	Uses a string literal for configuration (does not submit)

Here are some examples on how to use the command line interface with various options.

- Select a specific board when multiple boards are attached
ASK_U2BX_Configurator.exe COM14
ASK_U2BX_Configurator.exe SN273739
- Reset the device on the Starter Kit
ASK_U2BX_Configurator.exe RESET
- Detect COM port number of UART1 (USB channel A)
ASK_U2BX_Configurator.exe GetCOM
IF %ERRORLEVEL% GEQ 7 ECHO UART1 found at COM%ERRORLEVEL%
- Detect COM port number of ASK-Shell (USB channel B)
ASK_U2BX_Configurator.exe GetCOMB
IF %ERRORLEVEL% GEQ 7 ECHO ASK-Shell found at COM%ERRORLEVEL%
- Enable SENT interface
ASK_U2BX_Configurator.exe CfgSetBit:13:0 CfgScanOut
- Enable SENT interface
ASK_U2BX_Configurator.exe CfgSetByte:0x01:0x00:0x20 CfgScanOut
- Enable SENT interface
ASK_U2BX_Configurator.exe CfgSet:SENT:enabled CfgScanOut
For a list of available text literals, connect to the ASK-Shell and type "CfgHelp"
- Enable CAN1 interface
ASK_U2BX_Configurator.exe CAN1:connect CAN1:termination:terminated CAN1:pin3:GND CfgScanOut
- Restore board defaults
ASK_U2BX_Configurator.exe CfgSetDefault CfgScanOut
- Load settings from on-board non-volatile memory, slot 1
ASK_U2BX_Configurator.exe CfgLoad:1 CfgScanOut
- Load settings from a file
ASK_U2BX_Configurator.exe CfgLoadFile:C:\temp\set.cfg CfgScanOut

6.2.4 Starter Kit Configurator Firmware Programming

The starter kit provides 3 possibilities to reprogram the firmware in the RL78 board configuration controller.

- Using the automatic update function in the board configurator utility.
- Using the Renesas Flash Programmer (RFP) via the USB-C connection.
- Using RFP with an external programmer (like E2 Lite or E2) via the CN4 connector.

Figure 6.6 and Figure 6.7 show the circuit diagram for RL78 reprogramming.

Figure 6.6 RL78 reprogramming circuit on board version D019567_04_V0200

Figure 6.7 RL78 reprogramming circuit on board version D019567_04_V0300

6.2.4.1 Reprogramming RL78 with the Board Configurator

The easiest way to reprogram the board configurator RL78 is to use the firmware update function in the board configurator utility. When the configurator is started it will check the firmware version of the board configurator RL78. If it finds that the RL78 software has to be updated, it will show a corresponding dialog and ask whether the software should be updated.

Figure 6.8 shows this message.

Figure 6.8 Configurator software update request

6.2.4.2 Reprogramming RL78 using RFP via USB-C Connection

Another simple way to reprogram the board configurator RL78 is to use the Renesas Flash Programmer software (RFP) via the USB-C interface. The USB controller on the starter kit registers the FTDI chip with 2 virtual COM ports on the connected PC. One of these can be used by the RFP software to program RL78.

There is a small difference between board revision D019567_04_V0200 and board revision D019567_04_V0300 (refer to Figure 6.6 and Figure 6.7).

On board revision D019567_04_V0200 the RESET input on RL78 is directly connected to RESET signal generated by the FTDI USB interface. This means that the FTDI chip can always reset the board configurator and the RL78 firmware has to handle possible unwanted RESET signals.

On board revision D019567_04_V0300 the RESET signal from the FTDI chip can be interrupted by DIP switch SW4. Thus, it is possible to control that the FTDI RESET signal is only connected to RL78 if the processor has to be programmed.

6.2.4.3 Reprogramming RL78 using an External Programmer via CN4 Connector

RL78 can be programmed using a single wire UART interface. The 4-pin connector CN4 provides all necessary signals to connect an external programmer.

The standard interface of Renesas programming tools, like E2 Lite or E2, uses a 14 pin 2.54mm pitch connector.

It is possible to prepare a small adapter to connect a programmer to the starter kit and reprogram RL78.

Figure 6.9 shows the circuit diagram for such an adapter. The pull-up resistor R142 is already part of the starter kit. So, no components have to be added.

Table 6.2 lists all pins of the programmer connector and gives the reference to which pin on the starter kit this is connected.

Figure 6.9 Adapter to reprogram RL78

Table 6.2 Connections on the adapter to connect a Renesas programmer to the starter kit

Programmer		Starter Kit		Programmer		Starter Kit	
Pin		Pin		Pin		Pin	
1	NC	---	---	2	GND	4	GND
3	NC	---	---	4	NC	---	---
5	TOOL0	2	RL78_TOOL_0	6	NC	---	---
7	NC	---	---	8	VCC	1	VCC3V3
9	VCC	1	VCC3V3	10	RESET_OUT	3	RL78_RESET#
11	NC	---	---	12	GND	4	GND
13	RESET_OUT	3	RL78_RESET#	14	GND	4	GND

If the programmer is an E2 emulator it is necessary to use an additional adapter to connect the 20 pin 1.27mm pitch cable of E2 to the 14 pin 2.54mm pitch connector.

Note

The E2 emulator is connected to the adapter using the conversion adapter RTE0T00020KCA00000R. For programming RL78, switch SW1 on the conversion adapter must be set to position 3.

Otherwise, RFP cannot connect to RL78.

To reprogram the RL78 firmware on the starter kit follow this procedure:

1. Connect emulator E1, E2 or E2 Lite to connector CN4.
2. Start RFP software.
3. Create a new project for RL78 in RFP. The exact processor type is determined automatically when RFP connects to the target device on operation start.
4. There are 3 possibilities to provide the power supply to RL78:
 - From the USB connection of connector CN6 to the PC.

- From the board power supply on connector CN2.
 - From the emulator. In this case power supply must be switched on in the “Connect settings” in the RFP software.
5. Add the firmware file as “Program File” in RFP.
 6. Push the “Start” button to execute the programming operation as defined in “Operation Settings”.

7. Peripheral Circuits

7.1 RESET Circuit

The starter kit uses a GreenPAK IC SLG7RN48401-A for RESET signal control and status signal display. There are several means to trigger a RESET signal output to RH850.

The push button SW1 and the RESET signal from the power management IC are input to the GreenPAK IC and trigger a RESET signal output to RH850/U2B.

A RESET signal from an emulator connected to CN7 and a RESET signal from the board configurator RL78 can also trigger a RESET to RH850/U2B.

The lighted red LED11 indicates that a RESET signal is output to RH850/U2B.

Figure 7.1 shows the circuit diagram for the GreenPAK IC and the RESET signal input.

Figure 7.1 Reset circuit

The GreenPAK IC also controls output LEDs for several status signals:

- LED10 - ERROROUT_M#
- LED11 - RESET
- LED12 - VMONOUT#
- LED13 - Core voltage VDD_F

7.2 External Interrupt Signal

The RH850/U2B starter kit has 2 switches, that can be used as external interrupt inputs to RH850/U2B.

The interrupt inputs are enabled in the board configuration utility in the “HMI” settings.

SW2 generates the EX_INT0 signal. This is connected to RH850 port P10_6 / IRQ4.

SW3 generates the EX_INT1 signal. This is connected to RH850 port P14_0 / IRQ13.

Figure 7.3 shows the circuit diagram for the interrupt switches.

Figure 7.2 Interrupt input enable

Figure 7.3 External interrupt signals

7.3 Analog Signal Input

The starter kit includes two potentiometer POT11 and POT12, that allow analog signal input to ports AN20_0 (POT11) and AN20_1 (POT12).

The analog signal inputs are enabled in the board configuration utility in the “HMI” settings.

Figure 7.5 shows the circuit diagram for the potentiometer connection.

Figure 7.4 Analog input enable

Figure 7.5 Potentiometer connection

7.4 Rotary Encoder

The starter kit incorporates a rotary encoder with illuminated shaft, a built-in push button and 2 quadrature encoder outputs.

The rotary encoder is enabled in the board configuration utility in the “HMI” settings. There is one selection for the illumination of the encoder shaft and another one for the encoders and the push button.

The push button is connected to interrupt input IRQ37 at port P34_2.

The encoder signals are input to the on-chip encoder ENCA1 on ports P34_4 and P32_0.

The illumination of the encoder shaft uses RGB LEDs. These are controlled from ports P02_3 (red), P02_8 (green) and P02_10 (blue).

Figure 7.7 shows the circuit diagram for the rotary encoder.

Figure 7.6 Rotary encoder enable

Figure 7.7 Rotary encoder

7.5 LEDs

7.5.1 Circular LEDs

The board provides 16 LEDs arranged in a circle surrounding the rotary encoder.

The signal LEDs are enabled in the board configuration utility in the “HMI” settings.

The processor interface MSPI4 is used as clock synchronous interface to communicate to the 16 channel LED driver in IC9, and ports P22_6 and P22_8 are control signals for the LED driver.

Figure 7.9 shows the circuit diagram for the SPI LED.

Table 7.1 lists the pin functions on RH850/U2B going to the SPI LEDs.

Figure 7.8 Circular LEDs enable

Table 7.1 Connection of SPI LED

RH850/U2B Signal		Signal on SPI LED driver
Port	Function	
P22_1	MSPI4CL	CLK
P22_2	MSPI4SO	SDI
P22_3	MSPI4SI	SDO
P22_5	MSPI4CSS0	Enable data input from SPI LED driver to RH850/U2B
P22_6	P22_6	OE#
P22_8	P22_8	LE

Figure 7.9 Circular LED connection

7.5.2 User Signal LEDs

Four LEDs are provided to allow for status outputs of the application software using RH850/U2B port pins.

The signal LEDs are enabled in the board configuration utility in the “HMI” settings. Each LED can be activated separately.

The RH850/U2B ports P32_1, P32_2, P32_3 and P32_4 are used as LED outputs.

Figure 7.11 shows the circuit diagram for the user LEDs.

Table 7.2 lists the ports of RH850/U2B used for the user LEDs.

Table 7.2 Connection of signal LED

RH850/U2B Port	Signal LED
P32_1	LED20
P32_2	LED21
P32_3	LED22
P32_4	LED23

Figure 7.10 User Signal LED configuration

Figure 7.11 User signal LED connection

7.6 OLED Graphic Display

The RH850/U2B starter kit uses a display manufactured by EastRising Technology. The display is ER-OLED0.96-1.3B. It is a 0.96 inch display with a resolution of 128x64 pixel.

The OLED display is enabled in the board configuration utility in the “HMI” settings.

The flexible PCB coming from the display is connected to connector CN8 on the starter kit.

RH850/U2B controls the display via clock synchronous interface MSPI5.

Figure 7.13 shows the circuit diagram for the OLED display connection.

Table 7.3 lists the pin functions on connector CN8 going to the OLED display.

Figure 7.12 OLED display enable

7.7 CAN Interfaces

The starter kit provides 2 CAN interfaces. They can be enabled in the board configuration utility in the “Interfaces” settings.

The board configurator also provides the possibility to activate bus termination on the CAN output ports and to connect pin 3 of each CAN output to GND.

It is also possible to activate a loop back function between the 2 CAN outputs.

Figure 7.15 shows the circuit diagram for the CAN interfaces.

Figure 7.14 CAN configuration

Figure 7.15 CAN interfaces

On the starter kit the CAN interfaces use the connectors CN14 and CN15 for signal output.

The CAN signals can also be measured between RH850/U2B and the CAN transceiver on connector CN13.

Table 7.4 shows which RH850/U2B ports are used for the CAN interfaces.

Table 7.5 shows which RH850/U2B ports are used for the CAN interfaces.

Table 7.6 shows the pin configuration of the CAN output ports CN14 and CN15.

Table 7.4 RH850 ports being used for CAN interfaces

CAN0		CAN1	
RH850 Port	RH850 Function	RH850 Port	RH850 Function

7	LIN1	LIN enabled in board configurator. Pull-up can also be enabled in board configurator.
8	SENT1	SENT enabled in board configurator.
9	LIN1_BAT	LIN Power enabled in board configurator.
10	GND	

7.8.1 LIN Interface

The LIN interface is enabled in the board configuration utility in the “Interfaces” settings.

The board configurator also provides several possibilities to configure the LIN interface.

- **Power**
Enable the power supply to the LIN transceiver TJA1021.
- **Enable @RLIN34**
On the RH850/U2B side the interface RLIN34 is used on the pins P00_4 (RLIN34TX) and P00_5 (RLIN34RX) for the LIN interface. The connection is activated with this setting.
- **Master (PU_EN)**
This enables a pull-up on the LIN data line for a LIN Master interface.

Figure 7.17 LIN / SLP_N / WAKE_N configuration

Table 7.8 LIN measurement points

Connector	Function
CN11-1	LIN1_TX (RLIN34TX)
CN11-2	LIN1_RX (RLIN34RX)

The board configurator also includes settings to define the settings for the pins SLP_N and WAKE_N on the NXP transceiver IC.

On connector CN11 it is possible to monitor the LIN signals between the processor RH850/U2B and the LIN transceiver.

7.8.2 SENT Interface

The SENT interface is enabled in the board configuration utility in the “Interfaces” settings.

RH850/U2B uses the internal module RSENT13 on ports P34_1 (RSENT13RX) and P34_3 (RSENT13SPCO) for the interface.

The board configurator has also a possibility to output the SENT power supply signal on pin 1 of connector CN12.

On connector CN11 it is possible to monitor the SENT signals between the processor RH850/U2B and the SENT output.

Figure 7.18 SENT configuration

Table 7.9 SENT measurement points

Switch	Function
CN11-3	SENT1RX (RSENT13RX)
CN11-4	SENT1SPCO (RSENT13SPCO)

7.9 Connection Cable for CAN and LIN Interfaces

The starter kit includes 3 connection cables from 10-pin DIL to 9-pin D-SUB, that can be used for CAN and LIN connections to external hardware.

The DIL connector can be plugged-in to the connectors CN10 and CN11 for CAN interfaces or CN12 for LIN interface.

Table 7.10 shows the connection between the 10-pin connector and the 9-pin D-SUB connector, and the functions when the cable is connected to the CAN or LIN ports.

Figure 7.19 CAN / LIN cable

Table 7.10 Connection between 10-pin connector and 9-pin D-SUB connector

Pin number on DIL connector	Pin number on D-SUB connector	Function		
		When connected to CN10 (CAN0)	When connected to CN11 (CAN1)	When connected to CN12 (LIN)
1	1	—	—	VCC5V0 (when SW6-1 is ON)

9	9	—	—	LIN1_BAT (when SW8-4 is ON)
10	—			

7.10 UART Interfaces

The starter kit includes USB-C interface (connector CN6) with a dual channel USB to UART IC FTDI FT2232HQ.

One channel can be connected to RH850/U2B on ports P02_1 (RLIN31TX) and P02_4 (RLIN31RX). It is enabled in the board configurator “Interfaces” settings.

The second channel is used for software updates on the starter kit configurator IC RL78/F13. Refer to 6.2.4.2 *Reprogramming RL78 using RFP via USB-C Connection*.

The starter kit has 4 LEDs to show bus activity on the two UART channels.

- LED18 and LED19 show activity on the UART interface connected to RH850/U2B.
- LED24 and LED25 show activity on the RL78/F13 reprogramming interface.

On connector CN16 it is possible to measure the UART signals between RH850/U2B and the FTDI transceiver.

Figure 7.21 shows the circuit diagram for the UART interfaces.

Table 7.11 shows the UART measurement pins on connector CN16.

Table 7.12 shows the pin configuration on the USB-C connector CN6.

7.11 Ethernet Interface

The starter kit for RH850/U2B offers one Ethernet interface. This is a fast Ethernet interface compatible with 10BASE-T / 100BASE-TX.

The 10BASE-T/100BASE-TX Ethernet interface outputs its signals to a RJ45 connector (CN10).

The circuit diagram shows the Ethernet circuit.

The 10BASE-T/100BASE-TX interface can be enabled in the board configurator.

On the processor side the Ethernet interface is connected to the ETND0 unit on ports P11 and P25.

Figure 7.23 shows the circuit diagram for the Ethernet interface.

Table 7.13 shows the pin configuration on the Ethernet connector CN10.

Table 7.13 Connector CN10 for 10BASE-T/100BASE-TX Ethernet

Pin	Name	Signal	Pin	Name	Signal

7.12 Configuration Interfaces

The starter kit for RH850/U2B includes 2 serial interfaces that allow RH850/U2B to communicate to the RL78 board configuration controller. One interface uses IIC protocol, the other supports UART protocol.

These connections are intended to give RH850 the possibility to directly modify the configuration of the starter kit.

The IIC interface uses on RH850 side the RIIC0 interface on ports P00_1 and P00_2.

The UART interface uses on RH850 side the RLIN33 interface on ports P32_4 and P32_6.

Figure 7.24 Configuration interfaces enable

Figure 7.25 Connection of RH850/U2B to RL78/F13

7.13 Pmod™ Interfaces

The starter kit for RH850/U2B includes 2 Pmod interfaces. They support the Pmod modes 1A, 2A, 3A, and 6A.

The starter kit configurator can select which functions the Pmod interfaces support.

Figure 7.27 shows the circuit diagram for board version D019567_04_V0200.

Figure 7.28 shows the circuit diagram for board version D019567_04_V0300.

Table 7.14 and Table 7.15 show the pin configurations on the Pmod connectors and which RH850 functions are being used.

There are differences in the ports being used on the different board versions. The differences between the board versions are also shown in Table 7.14 and Table 7.15.

7.14 RHSB1 / MSPI6 Interface

The starter kit provides access to high speed serial interfaces using RH850/U2B RHSB1 and MSPI6 interface. The high speed serial interface signals are output to connector CN9.

These interface are enabled in the board configurator.

The configurator settings also allows to change the pins for the data signals, change the ports for the clock signals and select the source for the chip select signal.

Figure 7.30 RHSB1 / MSPI6 interface shows the circuit diagram for this interface.

Table 7.16 RHSB1/MSPI6 connector CN9 gives an overview of the possible settings.

7.15.1 Resolver Circuits

The resolver to digital converter circuit on RH850/U2B6 devices is called RDC3AL. It uses the analog input AN24_0 – AN24_3 for resolver 0 and the analog inputs AN26_0, AN26_2, AN27_1 and AN27_2 for resolver 1.

The resolver to digital converter circuit on RH850/U2B10 devices is called RDC3AS. It uses the analog input AN01_2, AN01_3, AN04_1 and AN04_3 for resolver 0 and the analog inputs AN22_2, AN22_3, AN23_2 and AN23_3 for resolver 1.

Table 7.17 lists ports used for resolver functions on RH850/U2B6.

Table 7.18 lists ports used for resolver functions on RH850/U2B10.

Table 7.19 and Table 7.20 show the pin configurations of the resolver connectors CN5 (resolver 0) and CN1 (resolver 1).

Figure 7.34 and Figure 7.35 show the circuit diagrams for the resolver circuits.

7.15.2 Motor Control Interfaces

The starter kit provides two connectors for 3-phase motor connections. Connector CN20 is used for Motor 0, connector CN21 is used for Motor 1.

In RH850/U2B there are two possibilities to generate the motor control signals. One is to use a dedicated motor control timer (TSG3), the other is to use the Generic Timer Module (GTM). The desired interface is selected in the board configurator interface (see *Figure 7.31*).

Figure 7.36 Motor interface show the circuit diagrams of the motor control interfaces.

Table 7.21 Motor 0 connector CN20 and *Table 7.22 Motor 1 connector CN21* show the port connections for both motor connectors.

Table 7.21 Motor 0 connector CN20

7	V_Phase_1	P13_3	P33_7	8	DIOOn_0	P12_8
9	W_Phase_0	P14_5	P33_0	10	DIOOn_1	P12_9
11	W_Phase_1	P14_4	P33_1	12	GND	
13	U_Phase_2	P13_0		14	U_Phase_Enc	P14_1
15	V_Phase_2	P13_1		16	V_Phase_Enc	P14_2
17	W_Phase_2	P13_2		18	W_Phase_Enc	P14_3
19	---			20	---	

Each motor control circuit includes 3 LEDs in red, green and blue. The LEDs are connected to the signals U_Phase_0 (red), V_Phase_0 (green) and W_Phase_0 (blue) of each motor and show the activity of the motor control signals.

Figure 7.36 Motor interface

8. Development Tools

8.1 E2 On-Chip Debug Emulator [RTE0T00020KCE00000R]

The E2 on-chip debug emulator is a powerful debugging tool with flash programming functions which supports various Renesas microcontrollers. It offers enhanced debug features for RH850 microcontrollers such as:

- Software Trace Function
- CAN Communications Time Measurement Solution
- Support of external trigger signals (input and output)

Technical details about E2, the latest manuals and the actual version of the USB driver can be found on the Renesas website for E2: [E2 emulator \[RTE0T00020KCE00000R\] | Renesas](#)

8.2 Software Development Tools

The following software development tools are included in the starter kit package:

- Green Hills MULTI IDE (90 days evaluation version)
- IAR Embedded Workbench EWRH850 for Renesas RH850 (128KB kickstart version or 30 days evaluation version)
- CS+ integrated development environment with compiler CC-RH (compiler is 60 days evaluation version, afterwards it can be used as 256KB code size limited version)
- Renesas Flash Programmer ([Renesas Flash Programmer \(Programming GUI\) | Renesas](#))
- Renesas Smart Configurator ([Smart Configurator | Renesas](#))

Installation and usage of these tools is described in the RH850 starter kit license information document (D017765-11), which is also part of the Starter Kit package.

9. RH850/U2B Starter Kit Example Software

Example software for the RH850/U2B Starter Kit can be downloaded from the following website:

https://www.renesas.com/y-ask-rh850u2b#design_development

A description of the sample software is included in each package.

10. Connectors

10.1 Resolver 1 Connector CN1

Please refer to 7.15.1 *Resolver Circuits* for details on the function of these pins.

Table 10.1 Resolver 1 connector CN1

Pin	Device port
1	RSLV1_S1
3	RSLV1_S3
5	RSLV1_S2
7	RSLV1_S4

Pin	Device port
2	RSLV1_R1
4	RSLV1_R2
6	Pull-up VCC5V0
8	GNDR

10.2 Power Supply Connector CN2

Please refer to 3 *Power Supply* for details on the function of these pins.

Table 10.2 Power supply connector CN2

Pin	Function
1	GND
2	—
3	+12V
4	+12V

10.3 Power Supply Test Connector CN3

Please refer to 3.3 *Power Supply Test Connector* for details on the function of these pins.

This connector is not assembled on board version D019567_06_V0300.

Table 10.3 Power supply test connector CN3

Pin	Device port
1	GND
3	V_BAT (12.0V)
5	V_5V7 (5.7V)
7	VDD (1.09V)
9	NC
11	VCC5V0 (5.0V)
13	VCC3V3

Pin	Device port
2	V_LDO0 (5.0V)
4	V_LDO1 (3.3V)
6	V_LDO2 (3.3V)
8	V_LDO3 (3.3V)
10	V_LDO4 (5.0V)
12	NC
14	GND

10.4 RL78 Programming Connector CN4

Please refer to 3.3 *Power Supply Test Connector* for details on the function of these pins.

This connector is not assembled.

Table 10.4 RL78 programming connector CN3

Pin	Function
1	VCC3V3
2	RL78_TOOL_0
3	RL78_RESET#
4	GND

10.5 Resolver 0 Connector CN5

Please refer to 7.15.1 *Resolver Circuits* for details on the function of these pins.

Table 10.5 Resolver 0 connector CN5

Pin	Device port
1	RSLV0_S1
3	RSLV0_S3
5	RSLV0_S2
7	RSLV0_S4

Pin	Device port
2	RSLV0_R1
4	RSLV0_R2
6	Pull-up VCC5V0
8	GNDR

10.6 USB-C Connector CN6

Please refer to 7.10 *UART Interface* for details on the function of these pins.

Table 10.6 USB-C connector CN6

Pin	Function	Signal Name
A1	GND	
A2	–	–
A3	–	–
A4	V-BUS	V_USBCN
A5	CC1	Pull-down GND
A6	DP1	USB_DP

	Device port	Function	Device port	Function
2	P10_4	DATA_IN_P (MSPI6_SIP)	P10_2	DATA_OUT_P (RHSB1MCSOP / RHSB1SOP / MSPI6_SOP)
4	P10_5	DATA_IN_N (MSPI6_SIN)	P10_3	DATA_OUT_N (RHSB1MCSON / RHSB1SON / MSPI6_SON)
8	P10_2	DATA_OUT_P (RHSB1MCSOP / RHSB1SOP / MSPI6_SOP)	P10_4	DATA_IN_P (MSPI6_SIP)
10	P10_3	DATA_OUT_N (RHSB1MCSON / RHSB1SON / MSPI6_SON)	P10_5	DATA_IN_N (MSPI6_SIN)

10.10 Ethernet Connector CN10

Please refer to 7.11 *Ethernet Interface* for details on the function of these pins.

Table 10.10 10BASE-T/100BASE-TX Ethernet connector CN10

Pin	Name	Signal	Pin	Name	Signal
1	TDPLUS	TXP	2	TDMINUS	TXN
3	RDPLUS	RXP	4	CT_TD	
5	CT_RD		6	RDMINUS	RXN
7	NC		8	GND	
9	GR_AN	Green LED, anode	10	GR_KA	Green LED, Cathode
11	YE_AN	Yellow LED, anode	12	YE_KA	Yellow LED, cathode
13	GND		14	GND	

10.11 LIN and SENT Monitor Connector CN11

Please refer to 7.8 *LIN and SENT Interfaces* for details on the function of these pins.

Table 10.11 LIN and SENT monitor connector CN11

Pin	Function	Condition
1	LIN1_TX	LIN enabled in board configurator.
2	LIN1_RX	
3	SENT1RX	SENT enabled in board configurator.
4	SENT1SPCO	

10.12 LIN and SENT Connector CN12

Please refer to 7.8 *LIN and SENT Interfaces* for details on the function of these pins.

Table 10.12 LIN and SENT connector CN12

Pin	Function	Condition
1	VCC5V0	SENT power enabled in board configurator.
2	NC	
3	NC	
4	NC	
5	GND	
6	GND	
7	LIN1	LIN enabled in board configurator. Pull-up can also be enabled in board configurator.
8	SENT1	SENT enabled in board configurator.
9	LIN1_BAT	LIN Power enabled in board configurator.
10	GND	

10.13 CAN Monitor Connector CN13

Please refer to 7.7 *CAN Interfaces* for details on the function of these pins.

Table 10.13 LIN and SENT monitor connector CN11

Pin	Function	Condition
1	CAN0_RX	CAN0 enabled in board configurator.
2	CAN0_TX	
3	CAN1_RX	CAN1 enabled in board configurator.
4	CAN1_TX	

10.14 CAN0 Connector CN14

Please refer to 7.7 *CAN Interfaces* for details on the function of these pins.

Table 10.14 CAN0 connector CN14

Pin	Function	Condition
1	NC	
2	CAN0L	CAN0 enabled in board configurator. Termination can also be enabled in board configurator.
3	GND	Pin 3 on GND enabled in board configurator.
4	NC	
5	NC	
6	NC	
7	CAN0H	CAN0 enabled in board configurator. Termination can also be enabled in board configurator.
8	NC	
9	NC	
10	GND	

10.15 CAN1 Connector CN15

Please refer to 7.7 *CAN Interfaces* for details on the function of these pins.

Table 10.15 CAN1 connector CN15

Pin	Function	Condition
1	NC	
2	CAN1L	CAN1 enabled in board configurator. Termination can also be enabled in board configurator.
3	GND	Pin 3 on GND enabled in board configurator.
4	NC	
5	NC	
6	NC	
7	CAN1H	CAN1 enabled in board configurator. Termination can also be enabled in board configurator.
8	NC	
9	NC	
10	GND	

10.16 UART Monitor Connector CN16

Please refer to 7.10 *UART Interface* for details on the function of these pins.

Table 10.16 UART signal on connector CN16

Pin	Function
1	GND
2	Data signal from RH850/U2B (port P02_1) to FTDI FT2232 (ADBUS0)
3	Data signal from FTDI FT2232 (ADBUS1) to RH850/U2B (port P02_4)

10.17 Device Port Connector CN17

The device port connectors provide direct access to RH850/U2B port pins.

Table 10.17 Device port connector CN17

Pin	Device port	Pin	Device port
1	AN25_2	2	AN2_0

12	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3

*1 Board version D019567_04_V0200, including level shifter (IC51)

*2 Board version D019567_04_V0300

10.24 PMOD1 Connector CN24

Please refer to 7.13 Pmod™ Interfaces for details on the function of these pins.

Table 10.24 PMOD1 pin configuration

Pin	Expanded GPIO (type 1A)		Expanded SPI (type 2A)		Expanded UART (type 3A)		Expanded I2C (type 6A)	
	Pmod signal	RH850 signal	Pmod signal	RH850 signal	Pmod signal	RH850 signal	Pmod signal	RH850 signal
1	GPIO	AN03_0 (P40_10) ^{*1} P23_3 ^{*2}	CS	MSPI5CSS2 (P23_3)	CTS (GPIO)	AN03_0 (P40_10) ^{*1} P23_3 ^{*2}	NC	P22_13
2	GPIO (PWM)	P23_1 (TOM1_1)	MOSI	MSPI5SO (P23_5)	TXD	RLIN323TX (P23_1)	NC	P11_5
3	GPIO	P23_0	MISO	MSPI5SI (P23_6)	RXD	RLIN323RX (P23_0)	SCL	RIIC1SCL (P00_6)
4	GPIO	AN21_0 (P40_12) ^{*1} P00_6 ^{*2}	SCK	MSPI5SC (P23_7)	RTS	AN21_0 (P40_12) ^{*1} P00_6 ^{*2}	SDA	RIIC1SDA (P00_7)
5	GND	GND	GND	GND	GND	GND	GND	GND
6	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3
7	GPIO	P22_13	GPIO (INT)	P22_13 (IRQ13)	GPIO (INT)	P22_13 (IRQ13)	GPIO	AN03_0 (P40_10) ^{*1} P23_3 ^{*2}
8	GPIO (PWM)	P11_5 (TAUD1O14)	GPIO (RESET)	P11_5	GPIO (RESET)	P11_5 (TAUD1O14)	GPIO	P11_10
9	GPIO	P11_10	GPIO (CS2)	P23_0 (MSPI5CSS3)	GPIO	P11_10	GPIO	P23_0
10	GPIO	P25_2	GPIO (CS3)	P25_2	GPIO	P25_2	GPIO	P25_2
11	GND	GND	GND	GND	GND	GND	GND	GND
12	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3	VCC	VCC3V3

*1 Board version D019567_04_V0200, including level shifter (IC58)

*2 Board version D019567_04_V0300

12. Schematics

CAUTION

The schematics shown in this document are not intended to be used as a reference for mass production. Any usage in an application design is the sole responsibility of the customer.

12.1 Y-ASK-RH850U2B6 (D019567_06_V0200)

12.1.1 RH850 U2B

R20UT5704ED0101 Rev.1.01
October 07, 2025

12.1.3 Power Supply

12.1.4 Board Control, Miscellaneous

12.1.5 Interrupt Input, A/D Measurement, Signal LED

12.1.6 PMOD 0/1 Interfaces

12.1.7 SPI LED & Rotary Encoder

R20UT5704ED0101 Rev.1.01
October 07, 2025

12.1.9 Ethernet Interface

12.1.10 UART Interface

12.1.11 LIN / SENT Interfaces

12.1.12 CAN 0/1 Interfaces

12.1.13 Resolver and Motor Control

12.1.14 Resolver Circuit 0

12.1.15 Resolver Circuit 1

12.1.16 Motor Control Circuit 0/1

12.2 Y-ASK-RH850U2B6 (D019567_06_V0300)

12.2.1 RH850 U2B

R20UT5704ED0101 Rev.1.01
October 07, 2025

12.2.3 Power Supply

12.2.4 Board Control, Miscellaneous

12.2.5 Interrupt Input, A/D Measurement, Signal LED

12.2.6 PMOD 0/1 Interfaces

12.2.7 SPI LED & Rotary Encoder

12.2.11 LIN / SENT Interfaces

12.2.12 CAN 0/1 Interfaces

12.2.13 Resolver and Motor Control

12.2.14 Resolver Circuit 0

12.2.15 Resolver Circuit 1

12.2.16 Motor Control Circuit 0/1

12.3 Y-ASK-RH850U2B10 (D019567_06_V0300)

12.3.1 RH850 U2B

R20UT5704ED0101 Rev.1.01
October 07, 2025

12.3.3 Power Supply

12.3.4 Board Control, Miscellaneous

12.3.5 Interrupt Input, A/D Measurement, Signal LED

12.3.6 PMOD 0/1 Interfaces

12.3.7 SPI LED & Rotary Encoder

12.3.8 RHSB1 / MSPI6 Interfaces

12.3.9 Ethernet Interface

12.3.10 UART Interface

12.3.11 LIN / SENT Interfaces

12.3.12 CAN 0/1 Interfaces

12.3.13 Resolver and Motor Control

12.3.14 Resolver Circuit 0

12.3.15 Resolver Circuit 1

12.3.16 Motor Control Circuit 0/1
